Johnson Economics

## MEMORANDUM

DATE: $\quad$ November 29, 2018

To: Tyler Bump
Bureau of Planning and Sustainability

From: Jerry Johnson
Johnson ECONOMICS LLC

SUBJECT: Economic Analysis of Proposed Changes to the Infill Development Standards

The City of Portland Bureau of Planning and Sustainability continues to refine the Residential Infill Project, and this analysis provides an updated to previous work completed by Johnson Economics on the project from March 2018. A number of changes have been made since the previous draft standards, including changes in allowable FAR, the number of units allowed in the structure, and a change in zoning of some parcels.

The proposed change in allowed development being evaluated are as follows:

| Units | Allowed Housing Type | R7 | R5 | R2.5 |
| :---: | :---: | :---: | :---: | :---: |
| Minimum Lot Size (1-2 Units) |  | 4,200 SF | 3,000 SF | 1,600 SF |
| 1 | Single Family Home | Base FAR: 0.4 | Base FAR: 0.5 | Base FAR: 0.7 |
| 2 | Duplex or Single Family Home + ADU | Base FAR: 0.5 <br> W/Bonus: 0.6 | Base FAR: 0.6 <br> W/Bonus: 0.7 | Base FAR: 0.8 <br> W/Bonus: 0.9 |
| Minimum Lot Size (3+ Units) |  | 5,000 SF | 4,500 SF | 3,200 SF |
| 3 | Triplex, Duplex +ADU, or House +2 ADUs | Base FAR: 0.6 <br> W/Bonus: 0.7 | Base FAR: 0.7 <br> W/Bonus: 0.8 | Base FAR: 0.9 <br> W/Bonus: 1.0 |
| 4 | Fourplex |  |  |  |
| Current Allowed FAR |  | 1.1 FAR | 1.35 FAR | 1.75 FAR |

The changes allow for more units on individual parcels, and modest increases in allowed FAR as the number of units increases. The bonus FAR is available if at least one of the units is affordable at $80 \% \mathrm{MFI}$, or an existing home is converted to multiple units. Both of these conditions favor multi-unit development solutions for redevelopment.

The geographic coverage for the residential infill project has also changed.

While the FAR reductions are significant, the current allowed size of structure for the three residential zones is likely well above what would be expected in the market, as homes in these size ranges represent a small percentage of housing stock. The revised allowable home sizes will likely restrict final home sizes below what the market may
support, particularly for single family homes, and we would expect new development to largely develop close to the new limits.

The new proposal includes a rezone of a number of parcels from R5 to R2.5, which has a significant impact on allowable density under the proposal, with fourplexes now allowed at up to 1.0 FAR on a 3,200 square foot lot.

In summary, the most recent proposed changes to the code increase allowable density in terms of units, and the FAR and bonus structure provides incentives for greater unit counts at redevelopment. The net impact is expected to be a greater proportion of redevelopment being multiple-unit properties, providing greater net unit yield and lower average price points as a result.

## I. Prototypes

As with our previous analyses, Johnson Economics modeled the economic feasibility of a series of prototypical development types. A total of 11 development prototypes were evaluated, five representing current zoning standards with an additional 6 under the revised standards. Under the new proposed standards, the allowable square footage is reduced due to lower allowable FAR, while the number of allowed units is increased. By allowing for multiple residential structures on the site, a developer is able to produce housing at a lower overall price point which broadens the potential market for the housing. While the lower price point will reduce market risk, these units are likely to be largely rental product.

The following are summary pro formas for these development forms. The assumed pricing levels in these examples was included as an example, with actual pricing varied based on a series of eleven discrete pricing bands identified in the study area. The number of pricing bins was reduced as the geographic coverage of the new proposal is more limited although including a greater number of parcels, with less pricing variability between areas.

Example of Development Prototypes, Rental Residential Analysis

## II. Predictive Development Modeling

## Description of Model

Johnson Economics used a predictive development model, which is designed to estimate the marginal impact of changes in the development environment on the expected magnitude and character of development. The model is designed to predict the magnitude and form of likely development or redevelopment activity over an assumed time frame. The primary approach used to predict likely development patterns is the relationship between the supportable residual land value for prospective uses and the current value of the property (including land as well as improvements, if any). The underlying assumption is that when the value of a property for new development is high relative to the current value of the property, it will be more likely to see development or redevelopment over a defined time-period.

The model evaluates the likelihood of development at the parcel level, although the results are expressed in aggregated geographies. What the model solves for is probabilities to redevelop as well as anticipated development forms, and the results reflect the expected value of development/redevelopment activity. The model will not indicate that a specific parcel will or won't redevelop, rather, it will indicate the probability of that occurrence as well as predict the likely form of development.

## Pricing Gradients

The analysis used the achievable pricing gradients developed in our March 2018 work. While these have not been changed, we recognize that pricing has continued to trend upwards for ownership housing product, while rental housing product has seen less escalation.

The model was broken down into eleven separate pricing bins, which have similar achievable price points. The table to the right shows the pricing bins, the number of parcels in that bin, as well as the average residential rent per square foot and the average sales price per square foot in that bin. A total of 118,528 parcels were evaluated, which represented all parcels zoned either R7, R5, or R2.5 in the study area. The average achievable rent assumption was \$1.91 per square foot, while the average achievable sales price was $\$ 273$ per square foot.

| Pricing <br> Bin | \# of <br> Parcels | Residential <br> Rent/SF | Sales <br> Price/SF |
| ---: | ---: | ---: | ---: |
| 1 | 7,525 | $\$ 1.47$ | $\$ 209$ |
| 2 | 19,516 | $\$ 1.54$ | $\$ 219$ |
| 3 | 8,776 | $\$ 1.64$ | $\$ 234$ |
| 4 | 6,889 | $\$ 1.75$ | $\$ 249$ |
| 5 | 11,326 | $\$ 1.85$ | $\$ 263$ |
| 6 | 17,059 | $\$ 1.95$ | $\$ 278$ |
| 7 | 15,700 | $\$ 2.05$ | $\$ 292$ |
| 8 | 13,824 | $\$ 2.17$ | $\$ 309$ |
| 9 | 13,043 | $\$ 2.32$ | $\$ 330$ |
| 10 | 4,570 | $\$ 2.61$ | $\$ 372$ |
| 11 | 300 | $\$ 2.72$ | $\$ 387$ |
| Total/Avg. | 118,528 | $\$ 1.91$ | $\$ 273$ |

## Model Output

Our predictive development model was run for two scenarios, reflecting current and proposed development standards. The results showed an expected aggregate increase in the level of construction investment but yielding a sharply higher number of predicted new residential units in the study area. The output reflects a modest increase in the level of redevelopment, but a greater unit density, expected net unit yield, and lower price point per unit on properties that do redevelop.

The predicted net development yield from residential development/redevelopment in the study area was 12,281 units over the next twenty years under the current zoning, increasing to 36,614 units under the proposed new zoning. The construction of these units will entail the loss of existing residential capacity (demolition of existing structures where present), which is reflected in the net unit estimates. The impact on rental residential pricing was highly significant, with average rents dropping by $56 \%$ as compared to the default scenario (current zoning), which reflects a change in unit size as opposed to reduced rents per square foot.

## SUMMARY OF PREDICTED DEVELOPMENT ACTIVITY WITH PROPOSED MODIFICATIONS IN ZONING CODES

## 20 Year Study Period, No Pricing Changes

|  | Predicted Development Yield |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: |
|  | Construction <br> Investment | New <br> Units | Replaced <br> Units | Net <br> Units | Average <br> Rent |
| BASELINE |  |  |  |  |  |
| New Construction | $\$ 5,233,460,967$ | 13,665 | $(1,384)$ | 12,281 | $\$ 4,159$ |
| NEW ZONING |  |  |  |  |  |
| New Construction | $\$ 6,105,186,215$ | 38,115 | $(1,501)$ | 36,614 | $\$ 1,823$ |
| NET IMPACT |  |  |  |  |  |
| Total | $\$ 871, \mathbf{7 2 5 , 2 4 8}$ | $\mathbf{2 4 , 4 5 0}$ | $\mathbf{- 1 1 7}$ | $\mathbf{2 4 , 3 3 3}$ | $\mathbf{- \$ 2 , 3 3 6}$ |
| \% Change | $17 \%$ | $179 \%$ | $8 \%$ | $198 \%$ | $\mathbf{- 5 6 \%}$ |

The number of new units predicted is quite high, and market support for that many units in these configurations may limit the study area's ability to support this level and type of development over a planning period.

When output is broken down by pricing bin, the impact on pricing is spread broadly, with redevelopment favoring higher density solutions providing smaller units at lower price points. As with our previous analysis, the lowest priced neighborhoods have no predicted redevelopment under either the baseline or new zoning scenario.

Summary of Rental Analysis Results at the Pricing Bin Level

| Pricing Bin | \# of Parcels | Residential Rent/SF | $\begin{gathered} \hline \text { Sales } \\ \text { Price/SF } \end{gathered}$ | Baseline |  | New Zoning |  | Net Change |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | Units | Avg. Rent | Units | Avg. Rent | Units | Avg. Rent | \% Price |
| 1 | 7,525 | \$1.47 | \$209 | 0 | \$0 | 0 | \$0 | 0 | \$0 | 0\% |
| 2 | 19,516 | \$1.54 | \$219 | 0 | \$0 | 0 | \$0 | 0 | \$0 | 0\% |
| 3 | 8,776 | \$1.64 | \$234 | 235 | \$3,178 | 641 | \$1,683 | 406 | $(\$ 1,496)$ | -47\% |
| 4 | 6,889 | \$1.75 | \$249 | 192 | \$3,396 | 537 | \$1,799 | 345 | $(\$ 1,597)$ | -47\% |
| 5 | 11,326 | \$1.85 | \$263 | 331 | \$3,618 | 1,001 | \$1,902 | 670 | $(\$ 1,715)$ | -47\% |
| 6 | 17,059 | \$1.95 | \$278 | 567 | \$3,854 | 2,396 | \$1,758 | 1,829 | $(\$ 2,096)$ | -54\% |
| 7 | 15,700 | \$2.05 | \$292 | 1,639 | \$4,008 | 6,280 | \$1,873 | 4,641 | $(\$ 2,135)$ | -53\% |
| 8 | 13,824 | \$2.17 | \$309 | 1,179 | \$4,224 | 5,381 | \$1,667 | 4,202 | $(\$ 2,557)$ | -61\% |
| 9 | 13,043 | \$2.32 | \$330 | 5,755 | \$4,046 | 13,467 | \$1,777 | 7,712 | $(\$ 2,269)$ | -56\% |
| 10 | 4,570 | \$2.61 | \$372 | 3,685 | \$4,568 | 8,213 | \$1,977 | 4,528 | $(\$ 2,590)$ | -57\% |
| 11 | 300 | \$2.72 | \$387 | 82 | \$4,679 | 199 | \$2,082 | 117 | $(\$ 2,598)$ | -56\% |
| Total/Avg. | 118,528 | \$1.91 | \$273 | 13,665 | \$4,159 | 38,115 | \$1,823 | 24,450 | $(\$ 2,336)$ | -56\% |

Under the assumptions used, rental residential largely outbid ownership residential solutions in the current pricing environment. Over the study period, the relationship between rental and ownership residential units will likely change, with ownership units shifting to the highest and best use solution.

## III. SUMMARY

Our analysis indicates that the proposed changes in entitlements would likely result in a modest increase in redevelopment activity in terms of construction investment but yield a significantly higher number of units through the development of multi-unit development forms.

The predicted marginal increase in unit capacity associated with the changes is significant, but the level of development may be limited by market factors and demand. The large number of units in a multi-unit configuration are likely to be disproportionately rental, and the market for this type of rental unit as well as investors interested in holding these types of income properties is limited. Nonetheless, our analysis indicates that the proposed changes will support an increase in residential yield as well as a reduction in average pricing for new units under the proposed changes.

## Ownership Residential

Ownership residential solutions under the proposed new codes would be expected to be limited, particularly for multiple-unit development projects. This is due to challenges in developing condominium units in the current environment. While smaller condominium units would likely be well received by the market due to their lower price point, few developers are interested in producing and selling condominiums. This is largely attributable to construction defect litigation risk, in which purchasers can sue the developer and members of his team (architects, contractors, product manufacturers).

Construction defects can range from complex foundation and framing issues which threaten the structural integrity of buildings, to aesthetic issues such as improperly painted surfaces and deteriorating wood trim around windows and doors. In the State of Oregon, there is a ten-year statute of limitations on construction defect claims. As condominium developments have homeowner's associations (HOA), the suits typically use the HOA as a class to
pursue to the claim. Pursuit of these claims was widespread during the last cycle, during which a large number of new condominium units were constructed.

Insurance rates have climbed significantly for condominium construction, which is typically carried by the developer as well as members of the team. Due to the vagaries of this type of litigation, developers and contractors now must buy 10-year trailing insurance before they commence construction, as that is the period during which can be sued. This additional insurance adds significantly to the cost of construction.

These factors have largely deterred developers from initiating new condominium projects due to concern regarding the cost, risk, and time burden entailed by construction defect litigation. If one was to be built, the costs associated with the cost of insurance and increased risk would need to be reflected in higher pricing. One way to reduce this risk is to sell units with fee-simple ownership of the property, where the unit includes the underlying land. This type of ownership is typically found in townhomes. While generating a lower density yield than three-and four-plex solutions, this type of development would likely be favored by a developer looking to construct and sell ownership residential units. While our model may indicate a multi-unit plex solution as representing the highest and best use from a return perspective, townhome development entails less risk and may be a more favored program solution for ownership residential.
