Susan,

While I highly sympathize with efforts to curtail the pollution caused by burning propane, I am curious to hear how in the meantime you propose to keep not just Americans, but people globally, safely warm in the predicted extreme cold that goes hand-in-hand with global warming (or more conservatively climate change), as well as keeping the economies of the world from collapsing with the removal of this and similar energy sources. Every effort to replace these will need to be coupled with other energy-intensive methods of creating other practical fuel sources, particularly solar and hydrogen.

Other than championing efforts to solve the over-population problem that greatly exacerbates this problem, are there currently available viable plans, as well as badly needed funds, already in place to accomplish this Herculean task in a timely manner - before this weather shift becomes, as many experts say, irreversible? If so, I would like to hear about them.

Thank you for your time and interest.
