City of Portland, Oregon

Intergovernmental Agreement for
Remedial Investigation and Source Control Measures

DEQ No. LQVC-NWR-03-10

Stormwater Evaluation Report

City of Portland Outfall Project
ECSI No. 2425

February 2010

Prepared By:
City of Portland, Bureau of Environmental Services

This page intentionally left blank.

Executive Summary

City of Portland (City) stormwater systems collect and convey stormwater draining industrial, commercial, residential, and undeveloped lands to the Portland Harbor area of the Willamette River. In 2003, the City and the Oregon Department of Environmental Quality (DEQ) entered into an Intergovernmental Agreement (IGA) to collaborate on the identification and control of upland contaminant sources discharging to the City's shared stormwater conveyance systems (i.e., outfall basins). In accordance with the IGA, the City has been conducting remedial investigations (RI) of City outfall basins to assist with the identification of significant contaminant sources and to determine if source control measures (SCMs) are needed. These efforts are part of the DEQ-led upland environmental investigations and source control work being conducted in conjunction with the U.S. Environmental Protection Agency's in-water Portland Harbor RI / feasibility study.

In 2007 and 2008, during the course of their respective Portland Harbor-related investigations, the City, the Lower Willamette Group (LWG), and others collected stormwater data from 25 City outfall basins and 24 non-City outfall basins. This report provides a basis for identifying City outfall basins where additional source tracing activities may be needed and supports the development of the City outfall basin RI/SCM reports.

This report does not evaluate potential risks or the significance of stormwater analytes discharging to the river through the City's conveyance system. The RI/SCM reports will integrate City basin investigation findings, upland site stormwater pathway evaluations conducted under DEQ oversight, and other pertinent data to summarize how sources have been identified and controlled through the respective authorities of DEQ and the City. The Basin RI/SCM process will be informed by the inriver remedial investigation, risk assessment, and feasibility study being completed by the LWG.

Evaluation Approach and Results

A multiple-step process was used to evaluate the stormwater data from City outfall basins.

Stormwater Screening

The first step in the evaluation process was to compare analyte detections to conservative Joint Source Control Strategy (JSCS) screening level values (SLVs) selected to be protective of inriver receptors. In some cases, SLV exceedances were noted for stormwater concentrations below DEQ's estimated background surface water concentrations or from areas with no significant sources (e.g., Forest Park). Therefore, to better understand which analytes in each City outfall basin may need further source tracing, additional data evaluation was necessary.

Statistical Analyses

For each analyte exceeding its SLV in at least one City outfall basin stormwater sample, the next step consisted of conducting a statistical analysis of stormwater data collected by the City, the LWG and others from City *and* non-City outfall basins within Portland Harbor. The harborwide analyses resulted in the sorting of analytes by basin into one of three "source tracing categories" (i.e., "lower," "moderate," and "higher" relative to harborwide concentration levels) as the basis for identifying which analytes in each City outfall basin should be evaluated further to determine whether additional source tracing is needed. Stormwater analytes in either the "moderate" or "higher" source tracing categories were further evaluated by comparison to relevant screening factors (e.g., estimated surface water background concentrations, factors of exceedance of SLVs, and industrial stormwater permit benchmark concentrations). This evaluation identified a list of analytes for each City outfall basin to be carried forward into basin-specific assessments for determining future City source tracing needs.

Stormwater Evaluation Process

Stormwater Screening

1. Screen stormwater data for City outfall basins against JSCS SLVs.
2. Select analytes for harborwide statistical analysis.

Statistical Analyses

1. Categorize stormwater analytes in each City basin by likelihood of having significant uncontrolled sources.
2. Identify analytes for further evaluation in each City basin.

City Basin Source Tracing Assessment

1. Assess whether known or potential sources within each City outfall basin may account for observed concentrations.
2. Make recommendations for additional

City Basin Source Tracing Assessment

The basin-specific assessments considered potential upland sources of the identified analytes (and whether these sites have conducted or are conducting stormwater source investigations under DEQ oversight), available LWG stormwater solids data, and other relevant information. The final step in the basin assessments resulted in each City outfall basin receiving one of the following source tracing recommendations:

- *No further City source tracing is planned* – Represents City outfall basins (13) that have low stormwater analyte concentrations and are considered the least likely to include significant, uncontrolled upland sources.
- *No further source tracing is recommended at this time (but may be needed in the future)* – Represents City outfall basins (10) where analytes were identified for further evaluation but where potential upland sources have been identified that may account for the observed concentrations and are in the process of conducting source control evaluations under DEQ oversight. The need for additional City source tracing efforts, DEQ-required source control measures at upland sites, or DEQ site discovery actions are contingent on the findings of the ongoing upland site source control evaluations.
- *Further source tracing may be needed* – Represents City outfall basins (Basins 52C and 53) where analytes are present in stormwater at levels that indicate uncontrolled sources may exist within the basin or that nearby sources may be impacting stormwater quality in the basins (e.g., air deposition, particle tracking)

and for which potential sources have not been identified. Additional City and DEQ evaluation is recommended to determine whether additional source tracing and/or DEQ site discovery efforts are needed.

Conclusions

The results indicate significant progress by the City, DEQ, and upland sites in identifying and controlling sources of contaminants to the City's shared stormwater conveyance systems within the Study Area. Key findings and conclusions include:

- Stormwater analyte concentrations in City outfall basins are predominantly lower than concentrations detected in non-City outfall basins (i.e., most of the basins in the "higher" source tracing category are non-City basins).
- Further source tracing is not needed for most analytes in the majority of the City outfall basins.
- City outfall basins in the "higher" source tracing category typically have known or potential upland sources of the analytes identified, and most of these upland sources are in the process of conducting source control evaluations under DEQ oversight. The City will continue to work with DEQ to track the progress of ongoing source control evaluations at these sites and will identify any further source investigation efforts that may be needed based on the results of these evaluations.
- The need for further source tracing in Basins 52C and 53 was identified. The City will work with DEQ to assess the need and priority for further source tracing in these basins, based on consideration of inriver sediment data, results from the Port of Portland's T-4 Early Action Recontamination evaluation, and other factors. .

The results of the stormwater evaluation are intended to focus City resources and future source tracing activities. The results are not intended to be used by upland sites to limit the analyses of potential chemicals of concern. In addition, the results are not intended to evaluate potential risks or the significance of stormwater analytes discharging to the river through the City's conveyance system. The City recognizes that analytes not being carried forward for source tracing evaluation may warrant additional consideration in the context of inriver cleanup goals defined by the inriver feasibility study or to address recontamination concerns during remedial design. Based on the analyses presented in this report, the City will work with DEQ on source identification in two identified basins and will review new information as it becomes available to further inform the outfall basin RI/SCM reports and to guide its ongoing source investigation program.

1 Introduction

This report presents an evaluation of the stormwater analytical results collected from City of Portland (City) stormwater outfalls discharging to the Willamette River within the Portland Harbor Study Area (Study Area). City stormwater systems convey stormwater draining from industrial, commercial, residential, and undeveloped lands to the Willamette River. In 2003, the City and the Oregon Department of Environmental Quality (DEQ) entered into an Intergovernmental Agreement (IGA) to collaborate on the identification and control of upland contaminant sources to City stormwater conveyance systems discharging to the Portland Harbor Study Area. The City has been conducting remedial investigations of City outfall basins (City of Portland Outfall Project), in accordance with the IGA, to assist with the identification and implementation of source control measures (SCM). These efforts are part of the DEQ-led upland environmental investigations and source control work being conducted in conjunction with the U.S. Environmental Protection Agency's (EPA) in-water Portland Harbor remedial investigation / feasibility study (RI/FS).

During the course of their respective Portland Harbor related investigations, the City, the Lower Willamette Group (LWG), and the Port of Portland (Port) collected stormwater and inline sediment trap data from 25 City outfall basins, at locations near the outfalls. This report provides an evaluation of these data to identify basins where significant sources may be present but have not been identified for source control measures. This information will be utilized to prioritize further City conveyance system source tracing.

1.1 Objective

This report presents the results of an outfall basin data analysis conducted to identify City outfall basins discharging to the Study Area where additional source tracing is needed. The evaluation steps were:

1. Screen stormwater data collected from City stormwater conveyance systems to identify a list of analytes for statistical analysis and potential source tracing activities.
2. Perform a statistical analysis of harborwide stormwater concentrations for the identified list of analytes using stormwater data from City and non-City stormwater conveyance systems discharging to the Willamette River within the Study Area to assess the relative significance of observed analyte concentrations.
3. Evaluate the results of the statistical analysis for City outfall basins, considering information on upland sites (known or potential sources), stormwater solids data, and other factors, to assess the need for additional source tracing in City outfall basins that discharge to the Portland Harbor.

Information presented in this report will also be used to support development of the outfall basin RI/SCM reports (see Section 1.3).

1.2 Report Organization

The report is divided into the following sections:

- *Section 2: Background*
  This section provides the overall context for the report, including a description of the City's outfall basin RI/SCM process and an explanation of how the stormwater data evaluation fits into this overall process.
- *Section 3: Data Sources*
  This section describes the sources of data evaluated for this report.
- *Section 4: Harborwide Stormwater Evaluation*
  This section presents the results of screening and statistical analysis of harborwide stormwater data discharging to the Portland Harbor to identify City outfall basins with potentially significant concentrations of one or more analytes in stormwater discharges. The analytes identified for potential source tracing are carried forward into the basin assessments presented in Section 5.
- *Section 5: Stormwater Basin Assessments*
  This section presents a basin-by-basin assessment of the stormwater analytes identified for potential source tracing. The basin assessments consider stormwater solids data, known potential upland sources, and other information to identify basins where additional source tracing efforts may be needed.
- *Section 6: Findings and Conclusions*
  This section summarizes findings and conclusions regarding the need for additional source tracing activities within specific City outfall basins.

1.3 Relationship to Other Documents

In 2004, the City developed the *Programmatic Source Control Remedial Investigation Work Plan for the City of Portland Outfalls Project* (Programmatic WP) (CH2M Hill, 2004), which included a structured, weight-of-evidence evaluation of City outfall basins that discharge stormwater to the initial study area (ISA) designated for the Portland Harbor Superfund Site to prioritize each basin for source investigation. Since that time, several technical memoranda and reports have been submitted to DEQ under the IGA that document the City's investigations of its stormwater conveyance systems.

Information in these documents and this report will support the development of the City's outfall basin RI/SCM reports, required under the IGA. The process employed by DEQ and the City to evaluate and control sources to City outfall basins is depicted conceptually in Figure 1-1. The RI/SCM reports will integrate City basin investigation findings, upland site stormwater pathway evaluations conducted under DEQ oversight,

and other pertinent data to summarize how sources have been identified and controlled through the respective authorities of DEQ and the City. The Basin RI/SCM process will be informed by the inriver remedial investigation, risk assessment (RA), and feasibility study (FS) being completed by the LWG. Additional source control may be required in some basins before sediment cleanup occurs, if inriver FS or Remedial Design evaluations identify a potential for recontamination. Therefore, a Basin RI/SCM report is also intended to provide sufficient information to guide further source reduction efforts by the City and DEQ, if needed.

2 Background

In December 2000, a section of the Willamette River called the Portland Harbor (shown on Figure 2-1), was added to EPA's Superfund National Priority List. Potential sources of the contamination that led to the Superfund listing include overwater activities and upland releases. DEQ and EPA, under a February 2001 Memorandum of Understanding, developed the *Portland Harbor Joint Source Control Strategy*[1] (JSCS), which provides a framework for identifying, evaluating, and controlling sources of contamination to the River.

The JSCS also establishes contaminant screening level values (SLVs) for assessing the need for upland source evaluation and control and for prioritizing upland source control tasks. As the SLVs are not cleanup levels[2], an exceedance of an SLV does not necessarily indicate that the upland source of contamination poses an unacceptable risk to human or the environment, but does require further consideration of whether source control is needed. Screening results and consideration of other factors identified in the JSCS are used by DEQ to prioritize upland sites as high, medium, and low priority and to determine if source control is required. Medium priority sites undergo a site-specific weight-of-evidence evaluation to determine if source control measures are required, using both upland information and in-water data. Low priority sources are those for which source control measures will not be required unless determined necessary by the Portland Harbor RI/FS or Record of Decision (ROD).

The City's Portland Harbor Outfall Project is being conducted in accordance with the August 13, 2003 IGA between the City and DEQ for the remedial investigation and source control measure evaluation. The source control work under the IGA is a shared effort with DEQ to identify, evaluate, and control upland sources of discharges to the City stormwater conveyance system that might adversely affect sediment and surface water quality in Portland Harbor. The IGA identifies the following joint City/DEQ objectives:

- Identifying significant sources of contaminants to City-owned outfalls using the authorities of DEQ and the City.
- Collecting and evaluating sufficient data to determine if source control measures are needed for discharges to the City stormwater collection systems or whether existing source control measures are effective.
- Identifying and implementing source control measures for discharges to the City stormwater collection system, in accordance with the following provisions:
    - The City will identify permitted and unpermitted upland discharges to its public stormwater collection system and make recommendations as to where source control measures are appropriate for upland sites.

[1] The JSCS was finalized in December 2005 (DEQ/EPA, 2005) and updated in July 2007.
[2] The EPA Portland Harbor ROD(s) will establish contaminant specific cleanup levels for the Superfund Site using Applicable or Relevant and Appropriate Requirements (ARARs) or risk-based levels (DEQ/EPA, 2005).

- DEQ and the City, using their respective authorities, will implement or require appropriate source control measures.

Initial priorities for source investigation activities conducted by the City were identified through two sequential planning efforts. The first of these, the development of the Programmatic WP (CH2M Hill, 2004), included a structured, weight-of-evidence evaluation of City outfall basins that discharge stormwater to the ISA to prioritize each basin for source investigation. The additional outfall basins within the expanded Study Area have been prioritized informally for source investigation using a similar approach as that used in the Programmatic WP (results of the prioritization of the basins in the expanded Study Area will be submitted to DEQ in Spring 2010).

The objectives of City's outfall investigation work to date have been to identify significant upland sources with complete stormwater pathways in basins prioritized for source tracing[3], to collect sufficient data in other basins to confirm that they are not significant pathways to the river, and to coordinate with DEQ on site investigations and implementation of source control measures under the City's and DEQ's respective authorities. The City has largely completed its source investigation work through a combination of data collection efforts, including the stormwater sampling described in this report and evaluation of upland site stormwater pathway data collected under DEQ oversight. Working collaboratively with DEQ under the IGA, the City has collected data that have supported the inclusion of additional sites in DEQ's Cleanup program, and supported the expansion of scopes of upland source investigation and source control activities at cleanup sites to address discharges to City conveyance systems.

The City's and DEQ's joint goal is to have significant sources of upland contamination to City stormwater conveyance systems identified before EPA's planned issuance of the ROD establishing cleanup goals for Portland Harbor, and to have these sources controlled before the inriver cleanup begins. This stormwater data evaluation report provides a basis for identifying City outfall basins where additional source tracing activities may or may not be needed and supports the development of the City outfall basins RI/SCM reports.

[3] "Priority 1" and "Priority 2" basins, as identified in the Programmatic WP (CH2M Hill, 2004) and the forthcoming *Prioritization of Study Area Basins* report (BES, in progress).

3 Data Sources

The sources of the data evaluated in this report include the City's stormwater data collected in 2007 and 2008 for the City of Portland Outfall Project, stormwater data collected between 2006 and 2009 under the City's municipal stormwater discharge permit, and data collected and/or compiled by the LWG in 2007 and 2008 for City and non-City outfalls discharging to the Portland Harbor Study Area. These data sources are described below. The locations of City and non-City outfall basins included in the stormwater data evaluation are shown on Figures 3-1a, 3-1b, and 3-1c. Data sources, sample type(s), and chemical analyses for all data used in the evaluation are summarized by outfall basin in Table 3-1.

3.1 City Data

The City designed its stormwater sampling program to obtain data in support of the IGA objectives: to evaluate the status of ongoing source tracing activities, to confirm whether significant sources are discharging to City stormwater conveyance systems associated with the outfalls, and/or to verify that significant sources have been identified and controlled. Stormwater data for this project were collected in accordance with the project-specific *Fall 2007 Stormwater Grab Sampling and Analysis Plan* (BES, 2007a) and *Winter 2008 Stormwater Sampling and Analysis Plan* (BES, 2007b) (stormwater SAPs), and the *Amended Programmatic Quality Assurance Project Plan* (QAPP) (BES, 2007c) and *Amended Programmatic Sampling and Analysis Plan* (Programmatic SAP) (BES, 2007d) for collection of water and solids samples for the City of Portland Outfall Project. Additional data for the Outfall Project are obtained through other City monitoring programs, such as the stormwater conveyance system discharge monitoring conducted under the City's NPDES Municipal Separate Storm Sewer System (MS4) Discharge Permit. The types of samples collected by the City for use in the City of Portland Outfall Project are described below.

3.1.1 Stormwater Grab Samples

Seventeen City outfalls were each sampled during four storm events in the 2007/2008 wet season (see Table 3-1). The grab sampling location within each basin was chosen to represent as much of the drainage basin as possible and to avoid low-elevation areas susceptible to backup flow from the river. Descriptions of the grab sampling locations, sample collection dates and methods, storm events sampled, chemical analyses, and sampling results are presented in Appendix A.

3.1.2 Stormwater Composite Samples

Outfall Basin 53

The City collected flow-weighted composite stormwater samples from Basin 53 as part of the 2007/2008 stormwater sampling, in accordance with the Winter 2008 stormwater

SAP (BES, 2007b). The City's sampling location in Basin 53 was selected to be representative of discharges from the entire basin and to supplement the Basin 53 data set collected in 2007 by the Port (the Port's data collection activities are described in Section 3.2). Descriptions of the Outfall 53 sampling location, sample collection dates and methods, storm events sampled, chemical analyses, and flow-weighted composite sampling results are presented in Appendix A.

Outfall Basin 19

Stormwater discharges from the City's stormwater outfall system are authorized and regulated under MS4 Discharge Permit #101314, issued jointly to the City, Multnomah County, and the Port. To supplement data obtained through the source investigations under the IGA, the City's Outfall Project team uses information gathered from the MS4 program to evaluate potential upland sources and identify areas where further investigation may be needed. Stormwater from Basin 19 has been monitored during at least three storm events per year starting in fiscal year (FY) 1998/1999 to generate a long-term effectiveness measure of the City's Industrial Stormwater Program. Starting in FY 2005/2006, the list of constituents analyzed in samples collected at Outfall 19 was expanded to meet the objectives of both the MS4 program and the City of Portland Outfall Project. The Outfall 19 MS4 monitoring data have previously been reported to DEQ in the City's Annual MS4 permit reports (http://www.portlandonline.com/bes/index.cfm?c=50289). Data and additional documentation for the Outfall 19 MS4 monitoring are provided in Appendix B. The Outfall 19 MS4 data for FY 2005/2006 through FY 2008/2009 as previously reported to DEQ are incorporated into the stormwater data evaluation presented in this report.

3.2 Non-City Data

The primary source of non-City data used in this report is the LWG's Round 3 (including Rounds 3A and 3B) stormwater sampling, a component of the overall LWG RI/FS for the Portland Harbor. The purpose of the Round 3 stormwater data collection included evaluating the potential for sediment recontamination from stormwater discharge to the river after cleanup of the Portland Harbor has been completed (Anchor and Integral 2007a, 2008b).

The Round 3 stormwater evaluation activities were conducted in 2007 and 2008. Concurrent with the LWG's Round 3 stormwater sampling and analyses, the Port collected stormwater data in the vicinity of its Terminal 4 property (including in Outfall Basin 53) and General Electric (GE) collected stormwater data at the GE Decommissioning Facility. The LWG included the Terminal 4 and GE Decommissioning Facility stormwater sampling data in its Round 3A/3B Stormwater Data Report. Including these data sources, the LWG's Round 3 stormwater evaluation incorporated the results from the collection of: flow-weighted composite stormwater samples at 36 sampling locations (including 11 City outfall basins); grab stormwater samples at 10 of these sampling locations; and sediment trap samples at 32 of these locations. Table 3-1 lists the basins sampled, sample type(s), and chemical analyses for each sampling

location included in the LWG's Round 3A/3B stormwater evaluation. Figures 3-1a through 3-1c show the stormwater basins included in the Round 3 data evaluation.

The LWG's Round 3 stormwater and sediment sampling activities are briefly summarized below. Detailed descriptions of these data collection efforts are available in the following documents:

- *Round 3A Stormwater Sampling Field Sampling Plan* (FSP; Anchor and Integral 2007a),
- *Round 3A Stormwater Sampling Field Sampling Plan* Addendum (FSP Addendum; Anchor and Integral 2007b),
- *Round 2 Quality Assurance Project Plan Addendum 8* (QAPP; Integral 2007), *Round 3A Stormwater Sampling Rationale* (Anchor and Integral 2007c),
- *Round 3A* and *Round 3B Stormwater Sampling Field Sampling Reports* (FSRs; Anchor and Integral 2007d; Anchor and Integral 2008a), and
- *Round 3A and 3B Stormwater Data Report* (Anchor and Integral, 2008b).

The Port's Terminal 4 field sampling activities are detailed in the following documents:

- *Storm Water Evaluation Work Plan* (Ash Creek Associates/Newfields, 2007),
- *Field Sampling Procedures Report Storm Water Sampling Program Terminal 4 Upland Facility* (Ash Creek Associates/Newfields, 2009a),
- *Storm Water Source Control Evaluation Terminal 4 Slip 1 and Slip 3 Upland Facilities* (Ash Creek Associates/Newfields, 2009b), and
- *Terminal 4 Recontamination Analysis* (BBL, 2006).

The field sampling activities conducted at the GE Decommissioning Facility are detailed in four GE stormwater monitoring reports (AMEC, 2007a, 2007b, 2007c, and 2007d).

3.2.1 Stormwater Composite Samples

The LWG, Port, and GE composite stormwater sampling efforts are described below.

LWG Sampling Locations

The LWG collected flow-weighted composite stormwater samples at 27 selected sampling locations[4] during Round 3A (conducted from February through July 2007) and Round 3B (conducted from November 2007 through February 2008). Nine City outfall basins were included in the LWG effort, and three to six samples were collected from each sampling location. The samples were collected using automated samplers as

[4] Two of these locations are treated as a single sampling location; sample site WR-145 became obstructed and was therefore moved to site WR-142 following the first round of sampling (Anchor and Integral, 2008b).

described in the FSP (Anchor and Integral 2007a, 2007b) and submitted unfiltered for organic compound analyses and as filtered/unfiltered pairs for metals analyses.

Port of Portland Terminal 4

The Port conducted stormwater characterization at seven locations in the vicinity of its Terminal 4 facility to evaluate whether stormwater and stormwater solids may be a potential source for future adverse impact to the Willamette River by recontamination of river sediments after cleanup of the Portland Harbor (Ash Creek Associates/Newfields, 2007). As noted above, one of the Port's sampling locations represented stormwater discharge from City Outfall Basin 53; another represented City Outfall Basin 52C. Three to five flow-weighted composite stormwater samples were collected from each sampling location during the winter/spring 2007 storm season and the fall 2007/winter 2008 storm season.

GE Decommissioning Facility

During its source control evaluation of the GE Decommissioning Facility, GE collected flow-weighted composite stormwater samples at two locations (designated "Manhole 2" and "Sample Vault 1") discharging stormwater from the site to the City's Basin 17 stormwater conveyance system. A total of three storms were sampled at each location during the spring and fall of 2007 (AMEC, 2007a, 2007b, 2007c, and 2007d).

3.2.2 Stormwater Grab Samples

As part of the Round 3A/3B stormwater evaluation, the LWG collected grab samples from ten basins during one to two storm events in 2007. The purpose of the grab samples was to collect partitioning (chemical dissolved phase/suspended sediment) rather than loading data; to meet this objective, the grab samples were collected during the rising limb of the storm hydrograph to increase the likelihood of detecting the target analytes (Anchor and Integral 2007a). Three of the grab sampling locations were within City outfall basins (see Table 3-1). The sampling locations were selected based on general knowledge of site uses and potential contaminant sources (Anchor and Integral 2007c).

3.2.3 Stormwater Sediment Samples

Stormwater sediment traps were deployed at most of the stormwater sampling locations established for the LWG's Round 3 stormwater data evaluation (including the Port's Terminal 4 sampling locations). The objective was to obtain samples of suspended stormwater sediment to supplement the chemical loading evaluation. Sediment was collected from a total of 32 locations (including 11 City basins) during the Round 3 sampling activities; stormwater sediment trap samples were not collected at four locations (WR-4, WR-181/Basin Q, and the two GE Decommissioning Facility locations) because no feasible location was available to install the sediment traps (Anchor and Integral, 2008b). Each sediment trap was installed as close as possible to the automated stormwater sampler and was in place for a minimum duration of 3 months. For cases where insufficient sediment volume accumulated at a particular station, analyses were

selected in accordance with the analytical priorities established in the FSP (Anchor and Integral 2008b). The basins where stormwater sediment traps were installed and the associated chemical analyses for each sediment trap location are indicated on Table 3-1.

4 Stormwater Data Evaluation

This section summarizes the data evaluation and statistical process used to identify City outfall basins and associated stormwater analytes that may warrant further source tracing to identify potentially significant uncontrolled upland sources. This process was developed to supplement the JSCS screening process to differentiate potentially significant sources that may need immediate action from lower contributing sources. Additional technical information and detail regarding the evaluation methodology are provided in Appendix C.

4.1 Overview of Stormwater Data Evaluation Approach

A multiple-step process was used to evaluate the stormwater data from City outfall basins. The process included the comparison of stormwater analyte concentrations detected in City stormwater outfall basins to established criteria in order to select analytes for statistical evaluation. This screening is followed by statistical analyses of harborwide stormwater data collected by the City, LWG and others for City and non-City outfall basins discharging to the Study Area to provide an objective context for interpreting the potential significance of results. Concentrations in City basins at the higher end of the spectrum can be compared to concentrations observed at known sources to help indicate where significant sources to the river may be present in City basins. The results of the stormwater data evaluation provide a basis for identifying City outfall basins where further source tracing may be needed for specific analytes. These analytes are carried forward into the basin-specific assessments of source-tracing needs presented in Section 5. This analysis does not evaluate the inriver sediment in the vicinity of City outfalls to determine if there is a complete pathway for upland contributions (e.g., an outfall may be identified for further source tracing even if there are no elevated sediment concentrations adjacent to the outfall).

Stormwater Data Evaluation Process

1. Stormwater Screening

   Screen stormwater data for City outfall basins against JSCS SLVs to select analytes for harborwide statistical analysis.

2. Statistical Analyses

   Categorize stormwater analytes in each basin by relative likelihood of having significant uncontrolled sources.

3. Identification of Basin Analytes

   Apply additional reference values (e.g. DEQ background and NPDES benchmarks) to statistical results to generate analyte list per basin for further evaluation in Section 5.

4.2 Stormwater Screening

The first step in the evaluation process was to compare individual stormwater sampling event analyte detections to conservative JSCS SLVs (see Appendix A). Because the SLVs are conservative screening values selected to be protective of inriver receptors, application of these values to in-pipe media (stormwater and stormwater solids) results in the identification of analytes that in some cases are below estimated background

concentrations or concentrations from areas with no sources, such as Forest Park. Additionally, SLVs do not recognize state-authorized NPDES discharges to the City's system (i.e., metals benchmarks are one to two orders-of-magnitude higher than the SLVs) and therefore are not always useful in evaluating where uncontrolled sources may be present. For this evaluation, the SLVs were used for the purpose of identifying the list of analytes to include in the statistical analyses.

Selection of Analytes for Statistical Evaluation

3. Screen individual stormwater event data points for City outfall basins against JSCS SLVs (Appendix A)
4. For any analyte >SLV in at least one sample, calculate arithmetic and geometric mean concentrations for each outfall basin (Appendix C, Attachment C-2)
5. Screen geometric mean concentrations for City outfall basins against JSCS SLVs (Appendix D).
6. Analytes with geometric mean concentrations >JSCS SLVs were evaluated in the harborwide statistical analysis (Appendix C).

To account for the inherent variability in stormwater data, geometric mean concentrations were calculated for analytes detected at concentrations above the JSCS SLV in at least one sampling event in any City outfall basin[5]. The geometric mean was selected as an appropriate measure of stormwater outfall concentrations for the purposes of the harborwide statistical analysis. Tables summarizing the mean and geometric mean concentrations and additional rationale and assumptions pertaining to these calculations are presented in Appendix C. All analytes for which at least one basin geometric mean concentration exceeded the SLV (see Table 4-1 and Appendix D) were carried forward into the harborwide statistical analysis for all City basins, as discussed below.

4.3 Statistical Analyses

A statistical mixture model was used for the analysis of the harborwide stormwater outfall data. A detailed description of the model (including the key assumptions, limitations, and statistical output) is provided in Appendix C. The model was used to analyze the distribution of the geometric mean concentrations for harborwide outfall basins and to assign each outfall basin to one of three concentration groups (i.e., lower, moderate, or higher). This concept is consistent with the JSCS method for identifying low, medium, and high priority sites. Statistical analysis was performed for the analytes selected based on the data screening described in Section 4.2 (unless the number of samples was insufficient to conduct a valid statistical analysis; see Table 4-1). Graphs of the results of the statistical evaluation are included in Appendix C.

Use of the full harborwide data set in the statistical evaluation allowed comparison of stormwater concentrations in City outfall basins to other stormwater discharges in the Portland Harbor Study Area. Source tracing categories were statistically identified based on specific outfall concentrations relative to harborwide concentration levels. For

[5] See data tables in Appendices A and B for data collected by the City; see Anchor and Integral 2008b for City outfall basin data collected by others.

each analyte included in the statistical evaluation, each outfall basin was assigned to one of three source tracing categories:

- **Category 1**. Stormwater analyte concentrations in these basins are lower relative to stormwater concentrations harborwide (i.e., relative to other private and public outfalls) and are least likely to have significant uncontrolled sources. The need for additional source tracing in City outfall basins within this category is low.
- **Category 2**. Stormwater analyte concentrations in these basins generally fall within a narrow moderate range and may or may not have significant uncontrolled sources. The need for additional source tracing in City outfall basins within this category should be evaluated further, unless otherwise indicated (see discussion below in Section 4.4).
- **Category 3**. Stormwater analyte concentrations in these basins are higher relative to harborwide concentrations and are the most likely to have significant uncontrolled sources. The need for additional source tracing in City outfall basins in this category is evaluated.

The break lines defining Categories 1 through 3 for each analyte are described and shown on the graphs in Appendix C. Table 4-2 summarizes the resulting distributions of source tracing categories by analyte and City outfall basin. Analytes identified as Category 2 or 3 source tracing categories were further evaluated to assess whether additional source tracing is needed in Section 4.4.

4.4 Selection of Analytes for City Outfall Basin Assessments

Selection Steps

1. For each City outfall basin, screen the geometric mean concentration of each Group 2 and 3 analyte against the following, as applicable:
   a. DEQ background concentration,
   b. 10x the JSCS SLV, and
   c. 0.1x the NPDES benchmark concentration.
2. For each City outfall basin, carry forward all analytes that exceed applicable screening criteria (Table 4-3) to the basin-specific assessments (Section 5).

The source tracing categories defined in Section 4.3 are based on harborwide concentration distributions. Due to the conservative assumptions in the statistical analysis (selection of analytes for the statistical analyses, assumptions in calculating the geometric mean concentrations, etc.) analytes identified as Category 2 or 3 were further evaluated to identify those basin-specific analytes that may indicate the presence of significant uncontrolled upland sources. Basin geometric mean concentrations were compared to relevant screening considerations (e.g., DEQ surface water background concentrations, factors of exceedance of SLVs, and industrial stormwater permit benchmark concentrations).

Analytes meeting one or more of the following conditions are considered unlikely to present a significant uncontrolled source and were not carried forward in the basin assessment for a given City outfall basin:

- The geometric mean concentration for a given City outfall basin was less than DEQ's background surface water concentration (DEQ, 2002) (metals only).
- The geometric mean concentration for a given City outfall basin was within one order of magnitude of the JSCS SLV. As most SLVs are conservative for stormwater-related media, a ten-fold exceedance was not considered a high priority for further source tracing.
- The geometric mean concentration for a given City outfall basin was less than 10 percent of the NPDES 1200Z benchmark concentration (applies only to copper, lead, and zinc).
- Total PAHs[6] are not carried forward if all individual PAH compounds are less than one order of magnitude greater than their respective JSCS SLVs.

Table 4-3 provides a basin-by-basin summary of the screening considerations and resulting analytes that were carried into the basin assessments presented in Section 5.

[6] The JSCS does not establish an SLV for total PAHs. Individual PAH compounds, as well as total PAHs, were statistically evaluated and assessed through further screening; however, only total PAHs were carried forward to the basin-specific assessments and potential future source tracing activities. PAH compounds typically have common sources (e.g., petroleum oils and coal-based products, combustion, fuels, asphalt, wood preservatives, and automobile fluids), and individual PAH compounds do not typically occur alone.

5 Stormwater Basin Assessments

This section evaluates the results of the statistical analysis of stormwater data described in Section 4 in the context of basin-specific information such as known upland sources, stormwater pathway investigation status, and sediment trap sampling results, to identify City outfall basins within the Study Area where additional source tracing efforts may be needed.

5.1 Assessment Methodology and Rationale

The assessment of each City outfall basin involves three primary evaluation steps:

Step 1: Identification of Stormwater Analytes for Further Evaluation

As discussed in Section 4, basin-specific stormwater analytes for each City outfall basin were identified by the statistical evaluation of harborwide stormwater concentrations and comparison to additional screening criteria. These analytes are summarized in Table 4-3 and carried forward to Step 2.

Step 2: Evaluation of Identified Stormwater Analytes in the Context of Relevant Basin Information

This step evaluates basin-specific source information for the stormwater analytes carried forward from Step 1. It considers upland site information, City source investigation findings, LWG and Port sediment trap results (as available) and comparisons of stormwater concentrations to industrial stormwater permit benchmarks to determine source-tracing needs. The evaluation steps are described below.

- *Information on Potential Upland Sources*

  Information on identified upland sites (potential sources) discharging to the City's stormwater conveyance system are inventoried to assess whether known sources may account for the presence of the identified stormwater analytes.

  The upland facilities identified as potential sources for the purpose of this evaluation include DEQ Cleanup Program sites, as listed in DEQ's Environmental Cleanup Site Information (ECSI) database, and facilities permitted by DEQ under the NPDES industrial stormwater discharge (1200Z) permit program due to stormwater exposures to industrial operations. Although limiting the list of potential sources to those meeting either of these criteria may omit some potential sources (such as sites with unidentified contamination issues, sites that do not require an NPDES permit, or sites that have had spills or that may illicitly discharge contaminants to the stormwater conveyance system), the list for each basin is intended to capture the known and likely potential sources based on

available information to facilitate the basin evaluations. These potential sources are listed by basin in Table 5-1.

For ECSI sites, Table 5-1 lists the current status under the DEQ cleanup program and indicates whether a stormwater pathway evaluation has been (or is being) conducted under DEQ oversight. This information has bearing on source tracing status; for example, if a site has been remediated and a stormwater pathway evaluation has been completed, the site may not be a significant ongoing source of contaminants to the conveyance system. Likewise, if stormwater pathway evaluations are currently underway at one or more upland sites within a given basin, it may not be possible to fully assess whether all significant sources within a basin have been identified until the stormwater pathway evaluations are completed.

- *City Stormwater Conveyance System Source Investigations*

  Table 5-1 also lists source investigations that the City has conducted to date in each City outfall basin. For some investigations, the results have been evaluated and reported to DEQ, while for others the evaluation is still in progress. Acknowledging the fact that basins with larger industrial areas typically warrant more extensive source investigations compared to smaller basins with fewer upland sites, the extent to which the conveyance system has been investigated provides a general indication of the progress that has been made toward tracing the contaminant sources in each basin. This information, together with information on the upland sites, provides the basis for whether stormwater analytes under evaluation are likely accounted for by the identified sources (see Table 5-1, right-hand column ["Stormwater Analytes Likely Accounted for by Identified Potential Sources?"]). General findings from City source investigations were also considered in the basin assessment conclusions (see Table 5-2).[7]

- *Sediment Trap Solids Data*

  For those analytes not available in stormwater data, LWG and Port sediment trap solids data (collected in City outfall basins 16, 18, 19, 22, 22B, 22C, 49, 52C, 53, M-1 and M-2) are incorporated into the basin assessments to evaluate whether these additional analytes need further source tracing efforts. Analytes detected in sediment trap solids samples are evaluated with regard to the JSCS Toxicity SLVs. If an analyte exceeds the JSCS Toxicity SLV in sediment trap solids but was not analyzed in stormwater, it is added to the list of analytes evaluated to determine whether further source tracing may be needed (see Table 5-2). The LWG and Port sediment trap data for City outfall basins are summarized in Appendix E.

[7] The City source investigation findings will be incorporated in detail in the outfall basin RI/SCM reports. The source investigation data helps identify the general location of potential sources within a basin and may be combined with upland site information to suggest where significant contributions to the shared conveyance system occur.

- *Comparison to NPDES 1200Z Permit Benchmarks*

  NPDES industrial stormwater permits establish benchmark concentrations for certain contaminants, identifying a performance threshold for these constituents. Discharges in excess of permit benchmarks warrant site response under the terms of the 1200Z permits. Among the parameters listed under the permit benchmarks are three metals (copper, lead, and zinc) that also are analytes included in the City stormwater data evaluation. The associated NPDES permit benchmarks are 100 µg/L for copper, 400 µg/L for lead, and 600 µg/L for zinc. For basins receiving discharges under NPDES 1200Z permits, the stormwater concentrations are compared to the applicable permit benchmarks (see Table 5-2). Stormwater analytes with concentrations less than the permit benchmarks are not recommended for additional source tracing in these basins at this time.

Step 3: Identification of Source Tracing Recommendations by Analyte

The information developed through the evaluation conducted in Step 2 is synthesized in Step 3 to provide source tracing recommendations by analyte for each basin. The conclusions and supporting rationale for source tracing recommendations are summarized in Table 5-2.

5.2 Results

Results of the basin assessment are presented in Tables 5-1 and 5-2. Table 5-2 summarizes conclusions with regard to the need for further source tracing efforts by the City in each basin evaluated. Based on these conclusions, each basin is placed into one of the following three groups: (1) basins for which no further source tracing is planned; (2) basins where further source tracing is not recommended at this time but may be needed in the future (depending on the outcome of current upland stormwater pathway evaluations and/or evaluation of City source investigation results); and (3) basins where further source tracing may be needed. The following table lists the basins that are categorized into each of these three groups:

Further Source Tracing Not Planned	Further Source Tracing Not Recommended At This Time	Further Source Tracing May Be Needed
22C, 22D, 45, 47, 48, 49, 50, 52A, M-2, M-3, S-2, S-5, S-6	16, 18, 19, 22, 22B, 46, 52, 53A, M-1, S-1	52C, 53

The basin assessment outcomes by group are summarized below. For further detail, refer to Table 5-2.

5.2.1 Basins Where Further Source Tracing is Not Planned

The basin assessments results indicate that no further source tracing is needed for 13 City outfall basins. Factors supporting this conclusion include:

- No stormwater analytes were identified for further evaluation based on the results of the harborwide statistical analysis and selection process described in Section 4, and no additional analytes were detected at concentrations greater than JSCS Toxicity SLVs in the associated Port/LWG sediment trap solids samples (where collected).
  (Applies to Basins 22C, 22D, 47, 48, 49, 50, 52A, M-2, M-3, S-2 and S-5)
- The only analyte identified for further evaluation in stormwater is a permitted metal, and stormwater concentrations did not exceed the corresponding permit benchmarks.
  (Applies to Basins 45 and S-6)

If new information arises that indicates the presence of significant unidentified sources to the stormwater conveyance system in any of these basins, the City will reevaluate the need for further source tracing in the basin and undertake further action as appropriate.

5.2.2 Basins Where Further Source Tracing is Not Recommended at This Time

For the ten City outfall basins in this group, analytes were identified for further evaluation in stormwater or exceeded JSCS Toxicity SLVs in sediment trap solids. Further source tracing efforts in these basins are considered premature at the current time because pending information from ongoing or recently completed upland investigations will inform the need for additional source tracing activities. The following factors support that further source tracing activities are not needed at this time:

- Stormwater pathway evaluations are currently underway at one or more upland sites in the City outfall basin. Analytes identified for further evaluation in this report have been found on upland site(s) or are under investigation. Results of these evaluations may indicate whether source control will be required by DEQ at these sites or if further source tracing is needed to identify other potential sources. (Applies to all basins in this category)
- The City has conducted one or more source investigations in the basin post-dating the 2007–2008 stormwater sampling. Evaluations of the results are in progress. (Applies to Basins 16, 18, 52, and 53A)
- Extensive source control measures are in the process of being implemented by upland sites in the basin; data collected following implementation of these source control measures will indicate whether further source tracing is needed.
  (Applies to Basins 18, 19, 22, 22B, 53A, and M-1)

5.2.3 Basins Where Further Source Tracing May Be Needed

Basin assessment results for Basins 52C and 53 indicate that further source tracing may be needed in these basins. In both these basins, PCBs were identified for further source tracing evaluation in stormwater and no sources of these analytes have been identified. A single pesticide was also identified for further source tracing in Basin 53.

6 Findings and Conclusions

The evaluation of stormwater data from City outfall basins discharging to the Portland Harbor Study Area, in the context of a harborwide stormwater data set and other relevant information (e.g., sediment trap data and information on upland sites/sources), provides a comprehensive basis for assessing the need for additional source tracing in City outfall basins and comprises a major component of the City's overall basin RI process (see Figure 1-1). The results of the evaluation indicate significant progress by the City, DEQ, and upland sites in identifying and controlling sources of contaminants to the City's shared stormwater conveyance systems within the Study Area.

This section presents key findings and conclusions regarding the need for additional source tracing activities. It also discusses the recommended actions by the City and/or DEQ to complete the identification and control of significant upland sources to City outfall basins before the EPA-directed Portland Harbor inriver cleanup begins.

Findings and conclusions of the statistical evaluation and source tracing categorization of harborwide stormwater data include:

- Of the 25 City outfall basins included in the stormwater data evaluation, only two are recommended for further evaluation of source tracing investigations at this time.
- Most analytes in City outfall basins are identified as source tracing Category 1 (i.e., least likely to have significant unidentified sources) as shown in Table 6-1.
- City outfall basins with stormwater source tracing Category 2 and 3 analytes typically have known or potential upland sources of the analytes identified. Most of these upland sources are in the process of conducting source control evaluations under DEQ oversight, as discussed in Section 5.
- Stormwater analyte concentrations in City outfall basins are predominantly on the lower range of the spectrum of harborwide stormwater concentrations.

The City's approach for identifying outfall basins for further source tracing is consistent with DEQ's current approach for identifying the priority for stormwater discharges in Portland Harbor under the JSCS (DEQ, 2010).

6.1 Further Source Tracing in City Outfall Basins

The source-tracing status of the City outfall basins, as identified through the basin-specific assessments discussed in Section 5 and summarized in Table 5-2, fall into three general groups:

- *No further City source tracing is planned* – This group, comprising the majority (13) of City outfall basins evaluated, represents basins for which stormwater analyte concentrations are low and which are least likely to include significant, uncontrolled upland sources. The City does not anticipate conducting further

source tracing activities in the stormwater conveyance systems within these basins.

- *No further source tracing is recommended at this time (but may be needed in the future)* – This group, comprising ten City outfall basins, generally represents basins where data analysis indicates contaminant sources are present but for which potential upland sources have been identified and are in the process of conducting source control evaluations under DEQ oversight. As indicated in Table 5-2, the City plans to review findings of the source control evaluation investigations of the identified sites. Whether additional City source tracing efforts, DEQ-required source control measures at upland sites, or DEQ site discovery actions are needed depends largely on the findings of the ongoing source control evaluations. Therefore, the City does not plan to conduct further source tracing in the stormwater conveyance systems within these basins at this time and will determine the need for further source tracing once additional information is available.
- *Further source tracing may be needed* – This group, comprising two City outfall basins (OF 52C and OF 53), represents basins where contaminants are present in stormwater at levels that indicate uncontrolled sources may exist within the basin or that nearby sources may be impacting stormwater quality in the basins (e.g., air deposition, particle tracking) and for which potential sources have not been identified. Additional City and DEQ evaluation is recommended to determine whether additional source tracing and/or DEQ site discovery efforts are needed.

It is important to note that source tracing recommendations have been developed in this report without review of relevant inriver data. For all basins where data indicate that source tracing should be considered now or following completion of investigation and control of known sources, inriver sediment data will be evaluated to ascertain the potential significance of the outfall as a contaminant pathway. The City recognizes that analytes not being carried forward for source tracing evaluation may warrant additional consideration in the context of inriver cleanup goals defined by the inriver FS, or to address recontamination evaluation concerns during remedial design.

6.2 Next Steps

The need for source tracing in Basins 52C and 53 was identified. The City will work with DEQ to assess the need and priority for further source tracing in these basins. The scope and timing of potential future source tracing activities will consider:

- Inriver sediment data (which are not elevated in the vicinity of these outfalls);
- Results from the Port of Portland's T-4 Early Action recontamination evaluation for stormwater discharges from various outfalls including OF 52C and OF 53;
- Results from upland investigations that may inform whether air deposition or particle tracking may be contributing to these basins; and

- Basin size, land use, and stormwater concentrations relative to DEQ upland source control decisions.

In addition, the City is currently initiating watershed planning activities along the east shore of the river, including the St. Johns area where Basins 52C and 53 are located, and will be identifying opportunities for improving stormwater management to further reduce pollutant contributions to the river.

For the remainder of the City outfall basins included in the stormwater data evaluation, the City will continue to work with DEQ to track the progress of ongoing source control evaluations at upland sites and will identify any further source investigation efforts that may be needed based on the results of these evaluations. The results of the stormwater data evaluation presented in this report will also assist DEQ in identifying upland site stormwater pathway evaluation and source control needs in City outfall basins and will support development of the basin RI/SCM reports that will be submitted to DEQ under the terms of the IGA.

Overall, the findings of this stormwater data evaluation indicate the collaborative work conducted by the City and DEQ under the IGA has been effective in identifying and characterizing upland sources of analytes to City stormwater outfall basins. The City expects that concentrations of contaminants to the City stormwater conveyance systems will be reduced by the ongoing and future implementation of site source control measures, as sites complete their source control evaluations under DEQ oversight. Reductions in contaminant discharges to City conveyance systems have also been achieved by other City stormwater and watershed health programs, including City Industrial Stormwater programs, water quality requirements for new and redeveloped sites under the Stormwater Management Manual, implementation of the Portland Watershed Management Plan, and other green infrastructure and incentive programs. These programs will continue to be implemented to maintain current gains and to further reduce overall loading as redevelopment and other changes across the landscape occur.

As noted in Section 5, many upland sites could be contributing contaminants to City stormwater conveyance systems, but the focus of this evaluation has been to assess basin stormwater data in the context of upland site information to identify basins where significant uncontrolled sources may be present but have not been accounted for. The City recognizes that future stormwater and solids data collected from any of the upland sites or City stormwater conveyance systems, as well as developments in the larger Portland Harbor RI/FS process, will help to refine the basin source tracing conclusions presented in this report. The City will review new information as it becomes available to guide its ongoing source investigation program. The City recognizes that analytes not being carried forward for source tracing evaluation may warrant additional consideration in the context of inriver cleanup goals defined by the inriver FS or to address recontamination concerns during remedial design.

The results of the stormwater evaluation are intended to focus City resources and future source tracing activities. The results are not intended to be used by upland sites to limit

the analyses of potential chemicals of concern. In addition, the results are not intended to evaluate potential risks or the significance of stormwater analytes discharging to the river through the City's conveyance system. Based on the analyses presented in this report, the City will work with DEQ on source identification in two identified basins and will review new information as it becomes available to further inform the outfall basin RI/SCM reports and to guide its ongoing source investigation program.

		Inline sediment trap	Metals (aluminum, antimony, arsenic, cadmium, chromium, copper, lead, mercury, nickel, selenium, silver, zinc), TS, TOC, PCB congeners, organochlorine pesticides, PAHs, phthalates, herbicides	
Schnitzer-Riverside WR-384	LWG Round 3A Stormwater Sampling	Stormwater – flow-weighted composite	*Metals* (aluminum, antimony, arsenic, cadmium, chromium, copper, lead, mercury, nickel, selenium, silver, zinc), TSS, TOC/DOC, PAHs, PCB congeners, herbicides	Anchor and Integral 2008b
		Inline sediment trap	Metals (aluminum, antimony, arsenic, cadmium, chromium, copper, lead, mercury, nickel, selenium, silver, zinc), TS, TOC, PCB congeners, organochlorine pesticides, PAHs, phthalates, herbicides	
Yeon-NW35 [6]	LWG Round 3A and 3B Stormwater Sampling	Stormwater – flow-weighted composite	*Metals* (aluminum, antimony, arsenic, cadmium, chromium, copper, lead, mercury, nickel, selenium, silver, zinc), TSS, TOC/DOC, PAHs, PCB congeners, herbicides	Anchor and Integral 2008b
		Inline sediment trap	TS, TOC, PCB congeners	

Notes:

Analytes in italics are reported in both total and dissolved (filtered) concentrations. Unless in italics, analytes are reported in total concentrations only.

(1) References are listed in Section 7 of report.

(2) In addition to the analytes listed, the City MS4 samples from OF 19 were also tested for ammonia-nitrogen, nitrate-nitrogen, orthophosphate phosphorus, total dissolved solids, total phosphorus, total solids, and hardness.

(3) The runoff sampled at this location drains to the combined sewer overflow bypass tunnel constructed in 2006.

(4) Due to insufficient volume collected in sediment traps and the large amount of sediment accumulated around the bottles, sediment was collected from within the outfall structure at this location for sediment sample analysis.

(5) Sample site WR-145 was moved to site WR-142 during the sampling period as the site became obstructed.

(6) This site was originally intended to measure Hwy 30 runoff only, however, as discussed in the Field Sampling Report (Anchor and Integral 2008a), the sampling equipment was installed at a location where additional drainage from NW 35th was sampled. In order to avoid confusion, this site has been renamed.

Table 4-1. Stormwater Analytes Selected for Statistical Evaluation. (1), (2)

PCB Congeners:
Total PCBs

PAHs:
Acenaphthene
Benzo(a)anthracene
Benzo(a)pyrene
Benzo(b)fluoranthene
Benzo(g,h,i)perylene
Benzo(k)fluoranthene
Chrysene
Dibenzo(a,h)anthracene
Fluoranthene
Indeno(1,2,3-cd)pyrene
Naphthalene
Phenanthrene
Pyrene
Total PAHs (3)

Pesticides:
2,4'-DDD
2,4'-DDE
2,4'-DDT
4,4'-DDD
4,4'-DDE
4,4'-DDT
Aldrin
Total chlordane
Dieldrin
Heptachlor
Heptachlor epoxide

Phthalates:
Bis(2-ethylhexyl)phthalate (BEHP)

Metals (total metals):
Arsenic
Cadmium
Copper
Lead
Manganese
Silver
Zinc

Other SVOCs:
Pentachlorophenol

Notes:

(1) This list includes all detected analytes for which any City outfall basin geometric mean concentration exceeded the JSCS SLV. The analytes identified above are listed regardless of the magnitude by which the geometric mean exceeds the conservative JSCS SLV. Exceedance of an SLV does not necessarily indicate an unacceptable risk to human or ecological receptors (DEQ/EPA, 2005). DEQ and EPA recognize the conservative nature (i.e., low concentrations) of the SLVs in the JSCS (DEQ and EPA, 2005, Table 3-1 revised July 2007) and that some SLVs are less than laboratory practical quantification limits (PQLs) using standard methods.

(2) Analytes shown in italics were analyzed and/or detected in a limited number of outfall basins (one to three basins); therefore, adequate data are not available to perform a meaningful statistical evaluation. These analytes are further evaluated in Section 5 for those basins in which these analytes were detected.

(3) The JSCS does not include an SLV for total PAHs; however, because individual PAH compounds do not typically occur alone, total PAHs were carried forward as an analyte for the harborwide statistical analysis.

Notes:

[1] Source tracing category divisions determined by statistical analysis of Portland Harbor stormwater data (including non-City basins). The statistical analysis is described in Section 4 and in Appendix C.

1	Stormwater analyte concentrations are lower relative to stormwater concentrations harborwide and least likely to have significant unidentified sources.
2	Stormwater analyte concentrations represent a range of moderate concentrations relative to the total harborwide range of stormwater concentrations and may or may not have significant unidentified sources.
3	Stormwater analyte concentrations are higher relative to harborwide concentrations and are the most likely to have significant unidentified sources.

[2] The process for selecting analytes for statistical evaluation is described in Section 4.2 and Appendix C.

[3] NA indicates outfall was not sampled for selected analyte.

[4] Samples were collected at two locations within Basins 22C, M-1, and M-2. Samples collected by the City are representative of entire basin discharges; the samples collected by LWG in these basins were located upstream.

The results of the stormwater evaluation are intended to focus City resources and future source tracing activities. The results are not intended to be used by upland sites discharging to the City's shared conveyance system to limit the analyses of potential chemicals of concern. In addition, the results are not intended to evaluate potential risks or the significance of stormwater analytes discharging to the river through the City's conveyance system.

Table 4-3. Assessment of Stormwater Analytes Identified in City Outfall Basins.

City Outfall Basin	Preliminary List of Analytes for Further Source Tracing Evaluation [1]	Source Tracing Category [2]	Additional Considerations / Analysis Outcome	Final List of Analytes for Further Source Tracing Evaluation in Basin Assessment [3]
OF 16	Total PCBs	2	Carried forward to basin assessment.	Total PCBs *Copper*
	PAHs:			
	Phenanthrene	2	Basin geomean does not exceed the SLV; not carried forward to basin assessment.	
	(Total PAHs) [4]	2	Basin geomean concentration for individual PAH compounds are less than SLVs; not carried forward to basin assessment.	
	Metals (total):			
	Cadmium	2	Basin geomean is less than DEQ suggested default background concentration for surface water.[5] Not carried forward to basin assessment.	
	Copper	2	Carried forward to basin assessment.	
	Lead	2	Basin geomean is less than 10% of NPDES 1200Z benchmark concentration; not carried forward to basin assessment.	
OF 18	Total PCBs	2	Carried forward to basin assessment.	Total PCBs *Copper*
	BEHP	2	Basin geomean is less than 10x the SLV; not carried forward to basin assessment.	
	Metals (total):			
	Cadmium	2	Basin geomean is less than DEQ suggested default background concentration for surface water.[5] Not carried forward to basin assessment.	
	Copper	2	Carried forward to basin assessment.	
	Lead	2	Basin geomean is less than 10% of NPDES 1200Z benchmark concentration; not carried forward to basin assessment.	
	Zinc	2	Basin geomean is less than 10x the SLV; not carried forward to basin assessment.	
OF 19	Total PCBs	2	Carried forward to basin assessment.	Total PCBs 4,4-DDD Aldrin Heptachlor Total chlordane
	PAHs:			
	Benzo(a)pyrene	2	Basin geomean is less than 10x the SLV. Basin geomean for total PAHs is Category 1. Not carried forward to basin assessment.	
	Benzo(k)fluoranthene	2	Basin geomean is less than 10x the SLV. Basin geomean for total PAHs is Category 1. Not carried forward to basin assessment.	
	Chrysene	2	Basin geomean is less than 10x the SLV. Basin geomean for total PAHs is Category 1. Not carried forward to basin assessment.	
	Dibenzo(a,h)anthracene	2	Basin geomean is less than 10x the SLV. Basin geomean for total PAHs is Category 1. Not carried forward to basin assessment.	
	Pesticides:			
	4,4'-DDD	N/A [6]	Exceedance based on only one sample result, which is an estimated value and is less than Tap Water PRGs. However, carried forward based on potentially significant detections of other pesticides.	
	Aldrin	N/A [6]	Exceedance based on only one sample result, which is an estimated value and is less than Tap Water PRGs. However, carried forward based on potentially significant detections of other pesticides.	
	Heptachlor	N/A [6]	Exceedance based on only one sample result, which is less than Tap Water PRGs. However, carried forward based on potentially significant detections of other pesticides.	
	Total chlordane	N/A [6]	Exceedance based on only one sample result, which is less than Tap Water PRGs. However, carried forward based on potentially significant detections of other pesticides.	
	BEHP	2	Basin geomean is less than 10x the SLV; not carried forward to basin assessment.	
	Metals (total):			
	Cadmium	2	Basin geomean is less than DEQ suggested default background concentration for surface water.[5] Not carried forward to basin assessment.	
	Lead	2	Basin geomean is less than 10% of NPDES 1200Z benchmark concentration; not carried forward to basin assessment.	
	Zinc	2	Basin geomean is less than 10x the SLV; not carried forward to basin assessment.	
OF 22	PAHs:			Arsenic
	Chrysene	2	Basin geomean is less than 10x the SLV; not carried forward to basin assessment.	
	Fluoranthene	2	Basin geomean does not exceed the SLV; not carried forward to basin assessment.	
	Phenanthrene	2	Basin geomean does not exceed the SLV; not carried forward to basin assessment.	
	Pyrene	2	Basin geomean is less than 10x the SLV; not carried forward to basin assessment.	
	(Total PAHs) [4]	2	Basin geomean concentrations for individual PAH compounds are less than 10x SLVs; not carried forward to basin	
	Metals (total):			
	Arsenic	2	Carried forward to basin assessment.	
	Cadmium	2	Basin geomean is less than DEQ suggested default background concentration for surface water.[5] Not carried forward to basin assessment.	
	Zinc	2	Basin geomean is less than 10x the SLV; not carried forward to basin assessment.

	Metals (total):			
	Copper	2	Carried forward to basin assessment.	
	Zinc	2	Carried forward to basin assessment.	

Notes:

N/A = not applicable

SLV = screening level value established in the Joint Source Control Strategy (JSCS) (DEQ/EPQ, 2005)

[1] Preliminary list consists of analytes for which the analyte was detected and the basin geometric mean ("geomean") concentration was ranked into source tracing Category 2 or 3 (see Table 4-2), unless otherwise noted.

[2] Source tracing category divisions determined by statistical analysis of Portland Harbor stormwater data (including non-City basins). The statistical analysis is described in Section 4 and in Appendix C.

[3] Basin assessment (presented in Section 5) evaluates further source tracing needs for identified analytes. Discharges of analytes shown in italics are regulated under the NPDES 1200Z industrial stormwater permit program.

[4] A JSCS SLV has not been established for total PAHs. PAH compounds typically have common sources, and therefore individual PAH compounds do not typically occur alone. For this reason, only total PAHs (not individual PAH compounds) are carried forward for the purposes of the basin assessments and potential future source tracing activities.

[5] Oregon Department of Environmental Quality (DEQ), 2002. Default background concentrations for metals. Internal DEQ memorandum, to DEQ Cleanup Project Managers, from: Toxicology Workgroup. Dated October 28, 2002.

[6] Pesticides were identified for evaluation if the basin geomean exceeded the JSCS SLV (in the case of Basin 19, only one sample was tested for pesticides, so any pesticide SLV exceedances in this Basin 19 sample were identified for evaluation; see data tables for FY 2008-09 in Appendix B). The number of basins in which pesticides analyses were conducted is too small to support a robust statistical analysis.

[7] Pentachlorophenol was detected in only 1 of 4 samples from this basin and not detected in other City outfall basins.

[8] Basin geomean for this analyte exceeds the JSCS SLV at the LWG sample location but not the City sample location.

[9] This PAH was ranked into Category 2 only for the LWG sample location; the ranking was Category 1 for the City sample location in this basin.

The results of the stormwater evaluation are intended to focus City resources and future source tracing activities. The results are not intended to be used by upland sites discharging to the City's shared conveyance system to limit the analyses of potential chemicals of concern. In addition, the results are not intended to evaluate potential risks or the significance of stormwater analytes discharging to the river through the City's conveyance system.

Notes:

N/A = not applicable.

[1] See Section 4 and Table 4-3 of this report. Identification of analytes for further evaluation is based on a statistical analyses conducted by the City to determine the significance of detected concentrations relative to other basins discharging to Portland Harbor. Analytes shown in italics are permitted under the NPDES 1200Z industrial stormwater permit program.

[2] Except as noted, reference for NPDES 1200Z permit holders is *BES Industrial Stormwater, Portland Harbor Permits – Sorted by Outfall, Report Date: 10/23/09* . NPDES 1200Z permits allow discharges of permitted analytes up to the designated benchmark concentrations. NPDES 1200Z permit analytes and benchmarks include copper (100 ug/L), lead (400 ug/L), and zinc (600 ug/L).

[3] Contaminants of interest (COI) for DEQ ECSI sites identified in Table 4.4-4 of the *Portland Harbor RI/FS Remedial investigation Report Draft* (Integral Consulting and others, 2009). The listing of "TPH" as a COI implies that PAHs are COIs because TPH consists of PAHs in addition to other compounds.

[4] NFA = No Further Action determination issued by DEQ. SCD = Source Control Decision by DEQ. Pending = site has agreed to work with DEQ under the cleanup program, but cleanup activities have not yet been initiated. N/A = not applicable because site is not an ECSI site (or no ECSI sites in basin).

[5] TBD = To be determined, pending results from ongoing site-specific stormwater source control evaluations being conducted under DEQ oversight, and/or the evaluation of recent City source tracing data (concurrent with or post 2007/2008 stormwater sampling events).

[6] Metals COIs for this site not listed individually [or this metal not listed] in Table 4.4-4, but selected metals COIs are identified in Panels 10.2-9A - 10.2-12C of the *Portland Harbor RI/FS Remedial investigation Report Draft* (Integral Consulting and others, 2009).

[7] ECSI #1549 encompasses a number of discrete DEQ Cleanup sites. The site COIs listed for these individual cleanup sites include the site COIs for the larger site (ECSI #1549).

[8] This site had an NPDES 1200Z permit for discharge to OF 53A at the time of the 2007-2008 City stormwater sampling; this permit has subsequently been terminated.

[9] The portion of this site designated as "Operational Unit 3" (OU3) discharges to Basin S-2. The COIs listed for ECSI #271 for Basins S-1 and S-6 are not necessarily representative of COIs for OU3. The COIs for OU3 will be refined during the course of the stormwater pathway evaluation currently underway (Ash Creek Associates/Newfields, 2008).

The results of the stormwater evaluation are intended to focus City resources and future source tracing activities. The results are not intended to be used by upland sites discharging to the City's shared conveyance system to limit the analyses of potential chemicals of concern. In addition, the results are not intended to evaluate potential risks or the significance of stormwater analytes discharging to the river through the City's conveyance system.

Table 5-2. Source Tracing Recommendations for City Outfall Basins.

City Outfall Basin	Stormwater Analytes Identified for Further Source Tracing Evaluation [1]	LWG / Port Sediment Trap Data [2]	Source Tracing Status by Analyte (including analytes elevated in sediment samples only)			Basin Assessment Conclusions	City Next Steps
			Analytes [3]	Further Source Tracing Needed?	Rationale		
OF 16	Total PCBs *Copper*	*Additional analytes exceeding JSCS Toxicity SLVs for solids:* Phthalates (BEHP, dibutyl phthalate)	PCBs	TBD	One source identified (see Table 5-1); stormwater pathway evaluation is currently underway.	**Further source tracing not recommended at this time:** ● A stormwater pathway evaluation is currently underway at one upland site (see Table 5-1); results may indicate whether further source tracing is needed to identify other PCB, phthalate and/or copper source(s). ● The City has conducted extensive source investigations, including sediment trap sampling post-dating the 2007-2008 stormwater sampling (see Table 5-1). Evaluation of these data is currently underway and will be presented in a forthcoming technical memorandum. Solids data will be reviewed to evaluate if additional source tracing or site discovery activities are warranted.	● Review findings of upland stormwater pathway evaluations, as available ● Continue coordination with DEQ regarding ongoing stormwater pathway evaluation ● Evaluate 2008 City sediment trap data
			(Phthalates)	TBD	One source identified (see Table 5-1). Stormwater pathway evaluation is currently underway.		
			Copper	No	Multiple copper sources identified (see Table 5-1). Stormwater pathway evaluation currently underway at one location. Copper is permitted and geomean concentration at the outfall is less than 50% of the NPDES permit benchmark. [5]		
OF 18	Total PCBs *Copper*	*Additional analytes exceeding JSCS Toxicity SLVs for solids:* Pesticides (DDD, DDE [1 of 5 samples], total chlordane and heptachlor [3 of 5 samples])	PCBs	TBD	Multiple sources identified (see Table 5-1); stormwater pathway evaluations are currently underway at several upland sites.	**Further source tracing not recommended at this time:** ● Stormwater pathway evaluations are currently underway at several upland sites (see Table 5-1); results may indicate whether further source tracing is needed to identify PCB, pesticide, and/or copper source(s). ● The City has conducted extensive source investigations, including sediment trap and inline solids sampling post-dating the 2007-2008 stormwater sampling (see Table 5-1). Evaluation of these data is currently underway and will be presented in a forthcoming technical memorandum. Solids data will be reviewed to evaluate if additional source tracing or site discovery activities are warranted.	● Review findings of upland stormwater pathway evaluations, as available ● Continue coordination with DEQ regarding ongoing stormwater pathway evaluations ● Evaluate 2007 - 2009 City sediment trap and inline solids data
			(Pesticides)	TBD	A source has been identified (see Table 5-1); a stormwater pathway evaluation is currently underway at this upland site and pesticides also are being screened at other sites in the basin.		
			Copper	No	Multiple sources identified (see Table 5-1). Stormwater pathway evaluations are currently underway. Copper is permitted and the geomean concentration at the outfall is less than 30% of the NPDES permit benchmark. [5]		
OF 19	Total PCBs 4,4-DDD Aldrin Heptachlor Total chlordane	*Additional analytes exceeding JSCS Toxicity SLVs for solids:* N/A[4]	PCBs	TBD	Multiple sources identified (see Table 5-1). Stormwater pathway evaluations are currently underway or under consideration.	**Further City source tracing not recommended at this time:** ● Stormwater pathway evaluations are currently underway at several upland sites (see Table 5-1); results may indicate whether further source tracing is needed to identify PCB and/or pesticide source(s). ● The City has conducted extensive source investigations (see Table 5-1) and major sources likely have been identified. Evaluation of City inline solids data will be included in the forthcoming Basin 19 Source Investigation Update Report. Solids data will be reviewed to evaluate if additional source tracing or site discovery activities are warranted.	● Review findings of upland stormwater pathway evaluations, as available ● Continue coordination with DEQ regarding ongoing stormwater pathway evaluations ● Collect additional pesticide data in stormwater ● Evaluate stormwater solids data set
			Pesticides	TBD	Pesticide data are limited and identification for further source tracing evaluation is based on one sample. Pesticides were detected in catch basin solids and stormwater samples at the Anderson Brothers site* (ECSI 970) in 2006/2007 and stormwater at the Chevron Asphalt site** (ESCI 1281) in 2009.		
OF 22	Arsenic	*Additional analytes exceeding JSCS Toxicity SLVs for solids:* N/A[4]	Arsenic	No	Multiple sources are identified and are conducting stormwater pathway evaluations (see Table 5-1). Basin geomean concentration is less than 2x background.	**Further source tracing not recommended at this time:** ● Stormwater pathway evaluations are currently underway at several upland sites (see Table 5-1); results may indicate whether further source tracing is warranted to identify arsenic source(s). ● The entire basin area is comprised of upland sites in DEQ Cleanup Program that are undergoing stormwater pathway evaluations.	● Continue coordination with DEQ regarding ongoing stormwater pathway evaluations

Table 5-2. Source Tracing Recommendations for City Outfall Basins.

City Outfall Basin	Stormwater Analytes Identified for Further Source Tracing Evaluation [1]	LWG / Port Sediment Trap Data [2]	Source Tracing Status by Analyte (including analytes elevated in sediment samples only)			Basin Assessment Conclusions	City Next Steps
			Analytes [3]	Further Source Tracing Needed?	Rationale		
OF 22B	Total PCBs 2,4'-DDE 2,4'-DDT 4,4'-DDD 4,4'-DDE Aldrin Dieldrin Heptachlor Heptachlor epoxide Total chlordane Arsenic Cadmium *Copper*	*Additional analytes exceeding JSCS Toxicity SLVs for solids* : BEHP	PCBs	TBD	Multiple sources identified (see Table 5-1); stormwater pathway evaluations are currently underway or under consideration at several upland sites.	**Further source tracing not recommended at this time:** ● The entire basin area is comprised of upland sites in DEQ Cleanup Program that are undergoing stormwater pathway evaluations. ● Stormwater pathway evaluations are currently underway at several upland sites (see Table 5-1). ● The City has conducted extensive source investigations, and major sources likely have been identified (see Table 5-1). ● Extensive source control measures are currently being implemented, including an interim remedial action measure to address infiltration of contaminated groundwater into the stormwater conveyance system; post-source-control-implementation monitoring data may indicate whether further source tracing is needed.	● Review findings of upland stormwater pathway evaluations, as available ● Continue coordination with DEQ regarding ongoing stormwater pathway evaluations
			Pesticides	TBD	Multiple sources identified (see Table 5-1); stormwater pathway evaluations are currently underway or under consideration at several upland sites.		
			(BEHP)	TBD	One source identified (see Table 5-1). Stormwater pathway evaluation is currently underway at this site and others are under consideration.		
			Metals	TBD	Multiple sources identified (see Table 5-1). Stormwater pathway evaluations are currently underway or under consideration. Copper is permitted, and basin geomean concentration at the outfall is less than 35% of the NPDES permit benchmark.[5] The basin geomean concentration for arsenic is lesss than 2x the background concentration.		
OF 22C	None	*Additional analytes exceeding JSCS Toxicity SLVs for solids* : None	N/A	N/A	N/A	**Further source tracing not planned:** ● Analyte concentrations are low in 2007/2008 stormwater samples. ● Stormwater pathway evaluations are currently underway at several upland sites (see Table 5-1). ● The single analyte ranked as source tracing Category 3 (acenaphthene) has known upland sources (see Table 5-1).	None
OF 22D	None	LWG/Port sediment trap sample not collected	N/A	N/A	N/A	**Further source tracing not planned:** ● Analyte concentrations are low in 2007/2008 stormwater samples. ● Basin unlikely to include significant sources (see Table 5-1).	None
OF 45	*Copper*	LWG/Port sediment trap sample not collected	*Copper*	No	One potential copper source identified (see Table 5-1); stormwater pathway evaluation is currently underway. Basin geomean concentration at the outfall is less than 30% of the NPDES permit benchmark.[5]	**Further source tracing not planned:** ● Analyte concentrations are low in 2007/2008 stormwater samples. ● Stormwater pathway evaluation is currently underway at the identified upland site (see Table 5-1); City requested additional characterization of discharges to Basin 45. ● City Illicit Discharge Elimination Program identified one site with copper in process water discharged to the stormwater system and required site to reroute process water to the sanitary sewer system.	None
OF 46	Total PAHs *Copper*	LWG/Port sediment trap sample not collected	PAHs	TBD	One source identified (see Table 5-1). Stormwater pathway evaluation is currently underway.	**Further source tracing not recommended at this time:** ● Stormwater pathway evaluation is currently underway at one upland site (see Table 5-1); results may indicate whether further source tracing is warranted to identify PAH and/or copper source(s). ● City source investigation did not identify significant sources. ● Basin stormwater is slated for diversion to wastewater treatment plant in 2011.	● Review findings of upland stormwater pathway evaluation, as available ● Continue coordination with DEQ regarding ongoing stormwater pathway evaluation
			Copper	No	One source identified (see Table 5-1); stormwater pathway evaluation is currently underway. Copper is permitted and the basin geomean concentration is less than 40% of the NPDES permit benchmark.[5]		
OF 47	None	LWG/Port sediment trap sample not collected	N/A	N/A	N/A	**Further source tracing not planned:** ● Analyte concentrations are low in 2007/2008 stormwater samples. ● City inline solids investigation did not indicate the presence of significant unidentified sources.	None

Table 5-2. Source Tracing Recommendations for City Outfall Basins.

City Outfall Basin	Stormwater Analytes Identified for Further Source Tracing Evaluation [1]	LWG / Port Sediment Trap Data [2]	Source Tracing Status by Analyte (including analytes elevated in sediment samples only)			Basin Assessment Conclusions	City Next Steps
			Analytes [3]	Further Source Tracing Needed?	Rationale		
OF 48	None	LWG/Port sediment trap sample not collected	N/A	N/A	N/A	**Further source tracing not planned:** ● Analyte concentrations are low in 2007/2008 stormwater samples. ● Basin unlikely to include significant sources (see Table 5-1). ● Basin has stormwater treatment in place. ● City inline solids source investigation indicated analyte concentrations in untreated solids were lower than JSCS Toxicity SLVs.	None
OF 49	None	*Additional analytes exceeding JSCS Toxicity SLVs for solids:* None	N/A	N/A	N/A	**Further source tracing not planned:** ● Analyte concentrations are low in 2007/2008 stormwater samples and generally low in sediment trap solids. ● Basin unlikely to include significant sources (see Table 5-1). ● Basin has stormwater treatment in place.	None
OF 50	None	LWG/Port sediment trap sample not collected	N/A	N/A	N/A	**Further source tracing not planned:** ● Analyte concentrations are low in 2007/2008 stormwater samples. ● Analyte concentrations were below JSCS Toxicity SLVs in 2007 City inline solids sample representing the majority of basin discharges. ● Stormwater pathway evaluations have been completed or are underway at both identified upland sites (see Table 5-1). ● Basin has stormwater treatment in place.	None
OF 52	Total PCBs *Copper*	LWG/Port sediment trap sample not collected	PCBs	TBD	One source has been identified, and a stormwater pathway evaluation is underway at this upland site (see Table 5-1).	**Further source tracing not recommended at this time:** ● Stormwater pathway evaluation is underway at one upland site; results may indicate whether further source tracing is warranted to identify PCB and/or metals source(s). ● The City conducted source investigations in this basin in 2008. Evaluation of these data is currently underway and will be presented in a forthcoming technical memorandum. Solids data will be reviewed to evaluate if additional source tracing or site discovery activities are warranted. ● BES Industiral Stormwater providing technical assistance at two sites in the basin that are potential metals sources.	● Review findings of upland stormwater pathway evaluation, as available ● Continue coordination with DEQ regarding ongoing stormwater pathway evaluation ● Evaluate 2008 City inline solids data
			Copper	No	One source has been identified, and a stormwater pathway evaluation is underway at this upland site (see Table 5-1). Copper is permitted and basin geomean concentration is less than 35% of the NPDES benchmark.		
OF 52A	None	LWG/Port sediment trap sample not collected	N/A	N/A	N/A	**Further source tracing not planned:** ● Analyte concentrations are low in 2007/2008 stormwater samples. ● Basin unlikely to include significant sources (see Table 5-1).	None
OF 52C	Total PCBs	*Additional analytes exceeding JSCS Toxicity SLVs for solids:* None / N/A[4]	PCBs	Yes	No sources have been identified (see Table 5-1).	**Further source tracing may be needed:** ● Source(s) of PCBs have not been identified (see Table 5-1).	● Coordinate with DEQ on next steps for possible source tracing
OF 53	Total PCBs Heptachlor epoxide	*Additional analytes exceeding JSCS Toxicity SLVs for solids:* None / N/A[4]	PCBs	Yes	No sources have been identified (see Table 5-1).	**Further source tracing may be needed:** ● Source(s) of PCBs and pesticides have not been identified (see Table 5-1).	● Coordinate with DEQ on next steps for possible source tracing
			Pesticides	Yes	No sources have been identified (see Table 5-1).		

Table 5-2. Source Tracing Recommendations for City Outfall Basins.

City Outfall Basin	Stormwater Analytes Identified for Further Source Tracing Evaluation [1]	LWG / Port Sediment Trap Data [2]	Source Tracing Status by Analyte (including analytes elevated in sediment samples only)			Basin Assessment Conclusions	City Next Steps
			Analytes [3]	Further Source Tracing Needed?	Rationale		
OF 53A	Total PCBs Arsenic *Zinc*	LWG/Port sediment trap sample not collected	PCBs	TBD	Multiple sources identified; stormwater pathway evaluations are currently underway at these upland sites (see Table 5-1).	**Further source tracing not recommended at this time:** ● Stormwater pathway evaluations are currently underway at two upland sites (see Table 5-1); results may indicate whether further source tracing is warranted to identify PCB and/or metals source(s). ● The City has conducted source investigations, including sediment trap and inline solids sampling post-dating the 2007-2008 stormwater sampling (see Table 5-1). Evaluation of these data is currently underway and will be presented in a forthcoming technical memorandum. Solids data will be reviewed to evaluate if additional source tracing or site discovery activities are warranted.	● Review findings of upland stormwater pathway evaluations, as available ● Continue coordination with DEQ regarding ongoing stormwater pathway evaluations ● Evaluate 2007/2008 City sediment trap data
			Metals	No	Multiple sources identified; stormwater pathway evaluations are underway at these upland sites (see Table 5-1). Basin geomean concentration for arsenic is approximately 2x background. Zinc is permitted and the basin geomean concentration is less than the NPDES benchmark.		
OF M-1	Total PCBs	*Additional analytes exceeding JSCS Toxicity SLVs for solids*: N/A[4]	PCBs	TBD	One source has been identified, and stormwater pathway evaluations are currently underway or under consideration at this and other upland sites (see Table 5-1).	**Further source tracing not recommended at this time:** ● Stormwater pathway evaluations have been completed or are underway at three upland sites; the pending results may indicate whether further source tracing is warranted to identify PCB source(s).	● Review findings of upland stormwater pathway evaluations, as available ● Continue coordination with DEQ regarding ongoing stormwater pathway evaluations
OF M-2	None	*Additional analytes exceeding JSCS Toxicity SLVs for solids:* N/A[4]	N/A	N/A	N/A	**Further source tracing not planned:** ● Analyte concentrations are low in 2007/2008 stormwater samples. ● Basin unlikely to include significant sources (see Table 5-1).	None
OF M-3	None	LWG/Port sediment trap sample not collected	N/A	N/A	N/A	**Further source tracing not planned:** ● Analyte concentrations are low in 2007/2008 stormwater samples. ● The stormwater pathway evaluation currently underway (see Table 5-1) is expected to be completed soon; results will further clarify any potential source issues.	None
OF S-1	Total PAHs *Copper*	LWG/Port sediment trap sample not collected	PAHs	TBD	One source identified (see Table 5-1). Stormwater pathway evaluation is currently underway.	**Further source tracing not recommended at this time:** ● Stormwater pathway evaluation is currently underway at one upland site (see Table 5-1); results may indicate whether further source tracing is warranted to identify PAH and/or copper source(s).	● Review findings of upland stormwater pathway evaluation, as available ● Continue coordination with DEQ regarding ongoing stormwater pathway evaluation
			Copper	No	One source identified (see Table 5-1); stormwater pathway evaluation is currently underway. Copper is permitted, and the basin geomean concentration at the outfall is less than 35% of the NPDES permit benchmark.[5]		
OF S-2	None	LWG/Port sediment trap sample not collected	N/A	N/A	N/A	**Further source tracing not planned:** ● Analyte concentrations are low in 2007/2008 stormwater samples. ● Stormwater pathway evaluation is underway (see Table 5-1).	None
OF S-5	None	LWG/Port sediment trap sample not collected	N/A	N/A	N/A	**Further source tracing not planned:** ● Analyte concentrations are low in 2007/2008 stormwater samples. ● Basin unlikely to include significant sources (see Table 5-1).	None

Table 5-2. Source Tracing Recommendations for City Outfall Basins.

City Outfall Basin	Stormwater Analytes Identified for Further Source Tracing Evaluation [1]	LWG / Port Sediment Trap Data [2]	Source Tracing Status by Analyte (including analytes elevated in sediment samples only)			Basin Assessment Conclusions	City Next Steps
			Analytes [3]	Further Source Tracing Needed?	Rationale		
OF S-6	*Copper* *Zinc*	LWG/Port sediment trap sample not collected	Metals	No	One source identified (see Table 5-1); stormwater pathway evaluation is currently underway. Copper and zinc are permitted. The basin geomean concentration for copper is less than 35% of the NPDES benchmark. The basin geomean concentration for zinc is less than the NPDES benchmark.[5]	**Further source tracing not planned:** ● Analyte concentrations are low in 2007/2008 stormwater samples. ● Stormwater pathway evaluation is currently underway at the identified upland site (see Table 5-1). ● Source investigation determined highest copper and zinc concentration at connection from identified source.	None

Notes:

N/A = not applicable

TBD = to be determined

[1] See Section 4 and Table 4-3 of this report. Identification of analytes for further evaluation is based on statistical analyses conducted by the City to determine the significance of detected concentrations relative to other basins discharging to Portland Harbor and evaluate whether significant uncontrolled sources may exist in City outfall basins. Analytes shown in italics are permitted under the NPDES 1200Z industrial stormwater permit program.

[2] Sediment data considered only for constituents not analyzed in stormwater (i.e., applies to pesticides and phthalates only). Source of sediment trap data: LWG Round 3A and 3B Stormwater Data Report (BBL, 2006; Anchor and Integral, 2008b). LWG and Port sediment trap data for City outfall basins are tabulated in Appendix E.

[3] Analytes shown in parentheses added to basin assessment because they exceed JSCS Toxicity SLVs in LWG/Port sediment trap solids and were not analyzed in stormwater from the basin.

[4] No additional constituents were analyzed in sediment trap samples that were not also analyzed in stormwater samples from this basin.

[5] DEQ-established NPDES 1200Z Permit Benchmark values: copper = 100 ug/L; lead = 400 ug/L; zinc = 600 ug/L.

(*) DEQ, 2009. Former Anderson Brothers Site - ECSI #970 - Source Control Decision. Prepared by Bob Schwarz, DEQ Cleanup Program. Dated July 16, 2009.
(**) DEQ, 2009. Former Chevron Asphalt Site - ECSI #1281 - Source Control Evaluation Report. Prepared by ARCADIS for Chevron Environmental Management. Dated May, 2009.

The results of the stormwater evaluation are intended to focus City resources and future source tracing activities. The results are not intended to be used by upland sites discharging to the City's shared conveyance system to limit the analyses of potential chemicals of concern. In addition, the results are not intended to evaluate potential risks or the significance of stormwater analytes discharging to the river through the City's conveyance system.

Table 6-1. Summary City Outfall Basin Source Tracing Categorization for Selected Analytes [1]

Category	Definition	Percent of City Outfall Basins Assigned to Category (by analyte)		
		Total PCBs [2]	**PAHs** [2, 3]	**Metals** [2, 4]
1 (lower)	Least Likely to Have Unidentified Significant Sources	64 %	80 %	69 %
2 (moderate) [5]	May or May Not Have Unidentified Significant Sources	36 %	27 %	31 %
3 (higher) [5]	Most Likely to Have Unidentified Significant Sources	0 %	1 %	1 %

Notes:

[1] Categories ≠ Risk. Categories are based on distribution of harborwide concentrations and without consideration of the significance of the outfall basin concentration (i.e., greater than or less than applicable screening levels, background concentrations, etc.).

[2] The percentage of City Outfalls within each category was estimated by combining the results for outfalls with multiple locations (OF M1, OF M2). For these outfalls the higher category was used. The results representative of Forest Park (OF 22C – Tualatin Hills) were not included in the results presented in this table.

[3] The percentage of City Outfalls within each category for PAHs is based on the cumulative results of the thirteen individual PAHs presented in Table 4-2 of the *Stormwater Evaluation Report.*

[4] The percentage of City Outfalls within each category for metals is based on the cumulative results of the six individual metals presented in Table 4-2 of the *Stormwater Evaluation Report.*

[5] Use of the full harborwide data set allowed stormwater concentrations in City Outfall basins to be ranked and evaluated relative to other stormwater discharges to the Portland Harbor Study Area. City outfall basins with analyte concentrations potentially in the upper range of the concentration distribution were identified for further evaluation of the need source tracing.

A1 Introduction

This report summarizes the results of the City of Portland (City) Bureau of Environmental Services' (BES) stormwater sampling activities conducted from September 2007 through May 2008 at 18 City outfalls within the Portland Harbor Study Area (Figure A-1). On August 13, 2003, the City and the Oregon Department of Environmental Quality (DEQ) entered into a remedial investigation/source control measure intergovernmental agreement (IGA) to collaborate on the evaluation and control of potential upland sources of discharges to the City stormwater conveyance system that might adversely affect sediment and surface water quality in the Portland Harbor. These investigation results are submitted pursuant to the IGA.

The data collection activities described in this report were conducted in accordance with the City's *Fall 2007 Stormwater Grab Sampling and Analysis Plan* (BES, 2007a) and *Winter 2008 Stormwater Sampling and Analysis Plan* (BES, 2007b) (stormwater SAPs), submitted to DEQ on August 23 and December 20, 2007, respectively.

This report describes stormwater sampling locations and conditions, summarizes field and laboratory procedures, and presents analytical testing results. It comprises Appendix A to the *Stormwater Evaluation Report, City of Portland Outfall Project, ECSI No. 2425* (BES, 2010), which evaluates the stormwater data, in conjunction with other basin data, to assess the need for and priority of additional source tracing in basins that discharge via City outfalls to Portland Harbor.

A1.1 Purpose

The purpose of the City's monitoring efforts was to conduct stormwater sampling and evaluations in accordance with the *Portland Harbor Joint Source Control Strategy* [(JSCS); DEQ/EPA, 2005, as amended 2007] in 17 basins and to collect stormwater data from one basin to supplement a land use study being conducted by the Lower Willamette Group (LWG). The City designed its stormwater sampling program to obtain data in support of meeting the remedial investigation objectives: to evaluate the status of ongoing source tracing activities, to confirm that no significant sources are discharging to City stormwater conveyance systems associated with the outfalls, and/or to verify that all significant sources have been identified and controlled.

A1.2 Report Organization

The remainder of this report is organized into the following major sections:

- Section A2: Sample Locations and Characteristics
- Section A3: Sampling Procedures
- Section A4: Storm Events Sampled
- Section A5: Laboratory Analyses and Data Management
- Section A6: Sample Results
- Section A7: References

Supporting information is provided in the following attachments:

- Attachment A1: Field Documentation
- Attachment A2: Storm Event Precipitation Graphs, (2007-2008 Stormwater Grab Sampling)

- Attachment A3: Hydrographs for Flow-Weighted Composite Samples
- Attachment A4: Summary of Stormwater Analytical Data
- Attachment A5: Laboratory Reports and Data Review Memoranda

A2 Sample Locations and Characteristics

In 2007 and 2008, stormwater samples were collected from the majority of City outfall basins within the Portland Harbor Study Area by the LWG, the Port of Portland (Port) and the City. Primary factors considered by the City in selecting the 18 outfall basins to be sampled included:

- Basin-specific objectives such as determining/confirming source investigation priority.
- Additional data needed to support ongoing stormwater evaluations.
- Whether samples obtained by the LWG and the Port represented the majority of the basin from which the sample was obtained.

Based on these factors, the following outfall basins were selected for stormwater sampling and analysis: Basins 48, 50, 52, 52A, M-1, M-2, M-3, S-1, S-2, S-5, and S-6 (sampled in fall 2007), and Basins 22C, 22D, 45, 46, 47, 53 and 53A (sampled in winter 2008). Characteristics of these basins are summarized in Table A-1. The basin outfall locations are shown on Figure A-1. The basin boundaries and sampling points are shown on Figures A-2 through A-19 and are described in Table A-1. Basins 22C, M-1 and M-2 were previously sampled by the LWG. However, the City collected additional samples because the LWG samples do not represent significant portions of these basins. Basin 53 was previously sampled by the Port; the City collected additional samples from this basin to supplement the LWG data set for the residential land use category.

A2.1 Grab Sample Locations

Stormwater grab samples were collected from each of the basins listed above, with the exception of Basin 53, from which composite stormwater samples were collected. The stormwater grab samples were generally collected from a manhole, not directly at an outfall (except at Outfall 22C), because the outfall pipe openings are typically submerged in the river or are otherwise difficult to access. The sampling location within each basin was chosen to represent as much of the drainage basin as possible, without compromising sample integrity due to anticipated river backup in the lower elevation systems. Basins with constructed conveyance systems at low elevations were anticipated to be only accessible for stormwater sample collection during fall, when the river is typically at its lowest stage; therefore, this factor was considered in prioritizing outfalls to be sampled during the fall 2007 monitoring period. The SAP identified alternative sampling locations that could be used in the event that the primary locations were not suitable for obtaining a representative sample. However, all primary sampling points proposed in the stormwater SAPs were successfully sampled, and alternative sampling locations were not required.

A2.2 Flow-Weighted Composite Sample Location

Outfall Basin 53 was included in the 2007 – 2008 stormwater sampling to supplement data collected by the Port for the recontamination analysis component of its EPA-directed cleanup of contaminated sediments at Terminal 4. Data collected by the Port at this outfall also was used by the LWG in its stormwater land use analysis (*Round 3A and 3B Stormwater Data Report;* Anchor and Integral, 2008). Specifically, the City's objectives for stormwater sampling in Basin 53 were to obtain additional stormwater data to evaluate contaminant concentrations detected in a 2007

sample collected by the Port in this basin and to facilitate statistical analysis of stormwater discharges from this basin.[1] To accomplish these objectives, the City elected to collect flow-weighted composite samples from this basin in accordance with LWG protocols. Flow-weighted composite samples, obtained using an automatic system, are collected progressively over the entire storm hydrograph and thus yield data representing mean contaminant concentrations in runoff over the course of the storm event being sampled.

[1] The City's sampling point in Basin 53 was at a different manhole than that utilized by the Port; however, both sampling points represent the total known basin area and therefore are considered comparable.

A3 Sampling Procedures

The sampling was conducted in accordance with the stormwater SAPs, which were developed to provide project-specific information to supplement the City's *Amended Programmatic Quality Assurance Project Plan* (QAPP) (BES, 2007c) and *Amended Programmatic Sampling and Analysis Plan* (Programmatic SAP) (BES, 2007d) for collection of water and solids samples for the City of Portland Outfalls Project. This section describes how key elements of these guidance documents were implemented.

A3.1 Sampling Staff

Personnel from BES performed the stormwater sampling. At a minimum, the sampling staff included a Storm Event Coordinator and Event Sampling Teams. The Storm Event Coordinator was responsible for tracking weather patterns, selecting the storm events for sampling, and directing sampling activities.

Event Sampling Teams were composed primarily of the City's Field Operations staff and were supplemented by other BES personnel as needed. Event Sampling Teams were two-person teams, including at least one experienced Field Operations staff member. Individual staff members were used, on occasion, if no traffic control was required.

In some cases, more than one Event Sampling Team was used during a single stormwater sampling event to decrease the length of field time and the number of individual storms needed to collect representative samples from all basin sampling locations designated in the stormwater SAPs.

A3.2 Storm Event Tracking

The stormwater SAPs identified the following target storm event criteria (consistent with the JSCS) for stormwater sampling:

- Antecedent dry period of at least 24 hours (as defined by <0.1 inch of rainfall over the previous 24 hours);
- Minimum predicted rainfall volume of >0.2 inches for the storm event; and
- Expected duration of the storm event of at least 3 hours.

These criteria were developed for implementation by upland sites. In this case, they were used as general guidelines to determine if forecasted storms should be targeted for sampling. Based on the City's experience with stormwater monitoring in this region, smaller storms or those of shorter duration are unlikely to generate runoff at the outfall that would be representative of entire stormwater basins that have large areas or significant pervious components. To the extent practicable, project personnel adhered to sampling only forecasted storms meeting the target storm criteria to help ensure that stormwater runoff would be adequate for sample collection, representative of stormwater runoff, and consistent between sampling events.

The Storm Event Coordinator worked directly with the City's contract weather forecasting service, Extended Range Forecasting Company, Inc., (ERF) to obtain forecasts and to decide whether to initiate a stormwater sampling event. The Storm Event Coordinator had the option to

use best professional judgment to determine potential storm events for which the targeted antecedent dry period might be shortened in an effort to collect a full data set. The minimum antecedent dry period was established at 6 hours, based on the stormwater monitoring program for the City's Underground Injection Control system permit.[2] For the 2007 and 2008 sample events, the antecedent dry period was greater than 24 hours for all the grab sampling events. For the composite sampling events from Outfall Basin 53, the antecedent dry period met or exceeded 24 hours for all three events.

A3.3 Field Sampling Procedures

Stormwater sampling procedures were conducted in accordance with the applicable Standard Operating Procedures (SOPs) included in the Programmatic SAP. The SOPs were established by the City's Field Operations section to standardize the data collection methodologies for a wide range of monitoring activities and thereby maintain comparability and representativeness of the data produced.

Given the varying complexity and size of the City outfall conveyance systems, the timing of grab sample collection relative to the start of the storm event was targeted to ensure that the grab samples represented contributions from the entire basin (including upper reaches of the system) and represented stormwater rather than flow from any non-stormwater sources (i.e., "dry-weather flow"). In general, the grab sampling events were timed to occur during what would be considered the rising limb of a flow hydrograph at each sample location. However, because flow monitoring was not conducted at the grab sample locations, determination of the optimum sampling window in each basin was based on the best professional judgment of the Storm Event Coordinator. The Storm Event Coordinator established the order in which basins were sampled based on characteristics such as basin size, the percent of impervious surfaces in a basin, forecasted storm size, and first-flush periods. In all cases, grab sampling was targeted to occur within the first 12 hours of observable storm runoff at the sampling site.

Grab stormwater samples were collected from the designated monitoring locations during four storm events for each basin. Two of the four events at each grab sample location targeted "first-flush" conditions (broadly defined for the purposes of basin-level monitoring as being within the first 3 hours of observed runoff), where applicable[3]. For flow-weighted composite sampling in Basin 53, three storm events were sampled. A description of each storm event sampled and an evaluation of the overall 2007 and 2008 sample representativeness are provided in Section A4.

The general procedures followed in the stormwater sampling program are summarized below, with reference to the applicable SOPs (refer to the Programmatic SAP for full descriptions of the SOPs). No significant deviations from the SOPs occurred during the course of the 2007 – 2008 stormwater sampling activities. Minor deviations in implementation of the SOPs are discussed in Section A3.4.

---

[2] DEQ Water Pollution Control Facility / Underground Injection Control permit number 102830, issued to the City of Portland on June 1, 2005.

[3] In Basins 48 and 50, stormwater is routed to stormwater treatment facilities prior to discharge at the outfalls. The treatment facilities are located upgradient of the stormwater sample locations in these two basins resulting in a lag or retention time between the onset of stormwater flow at the treatment facility and at the outfall. Therefore, the timing of first flush discharge at the outfall sampling location does not correlate with rainfall.

A3.3.1 General Procedures (Grab and Composite Sampling)

Determination of Stormwater Flow

As specified in the stormwater SAPs, in the event there was any question whether water observed at the sampling location represented stormwater flow or standing water, (e.g., for basins in which the outfall pipe opening was submerged), field crews made visual observations at the time of sampling, such as noting the flow direction of a floatable object, to confirm the presence of stormwater flow. In all cases, it was determined that stormwater flow was sampled.

Field Parameter Measurements

Data collected in the field during each sampling event included measurement of pH, conductivity, and temperature for all primary stormwater samples (i.e., excluding field duplicate samples and field decontamination blanks). During collection of the flow-weighted composite samples, field personnel collected a separate grab sample solely for the purpose of measuring field parameters. The procedures followed during collection of these measurements are specified in the following SOPs: *SOP 1.01a , Field pH Measurement of Water Samples*; *SOP 1.03a, Field Conductivity Measurement of Water Samples*; and *SOP 1.05a, Field Temperature Measurement of Water Samples*. The general procedures for collecting these measurements include (1) equipment calibration, to ensure accurate readings; (2) collecting and recording the measurement on the field sample documentation; (3) conducting a post-measurement check of the equipment after returning from the field to confirm the accuracy of the field readings; and (4) properly maintaining the equipment.

Quality Control Procedures

Sampling quality control (QC) procedures included decontamination of all sampling equipment before sampling, collection of QC samples in the field, and completion of a chain-of-custody (COC) form for each set of samples. The basic elements of these procedures are summarized in the following paragraphs.

Sampling Equipment Decontamination

The equipment decontamination procedures followed during the stormwater sampling program are detailed in *SOP 7.01a, Decontamination of Sampling Equipment*. The appropriate decontamination sequence was selected for each set of samples based on the chemical analyses to be performed. The decontamination procedures include the use of specified wash and rinse solutions, followed by drying and packaging steps. The field crew decontaminated all sampling equipment in the staging area of the BES Water Pollution Control Laboratory (WPCL) before leaving for the sampling sites.

Collection of Field Decontamination Blanks and Duplicate Samples

The stormwater SAPs specified preparation of one field decontamination blank for each sampling round (defined as collection of one sample during each event) and collection of one field duplicate sample for approximately every ten stormwater samples. All field decontamination blanks and duplicate stormwater samples were collected according to the procedures specified in *SOP 7.01c, Field Quality Control Sample Collection*. The field decontamination blanks were composed of de-ionized water that had been transferred to the sample containers using decontaminated sampling equipment. Each field duplicate sample was collected alongside the primary sample, using the same sampling protocol. The QC samples were delivered to the laboratory with the associated stormwater samples.

Sample Chain-of-Custody

Handling of the samples was conducted as specified in *SOP 7.01d, Sample Chain-of-Custody*. This SOP specifies the detailed procedures to be followed regarding sample labeling, documentation, packaging and preservation, transport, delivery/relinquishment, and laboratory security. These procedures include completion of a COC form for each batch of samples. Information recorded on the COC form includes the project name and file number, type of sample (e.g., grab, composite), matrix, sample location, sample identification number, field parameter measurements (pH, temperature, conductivity), requested analytes, comments or special instructions for the receiving laboratory, and any additional comments concerning sample quality.

A3.3.2 Collection of Grab Samples

With the exception of Outfall Basin 22C, all grab samples were collected using the following procedure. The procedure, which is designed for use where direct access is not possible, such as when accessing storm sewer pipes through manholes, is described in detail in *SOP 2.02b, Grab Sample Collection with Stainless Steel Beaker*. At each sampling location, field crew attached a decontaminated beaker to a rope, slowly lowered the beaker to the water surface, then submerged and retrieved it, keeping the beaker off of the bottom of the storm sewer pipe or the bed of the surface water, if possible, to prevent adding deposited sediment to the sample. At Outfall Basin 22C, samples were collected directly from the 84-inch-diameter outfall. The collected stormwater was then transferred to pre-prepared, analyte-specific sample bottles/containers; the sample bottles were filled to one-quarter full, rinsed (except when pre-cleaned or pre-preserved sample bottles were being used), then filled fully and capped. The filled containers were placed in a cooler with ice for storage and transport to the laboratory.

A3.3.3 Collection of Flow-Weighted Composite Samples

The flow-weighted composite samples from Basin 53 were collected in accordance with *SOP 2.01b, Flow-Paced Composite Sampling of Stormwater*. The samples were collected during three storm events (January 26, February 6, and March 12, 2008). Automatic flow monitoring and sampling equipment were installed at the monitoring location prior to sample collection, and remained in place for the duration of the sampling project. New sample collection bottles were placed in the equipment before each targeted storm event and replaced as needed during the event as bottles filled. The equipment was programmed to collect a uniform aliquot of stormwater following the discharge of a calculated "trigger volume" of stormwater flow, such that sample aliquot collection frequency increased with flow rate. Each aliquot was distributed to one of eight glass sample bottles within the automated sampler; samplers were programmed to distribute three aliquots to each sample bottle.

Trigger volumes for aliquot collection were determined by evaluating the total basin area, impervious area and predicted storm size and duration. The objective of these calculations was to generate sufficient sample volume for all requested laboratory analyses and generate a composite stormwater sample representing both the rising and falling limbs of the storm hydrograph. Following completion of the sampling event, field crews reviewed flow, sampler, and rain gage data to determine the extent of the storm event represented by the set of sample bottles, including any triggers missed.

To achieve the event-averaged stormwater sample targeted in the sampling objectives for this basin, the final composite sample was created in the laboratory from representative portions of

the individual sample bottles.[4] Creation of the final composite sample for each event is detailed on the Composite Bottle Data Sheet (included with field documentation in Attachment A1). Each sample was created by decanting a specified volume from the individual sample bottles into a churn splitter and agitating the contents as subsamples were decanted into individual bottles for analysis. The SOP provides that some bottles, typically from the beginning or end of the sampling event, may be omitted from the final composite if they are not considered representative of the targeted conditions (e.g., if they may represent surface water baseflow prior to stormwater runoff). Any aliquots omitted from the final composite sample are noted on the Composite Bottle Data Sheets.

A3.4 Deviations from the SAPs

No major deviations occurred from the stormwater SAPs during the course of the 2007 – 2008 stormwater sampling. Storm events sampled generally met the target storm criteria (see Section A4), and the full set of samples at each proposed monitoring location was successfully obtained. In general, the Event Sampling Teams adhered to all applicable SOPs. However, the following minor deviations from the SAPs and/or SOPs occurred during the course of the sampling activities; these deviations do not affect the quality of the resulting data:

- No field parameters (pH, temperature, and conductivity) were measured for the composite stormwater sample collected from Basin 53 during the January 26, 2008, storm event. The storm occurred earlier than had been predicted, so field personnel did not arrive at the site in time to collect the field measurements.
- The stormwater SAPs specify the collection of one field decontamination blank for each round of stormwater sampling. However, only two field decontamination blanks were obtained for the five stormwater grab sampling rounds conducted in 2008, and only two were collected for the three flow-weighted composite sampling events in Outfall Basin 53. A field decontamination blank was not collected during the February 5, 2008 grab sampling event because the event was truncated by cessation of precipitation. Only three of six basins were sampled and a blank sample had not been obtained when sampling ceased. Field decontamination blanks were not collected during the February 29 and May 13, 2008 events because it was determined that existing and future planned (April 2008) blanks would provide adequate data given data objectives. For the 2008 grab samples, and also the composite samples from Outfall Basin 53, two full sets of field decontamination blank data were considered representative of potential bias caused by field quality procedures, and sufficient for the objectives of source screening.
- SOP 7.01c provides that the field decontamination blank is to be collected upon arrival at the first sampling location, prior to actual sampling. None of the field decontamination blanks were collected at the first sampling location for any sampling event, and stormwater sampling generally occurred before collection of the field blank. Deviation from this SOP was the result of collecting the field decontamination blanks at times that would not interfere with the objectives of the grab sampling program, such as collecting grab samples on the rising limb of a hydrograph to represent first-flush conditions. In all

[4] If sample bottles included three aliquots (triggers) per equipment record (sample and flow minimum), then equal portions were taken from all bottles. If one or more bottles had three aliquots but a reduced sample volume, then the subsampled volume from each bottle did not exceed this maximum volume. If one or more bottles had less than three aliquots, then subsampled volumes on these bottles were adjusted to be one-third or one-half of the volumes subsampled from bottles with three aliquots.

cases, the field decontamination blanks were collected from decontaminated sampling equipment before it was used for stormwater sampling.

A3.5 Sample Collection Documentation

Field data were recorded on project-specific paperwork during each sampling event, in accordance with the procedures described in the Programmatic SAP. Each Event Sampling Team completed the following forms during the course of each sampling event, as applicable: for all sampling, a Daily Field Report and COC form were completed; for collection of flow-weighted composite samples, Trigger Volume Work Sheets and Composite Bottle Data Sheets were also completed. Copies of the completed field documents are provided in Attachment A1.

A4 Storm Events Sampled

This section describes the storm events during which stormwater samples were collected from the City outfall basins in accordance with the stormwater SAPs. Grab samples were collected during a total of ten storm events during the 2007/2008 wet season (September to May). Four sampling events were completed at each of the 17 outfall grab-sampling locations. Flow-weighted composite stormwater samples were collected from Outfall Basin 53 during three separate storm events during the 2007/2008 wet season. The 13 storm events sampled are described below.

A4.1 Storm Event Data

As described in Section A3.2, storm events were targeted for sampling by the Storm Event Coordinator based on ERF forecasts of storms that would meet the target storm event criteria. After a sampling event was completed, the characteristics of the storm event sampled were evaluated using data from the City's Hydrological Data Retrieval and Alarm (HYDRA) system rain gage network (http://or.water.usgs.gov/non-usgs/bes/raingage_info/). Precipitation data from the following eight rain gages near the Portland Harbor Study Area were used to characterize the storm events for each sampling location, using the most representative gage available for each location (rain gage locations are shown on Figure A-1):

HYDRA (Rain gage) Station	Address	Outfall Basin
Station # 58: Bonny Slope School	10351 NW Thompson Rd.	22C, 22D
Station # 117: Albina	2920 N Larrabee Ave.	45, 46
Station # 121: Yeon [5]	3395 NW Yeon St.	M-1, M-2, M-3, S-1, S-2, S-5, S-6
Station # 160: WPCL	6543 N Burlington.	50, 52, 52A
Station # 167: Terminal 4	11040 N Lombard St.	53, 53A
Station # 193: Astor Elementary School	5601 N Yale St.	48
Station # 204: Swan Island	2600 N Going St.	M-1, M-2, M-3, S-1, S-2, S-5, S-6

In addition to using the gage records from the above stations to characterize precipitation at each sample location, rainfall for the study area was characterized for the entire 2007/2008 wet season by averaging the gage data for the Swan Island, Albina, WPCL, Terminal 4, and Yeon rain gages. These five gages were used to characterize the average precipitation because they are most representative of precipitation falling directly on impervious surfaces within the developed/industrial portion of the lower Willamette River. Precipitation data averaged from the five gages are shown on Figures A-20 through A-29. Figure A-20 depicts monthly rainfall for the September 2007 to May 2008 sampling period compared to the long-term average monthly rainfall between 1971 and 2000 for the same months. Figures A-21 through A-29 depict average

[5] This gage was utilized only for a single event, during a period in which the Swan Island gage was out of service.

hourly rainfall for individual months and the timing, with respect to precipitation events, of sampling events conducted during that month.

The specific stormwater sampling events for each outfall basin are listed on Table A-2. Graphs depicting precipitation, based on hourly individual rain gage data, and sample collection times for each basin where grab sampling was conducted are presented in Attachment A2. The graphs are presented to show the relationship between the timing, magnitude, and duration of precipitation events, and the grab sample collection times. The graphs do not depict a relationship between precipitation and flow volume as flow data were not collected at grab sampling locations. For each basin, Attachment A2 also includes a summary of the characteristics of each sampling event and designates those events that are judged as meeting "first-flush" criteria. Hydrographs associated with the three flow-weighted composite samples from Basin 53, showing precipitation and flow data and timing of individual sample aliquots collected, are presented in Attachment A3.

Determination of which events represent first-flush conditions for the entire basin was largely based on timing of sampling (generally, considered to be within the first 3 hours of observed stormwater flow at the sampling location) but also took into account factors such as basin size, characteristics, and saturation conditions prior to the sampled storm event. For example, in smaller outfall basins with a high percentage of impervious surfaces, the first-flush would be assumed to occur early within the targeted initial 3-hour timeframe, whereas in larger basins with a greater amount of pervious surfaces the window for first-flush conditions could extend beyond the initial 3 hours of observed flow, especially if the ground surfaces are relatively unsaturated prior to the storm event sampled (i.e., relatively long antecedent dry period). Sampling crews determined the order in which basins were sampled using best professional judgement to evaluate when precipitation in a basin was sufficient to (1) generate the initial flow at a sampling location in response to precipitation, and (2) represent flow from the entire basin.

A4.2 Descriptions of Storm Events

The descriptions of grab- and composite-sampling events provided below are based on sampling crew field notes, average hourly rainfall data shown in Figures A-21 through A-29, and precipitation representative of each outfall presented in Attachment A2. As described in Section A3.2, the target JSCS criteria for stormwater sampling were met[6]. For the sampling events described below, the beginning and ending of an event is defined as the period of reasonably continuous precipitation for a specific storm. In addition, the event is dated in accordance with the date on which the stormwater sample was collected, not necessarily the date on which rainfall began. In accordance with standard practice, all rain gage data are recorded in Pacific Standard Time (PST). Therefore, all sample times presented in this report are given in PST.

For each sampling event, samples were defined as meeting "first flush" conditions, based on an overall impression of the individual outfall rainage data presented in Attachment A2 and consideration of the following factors:

- Timing of sample collection during the storm event(i.e., targeted first portion or rising limb of a flow hydrograph at each location);

[6] Sampling events were scheduled based on forecasted storm size and durations (usually described as a range) that were predicted to meet the sampling criteria described in Section 3.2. Hourly precipitation data for an individual representative City rain gain was plotted to depict each storm event by outfall in Attachment B. Actual storm size and duration varied from forecasted amounts as described in the text.

- Field Observations; and
- Size of the basin (including consideration of impervious surfaces).

A4.2.1 Grab-Sampling Events

September 28, 2007

No significant rainfall was recorded for 24 days preceding this event. The minimum forecasted rainfall for September 28 was 0.37 inches. Rainfall began on September 27 between 11:00 p.m. and 12:00 midnight and continued intermittently until between 4:00 p.m. and 5:00 p.m. on September 28. Approximately 0.46 inches of rain fell within the first 5 hours of the storm. Samples were collected from eleven outfall basins between 1:20 a.m. and 3:54 a.m. on September 28. Except for the two samples collected downstream from stormwater treatment facilities in Basins 48 and 50, samples collected prior to 4:00 a.m. on September 28 are considered to reflect first-flush conditions based on the basin characteristics, field observations, timing of sample collection relative to the start of rainfall, and the unsaturated state of the drainage areas prior to this storm. Samples collected after 4:00 a.m. are not considered to reflect first-flush conditions.

September 30, 2007

No significant rainfall was recorded for 34 hours preceding this event. The minimum forecasted rainfall for this event was 0.68 inches. Rainfall began between 3:00 a.m. and 4:00 a.m and ceased between 9:00 p.m. and 10:00 p.m. on September 30 for a cumulative total of approximately 0.70 inches. Stormwater samples were collected from three basins between 8:43 a.m. and 9:57 a.m. These samples likely do not represent first-flush conditions in the sampled basins given the timing of sample collection relative to the start of rainfall.

October 16, 2007

Less than 0.1 inches of precipitation occurred in the five days preceding this event. The minimum forecasted rainfall for this event was 0.35 inches. Rainfall began between 8:00 a.m. and 9:00 a.m. and ceased between 3:00 p.m. and 4:00 p.m. on October 16 for a cumulative total of approximately 0.14 inches. Stormwater samples were collected from eleven outfall basins between 9:50 a.m. and 12:12 p.m. [7] on October 16. Except for the samples from Basins 48 and 50, these samples are considered to reflect first-flush conditions based on the basin characteristics, field observations, and the timing of sample collection.

November 16, 2007

Less than 0.1 inches of precipitation occurred in the three days preceding this event. The minimum forecasted rainfall for November 16 was 0.47 inches. Rainfall began between 5:00 p.m. and 6:00 p.m. on November 15 and ceased between 9:00 p.m. and 10:00 p.m. on November 16 for a cumulative total of approximately 0.78 inches. Stormwater samples were collected from eleven outfall basins between 5:24 a.m. and 9:00 a.m. on November 16. These samples likely do not represent first-flush conditions based on the timing of sample collection.

December 15, 2007

Less than 0.1 inches of precipitation occurred in the eight days preceding this event. The minimum forecasted rainfall for this event was 0.31 inches. Rainfall began between 10:00 p.m. and 11:00 p.m. on December 14 and ceased between 9:00 a.m. and 10:00 a.m. on December 15 for

[7] The sample collected at 12:12 p.m. was collected downstream of the treatment facility in Basin 50.

a cumulative total of approximately 0.12 inches. Stormwater samples were collected from eight outfall basins between 11:35 p.m. on December 14 and 1:31 a.m. on December 15. Except for the samples from Basins 48 and 50, the samples collected during this event are considered to reflect first-flush conditions based on the basin characteristics, field observations, the timing of sample collection, and the unsaturated state of the drainage areas.

February 5, 2008

Less than 0.1 inches of precipitation occurred within the two days preceding this event. The minimum forecasted rainfall for this event was 0.42 inches. Rainfall began between 5:00 a.m. and 6:00 a.m. on February 5 and ceased between 4:00 p.m. and 5:00 p.m. for a cumulative total of approximately 0.16 inches. Stormwater samples were collected from three basins between 2:01 p.m. and 2:45 p.m. on February 5. These samples likely do not represent first-flush conditions given the low storm intensity and the timing of sample collection.

February 29, 2008

Less than 0.1 inches of precipitation, in scattered precipitation events, occurred in the twenty days preceding this event. The minimum forecasted rainfall for this event was 0.25 inches. Rainfall began between 3:00 p.m. and 4:00 p.m. on February 29 and ceased between 7:00 p.m. and 8:00 p.m. for a cumulative total of approximately 0.10 inches. Stormwater samples were collected from six outfall basins between 5:05 p.m. and 6:20 p.m. on February 29. These samples are considered to reflect first-flush conditions based on the basin characteristics, field observations, the timing of sample collection, and the unsaturated state of the drainage areas prior to this storm event.

March 20, 2008

Less than 0.1 inches of precipitation occurred in the 53 hours preceding this event. The minimum forecasted rainfall for this event was 0.23 inches. Rainfall began between 11:00 a.m. and 12:00 noon on March 20 and ceased between 7:00 p.m. and 8:00 p.m. for a cumulative total of approximately 0.30 inches. Stormwater samples were collected from six outfall basins between 6:05 p.m. and 7:10 p.m. on March 20. The sample from Basin 22C likely represents first-flush conditions based on field observations, timing of the sampling, and basin size and surface characteristics. The other five samples collected during this event are not designated as first-flush samples, given the timing of sample collection.

April 4, 2008

Less than 0.1 inches of precipitation occurred in the four days preceding this event. The minimum forecasted rainfall for this event was 0.17 inches. However, the forecasted range was between 0.17 and greater than 0.23 inches. Rainfall began between 6:00 a.m. and 7:00 a.m. on April 4 and ceased between 10:00 a.m. and 11:00 a.m. for a cumulative total of approximately 0.17 inches. Samples were collected from six outfall basins between 7:30 a.m. and 9:01 a.m. on April 4. These samples are considered to reflect first-flush conditions based on the basin characteristics, field observations, the timing of sample collection, and the unsaturated state of the drainage areas prior to the storm.

May 13, 2008

Less than 0.1 inches of precipitation occurred in the 14 days preceding this event. The minimum forecasted rainfall for this event was 0.12 inches. However, the forecasted range was between 0.12 and greater than 0.19 inches. Although the minimum forecasted precipitation did not meet JSCS criteria, the Storm Event Coordinator initiated sampling because it appeared that the 2007 – 2008

wet season was near its end based on the significant decrease in precipitation beginning about May 1. Rainfall began between 9:00 a.m. and 10:00 a.m. on May 13 and ceased between 1:00 p.m. and 2:00 p.m. for a cumulative total of approximately 0.10 inches. Samples were collected from three outfall basins between 12:57 p.m. and 2:25 p.m. on May 13. The sample collected at 12:57 p.m. likely reflects first-flush conditions based on the basin characteristics, field observations, the timing of sample collection, and the unsaturated state of the drainage areas prior to the storm. The other two samples likely do not represent first-flush samples based on the timing of sample collection relative to the start of rainfall.

A4.2.2 Flow-Weighted Composite Sampling Events – Outfall Basin 53

January 26, 2008

No significant rainfall was recorded in the 11 days preceding this event. The mimimum forecasted rainfall for January 26 was 0.38 inches. Rainfall began between 9:00 a.m. and 10:00 a.m. on January 26 and ceased between 6:00 a.m. and 7:00 a.m. on January 27 for a cumulative total of approximately 0.74 inches. The Basin 53 composite sample was collected in 24 aliquots at flow-paced intervals between 11:10 a.m. and 7:01 p.m. on January 26. The event hydrograph in Attachment A3 presents the timing of the individual aliquots relative to flow and precipitation at the sample location.

February 6, 2008

Less than 0.1 inches of precipitation occurred during the 24 hours preceding this event, and no rainfall was recorded in the 11 hours preceding this event. The minimum forecasted rainfall for February 6 was 0.22 inches. Rainfall began between 1:00 p.m. and 2:00 p.m. on February 6 and ceased between 3:00 a.m. and 4:00 a.m. on February 7 for a cumulative total of approximately 0.87 inches. The composite sample was collected in 33 aliquots at flow-paced intervals between 4:21 p.m. on February 6 and 6:46 a.m. on February 7 (see event hydrograph in Attachment A3). Approximately 0.22 inches of rain fell between 10:00 p.m. and 11:00 p.m. on February 6; therefore, the sample bottles filled before the sampling crew reached the site at 11:40 p.m. to change bottles. As a result, 7 triggers were missed before completion of bottle replacement at 11:52 p.m.

March 12, 2008

Approximately 37 hours with no recorded rainfall preceded this event. The minmum forecasted rainfall for this event was 0.66 inches. Rainfall began between 7:00 p.m. and 8:00 p.m. on March 12 and ceased between 2:00 p.m. and 3:00 p.m. on March 13 for a cumulative total of approximately 0.65 inches. The composite sample was collected in 26 aliquots at flow-paced intervals between 9:01 p.m. on March 12 and 7:35 a.m. on March 13 (see event hydrograph in Attachment A3).

A4.3 Storm Event Representativeness

General conditions during the 2007 – 2008 stormwater sampling efforts were assessed to determine whether the City Outfall discharge samples collected are considered representative of expected Portland Area rainfall and of first-flush and/or overall stormwater runoff conditions within a particular outfall basin.

The 2007 – 2008 stormwater samples collected are considered representative of discharges from a typical wet season (between September and May) in the Portland area, based on a comparison of

the average monthly rainfall data for Portland Harbor[8] with regional long-term rainfall data[9]. The monthly precipitation pattern for 2007/2008 sampling period generally matches the historical precipitation pattern (Figure A-20). In addition, the total rainfall for Portland Harbor during the sampling period was 35.8 inches, slightly exceeding the total long-term wet season average of 33.8 inches. The 2007/2008 wet season was somewhat wetter than normal during October 2007, December 2007, January 2008, and March 2008.

The sampling met the objective of representing first-flush conditions in all basins, where applicable. At least two of the four grab samples obtained from 14 of the 17 basins sampled are considered representative of first-flush conditions; the exceptions are Basins 48, 50, and 52. Stormwater runoff in Basins 48 and 50 is routed to stormwater treatment facilities prior to discharge at the outfalls; therefore, first-flush criteria are not applicable in these basins. In Basin 52, only one sample is considered representive of first-flush conditions; however, review of the resulting stormwater data from this basin does not indicate a low bias in concentrations associated with the non-first-flush events.[10] In addition to capturing first-flush conditions for individual storm events, samples obtained on September 28, 2007 (from Basins M-1, M-2, M-3, S-1, S-2, S-5, and S-6) are considered to be representative of seasonal first-flush conditions (i.e., the first-flush of the wet season) because, except for 0.05 inches of rain on September 4, 2007, the samples were collected during the first storm event of the 2007/2008 wet season. Samples that are not designated as first-flush are considered representative of general stormwater runoff conditions within each basin.

Review of the flow, sampler, and rain gage data associated with the flow-weighted composite samples (Basin 53) indicates all sampling events successfully captured flow representing all portions of the storm hydrograph, with no significant gaps in aliquot collection during the course of any storm event. During the February 6, 2008 sampling event, seven aliquots were missed during bottle changing. However, based on the approximately 15-hour precipitation event and the 33 aliquots collected, the missed aliquots are not considered significant.

Based on the above discussion, the City stormwater samples are considered representative of typical wet-season conditions in the Portland area. Individual basin samples captured both first-flush and general basin runoff conditions in all basins. Samples designated as first-flush were collected within appropriate time frames, based on the size of the basin, land uses in the basin (specifically the percent of impervious surface in a basin), and the amount of precipitation.

[8] Average monthly rainfall for the Portland Harbor area between September 2007 and May 2008 were calculated using City of Portland Swan Island, Albina, WPCL, Terminal 4, and Yeon rain gages.

[9] Regional average long-term rainfall calculated using 1971-2000 data for the Portland International Airport (NWS, 2009).

[10] Contaminant concentrations for Basin 52 stormwater samples are relatively similar for all events with one exception – a high PCB hit in one of the non-first-flush samples.

A5 Laboratory Analyses and Data Management

A5.1 Chemical Analyses

Table A-3 lists the chemical analyses and analytical methods for the 2007 and 2008 stormwater samples. All samples were submitted for laboratory analysis of polychlorinated biphenyl (PCB) congeners, total metals (arsenic, cadmium, chromium, copper, lead, mercury, nickel, silver, and zinc), semivolatile organic compounds (SVOCs), including polycyclic aromatic hydrocarbons (PAHs) and phthalates, and total suspended solids (TSS). The stormwater composite samples collected from Outfall Basin 53 also were analyzed for total organic carbon (TOC) and PCB Aroclors. Each sample was analyzed by the WPCL and the following contracted analytical laboratories: Columbia Analytical Services, of Kelso, Washington; Test America, of Beaverton, Oregon; and Pace Analytical Services, of Minneapolis, Minnesota. These laboratories all maintain rigorous quality assurance / quality control (QA/QC) practices consistent with those required in the QAPP to ensure that the resulting data would meet project data quality objectives.

A5.2 Data Management

Field and laboratory data obtained during the 2007 and 2008 stormwater sampling events were managed in accordance with the QAPP. BES maintains records of the field data in both hard copy and electronic (.pdf file) formats. Analytical laboratory data from the WPCL and contract laboratories (with the exception of the PCB congener data from Pace Analytical Services), along with associated field parameter measurements as recorded on the COC forms, were manually entered into the BES Laboratory Information Management System (LIMS), which functions as the BES database for data storage, sample tracking, and reporting. A hard copy of the entered data was printed and checked for data entry errors. After all sample results had undergone technical and data entry review, the WPCL Laboratory QA Specialist electronically marked each sample in LIMS to indicate that all analyses for the sample were complete and had been checked for errors. Data were not released for use until the internal data review process was complete. The analytical data are summarized in tables provided in Attachment A4.

A5.3 Data Review and Usability

In accordance with the QAPP, the City reviewed all field and analytical data associated with the stormwater samples to verify that the resulting data were of acceptable quality for the intended use. Based on review of the data and supporting documentation, as described in this section, the quality of the stormwater field and analytical data are adequate for the purposes of meeting the stormwater SAP objectives.

A5.3.1 Field Data

No significant issues associated with sample collection procedures were encountered, and field data were collected in general accordance with the SOPs and other guidance documentation (with the minor exceptions noted in Section A3.4). Based on equipment calibration and post-measurement review, all field data were determined to be valid and of acceptable quality. Field

data documentation for sampling also met the objectives identified in the SAP to the extent practicable and was determined to be acceptable.

A5.3.2 Laboratory Data

A WPCL chemist checked analytical data sheets and results of laboratory quality control samples to ensure that the QC statistics were within control limits and that appropriate corrective actions were taken if control limits were exceeded. The WPCL chemist also flagged or provided comments on results that did not strictly meet quality control criteria. The WPCL applied an "EST", denoting an estimated value, to qualify results where appropriate. The contracting laboratories used customized flags to communicate detailed QC issues.

For each sampling event, the final laboratory reports were reviewed and QC issues identified by the WPCL or the contracted laboratories are summarized in a Data Review Memorandum (DRM) for the sampling event. The DRMs are included with the associated laboratory reports in Attachment A5.

Table A-4 summarizes those laboratory QC exceptions for the stormwater data that resulted in flagging of the results and affect data interpretation. Refer to the DRMs in Attachment A5 for additional discussion of the QC issues.

A6 Sample Results

The field and chemical analytical results for the 2007 – 2008 stormwater samples are summarized by outfall basin in the data tables presented as Attachment A4 to this report. The full laboratory reports and accompanying DRMs are presented in Attachment A5. The data tables presented in Attachment A4 include notations where appropriate to indicate potential data quality concerns or use limitations, as discussed in the DRMs.

The data tables include values for total PCB congeners, total PCB Aroclors, and total PAHs. For a given sample, these totals were calculated by summing the concentrations of individual compounds that were detected within the analyte group. Where chemical analyses resulted in undetected values for all compounds within the analyte group, then the total value is considered undetected ("ND"). If any of the individual values used in the sum are estimated ("J" qualified), then the total value is considered estimated.

In summary, the 2007 – 2008 City Outfall Basin stormwater sampling data were collected in accordance with the programmatic and stormwater SAPs during storm events that have been confirmed to be representative of typical precipitation events for the area. The quality of the resulting data (as qualified by the reporting laboratories and as described in the DRMs) has been determined to be acceptable for the intended purposes. Based on these factors, the 2007 – 2008 City Outfall Basin stormwater sampling data meet the objectives of the stormwater SAPs.

Table A-1
Outfall Basin Characteristics and Descriptions of Stormwater Sampling Locations
2007 - 2008 City of Portland Outfall Stormwater Samples

Outfall Basin	Size (acres)	Impermeable Surface Area	Land Use(s) [1]	Sampling Location	
				Manhole/Outfall ID	Description
22C	1,107	2%	OS, HI, T, R	AAJ635	Samples collected directly from the 84" diameter outfall.
22D	240	4%	OS, R, T	AAE396	Located downstream of all known connections to the outfall. Samples collected at the manhole from the 48" line.
45	10	91%	HI, T, LI	ABC319	Located downstream of all known connections to the basin. Samples collected from the 27" line discharging from this manhole.
46	80	38%	OS, HI, R, G, T	AMR809	Located downstream of all known connections to the basin. Samples collected from the 60” line at the manhole.
47	9	69%	G, HI	AAT620	Located downstream of all known connections to the basin. Samples collected from the 27" line discharging from this manhole.
48	8	70%	R, HI	AAJ670	Located downstream of the stormwater treatment facility and all known connections to the outfall. Samples collected from the 30" line at the manhole.
50	39	58%	G, R, C, T, OS	AAE536	Located downstream of all stormwater treatment facilities and all known connections to the outfall. Samples collected from the 30" line discharging from this manhole.
52	23	76%	G, R, OS, T	AAE519	Located downstream of all known connections to the basin. Samples collected from the 27" line discharging from this manhole.
52A	25	70%	LI, G, HI, R, C	AAE397	Located downstream of all known connections to the basin. Samples collected from the 36" line at the manhole.
53	21	53%	R, C, G	AAC614	Located downstream of all known connections to the basin. Samples collected from 22” line discharging from this manhole.
53A	82	58%	HI	AAA170	Located downstream of all known connections to the basin. Samples collected at the manhole, or from 48" line discharging to it.

Table A-1
Outfall Basin Characteristics and Descriptions of Stormwater Sampling Locations
2007 - 2008 City of Portland Outfall Stormwater Samples

Outfall Basin	Size (acres)	Impermeable Surface Area	Land Use(s) [1]	Sampling Location	
				Manhole/Outfall ID	Description
M-1	162	78%	LI, R	AAM107	Located at last manhole before outfall. Samples collected from 60" line discharging from manhole. Excludes discharges from shoreline (and one upland) properties connected to the M-1 conveyance system.
M-2	127	78%	LI, R	AAM169	Located downstream of all known connections to the basin. Samples collected from 60" line discharging from this manhole.
M-3	111	78%	LI, G, R	AAQ004	Due to low elevation, excludes discharges from UPS and some catch basins on N. Basin near the outfall. Samples collected from the 60" line discharging from this manhole.
S-1	25	93%	HI, LI	AAM131	Located downstream of all known connections to the basin. Samples collected from 36" line discharging from this manhole.
S-2	27	66%	HI, LI	AAP957	Located downstream of all known connections to the basin. Samples collected from 36" line discharging from this manhole.
S-5	39	69%	HI, LI, G	AAP982	Located downstream of all known connections to the basin. Samples collected from 36" line discharging from this manhole.
S-6	22	83%	HI, LI	AAM118	Located downstream of all known connections to the basin. Samples collected from 36” line discharging from this manhole.

Notes:
1. Multiple land uses are listed in order of predominance. Land use definitions (based on zoning classifications):
   HI = Heavy Industrial
   LI = Light Industrial
   T = Major Transportation
   OS = Parks and Open Space
   C = Commercial
   G = General Employment
   R = Residential

Notes:

1. Sample types:
   - N = Normal
   - DUP = Field duplicate
   - FDB = Field decontamination blank. Note that each field decontamination blank is listed only at the collection site but represents the field blank for the entire sampling event.
2. Analyses:
   - TSS = Total suspended solids. Analysis performed by City of Portland, Bureau of Environmental Services' Water Pollution Control Laboratory (WPCL).
   - TOC = Total organic carbon. Analysis performed by WPCL.
   - Total Metals analysis includes arsenic, cadmium, chromium, copper, lead, nickel, silver, and zinc. Analysis performed by WPCL.
   - Total Mercury analsis performed by WPCL.
   - PAHs = Polycyclic aromatic hydrocarbons. PAH and phthalate analysis by EPA Method 8270M-SIM performed by Test America (TA).
   - SVOCs = Semivolatile organic compounds. Analysis of SVOCs (including PAHs and phthalates) by EPA Method 8270C performed by Columbia Analytical Services (CAS).
   - PCB = Polychlorinated biphenyls. PCB congener analysis performed by Pace Analytical Services. PCB Aroclor analysis performed by WPCL.
3. NA = Not Applicable

Table A-4
Laboratory and Field Data Quality Control Exceptions
2007 – 2008 City of Portland Outfall Stormwater Samples

Sample Date	QC Topic	Issue	Affected Sample(s)	Data Quality Flag[1]	Interpretation
Grab Samples					
9/28/07	Laboratory method blank	Di-n-butyl phthalate was detected in the blank analyzed by EPA Method 8270C and in all samples; the concentration in the blank is significant relative to the sample results.	All samples from this event.	Sample results are flagged "B".	Results for the OF 52, 52A, M-1, M-2, M-3, S-1 and field decontamination blank (FDB) samples are considered biased high (less than 10 times the method blank result). The results for OF 48, 50, S-2, S-5 and S-6 are considered a result of laboratory contamination (less than the method blank result).
		PCB congener 11 was detected at a low concentration in the method blank and in two samples.	FO071158 (OF S-6) FO071159 (OF 52A)	Sample results are flagged "B".	Both sample results for PCB congener 11 are considered the result of laboratory contamination (less than the method blank result). For OF 52A, the detection is not significant relative to the total PCB concentration. For OF S-6, the total PCB concentration is considered biased slightly high.
9/28/07	FDB	Zinc was detected in the FDB, and in two samples at concentrations less than 10 times the FDB concentration. Concentrations in the remaining samples are greater than 10 times the FDB detection.	FO071152 (OF 48) FO071153 (OF 48 duplicate)	Sample results for OF 48 are footnoted in the data table to indicate potential bias in results.	The results in the OF 48 samples are considered biased high (concentrations are less than 10 times the FDB concentration).

Table A-4 (continued…)

Sample Date	QC Topic	Issue	Affected Sample(s)	Data Quality Flag[1]	Interpretation
9/30/07	FDB	PCB congeners 129/138/163 and 153/168 were detected in the FDB at low concentrations.	FO071162 (OF M-1) FO071163 (OF 52) FO071164 (OF 52 duplicate)	As applicable (see Interpretation column), sample results are footnoted in the data tables to indicate potential bias in results.	The PCB congener 129/138/163 concentrations in the affected samples are greater than 5 times the FDB concentration and, therefore are not footnoted in the data tables. The congener 153/168 concentrations in the OF 52 samples are greater than 5 times the FDB concentration and, therefore are not footnoted in the data table. The PCB congener 153/168 concentration in OF M-1 is less than 5 times the FDB concentration and is considered biased high. As a result, for OF M-1, the total PCB concentration is considered biased slightly high.
		Di-n-butyl phthalate was detected in the FDB analyzed by EPA Method 8270C.	FO071161 (OF M-3) FO071162 (OF M-1) FO071163 (OF 52) FO071164 (OF 52 duplicate)	Sample results for OF 52, OF M-1, and OF M-3 are footnoted in the data table to indicate potential bias in results.	Results for the OF 52 samples are considered biased high (less than 10 times the FDB concentration). OF M-1 and M-3 sample concentrations are similar to the FDB detection and, therefore appear to be related to field decontamination procedures.
		Zinc was detected in the FDB.	FO071161 (OF M-3) FO071162 (OF M-1) FO071163 (OF 52) FO071164 (OF 52 duplicate)	None	Concentrations in all samples are greater than 10 times the FDB detection. Therefore, samples are not footnoted.
10/16/07	FDB	PCB congeners 129/138/163, 147/149, 153/168, 170, 174, 180/193, and 187 were detected in the FDB at low concentrations.	FO071253 (OF M-2) FO071254 (OF S-2) FO071255 (OF S-1) FO071256 (OF S-6) FO071258 (OF M-1) FO071259 (OF M-3) FO071261 (OF 52) FO071262 (OF 52A) FO071265 (OF 52 duplicate)	As applicable (see Interpretation column), sample results are footnoted in the data tables to indicate potential bias in results.	For all affected samples, the concentration of PCB congeners 129/138/163, 147/149, 153/168, 170, 174, 180/193, and 187 is less than 5 times the FDB concentration. The total PCB concentrations for these samples are considered biased slightly high.
		Zinc was detected in the FDB.	All samples from this event.	None	Concentrations in all samples are greater than 10 times the FDB detection. Therefore, samples are not footnoted.

Table A-4 (continued…)

Sample Date	QC Topic	Issue	Affected Sample(s)	Data Quality Flag[1]	Interpretation
11/16/07	FDB	Zinc was detected in the FDB.	All samples from this event.	None	Concentrations in all samples are greater than 10 times the FDB detection. Therefore, samples are not footnoted.
2/5/08	Laboratory method blank	Di-n-butyl phthalate was detected in the blank analyzed by EPA Method 8270C and in two samples; the concentration for the blank is significant relative to the sample results.	FO080221 (OF 45) FO080222 (OF 46)	Sample results are flagged "B".	Results for the OF 45 and OF 46 samples are considered biased high (less than 10 times the method blank concentration).
		Eleven PCB congeners / congener coelutions (comprising 20 individual congeners) were detected in the blank and in one or more of the three associated stormwater samples sample; the concentrations in the blank are significant relative to the sample results.	FO080221 (OF 45) FO080222 (OF 46) FO080220 (OF 47)	Sample results are flagged "B".	For the OF 46 sample, all but one (congener 183/185) of the blank detections were detected; the detections are considered a result of laboratory contamination (detected concentrations less than or very similar to the blank concentrations). For the OF 47 sample, six of the eleven blank detections were also detected; all are less than or less than 5 times the blank concentrations. For the OF 46 and OF 47 samples, the total PCB concentrations are considered biased significantly high. For the OF 45 sample, results for four of the congeners (11, 153/168, 170, and 183/185) were less than 5 times the blank concentrations; the total PCB concentration for this sample is considered biased slightly high.
2/29/08	FDB	Bis(2-ethylhexyl)phthalate was detected by EPA Method 8270M-SIM in the FDB and at similar (in some cases lower) concentrations in five samples.	FO080313 (OF 47) FO080214 (OF 53A) FO080316 (OF 45) FO080317 (OF 46) FO080319 (OF 22D duplicate)	Sample results are footnoted in the data tables to indicate potential bias in results.	For the OF 22D, OF 45, OF 53A samples, the detections are considered a result of field decontamination procedures (less than the concentration detected in the FDB). For the OF 46 and OF47 samples, results are considered biased high (less than 10 times the concentration detected in the FDB).

Table A-4 (continued…)

Sample Date	QC Topic	Issue	Affected Sample(s)	Data Quality Flag[1]	Interpretation
4/4/08	FDB	Zinc was detected in the FDB and in all associated stormwater samples.	All samples from this event	Sample results are footnoted in the OF 22C data table to indicate potential bias in results.	The zinc result for the OF 22C sample is considered biased high (less than 10 times the FDB detection). Zinc concentrations for the remaining samples are greater than 10 times the FDB concentration and are not flagged.
		PCB congener 11 was detected at a low estimated concentration in the FDB and also was detected at low concentrations in four of the associated field samples.	FO080511 (OF 45) FO080512 (OF 46) FO080513 (OF 46 duplicate) FO080509 (OF 47)	Sample results are footnoted in the data tables to indicate potential bias in results.	Sample results for PCB congener 11 are considered biased high (less than 5 times the FDB estimated concentration). The total PCB concentrations for these samples are considered biased slightly high.
Outfall Basin 53 Composite Samples					
1/26/08	Laboratory method blank	PCB congener 209 was detected at a low concentration in the method blank and in the associated stormwater sample; the concentration for the blank is significant relative to the sample result.	FO080172	Sample result is flagged "B".	The PCB congener 209 concentration in the sample is less than 5 times the blank concentration and is considered biased high. As a result, the total PCB concentration for the sample is considered biased slightly high.
	FDB	Bis(2-ethylhexyl)phthalate was detected by EPA Method 8270M-SIM in the FDB and in the associated stormwater sample.	FO080172	Sample result is footnoted in the data table to indicate potential bias in results.	The result for this sample is considered biased high (concentration is less than 10 times the FDB concentration).
2/6/08 – 2/7/08	Laboratory method blanks	Di-n-butyl phthalate was detected in the blank by EPA Method 8270C and in the sample; the concentration in the blank is significant relative to the sample result.	FO080264	Sample result is flagged "B".	Sample result is considered biased high (less than 10 times the method blank result).
		45 PCB congeners / congener coelutions (comprising 61 individual congeners) were detected in the blank analyzed by EPA Method 1668A and in the sample; the concentrations in the blank are significant relative to the sample results.	FO080264	Sample results are flagged "B".	The detections in the method blank were greater than 5 times the concentrations in the sample, and in many cases were greater than the sample concentrations. The total PCB congener concentration for this sample is considered biased significantly high.

Table A-4 (continued…)

Sample Date	QC Topic	Issue	Affected Sample(s)	Data Quality Flag[1]	Interpretation
3/12/08 – 3/13/08	Laboratory method blank	Bis(2-ethylhexyl)phthalate was detected in the blank for EPA Method 8270M-SIM and in both samples; the concentration for the blank is significant relative to the sample results.	FO080409 FO080414 (duplicate)	Sample results are flagged "B".	Result for the primary stormwater sample is considered a result of laboratory contamination (less than the blank concentration). Result for the duplicate sample is considered biased high (less than 10 times the blank concentration).

Notes:
FDB = Field decontamination blank

1. Except for issues regarding field decontamination blanks, data flags were assigned by the analytical laboratory reporting the data in accordance with laboratory-specific criteria.

DAILY FIELD REPORT

Project PORTLAND HARBOR STORMWATER Project No. 1020.005
Location _____ Date 9-28-07
Subject _____ By MJS, LAP

* TIME IN PST

0110: Arrive on-site @ M2-SW1 (5949 N. Basin Ave). Manhole is in left lane, not as indicated on map. Large truck traffic here. Moderate rainfall.

0120: Sample M2-SW1. Routine sampling.

0135: Arrive on-site @ M3-SW1 (N. Basin Ave & Emerson St).

0138: Sample M3-SW1. Routine.

0149: Arrive on-site @ M1-SW1 (6208 N. Ensign).

0155: Sample M1-SW1. Due To off-set channel, rails in manhole & laterals pouring down manhole it is difficult to obtain a representative sample @ This site. Debris from sidewall & rails cannot always be excluded from sample.

0220: Arrive on-site @ S1-SW1 (5555 N. Channel Ave).

Project No. 1020.005
Date 9-28-07
By MJS, LAP

0226: Sample S1_SW1. Routine sample.

0250: ~~Oracle~~ Arrive on-site @ 48_SW1 (5828 N. Van Houten Pl.)

0305: Sample 48_SW1 + DUP. Routine sample.

0317: Collected field decon blank.

0339: Arrive on-site @ 52_SW1 (Cathedral Park).

0345: Sample 52_SW1. Routine.

0354: Return to WPCL to relinquish samples.

DAILY FIELD REPORT

Project Portland Harbor Stormwater Samp | Project No. 1020.005
Location Various | Date 9/28/07
Subject Event 1 | By KCB

0103: Arrive @ WPCL. Start calibrating meters and preparing vans for sampling.

0115: MJS/JSM/LAP all here; depart WPCL to Swan Island TC sites.

0210: Arrive @ M2_SW1 to assist w TC for sample collection at this site. MJS/LAP collect sample.

0245: Collect sample from S2_SW1. No traffic on lagoon at this hour. Stainless bailer made contact w/ invert several times during sample collection, though excessive solids weren't noted in sample. Sample fairly clear; no sheen. pH meter acting weird; may have faulty probe connection.

0258: Collect sample from S5_SW1. Very little traffic on Channel; maybe 5-7 trucks during site visit. Banged beaker against invert a few times during sample collection. pH meter worked fine at this site.

0330: Collected sample from S6_SW1 at Cascade General. Flow turbulent at this site. Sample has low turbidity, no sheen. pH meter connection to pH probe definitely faulty. We have to hold connection while taking measurement to get accurate reading. Done w Swan Island.

0414: Collected sample from S2A-SW1. Had to wait for UP train to clear RR tracks to gain access. Flow here fairly laminar for such high volume. Sample quite turbid as compared to other samples. Could not get pH meter to work. MJS met us on site at 0435 to take pH measurement w/ his meter.

Subject Event 1
By RLB

0454: Collect sample from [SO_SW1]. Flow here turbulent. Took several attempts to fill bailer. Some organic and inorganic solids in sample. Organics in flow. Inorganics likely from pipe invert. Sample does not appear to be turbid

0515: Arrive @ WPCL.

Location M3_SW1
Subject Event 2.1

Project No. 1020.005
Date 9/30/07
By MJS, JXB

0800 - Arrive @ WPCL to light but consistent rain. Has been raining for several hours. Are planning to sample ~~only~~ only the 3 low elevation site that are at risk of having river back-up issues (i.e. M3_SW1, M1_SW1, and 52_SW1). We are allowing more time to elapse before repeating the other sites ~~for~~ per request of DEQ)

0835 on-site @ M3_SW1 to light but steady rain - heavy flow in manhole. No problems sampling.

0855 - Arrived on site @ M1-SW1 to light but steady rain - heavy flow in manhole & in overhanging laterals from CBs. Due to configuration of MH sampling teams could not exclude material along MH walls from entering sample

0935 - Arrived on site @ 52_SW1 to moderate rain & good flow in manhole Collected sample alongside Duplicate sample - FO 071164 = Duplicate

0957 - collected Field decon blank at 52_SW1 after collecting sample & duplicate FO 071165 FOB

DAILY FIELD REPORT

Project PORTLAND HARBOR STORMWATER Project No. 1020.05

Location _____ Date 10/16/07

Subject EVENT 2.5 By DJH

BACKGROUND - DRY FOR PAST 5+ DAYS EXCEPT <0.04" YESTERDAY. TODAY IS EXPECTED TO HAVE 5 OF RAIN

PRECIP BEGAN @ 0900 PST.

WILL USE TWO CREWS OF TWO/THREES WCR/RCB + ASA/ECH/DJH (T.C.)

0930 PST - ARRIVE AT M2 HAS BEEN RAINING STEADY + MODERATELY TO HEAVY FOR PAST HOUR

0950 PST - SAMPLE M2. FLOWING @ 3-4 fps AND @ 18" DEEP. VERY SOLID STORMWATER FLOW + GOOD SAMPLE.

1000 PST - ARRIVE AT S2 RAIN CONTINUES STEADY. FLOW IS V FAST = >5fps. THREE LATERALS IN M.H. ALL FLOWING

1020 PST SAMPLE S2

1030 PST ARRIVE AT S1. RAIN HAS DECREASED TO LIGHT BUT LOTS OF SHEET FLOW ACROSS ROAD DEEP + FAST FLOW, @ 4-5 fps

Project No. 1020.005
Date 10/16/07
By DJH

(S1 CONTINUED) NO LATERALS ENTERING M.H.

1040 P.S.T. SAMPLE S1 SAMPLE MODERATELY TURBID.

1050 PST ARRIVE AT S6. SPRINKLES ONLY NOW BUT GOOD STORM FLOW IN PIPE = W3 fps

1055 PST SAMPLE S6 = (CASCADE CULVERT) SAMPLE IS MODERATELY TURBID

1105 PST ARRIVE AT S5 LIGHT DRIZZLE STARTED AGAIN. STORM FLOW IN PIPE BUT SHALLOW (W 2-3") AND W 1-2 fps

1110 PST SAMPLE S5 A LITTLE TRICKY TO SWING TRAILER INTO DOWNSTREAM PIPE BUT ABLE TO DO IT. RAIN INCREASES AS WE LEAVE

1125 PST OFF SWAN ISLAND

DAILY FIELD REPORT

Project Portland Harbor Stormwater
Location Various
Subject

Project No. 1020.005
Date 10/16/07
By RCB

Attempting to sample following long dry period. Got permission to sample from Linda Schaffler prior to storm event. Rain forecasted to be 0.3" - 0.5" between mid-morning and midnight. Jon w/ERF said rain will be intermittent and unpredictable. Priority given to low elevation sites.

All times PST.

0945: Arrive at M1_SW1 to steady moderate rain. Sampled M1_SW1 at 0950. Very fast flow in pipe. CBs flowing into manhole during sample collection 1002 - offsite.

1004: Arrive at M3_SW1 to steady moderate rain. Good flow in pipe. Sample collected at 1006. Offsite @ 1015. We are (Jwer, RCB) going off of Swan Island to sample sites north of St. near WPCL.

1027 Arrive @ 48_SW1 to very light rain. Lower flow in this pipe as compared to S.I. sites. Sample collected @ 1031. Conductivity higher here than at other observed sites (180us/cm). There may be more GW I/I at this location. Offsite @ 1044.

1100 Arrive @ Cathedral Park location, 52-SW1 to very light rain, which stopped for ~ 20' minutes during sample collection. Samples [4 DUP] collected at 1105. Good flow in pipe, despite decreasing rain. Offsite @ 1127.

Project No. 1020.005
Date 10/16/07
By RCB

1132 Arrive at 52A-SW1. Not raining upon arrival, but began to pick up after 5 min or so. Field Decon Blank (FDB) collected using ultrapure DI at 1137. Water in manhole flowing slowly, but ~4" in depth - Collected sample @ 1140. Offsite @ 1157. DJH called via radio - His crew (ECH, DJH, [illegible]) finished sampling remainder of Swan Island sites; now going to lunch.

1208 Arrive at 50-SW1 to no rain. Low flow in pipe coming from WPCL as stormwater pond outlet as well as line draining parking lot and swales - Sample collected @ 1212. Offsite @ 1222, heading to WPCL to relinquish samples.

1319 Relinquished samples.

1400 Checked rain gages @ WPCL and Swan Island. 0.12" of rainfall on S.I. during sampling event, 0.14" at WPCL

Project Portland Harbor Stormwater Samp
Project No. 1020.005
Location
Date 11/16/07
Subject
By MJS, DJH

0521 On-site @ M3_SW1 Currently there is only light drizzle but there is still flowing water in gutters from earlier rain and pipe has heavy flow. Collected sample @ 0524. VELOCITY IS ~+3 fps, DEPTH ~ 6"

0540 - on site @ M2_SW1. Heavier drizzle/light rain w/ good flow in the pipe ~ 4-5fps w/ ~ 4" of depth w/ water actively entering adjacent catch basins. Sample is notably turbid.

0600 - on site @ M1_SW1. Heavy drizzle is falling w/ some flow entering catch basins, however b/c this site has significant base flow will wait for ~~better~~ heavier rain.

0605 - collected FDB @ M1_SW1 although did not sample site at this time

0630 - on site @ S2_SW1. Heavy drizzle has been consistently falling w/ good flow in curbs actively entering adjacent catch basins. All laterals in manhole are actively discharging w/ good amount of flow in pipe w/ ~ 4" of depth and 3-4 fps. Sample is slightly turbid.

0700 - SAMPLE S6-SW1 / RAINING STEADY (MODERATE) FOR LAST ~20 MINUTES STANDING WATER OVER MUCH OF PARKING LOT. LATERALS GUSHING / FLOWS IN PIPE 8-10 fps + ~ 3". EXCELLENT STORMWATER SAMPLE!

DAILY FIELD REPORT

Project PORTLAND HARBOR Study
Project No. 1020.005
Location
Date 11/16/07
Subject
By DJH, MSS

0720 - on site @ MI. Steady rain has been falling for ~ ½ hour and there is heavy flow in curbs and entering catch basins. All laterals are discharging heavily. Flow in the pipe is very fast ~ 8 fps MH and 4-3" deep. Samples are very turbid.
Due to configuration of site, it is not possible to retrieve bailer w/o contacting pipe sides and/or manhole walls.

FO 071398 FO 071401

0745 - SAMPLE [S5-SW1] AND [DUP1] MODERATE AND STEADY RAIN CONTINUES! GUTTERS FULL AND LATERALS ALL FLOWING FAST. FLOW = 4 FPS AND 6" DEEP. GREAT SAMPLE + DUP!

0800 - SAMPLE [S1-SW1] STILL RAINING V. STEADY. HEAVY FLOW ALONG CURBS FLOW = 4-6 FPS, 5" DEEP. SOLID FLOW IN BOTH PIPES. NO LATERALS VISIBLE HIGHER IN THIS M.H.

0900 - SAMPLE [S8-SW1] - LIGHT DRIZZLE LAST 15 MINUTES BUT FLOW REPRESENTS STORM FLOW. FLOW 5 FPS, 1.2" DEEP. RAIN BEGINS AGAIN AS WE FINISH SAMPLING

0915 - OFF TO WPCL EVENT 3 (AND 3.5.23 FOR 4) DONE!

DAILY FIELD REPORT

Project PDX Harbor
Project No. 1020.005
Locations OF 52, 52A & 50
Date 11/16/07
Subject Event 3
By RCB

All times PST.

0535 Depart WPCL after talking to DJH about weather. ERF says that today will be rainy at times w/ some breaks, perhaps even sun breaks. Approx 0.2" of rain last night and early this morning.

0539 Arrive @ OF 52 to very light rain & Decent flow in pipe, but not high volume. Flow in pipe is approx 1" deep / 2 fps. Sample collected successfully @ 0545. Sample is clear w/ no distinct odor.

0606. Arrive @ OF 52A. Light rain slightly increasing. Approx 2" of flow in pipe @ ~ 2 fps. River is not backing up line. Sample collected @ 0609. Sample is slightly turbid and brownish in color. No odor.

0630 Arrive @ OF 50 to light, steady rain. Flow entering mh from all sources but flow in invert downstream of mh is only ~ 1" deep. Halfway through sample collection, RCB dropped bailer string and bailer into mh, then spent the next 10 minutes fishing it out. Resumed sampling. Sample collected @ 0635. Sample is slightly turbid and brownish in color. No odor.

0641 En route to CRWTP Storm.

DAILY FIELD REPORT

Project Portland Harbor SW Samp
Location
Subject Six OF goals - Event 1

Project No. 1020.005
Date 2/5/08
By MJS, AJA

Some light rain this morning between 0500 and 0800, ranging from 0.04" to 0.11". Prior to that only ~0.03" in the previous 24 hours.

1145 some light rain has started. ERF reports that heavier rain should be starting soon, with periods of alternating heavy + light rain from now until 2100, with totals in that period ranging from 0.35 to 0.50".

1200 on site at 47-SW1 - there is a small amount of base flow, but it appears that much of the basin is not yet flowing

1235 47-SW1 rain increasing, then decreasing (1245)
~1330 - off site - spoke w/ Dan from ERF and he reports that we should expect more of the same.
1340 - Rain intensifying - will return to site
1350 - back on site to moderately heavy rain and good flow in manhole with all 4 totes flowing. Waiting for Linda and Karen to ~~[illegible]~~ sample
1401 - begin sampling - rain is continuing
1407 Concluded sampling
photo 1 downmanhole, photo 2 - basin photo of cattle wash off site proceeding to 45-SW1 - rain is continuing

1417 - on site @ 45-SW1 - rain has let up but still good flow, 1420 - started sampling

Attachments photos 3-5. Rain has let up to light rain

DAILY FIELD REPORT

Project Portland Harbor Stmwtr. Project No. 1020.005

Location NW, N Portland Date 2/29/08

Subject By JTM, WCR

1650 Arrive @ 47_SW1 after ample rain. Curbs are free flowing wl depths ~1.0". Water pooling ground CB adjacent to node - took photo. Captured additional photos of flow in node and curb flow. Cut fresh rope for stainless, decon'd beaker.

1704 Collected standard bottle set without deviation from protocol.

1708 Left Site

1732 Arrive @ 53A_SW1. Rain has subsided to very light showers. Topside of node flow estimation is ample. Captured photos of pooling stormwater along driveway, two depicting flow in pipe.

1745 Collected grabs without deviation from protocol.

1748 Left Site

1800 Arrive @ 72C_SW2. Rain and showers have ceased yet streets are still wet. Ample EOP flow, so collected grabs and captured photos of outfall flow.

1830 Left site.

DAILY FIELD REPORT

Project Portland Harbor
Location 45_SW1
Subject 2/29/08 Event

Project No. 1020.005
Date 2/29/08
By MJS, KHF

1530 - on set of very light rain
1600 - very light rain continuing - some slight runoff
1620 - rainfall intensifying and run-off increasing - begin mobilizing to first sites.
1707 - on site @ 45_SW1 to moderate steady rain and good flow in the manhole w/ active flow into catch basins and laterals are discharging took 4 photos (1-4)
1712 collected sample which is very turbid.
1721 - off site

1734 - on site @ 46_SW1 to light rain but still very heavy flow and heavy runoff currently on lot.
1738 - collected sample - flow is moderately turbid took 3 photos
1748 - off site

1814 - on site at 22D_SW1. Rain has ceased for ~15 minutes. There is flow in manhole but has low turbidity, may be baseflow -
1820 collected sample and duplicate - sample is slightly turbid

1834 Collected field blank at 22D_SW1.
1841 off site - rain has stopped

Subject grab sampling
By MJS

Some rain earlier in the day (~0.04") from 1200-1300 then some lighter rain 1400-1600. Went out to sample but did not appear to be good flow from entire basin so decided to wait for additional showers
1715 heavy showers moving Through the area which last for ~15 minutes followed by light rain
1750 rainfall intensifying slightly
1805 on site @ 22C_SW2 to continuous moderate rainfall Collected sample from end of pipe, flow was very heavy and slightly turbid.
1814 - off site - rain is intensifying
1826 - on site @ 22D_SW1 to very heavy rain that has been falling for ~15 minutes. Collected sample from manhole which is flowing heavily. Sample is extremely turbid.
1835 - off site to continued heavy rain

1908 - on site @ 46_SW1, heavy rain has ended for ~10 min but there is still light rain and heavy runoff throughout the facility and in the manhole. Sample is very turbid.

Page 1 of 1

Project Portland Harbor Stormwtr Samp
Location NPDX, ~~AIWP~~ JJM Swan Island
Subject
Project No. 2030.005
Date 3/20/2008
By JJM, LAP

All times in PST

1757 Arrive @ 53A-SW1. Currently heavy showers which are expected to turn to rain. About 30 min. ago, intense rain for about 20 min. Flow is clearly elevated in pipe. Captured photo. Showers quickly turned to steady rain
1810 Collected standard bottle set without deviation from protocol
1820 Captured photo of pooling stormwater and ample curb runoff along Rivergate. Then departed site. Rain is very heavy upon departure.
1840 Arrive @ 47-SW1 to very heavy rain. Street flooding and ample curb runoff. Captured photos of basin and pipe flow.
1848 Collected standard bottle set without deviation from protocol. *
1853 Departed site, still very heavy rain.
* 47-SW1 sample has visable surface sheen.; is slightly turbid/brown.
1859 Arrive @ 45-SW1. Rain has turned to showers, yet ample street pooling and runoff. Captured photos of site conditions and flow in pipe. Sample is milky, very turbid with visable surface sheen.
1910 Collected standard bottle set without deviation from protocol.
1916 Left site, still showering.

Page 1 of 1

Project PDX Harbor Stormwtr | Project No. 1020.005

Location N. PDX | Date 4/4/09

Subject EVENT 3.2/4.1 SAMPLING (All times recorded in PST) | By VJTM, DJH

0722 Arrive @ 53A-SW1 after moderate rainfall within previous 45min. Rain currently has subsided to light showers, however flow in pipe is elevated due to previous rain today. Topside estimate of flow depth ~ 4.0"

0730 Collected standard bottle set. Sample was very turbid, brownish. Conductivity was high possibly due to iron precipitate in sample that was likely scoured from line due to elevated storm flow. Rain increased intensity since arrival. Captured photos of pipe flow, site.

0745 Left site.

0802 Arrive @ 22C-SW2. Rain has been steady and heavy at times since departing previous site. Captured photos of site depicting rain intensity, storm flow on streets.

0810 Collected standard bottle set. Flow from outfall is elevated, sample is slightly turbid. Flow in pipe was ~8.0" (topside estimation). Captured photos of EOP flow.

0824 Left site.

0839 Arrive @ 47-SW1. Rain has increased intensity and has been continuous since departing previous site. Streets are flooded, captured photos of basin depicting storm flow/runoff. Flow in pipe is fast & deep. ~6.0"

0845 Collected standard bottle set. Captured photo of flow in pipe. Sample is very turbid with slight surface sheen. Some organics and larger sediment. Landscaping activity opposite side of cul-de-sac from node

0850 Departed site, FOR WPCL TO RELINQUISH SAMPLES

DAILY FIELD REPORT

Project Portland Harbor Stormwater Samp
Location 22D-SW1,
Subject 4/4/08 sampling event

Project No. 1020.005
Date 4/4/08
By MJS, JKB

0615 PST - light rain beginning. Forecast calls for rain to continue for most of the morning then turning to showers.

0705 - Mobilized to sites - rain is light but continuing. runoff is currently visible in lab parking lot
0742 - On-site @ 22D_SW1 to consistent light rain and good runoff visible in parking area. collected sample @ 0750. Sample was moderately turbid and appears to ~~be~~ contain storm flow. Took photos of flow in manhole and runoff at adjacent catch basin. Off site @ 0802

0824 - on site @ 45_SW1 to heavy rain and heavy runoff w/ heavy flow in the manhole. Collected sample and duplicate @ 0832 as rain intensified. Very heavy flow during sampling, sample is very turbid

0850 - on site @ 46_SW1 to rain subsiding, but still heavy runoff.
0855 - collected Field Decon Blank using a new decon bailer and ultrapure water.
0901 - collected sample for 46_SW1 - very heavy flow, sample is extremely turbid

Project Portland Harbor SW sampling
Project No. 1020.005
Location 53A-SW1
Date 5/13/08
Subject 5/13/08 Sampling
By MDS, LAP

12:53 PST: on site at 53A-SW1 to light but steady rain. It has been raining lightly for several hours and there is visible runoff throughout the drainage basin, although quite light volume. Flow in manhole is slightly elevated but is very turbid. Collected sample

1355: on site @ 22D-SW1. Light rain continues, although it has decreased in intensity. Flow is slightly turbid. Collected sample.

1419: on site @ 22C-SW2. Rain has ended. Still puddles in gutters adjacent to site but are no longer actively flowing. Flow has only very slight turbidity. Collected sample.

Project Portland Harbor Stormwater — Project No. 1020-005
Location 53_SW1 (N. Decatur + Rena) — Date 1/25/08
Subject Event 1 setup / Blank collection — By MJS, AJA

- @ 1118 onsite for storm event setup, decon, and collection of blank sample.
- Removed tubing from hand and pumped solutions from surface via an extension of peristaltic tubing connected to distribution arm. Performed decons/ the following solutions soapy, tap, nitric, acetone, DI, ultrapure DI. Collected blank sample by lowering Carboy and deconed 1-8L glass bottle into manhole and filling glass bottle w/ ultrapure DI and inserting intake tubing and pumping into analysis bottles.

Reinstalled sample intake tubing on board + installed downstream of manhole after calibrating ~~the~~ Sample volume.

Programmed flowmeter and sampler for a 0.5" storm anticipated this weekend.
See ~~addit~~ Green sheet for storm/comp info

@ 1/28/08 1150 onsite - retrieved sampler program is complete and all bottles are full. Uploaded flow data. It appears that the majority of the storm was captured.

012809S1.GHU - File name
Relinquished samples to lab where they will be composited in a large glass jar for sub sampling into analyte bottles

Project Portland Harbor Stormwater
Location OF53 (N. Decatur + Reno)
Subject Successful Storm Sampling

Project No. 1020.005
Date 1/28/08
By AJA

Background: Set Sampler up for Hail Mary Last chance weekend automated sampling of forecast storm (forcast originally for Sun 1/27/08). Storm came on Saturday. We did not have an opportunity to check the Sampler over the weekend.

On Monday 1/28/08, MJS & AJA found the sampler program had completed. All 8 bottles had been filled, the flow mon file showed nearly perfect storm capture. The storm was very defined between the hours of 1100 & 1930 (PST)

Field Parameters were not taken as the site was not visited during the storm.

DAILY FIELD REPORT

Page 1 of 2

Project Portland Harbor Stormwater | Project No. 1020.005
Location OF53 - N Decatur + Reno | Date 2/6/08
Subject aborted event clean-up, Event 2 set-up | By MJS, GCH

2/6/08 1305 - on-site to take down yesterday's attempt. There were 4 full bottles upon arrival and it appears that sampler worked correctly. There is barely sufficient sample volume to run samples, but we missed the initial portion of the storm and the portion that we did catch was much smaller than anticipated, so we will most likely not analyze samples. Will hang onto samples, though, until we confer w/ LAS.

was forecasted to begin at noon but came in at 0500

Trigger times:
bottle 1: 1115, 1347, 1354 (2/5/08)
2: 1359, 1405, 1414 (2/5/08)
3: 1449 (2/5/08), 0024 (2/6/08), 0031
4: 0039, 0045, 0130 (2/6/08)

} discarded samples 2/6/08

- Pulled bottles and installed 4 new bottles in their place. Deconned tubing w/ soapy water, tap water, DI water, Ultrapure DI water (did not perform nitric + acetone solution rinse this time due to inability to make CSE to capture spent solutions b/c entry vehicle is being repaired)
- Changed sampler pacing on flowmeter to 3246 cf which represents a storm of 1".
- Iced sampler base, removed lids from bottles and placed in Ziplock bag.
- Currently there is no flow in the pipe and the meter is reading those conditions accordingly

1332 - started sampler program + left site

Project Portland Harbor Stormwater — Project No: 1020.005
Location OF 53 - N. Decatur + Reno — Date 2/6/08
Subject Event 2 - grabs — By MJS, ECH

2/6/08 1600 on-site to steady heavy rain. Rain has just started and it appears that this is the leading edge of the storm. Currently the level in the pipe is 2.5", velocity = 5 fps and flow = 1.0 cfs. There are no samples yet, but there is heavy flow in the pipe.

1604 collected grab samples (field parameters) temperature = 6.8°C, cond = 56, pH = 6.7

1605 flow is picking up as rainfall continues. When leaving site level = 4.2", velocity = 7.0 fps, flow 2.5 cfs

2/6/08 2340 - on-site for bottle change. Rain had become very intense over the past hour and was concerned that bottles are becoming filled. Uploaded meter remately from the lab and it appears that all bottles have been filled recently. Still very heavy flow. - Pulled sampler which was displaying that the program is complete. Capped and pulled the eight full bottles and refilled w/ clean empty bottles labelled 9-16. Recorded sample times and restated the sampler program at 2352.

2/7/08 0858 - on site to retrieve samples for end of storm event. Sampler reports that there are 3 full bottles and program is running. Pulled the 3 full bottles, recorded the sample times and shut down sampler.

DAILY FIELD REPORT

Project Portland Harbor Storm Composite
Location N. Reno + Decatur, OF53
Subject Background + Set up notes for 3/12/08

Project No. 1020.005
Date 3/12/08
By AJA / DJH

Background Sampler recently set to capture previous weekend and Monday (3/10/08) storms. Attempts were unsuccessful due to insufficient rainfall. Sampler tubing was deconed prior to these attempts.

1140 ~~AM~~ (PST)

~~1040~~ (PST) DJH/AJA on site to re-set sampler for 3rd attempt at storm event predicted for late weds 3/12 and early Thurs, ~~3/13~~ 3/13/08. Forcasters predicting upwards of 0.5" or more, but in a showery pattern Thurs, trigger volume still set for only 0.35" (1136 cf) with the idea that we will perform a bottle swap if much greater rainfall occurs.

Renewed used bottles (from Monday 3/10 failed attempt) and re-iced sampler. Checked programming and refreshed batteries. Program running.

3/13/08 0620 PST - DJH ARRIVES FOR FIRST CHECK DURING A PERIOD OF HEAVY SHOWERS

PROGRAM COMPLETE AND ALL BOTTLES FILLED UPON ARRIVAL, BUT LAST SAMPLE WAS ~~0620~~ 0610 PST AJA

Project PORTLAND HARBOR STORM
Location N. RUNOFF DECATUR / OF 53
Subject FIRST SWAP

Project No. 1020.003
Date 3/13/08
By DJH

SO JUST ENDED 10 MINUTES AGO.

REPLACED ALL BOTTLES AND RESTARTED PROGRAM @ 0635 PST, WITH NEXT SAMPLE TAKEN AT @ 0642 PST

0640 PST - TOOK GRAB

SUMMARY - MAY HAVE MISSED 1-2 SAMPLES FROM @ 0620-0630 BUT EVERYTHING IS WORKING WELL.

~~0800~~ 0700 PST - OFFSITE TO OF 19

RAIN BASICALLY CEASED FROM @ 0720-0900 PST AND FLOW DROPPED TO 0 CFS.

0900 PST - DJH/PHA ONSITE TO SWAP BOTTLES BECAUSE WE WILL PROBABLY END STORM WITH TRIGGER #26 SINCE FLOW HAS DROPPED TO ZERO AND WE CAUGHT ANY PROLONGED SHOWERY EVENT FROM @ 3/12/08 2100 PST TO 3/13/08 0620 PST

REMOVED BOTTLE 9 W/ TWO TRIGGERS AND RESTARTED SAMPLER W/ BOTTLE 10

PST = Pacific Standard Time
Rain gage data obtained from USGS, Oregon Water Science Center (http://or.water.usgs.gov/non-usgs/bes/)
(1) Cumulative rainfall during this time less than 0.10 inches.
(2) Minimum forecasted rainfall data provided by Extended Range Forecasting, Inc.
(3) First flush sampling is typically conducted within the first 3 hours of stormwater discharge, but varies depending on the basin size and land use characteristics. Best professional judgment was utilized to characterize first flush criteria for each storm.
(4) N/A = First flush conditions are not applicable at this sampling location because stormwater is detained in a treatment pond upstream of the sample location at the Outfall.

Attachment A3
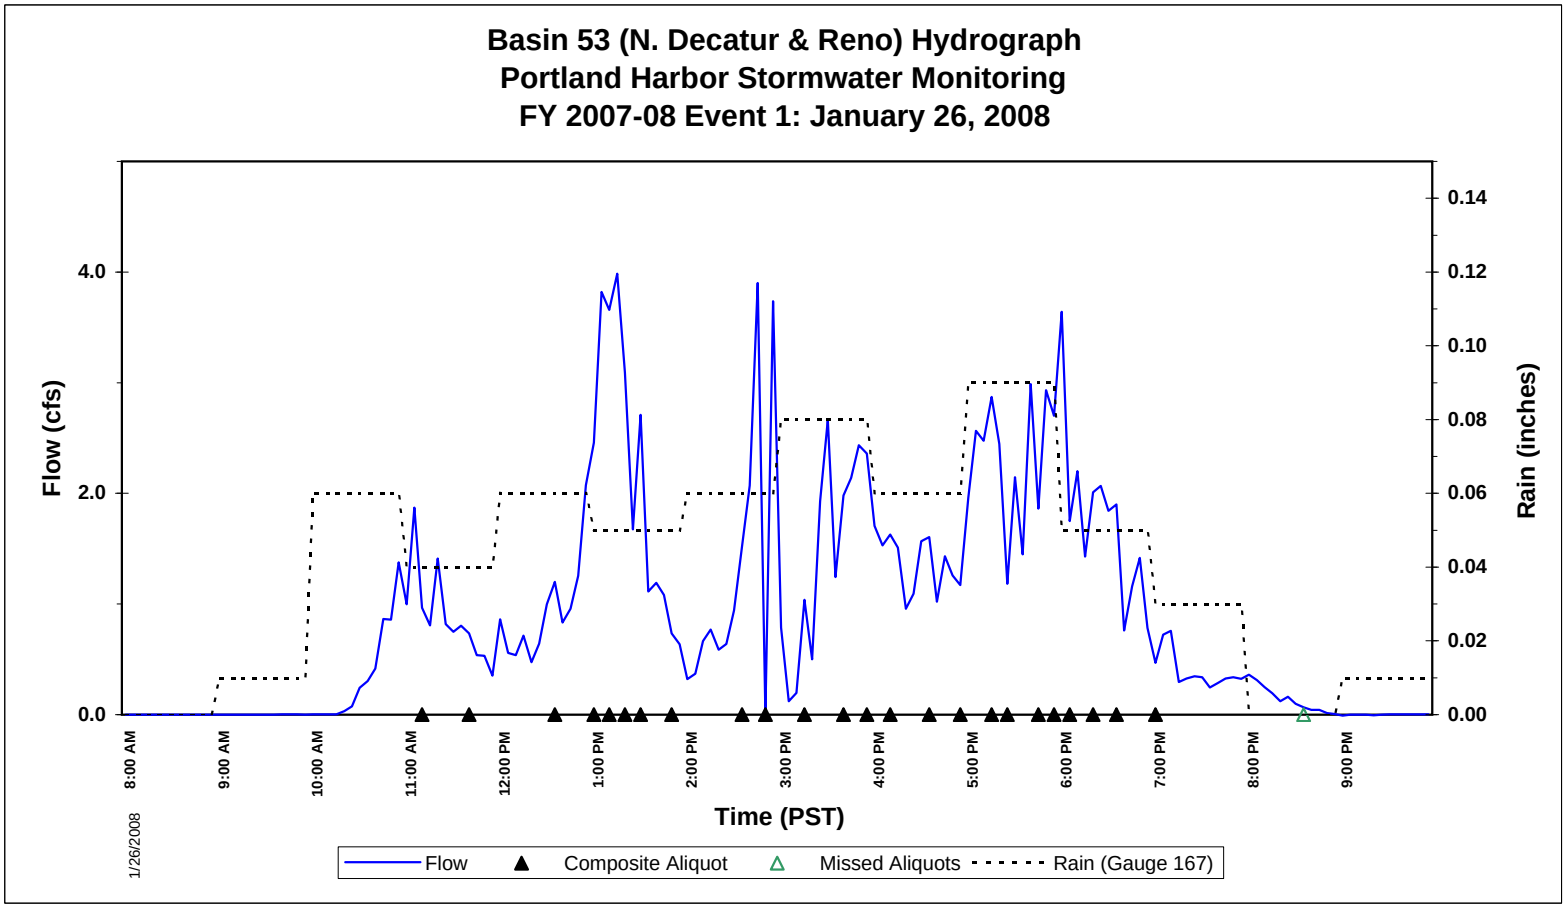
Hydrographs for Flow-Weighted Composite Samples



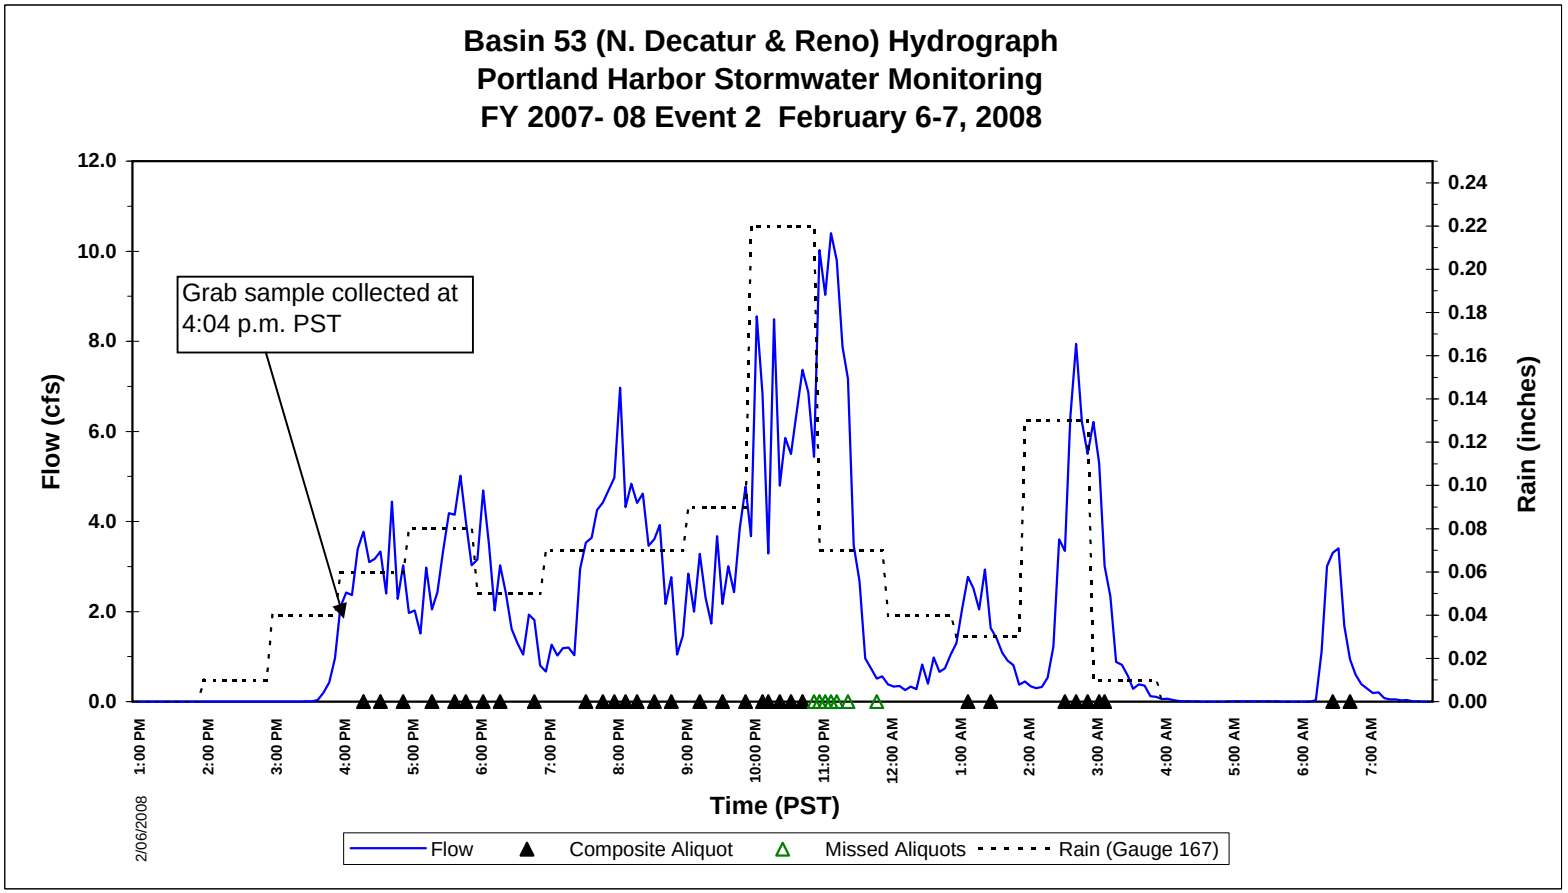
Summary of Storm Event Statistics, Outfall 53 Flow-Weighted Composite Sampling Event 1

Sample Date	Duration (hours)[1]	Antecedent Dry Period (hours)[2]	Minimum Forecasted Rainfall Total (inches)[3]
1/26/2008	10:45	>24	0.38

(1) Duration of flow available for sampling.

(2) Cumulative rainfall during this time less than 0.10 inches.

(3) Minimum forecasted rainfall data for the provided by Extended Range Forecasting, Inc.



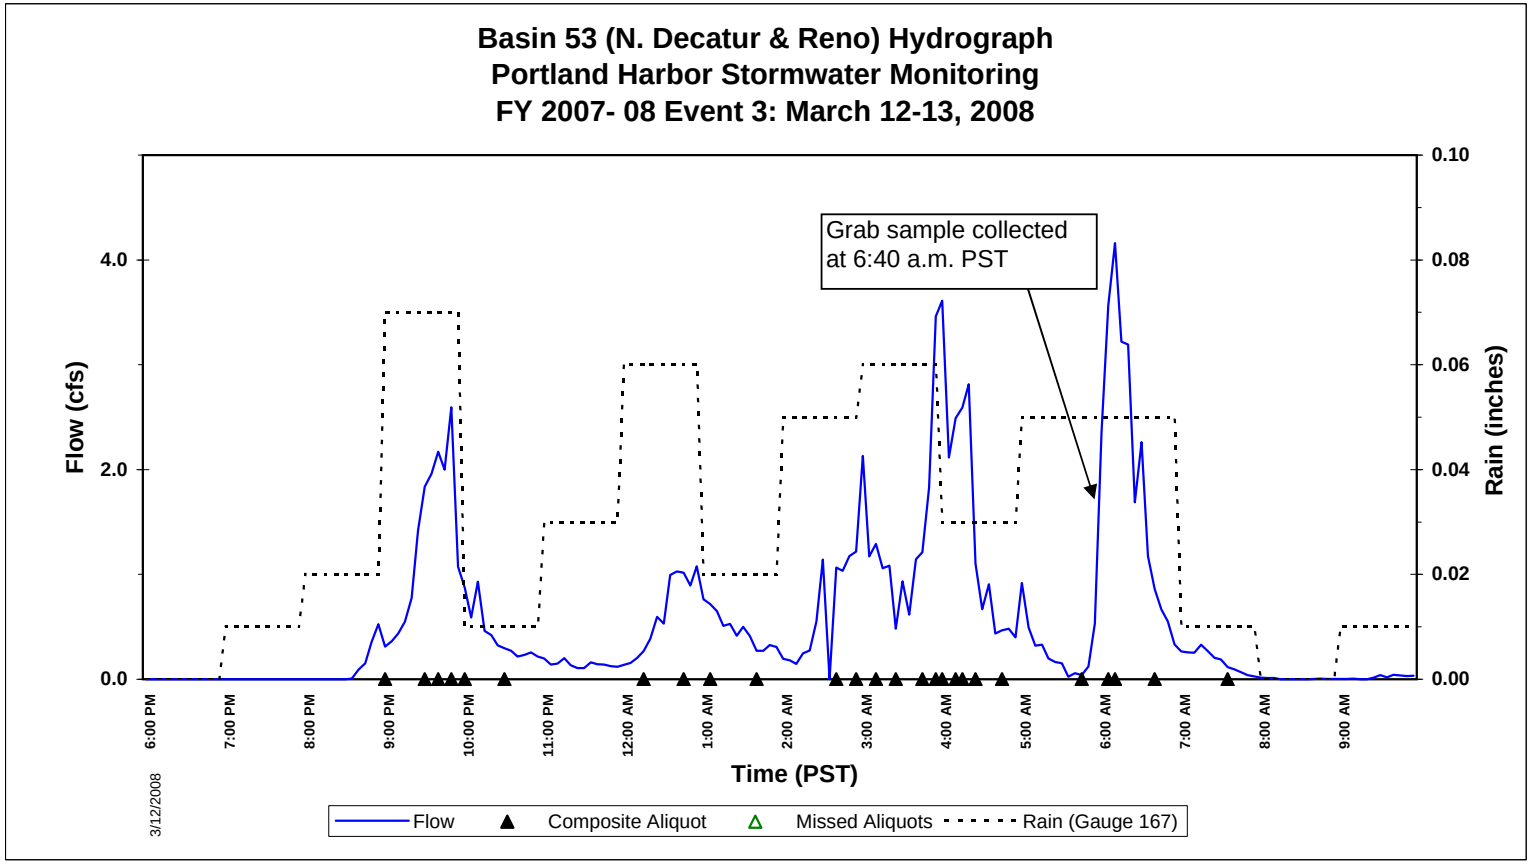
Summary of Storm Event Statistics, Outfall 53 Flow-Weighted Composite Sampling Event 2

Sample Date	Duration (hours)[1]	Antecedent Dry Period (hours)[2]	Minimum Forecasted Rainfall Total (inches)[3]
2/06/2008 - 2/07/2008	15:45	24	0.22 on 2/6; 0.92 on 2/7

(1) Duration of flow available for sampling.

(2) Cumulative rainfall during this time less than 0.10 inches.

(3) Minimum forecasted rainfall data for the provided by Extended Range Forecasting, Inc.



Summary of Storm Event Statistics, Outfall 53 Flow-Weighted Composite Sampling Event 3

Sample Date	Duration (hours)(1)	Antecedent Dry Period (hours)(2)	Minimum Forecasted Rainfall Total (inches)(3)
3/12/2008 - 3/13/2008	12:30	>24	0.03 on 3/12/2008; 0.63 on 3/13/2008

(1) Duration of flow available for sampling.

(2) Cumulative rainfall during this time less than 0.10 inches.

(3) Minimum forecasted rainfall data for the provided by Extended Range Forecasting, Inc.

Notes:

FDB= Field decontamination blank

NA = Not analyzed.

ND = Not detected.

U = The analyte was not detected above the reported sample quantification limit.

J = Estimated value. Analyte detected at a concentration less than the reporting limit and greater than or equal to the method detection limit.

-- = No JSCS screening level available.

ug/L = Micrograms per liter.

mg/L = Milligrams per liter.

(1) JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).

(2) The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.

(3) The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

(4) The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier II SCV Technology Benchmark values are listed for the constituent.

(5) Mercury analysis by WPCL SOP M-10.01.

(6) Because this analyte was detected in the associated FDB, and the concentration in the sample is less than 10 times the FDB concentration, the result reported for the sample is considered biased high.

= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.

bold = Concentration exceeds DEQ's SLV.

Notes:

MoCB = Monochlorobiphenyl
DiCB = Dichlorobiphenyl
TriCB = Trichlorobiphenyl
TeCB = Tetrachlorobiphenyl
PeCB = Pentachlorobiphenyl
HeCB = Hexachlorobiphenyl
HpCB = Heptachlorobiphenyl
OcCB = Octachlorobiphenyl

IUPAC Number[1]	Chemical Name	Units	Event 1 FO080315 2/29/2008	Event 1 FDB FO080320 2/29/2008	Event 2 FO080435 3/20/2008	Event 3 FO080508 4/4/2008	Event 3 FDB FO080514 4/4/2008	Event 4 FO080654 5/13/2008	JSCS Stormwater SLVs[2] Human Health Fish Consumption[3]	Human Health Ingestion[4]	Ecological[5]

NoCB = Nonachlorobiphenyl

FDB= Field decontamination blank

EMPC = Estimated maximum possible concentration.

ND = Not detected.

U = The analyte was not detected above the reported sample quantification limit.

-- = No JSCS screening level available.

ug/L = Micrograms per liter.

[1]IUPAC - International Union of Pure and Applied Chemistry.

[2] JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).

[3] The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.

[4] The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

[5] The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier II SCV Technology Benchmark values are listed for the constituent.

= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.

bold = Concentration exceeds DEQ's SLV.

Notes:

J = Estimated value. Analyte detected at a concentration less than the reporting limit and greater than or equal to the method detection limit.

FDB = Field decontamination blank

NA = Not analyzed.

ND = Not detected.

DUP = Duplicate

U = The analyte was not detected above the reported sample quantification limit.

-- = No JSCS screening level available.

ug/L = Micrograms per liter.

mg/L = Milligrams per liter.

(1) JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).

(2) The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.

(3) The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

(4) The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier II SCV Technology Benchmark values are listed for the constituent.

(5) Mercury analysis by WPCL SOP M-10.01.

(6) Because this analyte was detected in the associated FDB, and the concentration in the sample is less than or equal to the FDB concentration, the result reported for the sample appears to be related to field decontamination procedures.

= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.

bold = Concentration exceeds DEQ's SLV.

Notes:

MoCB = Monochlorobiphenyl
DiCB = Dichlorobiphenyl
TriCB = Trichlorobiphenyl
TeCB = Tetrachlorobiphenyl
PeCB = Pentachlorobiphenyl
HeCB = Hexachlorobiphenyl
HpCB = Heptachlorobiphenyl
OcCB = Octachlorobiphenyl
NoCB = Nonachlorobiphenyl
FDB= Field decontamination blank
EMPC = Estimated maximum possible concentration.
ND = Not detected.
NA = Not analyzed
DUP = Duplicate
U = The analyte was not detected above the reported sample quantification limit.
-- = No JSCS screening level available.
ug/L = Micrograms per liter.

IUPAC Number[1]	Chemical Name	Units	Event 1 FO080318 2/29/2008	Event 1 DUP FO080319 2/29/2008	Event 1 FDB FO080320 2/29/2008	Event 2 FO080436 3/20/2008	Event 3 FO080510 4/4/2008	Event 3 FDB FO080514 4/4/2008	Event 4 FO080653 5/13/2008	JSCS Stormwater SLVs[2] Human Health Fish Consumption[3]	Human Health Ingestion[4]	Ecological[5]

[1] IUPAC = International Union of Pure and Applied Chemistry.

[2] JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).

[3] The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.

[4] The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

[5] The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier II SCV Technology Benchmark values are listed for the constituent.

= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.

bold = Concentration exceeds DEQ's SLV.

Notes:

B = The analyte was detected in the laboratory method blank at a concentration that is significant relative to the sample result.

FDB= Field decontamination blank

NA = Not analyzed.

ND = Not detected.

U = The analyte was not detected above the reported sample quantification limit.

-- = No JSCS screening level available.

ug/L = Micrograms per liter.

mg/L = Milligrams per liter.

[1] JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).

[2] The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.

[3] The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

[4] The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier II SCV Technology Benchmark values are listed for the constituent.

[5] Mercury analysis by WPCL SOP M-10.01.

[6] Because this analyte was detected in the associated FDB, and the concentration in the sample is less than or equal to the FDB concentration, the result reported for the sample appears to be related to field decontamination procedures.

= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.

bold = Concentration exceeds DEQ's SLV.

Notes:

MoCB = Monochlorobiphenyl

DiCB = Dichlorobiphenyl

TriCB = Trichlorobiphenyl

TeCB = Tetrachlorobiphenyl

PeCB = Pentachlorobiphenyl

HeCB = Hexachlorobiphenyl

HpCB = Heptachlorobiphenyl

OcCB = Octachlorobiphenyl

NoCB = Nonachlorobiphenyl

FDB= Field decontamination blank

B = The analyte was detected in the laboratory method blank at a concentration that is significant relative to the sample result.

EMPC = Estimated maximum possible concentration.

ND = Not detected.

NA = Not analyzed

2008 Stormwater Grab Samples
Sample Location: ABC319

IUPAC Number[1]	Chemical Name	Units	Event 1 FO080221 2/5/2008	Event 2 FO080316 2/29/2008	Event 2 FDB FO080320 2/29/2008	Event 3 FO080440 3/20/2008	Event 4 FO080511 4/4/2008	Event 4 FDB FO080514 4/4/2008	JSCS Stormwater SLVs[2] Human Health Fish Consumption[3]	Human Health Ingestion[4]	Ecological[5]

U = The analyte was not detected above the reported sample quantification limit.

-- = No JSCS screening level available.

ug/L = Micrograms per liter.

[1]IUPAC = International Union of Pure and Applied Chemistry.

[2] JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).

[3] The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.

[4] The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

[5] The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier II SCV Technology Benchmark values are listed for the constituent.

[6] Total homolog and total congener values are biased high based on laboratory method blank detections of PCB congeners 11, 153/168, 170, and 180/193 (concentrations in the sample less than 5 times the concentrations in the blank).

[7] Total homolog and total congener values are biased high based on detection of PCB congener 11 in the FDB (concentration in the sample less than 5 times the concentration in the FDB).

= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.

bold = Concentration exceeds DEQ's SLV.

Notes:

B = The analyte was detected in the laboratory method blank at a concentration that is significant relative to the sample result.

FDB= Field decontamination blank

NA = Not analyzed.

ND = Not detected.

DUP = Duplicate

U = The analyte was not detected above the reported sample quantification limit.

-- = No JSCS screening level available.

ug/L = Micrograms per liter.

mg/L = Milligrams per liter.

(1) JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).

(2) The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.

(3) The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

(4) The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier II SCV Technology Benchmark values are listed for the constituent.

(5) Mercury analysis by WPCL SOP M-10.01.

(6) Because this analyte was detected in the associated FDB, and the concentration in the sample is less than 10 times the FDB concentration, the result reported for the sample is considered biased high.

= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.

bold = Concentration exceeds DEQ's SLV.

Notes:

MoCB = Monochlorobiphenyl
DiCB = Dichlorobiphenyl
TriCB = Trichlorobiphenyl
TeCB = Tetrachlorobiphenyl
PeCB = Pentachlorobiphenyl
HeCB = Hexachlorobiphenyl
HpCB = Heptachlorobiphenyl
OcCB = Octachlorobiphenyl
NoCB = Nonachlorobiphenyl
FDB= Field decontamination blank
B= The analyte was detected in the laboratory method blank at a concentration that is significant relative to the sample result.
EMPC = Estimated maximum possible concentration.
ND = Not detected.
NA = Not analyzed
DUP = Duplicate
U = The analyte was not detected above the reported sample quantification limit.
-- = No JSCS screening level available.

2008 Stormwater Grab Samples
Sample Location: AMR809

IUPAC Number[1]	Chemical Name	Units	Event 1 FO080222 2/5/2008	Event 2 FO080317 2/29/2008	Event 2 FDB FO080320 2/29/2008	Event 3 FO080437 3/20/2008	Event 4 FO080512 4/4/2008	Event 4 DUP FO080513 4/4/2008	Event 4 FDB FO080514 4/4/2008	JSCS Stormwater SLVs[2] Human Health Fish Consumption[3]	Human Health Ingestion[4]	Ecological[5]

ug/L = Micrograms per liter.

[1]IUPAC = International Union of Pure and Applied Chemistry.

[2] JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).

[3] The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.

[4] The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

[5] The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier II SCV Technology Benchmark values are listed for the constituent.

[6] Total homolog and total congener values are biased high based on PCB congener 11, 90/101/113, 129/138/163, 135/151, 147/149, 153/168, 170, 174, 180/193, and 187 detections in the laboratory method blank.

[7] Total homolog and total congener values are biased high based on detection of PCB congener 11 in the FDB (concentration in the sample less than 5 times the concentration in the FDB).

= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.

bold = Concentration exceeds DEQ's SLV.

Notes:

ND = Not detected.

NA = Not Analyzed

FDB= Field decontamination blank

U = The analyte was not detected above the reported sample quantification limit.

-- = No JSCS screening level available.

ug/L = Micrograms per liter.

mg/L = Milligrams per liter.

(1) JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).

(2) The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.

(3) The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

(4) The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier II SCV Technology Benchmark values are listed for the constituent.

(5) Mercury analysis by WPCL SOP M-10.01.

(6) Because this analyte was detected in the associated FDB, and the concentration in the sample is less than 10 times the FDB concentration, the result reported for the sample is considered biased high.

= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.

bold = Concentration exceeds DEQ's SLV.

Notes:

MoCB = Monochlorobiphenyl
DiCB = Dichlorobiphenyl
TriCB = Trichlorobiphenyl
TeCB = Tetrachlorobiphenyl
PeCB = Pentachlorobiphenyl
HeCB = Hexachlorobiphenyl
HpCB = Heptachlorobiphenyl
OcCB = Octachlorobiphenyl
NoCB = Nonachlorobiphenyl
FDB= Field decontamination blank
B= The analyte was detected in the laboratory method blank at a concentration that is significant relative to the sample result.
EMPC = Estimated maximum possible concentration.
ND = Not detected.
NA = Not analyzed
U = The analyte was not detected above the reported sample quantification limit.
-- = No JSCS screening level available.
ug/L = Micrograms per liter.

Sample Location: AAT620

IUPAC Number[1]	Chemical Name	Units	Event 1 FO080220 2/5/2008	Event 2 FO080313 2/29/2008	Event 3 FO080439 3/20/2008	Event 4 FO080509 4/4/2008	Event 2 FDB FO080320 2/29/2008	Event 4 FDB FO080514 4/4/2008	JSCS Stormwater SLVs[2] Human Health Fish Consumption[3]	Human Health Ingestion[4]	Ecological[5]

[1]IUPAC = International Union of Pure and Applied Chemistry.

[2] JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).

[3] The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.

[4] The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

[5] The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier II SCV Technology Benchmark values are listed for the constituent.

[6] Total homolog and total congener values are biased high based on PCB congener 11, 90/101/113, 129/138/163, 147/149, 153/168 and 180/193 detections in the laboratory method blank.

[7] Total homolog and total congener values are biased high based on detection of PCB congener 11 in the FDB (concentration in the sample less than 5 times the concentration in the FDB).

= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.

bold = Concentration exceeds DEQ's SLV.

Notes:

FDB = Field decontamination blank

B = The analyte was detected in the laboratory method blank at a concentration that is significant relative to the sample result.

U = The analyte was not detected above the reported sample quantification limit.

NA = Not analyzed

DUP = Duplicate

-- = No JSCS screening level available.

ug/L = Micrograms per liter.

mg/L = Milligrams per liter.

(1) JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).

(2) The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.

(3) The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

(4) The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier II SCV Technology Benchmark values are listed for the constituent.

(5) Mercury analysis by WPCL SOP M-10.01.

(6) Because this analyte was detected in the associated FDB, and the concentration in the sample is less than 10 times the FDB concentration, the result reported for the sample is considered biased high.

= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.

bold = Concentration exceeds DEQ's SLV.

Notes:
MoCB = Monochlorobiphenyl
DiCB = Dichlorobiphenyl
TriCB = Trichlorobiphenyl
TeCB = Tetrachlorobiphenyl
PeCB = Pentachlorobiphenyl
HeCB = Hexachlorobiphenyl
HpCB = Heptachlorobiphenyl
OcCB = Octachlorobiphenyl
NoCB = Nonachlorobiphenyl
FDB = Field decontamination blank
-- = No JSCS screening level available.
U = The analyte was not detected above the reported sample quantfication limit.
ug/L = Micrograms per liter.
ND = Not detected.
NA = Not analyzed
DUO = Duplicate

[1]IUPAC = International Union of Pure and Applied Chemistry.

[2] JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).

[3] The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.

[4] The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

[5] The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier II SCV Technology Benchmark values are listed for the constituent.

= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.

bold = Concentration exceeds DEQ's SLV.

Notes:

FDB = Field decontamination blank

B = The analyte was detected in the method blank at a concentration that is significant relative to the sample result.

U = The analyte was not detected above the reported sample quantification limit.

NA= Not analyzed

-- No JSCS screening level available.

ug/L = Micrograms per liter.

mg/L = Milligrams per liter.

(1) JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).

(2) The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.

(3) The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

(4) The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier I SCV Technology Benchmark values are listed for the constituent.

(5) Mercury analysis by WPCL SOP M-10.01.

= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.

bold = Concentration exceeds DEQ's SLV.

Outfall Basin 50
2007 Stormwater Grab Samples

Notes:

MoCB = Monochlorobiphenyl
DiCB = Dichlorobiphenyl
TriCB = Trichlorobiphenyl
TeCB = Tetrachlorobiphenyl
PeCB = Pentachlorobiphenyl
HeCB = Hexachlorobiphenyl
HpCB = Heptachlorobiphenyl
OcCB = Octachlorobiphenyl
NoCB = Nonachlorobiphenyl
FDB = Field decontamination blank
-- = No JSCS screening level available.
U = The analyte was not detected above the reported sample quantification limit.
ug/L = Micrograms per liter.
NA = Not analyzed
ND = Not detected.

[1] IUPAC = International Union of Pure and Applied Chemistry.

[2] JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).

[3] The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.

[4] The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

[5] The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier II SCV Technology Benchmark values are listed for the constituent.

= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.

bold = Concentration exceeds DEQ's SLV.

Notes:

FDB = Field decontamination blank

B = The analyte was detected in the method blank at a concentration that is significant relative to the sample result.

U = The analyte was not detected above the reported sample quantification limit.

-- = No JSCS screening level available.

ND = Not detected

NA = Not analyzed

DUP = Duplicate

ug/L = Micrograms per liter.

mg/L = Milligrams per liter.

[1] JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).

[2] The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.

[3] The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

[4] The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier II SCV Technology Benchmark values are listed for the constituent.

[5] Mercury analysis by WPCL SOP M-10.01.

[6] Because this analyte was detected in the associated FDB, and the concentration in the sample is less than or equal to the FDB concentration, the result reported for the sample appears to be related to field decontamination procedures.

= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.

bold = Concentration exceeds DEQ's SLV

Notes:															

MoCB = Monochlorobiphenyl
DiCB = Dichlorobiphenyl
TriCB = Trichlorobiphenyl
TeCB = Tetrachlorobiphenyl
PeCB = Pentachlorobiphenyl
HeCB = Hexachlorobiphenyl
HpCB = Heptachlorobiphenyl
OcCB = Octachlorobiphenyl
NoCB = Nonachlorobiphenyl
FDB = Field decontamination blank
-- = No JSCS screening level available.
U = The analyte was not detected above the reported sample quantification limit.
ug/L = Micrograms per liter.
ND = Not detected.
NA = Not analyzed
DUP = duplicate
[1]IUPAC = International Union of Pure and Applied Chemistry.
[2] JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).
[3] The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.
[4] The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.
[5] The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier II SCV Technology Benchmark values are listed for the constituent.
[6] Total homolog and total congener values are biased slightly high based on PCB congener 129/138/163, 147/149, 153/168, 170, 174, 180/193, and 187 detection in the FDB.
= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.
bold = Concentration exceeds DEQ's SLV.

Notes:

B = The analyte was detected in the laboratory method blank at a concentration that is significant relative to the sample result.

FDB = Field decontamination blank

U = The analyte was not detected above the reported sample quantification limit.

J = Estimated value. Analyte detected at a concentration less than the reporting limit and greater than or equal to the method detection limit.

-- = No JSCS screening level available.

ug/L = Micrograms per liter.

mg/L = Milligrams per liter.

ND = Not detected

NA = Not analyzed

(1) JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).

(2) The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.

(3) The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

(4) The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier I SCV Technology Benchmark values are listed for the constituent.

(5) Mercury analysis by WPCL SOP M-10.01.

= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.

bold = Concentration exceeds DEQ's SLV.

Notes:
MoCB = Monochlorobiphenyl
DiCB = Dichlorobiphenyl
TriCB = Trichlorobiphenyl
TeCB = Tetrachlorobiphenyl
PeCB = Pentachlorobiphenyl
HeCB = Hexachlorobiphenyl
HpCB = Heptachlorobiphenyl
OcCB = Octachlorobiphenyl
NoCB = Nonachlorobiphenyl
FDB = Field decontamination blank
-- = No JSCS screening level available.
U = The analyte was not detected above the reported sample quantification limit.
B = The analyte was detected in the laboratory method blank at a concentration that is significant relative to the sample result.
ug/L = Micrograms per liter.
NA = Not analyzed
ND = Not detected.
[1]IUPAC = International Union of Pure and Applied Chemistry.
[2] JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).
[3] The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.
[4] The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.
[5] The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier II SCV Technology Benchmark values a
[6] The detection of PCB congener 11 is not significant relative to the total PCB concentration.
[7] Total homolog and total congener values are biased slightly high based on PCB congener 129/138/163, 147/149, 153/168, 170, 174, 180/193, and 187 detection in the FDB.
= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.
bold = Concentration exceeds DEQ's SLV.

Notes:

B = The analyte was detected in the laboratory method blank at a concentration that is significant relative to the sample result.

U = The analyte was not detected above the reported sample quantification limit.

-- = No JSCS screening level available.

ug/L = Micrograms per liter.

mg/L = Milligrams per liter.

ND = Not detected

NA = Not analyzed

DUP = Duplicate

(1) JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).

(2) The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.

(3) The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

(4) The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier II SCV Technology Benchmark values are listed for the constituent.

(5) Mercury analysis by WPCL SOP M-10.01.

(6) Because this analyte was detected in the associated FDB, and the concentration in the sample is less than 10 times the FDB concentration, the result reported for the sample is considered biased high.

(7) SLV = Sum of SLVs for Aroclor 1016 and Aroclor 1242

= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.

bold = Concentration exceeds DEQ's SLV.

Notes:

MoCB = Monochlorobiphenyl
DiCB = Dichlorobiphenyl
TriCB = Trichlorobiphenyl
TeCB = Tetrachlorobiphenyl
PeCB = Pentachlorobiphenyl
HeCB = Hexachlorobiphenyl
HpCB = Heptachlorobiphenyl
OcCB = Octachlorobiphenyl
NoCB = Nonachlorobiphenyl
-- = No JSCS screening level available.
B = The analyte was detected in the laboratory method blank at a concentration that is significant relative to the sample result.
U = The analyte was not detected above the reported sample quantification limit.
EMPC = Estimated Maximum Possible Concentration

IUPAC Number[1]	Chemical Name	Units	Event 1 FO080172 1/26/2008	Event 1 FDB FO080171 1/26/2008	Event 2 FO080264 2/6/2008	Event 3 FO080409 3/12/2008	Event 3 DUP FO080414 3/12/2008	JSCS Stormwater SLVs[2] Human Health Fish Consumption[3]	Human Health Ingestion[4]	Ecological[5]

ng/L = Nanograms per liter.

ND = Not detected.

NA = Not analyzed

DUP = Duplicate

[1]IUPAC = International Union of Pure and Applied Chemistry.

[2] JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).

[3] The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.

[4] The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

[5] The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier II SCV Technology Benchmark values are listed for the constituent.

[6] Total homolog and total congener values are biased slightly high based on detection of PCB congener 209 in the laboratory method blank.

[7] Total homolog and total congener values are biased significantly high based on detection of numerous PCB congeners in the laboratory method blank.

= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.

bold = Concentration exceeds DEQ's SLV.

Notes:

J = Estimated value. Analyte detected at a concentration less than the reporting limit and greater than or equal to the method detection limit.

FDB= Field decontamination blank

NA = Not analyzed.

ND = Not detected.

U = The analyte was not detected above the reported sample quantification limit.

-- = No JSCS screening level available.

ug/L = Micrograms per liter.

mg/L = Milligrams per liter.

(1) JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).

(2) The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.

(3) The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

[4] The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oa Ridge National Laboratory Tier II SCV Technology Benchmark values are listed for the constituent.

[5]Mercury analysis by WPCL SOP M-10.01.

[6] Because this analyte was detected in the associated FDB, and the concentration in the sample is less than or equal to the FDB concentration, the result reported for the sample appears to be related to field decontamination proced

= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.

bold = Concentration exceeds DEQ's SLV.

Notes:

MoCB = Monochlorobiphenyl
DiCB = Dichlorobiphenyl
TriCB = Trichlorobiphenyl
TeCB = Tetrachlorobiphenyl
PeCB = Pentachlorobiphenyl
HeCB = Hexachlorobiphenyl
HpCB = Heptachlorobiphenyl
OcCB = Octachlorobiphenyl
NoCB = Nonachlorobiphenyl
FDB= Field decontamination blank
EMPC = Estimated maximum possible concentration.
ND = Not detected.
NA = Not analyzed
U = The analyte was not detected above the reported sample quantification limit.
-- = No JSCS screening level available.
ug/L = Micrograms per liter.

[1]IUPAC = International Union of Pure and Applied Chemistry.

[2] JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).

[3] The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.

[4] The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

[5] The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier II SCV Technology Benchmark values are listed for the constituent.

= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.

bold = Concentration exceeds DEQ's SLV.

Notes:

B = The analyte was detected in the laboratory method blank at a concentration that is significant relative to the sample result.

FDB= Field decontamination blank

U = The analyte was not detected above the reported sample quantification limit.

J = Estimated value. Analyte detected at a concentration less than the reporting limit and greater than or equal to the method dection limit.

-- = No JSCS screening level available.

ug/L = Micrograms per liter.

mg/L = Milligrams per liter.

ND = Not Detected

NA= Not analyzed

[1] JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).

[2] The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.

[3] The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

[4] The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier II SCV Technology Benchmark values are listed for the constituent.

[5] Mercury analysis by WPCL SOP M-10.01.

[6] Because this analyte was detected in the associated FDB, and the concentration in the sample is less than or equal to the FDB concentration, the result reported for the sample appears to be related to field decontamination procedures.

= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.

bold = Concentration exceeds DEQ's SLV.

Outfall Basin M-1

Notes:
MoCB = Monochlorobiphenyl
DiCB = Dichlorobiphenyl
TriCB = Trichlorobiphenyl
TeCB = Tetrachlorobiphenyl
PeCB = Pentachlorobiphenyl
HeCB = Hexachlorobiphenyl
HpCB = Heptachlorobiphenyl
OcCB = Octachlorobiphenyl
NoCB = Nonachlorobiphenyl
FDB= Field decontamination blank
-- = No JSCS screening level available.
U = The analyte was not detected above the reported sample quantification limit.
ug/L = Micrograms per liter.
ND = Not detected.
NA= Not analyzed
[1]IUPAC = International Union of Pure and Applied Chemistry.
[2] JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).
[3] The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.
[4] The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

[5] The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier II SCV Technology Benchmark values are listed for the constituent.
[6]Total homolog and total congener values are biased slightly high based on PCB congener 153/168 detection in the FDB.
[7] Total homolog and total congener values are biased slightly high based on PCB congener 129/138/163, 147/149, 153/168, 170, and 180/193 detection in the FDB.
= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.
bold = Concentration exceeds DEQ's SLV.

Notes:

B = The analyte was detected in the laboratory method blank at a concentration that is significant relative to the sample result.

FDB= Field decontamination blank

U = The analyte was not detected above the reported sample quantification limit.

J = Estimated value. Analyte detected at a concentration less than the reporting limit and greater than or equal to the method dection limit.

-- = No JSCS screening level available.

ug/L = Micrograms per liter.

mg/L = Milligrams per liter.

ND = Non detect

NA = Not analyzed

[1] JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).

[2] The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.

[3] The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

[4] The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier I SCV Technology Benchmark values are listed for the constituent.

[5] Mercury analysis by WPCL SOP M-10.01.

= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.

bold = Concentration exceeds DEQ's SLV.

Notes:
MoCB = Monochlorobiphenyl
DiCB = Dichlorobiphenyl
TriCB = Trichlorobiphenyl
TeCB = Tetrachlorobiphenyl
PeCB = Pentachlorobiphenyl
HeCB = Hexachlorobiphenyl
HpCB = Heptachlorobiphenyl
OcCB = Octachlorobiphenyl
NoCB = Nonachlorobiphenyl
FDB=Field decontamination blank
-- = No JSCS screening level available.

U = The analyte was not detected above the reported sample quantification limit.
ug/L = Micrograms per liter.
ND = Not detected.
NA = Not analyzed

[1]IUPAC = International Union of Pure and Applied Chemistry.

[2] JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).

[3] The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.

[4] The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

[5] The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier II SCV Technology Benchmark values are listed for the constituent.

[6] Total homolog and total congener values are biased slightly high based on PCB congener 129/138/163, 147/149, 153/168, and 180/193 detection in the FDB.

= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.

bold = Concentration exceeds DEQ's SLV.

Notes:

B = The analyte was detected in the laboratory method blank at a concentration that is significant relative to the sample result.

FDB= Field decontamination blank

U = The analyte was not detected above the reported sample quantification limit.

J = Estimated value. Analyte detected at a concentration less than the reporting limit and greater than or equal to the method dection limit. This data is of limited reliability.

-- = No JSCS screening level available.

ug/L = Micrograms per liter.

mg/L = Milligrams per liter.

ND = Not detected

NA = Not analyzed

(1) JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).

(2) The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.

(3) The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

(4) The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier II SCV Technology Benchmark values are listed for the constituent.

(5) Mercury analysis by WPCL SOP M-10.01.

(6) Because this analyte was detected in the associated FDB, and the concentration in the sample is less than or equal to the FDB concentration, the result reported for the sample appears to be related to field decontamination procedures.

= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.

bold = Concentration exceeds DEQ's SLV.

Outfall Basin M-3
2007 Stormwater Grab Samples
Sample Location: AAQ004

Notes:

MoCB = Monochlorobiphenyl
DiCB = Dichlorobiphenyl
TriCB = Trichlorobiphenyl
TeCB = Tetrachlorobiphenyl
PeCB = Pentachlorobiphenyl
HeCB = Hexachlorobiphenyl
HpCB = Heptachlorobiphenyl
OcCB = Octachlorobiphenyl
NoCB = Nonachlorobiphenyl
FDB= Field decontamination blank
-- = No JSCS screening level available.
U = The analyte was not detected above the reported sample quanitfication limit.
ug/L = Micrograms per liter.
ND = Not detected.
NA = Not analyzed

[1] IUPAC - International Union of Pure and Applied Chemistry.

[2] JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).

[3] The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.

[4] The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

[5] The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier II SCV Technology Benchmark values are listed for the constituent.

[6] Total homolog and total congener values are biased slightly high based on PCB congener 129/138/163, 147/149, 153/168, and 180/193 detection in the FDB.

: Highlighted values have been selected by DEQ for initial upland source control screening evaluations.

bold = Concentration exceeds DEQ's SLV.

Notes:

B = The analyte was detected in the laboratory method blank at a concentration that is significant relative to the sample result.

FDB= Field decontamination blank

U = The analyte was not detected above the reported sample quantification limit.

J = Estimated value. Analyte detected at a concentration less than the reporting limit and greater than or equal to the method detection limit. This data is of limited reliability.

-- No JSCS screening level available.

ug/L = Micrograms per liter.

mg/L = Milligrams per liter.

NA = Not analyzed

ND = Not detected

[1] JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).

[2] The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.

[3] The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

[4] The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier I SCV Technology Benchmark values are listed for the constituent.

[5] Mercury analysis by WPCL SOP M-10.01.

= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.

bold = Concentration exceeds DEQ's SLV.

Notes:

MoCB = Monochlorobiphenyl
DiCB = Dichlorobiphenyl
TriCB = Trichlorobiphenyl
TeCB = Tetrachlorobiphenyl
PeCB = Pentachlorobiphenyl
HeCB = Hexachlorobiphenyl
HpCB = Heptachlorobiphenyl
OcCB = Octachlorobiphenyl
NoCB = Nonachlorobiphenyl
FDB= Field decontamination blank
-- = No JSCS screening level available.
U = The analyte was not detected above the reported sample quantification limit.
ug/L = Micrograms per liter.
ND = Not detected.
NA = Not analyzed

[1] IUPAC = International Union of Pure and Applied Chemistry.

[2] JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).

[3] The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.

[4] The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

[5] The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier II SCV Technology Benchmark values are listed for the constituent.

[6] Total homolog and total congener values are biased slightly high based on PCB congener 129/138/163, 147/149, 153/168, 170, 174, 180/193, and 187 detection in the FDB.

= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.

bold = Concentration exceeds DEQ's SLV.

Notes:

B = The analyte was detected in the laboratory method blank at a concentration that is significant relative to the sample result.

FDB= Field decontamination blank

U = The analyte was not detected above the reported sample quantification limit.

J = Estimated value. Analyte detected at a concentration less than the reporting limit and greater than or equal to the method dection limit.

-- = No JSCS screening level available.

ND = Not detected

NA = Not analyzed

ug/L = Micrograms per liter.

mg/L = Milligrams per liter.

[1] JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).

[2] The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.

[3] The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

[4] The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier I SCV Technology Benchmark values are listed for the constituent.

[5] Mercury analysis by WPCL SOP M-10.01.

= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.

bold = Concentration exceeds DEQ's SLV.

Notes:

MoCB = Monochlorobiphenyl
DiCB = Dichlorobiphenyl
TriCB = Trichlorobiphenyl
TeCB = Tetrachlorobiphenyl
PeCB = Pentachlorobiphenyl
HeCB = Hexachlorobiphenyl
HpCB = Heptachlorobiphenyl
OcCB = Octachlorobiphenyl
NoCB = Nonachlorobiphenyl
FDB= Field decontamination blank
-- = No JSCS screening level available.
U = The analyte was not detected above the reported sample quantification limit.
ug/L = Micrograms per liter.
ND = Not detected.
NA = Not analyzed

[1] IUPAC = International Union of Pure and Applied Chemistry.

[2] JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).

[3] The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.

[4] The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

[5] The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier II SCV Technology Benchmark values are listed for the constituent.

[6] Total homolog and total congener values are biased slightly high based on PCB congener 129/138/163, 147/149, 153/168, 170, 174, 180/193, and 187 detection in the FDB.

= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.

bold = Concentration exceeds DEQ's SLV.

Notes:

B =The analyte was detected in the laboratory method blank at a concentration that is significant relative to the sample result.

FDB= Field decontamination blank

DUP = Duplicate

U = The analyte was not detected above the reported sample quantification limit.

J = Estimated value. Analyte detected at a concentration less than the reporting limit and greater than or equal to the method dection limit.

-- = No JSCS screening level available.

ug/L = Micrograms per liter.

mg/L = Milligrams per liter.

ND = Not detected

NA = Not analyzed

[1] JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).

[2] The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.

[3] The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

[4] The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier II SCV Technology Benchmark values are listed for the constituent.

[5] Mercury analysis by WPCL SOP M-10.01.

= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.

bold = Concentration exceeds DEQ's SLV.

Notes:

MoCB = Monochlorobiphenyl
DiCB = Dichlorobiphenyl
TriCB = Trichlorobiphenyl
TeCB = Tetrachlorobiphenyl
PeCB = Pentachlorobiphenyl
HeCB = Hexachlorobiphenyl
HpCB = Heptachlorobiphenyl
OcCB = Octachlorobiphenyl
NoCB = Nonachlorobiphenyl
FDB= Field decontamination blank
-- = No JSCS screening level available.
U = The analyte was not detected above the reported sample quantification limit.
ug/L = Micrograms per liter.
ND = Not detected.
NA = Not analyzed
[1]IUPAC = International Union of Pure and Applied Chemistry.
[2] JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).
[3] The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.
[4] The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.
[5] The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier II SCV Technology Benchmark values are listed for the constituent.
- Highlighted values have been selected by DEQ for initial upland source control screening evaluations.
bold = Concentration exceeds DEQ's SLV.

Notes:

B = The analyte was detected in the laboratory method blank at a concentration that is significant relative to the sample result.

FDB= Field decontamination blank

DUP = Duplicate

U = The analyte was not detected above the reported sample quantification limit.

J = Estimated value. Analyte detected at a concentration less than the reporting limit and greater than or equal to the method detection limit.

-- = No JSCS screening level available.

ug/L = Micrograms per liter.

mg/L = Milligrams per liter.

ND = Not detected

NA = Not analyzed

[1] JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).

[2] The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.

[3] The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

[4] The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier I SCV Technology Benchmark values are listed for the constituent.

[5] Mercury analysis by WPCL SOP M-10.01.

= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.

bold = Concentration exceeds DEQ's SLV.

Notes:

MoCB = Monochlorobiphenyl
DiCB = Dichlorobiphenyl
TriCB = Trichlorobiphenyl
TeCB = Tetrachlorobiphenyl
PeCB = Pentachlorobiphenyl
HeCB = Hexachlorobiphenyl
HpCB = Heptachlorobiphenyl
OcCB = Octachlorobiphenyl
NoCB = Nonachlorobiphenyl
FDB= Field decontamination blank
-- = No JSCS screening level available.

U = The analyte was not detected above the reported sample quantification limit.

B = The analyte was detected in the laboratory method blank at a concentration that is significant relative to the sample result.

ug/L = Micrograms per liter.

ND = Not detected.

NA = Not analyzed

[1]IUPAC = International Union of Pure and Applied Chemistry.

[2] JSCS SLVs = Portland Harbor Joint Source Control Strategy Screening Level Values (DEQ/EPA Final December 2005, Amended July 2007).

[3] The SLVs for chemicals in water taken up by fish for human consumption represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent.

[4] The SLVs for chemicals in water for human ingestion represent the most conservative value between EPA's MCLs and Region 9 PRGs.

[5] The SLVs for chemicals in water for ecological exposure represent EPA's NRWQC values. If no NRWQC values are available, then DEQ's AWQC values are listed for the constituent. If no AWQC values are available, then Oak Ridge National Laboratory Tier II SCV Technology Benchmark values are listed for the constituent.

[6] Total homolog and total congener values are biased slightly high based on PCB congener 129/138/163, 147/149, 153/168, 170, 174, 180/193, and 187 detection in the FDB.

= Highlighted values have been selected by DEQ for initial upland source control screening evaluations.

bold = Concentration exceeds DEQ's SLV.

Laboratory Reports and Data Review Memoranda

Part 1: 2007 Stormwater Grab Sampling

September 28, 2007
Sampling Event

Laboratory Data QA/QC Review
Upland Source Control Investigation
September 28, 2007 Stormwater Sampling

To: File

From: Julia Fowler, GSI

Date: June 2, 2009

This memorandum presents a quality assurance/quality control (QA/QC) review of the laboratory data generated during source control investigation sampling and analyses conducted by the City of Portland (City) on September 28, 2007. Eleven stormwater samples, one field duplicate sample and one field decontamination blank were collected by the City and submitted for analyses.

The laboratory analyses for these source control program samples were completed by the City's Bureau of Environmental Services (BES) laboratory and subcontracted laboratories. The following laboratories conducted the analyses listed:

- BES WPCL
    - Total Metals – EPA 200.8
    - Total Mercury – WPCL SOP M-10.02
    - Total suspended solids (TSS) – SM 2540D
- Test America (TA)
    - Polynuclear Aromatic Hydrocarbons (PAHs) – EPA 8270M-SIM
    - Phthalates – EPA 8270M-SIM
- Columbia Analytical Services (CAS)
    - Semivolatile Organic Compounds – EPA 8270C
- Pace Analytical Services (Pace)
    - Polychlorinated Biphenyls (PCB) Congeners – EPA 1668A

The BES Laboratory Information Management System (LIMS) summary report for all analyses associated with this stormwater sampling event and the subcontracted laboratory's data reports are attached.

The WPCL summary report for all analyses associated with this stormwater sampling event and the subcontracted laboratory's data reports are attached. The WPCL summary report comments that, with some exceptions (included in the following sections below), all analytical QA/QC criteria were met for these samples including holding times, calibration, method blanks, laboratory control sample recoveries, duplicate precision, matrix spike recoveries, and surrogate recoveries, as applicable.

The following QA/QC review is based on the available documentation supplied from each subcontracted laboratory and on exceptions noted in the WPCL summary report. The QA/QC review of the analytical data consisted of reviewing the following for each laboratory report, if available:

- Chain-of-custody for completeness and continuous custody
- Analysis conducted within holding times
- Chemicals of interest detected in method blanks
- Surrogate recoveries within laboratory control limits
- Internal standard recoveries within laboratory control limits
- Laboratory control sample and duplicate laboratory control sample recoveries within laboratory control limits

The results of the QA/QC review of the subcontracted laboratory reports are presented below.

Chain-of-Custody

The chain-of-custody forms showed continuous custody of the samples. The chain-of-custody procedures were adequate and sample integrity was maintained through the sample collection and delivery process.

Analysis Holding Times

The samples were extracted and analyzed within the required method-specific holding times.

Method Blanks

Method blanks were processed during the subcontracted laboratory analyses of PAHs, phthalates, SVOCs, and PCB congeners. Di-n-butyl phthalate was detected in the method blank for the EPA 8270C analyses at a concentration that is significant relative to the sample results. The results reported as detected in the associated samples are flagged "B".

A low concentration of PCB congener 11 was detected in the method blank. Two samples (FO071158: OF S-6 and FO071159: OF52A) contained similar concentrations and are flagged "B". Both sample results for PCB congener 11 are considered the result of laboratory contamination because they are less than the method blank result. For OF 52A, the detection is not significant relative to the total PCB concentration. For OF S-6, the total PCB concentration is considered biased slightly high.

Surrogate Recoveries

Surrogate recoveries were completed during the subcontracted laboratory analysis of PAHs and SVOCs. All surrogate recoveries were within laboratory control limits, with two exceptions. One of the surrogates analyzed with the method blank during the PAH analysis was outside laboratory control limits. Surrogate recoveries were within laboratory control limits for the remaining surrogates. One of the surrogates analyzed with sample FO071154 during the PAH analysis was outside laboratory control limits. TA reports that the data quality is not impacted; see the TA laboratory report for additional detail.

Internal Standard Recoveries

Internal standard recoveries were processed during the laboratory analysis of PCB congeners. The recoveries were within laboratory control limits with four exceptions. Pace Analytical reports the data were automatically corrected for recovery variations and accurate values were obtained.

Laboratory Control/Laboratory Control Duplicate Samples

Laboratory control/laboratory control duplicate samples (LCS/DLCS) were processed during the laboratory analysis of PAHs, phthalates, SVOCs, and PCB Congeners. All laboratory control sample recoveries were within laboratory control limits. The relative percent difference for benzoic acid between the laboratory control and laboratory control duplicate samples was outside of control limits. CAS did not report any data quality concerns associated with this result; see the CAS laboratory report for additional detail.

Other

The method reporting limit (MRL) for di-n-octyl phthalate by EPA 8270C was elevated because the initial calibration would not support the standard reporting limit. CAS reports that no other corrective action was possible.

A field decontamination blank (FDB) was collected and analyzed for metals, PAHs, phthalates, SVOCs, and PCB congeners. Zinc was detected in the FDB at a concentration of 8.76 ug/L. Zinc was detected in the primary and duplicate samples from OF 48 at concentrations less than 10 times the field blank concentration and is considered biased high for these samples. Concentrations in the remaining samples are greater than 10 times the blank detection.

LABORATORY ANALYSIS REPORT

Sample ID: **FO071148** **Sample Collected:** 9/28/2007 01:20 **Sample Received:** 09/28/07 **Sample Status:** **COMPLETE AND VALIDATED**

Proj./Company Name: PORTLAND HARBOR STORMWATER SAMP
Address/Location: SW-M2-AAM169-0907
5949 N BASIN AVE DS OF MANHOLE
Sample Point Code: M2_SW1
Sample Type: GRAB
Sample Matrix: STORMWTR

Report Page: Page 4 of 4
System ID: AL09049
EID File # : 1020.005
LocCode: PORTHASW
Collected By: MJS/LAP

Comments:
QA/QC: Except as follows, all analytical QA/QC criteria were met for this sample including holding times, calibration, method blanks, laboratory control sample recoveries, duplicate precision, matrix spike recoveries, and surrogate recoveries, as applicable. For Semivolatile Organics analysis, Di-n-butyl phthalate was detected in the Method Blank at 0.42 ug/L; the reported result may be a false positive.

Test Parameter	Result	Units	MRL	Method	Analysis Date
Nitrobenzene	<0.21	µg/L	0.21	EPA 8270	10/03/07

Comments:
QA/QC: Except as follows, all analytical QA/QC criteria were met for this sample including holding times, calibration, method blanks, laboratory control sample recoveries, duplicate precision, matrix spike recoveries, and surrogate recoveries, as applicable. For Semivolatile Organics analysis, Di-n-butyl phthalate was detected in the Method Blank at 0.42 ug/L; the reported result may be a false positive.

LABORATORY ANALYSIS REPORT

Sample ID: **FO071151** **Sample Collected:** 9/28/2007 02:26 **Sample Received:** 09/28/07 **Sample Status:** **COMPLETE AND VALIDATED**

Proj./Company Name: PORTLAND HARBOR STORMWATER SAMP
Address/Location: SW-S1-AAM131-0907
5555 N CHANNEL AVE DS
Sample Point Code: S1_SW1
Sample Type: GRAB
Sample Matrix: STORMWTR

System ID: AL09052
EID File # : 1020.005
LocCode: PORTHASW
Collected By: MJS/LAP

Comments:
QA/QC: Except as follows, all analytical QA/QC criteria were met for this sample including holding times, calibration, method blanks, laboratory control sample recoveries, duplicate precision, matrix spike recoveries, and surrogate recoveries, as applicable. For Semivolatile Organics analysis, Di-n-butyl phthalate was detected in the Method Blank at 0.42 ug/L; the reported result may be a false positive.

LABORATORY ANALYSIS REPORT

Sample ID: **FO071153** **Sample Collected:** 9/28/2007 00:00 **Sample Received:** 09/28/07 **Sample Status:** COMPLETE AND VALIDATED

Proj./Company Name: PORTLAND HARBOR STORMWATER SAMP
Address/Location: FIELD DUPLICATE

Report Page: Page 1 of 4

System ID: AL09054
EID File # : 1020.005
LocCode: PORTHASW
Collected By: MJS/LAP

Sample Point Code: DUP
Sample Type: GRAB
Sample Matrix: STORMWTR

Comments:
QA/QC: Except as follows, all analytical QA/QC criteria were met for this sample including holding times, calibration, method blanks, laboratory control sample recoveries, duplicate precision, matrix spike recoveries, and surrogate recoveries, as applicable. For Semivolatile Organics analysis, Di-n-butyl phthalate was detected in the Method Blank at 0.42 ug/L; the reported result may be a false positive.

LABORATORY ANALYSIS REPORT

Sample ID: **FO071154** **Sample Collected:** 9/28/2007 03:17 **Sample Received:** 09/28/07 **Sample Status:** **COMPLETE AND VALIDATED**

Proj./Company Name: PORTLAND HARBOR STORMWATER SAMP
Address/Location: FIELD BLANK

Sample Point Code: FDBLANK
Sample Type: GRAB
Sample Matrix: DIWTR

System ID: AL09055
EID File # : 1020.005
LocCode: PORTHASW
Collected By: MJS/LAP

Comments:
QA/QC: Except as follows, all analytical QA/QC criteria were met for this sample including holding times, calibration, method blanks, laboratory control sample recoveries, duplicate precision, matrix spike recoveries, and surrogate recoveries, as applicable. For Semivolatile Organics analysis, Di-n-butyl phthalate was detected in the Method Blank at 0.42 ug/L; the reported result may be a false positive. LAB: The result for Zinc was verified by re-analysis.

LABORATORY ANALYSIS REPORT

Sample ID: **FO071155** **Sample Collected:** 9/28/2007 03:45 **Sample Received:** 09/28/07 **Sample Status:** **COMPLETE AND VALIDATED**

Proj./Company Name: PORTLAND HARBOR STORMWATER SAMP
Address/Location: SW-52-AAE519-0907
CATHEDRAL PARK DS
Sample Point Code: 52_SW1
Sample Type: GRAB
Sample Matrix: STORMWTR

System ID: AL09056
EID File # : 1020.005
LocCode: PORTHASW
Collected By: MJS/LAP

Comments:
QA/QC: Except as follows, all analytical QA/QC criteria were met for this sample including holding times, calibration, method blanks, laboratory control sample recoveries, duplicate precision, matrix spike recoveries, and surrogate recoveries, as applicable. For Semivolatile Organics analysis, Di-n-butyl phthalate was detected in the Method Blank at 0.42 ug/L; the reported result may be a false positive.

Test Parameter	Result	Units	MRL	Method	Analysis Date
Nitrobenzene	<0.20	µg/L	0.20	EPA 8270	10/03/07
N-Nitrosodi-n-propylamine	<0.20	µg/L	0.20	EPA 8270	10/03/07
N-Nitrosodiphenylamine	<0.20	µg/L	0.20	EPA 8270	10/03/07
Pentachlorophenol	<1.0	µg/L	1.0	EPA 8270	10/03/07
Phenanthrene	0.31	µg/L	0.20	EPA 8270	10/03/07
Phenol	<0.50	µg/L	0.50	EPA 8270	10/03/07
Pyrene	0.26	µg/L	0.20	EPA 8270	10/03/07

End of Report for Sample ID: FO071155

Report Date: 01/07/08 **Validated By: Signature on File**

LABORATORY ANALYSIS REPORT

Sample ID: **FO071157** **Sample Collected:** 9/28/2007 01:58 **Sample Received:** 09/28/07 **Sample Status:** **COMPLETE AND VALIDATED**

Proj./Company Name: PORTLAND HARBOR STORMWATER SAMP
Address/Location: SW-S5-AAP982-0907
4800 N CHANNEL AVE DS
Sample Point Code: S5_SW1
Sample Type: GRAB
Sample Matrix: STORMWTR

System ID: AL09058
EID File # : 1020.005
LocCode: PORTHASW
Collected By: JJM/RCB

Comments:
QA/QC: Except as follows, all analytical QA/QC criteria were met for this sample including holding times, calibration, method blanks, laboratory control sample recoveries, duplicate precision, matrix spike recoveries, and surrogate recoveries, as applicable. For Semivolatile Organics analysis, Di-n-butyl phthalate was detected in the Method Blank at 0.42 ug/L; the reported result may be a false positive.

Collected By: JJM/RCB

Comments:
QA/QC: Except as follows, all analytical QA/QC criteria were met for this sample including holding times, calibration, method blanks, laboratory control sample recoveries, duplicate precision, matrix spike recoveries, and surrogate recoveries, as applicable. For Semivolatile Organics analysis, Di-n-butyl phthalate was detected in the Method Blank at 0.42 ug/L; the reported result may be a false positive.

November 15, 2007 Analytical Report for Service Request No: K0708884

Jennifer Shackelford
Portland, City of
1120 SW Fifth Avenue # 600
Portland, OR 97204

RE: Portland Harbor Stormwater

Dear Jennifer:

Enclosed are the results of the samples submitted to our laboratory on September 28, 2007. For your reference, these analyses have been assigned our service request number K0708884.

All analyses were performed according to our laboratory's quality assurance program. Where applicable, the methods cited conform to the Methods Update Rule (effective 4/11/2007), which relates to the use of analytical methods for the drinking water and waste water programs. The test results meet requirements of the NELAC standards. Exceptions are noted in the case narrative report where applicable. All results are intended to be considered in their entirety, and Columbia Analytical Services, Inc. (CAS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please call if you have any questions. My extension is 3281. You may also contact me via Email at LVo@caslab.com.

Respectfully submitted,

Columbia Analytical Services, Inc.

Loan Vo, Ph.D.
Project Chemist

Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

Inorganic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result.
E	The result is an estimate amount because the value exceeded the instrument calibration range.
J	The result is an estimated concentration that is less than the MRL but greater than or equal to the MDL.
U	The compound was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
i	The MRL/MDL has been elevated due to a matrix interference.
X	See case narrative.

Metals Data Qualifiers

#	The control limit criteria is not applicable. See case narrative.
B	The result is an estimated concentration that is less than the MRL but greater than or equal to the MDL.
E	The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
M	The duplicate injection precision was not met.
N	The Matrix Spike sample recovery is not within control limits. See case narrative.
S	The reported value was determined by the Method of Standard Additions (MSA).
U	The compound was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
W	The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
i	The MRL/MDL has been elevated due to a matrix interference.
X	See case narrative.
*	The duplicate analysis not within control limits. See case narrative.
+	The correlation coefficient for the MSA is less than 0.995.

Organic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
A	A tentatively identified compound, a suspected aldol-condensation product.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result.
C	The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
D	The reported result is from a dilution.
E	The result is an estimate amount because the value exceeded the instrument calibration range.
J	The result is an estimated concentration that is less than the MRL but greater than or equal to the MDL.
N	The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
P	The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results (25% for CLP Pesticides).
U	The compound was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
i	The MRL/MDL has been elevated due to a chromatographic interference.
X	See case narrative.

Additional Petroleum Hydrocarbon Specific Qualifiers

F	The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
L	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
H	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
O	The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
Y	The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
Z	The chromatographic fingerprint does not resemble a petroleum product.

Sample Matrix:	Water		

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier I data deliverables. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Thirteen water samples were received for analysis at Columbia Analytical Services on 09/28/2007. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

Semivolatile Organic Compounds by EPA Method 8270C

Method Blank Exceptions:
The Method Blank KWG0710624 contained low levels of di-n-Butyl Phthalate above the Method Reporting Limit (MRL). In accordance with CAS QA/QC policy, all sample results less than twenty times the level found in the Method Blank are flagged as estimated.

Elevated Method Reporting Limits:
The method reporting limit for di-n-octyl Phthalate is elevated because the ICAL would not support the standard reporting limit. No other corrective action was possible.

No other anomalies associated with the analysis of these samples were observed.

Approved by _____ Date 11.15.07

Cooler Receipt and Preservation Form

Client / Project: City of Portland Service Request K07 8884

Received: 9.28.07 Opened: 9.28.07 By: DJ

1. Samples were received via? *US Mail* *Fed Ex* *UPS* *DHL* *GH* *GS* *PDX* (*Courier*) *Hand Delivered*
2. Samples were received in: (circle) (*Cooler*) *Box* *Envelope* *Other*_____ *NA*
3. Were custody seals on coolers? NA Y (N) If yes, how many and where?_____
   If present, were custody seals intact? Y (N) If present, were they signed and dated? Y (N)
4. Is shipper's air-bill filed? If not, record air-bill number:_____ (NA) Y N
5. **Temperature of cooler(s) upon receipt (°C):** 0.7
   Temperature Blank (°C): N.P
6. If applicable, list Chain of Custody Numbers:
7. Were custody papers properly filled out (ink, signed, etc.)? NA (Y) N
8. Packing material used. *Inserts* *Bubble Wrap* *Gel Packs* (*Wet Ice*) *Sleeves* *Other*_____
9. **Did all bottles arrive in good condition (unbroken)?** *Indicate in the table below.* NA (Y) N
10. Were all sample labels complete (i.e analysis, preservation, etc.)? (Y) N
11. Did all sample labels and tags agree with custody papers? *Indicate in the table below* (Y) N
12. **Were the correct types of bottles used for the tests indicated?** NA (Y) N
13. Were all of the preserved bottles received at the lab with the appropriate pH? *Indicate in the table below* NA (Y) N
14. Were VOA vials and 1631 Mercury bottles checked for absence of air bubbles? *Indicate in the table below.* (NA) Y N
15. **Are CWA Microbiology samples received with >1/2 the 24hr. hold time remaining from collection?** (NA) Y N
16. Was C12/Res negative? (NA) Y N

RE: Portland Harbor

Enclosed are the results of analyses for samples received by the laboratory on 09/28/07 11:20. The following list is a summary of the Work Orders contained in this report, generated on 10/31/07 17:33.

If you have any questions concerning this report, please feel free to contact me.

Work Order	Project	ProjectNumber
PQI1011	Portland Harbor	36238

Howard Holmes, Project Manager

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report shall not be reproduced except in full, without the written approval of the laboratory.

Notes and Definitions

Report Specific Notes:

J	-	Estimated value. Analyte detected at a level less than the Reporting Limit (RL) and greater than or equal to the Method Detection Limit (MDL). The user of this data should be aware that this data is of limited reliability.
RL1	-	Reporting limit raised due to sample matrix effects.
Z2	-	Surrogate recovery was above the acceptance limits. Data not impacted.

Laboratory Reporting Conventions:

DET	-	Analyte DETECTED at or above the Reporting Limit. Qualitative Analyses only.
ND	-	Analyte NOT DETECTED at or above the reporting limit (MDL or MRL, as appropriate).
NR/NA	-	Not Reported / Not Available
dry	-	Sample results reported on a Dry Weight Basis. Results and Reporting Limits have been corrected for Percent Dry Weight.
wet	-	Sample results and reporting limits reported on a Wet Weight Basis (as received). Results with neither 'wet' nor 'dry' are reported on a Wet Weight Basis.
RPD	-	RELATIVE PERCENT DIFFERENCE (RPDs calculated using Results, not Percent Recoveries).
MRL	-	METHOD REPORTING LIMIT. Reporting Level at, or above, the lowest level standard of the Calibration Table.
MDL*	-	METHOD DETECTION LIMIT. Reporting Level at, or above, the statistically derived limit based on 40CFR, Part 136, Appendix B. *MDLs are listed on the report only if the data has been evaluated below the MRL. Results between the MDL and MRL are reported as Estimated Results.
Dil	-	Dilutions are calculated based on deviations from the standard dilution performed for an analysis, and may not represent the dilution found on the analytical raw data.
Reporting Limits	-	Reporting limits (MDLs and MRLs) are adjusted based on variations in sample preparation amounts, analytical dilutions and percent solids, where applicable.
Electronic Signature	-	Electronic Signature added in accordance with TestAmerica's *Electronic Reporting and Electronic Signatures Policy*. Application of electronic signature indicates that the report has been reviewed and approved for release by the laboratory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

PROJECT: PCB CONGENER ANALYSES

DATE: October 26, 2007

ISSUED TO: Test America
Attn: Howard Holmes
9405 SW Nimbus Avenue
Beaverton, OR 97008

REPORT NO: 07-1060388

INTRODUCTION

This report presents the results from the analyses performed on thirteen samples submitted by a representative of Test America. The samples were analyzed for the presence or absence of polychlorobiphenyl (PCB) congeners using USEPA Method 1668A.

REPORT OF: CHEMICAL ANALYSES

PROJECT: PCB CONGENER ANALYSES **DATE:** October 26, 2007

 REPORT NO: 07-1060388

RESULTS

The results from the analyses are included in the following:

Appendix A - Documentation
Appendix B - Sample Analysis Results

DISCUSSION

The recoveries of the isotopically labeled PCB internal standards in the sample extracts ranged from 40-164%. With the exceptions of four values, which were flagged "P" on the results tables; the labeled standard recoveries obtained for this project were within the target ranges specified in the method. Since the quantification of the native PCB congeners was based on isotope dilution, the data were automatically corrected for variation in recovery and accurate values were obtained.

A laboratory method blank was prepared and analyzed with the sample batch as part of our routine quality control procedures. The results show the blank, with the exception of a low level of PCB #11, to be free of PCB congeners at the reporting limits. Two samples contained similar levels of this congener and are flagged "B" on the results tables. These levels may be, at least partially, attributed to the background. It should be noted that levels less than ten times the background are not generally considered to be statistically different from the background. The results show that the sample preparation procedures did not significantly impact the results of the sample analyses.

Laboratory spike samples were also prepared with the sample batch using clean reference matrix that had been fortified with native standards. The results show that spiked native compounds were recovered at 80-112%, with relative percent differences of 1.0-7.9%. These results indicate high degrees of accuracy and precision for these determinations.

REMARKS

The sample extracts will be retained for a period of 15 days from the date of this report and then discarded unless other arrangements are made. The raw mass spectral data will be archived on magnetic tape for a period of not less than one year. Questions regarding the data contained in this report may be directed to the author at the number provided below.

September 30, 2007
Sampling Event

Laboratory Data QA/QC Review
Upland Source Control Investigation
September 30, 2007 Stormwater Sampling

To: File

From: Julia Fowler, GSI

Date: June 1, 2009

This memorandum presents a quality assurance/quality control (QA/QC) review of the laboratory data generated during source control investigation sampling and analyses conducted by the City of Portland (City) on September 30, 2007. Three stormwater samples, one field duplicate sample and one field decontamination blank were collected by the City and submitted for analyses.

The laboratory analyses for these source control program samples were completed by the City's Bureau of Environmental Services (BES) laboratory and subcontracted laboratories. The following laboratories conducted the analyses listed:

- BES WPCL
    - Total Metals – EPA 200.8
    - Total Mercury – WPCL SOP M-10.02
    - Total suspended solids (TSS) – SM 2540D
- Test America (TA)
    - Polynuclear Aromatic Hydrocarbons (PAHs) – EPA 8270M-SIM
    - Phthalates – EPA 8270M-SIM
- Columbia Analytical Services (CAS)
    - Semivolatile Organic Compounds (SVOCs) – EPA 8270C
- Pace Analytical Services (Pace)
    - Polychlorinated Biphenyls (PCB) Congeners – EPA 1668A

The WPCL summary report for all analyses associated with this stormwater sampling event and the subcontracted laboratory's data reports are attached. The WPCL summary report comments that, with some exceptions (included in the following sections below), all analytical QA/QC

criteria were met for these samples including holding times, calibration, method blanks, laboratory control sample recoveries, duplicate precision, matrix spike recoveries, and surrogate recoveries, as applicable. The following QA/QC review is based on the available documentation supplied from each subcontracted laboratory and on exceptions noted in the WPCL summary report. The QA/QC review of the analytical data consisted of reviewing the following for each laboratory report, if available:

- Chain-of-custody for completeness and continuous custody
- Analysis conducted within holding times
- Chemicals of interest detected in method blanks
- Surrogate recoveries within laboratory control limits
- Internal standard recoveries within laboratory control limits
- Laboratory control sample and duplicate laboratory control sample recoveries within laboratory control limits

The results of the laboratory QA/QC review of the subcontracted laboratory reports are presented below.

Chain-of-Custody

The chain-of-custody forms showed continuous custody of the samples. The chain-of-custody procedures were adequate and sample integrity was maintained through the sample collection and delivery process.

Analysis Holding Times

The samples were extracted and analyzed within the required method-specific holding times.

Method Blanks

Method blanks were processed during the subcontracted laboratory analyses of PAHs, phthalates, SVOCs and PCB Congeners. A low concentration of PCB Congener #11 (0.899 ng/L) was detected in the method blank but was not detected in the associated field samples.

Surrogate Recoveries

Surrogate recoveries were completed during the subcontracted laboratory analysis of PAHs and SVOCs. All surrogate recoveries were within laboratory control limits, with two exceptions. One of the surrogates analyzed with the method blank during the PAH analysis was outside laboratory control limits. Surrogate recoveries were within laboratory control limits for the remaining surrogates and therefore no data are flagged. One of the surrogates analyzed with sample FO071165 during the PAH analysis was outside laboratory control limits; see the TA laboratory report for further discussion.

Internal Standard Recoveries

Internal standard recoveries were processed during the laboratory analysis of PCB congeners. The recoveries were within control limits with the exception of the method blank. Pace

Analytical reports that the data were automatically corrected for recovery variation and accurate values were obtained.

Laboratory Control/Laboratory Control Duplicate Samples

Laboratory control/laboratory control duplicate samples were processed during the laboratory analysis of PAHs, phthalates, SVOCs, and PCB congeners. All laboratory control sample recoveries were within laboratory control limits. The relative percent difference for benzoic acid between the laboratory control and laboratory control duplicate samples was outside of control limits. CAS reports that the data quality is not significantly affected and no further corrective action was appropriate; refer to the CAS laboratory report for further discussion.

Other

The method reporting limits (MRL) for most samples were elevated during the EPA 8270C analyses due to less than optimal sample volume available for analysis.

A field decontamination blank (FDB) was collected and analyzed for metals, PAHs, phthalates, SVOCs, and PCB congeners. PCB congeners 129/138/163 and 153/168 were detected in the FDB at low concentrations. These congeners also were detected in the primary and duplicate samples from OF 52 and in the sample from OF M-1. The PCB congener 129/138/163 and congener 153/168 concentrations in the affected samples are greater than 5 times the FDB concentration and, therefore, are not footnoted in the data tables. The PCB congener 153/168 concentration in OF M-1 is less than 5 times the FDB and is considered biased high. As a result, for OF M-1, the total PCB concentration is considered biased slightly high.

Di-n-butyl phthalate was detected in the FDB blank analyzed by EPA Method 8270C. Results for the OF 52 samples are considered biased high (less than 10 times the FDB concentration). OF M-1 and M-3 sample concentrations are similar to the FDB detection and, therefore appear to be related to field decontamination procedures.

Zinc was detected in the FDB at a concentration of 1.49 ug/L. All detected concentrations in the samples were greater than 10 times the FDB.

Portland, OR 97204

RE: Portland Harbor Stormwater

Dear Jennifer:

Enclosed are the results of the samples submitted to our laboratory on October 01, 2007. For your reference, these analyses have been assigned our service request number K0708953.

All analyses were performed according to our laboratory's quality assurance program. Where applicable, the methods cited conform to the Methods Update Rule (effective 4/11/2007), which relates to the use of analytical methods for the drinking water and waste water programs. The test results meet requirements of the NELAC standards. Exceptions are noted in the case narrative report where applicable. All results are intended to be considered in their entirety, and Columbia Analytical Services, Inc. (CAS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please call if you have any questions. My extension is 3281. You may also contact me via Email at LVo@caslab.com.

Respectfully submitted,

Columbia Analytical Services, Inc.

Loan Vo, Ph.D.
Project Chemist

Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

Inorganic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result.
E	The result is an estimate amount because the value exceeded the instrument calibration range.
J	The result is an estimated concentration that is less than the MRL but greater than or equal to the MDL.
U	The compound was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
i	The MRL/MDL has been elevated due to a matrix interference.
X	See case narrative.

Metals Data Qualifiers

#	The control limit criteria is not applicable. See case narrative.
B	The result is an estimated concentration that is less than the MRL but greater than or equal to the MDL.
E	The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
M	The duplicate injection precision was not met.
N	The Matrix Spike sample recovery is not within control limits. See case narrative.
S	The reported value was determined by the Method of Standard Additions (MSA).
U	The compound was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
W	The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
i	The MRL/MDL has been elevated due to a matrix interference.
X	See case narrative.
*	The duplicate analysis not within control limits. See case narrative.
+	The correlation coefficient for the MSA is less than 0.995.

Organic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
A	A tentatively identified compound, a suspected aldol-condensation product.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result.
C	The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
D	The reported result is from a dilution.
E	The result is an estimate amount because the value exceeded the instrument calibration range.
J	The result is an estimated concentration that is less than the MRL but greater than or equal to the MDL.
N	The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
P	The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results (25% for CLP Pesticides).
U	The compound was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
i	The MRL/MDL has been elevated due to a chromatographic interference.
X	See case narrative.

Additional Petroleum Hydrocarbon Specific Qualifiers

F	The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
L	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
H	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
O	The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
Y	The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
Z	The chromatographic fingerprint does not resemble a petroleum product.

Sample Matrix:	Water		

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier I data deliverables. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Five water samples were received for analysis at Columbia Analytical Services on 10/01/2007. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

Semivolatile Organic Compounds by EPA Method 8270C

Relative Percent Difference Exceptions:
The Relative Percent Difference (RPD) for Benzoic Acid in the replicate Laboratory Control Sample (LCS/DLCS) analyses (KWG0710675-1 and KWG0710675-2) was outside control criteria. All spike recoveries in the LCS/DLCS were within acceptance limits, indicating the analytical batch was in control. The analyte in question was not detected in the associated field samples. The data quality is not significantly affected. No further corrective action was appropriate.

Elevated Method Reporting Limits:
The Method Reporting Limits (MRL) for most samples were elevated due to less than optimal sample volume available for analysis.

Sample Notes and Discussion
Insufficient sample volume was received to perform a Matrix Spike/Matrix Spike Duplicate (MS/MSD). A Laboratory Control Sample/Duplicate Laboratory Control Sample (LCS/DLCS) was analyzed and reported in lieu of the MS/MSD for these samples.

No other anomalies associated with the analysis of these samples were observed.

Approved by LJ Date 11.1.07

Notes and Definitions

Report Specific Notes:

J	-	Estimated value. Analyte detected at a level less than the Reporting Limit (RL) and greater than or equal to the Method Detection Limit (MDL). The user of this data should be aware that this data is of limited reliability.
RL1	-	Reporting limit raised due to sample matrix effects.
Z2	-	Surrogate recovery was above the acceptance limits. Data not impacted.

Laboratory Reporting Conventions:

DET	-	Analyte DETECTED at or above the Reporting Limit. Qualitative Analyses only.
ND	-	Analyte NOT DETECTED at or above the reporting limit (MDL or MRL, as appropriate).
NR/NA	-	Not Reported / Not Available
dry	-	Sample results reported on a Dry Weight Basis. Results and Reporting Limits have been corrected for Percent Dry Weight.
wet	-	Sample results and reporting limits reported on a Wet Weight Basis (as received). Results with neither 'wet' nor 'dry' are reported on a Wet Weight Basis.
RPD	-	RELATIVE PERCENT DIFFERENCE (RPDs calculated using Results, not Percent Recoveries).
MRL	-	METHOD REPORTING LIMIT. Reporting Level at, or above, the lowest level standard of the Calibration Table.
MDL*	-	METHOD DETECTION LIMIT. Reporting Level at, or above, the statistically derived limit based on 40CFR, Part 136, Appendix B. *MDLs are listed on the report only if the data has been evaluated below the MRL. Results between the MDL and MRL are reported as Estimated Results.
Dil	-	Dilutions are calculated based on deviations from the standard dilution performed for an analysis, and may not represent the dilution found on the analytical raw data.
Reporting Limits	-	Reporting limits (MDLs and MRLs) are adjusted based on variations in sample preparation amounts, analytical dilutions and percent solids, where applicable.
Electronic Signature	-	Electronic Signature added in accordance with TestAmerica's *Electronic Reporting and Electronic Signatures Policy.* Application of electronic signature indicates that the report has been reviewed and approved for release by the laboratory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report shall not be reproduced except in full, without the written approval of the laboratory.

REPORT OF: CHEMICAL ANALYSES

PROJECT: PCB CONGENER ANALYSES

DATE: October 26, 2007

ISSUED TO: Test America
Attn: Howard Holmes
9405 SW Nimbus Avenue
Beaverton, OR 97008

REPORT NO: 07-1060391

INTRODUCTION

This report presents the results from the analyses performed on five samples submitted by a representative of Test America. The samples were analyzed for the presence or absence of polychlorobiphenyl (PCB) congeners using USEPA Method 1668A.

SAMPLE IDENTIFICATION

Client ID	Sample Type	Date Received	Pace ID

REPORT OF: CHEMICAL ANALYSES

PROJECT: **PCB CONGENER ANALYSES** **DATE:** October 26, 2007

 REPORT NO: 07-1060391

DISCUSSION

The recoveries of the isotopically labeled PCB internal standards in the sample extracts ranged from 53-123%. With the exception of one value, which was flagged "P" on the method blank results table; the labeled standard recoveries obtained for this project were within the target ranges specified in the method. Since the quantification of the native PCB congeners was based on isotope dilution, the data were automatically corrected for variation in recovery and accurate values were obtained.

A laboratory method blank was prepared and analyzed with the sample batch as part of our routine quality control procedures. The results show the blank, with the exception of a low level of PCB #11, to be free of PCB congeners at the reporting limits. This analyte was not present in the samples at the reporting limit. The results show that the sample preparation procedures did not significantly impact the results of the sample analyses.

Laboratory spike samples were also prepared with the sample batch using clean reference matrix that had been fortified with native standards. The results show that spiked native compounds were recovered at 80-112%, with relative percent differences of 1.0-7.9%. These results indicate high degrees of accuracy and precision for these determinations.

REMARKS

The sample extracts will be retained for a period of 15 days from the date of this report and then discarded unless other arrangements are made. The raw mass spectral data will be archived on magnetic tape for a period of not less than one year. Questions regarding the data contained in this report may be directed to the author at the number provided below.

October 16, 2007
Sampling Event

Laboratory Data QA/QC Review
Upland Source Control Investigation
October 16, 2007 Stormwater Sampling

To: File

From: Julia Fowler, GSI

Date: June 1, 2009

This memorandum presents a quality assurance/quality control (QA/QC) review of the laboratory data generated during source control investigation sampling and analyses conducted by the City of Portland (City) on October 16, 2007. Eleven stormwater samples, one field duplicate sample and one field decontamination blank were collected by the City and submitted for analyses.

The laboratory analyses for these source control program samples were completed by the City's Bureau of Environmental Services (BES) laboratory and subcontracted laboratories. The following laboratories conducted the analyses listed:

- BES WPCL
    - Total Metals – EPA 200.8
    - Total Mercury – WPCL SOP M-10.02
    - Total suspended solids (TSS) – SM 2540D
    - Test America (TA)Polynuclear Aromatic Hydrocarbons (PAHs) – EPA 8270M-SIM
    - Phthalates – EPA 8270M-SIM
- Columbia Analytical Services (CAS)
    - Semivolatile Organic Compounds (SVOCs) – EPA 8270C
- Pace Analytical Services (Pace)
    - Polychlorinated Biphenyls (PCB) Congeners – EPA 1668A

The WPCL summary report for all analyses associated with this stormwater sampling event and the subcontracted laboratory's data reports are attached. The WPCL summary report comments that, with some exceptions (included in the following sections below), all analytical QA/QC

criteria were met for these samples including holding times, calibration, method blanks, laboratory control sample recoveries, duplicate precision, matrix spike recoveries, and surrogate recoveries, as applicable .The following QA/QC review is based on the available documentation supplied from each subcontracted laboratory and on exceptions noted in the WPCL summary report. The QA/QC review of the analytical data consisted of reviewing the following for each laboratory report, if available:

- Chain-of-custody for completeness and continuous custody
- Analysis conducted within holding times
- Chemicals of interest detected in method blanks
- Surrogate recoveries within laboratory control limits
- Internal standard recoveries within laboratory control limits
- Laboratory control sample and duplicate laboratory control sample recoveries within laboratory control limits

The results of the QA/QC review of the subcontracted laboratory reports are presented below.

Chain-of-Custody

The chain-of-custody forms showed continuous custody of the samples. The chain-of-custody procedures were adequate and sample integrity was maintained through the sample collection and delivery process.

Analysis Holding Times

The samples were extracted and analyzed within the required method-specific holding times.

Method Blanks

Method blanks were processed during the subcontracted laboratory analyses of PAHs, phthalates, SVOCs and PCB congeners. No analytes were detected in the method blanks.

Surrogate Recoveries

Surrogate recoveries were completed during the subcontracted laboratory analysis of PAHs and SVOCs. All surrogate recoveries were within laboratory control limits.

Internal Standard Recoveries

Internal standard recoveries were processed during the laboratory analysis of PCB congeners. All internal standard recoveries were within control limits.

Laboratory Control/Laboratory Control Duplicate Samples

Laboratory control/laboratory control duplicate samples (LCS/DLCS) were processed during the laboratory analysis of PAHs, phthalates, SVOCs, and PCB congeners. All laboratory control sample recoveries were within laboratory control limits. The relative percent differences for 2,4-Dimethylphenol, 2,4-Dinitrophenol and benzoic acid between the laboratory control and

laboratory control duplicate samples were outside of control limits. See the CAS laboratory report for additional detail.

Other

A field decontamination blank was collected and analyzed for metals, PAHs, phthalates, SVOCs, and PCBs. PCB congeners 129/138/163, 147/149, 153/168, 170, 174, 180/193, and 187 were detected in the FDB at low concentrations. One or more of these congeners also were detected in the primary and duplicate samples from OF 52, and in the sample from OF 52A, OF M-1, OF M-2, OF M-3, OF S-1, OF S-2, and OF S-6. For all affected samples, the concentrations of PCB congeners 129/138/163, 147/149, 153/168, 170, 174, 180/193, and 187 are less than 5 times the FDB concentration and are considered the result of field decontamination procedures. Therefore, the total PCB concentrations for these samples are biased slightly high.

Zinc was detected in the FDB at a concentration of 2.42 ug/L. Concentrations in all samples are greater than 10 times the FDB detection.

December 1, 2007 Analytical Report for Service Request No: K0709708

Jennifer Shackelford
Portland, City of
1120 SW Fifth Avenue # 600
Portland, OR 97204

RE: Portland Harbor Stormwater Samp.

Dear Jennifer:

Enclosed are the results of the samples submitted to our laboratory on October 17, 2007. For your reference, these analyses have been assigned our service request number K0709708.

All analyses were performed according to our laboratory's quality assurance program. Where applicable, the methods cited conform to the Methods Update Rule (effective 4/11/2007), which relates to the use of analytical methods for the drinking water and waste water programs. The test results meet requirements of the NELAC standards. Exceptions are noted in the case narrative report where applicable. All results are intended to be considered in their entirety, and Columbia Analytical Services, Inc. (CAS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please call if you have any questions. My extension is 3281. You may also contact me via Email at LVo@caslab.com.

Respectfully submitted,

Columbia Analytical Services, Inc.

Loan Vo, Ph.D.
Project Chemist

Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

Inorganic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result.
E	The result is an estimate amount because the value exceeded the instrument calibration range.
J	The result is an estimated concentration that is less than the MRL but greater than or equal to the MDL.
U	The compound was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
i	The MRL/MDL has been elevated due to a matrix interference.
X	See case narrative.

Metals Data Qualifiers

#	The control limit criteria is not applicable. See case narrative.
B	The result is an estimated concentration that is less than the MRL but greater than or equal to the MDL.
E	The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
M	The duplicate injection precision was not met.
N	The Matrix Spike sample recovery is not within control limits. See case narrative.
S	The reported value was determined by the Method of Standard Additions (MSA).
U	The compound was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
W	The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
i	The MRL/MDL has been elevated due to a matrix interference.
X	See case narrative.
*	The duplicate analysis not within control limits. See case narrative.
+	The correlation coefficient for the MSA is less than 0.995.

Organic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
A	A tentatively identified compound, a suspected aldol-condensation product.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result.
C	The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
D	The reported result is from a dilution.
E	The result is an estimate amount because the value exceeded the instrument calibration range.
J	The result is an estimated concentration that is less than the MRL but greater than or equal to the MDL.
N	The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
P	The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results (25% for CLP Pesticides).
U	The compound was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
i	The MRL/MDL has been elevated due to a chromatographic interference.
X	See case narrative.

Additional Petroleum Hydrocarbon Specific Qualifiers

F	The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
L	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
H	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
O	The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
Y	The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
Z	The chromatographic fingerprint does not resemble a petroleum product.

Client / Project: WPCL - City of Portland BES Service Request K07 709708

Received: 10/17/07 Opened: 10/17/07 By: DD

1. Samples were received via? *US Mail* *Fed Ex* *UPS* *DHL* *GH* *GS* *PDX* (Courier) *Hand Delivered*
2. Samples were received in: (circle) (Cooler) *Box* *Envelope* *Other* _____ *NA*
3. Were custody seals on coolers? NA Y (N) If yes, how many and where? _____
   If present, were custody seals intact? Y (N) If present, were they signed and dated? Y (N)
4. Is shipper's air-bill filed? If not, record air-bill number: _____ NA Y (N)

5. Temperature of cooler(s) upon receipt (°C):	-0.2			
Temperature Blank (°C):				
6. If applicable, list Chain of Custody Numbers:				

7. Were custody papers properly filled out (ink, signed, etc.)? NA (Y) N
8. Packing material used. *Inserts* *Bubble Wrap* *Gel Packs* (Wet Ice) *Sleeves* *Other* _____
9. **Did all bottles arrive in good condition (unbroken)?** *Indicate in the table below.* NA (Y) N
10. Were all sample labels complete (i.e analysis, preservation, etc.)? (Y) N
11. Did all sample labels and tags agree with custody papers? *Indicate in the table below* (Y) N
12. **Were the correct types of bottles used for the tests indicated?** NA (Y) N
13. Were all of the preserved bottles received at the lab with the appropriate pH? *Indicate in the table below* (NA) Y N
14. Were VOA vials and 1631 Mercury bottles checked for absence of air bubbles? *Indicate in the table below.* (NA) Y N
15. **Are CWA Microbiology samples received with >1/2 the 24hr. hold time remaining from collection?** (NA) Y N
16. Was C12/Res negative? NA (Y) N

RE: Portland Harbor

Enclosed are the results of analyses for samples received by the laboratory on 10/17/07 12:35. The following list is a summary of the Work Orders contained in this report, generated on 11/20/07 11:56.

If you have any questions concerning this report, please feel free to contact me.

Work Order	Project	ProjectNumber
PQJ0645	Portland Harbor	36238

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report shall not be reproduced except in full, without the written approval of the laboratory.
