Subject: shipping propane

Here is a wonderful opportunity to live up to the **Climate Action Champions** award: say NO to the liquified propane terminal. The proposed propane export terminal would result in over 10,000 tons of CO₂ released into the atmosphere each day. This is just from the burning of propane. It doesn't include the massive footprint involved in the fracking, liquefying or shipping process.

Propane gas is obtained by fracking. It would be shipped down the Columbia by train, then stored in tanks. Just one train derailment or storage tank explosion would be a huge catastrophe for this region.

Just say NO.

thank you
