The following applications of smart grid are examples of how smart grid technology can be used. A smart grid must be *designed* to run desired applications. Potential smart grid deployments include:

DISTRIBUTION GRID MANAGEMENT: Distribution power systems consist of hundreds of distribution feeders and thousands of distribution transformers that supply millions of customers. They also contain a large number of locally and remotely controllable devices. Distribution power systems are large and complex systems to control. Basic modernization that includes distribution automation and control systems as well as smart grid technologies will enable distribution systems to be more fully automated, capable of self-healing, and optimized to reduce losses.

OUTAGE MANAGEMENT AND RECOVERY: Smart grid technologies can significantly enhance outage detection, providing near instantaneous detection, a capability not currently available to distribution system operators. Information will be available on when and where outages have occurred, and will contribute to determining causes of outages. Recovery time will be minimized and outages will have reduced impacts on consumers.

VOLTAGE OPTIMIZATION-CONSERVATION: Many loads operate more efficiently at lower voltage. With voltage optimization, voltages are optimized to loads, so that they operate as efficiently as possible with minimal disruptions. Smart grid equipment on the system, such as distributed sensors, control capacitors, and regulators will provide capabilities to optimize voltage. Advanced metering will provide voltage information on the consumer premises.

DEMAND RESPONSE: With peak demand pricing, advanced metering infrastructure, energy management capability, and smart appliances, consumers can take advantage of "prices to devices." This concept enables consumers to take control of their electricity use when prices rise during peak demand periods. Consumers will pre-program their energy management systems or smart appliances to operate within selected price and performance levels. When high prices arrive, the system reacts automatically as directed by the consumer, by turning equipment down, stopping operation of certain functions or not operating at all.

SMART GRID TECHNOLOGIES RESEARCH IN OREGON

Oregon recognizes that the use of smart grid applications can enable a more rapid restoration of power after outages and help build resiliency, enhance reliability and security, and reduce risk and vulnerability. Applying smart grid technologies into the energy infrastructure in Oregon is in the initial planning stages.

Oregon is researching a variety of smart grid technologies that could possibly be used to improve the resiliency of its electric delivery infrastructure and support the deployment and penetration of renewable resources. The goal is that during power outages, Oregon's electric utilities could implement smart grid applications to accomplish the intelligent routing of electricity to serve customers in a prioritized manner.

Oregon's electric distribution feeders provide service in only one direction, from the substation (source) to the customer (load). Most feeders also contain switches that allow certain customers or segments of feeders to be transferred to a different feeder during outage conditions. This switching process is manual and causes customers to be "dropped" momentarily and then "picked up" by the second feeder. Traditionally, such operations are often limited since there is usually insufficient time to analyze whether the second feeder has the capacity to serve additional electric demand. Since the number of protective devices on any given feeder has been historically limited by economic considerations, the strategy often results in the curtailment of service to customers that are served by unaffected equipment.

Smart grid can augment the manual process that is in use in Oregon today with one that is high-speed and to some degree, automatic (Distribution Automation or DA). DA provides an automated response to feeder line faults by using an analytical assessment, direct automatic feeder sectionalizing and restoration. After the system detects a line fault, it determines its location, and opens the nearest available switches during a tripped state of the fault-clearing recloser or breaker. This automatically isolates the faulted segment from the rest of the feeder. Afterward, the system automatically closes switches to restore power to unfaulted distribution feeder segments. This sequence of events is considered to be self-healing since it occurs automatically. The validation process, which confirms the faulted distribution feeder segment, is a critical step and must precede any automatic restoration.

NEXT STEPS FOR SMART GRID INTEGRATION

It is clear that smart grid technologies could improve electric reliability, reduce customers' cost of outages, reduce electric production costs, reduce system losses and associated financial benefits to utilities and consumers. However, it will take time and is not without its costs.

Oregon is in the process of developing uniform integration standards and policies for smart grid considerations. OPUC first consulted with the states of California, Colorado, Illinois, New York, Texas, and the District of Columbia, to research different approaches to applying smart grid technologies around the country. In the fall of 2010, OPUC drafted a Smart Grid Straw Proposal and initiated discussions with the utilities in the state. Based on feedback from the utilities as well as input received at public meetings and workshops, OPUC established guidelines for developing "Utility Smart Grid Plans." OPUC guidelines recommend utilities address the following issues in their respective Smart Grid Plans.

- Access, Control, and Use of Customer Information
- Opt in, Opt out, or Mandatory Program Participation
- Treatment of Obsolescence Risk
- Utility Energy Management in Customer's Home or Business

On May 25, 2011, commissioners issued an interim Order to develop a process for staff and utilities to gather necessary information to establish planning guidelines and make policy decisions on smart grid. For copies of the guidelines and to track smart grid progress in Oregon, go to OPUC's website at www.oregon.gov/PUC/.

OPUC and state utility operators actively support current standards and guidelines of the North American Electrical Reliability Corporation involving Critical Infrastructure Protection and Cyber Security Safeguards. OPUC also conducts annual audits of investor owned energy utilities to ensure cyber security issues and concerns are addressed and resolved.

NEXT STEPS FOR INTEGRATING RENEWABLE RESOURCES

The role of renewable resources in emergency planning is not yet clear. Renewable resources provide significant benefits by reducing the environmental footprint of electricity and fuel production. Renewable energy developments are also considered a sustainable long-term investment in a naturally-replenished resource rather than a finite one. Of particular interest in emergency planning, renewable resources may be scalable. They may be available as small-scale distributed generation rather than central power developments far from communities in need. Also, the fuel (the renewable resource) would continue to be available when roads and traditional supply routes are not. In these roles, renewable energy generators may provide energy emergency managers with an opportunity to provide power to emergency services when needed during an event.

The first step to support the integration of renewable resources into the electrical grid is to ensure that transmission capacity exists and balancing can be managed. BPA, which owns and operates three-quarters of the Pacific Northwest's high-voltage transmission, plays a vital role in facilitating the integration of renewable resources into the region's transmission system. With wind generation reaching an all-time peak of 3,006 megawatts in February 2011 and anticipated 5,000 to 6,000 megawatts by 2013, BPA and other utilities have project proposals underway to increase load capacity. Not only will there be an increasing volume of new renewable generation dispersed across the state, but the variability of the energy production requires significant attention to balancing – unlike conventional power developments where dispatchable power is predictable and controlled.

RW Beck completed the Oregon Distributed Energy Resiliency Study to assist the state to identify opportunities to improve energy resilience through the design and integration of distributed renewable energy investments into the existing energy network. This study considers how new technologies, including renewable energy resources, could provide local energy generation to communities and emergency service providers during energy emergencies when their energy network supply may possibly be disrupted. See Appendix K in this plan to review the executive summery. The complete study is posted on ODOE's webpage at www.oregon.gov/ENERGY.

CYBER SECURITY

As Oregon's smart grid investments and initiatives increase, cyber security, a key component of energy assurance, will become more crucial. Because smart grid relies on information communication, cyber vulnerabilities can equate to smart grid vulnerabilities, which in turn lead to vulnerabilities in the entire energy supply system.

Cyber security falls under Emergency Support Function (ESF) 2, the communications sector. In Oregon, OPUC and Oregon Emergency Management are the primary state agencies responsible for planning, preparedness, response, and recovery from cyber security breaches in the state.

Cyber security includes preventing damage to, unauthorized use of, or exploitation of electronic information and communications systems and the information contained therein to ensure confidentiality, integrity, and availability. Cyber security also includes restoring electronic information and communications systems in the event of a terrorist attack or natural disaster.

Oregon will consider a cyber security strategy that takes into account information on impacts, vulnerabilities, and threats to produce a risk assessment. This includes addressing deliberate attacks, such as those launched by disgruntled employees, industrial espionage, and terrorists as well as preventing inadvertent compromises of the information infrastructure due to user errors, equipment failures, and natural disasters.

Chapter 5

Types of Energy Emergencies

OREGON STATE ENERGY ASSURANCE PLAN

INTRODUCTION

During any given year, Oregon faces a variety of energy supply disruptions. When these disruptions are limited in scope, and addressed quickly by energy providers, they are barely newsworthy. If, however, these disruptions extend over wide areas and last more than several hours they may become “energy emergencies” requiring the intervention of government agencies.

The term "energy" includes producing, refining, transporting, generating, transmitting, conserving, building, distributing, and maintaining energy systems and system components. "Energy resources" includes electricity, natural gas, gasoline and middle distillates, coal, wood fuels, geothermal sources, and any other resource yielding energy.

CHARACTERISTICS OF ENERGY EMERGENCIES

In general, an energy emergency exists whenever supplies of fuels or electricity are inadequate to meet demand. Shortages and disruptions can result from many factors. Threats to the energy infrastructure include:

- SEVERE WEATHER CONDITIONS: Winter storms, wind storms, drought, and heat waves could stress the energy system as sudden or unexpected surges in demand cannot be met by actual or expected supply levels. Wind storms and freezing rain can also disrupt electrical supply and distribution and hamper transportation.

- NATURAL DISASTERS: Floods, earthquakes, and tsunami conditions could reduce supply, disrupt distribution, and cause physical destruction of energy systems and/or components. A severe earthquake is likely the Pacific Northwest’s most catastrophic event and is examined more fully in this chapter.

- ENERGY INFRASTRUCTURE EVENTS —Spikes in demand during peak energy use, unanticipated power plant or refinery shutdowns, transmission system congestion, and equipment and system failures could result in the reduction of supply and disrupt distribution.

- NATIONAL SECURITY EVENTS: Acts of terrorism, cyber attacks, and sabotage could result in the physical destruction of energy systems and/or components, increase demand for fuels, and also reduce the fuel supplies available to the United States.

- POLITICAL FACTORS — Oil embargos, war, and the mobilization of defense resources could create a sudden surge in demand. These events could also reduce the fuel supplies available to the United States.

- MARKET RELATED EVENTS – A sharp, sudden escalation in the price of energy products could result from a curtailment of supplies and stocks. These conditions could reduce demand for conventional energy resources.

ENERGY INFRASTRUCTURE PROTECTION

Protecting the critical energy infrastructure is the shared responsibility of the private sector and local, state, and the federal government. "Critical" infrastructure is infrastructure that, if disrupted, would significantly impact public health and safety, the economy, and/or national security. Any prolonged interruption of the supply of basic energy - whether it is petroleum, electricity, or natural gas products - could pose considerable harm to Oregonians, our environment, and the state's economy.

FEDERAL, STATE, LOCAL, AND PRIVATE INDUSTRY PARTNERSHIPS

No single government agency, industry group, or company can secure the entire energy infrastructure from every hazard or threat. Collaboration at all levels is essential to securing an interdependent infrastructure that is owned, operated, hosted, and regulated by many entities.

The state is partnering with DOE/OE and the private sector to coordinate critical energy infrastructure protection and resiliency efforts. This includes mitigating energy emergencies, identifying Oregon's critical energy infrastructure, and protecting the state's energy assets. USDOE recognizes the major role Oregon and other states play in developing policy and practices to protect energy assets within and beyond their borders as well as a states' central role in preparing for and responding to energy shortages, disruptions, and emergencies.

As the lead federal agency, USDOE has established liaisons with state agencies in each state responsible for preventing and responding to energy disruptions. The overall goal is to have a robust, resilient energy infrastructure in which continuity of business and services is maintained through secure and reliable information sharing, effective risk management programs, coordinated response capabilities, and trusted relationships between public and private partners at all levels of industry and government.

Earthquakes

OREGON STATE ENERGY ASSURANCE PLAN

INTRODUCTION

The Portland metropolitan area and surrounding vicinity has been the most seismically active region in Oregon. Six earthquakes of magnitude 5 or higher have occurred within the greater Portland area within the last 150 years, including a 5.6 magnitude earthquake near Scotts Mills in 1993 and two 6.0 magnitude earthquakes near Klamath Falls later that same year. These occurrences and an extensive geologic record of seismic activity indicate that Oregon will someday experience a catastrophic earthquake. Oregon Department of Geology and Mineral Industries (DOGAMI) is collaborating with ODOE and OPUC on earthquake risk studies to the energy sector and various reports on this topic will be available in the future.

OREGON CRITICAL ENERGY INFRASTRUCTURE HUB

A concentration of Oregon's critical energy infrastructure is located in the heart of the high seismic hazard area along an eight mile stretch of the lower reach of the Willamette River in northwest Portland. This includes marine oil terminals, fuel tank farms, liquefied natural gas, natural gas, and power transmission systems. This Critical Energy Infrastructure Hub (CEI Hub) for the state sits on top of very poor soils that are highly susceptible to earthquake-induced permanent ground deformation.

More than 90 percent of Oregon's refined petroleum products come from four refineries located in the Puget Sound area of Washington State. The refineries transport product to Oregon by pipeline and marine vessels. Product enters the state at the CEI Hub before this fuel is distributed throughout Oregon to the end user, which includes the Portland International Airport. In addition, critical high voltage transmission lines and distribution substations sit at the river crossing in the CEI Hub. Liquid fuel and natural gas pipelines and transfer stations are also located at the CEI Hub.

TYPES OF EARTHQUAKES

DOGAMI confirms that Oregon and the city of Portland face danger from two types of earthquakes. They include Crustal earthquakes and the Cascadia Subduction Zone earthquakes. Both types could produce widespread damage and have potentially significant consequences.

CRUSTAL EARTHQUAKES

Crustal earthquakes are produced by shallow faults as deep as 15 miles below the surface. The Portland Hills Fault falls under this category of crustal earthquakes. The Portland Hills Fault runs from north of Forest Park, goes along the foot of Portland's West Hills and beneath Portland State University, then crosses the Willamette River and heads southeast to Milwaukie. The Portland Hills Fault can result in an earthquake of magnitude 7 and intense shaking.

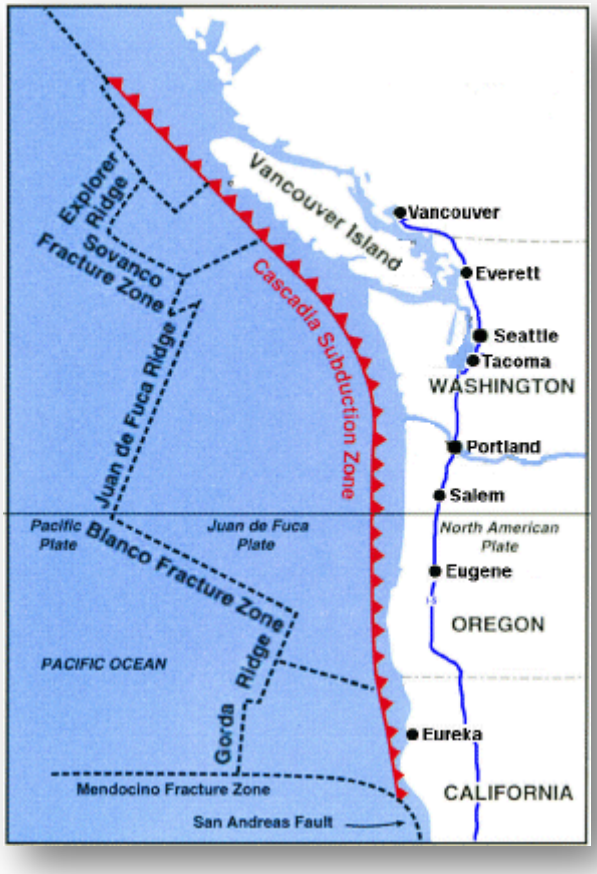
Figure 25: Portland Hills Fault runs from north of Forest Park and along the Portland West Hills and crosses the Willamette River

The duration of the event would be 20-30 seconds, but the ground shaking and damage can be intense because of the fault's proximity and local soil conditions.

CASCADIA SUBDUCTION ZONE

The Pacific Northwest's extreme disaster is a magnitude 9 earthquake on the Cascadia Subduction Zone, which would produce minutes of strong ground shaking, coastal subsidence, landslides, liquefaction, lateral spreads, and a coastal tsunami. Much of Oregon's infrastructure has not been designed to tolerate these extreme conditions.

The Pacific Northwest sits on a convergent continental boundary, where two tectonic plates are colliding. This boundary is called the Cascadia Subduction Zone. The Cascadia Subduction Zone is a 600 mile-long fault where the Juan de Fuca and North American plates converge and the heavier Juan de Fuca Plate plunges, or subducts, beneath the as it heads eastward. The two plates are converging at a rate of about one to two inches per year, which causes stress to accumulate. Earthquakes are caused by the abrupt release of this slowly accumulated stress.



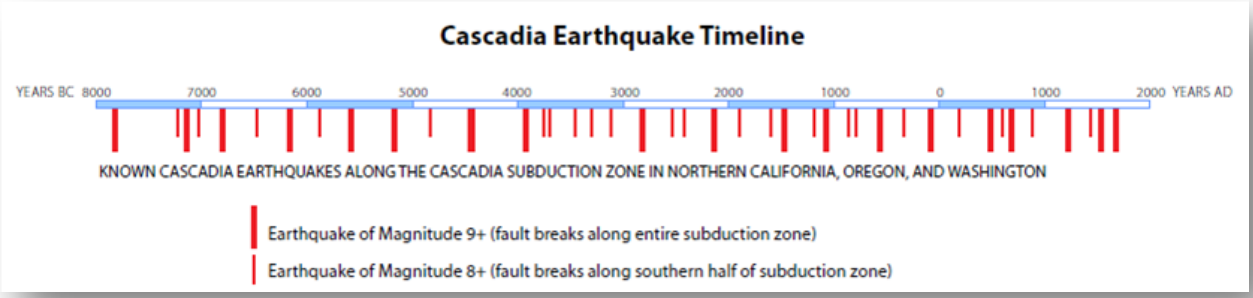


Figure 26: 600 mile-long Cascadia Subduction Zone Fault

The fault runs parallel to the coasts of British Columbia, Washington, Oregon and northern California. Evidence shows that the plates are sticking as they pass each other, building up tremendous pressure that could be unleashed in a magnitude 9 earthquake.

Similar subduction zones have produced the two largest recorded earthquakes in the world. This includes a magnitude 9.5 quake on the coast of Chile in 1960 and a magnitude 9.2 quake in southern Alaska in 1964.

No quakes of that size have been measured in Oregon's brief recorded history, but many lines of evidence, such as buried coastal marshes, indicate that such events occurred 41 times in the past 10,000 years *(see timeline)*. They strike, on average, about every 250 years -- occurring as close as 30 years apart and as far as 580 years apart according to recent data. The last megaquake hit the Pacific Northwest in January 26, 1700.

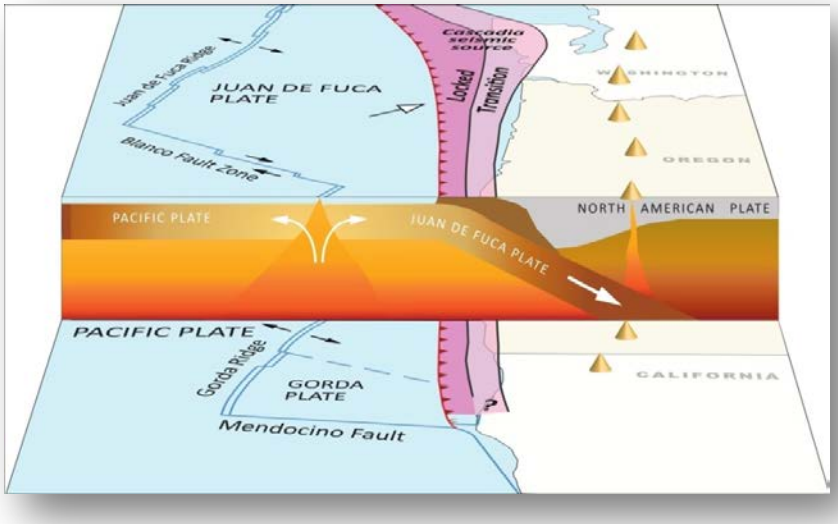

Figure 27: Cascadia Earthquake Timeline

Unlike the crustal earthquakes that produce shaking for a minute or less, subduction-zone quakes produce shaking that can last four or five minutes and deadly tsunamis as high as 30 to 50 feet. The 1964 Alaska quake generated a tsunami that killed four children at Oregon's Beverly Beach and 11 people in Crescent City, California.

Figure 28: Cascadia Subduction Zone Fault

Not only would coastal communities be severely impacted, but towns and cities as far inland as the Willamette Valley and the Puget Sound area would feel the effects of such lengthy shaking. In Oregon alone, researchers have estimated that such a quake could cause billions in damages and kill 5,000 people.

Earthquake Risk Study

It is clear that earthquake impacts to the CEI Hub could adversely affect energy lifelines. Consequently, it is critical for emergency planners and decision-makers to gain a better understanding of the seismic hazards, vulnerabilities, and consequences if the CEI Hub was compromised. The goal is to minimize direct earthquake damage to the CEI Hub and ensure a rapid recovery of the state's energy supply and distribution systems.

As a result, DOGAMI is conducting an earthquake risk study for Oregon's CEI Hub in Portland. The study assesses the seismic hazards, vulnerabilities and potential impacts to the energy sector facilities and systems, and possible impacts to the State of Oregon.

SEISMIC HAZARDS

DOGAMI's study confirms that the Portland Hills Fault and the Cascadia Subduction Zone earthquakes can trigger the following seismic hazards.

- GROUND SHAKING - The U.S. Geological Survey reports that extensive ground shaking is expected for western Oregon from the Cascadia fault. The figure below shows Oregon's ground shaking seismic hazards with higher expected shaking levels represented by the red colors (darker, if viewed in black and white). For the CEI Hub, strong ground shaking is expected to last for one to two minutes from a Cascadia earthquake. This prolonged duration of shaking would produce significant damage, particularly in areas of weak soils and weak infrastructure.

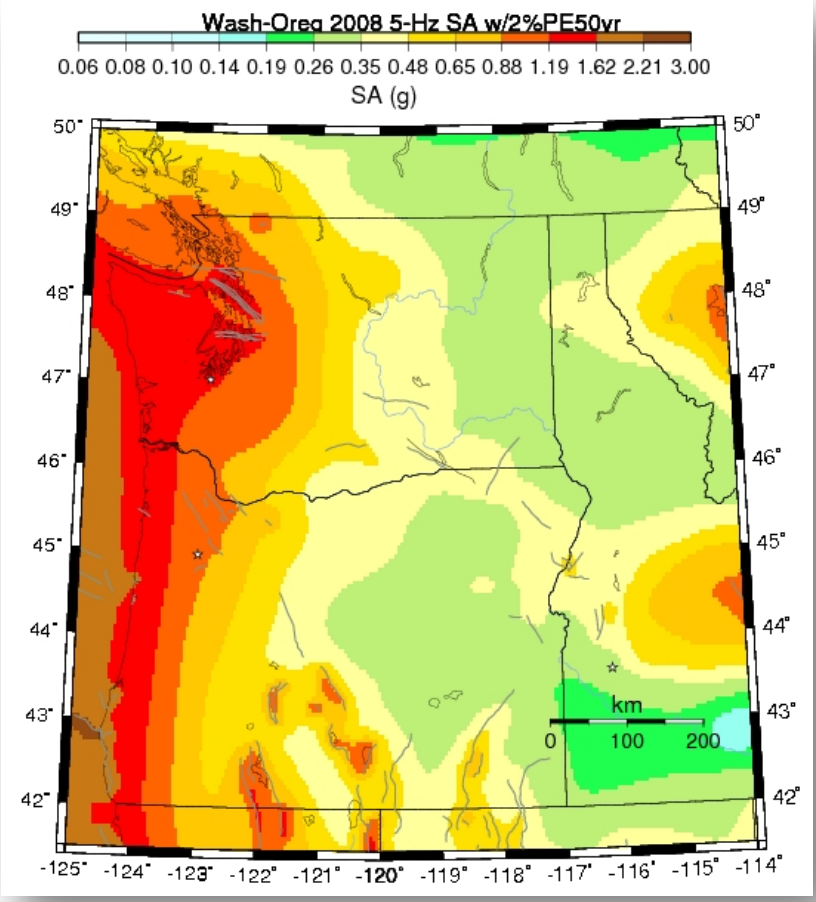

Figure 29: Ground shaking map
http://earthquake.usgs.gov/hazards/products/conterminous/2008/maps/wus/pacnw/3hzSA.OrWa.jpg

LIQUEFACTION - Liquefaction occurs when ground shaking agitates loose, water-saturated, sandy soils and results in liquefied soils. As a result, buildings can sink several feet into the ground and buried pipes can float to the ground surface. The CEI Hub is adjacent to the Willamette River and has extensive deposits of highly liquefiable soils. These soils have been naturally deposited by river activity as well as from manmade activities such as from river dredging.

LATERAL SPREADING - Lateral spreading occurs when the ground permanently moves laterally due to earthquake shaking. Lateral spreading is common along river fronts because river deposited soils are often weak and water-saturated. Lateral spreading can occur on gentle slopes and even on flat ground. The CEI Hub has extensive deposits of soils highly susceptible to lateral spreads.

LANDSLIDES - Landslides are land masses that move down hill and result in permanent ground deformation. Earthquakes can trigger landslides due to the ground shaking over a wide region and cause extensive damage. The CEI Hub area has several mapped landslides. This includes debris flows from the West Hills and rock falls and slumps along Highway 30. These mapped landslides are assumed to be triggered from rainfall events and not by earthquake activity.

CO-SEISMIC SETTLEMENT - Co-seismic settlement is where the ground surface is permanently lowered due to seismic shaking and occurs in certain types of soft, loose soils. The CEI Hub area has soils that are generally susceptible to co-seismic settlement. In some places, settlement could be on the order of a few inches or more. When soils experience uniform settlement, structures are often unharmed. However, when soils experience differential settlement, structures can incur damage.

BEARING CAPACITY FAILURES - Bearing capacity failures can occur when, during shaking, the foundation soils cannot support the structure that they are intended to support. This occurs when the subgrade soils have not been engineered and constructed adequately. The CEI Hub area has soils that are generally susceptible to co-seismic bearing capacity failures. When soils experience differential settlement, structures can tilt and incur damage.

SLOSHING - Sloshing occurs when liquid becomes agitated by ground shaking. Sloshing in tanks has produced damage from distant earthquakes. The CEI Hub has numerous tanks with liquid fuel and other products that are susceptible to sloshing. Waves and splashing of liquids can overtop and/or damage tanks.

SEICHES - Seiches are waves that oscillate in water bodies and can be initiated by ground shaking. Seiches can vary from minor (inches in height) to over ten feet and last up to hours. The Willamette River in the CEI Hub area could experience a seismically-induced seiche.

FIRES - Fires are often triggered as secondary effects from earthquakes. Numerous potential ignition sources are available in the CEI Hub area. Certain types of fires, such as fires with predominately petroleum fuel or transformer PCBs require advanced fire specialists to contain.

HAZARDOUS MATERIAL RELEASES - Hazardous materials are often released during earthquakes. Numerous potential sources for possible uncontrolled hazardous material releases exist in the proximity of the CEI Hub both onsite and at nearby energy facilities. These materials can pose different types of hazards. This includes corrosive, explosive, combustible, poisonous, and/or toxic risks. A few examples are: petrochemicals, liquefied natural gas, chlorine gas, and anhydrous ammonia.

ENERGY FACILITY AND SYSTEM VULNERABILITIES

Onsite meetings and tours were conducted at all relevant energy facilities in the CEI Hub to evaluate seismic vulnerabilities. The petroleum companies visited include: BP Terminal, Chevron Terminal, Conoco Phillips Terminal, KinderMorgan Terminal and Pipeline Company, McCall Oil Terminal, NuStar Terminal, and Shell Terminal. Key components evaluated include tank farms, marine docks, interconnecting pipelines, tank truck loading/off-loading racks, rail car loading/unloading racks, containment and drainage control areas, control rooms, and lube oil and additive blending facilities.

Onsite visits were also made to natural gas and utility companies in the CEI Hub. They include: Northwest Natural, Williams Northwest Pipeline, PGE, and BPA. No PacifiCorp facilities reside in the CEI Hub so no visits were made. Key components evaluated at the electrical facilities include electric substations that feed into the region's power grid. Substations include control buildings with control equipment and back-up batteries, transformers, circuit breakers, and bus structures. The power system also includes transmission lines and transmission towers. The natural gas system includes gate stations, transmission and distribution pipes, and an LNG terminal, which includes tanks, liquification and gasification processing equipment, and control equipment.

The study showed that the energy facilities and systems across the petroleum, electricity, and natural gas sectors vary to a great extent. Some facilities have infrastructure that range from about 100 years old and were built to no or very antiquated standards to new and built to the current state-of-practice standards. Because of the wide range of ages and associated construction practices, the seismic vulnerability of the facilities also spans a wide range.

Based on visual observations, engineering judgment and limited information from the facility operators, DOGAMI's study confirmed that major seismic vulnerabilities exist in the CEI Hub. Some critically important structures appear to be highly susceptible to significant damage in a major earthquake. In contrast, some structures are expected to have adequate seismic performance. All of the facilities in the CEI Hub are vulnerable to the seismic hazards described above.

SECTOR SPECIFIC FINDINGS

PETROLEUM

The CEI Hub petroleum facilities receive liquid fuel by pipeline and marine vessels. In general, 75 percent of the refined petroleum product is transported by pipeline and the remainder by tankers or barges. The transportation method and amounts do vary depending on product need, transportation costs, weather and other conditions. The liquid fuel pipeline was largely constructed in the 1960s when the regional seismic hazards were unknown and state-of-practice construction techniques at that time did not include any reference to seismic standards. The regional seismic hazards are now known to be significant and the soils at the river crossings are susceptible to liquefaction and lateral spreading. The 1960s vintage pipeline design did not consider ground movements from lateral spreading at river crossings or the stresses to the pipelines induced by earthquakes that may cause pipe damage and multiple breaks. A pipe break would have a significant impact on all of the petroleum facilities in the CEI Hub and could result in a statewide fuel shortage.

The navigational shipping channel from the Columbia River mouth to the lower Willamette River is used to transport fuel by marine vessels. The Columbia River mouth is expected to have tsunami damage and the channel is expected to experience slope failure, which would close the channel to traffic. It is possible that bridges and other river crossings, such as buried gas pipelines and electrical crossings, would be damaged and temporarily block the waterway. Closure of the shipping channel would prevent marine vessels from delivering liquid fuel and emergency response and recovery equipment.

All of the port facilities in the CEI Hub have significant seismic risks due to liquefaction, lateral spreading, and seiches. Some older piers were constructed without any seismic protection, have deteriorated, and are likely to fail in even a moderate earthquake. If oil products are released and contaminate the navigable waterway, the waterway may be closed to river traffic, thus impeding emergency response activities as well as the supply chain. The local capacity to fight fires and clean hazardous material spills is limited.

Only three existing tanks are known to have addressed liquefaction vulnerabilities. The fuel terminals in the CEI Hub on average have a three to five day supply in the tank farms for regular unleaded gasoline and diesel fuel. Premium gasoline is subject to the daily delivery and heavily dependent on whether the intercompany pipeline on Front Avenue is operational. If the supply chain is disrupted by pipe breaks north of the CEI Hub and closure of the shipping channel to the west, fuel would quickly become scarce. Options to transport fuel from the east and south and by air are limited.

Portland International Airport (PDX) receives 100 percent of its liquid fuels from a terminal in the CEI Hub. PDX has a limited onsite fuel supply. If the pipeline between the CEI Hub and PDX fails, then PDX would likely experience a shortfall and operations would be impacted.

NATURAL GAS

Oregon's largest natural gas service provider receives the majority of their natural gas from pipelines that cross under the Columbia River between Washougal, Washington and Troutdale, Oregon. One of the natural gas pipelines crosses under the Willamette River at Multnomah Channel near their gate station at the southern end of Sauvie Island. The soils at these river crossings are subject to liquefaction and lateral spreading. The pipes are 1960s vintage and constructed without seismic design. The consequences of potential pipe failures could be major for natural gas service territories and Oregon. The natural gas company's storage capacity is limited and pipe breaks could lead to a natural gas shortfall in the state as well as explosions or fires.

ELECTRICITY

Electrical facilities and systems have significant seismic risk due to ground shaking and ground failure, including liquefaction and lateral spreading. Seismically vulnerable facilities include substations and transmission towers in the CEI Hub as well as facilities outside of the CEI Hub, including power plants, substations and transmission lines, all which are important for distribution.

Major vulnerabilities in the CEI Hub include the control buildings, transformers and other electrical equipment in yards at the substations, and transmission towers near the Willamette River. Damage is likely to occur to both the transmission system and the distribution system in the CEI Hub. Damage to the electrical grid will likely result in a blackout in the CEI Hub and elsewhere.

Bonneville Power Administration (BPA) has conducted a comprehensive seismic vulnerability study and implemented a long-term seismic mitigation program. This includes seismic strengthening of substation yards, including anchoring and bracing high-voltage equipment to withstand earthquake motions. These mitigation techniques will improve the reliability of seismic performance.

BPA studies also indicate that transmission system failure due to a magnitude 9 Cascadia earthquake would require between 7 and 51 days to make emergency damage repairs to the transmission system in Oregon and Washington. This scenario assumed many ideal conditions, which includes BPA employees and contractor resources are immediately available to make repairs as well as all roads and bridges are passable and adequate fuel is available to support recovery operations.

BPA has conducted subsurface, liquefaction and lateral spreading analyses at one of the transmission tower sites at the Willamette River crossing. The analysis concluded that severe ground movement up to 25 feet towards the river channel is possible resulting in extensive damage to transmission towers. As a result, power lines could temporarily block river traffic, including the pathway to the oil terminals. BPA anticipates mitigation on these transmission towers to be completed by 2014.

RECOMMENDATIONS

DOGAMI makes four recommendations to both private and public energy sector stakeholders to improve energy sector resiliency in Oregon.

1. Energy sector companies should conduct Seismic Vulnerability Assessments on all of their systems or facilities, and should work with the appropriate local, state, tribal and federal government agencies and stakeholders to achieve timely completion of the assessments to understand existing vulnerabilities.

2. Energy sector companies should institutionalize long-term seismic mitigation programs, and should work with the appropriate local, state, tribal and federal government agencies and stakeholders to achieve timely and effective mitigation to ensure facility resilience and operational reliability.

3. The State of Oregon's Homeland Security Council should review the vulnerability and resilience of the energy sector to earthquakes and other natural disasters within the scope of their mission. This could involve partnering with ODOE, OPUC, DOGAMI, ODOT, Building Codes Division, and the Oregon Seismic Safety Policy Advisory Commission (OSSPAC).

4. Energy sector companies and the State of Oregon should build Oregon's seismic resilience to a Cascadia earthquake. Adopting pro-active practices and a risk management approach will help achieve seismic resilience. Encouraging a culture of awareness and preparedness concerning the seismic vulnerability of the energy sector including long range energy planning should be conducted.

The Earthquake Risk Study will assist emergency planners to design realistic earthquake drill scenarios to test plans and procedures in response to energy emergencies to ensure program readiness. The findings in this report will also assist the state to develop long-term risk management strategies for improved energy assurance and resiliency. A copy of the Earthquake Risk Study is available on OPUC's website at www.oregon.gov/PUC.

Chapter 6

Overview of Energy Sector-Specific Emergency Response Plans

OREGON STATE ENERGY ASSURANCE PLAN

INTRODUCTION

Despite efforts to reduce risk and implement mitigation measures to limit vulnerabilities to Oregon's energy lifelines, emergency planners and decision-makers recognize that it is impossible to plan for every contingency. Emergencies will occur. ODOE and OPUC developed and maintain sector-specific energy emergency response plans to prepare for, respond to, and recover from fuel, natural gas, and electricity emergencies. The goal is to protect public health and safety, the environment, and the region's economy.

AUTHORITY

In the event of an energy emergency, the Governor directs the state's overall response effort to protect public health and safety, the environment, and the region's economy. ORS Chapter 401, Section 035 states "the Governor is responsible for the emergency services system within the State of Oregon."

ORS Chapter 176, Section 785 authorizes the Governor to declare a state of emergency when he determines there is an existing or imminent severe disruption in the supply of one or more energy resources. The severe disruption can originate in Oregon or elsewhere. The Governor may by proclamation declare a state of emergency exists with regard to such resources only after consultation with the President and majority and minority leaders of the Oregon State Senate and the Speaker and majority and minority leaders of the Oregon State House of Representatives. In the proclamation, the Governor will cite with specificity the nature of the severe disruption in the supply of one or more energy resources.

OREGON DEPARTMENT OF ENERGY

ORS Chapter 176, Section 809 authorizes ODOE to develop and maintain the Oregon Petroleum Contingency Plan to maintain emergency services, continue productivity and reduce hardship during a severe fuel oil shortage or any other emergency threatening the availability of any energy oil resource necessary to maintain essential services and transportation. ODOE could implement a Fuel Allocation Program to ensure adequate fuel is provided to the state's emergency and essential service providers.

OREGON PUBLIC UTILITY COMMISSION

ORS Chapter 757, Sections 710-730 authorizes OPUC to regulate utility rates, safety, and reliability standards for individuals, firms, partnerships, corporations, associations, cooperatives, and municipalities who sell and distribute electricity and natural gas in Oregon. In an emergency, OPUC will respond to the Oregon State Emergency Coordination Center (ECC) to serve as the principal liaison between the state and utilities to ensure rapid recovery of the power and/or natural gas systems.

OREGON EMERGENCY MANAGEMENT

ORS Chapter 401, Section 270 authorizes Oregon Emergency Management (OEM) to develop, revise, publish, and distribute the State of Oregon Emergency Management Plan to coordinate the activities of all public and private organizations providing emergency services within the state. The Statutes also require OEM to provide for and staff the state ECC to aid the Governor and state agencies in responding to major emergencies and disasters.

CONCEPT OF OPERATIONS

ODOE and OPUC energy sector-specific emergency response plans establish a concept of operations that models the Emergency Support Functions (ESF) structure as outlined in the National Response Framework (NRF) and incorporates the National Incident Management System (NIMS). This concept of operations enables emergency responders at all levels of government and private industry across jurisdictional boundaries to work together more effectively to manage energy emergencies no matter the cause, size or complexity of the event.

Also, ODOE and OPUC's energy sector-specific emergency response plans are consistent with the State of Oregon Emergency Management Plan. State agency activities in this plan are organized as "Emergency Support Functions" (ESF) to coincide with the federal ESFs to:

- Establish fundamental disaster roles and responsibilities that enable close state/federal cooperation necessary to support the emergency management efforts of local jurisdictions involved in energy disaster operations during a State or Presidential declared disaster.

- Identify lines of cooperation and communications between state agencies and their corresponding federal response agencies as outlined in the NRF.

- Establish a concept of operations, which incorporates NIMS that provides a state level interagency mechanism to facilitate the delivery of state and/or federal response assistance.

Consistent with the federal ESFs, the state ESFs are mechanisms for grouping functions most frequently used to provide state-to-state and state-to-local support and to coordinate with federal ESFs for declared disasters and emergencies. There are 13 Emergency Support Functions.

EMERGENCY SUPPORT FUNCTIONS (ESFS)		
ESF	**SECTOR**	**PRIMARY AGENCY**
1	Transportation	Oregon Department of Transportation
2	Communications	Oregon Emergency Management Oregon Public Utility Commission
3	Public Works and Engineering	Oregon Department of Transportation
4	Firefighting	Oregon State Fire Marshal
5	Information and Planning	Oregon Emergency Management Lead State Agency for Declared Disaster
6	Mass Care	Oregon State Department of Human Resources
7	Resource Support	Oregon Department of Administrative Services
8	Health and Medical Services	Oregon State Department of Human Resources
9	Search and Rescue	Oregon Emergency Management
10	Hazardous Materials	Oregon State Fire Marshal Oregon Department of Environmental Quality
11	Food	Oregon Department of Agriculture
12	**Energy**	**Oregon Department of Energy** **Oregon Public Utility Commission**
13	Public Safety	Oregon State Police

SEE APPENDIX A

MEMORANDUM OF UNDERSTANDING

As primary agencies for ESF 12, ODOE and OPUC entered into a Memorandum of Understanding (MOU) to establish a framework for cooperation for preparedness and response to energy emergencies that impact the state. The MOU provides guidance on ODOE and OPUC roles and responsibilities for issuing emergency notifications; assessing the severity of events; issuing protective action decisions; providing emergency information; activating and responding to emergency operation centers; ensuring program readiness; as well as developing and maintaining emergency response plans for fuel, natural gas, and electricity shortages and disruptions. ***SEE APPENDIX B.***

ENERGY SECTOR-SPECIFIC EMERGENCY RESPONSE PLANS

While no plan can replace the common sense and good judgment of emergency responders and decision-makers, energy sector-specific emergency response plans provide a framework to guide the efforts of ODOE and OPUC to prepare for, respond to, and recover from energy emergencies.

Overview of the Oregon Petroleum Contingency Plan

INTRODUCTION

Because Oregon has virtually no refining capacity and no crude oil reserves, the state faces unique challenges in the event of a petroleum emergency. Preparing for a fuel shortage and anticipating the impacts of a prolonged supply disruption are critically important due to the lack of easily accessible alternative sources for refined petroleum products.

To mitigate the effects of a petroleum supply or distribution emergency, ODOE developed and maintains the Oregon Petroleum Contingency Plan. This Oregon Petroleum Contingency Plan specifies alert and notification procedures as well as actions to assure the protection of public health and safety during severe and long-term fuel disruptions or shortages, regardless of the cause.

The Oregon Petroleum Contingency Plan includes a fuel allocation program to provide gasoline and diesel to the state's emergency services (law enforcement, fire, and medical services) and essential service providers (utilities, telecommunications, public works, public transit, sanitation services and more).

The plan identifies the state's emergency and essential service providers along with pre-designated fueling locations in each county to ensure fuel allocation can proceed in a timely and orderly manner in times of petroleum supply and distribution system constraints.

EMERGENCY RESPONSE ACTIONS

The Oregon Petroleum Contingency Plan identifies emergency preparedness and response actions to monitor and track fuel disruptions. Tracking fuel disruptions allows ODOE decision-makers to assess the severity of supply shortages, determine appropriate mitigation measures, advise state policy makers, prioritize allocation of resources, keep state and local emergency organizations informed, and provide timely and accurate information to the public.

For planning purposes, the Oregon Petroleum Contingency Plan identifies four levels of fuel supply conditions to prepare for, respond to, and recover from. These four levels are consistent with NASEO's State Energy Assurance Guidelines.

Normal Conditions – Level 1 Monitor and Alert	
CONDITIONS	ODOE PREPAREDNESS ACTIONS
➢ No discernable shortage ➢ Possible shortages elsewhere	Review and update Petroleum Emergency Contact List (Quarterly)
	Review and update Oregon State Energy Assurance Plan (Annually or as needed)
	Update the Oregon Petroleum Contingency Plan (Annually or as needed)
	Conduct Petroleum Exercises and Training (As Needed)
	Serve as Liaison to Petroleum Industry Partners
	Participate in Regional and National Energy Infrastructure Events (As Needed and as Resources Allow)
	Monitor Petroleum Markets
	Monitor Petroleum Supply & Demand 1. Gasoline Consumption 2. Petroleum Product Demand 3. Wholesale and Retail Prices 4. Inventories and Production 5. Infrastructure Information 6. Source of Crude Oil
Shortage – Level 2 **Mild Fuel Shortage**	
CONDITIONS	STATE RESPONSE ACTIONS
➢ 5-10% reduction in petroleum supply for a week or more ➢ Isolated shortages could also trigger a Level 2 event.	Activate ODOE Emergency Operations Center (EOC) - Begin a limited activation of the ODOE EOC to monitor the event.
	Assess Severity of Petroleum Disruption - Contact petroleum industry partners to determine the nature, extent, and duration of a potential, impending, or actual fuel disruption. Assess potential impacts to the supply and distribution system. *APPENDIX C – FUEL SUPPLY TRACKING FORM*
	Issue Notifications - Alert and notify the governor's office, federal, state and local emergency response agencies as needed. *APPENDIX D – PETROLEUM CALL TREE* *APPENDIX E – PETROLEUM NOTIFICATION TABLE*
	Draft Situation Reports - Provide situation reports to keep the governor's office, legislative branch, federal, state, and local emergency response organizations informed about developing conditions in the event. *APPENDIX F – SAMPLE SITREP*

	Implement a Public Information Campaign - Issue news releases, conduct news conferences, compile media kits to provide information on Oregon's fuel supply and distribution system to promote voluntary conservation activities, and to prevent or limit panic buying and hoarding of fuel. Warn against price gouging as appropriate.
	Monitor Petroleum Energy Resiliency - The Infrastructure Security and Energy Restoration Division within DOE/OE provides information and critical updates during energy emergencies.
Shortage – Level 3 **Intermediate Fuel Shortage**	
CONDITIONS	STATE RESPONSE ACTIONS
➢ 10-15% reduction in petroleum products for three weeks or more ➢ Moderate to severe isolated shortages could also trigger a Level 3 event.	*Continue Response Actions from a Level 2 Shortage*
	Full Activation of ODOE EOC - Fully activate ODOE EOC to monitor the event. Procedures for ODOE EOC response positions are located in the Oregon Petroleum Contingency Plan. *APPENDIX G – ODOE EOC OPERATIONS CHART*
	Convene Petroleum Advisory Group - The ODOE Director chairs this group, which meets as needed. The Petroleum Advisory Group's role during a crisis is to assist ODOE in determining: 1. Appropriate voluntary conservation measures for the public to encourage less consumption. 2. The need for mandatory conservation measures if voluntary measures fail to mitigate the expected impacts of a shortage or disruption.
	Implement Fuel Allocation, as appropriate - Consider the need for and implement the Fuel Allocation Procedures as appropriate to ensure fuel for the state's emergency and essential services sectors. Emergency service providers include law enforcement, fire services, and medical services. Essential service providers include utilities, telecommunications, public works, transportation, public transit systems, sanitation, and other services as needed.
	Advise Governor - Recommend precautionary measures needed to end an existing shortage or to reduce the chances for or prevent a long-term disruption from occurring. ODOE will implement voluntary conservation measures directed by the Governor.
Shortage – Level 4 **Severe Fuel Shortage**	
CONDITIONS	STATE RESPONSE ACTIONS
➢ Greater than 15% reduction in availability of petroleum products	*Continue Response Actions from a Levels 2 and 3 Shortage*
	ODOE EOC Operation - Maintain full activation of the ODOE EOC to direct and control Oregon's response throughout the duration of the event.
	Declare State of Emergency, if appropriate - Advise the Governor to declare a state of emergency so mandatory conservation measures and fuel allocation procedures can be implemented if needed.

➢ Severe or long-term isolated or widespread shortages could also trigger a Level 4 event.	Issue Mandatory Conservation Measures, as appropriate - Consider and implement mandatory measures and recommend additional voluntary conservation measures as appropriate to mitigate a severe and/or long-term shortage or disruption.
	Implement Fuel Allocation, as appropriate - Consider the need for and implement the Fuel Allocation Procedures as appropriate to ensure fuel for the state's emergency and essential services sectors. Emergency service providers include law enforcement, fire services, and medical services. Essential service providers include utilities, telecommunications, public works, transportation, public transit systems, sanitation, and other services as needed.
	Implement Odd/Even Fuel Allocation, as appropriate - Consider the need for and implement the Odd/Even Fuel Allocation Procedures as appropriate to allocate fuel for the public.
	Issue Fuel Waivers, as appropriate - Consider waiving fuel or fuel additive requirements temporarily if doing so will alleviate the fuel supply emergency. Work with the Oregon Department of Environmental Quality and the U.S. Environmental Protection Agency to issue fuel waivers.
	Request Federal Assistance, as appropriate - Consider requesting federal assistance when severe petroleum events exhaust state resources and Oregon's ability to recover rapidly from supply and distribution problems.

VOLUNTARY AND MANDATORY CONSERVATION MEASURES

During petroleum shortages or disruptions, ODOE will recommend and implement various approaches to encourage the public to reduce fuel consumption depending on the severity of the event conditions. The goal of fuel conservation measures is two-fold. One is to reduce panic, prevent hoarding of fuel, and prevent price gouging at the gasoline pumps. The second is to reassure Oregon citizens that the state is taking the necessary steps to mitigate the impending or actual supply shortage situation.

Fuel conservation measures are designed to alleviate supply shortages or disruptions and hopefully prevent a crisis and the need to implement Oregon's Fuel Allocation Program. The state of Oregon's initial response to a forecasted supply problem is to implement a public information campaign to provide fuel saving tips to its citizens. If the supply shortage or disruption worsens, the plan establishes two broad types of efforts to reduce energy consumption. The first response is a public appeal for voluntary fuel conservation. If the voluntary conservation measures are ineffective in mitigating the fuel shortage situation, the second response is to issue a series of mandatory conservation measures to reduce petroleum consumption by all governmental agencies and political subdivisions in the state. Mandatory conservation measures require an Emergency Declaration by the Governor.

VOLUNTARY CONSERVATION MEASURES

PUBLIC INFORMATION CAMPAIGN - Launch public information campaign to encourage commuters to practice responsible driving and vehicle maintenance to save on fuel. This includes the following fuel saving tips:

- Slow Down and Watch Speed
- Consolidate Trips
- Accelerate and Brake Smoothly
- Reduce Idling
- Check Tire Pressure
- Travel Light
- Minimize Use of Heater and Air Conditioning
- Close Windows at High Speeds
- Choose the Right Oil
- Be Kind to Your Vehicle
- Other fuel saving tips as appropriate.

GAS PRICE REPORTER WEBSITE - Establish and manage the "Gas Price Reporter Website." The website enables Oregonians to report evidence suggesting unlawful conduct in gasoline pricing at www.doj.state.or.us. The Attorney General investigates and prosecutes individuals and companies that unlawfully fix the price of gasoline in Oregon.

RIDE SHARE PROGRAM - Initiate emergency rideshare program to save fuel by improving the attractiveness of car and vanpools.

MASS TRANSIT PROGRAM - Assist local agencies in expanding new transit service, reducing transit fare and instituting or expanding free transit fare zones.

BICYCLE PROGRAM - Encourage commuters who live within bicycling distance of their places of employment to use their bicycles. For this program to be successful, local governments and employers may need to provide more bicycle racks or secured parking areas for employees. Temporary bicycle lanes may be created to encourage cycling and to accommodate increases in the number of cyclists.

FLEXIBLE WORK HOURS - Encourage the use of flexible work hours for both short and long-term demand reduction, improvement in fuel efficiency, and reduction in traffic congestion.

THERMOSTAT SETTINGS - Set thermostats higher in the summer and lower in the winter to reduce the amount of fuel used for heating or air conditioning.

MANDATORY CONSERVATION MEASURES

ELIMINATE NON-ESSENTIAL DRIVING - Reduce or eliminate all non-essential government and commercial vehicle use.

STRICTLY ENFORCING SPEED LIMITS - Intensified speed limit enforcement by eliminating the use of warning tickets.

INTENSIFY FLEXIBLE WORK HOUR PROGRAMS - Programs include, but are not limited to the following:

- Staggered Work Hours
- Flextime
- Four-Day Work Week
- Parking Facility Limitations

MANDATORY VEHICLE TIRE PRESSURE INSPECTION

ONE DAY CLOSING OF RETAIL STORES

OREGON FUEL ALLOCATION PROGRAM

ODOE will implement the state's Fuel Allocation Program as appropriate. The purpose of Oregon's Fuel Allocation Program is to help mitigate shortages and hardships for priority users who are unable to acquire sufficient fuel at any price. ODOE will implement this program only after the governor proclaims a state of emergency and when market forces, voluntary conservation, or other mandatory programs are unable to provide for adequate and equitable distribution of fuel.

If fuel allocation becomes necessary, ODOE would administer the state's Fuel Allocation Program and designate the set-aside volume. ODOE is responsible for working with the state's petroleum suppliers and wholesalers to implement the set-aside volume for use by the state.

SET-ASIDE PRIORITY PROGRAM

The set-aside program is designed to interfere minimally with the market, using set-aside volumes that are sufficient only to satisfy hardship and emergency cases. The set-aside program makes no attempt to reduce or inhibit the market price of fuels. All fuel delivered through the program will be purchased at the market price, and whenever possible, through the usual supplier.

The percentage will be no larger than what is expected to be required to meet emergency supply needs. The percentage is based on the amount of fuel already in the state in storage and the amount estimated to enter the state from the prime suppliers each month.

Set-Aside Percentages

Monthly Fuel Volume from Oregon Suppliers

Motor Gasoline	up to 5 percent
Middle Distillate (diesel & heating oil)	up to 4 percent
Jet Fuel	up to 5 percent
Aviation Gasoline	up to 5 percent
Boiler Fuel (#4 & heavy fuel oil)	up to 3 percent
Propane	up to 3 percent
Kerosene	up to 2 percent

ODOE's Fuel Allocation Program is designed to ensure emergency fuel to priority users performing life saving functions, restoring Oregon's critical infrastructure, and preventing community hardships.

ODOE uses a three-tiered approach for allocating fuel to these priority users. Tier 1 covers the state's emergency services providers. Tier 2 covers the state's essential services providers. Tier 3 allows for a community to request fuel supplies from the state set-aside. A community must show it has an emergency or hardship caused by a shortage of fuel or is receiving relatively less than other areas of the state. Providing emergency fuel to communities is the only element where retail service stations may receive a set-aside allocation. However, the State will not direct set-aside volumes to specific stations. It will direct prime suppliers to release a certain volume to an area through normal supply channels.

PRIORITY FUEL USERS

Priority Fuel Users	
TIER 1 - Emergency Services Sector *Agencies and Organizations Performing Life Saving Functions* Emergency fuel requests from emergency services providers will be immediately reviewed and acted on by ODOE.	▪ Law Enforcement ▪ Fire Services ▪ Medical Services (Ambulances, Air Transport, and Hospitals) ODOE will work with and rely on the expertise and assessments of each county emergency management agency to determine fuel needs for their respective jurisdictions.
TIER 2 - Essential Services Sector *Agencies and Organizations Performing Critical Functions to Restore Oregon's Fuel Supply and Distribution System and Other Critical Infrastructure. Tier 2 involves the state's 13 Emergency Support Functions (ESFs).* Emergency fuel requests from essential services providers will be reviewed by ODOE on a case-by-case basis. Approval will depend on fuel availability and event conditions. Examples of essential services include, but are not limited: 1) agriculture production and distribution; 2) energy production (utilities crews); 3) public transit; 4) public works (sewer-water crews); 5) telecommunications crews; 6) transportation (highways, roads, and bridge crews); 7) sanitation (trash pickup crews); and 8) others as appropriate.	▪ ESF 1: Transportation ▪ ESF 2: Communications ▪ ESF 3: Public Works and Engineering ▪ ESF 4: Fire Fighting ▪ ESF 5: Emergency Management ▪ ESF 6: Mass Care ▪ ESF 7: Logistics Management ▪ ESF 8: Public Health and Medical Services ▪ ESF 9: Search and Rescue ▪ ESF 10: Oil and Hazardous Materials ▪ ESF 11: Agriculture and Natural Resources ▪ ESF 12: Energy ▪ ESF 13: Public Safety and Security ODOE will work with and rely on the expertise and assessments of each ESF lead state agency to determine fuel needs for their respective sector(s).
TIER 3 - Community Hardship *Cities and Counties Experiencing Hardships Caused By a Shortage of Fuel* Emergency fuel requests from communities will be reviewed by ODOE on a case-by-case basis. Approval will depend on fuel availability and event conditions.	▪ City ▪ County ▪ Other sectors as appropriate

FUEL USE DATABASE

To ensure the protection of public health and safety, the environment, and the state's economy during a fuel crisis, ODOE must ensure the delivery of fuel to emergency and essential service providers responsibly, efficiently, and without delay.

ODOE established and maintains a database containing fuel consumption figures, key contacts, and pre-designated emergency fueling locations for the state's emergency services and essential services sectors. Having a clear understanding of the fuel use needs of the state's emergency and essential services sectors prior to a fuel crisis allows ODOE to better anticipate and meet fuel needs during an actual emergency.

The database reflects fuel consumption for emergency and essential services sectors under normal day-to-day operations over a one week period. Additional fuel may be needed when agencies are responding to emergencies. Oregon's Fuel Use Database is reviewed and updated as needed. Fuel use figures for the state's emergency and essential services sectors are provided by county.

SAMPLE

FUEL APPLICATION PROCESS - WEBEOC

ODOE may receive fuel requests due to natural disasters or unforeseen emergencies at any time. Once ODOE activates WebEOC for a determined emergency, all priority users requesting emergency fuel must log onto ODOE's WebEOC, access the Emergency Fuel Request board and complete all fields provided as appropriate. Priority users requesting fuel must be prepared to provide information on the organization requesting the fuel, 24/7 contact information, type of fuel needed, the reason for the request, and the intended use of the fuel if approved.

ODOE will process fuel requests based on 1) the availability of fuel; 2) event conditions; and 3) the Governor's priorities. ODOE would follow general guidelines to provide fuel to perform life saving functions first, restoring critical services second, and all other requests will be handled as they are received.

If WebEOC becomes inoperable due to event conditions, fuel requests can be texted, faxed, emailed, mailed, or delivered directly to ODOE for review and approval.

UNUSED SET-ASIDE VOLUME

Maximum flexibility in the release of the unused portion of the monthly set-aside volume is achieved by balancing public benefit with logistical and administrative efficiency. The Petroleum Event Manager may choose either to release to the supplier unused portions of the set-aside no later than the 20th of each month, or to hold any unused volume until the first of the following month. This unused set-aside volume will not be counted in computing the subsequent month's set-aside volume, but must be distributed the following month. Whichever option the Petroleum Event Manager selects, all suppliers are required to comply ensuring uniformity in the release of supplies.

FUEL ALLOCATION FOR OREGON CITIZENS

During a fuel supply shortage situation, the need for a method to alleviate potentially long lines at retail service stations may arise. ODOE, at the direction of the Governor, could implement the Odd/Even Fuel Allocation Measure for the public. This measure is designed to help space purchases of gasoline and aids in its equitable distribution. The measure has the potential effect of shortening lines at gasoline retail outlets by cutting in half the number of customers that may attempt to get gasoline on any given day.

The Odd/Even Fuel Allocation Measure for the public may also provide a psychological benefit by reducing uncertainty regarding fuel availability. It may additionally encourage the conservation of fuel by causing trips to be better planned. Minimizing waiting lines may also reduce consumption by saving fuel that is used while idling. Under this plan, gasoline may be purchased or sold only in accordance with the following procedures.

ODD/EVEN FUEL ALLOCATION MEASURE

Odd/Even Fuel Allocation Measure		
ODD Days of the Month	EVEN Days of the Month	Sundays, Legal Holidays, & 31st of Any Month
Vehicles with Oregon license plates: • Ending with odd numbers • Ending with letters A-M	Vehicles with Oregon license plates: • Ending with even numbers • Ending with letters N-Z	Anyone may purchase gasoline on Sundays, legal holidays, or the 31st of any month.
EXEMPTIONS: The following vehicles are exempted from the odd/even gasoline purchase plan, but will wait their turn in line at any gasoline station: Common carriers, including taxis, rental vehicles, commercially licensed vehicles, or private vehicles used for designated commercial purposes, and vehicles with out-of-state license plates.		

The Odd/Even Measure does not directly save any calculable amount of gasoline. It is designed as a distribution aid and not a conservation measure. Enforcement responsibility rests with service station personnel.

FUEL LIMIT PURCHASE REQUIREMENT

Depending on the severity of the fuel shortage situation, ODOE may advise the Governor to also require motorists to purchase a certain amount of gasoline or diesel at the pumps. The measures include the Minimum Fuel Purchase Requirement and the Maximum Fuel Purchase Requirement. These measures should be implemented in conjunction with the Odd/Even Distribution Measure.

Fuel Limit Purchase Requirement	
Mimimum Fuel Purchase Requirement	Maximum Fuel Purchase Requirement
Minimize gasoline lines by discouraging the making of frequent but small gasoline purchases by consumers. This measure also discourages tank topping.	Ensures some gasoline will be available to motorists located or traveling through the state. Limiting the amount of gasoline purchased by motorists in one visit will help prevent supplies from running out prematurely at a particular retailer.
NOTE: ODOE will set the minimum and maximum purchase quantity as appropriate. Retailers may lower the set amount at their discretion due to market forces.	
ASSUMPTIONS: All retail stations will be assumed to normally operate one hundred hours per week unless evidence is provided to the contrary.	

LIMITED HOURS OF OPERATION

If the fuel shortage situation continues to worsen, ODOE may also advise the Governor to require retail gasoline and diesel outlets to reduce the hours of normal operations.

Limited Hours of Operation By Motor Fuel Retailers		
Percentage of Hours Rule	Designated Days Rule	Sunday Closings with Percentage Rule
Order retail gasoline and diesel outlets to reduce hours of weekly operation by a fixed percentage of normal operating hours.	Order retail gasoline and diesel outlets to close for business on specified days of the week. Pre-designated emergency fueling locations for priority users are exempt.	Order retail gasoline and diesel outlets to not operate on Sundays of any week and to reduce hours of normal operation on other weekdays.
NOTE: If any of the three rules are ordered, stations will post the hours of operation visibly upon the premises for all motorists to see.		
ASSUMPTIONS: All retail stations will be assumed to normally operate one hundred hours per week unless evidence is provided to the contrary.		

ODOE may advise the Governor to implement additional fuel allocation measures as appropriate.

REQUESTING FEDERAL ASSISTANCE

When an incident occurs that exceeds or is anticipated to exceed local and State resources, the Governor can request federal assistance under the Stafford Act. The Stafford Act authorizes the President to provide financial and other assistance to state and local governments to support response, recovery, and mitigation efforts following Presidential emergency or major disaster declarations.

FUEL SUPPLY

In the event of a severe or long-term fuel emergency, ODOE can advise the Governor to request the federal government assist Oregon to obtain fuel, (gasoline, diesel, jet fuel, etc), assist in fuel delivery, as well as provide portable fueling locations to support the state's response and recovery efforts. This includes requesting generators to ensure the state's petroleum distribution terminals and pipeline companies can assess and address damages promptly to restart facility and system operations without delay.

As the lead state agency for ESF 12, ODOE would work with the USDOE (the federal ESF 12 lead agency) to request and coordinate the delivery of supplies, equipment and systems, and personnel.

FUEL WAIVERS

ODOE can advise the Governor to request the federal government to waive a fuel or fuel additive requirement if doing so will alleviate the fuel supply crisis. The U.S. Environmental Protection Agency (EPA) with the concurrence of DOE/OE may temporarily waive a fuel or fuel additive requirement under the Clean Air Act Section 211(c)(4)(C). A fuels waiver can be issued only when the criteria specified in the Clean Air Act have been met and apply to gasoline and diesel fuel only. If the fuels waiver criteria have been met, EPA may grant a waiver to allow use of a fuel that normally is not allowed in a particular time period or geographic area.

In general, these criteria allow a fuels waiver only to address a temporary emergency fuel supply shortage that exists throughout a state or region that was caused by an unusual situation and that could not have been avoided by prudent planning. "Spot" or localized shortages generally are not fuel supply disruptions for which a waiver may be issued. A fuel supply disruption that meets the criteria for a waiver must be one that results in a generalized supply emergency. Fuels waivers cannot be issued to address concerns regarding the price of fuel.

If EPA and DOE/OE determines that a fuels waiver is necessary, ODOE will submit a formal written request for a fuels waiver to be made by or on behalf of the Governor to the EPA Administrator.

The EPA Administrator will consult with and seek concurrence by the Secretary of Energy upon receiving a formal written request for a fuels waiver. The EPA Administrator will issue a temporary waiver if it is determined that extreme and unusual fuel or fuel additive supply circumstance exist in Oregon which prevent the distribution of an adequate supply of the fuel or fuel additive to consumers. The waiver is effective for a period of 20 calendar days or less.

DRIVER HOUR WAIVERS

ODOE can also advise the Governor to request the Federal Motor Carrier Safety Administration (FMCSA) to lift driver hour requirements to ensure fuel deliveries proceed without delay to ensure public health and safety. Severe and long-term fuel disruptions have typically been widespread, affecting a number of states and caused by factors that exceed the petroleum industry's ability to respond.

FMCSA provides relief from compliance with most safety regulations when an emergency is declared. According to 49 CFR 390.5 an "emergency" means any storm, earthquake, explosion, blackout, or other occurrence, natural or manmade, that interrupts the delivery of essential services or supplies such as food and fuel or otherwise immediately threatens human life or public welfare.

When a state issues an emergency declaration, driver hour requirements are automatically lifted for up to 30 days from the date of the declaration. This applies to motor carriers or

drivers of commercial motor vehicles providing direct assistance to save lives or property or to protect public health and safety. A driver's manifest must clearly show a destination for delivery of essential service/commodity in the state declaring the emergency. It is the responsibility of each state to notify FMCSA of an emergency declaration. FMCSA will then post the state(s) emergency declaration(s) on its website for drivers to download.

DISSEMINATING EMERGENCY INFORMATION

During forecasted or actual fuel emergencies, ODOE is responsible for developing and disseminating emergency information to decision-makers, responders, the news media, and the public. Timely and accurate information increases awareness and understanding of the fuel crisis situation and helps minimize public panic, topping off gas tanks, and hoarding fuel.

ODOE will provide current event status information to decision-makers, responders, the news media, and the public. The information includes, but may not be limited to:

- Fuel Supply Information
- Conservation Measures – voluntary and mandatory
- Conservation Information and Education
- Oregon's Fuel Allocation Program

DRILLS AND EXERCISES

To ensure that Oregon is prepared to respond to a fuel crisis, ODOE will coordinate, implement, and participate in workshops and seminars, tabletops, drills, and exercises that provide opportunities for state and county decision-makers and responders to demonstrate the ability to:

- Alert and notify key responders to report to emergency centers or locations as appropriate.
- Activate, staff, and operate state and county Emergency Operations Centers throughout the duration of a fuel crisis.
- Direct and control the overall state response to petroleum emergencies. This includes assessing the severity of the event, determining potential impacts to Oregon, and determining appropriate protective actions.
- Issue voluntary and mandatory conservation measures.
- Implement Oregon's fuel allocation program.
- Provide timely emergency information and instructions to the public. This includes activating, staffing and operating the Telephone Information Center and the News Center.

- Communicate with industry, federal, state, and local emergency response organizations throughout the duration of the fuel crisis. This includes demonstrating primary and backup communication systems.

For major exercises, ODOE will establish or take part in an Exercise Planning Team. This Team includes representatives from industry, federal, state, and local agencies as appropriate. The Exercise Planning Team develops the exercise objectives and limitations, the extent-of-play, and the scenario.

After each drill or exercise, members of the Exercise Planning Team will report needed corrective actions to ODOE. ODOE will provide information about the corrective actions to the U.S. Department of Energy in the quarterly reports on the State Energy Program. ODOE will arrange for state or federal representatives to observe and provide comments to ODOE on Oregon's performance in the drills or exercises as needed.

PLAN REVIEW AND UPDATE

ODOE will review and update Oregon's Petroleum Contingency Plan annually or as needed. Revisions will include improvements identified through drills and exercises. ODOE's Emergency Preparedness Manager is responsible for conducting the review and coordinating revisions with industry, federal, state, and county emergency response agencies.

ODOE will work with state agencies and county emergency managers biennially to update and maintain the statewide fuel use database to ensure accurate fuel consumption numbers for the state's emergency and essential services sectors.

ODOE will work with industry, federal, State, and county emergency response agencies quarterly to update the petroleum emergency contacts list. ODOE will prepare quarterly reports detailing Oregon's petroleum emergency preparedness activities for the State Energy Program. This will ensure that Oregon's Petroleum Contingency Plan and state and local decision-makers and emergency responders authorized to implement the plan maintain a state of readiness to ensure the protection of Oregonians in the event of a fuel crisis.

Electricity Emergency Response Plan

INTRODUCTION

An electric power event can be categorized as an outage, an incident, or an emergency. Events can range from a high frequency, low impact outage or incident to a low frequency, high impact emergency. Examples of high frequency, low impact outages or incidents are cross-phasing of lines by surrounding vegetation or more serious, individuals coming in contact with high-voltage lines or equipment. Low frequency, high impact emergencies include earthquakes and man-made attacks. The following is the progressive response of the OPUC.

EMERGENCY RESPONSE PHASES AND ACTIONS

Level I: Normal Conditions[1]

Conditions: Normal—no electric power disruption, shortage, or constraints on reliable service delivery.
State Agency Lead: OPUC

OPUC Duty Officer measures include:

- Receive notices of reportable[1] outages or incidents from operators.
- Evaluate reportable outages or incident notices received to anticipate impact on electric power supply, relying heavily upon electric company experts.
- Maintain a contact list located in-house to aid in contacting individuals in the various public and private industries.
- Review previous situation reports to evaluate adequacy of OPUC's response practices.
- Review previous tabletop exercises, evaluate lessons learned, and implement into response plan procedures.
- Encourage energy utilities to hold in-house tabletop exercises.
- Update OPUC's emergency response plan as needed.

[1] Electric utilities experience reportable incidences often for various reasons, such that these minor events are normal operating conditions.

- Participate in collaborative efforts with state, local government and electric utility operators.

- Identify response vulnerabilities in cross-coordination between industries and state agencies.

LEVEL II: MILD SHORTAGE, OUTAGE, OR INCIDENT

Conditions: Mild Outage or Incident—an identifiable event that may have the potential to cause an electric power disruption, shortage, or become a constraint on reliable electric power service.
Lead: Electric Power Companies
State Agency Lead: OPUC
Support: Oregon Emergency Management, Oregon Department of Energy, Oregon Emergency Response System

Level II triggered by:

- Significant storms[2] or similar incidents without a declaration of emergency.

- Activation of electric utility EOC.

OPUC Duty Officer response measures include:

- Receive update notices, as required, from utility operator.

- Monitor state, regional and world events and forecasted weather conditions that may impact Oregon electric power and natural gas[3] supplies and service delivery.

- Keep informed by utility operators as they perform emergency response operations, procedures, and distribution of accurate event information to the public.

LEVEL III: MODERATE SHORTAGE, ESCALATING INCIDENT, OR DISRUPTION

Conditions: Imminent threat or escalating incident—an identifiable event that has been verified to lead to an electric power disruption, shortage, or become a constraint on reliable electric power service lasting two-to-four weeks.
Lead: Electric Power Companies
State Agency Lead: OPUC
Support: Governor's Office, Oregon Emergency Management, Oregon Department of Energy, Oregon Military Department, Oregon Department of Transportation, Civil Air Patrol, Oregon State Department of Human Resources, American Red Cross

[2] i.e. winter storm event 2006, 2007, and 2008
[3] The state of Oregon has many electric generation facilities that are fueled by natural gas and those are identified as interdependencies between the natural gas and electric sectors.

Level III triggered by factors, such as:

- Moderate shortage, escalating incident, or disruption.
- Utility Operator requests for limited assistance.
- Impact extends to interdependent[4] utility operators.

OPUC Duty Officer response measures include:

- Serve as a liaison—during Level III and Level IV status—between electric power operators and other state agencies to meet the needs of the operators on a state level. OPUC does not manage utility operations but assists in procuring state resources for the responding utility.
- Implement in-house Situation Report[4] to define the source and details of the outage or incident. The Situation Report includes information on the operator involved, area impacted, cause (if known), and expected duration.
- Maintain communication with electric power operator for updates.
- Notify Commissioners, PUC executives, and Public Information Officer[5] (PIO) with initial and interim situation reports as necessary.
- Send courtesy notifications to other utility operators, ODOE, OERS, and other state support agencies related to ESF 12.
- Update OERS with utility situation report.
- Evaluate geographical areas affected by the cascading effects of the event and notify stakeholders.
- Support necessary reconnaissance efforts to aid in evaluating energy infrastructure.
- Consider issuing public appeal for voluntary reduction of electric power and natural gas consumption in accordance with the Regional Curtailment Plan.

[4]Utility operators that are reliant upon the impacted energy resource provided by the originating impacted utility, which may warrant a request for assistance by the dependent utility operator.
[5]See Appendix H.
[6] The PUC's PIO does not actively release statements regarding these incidents to the public. However, if the public inquires, concerns will be resolved as needed.

- Implement voluntary reduction of electric power and natural gas consumption in accordance with stage 1 or 2 of the Regional Curtailment Plan, as necessary, by consumers, businesses, schools, institutions, and state building operators.

- Escalate to Level IV status as appropriate.

LEVEL IV: SEVERE SHORTAGE, DISRUPTION, OR EMERGENCY

Conditions: Disruption, shortage, or constraint has taken place causing loss of electric power supply that may last weeks or months.
Lead: Electric Power Companies
State Agency Lead: OPUC
Support: Governor's Office, Oregon Emergency Management, Oregon Department of Energy, Oregon Emergency Response System, U.S. Department of Energy, Oregon Military Department , Oregon Department of Transportation, Civil Air Patrol, Oregon State Department of Human Resources, American Red Cross

A Level IV status is triggered by several factors such as:

- Declaration of state of emergency by the Governor.

- Escalation of a high frequency, low impact outage or incident estimated to last a period of months, precluding the reliability of electric power service delivery.

- Electric power companies recognizing that either company resources—staff experts, materials, equipment—are being exhausted or a multi-jurisdictional emergency is occurring.

- A devastating natural or deliberate disaster that immediately impacts electric power infrastructure with little or no warning.

- Energy demand exceeds generation supply such that electric power shortage occurs and the situation becomes unmanageable by electric power operators, balancing authorities, and excess market supply.

Under the conditions listed the ECC will be activated under standby, limited, or full activation status determined by the Director of OEM[7]. OPUC works with the OEM team and other responders to the ECC to provide subject matter expertise.

OPUC Duty Officer response measures include:

[7] State of Oregon Emergency Management Plan: Vol. II, Annex A.III.

- Present initial situation report to OEM at ECC and OEM's PIO consolidates information for public media release.

- Notify OERS with appropriate updates.

- Notify USDOE if necessary.

- Maintain communication with electric power operator for updates and continue providing resource support.

- Update OEM with interim situation report.

- Evaluate geographical areas affected, cascading effects of the event and notify ECC State Support Functions 1-13.

- Advise Governor and OEM Director to implement curtailment of electric power and natural gas usage in accordance with the Regional Curtailment Plan stages 3, 4, and 5.

- Identify interdependencies between the electric power, natural gas, and petroleum sector to minimize impact upon sectors outside of the electric power industry.

- Facilitate utility operators with possible resources (See Table 6.1) from various state agencies.

Following event:

- Demobilize response-recovery as emergency abates and return to normal operational conditions.

- Return borrowed assets to originating agency.

Table 6.1: Various Agencies and Resources.

AGENCY	RESOURCES[7]								
	Fuel	Road Access	Shelter	Air Transport	Reconnaissance	Transportable Generators	Manual Labor Crews	Electricians & Technicians	Portable Kitchens
Oregon Department of Energy	X								
Oregon Department of Transportation		X							
Oregon State Police		X							
Oregon Military Department	X	X	X	X	X	X	X	X	X
Civil Air Patrol				X	X				
Oregon State Department of Human Resources			X						
Oregon Department of Forestry									X
Oregon Department of Agriculture									X
Department of Corrections	X						X	X	

The Regional Curtailment Plan[8] applies to all regional loads. Under this plan, curtailment is requested or ordered as a percentage of historical, weather-normalized (Base Billing Period) electric consumption. Although the curtailment stages are generally associated with increasing deficits, the stages are not necessarily implemented in a sequential manner. The plan is flexible, allowing the state to move from one curtailment stage to another as required to adapt to dynamic changes of the incident (See Table 6.2).

[8] In the event of an emergency, precedence is given to each agency to evaluate the needs of their own agency and if excess resources exist they may provide them for use in energy emergency response considerations.
[9] See Appendix I.

Table 6.2: Regional Curtailment Plan Summary

STAGE	NATURE	CURTAILMENT %	TYPE OF CURTAILMENT
1	Voluntary	No Specific %	Uniform among all regional consumers
2	Voluntary	5% +	Uniform among all regional consumers
3	Mandatory	5% – 15%	Uniform among all regional consumers
4	Mandatory	15 %	Residential consumers
		15% +	General use consumers
		15% +	Major use consumers
5	Mandatory	% consistent with Stage 4 + additional curtailment	Continued consumer curtailment with additional utility action including plant closures and possible rotating outages

Any additional curtailment activities will be done in accordance with the plan and stated in the tariffs approved by the Public Utility Commission. The Commission will be available to handle customer appeals from utility curtailment decisions.

It is noted that although the emergency response plan is centered on an outage, incident, or emergency that originates with a utility operator, this does not limit the scope of the response plan. For example, if events outside of the purview of utility operators become relevant to the respective operator, whether by notification to OPUC from OEM or other collaborative groups, OPUC will take an active part in notifying utility operators of these events.

Natural Gas Emergency Response Plan

INTRODUCTION

A natural gas event can be categorized as an outage, an incident, or an emergency. Events can range from a high frequency, low impact outage or incident to a low frequency, high impact emergency. Examples of high frequency, low impact outages or incidents are gas discharge identified by customers, residential or business, or more serious, excavation contact with pipelines. In the latter case, excavation contact that damages or punctures a pipeline has the potential to cause ignition of gas, which may produce a hazard to life, safety, and property. Low frequency, high impact emergencies include earthquakes and man-made attacks.

EMERGENCY RESPONSE PHASES AND ACTIONS

LEVEL I: NORMAL CONDITIONS[10]

Conditions: Normal—no natural gas disruption, shortage, or constraints on reliable service delivery.
State Agency Lead: OPUC

OPUC Duty Officer measures include:

- Receive notices of reportable outages or incidents from operators.
- Evaluate reportable outages or incident notices received to anticipate impact on natural gas supply, relying heavily upon company experts.
- Maintain a contact list located in-house to aid in contacting individuals in the various public and private industries.
- Conduct annual inspection of intrastate[11] natural gas operations, facilities, and pipeline systems according to state statute[12] and federal code regulations[13] to ensure reliable service delivery.
- Review previous situation reports to evaluate adequacy of OPUC's response practices.
- Review previous tabletop exercises, evaluate lessons learned, and implement into response plan procedures.

[10] Natural gas utilities experience reportable incidences often for various reasons, such that these minor events are normal operating conditions.
[11] The OPUC is directly responsible to conduct audits of intrastate natural gas pipeline. Interstate natural gas pipelines and intrastate liquid petroleum pipelines are under the jurisdiction of U.S. Department of Transportation Pipeline and Hazardous Materials Safety Administration (PHMSA).
[12] Oregon Administrative Rule: Chapter 860 Division 31.
[13] Code of Federal Regulations Title 49: Parts 191, 192, 193, 195, 198, and 199.

- Update OPUC's emergency response plan as needed.
- Participate in collaborative efforts with state, local government and utility operators.
- Identify response vulnerabilities in cross-coordination between industries and state agencies.

LEVEL II: MILD SHORTAGE, OUTAGE, OR INCIDENT

Conditions: Mild Outage or Incident—an identifiable event that may have the potential to cause a natural gas disruption, shortage, or become a constraint on reliable natural gas service.
Lead: Natural Gas Companies
State Agency Lead: OPUC
Support: Oregon Emergency Management, Oregon Department of Energy, Oregon Emergency Response System

Level II triggered by:

- Significant storms[14] or similar incidents without a declaration of emergency.
- Activation of gas utility Emergency Operation Center (EOC).

OPUC Duty Officer response measures include:

- Receive update notices, as required, from utility operator.
- Monitor state, regional, and world events and forecasted weather conditions that may impact Oregon natural gas supplies and service delivery.
- Keep informed by utility operators as they perform emergency response operations, procedures, and distribution of accurate event information to the public.

LEVEL III: MODERATE SHORTAGE, ESCALATING INCIDENT, OR DISRUPTION

Conditions: Imminent threat or escalating incident —an identifiable event that has been verified to lead to a natural gas disruption, shortage, or become a constraint on reliable natural gas service lasting two-to-four weeks.
Lead: Natural Gas Companies
State Agency Lead: OPUC
Support: Governor's Office, Oregon Emergency Management, Oregon Department of Energy, Oregon Military Department, Oregon Department of Transportation, Civil Air Patrol, Oregon State Department of Human Resources, American Red Cross

Level III triggered by factors, such as:

- Moderate shortage, escalating incident, or disruption.
- Utility Operator requests for limited assistance.
- Impact extends to interdependent[15] utility operators.

OPUC Duty Officer response measures include:

- Serve as a liaison—during Level III and Level IV status—between natural gas operators and other state agencies to meet the needs of the operators on a state level. OPUC does not manage utility operations but assists in procuring state resources for the responding utility.
- Implement in-house Situation Report[16] to define the source and details of the outage or incident. The Situation Report includes information on the operator involved, area impacted, cause (if known), and expected duration.
- Maintain communication with natural gas operator for updates.
- Notify Commissioners, PUC executives, and PIO with initial and interim situation reports as necessary.
- Send courtesy notifications to other utility operators, ODOE, OERS, and other state support agencies related to ESF 12.
- Update OERS with utility situation report.
- Evaluate geographical areas affected by the cascading effects of the event and notify stakeholders.
- Support necessary reconnaissance efforts to aid in evaluating energy infrastructure.
- Consider issuing public appeal for voluntary reduction of natural gas and electric[17] consumption in accordance with stage 1 or 2 of the Regional Curtailment Plan.
- Implement voluntary reduction of natural gas and electric power consumption in accordance with stage 1 or 2 of the Regional Curtailment Plan, as necessary, by consumers, businesses, schools, institutions, and state building operators.

[14] i.e. winter storm event 2006, 2007, and 2008.
[15] Utility operators that are reliant upon the impacted energy resource provided by the originating impacted utility, which may warrant a request for assistance by the dependent utility operator.
[16] See Appendix H.
[17] The state of Oregon has many electric generation facilities that are fueled by natural gas and are identified as interdependency between the natural gas and electric sectors.

- Escalate to Level IV status, as appropriate.

LEVEL IV: SEVERE SHORTAGE, DISRUPTION, OR EMERGENCY

Conditions: Disruption, shortage, or constraint has taken place causing loss of natural gas supply that may last weeks or months.
Lead: Natural Gas Companies
State Agency Lead: OPUC
Support: Governor's Office, Oregon Emergency Management, Oregon Department of Energy, Civil Air Patrol, Oregon Department of Transportation, Oregon Military Department, Oregon State Department of Human Resources, American Red Cross, Oregon Emergency Response System, U.S. Department of Energy

A Level IV status is triggered by:

- Declaration of state of emergency by the Governor.
- Escalation of a high frequency, low impact outage or incident estimated to last a period of months, precluding the reliability of natural gas service delivery.
- Natural gas companies recognizing that either company resources—staff experts, materials, equipment—are being exhausted or a multi-jurisdictional emergency is occurring.
- A devastating natural or deliberate disaster that immediately impacts natural gas infrastructure with little or no warning.
- Energy demand exceeds generation supply such that natural gas shortage occurs and the situation becomes unmanageable by natural gas operators, balancing authorities, and excess market supply.

Under the conditions listed the ECC will be activated under standby, limited, or full activation status determined by the Director of OEM[18]. OPUC works with the OEM team and other responders to the ECC to provide subject matter expertise.

OPUC response measures include:

- Present initial situation report to OEM at ECC and OEM's PIO consolidates information for public media release.
- Notify OERS with appropriate updates.
- Notify USDOE if necessary.

[18] State of Oregon Emergency Management Plan: Vol. II, Annex A-III.

- Maintain communication with natural gas operator for updates and continue providing resource support.
- Update OEM with interim situation report.
- Evaluate geographical areas affected by cascading effects of the event and notify ECC State Support Functions 1-13.
- Advise Governor and OEM Director to implement curtailment of natural gas and electric usage in accordance with the Regional Curtailment Plan stages 3, 4, and 5.
- Identify interdependencies between the natural gas, electric power, and petroleum sector to minimize impact upon sectors outside of the natural gas industry.
- Facilitate utility operators with possible resources (See Table 6.3) from various state agencies.

Following event:

- Demobilize response-recovery as emergency abates and return to normal operational conditions.
- Return borrowed assets to originating agency.

Table 6.3: Various Agencies and Resources

	RESOURCES[19]								
AGENCY	Fuel	Road Access	Shelter	Air Transport	Reconnaissance	Transportable Generators	Manual Labor Crews	Electricians & Technicians	Portable Kitchens
Oregon Department of Energy	X								
Oregon Department of Transportation		X							
Oregon State Police		X							
Oregon Military Department	X	X	X	X	X	X	X	X	X
Civil Air Patrol				X	X				
Oregon State Department of Human Resources			X						
Oregon Department of Forestry									X
Oregon Department of Agriculture									X
Department of Corrections	X						X	X	

The Regional Curtailment Plan[20] applies to all regional loads. Under this plan, curtailment is requested or ordered as a percentage of historical, weather-normalized (Base Billing Period) natural gas consumption. Although the curtailment stages are generally associated with increasing deficits, the stages are not necessarily implemented in a sequential manner. The plan is flexible, allowing the state to move from one curtailment stage to another as required to adapt to dynamic changes of the incident (See Table 6.4).

Table 6.4: Regional Curtailment Plan Summary

STAGE	NATURE	CURTAILMENT %	TYPE OF CURTAILMENT
1	Voluntary	No Specific %	Uniform among all regional consumers
2	Voluntary	5% +	Uniform among all regional consumers
3	Mandatory	5% – 15%	Uniform among all regional consumers
4	Mandatory	15 %	Residential consumers
		15% +	General use consumers
		15% +	Major use consumers
5	Mandatory	% consistent with Stage 4 + additional curtailment	Continued consumer curtailment with additional utility action including plant closures and possible rotating outages

Any additional curtailment activities will be done in accordance with the plan and stated in the tariffs approved by the Public Utility Commission. The Commission will be available to handle customer appeals from utility curtailment decisions.

It is noted that although the emergency response plan is centered on an outage, incident, or emergency that originates with a utility operator, this does not limit the scope of the response plan. For example, if events outside of the purview of utility operators become relevant to the respective operators, whether by notification to OPUC from OEM or other collaborative groups, OPUC will take an active part in notifying utility operators of these events.

[19] In the event of an emergency, precedence is given to each agency to evaluate the needs of their own agency and if excess resources exist they may provide them for use in energy emergency response considerations or as directed by the Governor.
[20] See Appendix I

.

LNG Import Terminal Emergency Preparedness

INTRODUCTION

The LNG import-export terminals proposed for siting along the Oregon coast and Columbia River would be subject to natural disasters like earthquakes, tsunamis, floods, fires, and winter storms. LNG import-export terminals would also subject to man-made events such as industrial accidents (including fire), spills, terrorism, bomb threats, civil disturbances or violence in the work place. These events could affect Oregon citizens working at the import-export terminals, living adjacent to the terminals, or working, living, or recreating along the LNG vessel transit routes.

AUTHORITY

Should an LNG import-export terminal be built and operate in the state, ensuring the health and safety of Oregonians in the event of LNG emergencies is the responsibility of the Governor. The Governor designated ODOE the lead state agency to protect Oregonians from LNG emergencies involving leaks or fires. These events could jeopardize the health and safety of Oregon citizens.

ODOE works with LNG developers, the U.S. Coast Guard, other state agencies, and local emergency response organizations to create an LNG emergency preparedness and response plan for each proposed project. ODOE will develop and maintain the Oregon Statewide LNG Emergency Response Plan (LNG ERP) - a statewide strategy for responding to emergencies at LNG import-export terminals and incidents along the transit corridors involving LNG vessels.

GUIDING PRINCIPLES

The purpose of the LNG ERP is to ensure an effective and well-coordinated response with LNG developers, USCG, state, and local organizations to protect public health, safety, and the welfare of Oregonians in the event of an LNG emergency. The LNG ERP also ensures a consistent federal, state, and local response to LNG emergencies in Oregon regardless of which import-export terminal and local community in Oregon is impacted.

ODOE will direct and control the state's overall response to LNG emergencies that impact the state and will implement the LNG ERP as appropriate depending on event conditions. The LNG ERP will be developed in coordination with plans and procedures of industry and federal, state, and local emergency response organizations. These include:

- Federal Emergency Response Framework

- U.S. Coast Guard Navigational Vessel Inspection Circular No. 05-08
- Vessel Transit Management Plan
- LNG Import-Export Terminal Security Plans
- National Fire Protection Association Handbook
- Jordan Cove Emergency Response Plan
- Oregon LNG Emergency Response Plan
- Oregon Department of Energy Duty Officer Procedures
- Oregon Emergency Response System Duty Officer Procedures
- Clatsop County LNG Emergency Response Plan
- Coos County LNG Emergency Response Plan
- Local Fire and Law Enforcement LNG Emergency Response Plans

PROPOSED OREGON STATE LNG EMERGENCY RESPONSE PLAN FORMAT

The LNG ERP will address the unique conditions surrounding each LNG emergency and will take into account that it is not possible to plan for every contingency. As a result, the LNG ERP will be designed to cover all levels of LNG events regardless of the cause. These could range from minor inconveniences to the worst case situation – an LNG fire jeopardizing public health and safety.

The LNG ERP will also provide decision-makers the flexibility to assess the severity of each potential emergency, determine its potential risks to Oregonians and then implement the appropriate protective actions to mitigate the unique event conditions.

The LNG ERP will consist of three parts. They include:

1. An Overview of Oregon's LNG Supply and Distribution System – The overview will describe LNG, the LNG import-export terminal(s) in Oregon, and discuss LNG production capabilities and distribution systems associated with these projects.

2. Basic Plan – The Basic Plan will describe Oregon's strategy and approach to respond to LNG emergencies that impact the state. The Basic Plan will provide descriptions of the essential elements of advance planning that have been taken into consideration and provisions to cope with emergency situations. It will also identify the emergency response roles of lead and support organizations responding to LNG emergencies.

3. Procedures – Procedures will describe the objectives of each emergency response position at the ODOE EOC. The procedures will include check lists with specific tasks to be completed by each response position. This includes procedures for:

- Providing emergency notifications, providing event status updates, and terminating an event. Emergency contact information for LNG developers and federal, state, county, and local decision-makers and responders are also provided.
- ODOE EOC setup, staffing, and operations.
- ODOE Telephone Information Center setup, staffing, and operations.
- ODOE News Center setup, staffing, and operations.
- Members of the ODOE EOC Emergency Management Team, Assessment Team, Public Information Team, Operations Team, and Logistics Team.
- Determining and issuing protective actions and decisions.
- Declaring a state of emergency.
- Requesting federal support.
- Developing and issuing news releases. This includes boilerplate news releases, brochures, calendars, and other pre-printed public information materials.
- Other as appropriate.

REFER TO APPENDIX J - PROPOSED OREGON STATE LNG EMERGENCY RESPONSE PLAN FORMAT

Chapter 7

Ensuring Program Readiness

OREGON STATE ENERGY ASSURANCE PLAN

INTRODUCTION

To ensure that Oregon is prepared to respond to an energy crisis, ODOE and OPUC will work with industry and federal, state, and local emergency response organizations to conduct workshops and seminars, drills, tabletops, and exercises as appropriate and as resources allow. Training is essential to maintain program readiness to protect public health and safety in the event of a petroleum, electricity, or natural gas emergency impacting Oregon. ODOE will maintain open communications with USDOE and other western states to monitor regional, national, and international energy sector concerns and issues with potential impacts to Oregon's energy infrastructure. ODOE and OPUC will review and update the Oregon State Energy Assurance Plan annually or as needed.

TRAINING

ODOE is responsible for coordinating the training and Oregon's participation in drills and exercises involving the petroleum sector. ODOE will provide and coordinate training opportunities for decision-makers and responders at all levels of government and industry on Oregon's Petroleum Contingency Plan and procedures. This includes classroom instruction or participation in state or regional drills and exercises.

OPUC is responsible for coordinating the training and Oregon's participation in drills and exercises involving the electricity and natural gas sectors. OPUC will provide and coordinate training opportunities for decision-makers and responders at all levels of government and utilities on Oregon's Electricity and Natural Gas Emergency Response Plans.

Lessons learned from drills and exercises will be incorporated into the energy sector-specific emergency response plans as appropriate.

MAINTAINING REGIONAL, NATIONAL, AND INTERNATIONAL ENERGY OUTLOOK

DOE/OE is the lead federal agency in response to energy emergencies that impact the nation. As the lead federal agency, DOE/OE provides training and information sharing opportunities to the states. ODOE's Emergency Preparedness Manager and OPUC's Utility Safety, Reliability & Security Administrator will participate in the following DOE/OE activities as time and resources allow.

- Periodic conference calls to address energy issues
- Annual meeting, conference, or workshop
- Online training for new Software, communications tools
- Regional exercise

ODOE's Emergency Preparedness Manager will serve as the designated state contact for petroleum emergencies to provide DOE/OE and other western states with timely assessments of event conditions and other pertinent emergency information during petroleum emergencies.

OPUC's Utility Safety, Reliability & Security Administrator will serve as the designated state contact for electricity and natural gas emergencies to provide DOE/OE and other western states with timely assessments of event conditions and other pertinent emergency information during electricity and natural gas events.

PUBLIC INFORMATION AND OUTREACH

ODOE and OPUC will conduct a public education program for Oregonians to help ensure the public has access to information about:

- The potential impacts of energy lifeline shortages or disruptions to the community.
- Preventive measures to help avoid or reduce the impacts if energy supply shortages or disruptions were to occur.
- Conservation measures to be taken before, during and after energy emergencies to help the state recover from supply shortages and disruptions.

Activities include, but are not limited to:

- Providing information materials to the counties for distribution to local residents.
- Providing emergency response information on ODOE's and OPUC's web pages.
- Making emergency response information available to libraries, schools, hospitals, and other locations as appropriate.
- Providing speakers upon request to give presentations on the Oregon State Energy Assurance Plan and energy sector specific emergency response plans.
- Providing information upon request to the news media about the Oregon State Energy Assurance Plan and energy sector-specific emergency response plans as appropriate.

PLAN REVIEW AND UPDATE

ODOE and OPUC will review and update the Oregon State Energy Assurance Plan annually or as needed. Revisions will include improvements identified through drills and exercises. ODOE's Emergency Preparedness Manager will initiate the review and coordinate revisions with industry, federal, state, and county emergency response agencies as appropriate. ODOE will submit the Oregon State Energy Assurance Plan to USDOE annually as the plan of record.

THIS PAGE LEFT BLANK INTENTIONALLY

ESF 12 Tasked Agencies	
Primary Agencies	Oregon Department of Energy (ODOE) Public Utility Commission (PUC)
Supporting Agencies	Department of Administrative Services (DAS) Department of Human Services (DHS) Oregon Military Department (OMD) Oregon Department of Transportation (ODOT)
Adjunct Agencies	

1 Purpose

- Facilitate restoration of damaged energy systems and components during a potential or actual emergency or major disaster.
- Manage state response to emergencies involving radioactive materials releases from fixed nuclear facilities (Hanford), commercial nuclear power plants (Columbia Generating Station and the Trojan Independent Spent Fuel Storage Installation), and research reactors (Oregon State University and Reed College).
- Manage state response to transportation accidents involving radioactive material shipments on Oregon highways.
- Manage state response to emergencies involving the severe or long-term shortage or disruption of petroleum products. This includes implementing the state wide fuel allocation program when appropriate.
- Manage state response to emergencies involving the transportation, transmission and distribution of Liquefied Natural Gas (LNG).

2 Scope

Gathers, assesses, and shares information on energy system damage and estimations of the impact of energy system outages within affected areas. Determine issues and implements appropriate protective actions to ensure the protection of public health and safety during energy emergencies. Works closely with, and aids in, meeting requests for assistance from local officials, energy industry suppliers and distributors. Within ESF 12, energy includes producing, refining, transporting, generating, transmitting, conserving, building, distributing and maintaining energy systems and system components.

3 Roles and Responsibilities

3.1 Primary Agencies

3.1.1 Department of Administrative Services

Provide restorative services including structural, HVAC and electrical systems within state-owned facilities during or after an incident in the state of Oregon which requires a coordinated response.

3.1.2 Oregon Department of Energy

- The Oregon Department of Energy is responsible for planning, preparedness, response, and recovery from petroleum disruptions (ORS 176), liquefied natural gas mishaps (496), and radiological emergencies (496).

- ODOE operates an agency Emergency Operations Center (EOC) in Salem. The agency EOC serves as the state-wide coordination point for ODOE emergency response activities. ODOE provides a liaison to the state Emergency Coordination Center (ECC) when activated. ODOE maintains six 24/7 duty officers. ODOE is responsible for ensuring state and local emergency response organizations are trained and prepared to respond to petroleum, LNG, and radiological emergencies.

- Petroleum Emergency Preparedness and Response - ODOE maintains Oregon's Petroleum Contingency Plan. The purpose of the plan is to ensure an effective, well-coordinated response with industry, federal, state, and local emergency response organizations to protect public health and safety, the environment, and the region's economy. The plan applies a free market approach with government intervention only when it becomes necessary to protect public health and safety.

- Lead agency for ensuring a coordinated response to severe or long-term petroleum emergencies that impact the state. ODOE developed and maintains the *Oregon Petroleum Contingency Plan* that includes a state-wide fuel allocation program. ODOE is also the lead agency for ensuring a coordinated response to transportation, transmission and distribution emergencies involving Liquid Natural Gas (LNG) vessels, pipelines, and facilities.

- Developed and maintains the state of Oregon's LNG Emergency Response Plan. The plan defines the state's role and responsibilities to prepare for, respond to, and recover from LNG emergencies that threaten the health and safety of Oregon citizens, the environment, and the region's economy.

- LNG Emergency Preparedness and Response - Three LNG import facilities are proposed for Oregon to serve the growing need for natural gas supplies in the region. The projects, if built, would receive LNG from ocean going vessels, temporarily store it, and then regasify it before sending it out by pipeline to homes, businesses, electrical generating plants and industries in the Pacific Northwest as well as other parts of the Western United States. Two of the state's LNG Import terminals are proposed the Columbia River and one is proposed in Coos Bay, Oregon.

- Nuclear Emergency Preparedness and Response - ODOE is the lead state agency on nuclear emergency preparedness, response, and recovery. This includes incidents involving fixed nuclear facilities, Independent Spent Fuel Storage Installations (ISFSI), Research Reactors, and radioactive materials transport on Oregon highways (ORS 469). ODOE developed and maintains the Oregon CGS/Hanford Emergency Response Plan, Trojan ISFSI Plan, and the Radioactive Materials Transportation Plan. These plans define the state's role and responsibilities to prepare for, respond to, and recover from radiological emergencies that threaten the health and safety of Oregon citizens, the environment, and the region's economy. ODOE also reviews Oregon State University and Reed College Research Reactor Emergency Response Plans.

- The Federal Emergency Management Agency evaluates ODOE's ability to respond to radiological emergencies biannually to ensure program readiness.

- Assess energy system damage and monitors repair work.

- Collect, assess and provide information to energy supply, demand, and market impacts.

- Identify supporting resources necessary to restore energy systems.

- May deploy DOE response teams as needed to affected areas to assist in response and restoration efforts.

3.1.3 Public Utility Commission

- Regulates the state's investor owned electric, natural gas and telephone utilities, and certain water companies.

- Ensure that utilities and companies have adequate emergency preparedness plans in place.

- During emergencies, disasters, and when the State ECC is activated, the PUC serves as the state's liaison to the utilities.

- Provide assistance to ensure public utilities and PUC regulated entities can effectively restore power, natural gas and other energy sources following a disaster which impact energy resources. Ensure public utilities and PUC regulated entities mobilize and employ the necessary resources available in accordance with emergency plans, as applicable.

3.2 Support Agencies

3.2.1 Department of Human Services

- Provide assistance as appropriate when a disaster occurs that impacts energy resources causing any public health concern or crisis.
- Provide restorative services including structural, HVAC and electrical systems within state-owned facilities during or after an incident in the state of Oregon which requires a coordinated response.

3.2.2 Oregon Military Department

- Provides support assistance as needed.

3.2.3 Oregon Department of Transportation

- Provide traffic control for response to transportation accidents involving radioactive material shipments on state highways.
- Provide staging areas for checkpoints of shipments of agriculture products coming from southeast Washington in the event of a radioactive materials release from Hanford or the Columbia Generating Station.
- Provide technical assistance to transit providers to help with additional riders a fuel crisis would bring to transit systems.
- Provide technical assistance to local governments that start or expand rideshare programs in response to a fuel shortage.
- Assist with distribution of fuel crisis information through local ODOT District and DMV offices.
- Impose highway restrictions as needed in the event of an energy resource emergency, to include actions such as reduced speed limits and new multi-occupant vehicle lane designations.

3.3 Adjunct Agencies

[TO BE DEVELOPED]

4 Concept of Operations

OEM will coordinate all requests for assistance and communicate with the state agencies to identify the appropriate action and state resources to be used. Once Energy assets have been identified to meet the request, OEM will create an action using Ops Center to the specific State agencies to accomplish the task.

ODOE operates an agency Emergency Operations Center (EOC) in Salem. The agency EOC serves as the state-wide coordination point for ODOE emergency response activities. ODOE provides a liaison to the state Emergency Coordination Center (ECC) when activated. ODOE maintains six 24/7 duty officers. ODOE is responsible for ensuring state and local emergency response organizations are trained and prepared to respond to petroleum, LNG, and radiological emergencies.

In the event of a petroleum emergency, ODOE would direct and coordinate the state's overall response effort. ODOE will assess the severity and duration of a supply shortage or disruption, identify potentially affected areas, determine the risks and potential impacts to Oregonians, and advise the Governor on how best to protect the health and safety of Oregonians and the state's economy. This includes recommending and implementing voluntary or emergency conservation measures to reduce the use of petroleum products in the state and implementing Fuel Allocation Procedures if necessary. ODOE is also responsible for coordinating all emergency information and instructions released to the public and news media regarding the state's response effort and emergency actions.

The Oregon Petroleum Contingency Plan includes a state-wide fuel allocation program. If fuel allocation becomes necessary, ODOE would administer the state's Fuel Allocation Program and designate the set-aside volume. ODOE is responsible for working with the state's petroleum suppliers and wholesalers to implement the set-aside volume for use by the state. The set-aside program is designed to interfere minimally with the market, using set-aside volumes that are sufficient only to satisfy hardship and emergency cases. The set-aside program makes no attempt to reduce or inhibit the market price of fuels. All fuel delivered through the program will be purchased at the market price, and whenever possible, through the usual supplier.

ODOE's Fuel Allocation Program is designed to ensure emergency fuel to priority users performing life saving functions, restoring Oregon's critical infrastructure, and preventing community hardships. ODOE uses a three-tiered approach for allocating fuel to priority users. Tier 1 covers the state's emergency services providers. Tier 2 covers the state's essential services providers. Tier 3 allows for a community to request fuel supplies from the state set-aside. A community must show it has an emergency or hardship caused by a shortage of fuel or is receiving relatively less than other areas of the state. Providing emergency fuel to communities is the only element where retail service stations may receive a set-aside allocation. However, the State will not direct set-aside

volumes to specific stations. It will direct prime suppliers to release a certain volume to an area through normal supply channels.

During a fuel supply shortage situation, the need for a method to alleviate potentially long lines at retail service stations may arise. ODOE would implement the Odd/Even Fuel Allocation Measure for the public as appropriate.

All fuel rationing activities requires an Energy Emergency Declaration from the Governor.

In the event of an emergency at an LNG import terminal or along the transport route, ODOE will direct and control the state's overall response effort. This includes:

- Receiving initial notifications from LNG developers about an event,
- Notifying and/or establishing contact with all affected federal, state, and county emergency response organizations to ensure a coordinated response,
- Working with the U.S. Coast Guard, state agencies, and local emergency response organizations to assess the severity of the event, determine impacts to Oregon, and advise the Governor on protective actions for the public, and
- Developing and disseminating emergency information to the public and the news media.

In the event of a radiological emergency, ODOE will direct and control the state's overall response. This includes:

- Alert and mobilize emergency responders,
- Provide timely and accurate information to the public and news media,
- Assess the severity of the radiological accident,
- Issue and implement appropriate protective action recommendations to protect public health and safety,
- Identify and track the radioactive release, and
- Sample, process, and analyze potentially contaminated soil, vegetation, air, and water.

THIS PAGE LEFT BLANK INTENTIONALLY

UNDERSTANDING ON THE AREAS OF RESPONSIBILITIES PERTAINING TO EMERGENCY RESPONSE BETWEEN THE OREGON DEPARTMENT OF ENERGY AND THE OREGON PUBLIC UTILITY COMMISSION

PURPOSE

This Memorandum of Understanding (MOU) establishes a framework for cooperation and outlines responsibilities for the Oregon Department of Energy (ODOE) and the Oregon Public Utility Commission (OPUC) for preparedness and response to energy emergencies that impact the state. This includes petroleum disruptions and shortages, natural gas events, and electricity emergencies. While ODOE takes the lead in preparing for, responding to, and recovery from petroleum mishaps, OPUC is responsible for electricity and natural gas incidents.

RESPONSIBILITIES

❑ Initial Notifications

Petroleum Events – ODOE will provide courtesy notifications to the OPUC. No action is required by the OPUC unless the petroleum emergency impacts the natural gas or electricity supply and distribution systems.

Natural Gas Events – OPUC will provide courtesy notifications to the ODOE. No action is required by ODOE unless the natural gas event impacts the petroleum supply and distribution system.

Electricity Events – OPUC will provide courtesy notifications to ODOE. No action is required by ODOE unless the electricity event impacts the petroleum supply and distribution system.

❑ Event Assessment and Protective Action Decisions

Petroleum Events – ODOE will work with petroleum industry partners to assess the severity of the fuel disruption or shortage, determine its impact on Oregon, and implement protective actions as appropriate to protect the health and safety of Oregonians. This includes issuing voluntary and emergency fuel conservation measures as appropriate and the allocation of emergency fuel if it becomes necessary. Emergency conservation measures and the allocation of fuel require an Emergency Declaration by the Governor. ODOE will work with the Governor's Office and the appropriate state agencies to secure an Emergency Declaration, if appropriate. If fuel allocation becomes necessary, ODOE will work with and rely on the expertise of the OPUC to determine fuel needs for the electricity and natural gas sectors.

Natural Gas Events – OPUC will work with natural gas companies to assess the severity of the natural gas disruption or shortage, determine its impact on Oregon, and implement protective actions as appropriate to protect the health and safety of Oregonians.

Electricity Events – OPUC will work with utility companies and the Bonneville Power Administration to assess the severity of electricity outages, determine its impact on Oregon, and implement protective actions as appropriate to protect the health and safety of Oregonians.

❑ Emergency Information

Petroleum Events – ODOE will draft and disseminate emergency information to the news media and the public. ODOE will provide event status updates to the Governor, the legislative leadership, the Petroleum Advisory Group, state and local emergency response organizations including OPUC, states in the Petroleum Administration Defense District V, U.S. Department of Energy (USDOE), and other federal agencies as appropriate.

Natural Gas Events – OPUC will draft and disseminate emergency information to the news media and the public. OPUC will provide event status updates to the Governor, the legislative leadership, natural gas industry, state emergency response organizations including ODOE, USDOE, Pipeline Hazardous Materials Safety Administration, and other federal agencies as appropriate.

Electricity Events – OPUC will draft and disseminate emergency information to the news media and the public. OPUC will provide event status updates to the Governor, the legislative leadership, state emergency response organizations including ODOE, and other agencies as appropriate.

❑ Emergency Center

Petroleum Events – The ODOE Emergency Operations Center (EOC) will be activated in response to petroleum emergencies that impact the state. ODOE staff will direct and control the state's overall response to petroleum emergencies from the ODOE EOC. This includes assessing the severity of the event; determining the event's impacts on Oregonians; determining and implementing appropriate protective actions; and issuing emergency information to federal, state, and local response organizations, the news media, and the public. If the Oregon Emergency Coordination Center (ECC) at the Oregon Emergency Management Division (OEM) is activated, ODOE will send a liaison to the Oregon ECC to provide information on ODOE actions in response to the petroleum event as appropriate.

Natural Gas Events – OPUC will report to the Oregon ECC at OEM in response to natural gas emergencies that impact the state. OPUC staff will provide support to the state's overall response to natural gas emergencies from the Oregon ECC. This includes assessing the severity of the event; determining the event's impacts on Oregonians; determining and implementing appropriate protective actions; and issuing emergency information to federal, state, and local response organizations, the news media, and the public.

Electricity Events – OPUC will report to the Oregon ECC at OEM in response to electricity emergencies that impact the state. OPUC staff will provide support to the state's overall response to electricity emergencies from the Oregon ECC. This includes assessing the severity of the event; determining the event's impacts on Oregonians; determining and implementing appropriate protective actions; and issuing emergency information to federal, state, and local response organizations, the news media, and the public.

❑ Interface with the U.S. Department of Energy's (USDOE) Office of Energy Assurance

USDOE's Office of Energy Assurance (OE) is the lead federal agency in response to energy emergencies that impact the nation. OE will call the designated state contacts (noted below) for timely assessment of the event conditions and other pertinent emergency information during energy emergencies. OE will also provide training and information sharing opportunities to the states. They include:

- ⇨ Periodic Conference Calls to Address Energy Issues as Needed
- ⇨ Annual Meeting/Conference
- ⇨ Online Training for New Software/Communications Tools
- ⇨ Regional exercise (optional)

Petroleum Events -- ODOE will serve as OE's primary contact for information about emergencies impacting Oregon's petroleum supply and distribution system. ODOE will ensure that the agency's plans and procedures are consistent with OE's for information sharing. ODOE will also participate in activities conducted by OE as appropriate and as resources allow.

Natural Gas Events – OPUC will serve as OE's primary contact for information about emergencies impacting Oregon's natural gas supply and distribution system. OPUC will also participate in activities conducted by OE as appropriate and as resources allow.

Electricity Events – OPUC will serve as OE's primary contact for information about emergencies impacting Oregon's electricity supply and distribution system. OPUC will also participate in activities conducted by OE as appropriate and as resources allow.

❑ Emergency Response Training

Petroleum Events – ODOE will conduct drills and exercises to ensure the industry, federal, state, and local emergency response organizations are prepared to respond to petroleum emergencies that impact the state.

Natural Gas Events – OPUC will monitor industry-initiated drills and exercises to ensure the natural gas operators are prepared to respond to natural gas emergencies that impact the state.

Electricity Events – OPUC will monitor industry-initiated drills and exercises to ensure the utility operators are prepared to respond to electricity emergencies that impact the state.

❑ Plan/Procedures

Oregon State Energy Assurance Plan - ODOE and OPUC will review and update the Oregon State Energy Assurance Plan annually or as needed. Revisions will include improvements identified through drills and exercises. ODOE's Emergency Preparedness Manager will initiate the review and coordinate revisions with industry, federal, state, and county emergency response agencies as appropriate. ODOE will submit the Oregon State Energy Assurance Plan to USDOE annually as the plan of record.

Sector Specific Emergency Response Plans

Petroleum Events – ODOE will develop and maintain emergency plans and procedures for petroleum emergencies that impact the state. The Oregon Petroleum Contingency Plan will be reviewed annually and revised as appropriate to ensure that plans and procedures are consistent with: the changing trends of the world petroleum market; and the plans and procedures of federal, state, and local organizations that support ODOE's response to petroleum emergencies. ODOE will update the Oregon Petroleum Emergency Contacts List quarterly.

Natural Gas Events – OPUC will develop and maintain emergency plans and procedures for natural gas emergencies that impact the state. The Natural Gas Emergency Plan will be reviewed annually and revised as appropriate to ensure that plans and procedures are consistent with: the changing trends of the world natural gas market; and the plans and procedures of federal, state, and local organizations that support OPUC's response to natural gas emergencies.

Electricity Events – OPUC will develop and maintain emergency plans and procedures for electricity emergencies that impact the state. The Electricity Emergency Plan will be reviewed annually and revised as appropriate to ensure that plans and procedures are consistent with: the changing trends of the world electricity market; and the plans and procedures of federal, state, and local organizations that support OPUC's response to electricity emergencies.

EFFECTIVE DATES, EXPIRATION AND CHANGES TO THIS MEMORANDUM OF UNDERSTANDING

❑ Effective Date

This Memorandum of Understanding (MOU) is effective as of the date it is signed.

❑ Expiration

This MOU will remain in effect until formally cancelled by one of the parties to the MOU.

☐ Changes

This MOU can be changed by mutual agreement of the parties involved. In the event of changes, a new MOU will be issued and signed by the parties.

FUEL SUPPLY DISRUPTION TRACKING FORM

DATE:	COMPLETED BY:
TIME: am/pm	TITLE:

1. PETROLEUM INFRASTRUCTURE AFFECTED

REFINERY(S)	DISTRIBUTION TERMINAL(S)	PIPELINE COMPANY(S)
☐ BP Cherry Point ☐ Conoco Phillips ☐ Shell Anacortes ☐ Tesoro Refining & Marketing Company	☐ BP ☐ Chevron ☐ Conoco Phillips ☐ Kinder Morgan ☐ McCall Oil ☐ NuStar ☐ Shell ☐ Tesoro	☐ Chevron Pipeline *(Salt Lake City to Spokane)* ☐ Kinder Morgan Pipeline *(Portland terminal to PDX and Eugene Terminal)* ☐ NuStar Pipeline (Umatilla to Union Pacific storage facility south of Hermiston) ☐ Olympic Pipeline *(WA refineries to Portland terminals – 230 miles)*

2. FACILITY OR SYSTEMS AFFECTED

SYSTEM AFFECTED

☐ Tank Farm(s) ☐ Pipelines ☐ Containment ☐ Marine Dock ☐ Loading Racks ☐ Other: _____

DESCRIPTION: _____

CAUSE OF SUPPLY DISRUPTION OR ACCIDENT

☐ Refinery or Terminal Shutdown ☐ Pipeline Failure ☐ Natural Disaster ☐ Terrorism or Sabotage ☐ War or Civil Unrest ☐ Fire or Explosion ☐ Other: _____

DESCRIPTION: _____

3. PRODUCT SUPPLY AFFECTED

☐ Crude	☐ Jet Fuel	☐ Fuel Oil	☐ Heating Oil (No. 2 Distillate)	☐ Other _____
☐ Gasoline	☐ Aviation Gasoline	☐ Additives		☐ Other _____
☐ Diesel		☐ Propane		

4. PETROLEUM INDUSTRY RESPONSE & RECOVERY ACTIONS

☐ *Facility operators must complete a Facility Operations Log following petroleum emergencies and a Facility Start-Up Plan prior to restarting operations. ODOE responders should obtain this information from operators during the state's assessment of fuel supplies. See Attachment 1B.*

☐ Power Yes ___ No ___

☐ Water Yes ___ No ___

☐ Communications Yes ___ No ___

5. PETROLEUM INDUSTRY REQUESTS OF ODOE

☐ Request ODOE coordinate acquiring waivers of federal and state driver hour limitations to increase bulk highway fuel transport.
☐ Request ODOE coordinate acquiring waivers from DEQ and EPA for the import of gasoline that does not meet local and federal air quality requirements.
☐ Request ODOE coordinate with USDOE to obtain Jones Act waivers for the import of petroleum products on non-US flag vessels.
☐ Request ODOE facilitate obtaining generators for distribution terminals in the event of a power outage to support recovery actions. .
☐ Other actions as appropriate: _____

_____

Notification and Activation of Oregon Emergency Response Organizations for Petroleum Emergencies

The Oregon Department of Energy (ODOE) will provide initial notifications to federal, state, and local emergency response organizations in the event a petroleum emergency. Upon activation of the agency's Emergency Operations Center, ODOE may request organizations send representatives to the ODOE EOC to support the state's response to fuel shortages and disruptions depending on the severity of event conditions.

Emergency Response Organization	Level 1 No discernable shortage. Possible shortages elsewhere	Level 2 5-10% reduction in supply for a week or more. Estimated shortage by days a terminal is closed or the number of substitutions of truck deliveries instead of normal pipeline supply.	Level 3 10-15% reduction in supply for three weeks or more. Curtailments by local gas distribution companies for two weeks or more.	Level 4 Greater than 15%* reduction in availability of petroleum products.
Governor	*ODOE routinely monitors international and domestic events to better anticipate problems with potential impacts to Oregon's petroleum supply, distribution system and prices.*	Notify. Standby for additional information.	Notify. Report to ODOE EOC if requested.	Notify. Report to ODOE EOC.
State Agencies: OERS, OEM, ODOT, OSP, OMD, PUC, ODA, DAS, and DEQ		Notify. Standby for additional information.	Notify. Report to ODOE EOC if requested.	Notify. Report to ODOE EOC.
County Agencies: 36 County Emergency Management Agencies		Notify. Standby for additional information.	Notify. Limited activation of county EOCs as appropriate.	Notify. Full activation of county EOCs as appropriate.
Federal Agencies: USDOE, EPA, and USCG		Notify. Standby for additional information.	Notify. Standby for additional information.	Notify. Standby for additional information. Support ODOE EOC as needed.
PADD V States: Alaska, Arizona, California, Idaho, Hawaii, Nevada, and Washington		Notify. Standby for additional information.	Notify. Standby for additional information.	Notify. Standby for additional information.
Refineries: BP Cherry Point Refinery, Conoco Phillips Refinery, Shell Anacortes Refinery, and Tesoro Refinery		Notify. Assess and report on supply situation.	Notify. Assess and report on supply situation.	Notify. Assess and report on supply situation.. Support fuel allocation measures as needed.
Terminals: BP, Chevron, Conoco Phillips, Kinder-Morgan Energy, McCall, Shell Oil Products, NuStar, and Tesoro Petroleum *(Vancouver, WA)*		Notify. Assess and report on supply situation.	Notify. Assess and report on supply situation.	Notify. Assess and report on supply situation. Support fuel allocation measures as needed.
Pipelines: Chevron Pipeline Company, Chevron Willbridge Products System, NuStar, Kinder-Morgan Pacific Operations, & Olympic Pipeline Company		Notify. Assess and report on supply situation.	Notify. Assess and report on supply situation.	Notify. Assess and report on supply situation. Support fuel allocation measures as needed.
Associations: OPMA and WSPA		Notify. Assess and report on supply situation.	Notify. Assess and report on supply situation.	Notify. Assess and report on supply situation.. Support fuel allocation measures as needed.

SITUATION REPORT #75

September 15, 2010 (9:00 a.m. PST)

OREGON DEPARTMENT OF ENERGY

http://www.energy.state.or.us/EOC/index.htm

EMERGENCY SUPPORT FUNCTION (ESF) 12: ENERGY

ORS 176.809 authorizes the Oregon Department of Energy (ODOE) to prepare and respond to petroleum emergencies that impact Oregon. ODOE continues to work with suppliers, wholesalers, and distributors to restore the petroleum infrastructure and ensure fuel is delivered to emergency and essential service providers in the state in the aftermath of the magnitude 9.0 earthquake Tuesday, June 15, 2010 at 10 a.m. The quake rocked the Pacific Northwest from Canada to Northern California and caused approximately four minutes of ground shaking which was felt significantly west of the Cascades and most severely along the coast.

BACKGROUND

There are no internal crude resources in Oregon and the state has no refining capabilities. Oregon imports 100 percent of its refined petroleum products. More than 90 percent of the fuel Oregon receives come from four refineries in the Puget Sound Area of Washington State. More than 70 percent of this fuel is transported 230 miles from the refineries to eight petroleum distribution terminals near the Linton Wilbridge and St. Helens Road area of Northwest Portland via the Olympic Pipeline. Once the fuel reaches the Portland distribution terminals, one pipeline, a fleet of about 1,500 trucks, and barges on the Columbia distribute fuel to roughly 2,250 retail service stations throughout the state.

On average there is a one week supply of diesel and unleaded gasoline in storage at the Portland distribution terminals. Retail service stations store a 2-3 day supply of fuel onsite. The Portland International Airport has a 3-day supply of jet fuel in storage on site.

Refineries and petroleum distribution terminals are not designed to withstand a 9.0 earthquake with four minutes of ground shaking. Damages to facilities, tanks, facility piping, and other systems was significant throughout western Oregon and Washington. While crude and product pipelines are flexible by design, earth movement from a catastrophic quake put significant stress on the pipelines and will likely caused leaks and damages throughout the lines. It will likely weeks or months to fully assess and repair anticipated damage to these facilities. Expect little to no production or product movement for more than one week.

Electricity, telecommunications, pipelines, bridges and roads, natural gas and city water supply are critical resources for facility operations, responding to emergencies onsite, and recovery efforts to restore the petroleum infrastructure following a catastrophic event.

0 – 72 HOURS

ODOE ACTIONS

- Activated ODOE EOC and established communications with refineries, petroleum distribution terminals, and pipeline companies servicing Oregon to assess impacts to the petroleum infrastructure.

SAMPLE

- ODOE Liaisons responded to the Joint Field Office to address fuel issues and concerns. ODOE requested generators for refineries and petroleum distribution terminals.

- Established contact with the U.S. Department of Energy, Lead Federal Agency for ESF 12. We participated in USDOE daily conference calls with all 50 states to assess regional and national fuel outlook and possible assistance to Oregon.

- Requested information from the Oregon Public Utility Commission (PUC) about damages to the electricity, natural gas, and telecommunications infrastructure. Power, natural gas, and communications capabilities are critical to the refineries, petroleum distribution terminals, and pipeline companies to conduct timely damage assessments of facilities, equipment, and systems and for operations.

- Requested information from the Oregon Department of Transportation (ODOT) on damages to roads and bridges to determine viable transportation corridors to support fuel deliveries.

- Requested the Oregon Department of Aviation conduct a flyover of the refineries and petroleum distribution terminals for a visual assessment of the conditions at these facilities.

- Requested U.S. Coast Guard provide special access for workers to enter distribution terminals during the lockdown of port facilities. MARSEC 3 puts the Port of Portland in lockdown stopping the movement of fuel and worker traffic into and out of the petroleum distribution terminals.

- Drafted and issued news releases providing information on impacts to Oregon's fuel supply and distribution system, protective action recommendations for the public and voluntary fuel conservation measures.

PETROLEUM INDUSTRY ACTIONS

REFINERIES - Onsite workers at four refineries in Washington State completed initial visual inspections of its facilities. All four refineries sustained severe damage to their facilities, equipment, and systems and remain in shutdown mode. All four refineries lost power as a result of the earthquake and do not have generators onsite. Refineries remain without power. Power is required for refinery workers to complete a detailed engineering inspection of pipes, vessels, structures, and tanks to evaluate mechanical integrity.

PETROLEUM DISTRIBUTION TERMINALS – Onsite workers at eight Portland petroleum distribution terminals completed initial visual inspections of their facilities. All eight distribution terminals report severe damages to terminal facilities, tanks, containment systems, additive systems and facility piping resulting in spills and leaks. All eight terminals are without power. Some terminals have small generators onsite to produce limited backup power for running boilers for steam heating of heavy oil lines and tanks and for providing minimal lighting. These generators do not produce enough power to drive operations or to complete a more detailed assessment of damages. Power is required for terminal workers to complete a detailed engineering inspection of pipes, vessels, structures, and tanks to evaluate mechanical integrity.

PIPELINE COMPANIES – Pipeline operators reported difficulty in assessing integrity of the pipeline system due to the loss of power. Aerial Patrols have conducted over-flights along the Right of Way and reported many releases requiring verification. Operators had to postpone dispatching personnel to inspect the pipeline Right of Ways until roads and bridges were viable. Inspecting the pipeline Right of Way must be done by vehicle and walking the length of the pipelines. Power is also necessary to verify the pressure and integrity of the pipelines.

SAMPLE

72 – 168 Hours

Assumptions: Limited telecommunications capabilities, generators delivered to refineries and petroleum distribution terminals, and limited viable roads and bridges.

- ODOE EOC remained fully operational and decision-makers and emergency responders continue to work with refineries, petroleum distribution terminals, and pipeline companies servicing Oregon to assess impacts to the petroleum infrastructure.
- ODOE Liaisons continued participation at the JFO to coordinate ESF 12 response and recovery efforts for the fuel sector. This included working with the Oregon Military Department to coordinate the delivery of generators to the petroleum distribution terminals and working with Washington State on the delivery of generators to the refineries.
- ODOE requested USDOE provide assistance in obtaining fuel from other regions to support emergency response efforts in Oregon. ODOE requested Oregon Military Department assistance in providing portable fueling locations to dispense fuel for emergency and essential services providers.
- Continued to work closely with PUC to monitor the restoration efforts of the electricity, natural gas, and telecommunications infrastructure to support fuel supply and distribution system damage assessment and restoration efforts.
- Continued to work closely with ODOT to monitor the restoration of roads and bridges to determine viable transportation corridors to support fuel deliveries.
- Continued to work closely with USCG to approve access of workers to the distribution terminals in a MARSEC 3 lockdown of port facilities.
- Began work with Oregon counties impacted by quake to assess fuel needs of emergency service providers. This included law enforcement, fire service, and medical service providers.
- Began work with state agencies to assess fuel needs for essential service providers. This includeds utilities, telecommunications, transportation, sanitation, public works, agriculture, and other essential service providers to assess fuel needs.
- Continued to draft and issue news releases providing information on impacts to Oregon's fuel supply and distribution system, protective action recommendations for the public and voluntary fuel conservation measures.

PETROLEUM INDUSTRY ACTIONS

Refineries, petroleum distribution terminals, and pipeline companies received generators allowing onsite workers the ability to begin detailed engineering inspections of pipes, vessels, structures, tanks, and pipelines to evaluate mechanical integrity. It took 24-48 hours to complete a detailed inspection of facilities with the available power. There was no production or movement of fuel at this time.

1 Week – 1 Month

Assumptions: Limited telecommunications capabilities, refineries and petroleum distribution terminals operating with generators, and limited viable roads and bridges.

SAMPLE

- ODOE EOC remained fully operational and decision-makers and emergency responders continue to work with refineries, petroleum distribution terminals, and pipeline companies servicing Oregon to get fuel production and movement restored.

- ODOE Liaisons continued participation at the JFO to coordinate ESF 12 response and recovery efforts for the fuel sector. This included working with the Oregon Military Department to identify locations to establish portable fueling stations and coordinate the delivery of fuel obtained from USDOE from other regions to the emergency and essential service providers in Oregon.

- Worked with ODOT to implement public campaign promoting mobility conservation measures like taking public transit, carpooling, bicycling, and other ways to limit driving personal vehicles.

- Implemented Odd/Even fuel allocation for the public.

- Worked with Oregon Department of Justice (DOJ) to suspend regulations on additives like boutique gasoline requirements until the supply chain was fully restored. Some fuels from outside the region did not meet Oregon standards.

- Worked with DOJ to suspend regulations on vapor recovery systems at dock facilities to allow all distribution terminals with working docks to receive fuel from tanker vessels. Both Chevron and Kinder Morgan dock facilities sustained significant damage. Of the eight distribution terminals, only Chevron and Kinder Morgan (docks located right next to each other) were permitted to receive gasoline products by tankers. The dock facilities at six of the terminals were not equipped with vapor recovery systems.

- Continued to work closely with PUC to monitor the restoration efforts of the electricity, natural gas, and telecommunications infrastructure to support fuel supply and distribution system damage assessment and restoration efforts.

- Continued to work closely with ODOT to monitor the restoration of roads and bridges to determine viable transportation corridors to support fuel deliveries.

- USCG change in its MARSEC 2 level (from MARSEC 3 to MARSEC 2) lifted lockdown of port facilities allowing access of workers to the distribution terminals without security clearance.

- Continued to draft and issue news releases providing information on impacts to Oregon's fuel supply and distribution system, protective action recommendations for the public and voluntary fuel conservation measures.

PETROLEUM INDUSTRY ACTIONS

Refineries, petroleum distribution terminals, and pipeline companies completed engineering assessments of facilities and systems. The assessments confirmed signification damages to the integrity of pipes, vessels, structures, tanks, and pipelines, which severely impacted operations. Industry personnel prioritized and repaired facilities, equipment and systems as needed to jumpstart fuel production and distribution. Limited fuel production and movement occurred during this period.

1 Month – Present

Assumptions: Moderate telecommunications capabilities, electricity restored to refineries and petroleum distribution terminals, and some viable roads and bridges to support fuel deliveries.

SAMPLE

- ODOE EOC continues 24/7 operation at a limited activation to continue working with petroleum distribution terminals to set aside and allocate available fuel for emergency and essential service providers as directed by ODOE.

- If JFO is still operational, ODOE Liaisons will continue to participate at the JFO to coordinate ESF 12 response and recovery efforts for the fuel sector.

- Monitor and determine when waivers for additives and vapor recovery systems are to be lifted. Trigger – viable roads and bridges allowing for delivery of additives.

- Monitor and determine when to terminate Odd/Even fuel allocation for the public.

- Monitor and determine when to terminate fuel allocation for emergency and essential services. Trigger – when emergency and essential services are able to fuel up at their normal fueling locations.

- Continue to work closely with PUC to monitor the restoration efforts of the electricity, natural gas, and telecommunications infrastructure.

- Continue to work closely with ODOT to monitor the restoration of roads and bridges to determine viable transportation corridors to support fuel deliveries.

- Continue to draft and issue news releases providing information on impacts to Oregon's fuel supply and distribution system, protective action recommendations for the public and voluntary fuel conservation measures.

PETROLEUM INDUSTRY ACTIONS

Refineries, petroleum distribution terminals, and pipeline companies continue repairs to facility, equipment, and systems. Moderate fuel production and movement during this period.

DRAFT

OREGON PUBLIC UTILITY COMMISSION
March 31, 2010

Introduction

This document provides a Utility Emergency Incident & Outage Situation Report form to be used in the administration of the Oregon State Energy Assurance Plan.

OVERVIEW

The Oregon Public Utility Emergency Response Plan is incorporated in Part II of the Energy Assurance Plan. The Emergency Response Plan outlines four levels of alert with its associated triggering events as shown below.

	ACTIVATING EVENTS
LEVEL I	An injury causes hospitalization or death.
	Service to more than 50,000 electric customers (50 natural gas customers) is disrupted for over 2-hours.
LEVEL II	Activation of electric or natural gas utility Emergency Operation Center (EOC).
LEVEL III	Moderate shortage, escalating incident, or disruption.
	Utility Operator requests for limited assistance.
	Impact extends to interdependent utility operators.
LEVEL IV	Escalation of a high frequency, low impact outage or incident estimated to last a period of months, precluding the reliability of electric or natural gas service delivery.
	Utility companies recognizing that either company resources—staff experts, materials, equipment—are being exhausted or a multi-jurisdictional emergency is occurring.
	A devastating natural or deliberate disaster that immediately impacts electric or natural gas infrastructure with little or no warning.
	Energy demand exceeds generation supply such that electric or natural gas shortage occurs and the situation becomes unmanageable by natural gas operators, balancing authorities, and excess market supply.
	Implementation of mandatory Regional Curtailment Plan required.

When an event escalates and triggers Level III, the Public Utility Commission Duty Officer will complete this form in conjunction with other LEVEL III response actions. This form will serve as a situational report to collect relevant information to be used to brief PUC executive staff, Oregon Emergency Management, and other necessary parties.

ORDER NO. 93-084

ENTERED JAN 19 1993

BEFORE THE PUBLIC UTILITY COMMISSION

OF OREGON

UM 500

In the Matter of the Commission's Investigation into an Electric Load Curtailment Plan.) ORDER

DISPOSITION: CURTAILMENT POLICIES ADOPTED

INTRODUCTION

Oregon Revised Statutes Chapters 757 and 758 require those who sell electricity (or natural or synthetic gas) to the public in Oregon to have in place load-curtailment plans approved by the Commission. The requirement applies to individuals, firms, partnerships, corporations, associations, cooperatives, and municipalities. The plans would apply during any energy emergency declared by the Governor pursuant to ORS 176.750 through 176.820. The current plans on file with the Commission have been in effect since the late 1970's.

Load-curtailment plans address energy shortages lasting months, rather than short-term shortages that might result from a period of unusually cold weather. ORS 757.710 directs that the plans address "any predictable circumstance that may jeopardize prolonged continuity of service."

During the past three years, a group of regulatory and utility representatives from Oregon, Washington, Idaho, and Montana have developed a regional electric load curtailment plan. Representatives from private and public utility companies, state regulatory commissions, the Bonneville Power Administration, the direct service industries, the Northwest Power Planning Council, the Oregon Department of Energy, and others, worked to develop the plan. They created a regional plan designed to deal effectively with long-term shortage situations and promote curtailment plan uniformity among the states. The plan was issued in May 1992.

The regional plan does not, by itself, have any enforcement authority. Sponsors of the plan encourage the four states to individually adopt curtailment plans consistent with the regional plan.

At its public meeting on August 4, 1992, the Commission considered a recommendation by its staff that it initiate an investigation into revising the Commission's electric load curtailment policies. The Commission adopted its staff's recommendations. The regional plan has served as a focal point for the investigation.

The Commission served notice of its investigation on a large number of individuals and organizations who might be interested in curtailment plans. Written comments were invited. During September 1992 hearing sessions were held in Salem, Grants Pass, Bend, and Baker City, Oregon. Those who commented on the plan agreed with the general principles stated in the regional plan.

Commission staff recommends that the Commission require each electric energy utility operating in Oregon to file a load curtailment plan with the Commission. Staff recommends that the filed plans be based on a model plan issued by the Commission. Staff also recommends that the Commission adopt the regional curtailment plan as a general policy guideline for dealing with long-term electric energy shortages.

PROPOSED CURTAILMENT POLICIES

The proposed model plan contains five phases of curtailment. The first two involve appeals for voluntary curtailment; the last three involve mandatory curtailment amounts. The model plan provides for enforcement of mandatory curtailment by the use of penalties.

The voluntary phases would consist of requests that customers curtail their consumption of electricity. Most people would be willing to reduce their consumption when faced with the consequences of a shortage.

If voluntary curtailment failed to bring resources and loads into balance, mandatory curtailment would be required. In phase one of mandatory curtailment, customers would be required to consume less electricity than they consumed during the corresponding billing period the previous year. A required percentage reduction would be established and would apply to all customers.

The second stage of mandatory curtailment would require an additional reduction in consumption of electricity. As more severe curtailment steps are required, differences among the customer classes become more important. Some will be able to take additional curtailment measures with less disruption than others. Therefore, it may not be practical or even possible to require the same percentage reduction for all customer classes. For instance, the Commission may decide that residential customers should continue curtailing at least 15 percent, general use customers should curtail 20 percent, and major use customers should curtail 25 percent. The required amount of curtailment would be at least 15 percent, and all customers within a customer class would be subject to the same requirements.

The third, and last, stage of mandatory curtailment would be the curtailment of last resort to keep the system functioning. Selective shutoffs of service and rolling blackouts could be ordered.

A system of escalating penalties would be used to enforce mandatory curtailment. The penalties would start at ten cents per kilowatt hour of excess use and go as high as forty cents per kilowatt hour of excess use plus disconnection of service.

Exemptions would be available to customers who demonstrated to their utility that the required curtailment would result in unreasonable exposure to health or safety hazards, would seriously impair their welfare, or would cause extreme economic hardship. For example, critical load customers like hospitals, police, and fire stations could obtain exemptions after demonstrating that nonessential energy use had been curtailed. A customer dissatisfied with the utility's response could appeal to the Commission.

CURTAILMENT POLICIES ADOPTED

The goal of utility companies and government officials is to have electric energy available to the public on a consistent, uninterrupted basis. However, many factors affect the balance between demand for electricity and the supply of it, and programs do not always work out as planned. A prolonged drought or loss of existing resources could put an unanticipated strain on the supply network. Utilities might be unable to obtain approval for and build new resources to timely meet increasing load demands.

The Commission does not expect a significant shortage of electrical energy in Oregon in the foreseeable future, but contingency plans are both prudent and required by law. At its public meeting on November 24, 1992, the Commission considered energy load curtailment issues. The Commission adopted the policies recommended by its staff.

The staff recommendation includes a model plan to be used by individual utilities in preparing their individual curtailment plans. Staff also recommends that the Commission adopt the regional plan as a statement of general principles and a declaration of its commitment to a regional approach to curtailment planning.

The model plan provides an appropriate balance between the need for flexibility in dealing with future events and the need for specificity so people will know how the plan will work. It allows decision-makers to match the level of curtailment to the shortage being experienced. As circumstances change, curtailment requirements can be adjusted. The plan is designed to require only the minimum necessary administrative burdens on utilities, but still ensure that customers are treated fairly and consistently. The plan imposes equal burdens on similarly situated customers.

In the event of a shortage of electricity, the Commission will initiate the statewide voluntary phases of the curtailment program, although utilities are at liberty to seek voluntary curtailment from their customers at any time. The Commission will publicly declare the need for curtailment and coordinate its activities with the utilities. Obtaining significant curtailment from the public will be crucial to the success of the voluntary portion of the program.

If voluntary curtailment is insufficient and there still is a shortage of electricity, the Governor may declare an emergency and start the mandatory portion of the program. If directed by the Governor in an executive order, the Commission will issue an order directing Oregon consumers of electricity to curtail the amount of electricity consumed. The percentage of required curtailment in phase one will be between five and 15 percent. The utilities will then administer their curtailment plans on file with the Commission.

Any additional curtailment activities will be done in accordance with the plan adopted in this order and stated in the tariffs approved by the Commission.

The Commission will be available to handle customer appeals from utility curtailment decisions. The Commission's existing procedures are adequate to handle any curtailment-related disputes.

The issues addressed in this order relate to the possibility of a long-term shortage of electricity. The effects of such a shortage would be regional. The Commission will work with people from other states as well as those from Oregon to best handle any shortage. The Commission urges others involved in supply/resource issues to cooperate and work together. Oregon, and other states, will be better able to effectively deal with a supply shortage if all parties in interest in the region work together.

CONCLUSIONS OF LAW

1. Utilities filing curtailment plans consistent with Attachment 1 to this order will meet the requirements of ORS 757.710(1);

2. The model plan is consistent with the public health, safety, and welfare, and with Oregon energy policies;

3. Implementation of the model plan is technically feasible and will minimize the effects of any shortages requiring curtailment;

4. The Commission consulted with the director of the Department of Energy about curtailment issues;

5. The Commission should direct utilities to file curtailment plans consistent with the attached model plan;

6. The Commission should adopt the regional plan as a statement of general principles.

ORDER

IT IS ORDERED that:

1. Within 90 days of the issue date of this order, each person defined in ORS 758.400 engaged in the business of sale or resale of electricity in Oregon shall present for approval a curtailment plan consistent with the model plan included as Attachment 1 to this order;

2. The Commission adopts as a statement of general principles the Regional Curtailment Plan for Electric Energy included as Attachment 2 to this order.

Made, entered, and effective JAN 19 1993.

A party may request rehearing or reconsideration of this order pursuant to ORS 756.561. A party may appeal this order pursuant to ORS 756.580.

CONDENSED VERSION

REGIONAL CURTAILMENT PLAN

FOR ELECTRIC ENERGY

within the States of Washington, Oregon, Idaho, and Montana

SECTIONS I AND II. PURPOSE AND OVERVIEW OF THE REGIONAL CURTAILMENT PLAN

This Plan identifies the process by which the States of Washington, Oregon, Idaho, and Montana would initiate and implement regional load curtailment. Included in the Plan are detailed procedures to be followed during a protracted regional electrical energy shortage to ensure uniform treatment of all regional consumers. The Plan is not intended to be activated for relatively short-term emergencies such as those caused by extremely cold weather or the temporary loss of a major transmission line, even if individual States take action to alleviate the problem.

The goal of this Plan is to accomplish curtailment while treating consumers fairly and equitably, minimizing adverse impacts from curtailment, complying with existing State laws and regulations, and providing for smooth, efficient, and effective curtailment administration. This Plan serves as a guideline or blueprint for each of the four Pacific Northwest States to use in developing their individual State curtailment plans.

SECTION III. DEFINITIONS

The following definitions apply to terms used in this Regional Curtailment Plan and in individual State plans. If the first letter(s) of the term are shown in parentheses, the term may appear in either upper case or lower case throughout the Plan.

A. Base Billing Period. One of the billing periods comprising the Base Year. Billing Periods are established by the utility and are normally either monthly or bimonthly. Base Billing Period data are weather-normalized before being used to calculate the amount of curtailment achieved.

B. Base Year. Normally, the 12-month period immediately preceding imposition of State-initiated load curtailment. If energy use during that period is atypical, States may select a different 12-month period.

C. Critical Load Consumer. A consumer that supplies essential services relating to public health, public safety, or energy production.

D. **Curtailment.** Load reduction, irrespective of the means by which that reduction is achieved.

E. **Curtailment Target.** The maximum amount of energy that a consumer may use and still remain in compliance with the State curtailment order; the Curtailment Target is figured individually for each consumer by Base Billing Period.

F. **Excess Power Consumption.** The lower of the following two values for loads subject to penalty: (1) the difference between a consumer's actual (or metered) consumption level during a billing period and the Curtailment Target, or (2) the difference between the consumer's weather-normalized energy use during a billing period and the Curtailment Target.

G. **Extra-Regional.** Any load, resource, or entity located outside of the region as defined in section 3.(14) of P.L. 95-501, the NW Power Act.

H. **General Use Consumer.** Any non-residential consumer who does not qualify as a Major Use Consumer.

I. **Implementation Record.** The collection of significant notes, memos, correspondence, and other material generated for each curtailment, whether such documents are formal or informal in nature. The Utility Coordinator is responsible for maintaining the Implementation Record.

J. **Major Use Consumer.** A consumer who has purchased over 5 average annual megawatts (43,800 MWh) during the Base Year.

K. **Non-Regional.** Any load, resource, or entity located outside of the region as defined in this Plan.

L. **Plan.** This Regional Curtailment Plan.

M. **Region.** The States of Washington, Oregon, Idaho, and those portions of Montana that are west of the Continental Divide and/or within the control area of the Montana Power Company.

N. **Regional Electric Energy Curtailment Analysis Model (REECAM).** A computer program used by the Utility Coordinator and other interested parties to evaluate the status of the regional electric power system and analyze the need for region-wide curtailment.

O. **Regional Load.** The load placed by ultimate consumers within the region on their respective utility suppliers; the load subject to curtailment under this Plan.

P. **State.** Any of the four Pacific Northwest States: Washington, Oregon, Idaho, and Montana.

Q. **State Contact(s).** Individuals who represent their respective States in connection with curtailment issues.

R. **State-Initiated.** Actions taken by the States to implement their individual State load curtailment plans.

S. **Threshold Consumption Level.** The maximum amount of energy that a consumer can use during mandatory load curtailment without being subject to penalties under this Plan.

T. **Utility Contact(s).** Individuals who represent their respective utilities in connection with curtailment issues.

U. **Utility Coordinator.** The Director of the Northwest Power Pool.

V. **Utility Curtailment Reports.** Report(s) summarizing curtailment data; such reports are to be submitted monthly by utilities to their respective States and the Utility Coordinator.

W. **Weather-Normalization.** The procedure that utilities use to reflect the impact of weather on utility load levels. Some utilities refer to this process as "weather-adjustment."

SECTION IV. CURTAILMENT STAGES

State curtailment directives apply to all Regional Loads. Under the Plan, curtailment is requested or ordered as a percentage of historical, weather- normalized (Base Billing Period) electric energy consumption. Although the curtailment stages are generally associated with increasing deficits, the stages are not necessarily implemented in a sequential manner; the Plan is flexible so as to allow States to move from one curtailment stage to another as required to adapt to rapid and dramatic changes in the energy supply situation.

The five curtailment stages are:

Stage #	Nature	Curtailment %	Type of Curtailment
Stage 1	Voluntary	No Specified %	Uniform among all regional consumers
Stage 2	Voluntary	5% +	Uniform among all regional consumers
Stage 3	Mandatory	5% - 15%	Uniform among all regional consumers
Stage 4	Mandatory	15% 15% + 15% +	Residential Consumers General Use Consumers Major Use Consumers
Stage 5	Mandatory	% Associated with Stage 4 + additional curtailment	Continued Consumer Curtailment plus Utility Action, including Plant Closures and possible Black-Outs

SECTION V. INITIATION OF REGIONAL LOAD CURTAILMENT

Using REECAM (described in Appendix A of the Plan) and other analytical tools, the Utility Coordinator shall monitor the region's energy situation and notify State and Utility Contacts when it appears that a protracted energy shortage could be developing. The State Contacts, in consultation with the Utility Coordinator, Utility Contacts, and other interested parties, will analyze the results of REECAM to determine if regional load curtailment is required. If they agree on the need, they will settle on the appropriate stage and level (percentage reduction), consult with others within their respective States using briefing materials prepared by the Utility Coordinator, and then again coordinate with each other. To the extent changes in the original recommendation are indicated as a result of such intra-State consultations, the State Contacts will work together to reach a new consensus. The State Contacts will then begin developing situation-specific curtailment implementation procedures. The States will initiate region-wide load curtailment by notifying the public, the Utility Coordinator, and all utilities operating within their respective borders that load curtailment is in effect.

SECTION VI. ADMINISTRATION OF STATE-INITIATED CURTAILMENT

A. Utility Activities

(1) Overview

(a) **Ability of Utilities to Comply with Plan Requirements.** Utilities will conform to the requirements of their respective State plans to the extent possible. Utilities may petition their States for exemption from specific requirements of their State plan.

(b) **Stage-by-Stage Utility Administrative Obligations.** Upon notice that their respective States have called for regional load curtailment, the region's utilities shall immediately begin complying with the directives of their State plan(s). All requirements for lower level stages continue to apply to higher level stages. Throughout the curtailment period, utilities will provide consumers with as much useful information as they reasonably can. The requirements specified below represent the minimum actions that each utility must take to remain in compliance with the Plan.

- **Stage 1.** Utilities must begin (or continue if they have already begun) providing curtailment information to their consumers. Both the nature of the information and the means by which they convey it to consumers (media communications, bill stuffers, etc.) are left to the utility. Utilities shall also assist States, as appropriate, in briefing the media about the shortage.

- **Stage 2.** In Stage 2, utilities must: (a) notify their consumers of the percentage level of State-initiated voluntary curtailment; (b) provide curtailment tips to consumers; (c) answer consumer questions about curtailment; (d) provide curtailment reports to the States and the

Utility Coordinator; and (e) provide more detailed information to the media than provided in Stage 1.

- **Stage 3.** In Stage 3, utilities must: (a) notify their consumers of the percentage level of State-ordered mandatory curtailment; (b) calculate weather-normalized Base Billing Period data and Curtailment Targets for all consumers who will be audited in the current billing period; (c) provide Curtailment Targets to all consumers who request such data for their own accounts; (d) provide audited consumers with information about how to apply for exemption and adjustment of Base Year data; (e) process requests for exemption and Base Year data adjustments from those consumers selected for audit who would otherwise be subject to penalties; and (f) implement the penalties aspect of the Plan.

- **Stage 4.** In Stage 4, utilities must notify their consumers of any applicable changes in State-initiated mandatory curtailment.

- **Stage 5.** In Stage 5, utilities must collaborate with the States to develop and implement the most effective methods for securing the required load curtailment.

(2) Suggested Curtailment Actions.

Utilities shall disseminate information to consumers regarding actions they can take to reduce their electric energy consumption. The States and utilities will work together to develop this material. The recommendations will be based on the actions described in Appendix C of the Plan, "Curtailment Measures." Utilities will be responsible for tailoring this curtailment information to their service areas, adding utility-specific information, printing, and disseminating the material to their consumers.

(3) Base Year Data and Curtailment Targets.

(a) Identification of the Base Year. Each time the Plan is activated, the States will identify the applicable Base Year. Once established, the Base Year for a shortage will remain unchanged throughout the curtailment period. Normally, the Base Year is the 12-month period immediately preceding initiation of load curtailment under this Plan. Base Year and Base Billing Period data shall be weather-normalized using the utility's standard procedures. The States may choose an alternative Base Year if they decide that the data for the 12-month period preceding load curtailment is atypical and its use would result in an inequitable allocation of curtailment among the region's consumers.

(b) Estimating Base Billing Period Data for Consumers for Whom No Base Billing Period Data Exists. Base Billing Period data must be obtained or developed for any consumer who is audited under this Plan. Utilities have the option of excluding residential and General Use

Consumers without actual Base Billing Period data from the random sample of audited consumers. Utilities must estimate the Base Billing Period data for any audited consumer for whom actual data does not exist or is found to be inaccurate.

(c) **Communicating Curtailment Target Information to Consumers.** During mandatory curtailment, utilities are required to provide retrospective, current billing period, and forthcoming billing period Curtailment Target information to any consumer who so requests. Utilities are also required to provide retrospective Curtailment Target information to any audited consumer who will be issued a warning or penalty. At their option, utilities may provide Curtailment Target information to other consumers or consumer classes as well.

(4) **Auditing Consumers for Compliance with State Orders for Mandatory Load Curtailment.** Each month, utilities must audit at least one percent of residential users, five percent of General Use Consumers, and 100% of their Major Use Consumers (including those Major Use Consumers with estimated Base Billing Period data) plus any consumers penalized in the previous billing period. The number of consumers exempted or excluded from audit does not affect the sample size.

New samples shall be drawn each month. Consumers penalized under this Plan shall continue to be audited until their energy use falls below the Threshold Consumption Level. Once their energy use falls below that level, they will be audited again only if selected by random sample.

Unless a utility is auditing 100% of its residential users and General Use Consumers, all such consumers selected for audit shall be chosen on a random sample basis, except that the following consumers are to be excluded: (a) consumers granted an exemption under this Plan; and (b) consumers with an estimated power bill in the current billing period. Utilities may also choose to exclude consumers with estimated Base Billing Period data, assuming the States do not require their inclusion in the pool of consumers subject to audit.

(5) **Penalties for Non-Compliance.**

(a) **Nature of Penalties.** The Plan identifies penalties for non-exempted consumers who fail to comply with State orders for mandatory curtailment. The penalties under this Plan are structured as follows:

Violation *	Penalty
First Bi-monthly Violation	10¢ per kWh of excess use
Second Bi-monthly Violation	20¢ per kWh of excess use
Third Bi-monthly Violation	40¢ per kWh of excess use
Fourth Bi-monthly Violation	1 Day Disconnection + 40¢ per kWh of excess use

Fifth Bi-monthly Violation	2 Day Disconnection + 40¢ per kWh of excess use
Sixth and All Subsequent Violations	Penalties are determined by the State. Civil penalties or other corrective actions would be possibilities.

* The penalty for violators who are billed every two months will escalate on every power bill in which they are subject to penalty. Consumers billed on a monthly basis will be assessed the same penalty on two successive occasions before incurring the next higher level penalty. During any continuous period of curtailment, assessed penalties remain "on the record" for the purposes of administration of subsequent penalties, even if there has been an intervening period of "compliance."

Utilities are expected to adhere to their standard disconnect criteria and procedures whenever disconnecting consumers in accordance with this Plan. Health, safety, and welfare considerations are to be taken into account, and consumers must pay normal disconnect and reconnect charges.

(b) Calculation of Financial Penalties. Financial penalties will be calculated by multiplying the consumer's Excess Power Consumption each billing period by the appropriate penalty level identified above.

(1) **Threshold Consumption Level.** The Threshold Consumption Level assigned to each consumer class is identified in the table below. If the required load reductions are not occurring during a curtailment period, the States may change the percentage relationship of the Threshold Consumption Level to the Curtailment Target so as to effect better compliance with the curtailment order.

Type of Consumer	Threshold Consumption Level
Residential Consumers	10% above Curtailment Target
General Use Consumers	10% above Curtailment Target
Major Use Consumers	2% above Curtailment Target

(2) **Excess Power Consumption Calculation.** Penalties are not assessed if a consumer's load (either actual load or weather-normalized load) is equal to, or less than, the Threshold Consumption Level. Excess Power Consumption is the lower of the following two values for each sampled load subject to penalty: (a) (Actual Load) minus (Curtailment Target) or (b) (Weather-Normalized Load) minus (Curtailment Target).

(c) **Assessment of Penalties.**

(1) **Penalties vs Warnings.** Consumers will be assessed penalties only if they have Excess Power Consumption and if they are to be penalized based on the utility's penalty assessment procedures described below. Any sampled consumer who is not penalized and whose use exceeds the Curtailment Target will receive a warning.

(2) **Penalty Assessment Procedures.** Utilities sampling at the mandated minimum percentages for each sector as specified in this Plan [1%-5%-100%] (or as otherwise specified by the States and reflected in the Implementation Record) shall assess penalties on all consumers with Excess Power Consumption.

Utilities sampling a higher percentage of consumers than required under the Plan may choose among the following penalty assessment options:

(a) Assess penalties on all sampled consumers with Excess Power Consumption; (this methodology must be used for Major Use Consumers even if the utility chooses option (b), below, for its other consumer sectors); or

(b) Develop a ratio of the minimum percentage sample size to the actual percentage sampled for the residential and/or General Use consumer sectors. Multiply the resulting percentages by the total number of violators in each respective consumer sector to determine the minimum number of penalties that must be assessed in each sector. Calculate the percentage violation for each individual consumer that has been sampled (Excess Power Consumption divided by Curtailment Target) and apply penalties to the "worst offenders" in the overall sample based on their percentage "Excess Power Consumption." Also penalize all consumers who were penalized in the previous billing period and who still have Excess Power Consumption.

(3) **Treatment of DSIs.** Penalties applicable to BPA's direct-service industrial customers will be assessed by the States based on billing data provided by BPA.

(d) **Billing Consumers for Penalties.** Utilities may describe the penalty on the power bill as "State-mandated" and shall include any State-provided material describing the penalty aspect of the Plan as a bill stuffer in the bills of penalized consumers. The States will consider printing this material on State letterhead so as to reinforce the public's understanding that penalties are due to a violation of State mandate. Utilities shall note

that failure to pay penalties will result in service disconnection in accordance with standard disconnect criteria and procedures.

(e) **Treatment of Penalties Pending Adjustment/Exemption Determinations.** Consumers who have applied for adjustment of Base Billing Period data and/or exemption from mandatory curtailment may request a stay of enforcement of the penalty aspect of the Plan pending a final decision regarding its request. Any consumer who has been granted such a stay shall be subject to retroactive penalties as applicable if the request is ultimately denied.

(f) **Use of Funds Collected under the Penalty Provisions of the Plan.** Funds collected under State-ordered penalty provisions of this Plan shall be set aside in a separate account. The ultimate disposition of these funds will be determined by the appropriate State commission in the case of investor-owned utilities and by the governing bodies of publicly-owned utilities.

(6) **Incentives.** Whenever curtailment is in effect, individual utilities are encouraged to implement creative incentive programs to motivate consumers to provide additional load reductions relative to their Curtailment Targets.

(7) **Exemptions and Adjustments.**

(a) **Consumer Application for Exemption/Adjustment.** Utilities are responsible for informing their consumers how to apply for exemption from Plan requirements or adjustment of Base Billing Period data. Utilities may elect to process exemptions and adjustments only for audited consumers. Consumers seeking an exemption or adjustment shall apply first to their utility and then, if dissatisfied with that outcome, to their respective State. The State will not consider any consumer's appeal unless it has first been processed by the consumer's utility.

(b) **Granting Consumer Requests for Exemption from Mandatory Curtailment.** No automatic consumer exemptions will be granted under mandatory State-initiated load curtailment. Exempted consumers should be told that exemption may not protect them from Stage 5 black-outs.

- **Critical Load Consumers.** Critical Load Consumers may be exempted once they have demonstrated to their utility that they have eliminated all non-essential energy use and are using any reliable, cost-effective back-up energy resources in load.

- **Other Consumers.** Exemptions for consumers not qualifying as Critical Load Consumers under this Plan will be evaluated based on whether curtailment would result in unreasonable exposure to health or safety hazards, seriously impair the welfare of the affected consumer, cause extreme economic hardship relative to the amount of energy saved, or produce counterproductive results.

(c) **Utility Record-Keeping Relative to Consumer Exemptions.** Utilities shall make their records regarding exemption determinations available to their respective States upon request.

(d) **Utility Exemption from State Plan Requirements.** Utilities may appeal to their respective States, requesting an exemption from any aspect of their State plan. Their petition for exemption should identify the specific requirements from which they wish to be exempted, the reason(s) behind their request, and alternative actions that they can reasonably take in lieu of such requirements.

(8) **Measurement of the Amount of Curtailment Achieved and Determination of Compliance.** At all times during State-initiated regional load curtailment, utilities shall provide their respective States and the Utility Coordinator with consumption and savings data on a monthly basis in the form specified in Appendix D of the Plan. To the extent that circumstances at the time of actual load curtailment dictate the need for additional data or more frequent data submittal, the States shall so inform the utilities and the utilities shall use best efforts to comply with the State request.

(9) **Special Arrangements.**

(a) **Use of Consumer-Owned Generation Facilities.** The States' mandatory curtailment orders apply only to electric energy purchased from a utility: all consumers are required to reduce their electric energy purchases from their utility by the required percentage. However, consistent with their respective utility's needs for safety and system protection, consumers having their own generation facilities or access to electricity from non-utility power sources may use energy from those other sources to supplement their curtailed power purchases from their electric utility.

(b) **Curtailment Scheduling.** During periods of mandatory curtailment, a consumer is obligated to provide the requisite amount of curtailment within each billing period. Within that period, and subject to equipment limitations and utility rules on load fluctuations, consumers are free to schedule their curtailment so as to minimize the economic cost, hardship, or inconvenience they experience as a result of the mandatory curtailment requirement.

(c) **Case-by-Case Arrangements.** Utilities may choose to work creatively with individual consumers to secure additional curtailments as appropriate.

B. **State Activities**

(1) **Providing Curtailment Information to Utilities.** States shall provide utilities with information regarding curtailment administration and work with utilities to

develop consumer curtailment tips for consumers. (See Plan Appendix B, "Types of Curtailment Information" and Appendix C, "Curtailment Measures.")

(2) **Processing Utility Requests for Exemption and Second Level Consumer Appeals for Adjustments and/or Exemptions.** The States shall process utility requests for exemption from Plan requirements and consumer requests for either exemption or adjustment of Base Year data in cases where the consumer is appealing its utility's determination. The States shall keep interested parties apprised of the status of appeals-in-process.

(3) **Periodic Reassessment of Administrative Decisions and Maintenance of the Implementation Record.** Together, the States will review the appropriateness and continued applicability of implementation decisions on a monthly basis, or as otherwise indicated. Significant decisions shall be recorded in the Implementation Record. The types of matters that will be addressed in the periodic reviews and which may be reflected in materials that will become part of the Implementation Record include:

- **Achievements and Objectives.** Analysis of the amount of curtailment actually achieved based on the data provided in the Utility Curtailment Reports and a review of the most recent REECAM results;

- **Curtailment Stage and Level.** Identification of the applicable curtailment stage and level; also, any identified procedures for changing the applicable curtailment stage and/or level;

- **Public Information.** The general agreement among the States as to how to disseminate the curtailment message: tenor of messages, dates of announcements, specifics as to utilized media, etc.;

- **Base Year Consumption.** The Base Year to be used for measuring curtailment impacts;

- **Procedural Matters.**

  (a) Development of additional administrative procedures as required;
  (b) Assessment of the need, if any, for making changes to the Plan to secure increased compliance with the curtailment directives;
  (c) Discussion of implementation problems and proposed solutions thereto; and
  (d) Evaluation of the appropriateness of the materials being made available to utilities and provided by utilities to the States, and a determination as to whether changes are required;

- **Curtailment Records.** The specific requirements on utilities and States regarding curtailment records (what needs to be recorded, how that information will be stored, who can access it...); and

- Return to Normal Operations. The general agreement among the States relative to announcing an end to regional load curtailment and resuming normal utility operations.

C. Return to Normal Operations. Once the shortage is alleviated, the States and utilities must bring closure to the curtailment process and effect a return to normal operations. The States will detail the process for utilities to follow. The nature of the actions to be taken will be influenced by the applicable stage of curtailment. At a minimum, the following types of activities need to occur: (1) The public must be informed that curtailment is no longer required; (2) Curtailment activities must officially cease as of the date that curtailment orders are lifted by the States. The States will provide utilities with guidelines to bring closure to curtailment activities such as: exemptions and appeals, penalty assessments, curtailment incentives (if any), and curtailment reports; and (3) State authorities will take whatever action is required to rescind any State orders for mandatory load curtailment.

SECTION VII. UTILITY LIABILITY AND FINANCIAL RELIEF

State law in each of the four Pacific Northwest States provides for waivers of, or exemptions from, liability in the case of utilities enforcing mandatory load curtailment ordered by the State. Individual consumer data will be treated as proprietary in accordance with standard utility practices and State law (identified in Plan Appendix F). If State law prohibits utilities from releasing consumer account information to the State, consumers seeking exemptions and/or adjustments shall expressly authorize such exchange. Utilities may seek financial relief for the extraordinary costs of curtailment using established channels, including utility rate case procedures and BPA power sales contract provisions.

SECTION VIII. ANNUAL REVIEW, POST-CURTAILMENT EVALUATION, AND UPDATE OF THE REGIONAL CURTAILMENT PLAN

At least once a year and after any curtailment, the Utility Coordinator will convene a meeting of all four State Contacts and interested utilities for the purpose of reviewing and updating the Plan and associated Appendices. Upon completion of the review, necessary changes will be made, a list of those changes prepared, and a revised plan issued. Changes will be noted in Appendix G.

SECTIONS IX AND X. APPENDICES AND RELATED CURTAILMENT INFORMATION

The following appendices are included in the Plan: (A) Regional Electric Energy Curtailment Analysis Model; (B) Curtailment Information; (C) Curtailment Measures; (D) Utility Curtailment Reports; (E) Contact Information Regarding the Utility Coordinator, State Contacts, and Utility Contacts; (F) State Statutes Citations and State Agencies; and (G) Annual Updates to the Plan. The following supplemental material is available under separate cover: (A) Individual State Plans and Summary of the Differences among the State Plans; (B) Utility Plans; and (C) State Statutes (copies of the actual statutory language).

APPENDIX J

Proposed Oregon State LNG Emergency Response Plan

Oregon Revised Statutes (ORS) 176.750-810 authorizes the Oregon Department of Energy (ODOE) to develop and maintain a statewide contingency plan in response to liquefied natural gas (LNG) emergencies that impact the state. This describes the format of the state's LNG Emergency Response Plan should an LNG import terminal be built in Oregon.

Introduction: Overview of Oregon's LNG Supply & Distribution System

BASIC PLAN	PROCEDURES
Plan Section 1 - Guiding Authority and Principles This section of the basic plan describes the Governor's Energy Resources Emergency Powers and ODOE authority to plan, prepare, and respond to LNG emergencies that impact the state.	**Procedures Section 1** – supports Section 1 of the basic Plan. Information includes a copy of the: • ORS 176.750-810 • Governor letter appointing ODOE lead state agency to plan, prepare, and respond to LNG emergencies
Plan Section 2 – Scope This section describes the purpose, scope, and concept of operations for the Oregon LNG Emergency Response Plan.	**Procedures Section 2** – supports Section 2 of the basic Plan. Information includes: • Emergency Planning Zone Map • Description of Zone 1, Zone 2, and Zone 3
Plan Section 3 - Emergency Response Organizations ODOE works with federal, state, local, law enforcement, and industry organizations to ensure a coordinated response effort to LNG emergencies. This section of the basic plan describes the roles and responsibilities of local, state, federal, and industry organizations responding to LNG emergencies in Oregon.	**Procedures Section 3** – supports Section 3 of the basic plan. Information includes: • Established agreements with local, state, federal, and industry organizations responding to LNG emergencies in Oregon as appropriate.
Plan Section 4 – Alert and Notifications This section describes how federal, state, local, law enforcement, and industry emergency response organizations are notified of LNG events that impact the Oregon.	**Procedures Section 4** – supports Section 4 of the basic plan. Information includes: • Alert & Emergency Notification Call Tree • Emergency Contact List • Maintenance Procedures for Emergency Contact List.
Plan Section 5 – Communications This section describes the need for effective communication and information sharing after initial notifications are made as described in Section 4. This section explains ODOE's approach to gather and disseminate emergency information and/or instructions to government officials, industry, emergency responders, news media, and the public.	**Procedures Section 5** – supports Section 5 of the basic plan. Information includes pre-printed materials including brochures, boilerplate news releases, event update forms, activity logs, commonly asked questions/answers, and procedures for communicating with the: • Governor's Office • Legislative Leadership • Local Emergency Response Organizations • State Emergency Response Organizations • Federal Emergency Response Organizations • LNG Terminal • News Media • Public

Plan Section 6 - Emergency Response Measures This section provides an overview of the Plan's five levels of readiness conditions. This includes information on the state's primary concern and response actions for each readiness condition. • Condition A - Normal • Condition B - Awareness • Condition C - Caution • Condition D - Alert • Condition E - Imminent Danger	**Procedures Section 6** – supports Section 6 of the basic plan. Information includes procedures for ODOE Emergency Operations Center (EOC) activation in response to LNG emergencies, ODOE EOC capabilities, and procedures for key ODOE EOC response positions. This includes: • Governor's Representative • ODOE Director • LNG Event Manager • Technical Advisor • LNG Facility Specialist • Public Information Officer (PIO) • Deputy PIO • County Liaison • State Agency Liaison • Federal Agency Liaison • LNG Terminal Liaison • EOC Manager • EOC Facilities Specialist • Graphical Information Specialist • Emergency Web Page Operator • News Center Manager • Telephone Information Center Manager • Phone Team Operator(s) • Other Positions as Appropriate
Plan Section 7 - Recovery This section describes the actions that will be taken by ODOE and other federal, state, and local emergency response organizations along with the LNG terminal after the emergency to return the facility and community back to pre-emergency conditions.	**Procedures Section 7** – supports Section 7 of the basic plan. Information includes procedures for key ODOE response positions for the Recovery Phase. This includes: • LNG Event Manager • LNG Facility Specialist • Public Information Officer (PIO) • County Liaison • State Agency Liaison • Federal Agency Liaison • LNG Terminal Liaison
Plan Section 8 – Maintaining Emergency Preparedness This section explains how ODOE will maintain the Oregon LNG Emergency Response Plan and ensure the state is prepared to respond to a LNG emergency in coordination with the local and federal emergency response organizations as well as the LNG terminal. This section will also describe how ODOE will work to increase public awareness of and confidence in the Oregon LNG Emergency Response Program.	**Procedures Section 8** – supports Section 8 of the basic plan. Information includes a schedule for: • Schedule for plan review updates. • Schedule for training, drills, and exercises. • Public education and outreach program.

Appendix K

Oregon Distributed Energy Resiliency Study

Introduction

This Report's overarching objective is to identify opportunities to improve energy resilience through the design and integration of distributed renewable energy investments into the existing energy network. This study considers how new technologies, including renewable energy resources, could provide local energy generation to communities and emergency service providers during energy emergencies, when their energy network supply may possibly be disrupted.

The Oregon Department of Energy (ODOE) will use the information that is provided by this Project to support its Energy Assurance Plan (EAP).

Highlights of this Report are briefly noted below. For a more complete understanding of such items, this Report should be read in its entirety.

Access to Information

This Report is broadly based on information, data, and reports that were provided by various organizations, including:

Bonneville Power Administration (BPA)

Idaho Power Company (IPC)

Oregon Department of Energy (ODOE)

Oregon Department of Transportation (ODOT)

Oregon Public Utility Commission (PUC)

PacifiCorp

Portland Gas and Electric (PGE)

United State Department of Energy (U.S. DOE)

U.S. DOE Energy Information Administration (EIA)

U.S. DOE National Energy Technology Laboratory (NETL)

Western Electricity Coordinating Council (WECC)

All such information is considered to be in the public domain. Confidential information was not provided or utilized.

Critical Facilities

Renewable Resources

Section 1 identifies the full spectrum of Oregon's existing and planned renewable resources. However, not all of Oregon's wind resources qualify as critical in an energy assurance context. In fact, there are reasons why none of Oregon's renewable resources are critical, including:

Renewable resources (most notably wind and solar) provide energy but not capacity.

Renewable resources cannot be dispatched and, therefore, are less likely to be useful during an energy crisis.

During a large-scale emergency, the complete restoration of the electric grid may take hours or even days. That period of time is sufficiently long to observe considerable variation in capacity and energy from renewable resources.

During a large-scale electric emergency, prevailing utility operating practices are to bring renewable resources back on-line after all other resources are dispatched.

Hydroelectric Resources

Hydroelectric resources are responsible for approximately 42 percent of the electricity consumed in Oregon. The dams of special importance include John Day, The Dalles, Bonneville, and McNary, which are all located along the Columbia River and collectively account for over 6,000 megawatts (MW) of capacity, or nearly 80 percent of Oregon's hydroelectric energy. Hypothetical events that affect the river (e.g., drought, floods, terrorist attacks, federal court decisions regarding salmon restoration) could result in the loss of approximately half of Oregon's electric supply.[1]

Conventional Resources

Conventional resources (excluding hydroelectric) account for approximately 54 percent of Oregon's electric supply with natural gas (14 percent) and coal (34 percent) ranking highest, on the basis of historical energy usage. The most critical non-hydroelectric conventional plants are Boardman (coal), Hermiston, Beaver, Klamath, Port Westward, and two Coyote Springs facilities (all natural gas).

Electric Transmission

All electric transmission lines in the Pacific Northwest at or above 345 kilovolts (kV) should be classified as being critical to Oregon. BPA is responsible for 5,568 miles of lines throughout the Pacific Northwest at or above 345 kV. While some of BPA's lines are outside of Oregon, the interconnected nature of the transmission system still requires such lines to be classified as being critical. BPA's regional 230-kV and

[1] It should be noted that the regional electric transmission and generation systems are highly interconnected. Some of the hydroelectric energy produced by plants that are located along the Columbia River is not intended for Oregon's use and other interconnected plants could be utilized as replacement energy.

287-kV transmission lines should also be considered to be critical, in the absence of any detailed determinations to the contrary. In addition, BPA's high-voltage substations should also be included. A delineated list of such lines and substations is not available due to security concerns.

Electric Distribution

Currently, there are no distribution lines that are considered to be critical from a regional or statewide perspective. Specific distribution lines that serve emergency service providers are critical, but cannot be delineated due to the absence of pertinent information.

Smart Grid and Advanced Metering Infrastructure

Currently, Smart Grid and Advanced Metering Infrastructure (AMI) are not widely utilized in Oregon, which precludes such assets from being considered a critical asset.

Blackstart Operations

A large-scale emergency in Oregon could cause the electric transmission and generation grid to become completely de-energized (e.g., dark). Such events would be followed by a blackstart start condition whereby certain generating units are called upon to initially re-energize the grid. While the identities of specific blackstart generating units have been withheld by Oregon's electric utilities for reasons of security, they are likely to include larger hydroelectric plants.

Emergency Service Providers

The energy requirements of certain service providers are considered to be of paramount importance during emergency conditions. The entities of highest priority include:

- 911 dispatch centers
- Airports
- Assisted care living facilities (e.g., senior citizen facilities, handicap persons facilities, homes of the disabled)
- Communications service providers (e.g., voice, data, Internet, television, cable television, radio)
- Correctional facilities (e.g., jails and prisons)
- Electric utilities (critical facilities such as warehouses and maintenance and repair centers)
- Emergency Operations Centers (EOC)
- Emergency shelters (e.g., designated locations such as schools, religious institutions, recreation centers)
- Fire stations

Petroleum Distribution Terminals

Gas stations (if required to serve the petroleum needs of other emergency service providers)

Health care (e.g., hospitals, ambulance services, and clinics which contain emergency room facilities)

National Guard

Oregon Department of Transportation (ODOT)

Other essential county, state, and federal departments

Police stations

Public Works (e.g., water, wastewater, street maintenance, traffic signals at priority intersections)

Railroad operations and crossings

Red Cross

Schools (short-term, until all students return home)

Providing reliable and resilient electric service to the above entities during a large-scale emergency is a critical matter that requires the PUC's attention. The PUC works with utilities to ensure timely restoration of the power grid during emergencies. Energy related characteristics are discussed in Section 2.

Vulnerability and Risk Assessment

Section 3 contains an assessment of the vulnerabilities and risks that are associated with Oregon's key energy categories, as summarized in the following table. Overall, findings indicate that hydroelectric resources are most critical to Oregon.

Table 1
Energy Sector Criticality and Vulnerability

CATEGORY	Market Dominance/ Relative Capacity	Number of Customers Served	Strategic Location	Seasonal Vulnerability	Degree of Redundancy	Historical Evidence of Disruption
Electric Generation (Conventional without Hydroelectric)	Low	Low	High	High	Medium	Low
Hydroelectric Generation	High	High	High	High	Medium	Low
Renewable Electric Resources	Low	Low	High	High	Medium	Medium
Electricity Transmission	Low	Low	High	Low	Medium	Low
Natural Gas Transmission/ Pipelines	High	High	Low	High	High	Low

Key issues that confront critical assets are found to include the following:

Critical Infrastructure Protection (CIP) and terrorist attacks: Critical infrastructure is defined to be assets that are so vital to Oregon, that their incapacity or destruction would have a debilitating impact on the state's security, economy, public health or safety. Large hydroelectric generating facilities and associated high-voltage transmission lines are considered critical to Oregon as they serve a significant percentage of state's electricity requirements. The U.S. DOE conducted an audit of BPA's critical infrastructure in 2010 and discovered that BPA did not, for the most part, implement a major physical control system (e.g., electronic perimeter intrusion motion detection and alarms).

High levels of precipitation or runoff: Periods of high spring runoff can have a significant impact on hydroelectric power and, thereby, cause a reduction in the utilization and pricing of renewable resources, as evidenced in April-May 2011.

Seismic activity: Earthquakes can significantly impact Oregon's electric, natural gas and petroleum resiliency. The Oregon Department of Geology and Mineral Industries (DOGAMI) is evaluating the impacts of earthquakes in Oregon and its report should be reviewed for additional information.[2]

Weather: Severe windstorms have historically impacted Oregon's electric grid, thereby causing widespread curtailments in electric service.

[2] "Oregon State Energy Assurance Plan", Oregon Department of Energy, Oregon Public Utility Commission, March 2011.

Integration of Renewable Energy and Smart Grid Technologies

Section 4 contains a discussion of the technical issues, which confront the integration of renewable resources, the role that Smart Grid technologies could play in addressing such matters, and the benefits that can be provided to Oregon's constituents. Some of the potentially more notable benefits include:

Improve electric reliability: Smart Grid technologies can improve the reliability of electric service by reducing the duration of outages and the number of customers without service.

Reduce electric production costs: Providing consumers with real-time electric pricing information and alternative tariffs (such as critical peak pricing) can yield reduced electric costs to consumers and the cost of electricity production.

Reduce peak electric demand: The amount of electricity demanded by Oregon's consumers varies greatly throughout the year, with peak electric demand occurring during the hottest and coldest points of time. Smart Grid applications can communicate the real-time price of electricity to consumers, especially during periods of peak demand. Consumers are expected to react to such price signals by reducing usage, and thereby reduce peak demand. Reductions in peak demand will cause delays or cancellations in the need for new electric power plants.

Reduce system losses: Smart Grid applications provide electric utilities with greater insight into the operation of their electric distribution systems. Such information can be used to configure the distribution system (e.g., the opening and closing of switches) in a manner that minimizes electric losses. Reductions in electric losses translate into a reduction in the total cost of electric supply and retail costs to consumers.

Future Renewable Energy Requirements

Section 5 contains a discussion of the regulatory and technological frameworks for promoting and facilitating energy resiliency in Oregon through the use of future renewable resources and Smart Grid applications. Examples of specific ways that renewable resources may be beneficial to Oregon's energy resiliency include:

Improve fuel diversity: Oregon is heavily dependent on hydroelectric resources to meet its electric requirements. Increasing resource diversity improves the state's energy resiliency and ability to respond to large-scale events that affect electric supply. Renewable resources promote Oregon's energy resiliency, as they are likely to be independent of emergencies that affect availability of hydroelectric energy. The role that Smart Grid plays in such cases is to provide electric utilities with greater insight into the real-time operations and control of renewable resources.

Reduce response times to emergencies: Damage to the electric grid could require significant repair and loss of service to Oregon's constituents. It is reasonable to

assume that repairs to larger facilities, such as high-voltage equipment or hydroelectric dams, would be more intrusive than that of smaller facilities. Since renewable resources are generally smaller in scale, it can then be argued that they might become operational faster than their large-scale counterparts.

Enhance reliability and dispatch: Oregon's largest electric utilities do not include renewable resources in their emergency operating plans. Two key reasons are that renewable resources are considered to be less reliable than conventional resources and they cannot be dispatched. These obstacles can be partly addressed through the two-way communications capabilities that are common in Smart Grid applications.

Capturing these benefits requires a technological roadmap, which is discussed in Section 5 and includes:

Identify key public facilities where electric service reliability is critical

Require utilities to revise their outage restoration plans to include important public facilities

Establish a minimum functionality requirements for any AMI project proposed by the state's utilities

Require utilities to describe how data from AMI and Smart Grid technologies will be archived and utilized to improve utility asset management, operations, maintenance, planning processes, and electric reliability

Evaluate market conditions that might impede the development of bulk wholesale renewable power sources

Recommended Next Steps

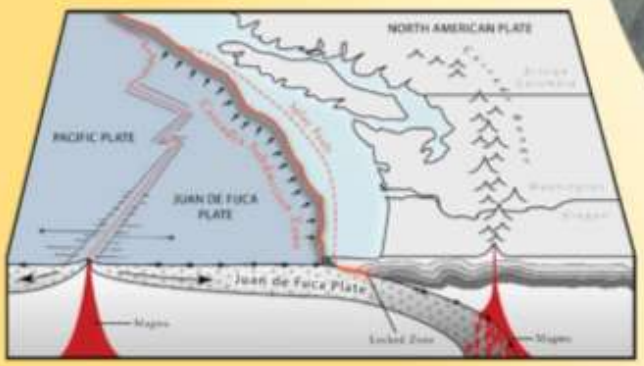
Lastly, Section 6 offers numerous candidate next steps that Oregon should consider to enhance the resiliency of electric supply. The broad categories under consideration include:

Identification and documentation of critical assets

Promotion of Smart Grid applications

Review of electric utility operations

Characterize emergency stakeholders (locations, energy requirements, backup capabilities and gaps)



Earthquake Risk Study for Oregon's Critical Energy Infrastructure Hub

Summary of Report
Earthquake Risk Study for Oregon's Critical Energy Infrastructure Hub

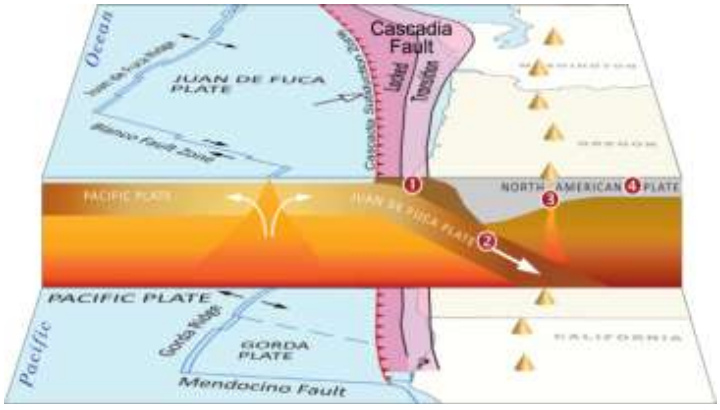
Six magnitude 5 or higher earthquakes have occurred within the Portland metropolitan area in the past 150 years. The Cascadia Subduction Zone has produced more than 40 large magnitude earthquakes in the past 10,000 years. The most recent occurred on January 26, 1700 with an estimated magnitude 9. These occurrences and extensive scientific understanding of seismic processes indicate that it is not a question of *if* Oregon will experience a catastrophic earthquake, but *when* it will occur.

Oregon's critical energy infrastructure (CEI) Hub is located in an area with significant seismic hazard. Significant liquid fuel, natural gas and electrical infrastructure and facilities are situated in this relatively small area in Portland. The CEI Hub covers a six-mile stretch on the lower Willamette River located between the south tip of Sauvie Island and the Fremont Bridge on US Highway 30. The energy sector facilities in the CEI Hub include:

- All of Oregon's major liquid fuel port terminals
- Liquid fuel transmission pipelines and transfer stations
- Natural gas transmission pipelines
- Liquefied natural gas storage facility
- High voltage electric substations and transmission lines
- Electrical substations for local distribution

More than 90 percent of Oregon's refined petroleum products come from the Puget Sound area of Washington State. Oregon imports the product by pipeline and marine vessels to the CEI Hub before it is distributed throughout Oregon to the end user. One large consumer is the Portland International Airport. In addition, much of NW Natural's natural gas passes through the CEI Hub. A high voltage electrical transmission corridor crosses the area as well as supplies distribution for this area.

Site map of the Critical Energy Infrastructure (CEI) Hub on the western bank of the Lower Willamette River area in NW Portland, Oregon. The CEI Hub, outlined in red, stretches for six miles. (Google Earth)



Oil terminals in the CEI Hub. (DOGAMI photo)

Earthquake Risk Study for Critical Energy Infrastructure Hub

The Oregon Department of Geology and Mineral Industries (DOGAMI) conducted an earthquake risk study on Oregon's CEI Hub as part of the Oregon Energy Assurance Project (EAP) with Oregon Department of Energy (ODOE) and Public Utility Commission of Oregon (OPUC). The study focuses on a large-magnitude Cascadia earthquake which because of widespread shaking and vulnerable infrastructure poses a high risk to the health and safety of Oregonians and the region's economy. The study identifies and defines the CEI Hub area, assesses the seismic hazards and identifies the vulnerabilities of the petroleum (liquid fuel), natural gas, and electric energy facilities in the CEI Hub.

Oregon's Natural Hazards

Oregon has numerous natural hazards. These range from high probability (fires) to low probability (volcanic eruptions). Earthquakes are considered to have a moderate probability because earthquakes in Oregon are rare. The earthquake vulnerability score for Oregon, however, is very high because a vast majority of Oregon's existing infrastructure has been designed and constructed without seismic resistance considerations. The earthquake consequence score is also very high because damage will likely be widespread and, in many places, severe. Finally, the earthquake overall risk score is very high because when a major earthquake occurs, it will likely result in a high loss of life, economic damages and long-term impacts.

Cascadia seismic source is Oregon's most threatening fault and can produce a magnitude 9 earthquake and accompanying coastal tsunami waves. (DOGAMI)

Energy Facilities in the CEI Hub

A significant portion of Oregon's electricity, natural gas, and fuel oil infrastructure is concentrated in the CEI Hub (a six-mile stretch in the lower Willamette River located between the south tip of Sauvie Island and the Fremont Bridge on US Highway 30). A magnitude 8 or 9 Cascadia Subduction Zone earthquake would impact the CEI Hub with:

- Ground shaking
- Liquefaction (soil behavior phenomenon in which a saturated sand softens and loses strength during strong earthquake ground shaking)
- Lateral spreading (where surficial soil permanently moves laterally due to earthquake shaking)
- Landslides
- Co-seismic settlement (where the ground surface is permanently lowered due to seismic shaking)
- Bearing capacity failures (when the foundation soil cannot support the structure it is intended to support)

In addition, secondary seismic hazards could be initiated and include:

- Seiches (waves that oscillate in water bodies often initiated by ground shaking)
- Fire
- Hazardous material releases, including by sloshing of liquid agitated by ground shaking

Liquefaction and lateral spreading hazards are of primary concern to the oil terminals that handle Oregon's fuel supply. The CEI Hub is adjacent to the Willamette River and has extensive deposits of highly liquefiable soils. These soils (made of sands, silts, gravels and clays) have been naturally deposited by river activity as well as been created from man-made activities, such as hydraulically placed material from river dredging or debris placed as landfill. For this reason, DOGAMI performed ground deformation analyses to better understand the nature of the hazard and the possible mitigation needs. A section on the deformation analyses is included in this study. Tsunamis are expected to damage the coastal areas, including ports along the coast and Columbia River mouth, but are not expected to cause significant damage in the Portland waterways.

DOGAMI staff and others visited all relevant energy companies with facilities in the CEI Hub. DOGAMI and ODOE staff conducted site visits at these petroleum facilities: BP, Chevron, ConocoPhillips, KinderMorgan (KM) fuel terminals and KM pipeline, McCall Oil, Nustar, and Shell. The fuel facilities often include: transmission and distribution pipelines, piers or wharves, tank farms, loading racks, control buildings, electric distribution equipment, and many other components. The liquid fuel transmission system includes gate stations, and transmission and distribution pipes at the Columbia and Willamette river crossings. DOGAMI and OPUC staff also conducted site visits of natural gas and electrical facilities owned by NW Natural, Portland General Electric, and the Bonneville Power Administration (BPA).

General Findings

The CEI Hub facilities have infrastructure that ranges from about 100 years old built to no or very antiquated standards to new infrastructure built to the current state-of-practice standards. Because of the wide range of ages and associated construction practices, the seismic

vulnerability of the facilities also spans a wide range. Based on visual observations, engineering judgment and limited information from the facility operators, major seismic vulnerabilities exist in the CEI Hub. The vast majority of the facilities are constructed on soils susceptible to liquefaction. Some critically important structures appear to be susceptible to significant damage in a major earthquake. In addition, DOGAMI discovered that older building codes and practices did not adequately address many non-building structures that exist in the CEI Hub, such as tanks, pipes, and piers. One explanation is because non-building structures typically hold few, if any, people and the focus of the building code has traditionally been on life safety. Current building codes do not adequately address the seismic deficiencies in existing CEI Hub facilities. The expected length of time to resume services after a Cascadia earthquake has not been evaluated by any company except BPA.

Sector Specific Findings

Liquid Fuel

Liquid fuel pipeline: The CEI Hub petroleum facilities receive liquid fuel via two methods: 1) the liquid fuel transmission pipeline, and 2) marine vessels. The transportation method and amounts vary due to product need, transportation costs, weather and other conditions. The liquid fuel pipeline was largely constructed in the 1960s when the regional seismic hazards were unknown and state-of-practice construction techniques at that time did not include any reference to seismic standards. The regional seismic hazards are now known to be significant and the soils at the river crossings are susceptible to liquefaction and lateral spreading. The 1960s vintage pipeline design did not consider ground movements from lateral spreading at river crossings or the stresses to the pipelines induced by earthquakes that may cause pipe damage and multiple breaks. A pipe break would have a significant impact on all of the petrochemical facilities in the CEI Hub and could result in a statewide fuel shortage.

Shipping channel: The navigational channel from the Columbia River mouth to the lower Willamette River is used to transport fuel by marine vessels. The Columbia River mouth is expected to have tsunami damage and the channel is expected to experience slope failure, which would close the channel to traffic. It is possible that bridges and other river crossings, such as buried gas pipelines and electrical crossings, would be damaged and temporarily block the waterway. Closure of the shipping channel would prevent marine vessels from delivering liquid fuel as well as emergency response and recovery equipment from being delivered.

Marine terminals: All of the port facilities in the CEI Hub have significant seismic risks due to liquefaction, lateral spreading, and seiches. Some older piers were constructed without any seismic protection, have deteriorated, and are likely to fail in even a moderate earthquake. If oil products are released and contaminant the navigable waterway, the waterway may be closed to river traffic thus impeding emergency response activities as well as the supply chain. The local capacity to fight fires and clean hazardous material spills is limited.

Fuel supply: Only three existing tanks are known to have addressed liquefaction vulnerabilities. The fuel terminals in the CEI Hub on average have a three to five day supply in the tank farms for regular unleaded gasoline and diesel fuel. Premium gasoline is subject to the daily delivery and heavily dependent on whether the intercompany pipeline on Front Avenue is operational. If the supply chain is disrupted by pipe breaks north of the CEI Hub and closure of the shipping

channel to the west, fuel would quickly become scarce. Options to transport fuel from the east and south and by air are very limited.

Portland International Airport (PDX): PDX airport receives 100 percent of their liquid fuels from a terminal in the CEI Hub. PDX has a limited on-site fuel supply. If the pipeline between the CEI Hub and PDX fails, then PDX would likely experience a shortfall and operations would be impacted.

Left: Lateral timber bracing for steel plumb piles in the CEI Hub is considered inadequate by California's MOTEMS standards. (DOGAMI photo) Right: An example of a damaged pier in the 2010 Chile earthquake (Technical Council on Lifeline Earthquake Engineering – TCLEE, 2010)

This under-designed oil terminal pier foundation (left) in area with high susceptibility for liquefaction and lateral spreading in the CEI Hub and the poor timber-to-concrete oil terminal pier connection and exposed rebar foundation (right) in the CEI Hub are considered inadequate. (DOGAMI photo)

The connection on this pier in the CEI Hub appears to have deteriorated due to a split in the timber beam. This type of damage suggests that the condition of the structure may not be routinely monitored and maintained and that the overall pier is seismically vulnerable. (DOGAMI photo)

The approach (foreground) to the 1966 Astoria-Megler Bridge that spans the Columbia River has major structural deficiencies that could lead to a collapse following an earthquake. Damaged bridge sections could block waterway access to the CEI Hub. (DOGAMI photo)

Natural Gas

Natural gas: Oregon's largest natural gas service provider receives the majority of their natural gas from pipelines that cross under the Columbia River both near Sauvie Island and also between Washougal, Washington and Troutdale, Oregon. One of the natural gas pipelines crosses under the Willamette River at Multnomah Channel near their gate station at the southern end of Sauvie Island. The soils at these river crossings are subject to liquefaction and lateral spreading, the pipes are 1960s vintage and constructed without seismic design provisions, and the consequences of potential pipe failures could be major for natural gas service territories and Oregon. The natural gas company's storage capacity is limited and pipe breaks could lead to a natural gas shortfall in the state as well as explosions or fires.

Electricity

Electrical facilities: Electrical facilities and systems have significant seismic risk due to ground shaking and ground failure, including liquefaction and lateral spreading. Seismically vulnerable

facilities include substations and transmission in the CEI Hub as well as facilities outside of the CEI Hub, including power plants, substations and transmission lines, all which are important for distribution.

Major vulnerabilities in the CEI Hub include the control buildings, transformers and other electrical equipment in yards at the substations, and transmission towers near the Willamette River. Damage is likely to occur to both the transmission system and the distribution system in the CEI Hub. Damage to the electrical grid will likely result in a blackout in the CEI Hub and elsewhere.

BPA: Bonneville Power Administration (BPA) has conducted a comprehensive seismic vulnerability study of their system and has had a long-term seismic mitigation program in place since 1993. BPA's long-term seismic mitigation program includes 1) investment protection (e.g. anchoring transformers), and 2) power system recovery of critical paths (e.g. hardening of equipment at one of multiple bays within a major substation). The first phase of BPA's mitigation program includes bracing and restraining critical equipment and seismically upgrading critical building facilities west of the Cascade Range. Seismic strengthening in the substation yard would typically include: anchoring high-voltage power transformers; bracing transformer conservators and radiators; replacing seismically vulnerable live tank circuit breakers with more robust dead tank circuit breakers; adding damping systems to existing live tank circuit breakers; hardening transformer bushing storage facilities; replacing rigid bus connections with flexible bus. These mitigation techniques will improve the reliability of seismic performance. Additional phases of the seismic mitigation program will include facilities east of the Cascade Range.

BPA has a critical 115 kV and 230 kV high voltage transmission river crossing in the CEI Hub as well as a substation. At the substation in the CEI Hub, some of the high-voltage equipment had been anchored and braced to withstand earthquake motions. BPA is in the process of conducting seismic strengthening of the control building and equipment inside the control building (e.g., brace computer floors, control cabinets, battery racks, ceiling, pipes, etc) and additional mitigation in the yard. BPA has conducted subsurface, liquefaction and lateral spreading analyses at one of the transmission tower sites at the Willamette River crossing and concluded severe ground movement up to 25 feet towards the river channel is possible. Until mitigated, it is likely that at least two transmission towers would experience extensive damage, be inoperable, require repair or replacement, and power lines could temporarily block river traffic, including the pathway to the oil terminals. The BPA transmission towers at the Willamette River crossing are scheduled to be seismically analyzed, have a seismic mitigation design completed in 2013, and be mitigated by 2014.

Recent unpublished BPA Cascadia earthquake scenario studies of the existing transmission line system indicate that their main grid would require between 7 and 51 days to make emergency damage repairs to the transmission line system (Oregon and Washington) from a magnitude 9 Cascadia earthquake. This scenario assumes many ideal conditions (BPA employees and contractor resources are immediately available, all roads and bridges are passable, available fuel, etc), which is optimistic.

Left: These high voltage electrical transmission towers are built on a river bank in the CEI Hub susceptible to lateral spreading. (DOGAMI photo) Right: Structural damage to a high voltage transmission tower located at a river crossing in 2010 Chile earthquake (Technical Council on Lifeline Earthquake Engineering – TCLEE)

Impacts to Oregon

Based on visual observations, engineering judgment, limited analyses, and limited information from the facility operators, city records, and available literature, significant seismic risk exists in the CEI Hub. Some critically important structures appear to be susceptible to significant damage in a major earthquake with catastrophic consequences. Multiple liquid fuel transmission pipe breaks and natural gas transmission pipe breaks are possible. Damage to liquid fuel, natural gas, and electrical facilities in the CEI Hub is likely. The waterway would likely be closed and require clean up.

Due to a combination of the existing seismic hazards, vulnerability of the exposed infrastructure and potential consequences, Cascadia earthquakes pose substantial risk to the CEI Hub and to Oregon. Not only are the energy sector facilities in the CEI Hub dependent on other sectors and systems in Oregon, including transportation and communication, they are interdependent upon each other. A major Cascadia earthquake and tsunami would likely produce an unprecedented catastrophe much larger than any disaster the state has faced.

Western Oregon will likely face an electrical blackout, extended natural gas service outages, liquid fuel shortage, as well as damage and losses in the tens of billions of dollars in a future major Cascadia earthquake. Preparing for a catastrophic disaster to become more resilient is needed to improve personal safety and security, and safeguard communities and businesses.

Recommendations

The most critical call-to-action that DOGAMI has concluded from this study of the CEI Hub is this: Energy sector companies must **pro-actively integrate seismic mitigation** into their business practices for Oregon's energy sector to adequately recover from a magnitude 8.5 to 9 Cascadia earthquake in a reasonable time period.

Although energy sector companies have made efforts to prepare for seismic events, such as through emergency planning and complying with the current building codes, these efforts are

limited and a timely restoration of energy sector services is questionable. As discussed in the Summary of Findings section, only one company has completed comprehensive seismic vulnerability assessments and instituted seismic mitigation plans. Energy sector companies must make earthquake mitigation an integral part of their overall business plan. This is not only prudent for the impact a large magnitude Cascadia earthquake would have on Oregonians and the environment; it is good business continuity management. Oregon homes, businesses and industries depend upon reliable energy sources. Liquid fuel, natural gas and electricity are critical to our economy, environment and everyday existence, and the energy sector must do more in order to assure those services and products in the event of a large earthquake.

In order for the energy sector to pro-actively integrate seismic mitigation into their operations, DOGAMI makes these four recommendations to both private and public energy sector stakeholders:

1. Energy sector companies should conduct ***Seismic Vulnerability Assessments*** on all of their systems or facilities, and should work with the appropriate local, state, tribal and federal government agencies and stakeholders to achieve timely completion of the assessments to understand existing vulnerabilities.
2. Energy sector companies should institutionalize long-term ***seismic mitigation programs;*** and should work with the appropriate local, state, tribal and federal government agencies and stakeholders to achieve timely and effective mitigation to ensure facility resilience and operational reliability.
3. The State of Oregon's ***Homeland Security Council*** should review the vulnerability and resilience of the energy sector to earthquakes and other natural disasters within the scope of their mission. This could involve the EAP partners (ODOE, OPUC, and DOGAMI) as well as ODOT, Building Codes Division, and the Oregon Seismic Safety Policy Advisory Commission (OSSPAC).
4. Energy sector companies and the State of Oregon should ***build Oregon's seismic resilience*** to a Cascadia earthquake. Adopting pro-active practices and a risk management approach will help achieve seismic resilience. Encouraging a culture of awareness and preparedness concerning the seismic vulnerability of the energy sector including long range energy planning should be conducted.

Emergency batteries, as well as other components such as generators and communication devices, should be braced or anchored to a withstand Cascadia earthquake. (DOGAMI photo)

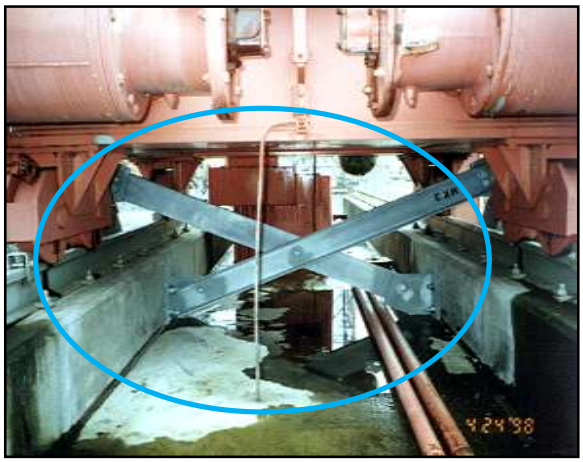


Photo shows the front view of an existing transformer with seismic anchorage including steel cross bracing as mitigation. (Photo: Leon Kempner)

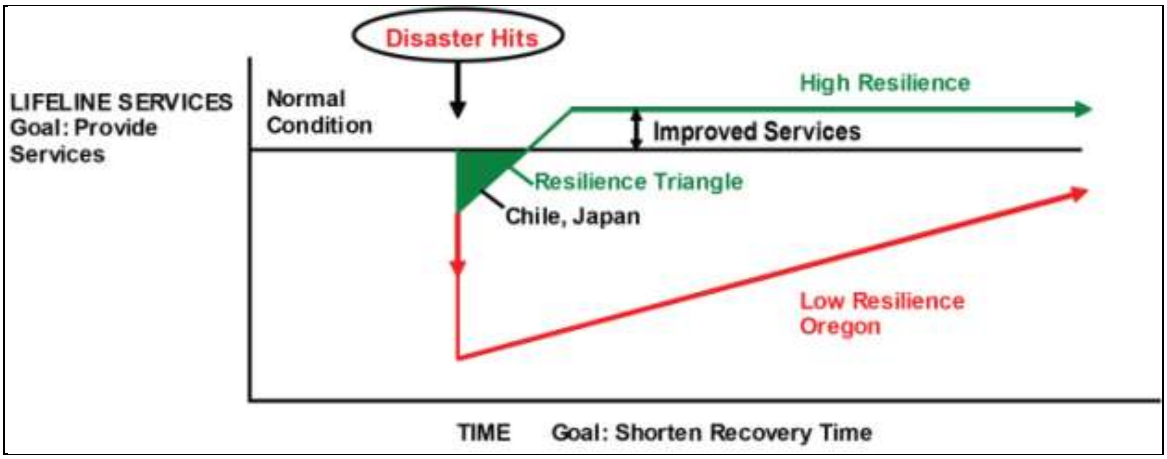
The length of time to resume services after a Cascadia earthquake should be evaluated by each energy company to establish a baseline understanding, and improvements to achieve a satisfactory service level should be made. Improvements, for example, can involve adding stone columns to strengthen the ground against liquefaction-related damage and anchoring power transformers to prevent sliding-related damage.



For the EAP, DOGAMI developed the resilience triangle graph with the resilience triangle shown in green. (*See figure)* The basic principle of the resilience triangle is that the smaller the triangle, the higher the resilience. Higher resilience requires minimal reductions in critical lifeline services after a disaster, speedy recovery of those services, and an overall improved service level as a result of rebuilding damaged systems and implementing better systems. The resilience triangle diagram indicates that Chile and Japan have high levels of earthquake resilience on the basis of their performance after the 2010 magnitude 8.8 earthquake in Chile and 2011 magnitude 9.0 earthquake in Japan (notwithstanding the nuclear energy issues). At the current stage, Oregon's energy sector has low resilience and is expected to have significant loss of energy sector services and a slow recovery time.

Funding is essential to increase Oregon's seismic resilience in the energy sector, and to:

- Pay for assistance and oversight to compel private sector companies into action to conduct Seismic Vulnerability Assessments and implement seismic mitigation programs
- Support an effective Homeland Security Council on energy security preparedness
- Build the State of Oregon's energy resilience
- Increase Oregonians' awareness of the effect of a Cascadia earthquake on energy availability

As part of this project, DOGAMI and EAP partners promoted seismic awareness of Oregon's critical energy infrastructure. We developed productive relationships with other state agencies, federal agencies, energy sector companies, associations, emergency response organizations and other major stakeholders regarding seismic preparedness. We conducted table-top exercises and

outreach and have more planned with energy companies and associations. The EAP partners have made more than 60 presentations to various stakeholders during the duration of this study.

Resilience Triangle (modified from MCEER)

These efforts were minimal, however, considering the task at hand. In order to build resilience in Oregon's energy sector, it is necessary to increase awareness on the risk to the energy sector and Oregonians from a Cascadia earthquake. There needs to be a cultural shift by Oregonians to become an earthquake-prepared culture. The energy sector must demonstrate transparency and accountability concerning Cascadia earthquake preparedness activity.

This study has demonstrated that Oregon's CEI Hub is vulnerable to a Cascadia earthquake, and that such an earthquake will impact our supply and sources of liquid fuel, natural gas and electricity throughout Oregon.

Oregonians should heed this study's findings, that:

- A Cascadia earthquake will occur.
- Oregon's CEI Hub – where critical energy infrastructure is located in a six-mile stretch of land – is vulnerable to a Cascadia earthquake.
- Oregon's resilience to a Cascadia earthquake is low.
- Energy sector companies must adopt best practices and pro-actively integrate seismic mitigation efforts into their business operations to prepare their facilities and systems to absorb and recover from a Cascadia earthquake and to sufficiently restore critical electric, natural gas and liquid fuel services to Oregon homes, businesses and industries in a reasonable time period. This has not happened to date, as this study has shown.
- More stringent oversight authority on seismic preparedness in the energy sector (liquid fuel, electricity and natural gas) may be needed.

Section 1
Introduction

The Oregon Department of Geology and Mineral Industries (DOGAMI) conducted an earthquake risk study of Oregon's Critical Energy Infrastructure (CEI) Hub in Portland, Oregon. This study was conducted as part of a larger U.S. Department of Energy (DOE)-funded Energy Assurance Project (EAP) conducted by the Oregon Department of Energy (ODOE), Public Utility Commission of Oregon (OPUC) and DOGAMI. More information on the EAP project is at http://www.oregon.gov/ENERGY/Recovery/Funding.shtml#Energy_Assurance_Planning, including the Oregon Energy Assurance Plan http://www.oregon.gov/ENERGY/docs/OregonStateEnergyAssurancePlan.pdf.

Background

Oregon is exposed to many natural hazards, including earthquakes, volcanoes, floods, landslides, and more. These hazards have varying characteristics, including frequency of occurrence and severity of possible damage and impact. For example, severe winter storms can occur every few years and sometimes as often as several times per year. Because of technological advances in weather forecasting, these storms typically have several days of advance warning. They typically have limited fatalities (e.g., tens of fatalities or fewer) and can result in flooding, landslides, and downed trees that impact communities, roads, and electrical service to a limited portion of the state. The economic impact can reach hundreds of millions of dollars.

In contrast, major earthquakes rarely occur, but there are no systems that allow for days or hours of advance warning of earthquakes. Major earthquakes in urban areas would likely result in more damage than winter storms because the existing building inventory has many seismically deficient buildings that were constructed before modern seismic building codes.

The most likely major earthquake to occur in Oregon is on the Cascadia Subduction Zone, which is an earthquake fault at the boundary of the Juan de Fuca and North American plates. The next Cascadia earthquake could be as large as a magnitude 9.2, which would shake a substantial portion of the Pacific Northwest and create a tsunami that would flood low-lying coastal areas. Although a magnitude 8 or higher Cascadia earthquake is an infrequent event, it would likely result in thousands of fatalities and widespread, devastating damage throughout western Oregon. The consequences from a major Cascadia earthquake would be much greater and farther reaching than any other natural hazard in Oregon. DOGAMI focused its study on a Cascadia earthquake of magnitude 8 or higher because of the potential consequences to the state of Oregon. Specific information on Oregon's hazards is included in Section 2: Characterization of Oregon's Natural Hazards and Section 4: Seismic Hazards in the CEI Hub.

Oregon's energy sector will be among many severely impacted industries after a major Cascadia earthquake. The energy sector involves the petroleum, natural gas and electricity industries. Each energy industry is a network. The petroleum supply chain involves oil resource development, oil refineries and distribution systems that include fuel terminals with products as well as multiple modes of transportation. Likewise, the natural gas supply chain involves resource development, processing and distribution systems. The electricity supply chain involves generation,

transmission and distribution. For Oregon to have a secure and stable energy supply, energy sector industries must ensure a resilient supply chain during normal operations as well as during extreme conditions, including a Cascadia earthquake.

This study evaluates seismic hazard, vulnerability, risk and resilience in the CEI Hub. These concepts have varying meanings among earth scientists, engineeres and social scientists, so for the purposes of this report, we define them as follows:

- Seismic Hazard: The combination of the severity of damaging seismic effects (shaking, liquefaction, landslides) at a particular location with the frequency with which those effects occur at that location. A very large earthquake that is very rare poses a small seismic hazard, as do very frequent but very small earthquakes. High levels of seismic hazard result from the combination of relatively frequent and relatively large earthquakes. Sesimic hazard is a function of the size and frequency of the earthquake, its location relative to the site in question, and geologic conditions at the site.
- Seismic Vulnerability: The degree to which a particular structure or system is likely to sustain damage when exposed to a particular level of damaging seismic effects like shaking, liquefaction or landsliding. Seismic vulnerability is an intrinsic characteristic of the structure or system.
- Seismic risk: The combination of seismic hazard affecting an area, the vulnerability of the structures and systems in that area, and the consequences of failure of those structures and systems.
- Seismic Resilience: The ability of a structure, system or community to recover from a damaging earthquake. Resilience includes not only the resistance of the system to initial damage, but also the ease and speed with which it can be brought back into service after the event.

Objective

This purpose of this study is to better understand the vulnerabilities of the energy sector when it is confronted with a magnitude 8 or larger Cascadia earthquake. This risk study focuses on Cascadia earthquakes because a large magnitude Cascadia earthquake poses the highest risk of all natural hazards to the state of Oregon (Wang, 2008).

Study goals were to:

- Characterize Oregon's natural hazards by developing qualitatively-derived risk scores to estimate the scale of potential disasters,
- Better understand CEI facility operations and learn about site conditions, structures, and components as well as the systems and interdependencies,
- Describe some of the potential critical seismic vulnerabilities in the energy sector, and
- Offer recommendations to improve energy sector resiliency to minimize earthquake impacts.

Use of this Study

This report provides information to help encourage a seismically resilient energy sector and protect Oregonians in the event of a future Cascadia earthquake. It can be used to develop scenarios, demonstrate objectives, and determine extent-of-play for table-top exercises. The findings in this report can be applied to the development of mitigation, response, and recovery strategies in the Oregon State Energy Assurance Plan and Energy Sector-Specific Emergency Response Plans. The findings can also be used in Oregon resilience planning efforts directed by the Oregon Seismic Safety Policy Advisory Commission (OSSPAC).

Scope of Work

DOGAMI was tasked to determine seismic hazard and risk information of critical energy facilities in Oregon in an intra-governmental agreement with OPUC. DOGAMI did not perform detailed seismic vulnerability assessments of any specific facility, system or asset.

Although DOGAMI had conducted previous studies on Oregon earthquake resilience, including Wang 1999, Wang 2008, and Wang 2010a, these studies did not focus on the energy sector. Because there were many unknowns involving the energy sector, DOGAMI's approach was to: 1) gather information and learn about the state's energy systems; 2) characterize Oregon's natural hazards and its impacts on the energy sector; 3) conduct scoping studies; 4) perform document reviews; 5) collect input and expert opinions from a wide range of professionals (see Section 8: Acknowledgements); 6) conduct visual screening assessments; and 7) perform our own state-of-practice engineering studies. The goal was to evaluate the overall vulnerability of the energy sector to damage at the CEI Hub from a magnitude 8 or larger Cascadia earthquake.

From these activities, DOGAMI created a natural hazard risk matrix based on the natural hazards recognized by the State of Oregon's Natural Hazard Mitigation Plan. DOGAMI also defined the CEI Hub project study area as the six-mile stretch of the lower Willamette River located between the south tip of Sauvie Island and the Fremont Bridge on US Highway 30. (*Figure 1*) The project entailed assessing the seismic hazards of the CEI Hub, identifying the major energy sector facilities in the CEI Hub, and surveying their seismic vulnerabilities.

DOGAMI staff conducted a review of building codes to help assess the vulnerability of the structures in the CEI Hub. DOGAMI conducted site visits to all major energy sector facilities in the CEI Hub (*Figure 1*) as well as several facilities outside of the CEI Hub. In each case, the facility's operator accompanied DOGAMI to visually survey their facilities, which is discussed in the following section: Study Methods.

Figure 1: Site map of the Critical Energy Infrastructure (CEI) Hub on the western bank of the Lower Willamette River area in NW Portland, Oregon. The CEI Hub, outlined in red, stretches for six miles. (base map: Google Earth)

DOGAMI also partnered with academic earthquake professionals to co-conduct a statewide economic study focusing on energy sector interdependencies (*Appendix A*) as well as a ground deformation analysis for this project *(Appendix B)*. These studies provide specialized technical information that is useful towards meeting the study objective.

As a result, this earthquake risk study provides generalized information on the seismic hazard, the exposed facilities, consequences of the seismic hazards to the exposed facilities, and key findings and recommendations to make the energy systems more resilient to earthquake impacts. The term "risk" is defined herein as a function of the threat of seismic hazard, the vulnerability of the exposed parts, and the severity of the consequences. Sections 4 and 5 of this report address the seismic hazards and seismic vulnerability of the exposed facilities in the CEI Hub. Section 6 starts with a discussion of consequences to help illustrate the concept, then addresses the conditions involving seismic risk in the CEI Hub, and ends with discussing impacts to Oregon. This information will allow the energy industry and decision-makers from all levels of government to collaborate on strategies to rapidly recover from a major disaster, and to protect public health and safety, the environment, and the region's economy.

Study Methods

The project method involved assessing the seismic hazard in the CEI hub area posed by a Cascadia earthquake (Section 4 of this study). Although local crustal faults exist in the CEI Hub, only the Cascadia fault was evaluated based on its higher probability of occurrence, many seismic hazards and high risk (Sections 2 and 4 of this study). Many seismic hazards were considered, which included ground shaking, soil susceptibility to earthquake-induced liquefaction, lateral spreading, landslides, and co-seismic settlement. Since liquefaction and lateral spreading hazards are the primary concerns, especially to the waterfront facilities, we co-conducted a ground deformation analyses to better understand the nature of the hazards and the possible mitigation needs.

DOGAMI reviewed the building code environment for facilities in the CEI Hub to determine the design conditions of the facilities. Building codes set forth minimum standards on new construction and for certain major changes. Building codes are frequently upgraded to reflect new design knowledge including seismic hazards. These codes play a vital role in the seismic robustness of structures. If the code requires a high level of seismic design, then the new structure is designed and built to resist seismic forces. In contrast, if past codes call for seismic design levels that are significantly lower than the levels in the current code, then those structures may be seismically deficient.

The EAP partners, which include staff from DOGAMI, ODOE, and OPUC, assessed the seismic vulnerability of CEI Hub facilities through a series of site visits and meetings. Key individuals are listed in Table 1 and contributors are listed in the acknowledgements (Section 8). The EAP assessments included on-site facility visits in the CEI Hub to meet with the operators and tour their facilities, as well as viewing facilities by boat and aerial reconnaissance. A few site assessments were conducted at facilities outside of the CEI Hub. DOGAMI co-organized two boat tours with the City of Portland and invited key stakeholders including Oregon leadership (director of Oregon Emergency Management, representative from Senate President's office), FEMA and EAP partners. DOGAMI, OPUC and Oregon Department of Transportation (ODOT) also conducted aerial reconnaissance with the Civil Air Patrol covering the CEI Hub to the Columbia River mouth to consider emergency response options using the Columbia River waterway.

Table 1: List of Key Individuals: EAP Partners and Stakeholders (cont)

Williams Northwest Pipeline George Angerbauer Manager of Public Outreach Troy Robey Assistant District Manager, Battle Ground District

Assessment of the energy sector facilities in the CEI Hub included:

- All of Oregon's major liquid fuel port terminals
- Liquid fuel transmission pipelines and transfer points
- Liquefied natural gas (LNG) facility
- High voltage electric substation and transmission lines

Assessment of energy facilities outside the CEI Hub included:

- Four electrical substations
- Two power plants (Port Westward and Beavers in Western Oregon (Columbia County)
- A natural gas gate station on Sauvie Island
- A liquid fuel terminal in Eugene

ODOE organized site visits at these petroleum facilities: BP, Chevron, ConocoPhillips, KinderMorgan (KM) fuel terminals and KM pipeline, McCall Oil, Nustar, and Shell. Site visits were also conducted at Bonneville Power Administration (BPA), NW Natural, Portland General Electric (PGE), and Williams Northwest Pipeline. We did not visit any PacifiCorp facilities as all are located outside the CEI Hub.

DOGAMI reviewed US Coast Guard (USCG) inspection protocols for port facilities with petroleum terminals. Because USCG inspections of the Portland fuel terminals do not include a seismic component, the EAP partners worked with the California State Lands Commission to look at how California addresses seismic issues at port facilities with fuel terminals. With help from Martin Eskijian, Supervisor, Engineering Branch Marine Facilities Division from the California State Lands Commission (retired in 2011) and his staff, the EAP partners reviewed parts of the Marine Oil Terminal Engineering and Maintenance Standards (MOTEMS), which is implemented and enforced by California State Lands Commission that incorporates seismic safety http://www.slc.ca.gov/Division_Pages/MFD/MOTEMS/MOTEMS_Home_Page.html.

The EAP partners joined MOTEMS staff on two oil refinery inspections in Richmond and Benecia, California, as well as observed a MOTEMS regulatory review meeting with a petroleum company at the MOTEMS office in Hercules, California. DOGAMI and ODOE, with the assistance of MOTEMS staff engineer Kendra Oliver at four of the Portland fuel terminals, conducted site visits to inspect the piers and the wharves used for transporting liquid fuel in the CEI Hub.

A significant part of the project involved identifying key stakeholders for all the energy sectors as well as government agencies and other stakeholders. These are listed in *Table 2.* Many other individuals provided their expertise upon request. These individuals are listed in Section 8: Acknowledgments. The EAP partners provided EAP information to the energy sector, as well as the public, at many meetings and through a variety of media in order to build awareness. For this report, the names of the companies have often not been identified, and in places, replaced with "*unnamed*". Furthermore, the location of their facilities in the CEI Hub have not been pinpointed. This action was taken to promote participation from privately-owned energy sector operators while respecting their privacy when obtaining seismic vulnerability data associated with their facilities.

Table 2: List of stakeholders in this Earthquake Risk Study for Critical Energy Infrastructure Hub.

Private sector fuel stakeholders	Private sector electricity natural gas stakeholders	Government Agency stakeholders	Non-profit stakeholders	Academic stakeholders
BP	NW Natural	Bonneville Power Administration (BPA)	American Society of Civil Engineers	University of British Columbia

Shell		Port of Portland		
		US Coast Guard		
		US Dept. of Energy		
		US Geological Survey		

Limitations

This study did not entail site-specific vulnerability and risk studies, including studies of any particular facility or system, and provides only estimates of seismic vulnerability based on reconnaissance visual inspections, site-independent analyses and studies and existing site specific information conducted by CEI Hub facilities. The study is only an exploratory seismic risk study of the CEI Hub. Additional studies are required to obtain site specific conditions, and accurate and comprehensive vulnerability and risk data.

While tsunami damage is expected to impact coastal areas, including maritime fuel transport through Columbia River mouth, DOGAMI did not assess damages from tsunami impacts in the CEI Hub because it was outside the scope of this project. Models of likely tsunami inundation from Cascadia earthquakes suggest that tsunami effects in the Columbia River diminish rapidly east of Astoria, and the possibility of tsunami inundation in Portland is remote. (Priest et al, 1999). DOGAMI did not assess dam failure impacts to the CEI Hub because it was outside the scope of this project.

Report Organization

The report is organized into these sections:

Summary of Report
Section 1. Introduction
Section 2. Characterization of Oregon's Natural Hazards
Section 3. Oregon's Energy Sector
Section 4. Seismic Hazards in the CEI Hub
Section 5. Energy Facilities and Vulnerabilities in the CEI Hub
Section 6. Summary of Findings
Section 7. Recommendations
Section 8. Acknowledgments
Section 9. References
Section 10. Appendices

Funding

Funding for this project was provided by the U.S. Department of Energy to the Oregon Department of Energy with American Recovery and Reinvestment Act (stimulus) funds through the Enhancing State Government Energy Assurance Capabilities/Planning for Smart Grid Resiliency. The Oregon Department of Energy received $547,749 in funding for the grant. The Oregon Department of Energy sub-contracted with the Public Utility Commission of Oregon, which sub-contracted with the Oregon Department of Geology and Mineral Industries, to produce this report.

This material is based upon work supported by the U.S. Department of Energy under Award Number #DE-OE0000124. This report was prepared as an account of work sponsored by an agency of the United States Government. Neither the United States Government nor any agency thereof, nor any of their employees, makes any warranty, express or implied, or assumes any legal liability or responsibility for the accuracy, completeness, or usefulness of any information, apparatus, product, or process disclosed, or represents that its use would not infringe privately

owned rights. Reference herein to any specific commercial product, process, or service by trade name, trademark, manufacturer, or otherwise does not necessarily constitute or imply its endorsement, recommendation, or favoring by the United States Government or any agency thereof. The views and opinions of authors expressed herein do not necessarily state or reflect those of the United States Government or any agency thereof.

Section 2
Characterization of Oregon's Natural Hazards

The section discusses the natural hazards and risks in Oregon and summarizes key results from previous statewide earthquake and tsunami studies.

Natural Hazards and Risk

Oregon is exposed to a wide range of natural hazards, each with its own characteristic frequency and severity. Floods, wind and winter storms are expected to occur frequently in limited geographic area, and are, therefore, considered to be high-probability, low-consequence events. In contrast, large Cascadia Subduction Zone earthquakes and tsunamis rarely occur, but would results with significant, widespread damage. Cascadia earthquakes are considered to be low-probability, high-consequence events.

The earthquake hazard in Oregon varies depending on the location. The likelihood of an earthquake occurring in western Oregon is higher than in eastern Oregon, thus the earthquake hazard is considered to be higher in western Oregon (Figure 2). Considering the entire state of Oregon as a whole, the overall earthquake hazard can be considered as high to moderate. The earthquake risk, however, may be considered as very high. The terms hazard and risk may be defined differently by engineers, business continuity specialists, social scientists, emergency managers, and others and may also vary depending on the specific context. In risk studies performed by engineers, the risk level is often determined as a function of the hazard (the probability of the earthquake occurring), the vulnerability of the exposure, and the consequences. Additional information on probability and risk concepts in engineering are covered in Ang and Tang (2007) and Garvey (2008).

The State of Oregon's Natural Hazards Mitigation Plan, produced by the Oregon Emergency Management with the assistance of many state agencies, is state government's plan to address natural hazards. This plan, available on http://opdr.uoregon.edu/stateplan, is in a continual process of being updated. Oregon's Governor last approved and adopted the plan in 2009. The major hazards identified for Oregon in this plan include: climate change, coastal erosion, drought, dust storm, earthquake, fire (wildland-urban interface), flood, landslide and debris flow, tsunamis, volcanic, windstorm and winter storm.

Development of Risk Matrix

In the early stages of this EAP, DOGAMI assessed how different natural hazards compare with each other with respect to the hazard, vulnerability and consequence to rank how Cascadia earthquakes compare with other hazards. DOGAMI used the identified hazards identified in the State of Oregon's Natural Hazards Mitigation Plan and created a qualitative statewide risk matrix for natural hazards. (See *Table 3)* The table was developed to provide a better understanding of the state's natural hazards and the risk to estimate the scale of potential future disasters. The risk scores include low, moderate, high and very high. The risk scores were subjectively determined by expert opinion and are based on the probability of the hazard, the vulnerability of the exposure, and the consequence of likely damage for the state as a whole. These scores do not specifically consider energy infrastructure.

Table 3: Statewide Risk Matrix for Natural Hazards (Oregon Emergency Management identified the hazards list; EAP partners created the risk matrix)

Description of Hazard	Hazard	Vulnerability	Consequence	Risk Score
Climate Change	NE	NE	NE	NE
Coastal Erosion	H	M	M	M
Drought	M	M	H	M
Dust Storm	L	L	M	L
Earthquake	**M**	**VH**	**VH**	**VH**
Fire (Wildland-Urban Interface)	H	M	M	M
Flood	VH	M	M	H
Landslides and Debris Flow	VH	M	M	H
Tsunamis	M	H	VH	H
Volcanic	L	M	M	M
Windstorm	M	M	H	M
Winter Storm	VH	H	H	H

Explanation: VH=very high; H=high; M=moderate; L=Low; NE=not estimated

The earthquake hazard is only moderate because earthquakes are rare. For example, a magnitude 8 or so Cascadia earthquake has a recurrence interval of about 250 years, and a magnitude 9 Cascadia earthquake has a recurrence interval of about 500 years. The earthquake vulnerability score is very high because the vast majority of Oregon's existing infrastructure has been designed and constructed without seismic resistance considerations. The consequence score is also very high because damage will likely be widespread and, in many places, severe. Finally, the earthquake risk score is very high because when a major earthquake occurs, it will likely result in a high loss of life, economic damages, and long-term impacts.

Method to Develop Risk Score

In developing the risk scores, DOGAMI gave broad consideration to numerous factors that would have a statewide significance. Factors include the hazard's: onset pattern (ie. earthquakes do not have forewarning, but tsunamis have at least minutes of warning); frequency (ie. earthquakes are rare, but storms are frequent); geographic location and spatial extent (ie. Cascadia earthquakes can suddenly impact all of western Oregon, whereas fires are localized); severity of impact resulting in many fatalities and/or high economic losses (ie. earthquakes can cause widespread physical damage to critical energy infrastructure, transportation, emergency response facilities and other essential facilities). As specific examples, coastal erosion and tsunamis are limited to the coastal areas, whereas winter storms and fires can occur anywhere in the state.

The risk matrix can be used to help determine and prioritize risk management strategies. For each hazard, a single ranking of low, moderate, high or very high was subjectively selected for the probability of the hazard, vulnerability, and consequence. Low, moderate, high and very high were assigned values of 1, 2, 3 and 4, respectively. The risk score was calculated by taking the square root of the sum of the squares, and assigned as low, moderate, high or very high for values less than 3, 3 to less than 4.5, 4.5 to less than 6, and 6 or greater, respectively.

Previous Statewide Earthquake Studies

For most of Oregon's history, the seismic potential was considered to be minimal. Even as late as 1980 during the Mt. St. Helens volcanic eruption, geologists were generally unaware of Oregon's major faults and their earthquake potential. During the 1980s, geologists learned about the Cascadia Subduction Zone and that it could produce large earthquakes. By the late 1980s, there was general consensus among earthquake scientists that the Cascadia fault could unleash a magnitude 8 or higher earthquake and accompanying tsunami (Wang, 1998a). Since that time, scientific research has continued to improve our understanding of the Cascadia fault and numerous earthquake and tsunami studies have been performed.

Figure 2 shows a current scientific model of the location of the Cascadia Subduction Zone. The potential rupture surface of the Cascadia fault extends from the western edge (white line with triangles) to the eastern edge (dashed black line). The eastern edge of the fault is important because, in general, the shaking levels are closer to the fault.

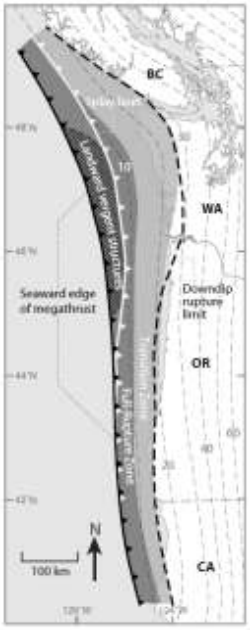

Figure 2: Cascadia Subduction Zone between the black dashed line and the white line with triangles. (Witter et al, 2011).

Statewide Damage and Loss Estimates

In 1998, Oregon was the first state in the nation to conduct a statewide earthquake damage and loss study (Wang, 1998b, Wang and Clark, 1999). Using HAZUS97, a damage and loss estimation software package from FEMA, DOGAMI produced a technical report that included evaluations of damage and losses for the entire state for 1) a magnitude 8.5 Cascadia earthquake and 2) a 500-year return interval probabilistic ground motions. In the second evaluation, the ground motions expected to be met or exceeded in a 500-year period are used in the building code to design for earthquake shaking.

As part of that study, DOGAMI developed a statewide soils map. Next, DOGAMI developed a suite of ground motions that integrated the soils map. The ground motions were used to estimate

damage to infrastructure from shaking. *Figure 3* illustrates how layers of information are used to determine damage where the uppermost layer depicts highest damage in red (Wang, 1998b). *Figure 4* shows a spectral velocity map of Oregon at 0.3 seconds, which was one of the ground motion maps used to estimate damage (Wang, 1998c). The statewide damage and loss assessment was conducted in two parts, both indicating severe losses. Building damage from a hypothetical magnitude 8.5 Cascadia earthquake was estimated using FEMA's HAZUS97 software and indicated almost 1,000,000 buildings with some level of damage from earthquake shaking (Wang and Clark, 1999). Fatalities were estimated using crude methodologies and indicated more than 3,000 fatalities from tsunamis, 2,000 fatalities from severe building damage, and many more casualties. (Wang, 1999)

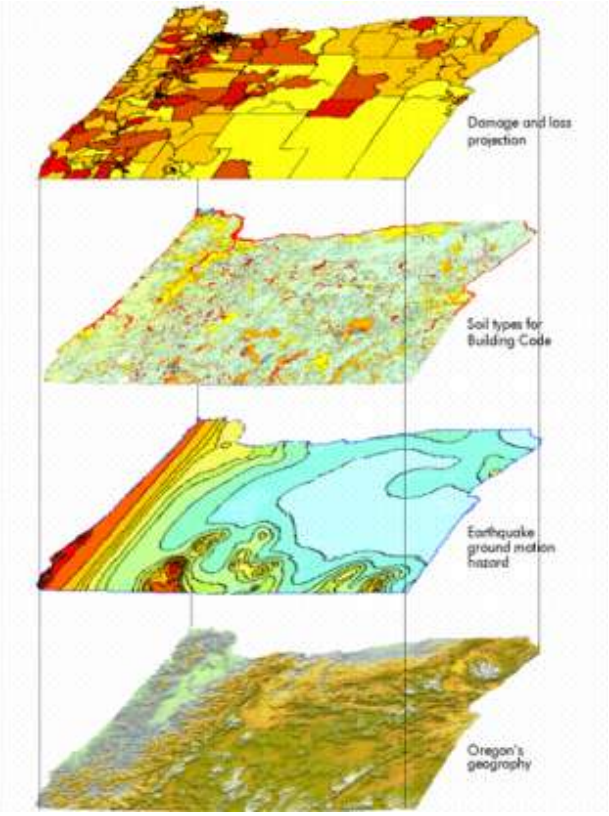

Figure 3: Schematic showing a statewide GIS-based (HAZUS97) study damage and loss assessment using probabilistic ground motions that represent equal seismic hazards throughout Oregon. (Wang, 1998b)

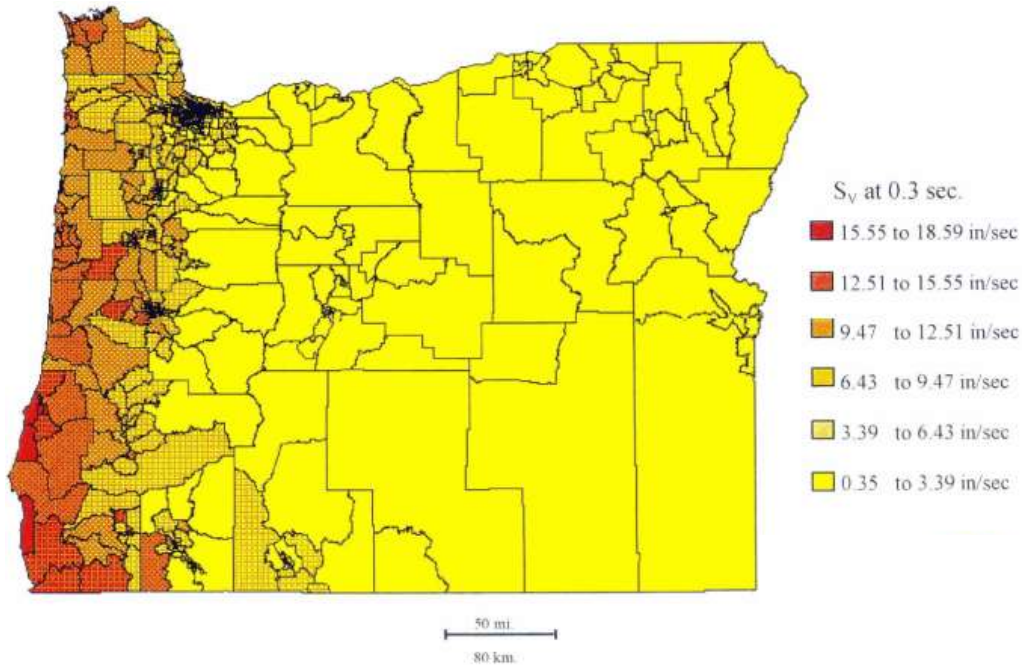

Figure 4: Spectral Velocity Map of Oregon at 0.3 seconds (Wang, 1998c)

Today, earthquake scientists have gained a better understanding of the Cascadia fault, the soils in Oregon, and expected ground motions. Researcher Chris Goldfinger and his colleagues have examined the offshore geologic record of large Cascadia earthquakes in the past 10,000 years. (Goldfinger et al, 2012) *Figure 5* shows a simplified timeline of Goldfinger's findings, which indicate over 40 earthquakes (DOGAMI, 2010). Seismic hazards are further discussed in Section 4.

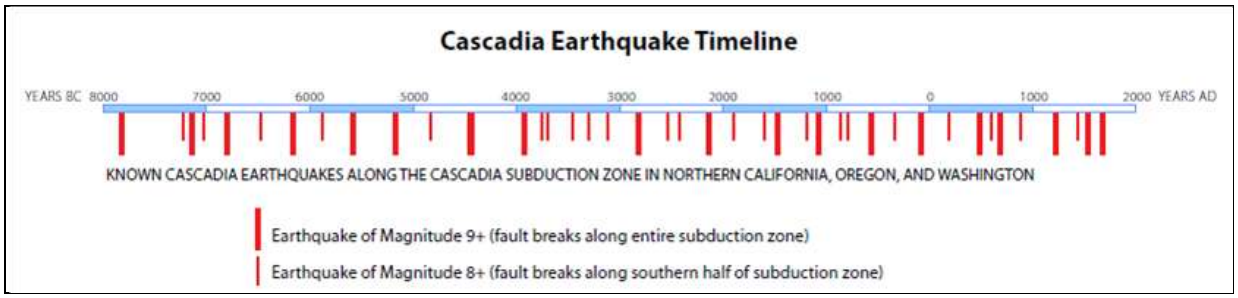

Figure 5: 10,000 year record of past large magnitude earthquakes on the Cascadia Subduction Zone. (DOGAMI, Cascadia Winter 2010)

Lessons from Recent Subduction Zone Earthquakes

In recent years, three significant earthquakes have occurred in subduction zones around the world. These include:

- 2004 magnitude 9.1 Sumatra earthquake
- 2010 magnitude 8.8 Chile earthquake
- 2011 magnitude 9.0 East Japan earthquake

Each time a major subduction zone earthquake occurs, earthquake professionals working in the Cascadia region gather important earthquake information and learn a great deal more about the Cascadia Subduction Zone.

In the Sumatra earthquake, one big lesson learned was that tsunamis can kill over 200,000 people from one side of the ocean to the other side. The tsunami hit and killed people in Sumatra, but also traveled across the Indian Ocean and killed people in 12 other countries including Thailand, India, and Sri Lanka. In 2009, stakeholders from the Pacific Northwest discussed tsunami vertical evacuation refuges as a new mitigation option. (Wang, 2010a)

In the 2010 Chile earthquake, moderate shaking damaged an oil refinery that was rendered inoperable for months. Earthquake professionals working in the Cascadia region learned lessons on the importance of critical infrastructure. (Wang, 2010b)

In the 2011 Japan disaster, the electrical sector was impacted not only by damaged nuclear and thermal power plants, but also by undamaged nuclear power plants, which were shut down due to the public's concern about their safety. Also, one electric company experienced damage to 85 of its high voltage transformers. The Oregon Seismic Safety Policy Advisory Commission adopted policy recommendations to address the issue of critical infrastructure (including fuel and electric) following the Japan earthquake. (http://www.oregon.gov/OMD/OEM/osspac/docs/lessons_recomm_7-11.pdf). They are reprinted in the Winter 2012 Cascadia (DOGAMI).

Based on observations from historical earthquakes, scientists have determined that 1) large earthquakes release more energy and produce stronger ground shaking than small earthquakes, 2) the level of ground shaking lowers with distance away from epicenter of the earthquake, and 3) damage is typically concentrated nearer the epicenter of the earthquake as well as in farther locations with soft soil deposits, such as old lake bed soils. Based on post-earthquake field visits after the 2004, 2010 and 2011 subduction zone earthquakes, co-author Yumei Wang, observed that the damage in those subduction zone earthquakes was concentrated in three areas:

1. Tsunami inundation zones,
2. Areas of permanent ground deformation, such as landslides and liquefaction zones, and
3. Seismically weak buildings and infrastructure.

Section 3: Oregon's Energy Sector

This section provides an overview of Oregon's energy sector, the CEI Hub project study area, and Oregon's economic interdependencies with the energy sector.

Overview of Energy Sector

Three energy sources are considered—electricity, natural gas and fuel oil. The energy sectors have separate systems for supplying their products and/or services. Not surprisingly, each has sector-specific seismic vulnerabilities.

The crude oil used in Oregon originates in the Alaska North Slope oil fields. The Trans Alaska Pipeline transports crude oil from these oil fields to the Valdez terminal in southern Alaska. From there, barges, tankers and pipelines carry the crude oil to four refineries located in the Puget Sound area of Washington State, which provide more than 90 percent of Oregon's refined petroleum product. About 75 percent of the product is transported via the Olympic Pipeline to seven petroleum distribution terminals located within close proximity of one another in the CEI Hub project study area, further described in the next section. The remaining fuel coming to Oregon from the Washington State refineries is transported by tanker vessels to the Portland facilities. (ODOE, 2011)

In 2010, Oregon's electrical power mix from a variety of power plants was 0.77% biomass, 35.46% coal, 0.12% geothermal, 38.74% hydroelectric, 0.04% landfill gases, 16.24% natural gas, 3.66% nuclear, 0.14% other, 0.17% petroleum, 0.34% waste, and 4.31% wind (ODOE Power Mix Fact Sheet, 4/4/12). The electrical grid that serves the state of Oregon is coordinated and highly interconnected with similar systems in the 13 western U.S. states, parts of northern Mexico and western Canada. Critical grid functions, in relation to Oregon, are most predominately the responsibility of the Bonneville Power Administration (BPA), Western Electricity Coordinating Council (WECC), PacifiCorp and PGE. On a local level, the electric distribution systems, as well as some transmission and generation, are also the responsibility of Oregon's numerous municipal and public power agencies. Being integrated, Oregon's generation and transmission systems are exposed to adverse events that may be caused over a thousand miles away. In theory, Oregon's electric resiliency (e.g., reliability) can be significantly impacted by transmission or generation related events that could occur anywhere in the entire interconnected region. Conversely, events emanating within Oregon could also significantly impact other states. The prudent management, operations, planning and maintenance of bulk power transmission and generation grids play a fundamental role in Oregon's electric resiliency (RW Beck, 2011).

Oregon receives natural gas from British Columbia, Alberta, Wyoming, Colorado and New Mexico. Two connected interstate pipelines currently serve Oregon customers. The Williams Company pipeline and the Gas Transmission Northwest (GTN) pipeline owned by the TransCanada Corporation bring product from the Rocky Mountains and Canada. The Ruby Pipeline transports domestic natural gas 675 miles across four states from Opal, Wyoming to the existing Gas Transmission Northwest (GTN) pipeline near Malin, Oregon. According to the Northwest Gas Association (NGWA), the Pacific Northwest is home to more than 48,000 miles of natural gas transmission and distribution pipelines (ODOE, 2011).

More information on the energy assurance project, including the Oregon Energy Assurance Plan is at http://www.oregon.gov/ENERGY/docs/OregonStateEnergyAssurancePlan.pdf.

Critical Energy Infrastructure (CEI) Hub: Project Study Area

The study region for this project was determined based on the location and importance of Oregon's liquid fuel oil terminals. Oregon's liquid fuel terminals are located along a six-mile stretch along the lower Willamette River in Portland. As part of this study, we identified and termed these six miles as the "critical energy infrastructure Hub" or CEI Hub. The CEI Hub is located in a region of high seismicity (*Figure 6*, FEMA 2002).

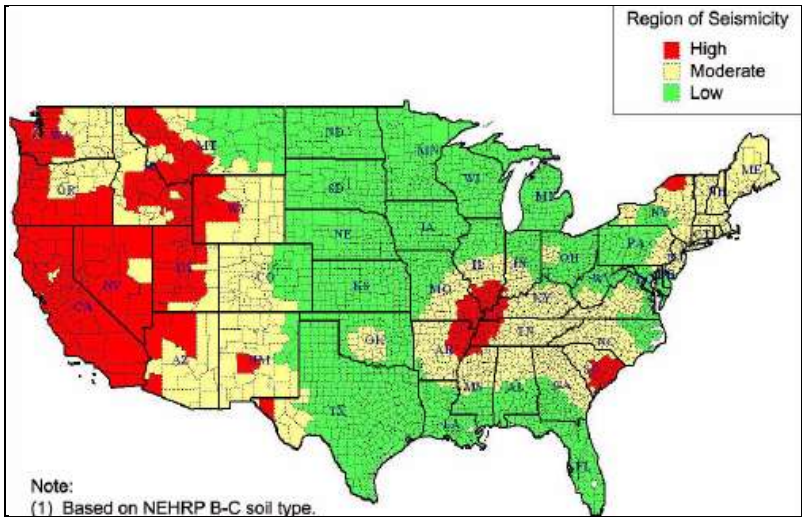

Figure 6: Map showing regions of high, moderate and low seismicity. The CEI Hub is in the high region (FEMA, 2002).

The CEI Hub covers a six-mile stretch of the lower Willamette River located between the south tip of Sauvie Island and the Fremont Bridge on US Highway 30. The energy sector facilities in the CEI Hub include:

- All of Oregon's major liquid fuel port terminals (see *Figures 7, 8 and 9*)
- Liquid fuel transmission pipelines and transfer terminals
- Natural gas transmission and distribution pipelines
- Liquefied natural gas (LNG) storage facility
- High voltage electric substations and transmission lines
- Electrical substations for local distribution

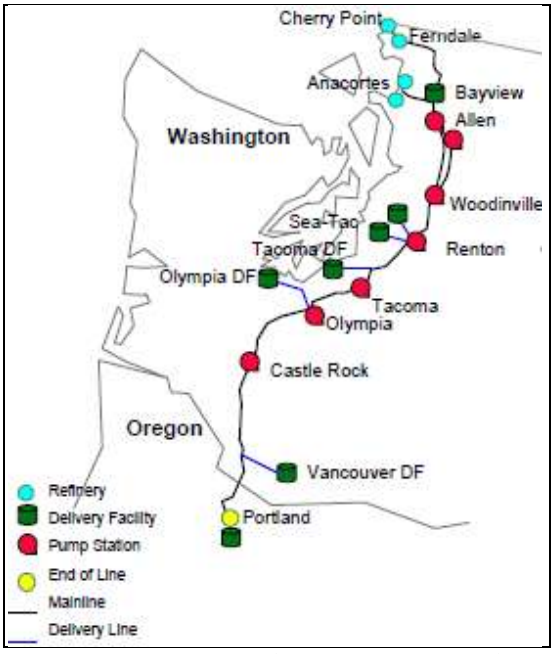

Figure 7: The liquid fuel oil terminals for more than 90 percent of Oregon's supply are located at the end of the line (yellow dot) in Portland, Oregon. (http://www.bppipelines.com/cartoon-maps/olympic.pdf)

Figure 8: Oil terminals in the southern portion of the CEI Hub. (DOGAMI photo)

Figure 9: Oil terminals in the northern portion of the CEI Hub (foreground of photo). (DOGAMI photo)

Petroleum enters the state by pipeline and marine vessels and is transferred to terminals at the CEI Hub before it is distributed throughout Oregon to the end user. Once the product reaches the CEI Hub, tanker trucks deliver fuel to customers in the Portland metro area, barges deliver fuel farther east on the Columbia River, and a pipeline continues south to a terminal in Eugene. Fuel is distributed throughout Oregon, including to the Portland International Airport and many other major consumers.

Oregon's oil terminals are located along the western bank of the Willamette River (*Figures 8 and 9*). The Portland fuel terminals are on a six-day delivery cycle. On average, terminals have a three to five day supply in the tank farm for regular unleaded gasoline and diesel fuel. Premium gasoline is subject to the daily delivery and heavily dependent on whether an inter-company pipeline on Front Avenue is operational. All seven terminals have the capability to receive product by vessel. However, only Chevron and Kinder Morgan terminals have the marine vapor recovery systems required to load unleaded fuel onto vessels for transport up the Columbia River to Pasco, Washington. Diesel can be loaded on vessels without the vapor recovery systems. Vessel deliveries vary. Chevron reports on average, its terminal receives a shipment by barge every three or four days and by ship every seven or eight days. (Portland PBEM, Earthquake Response Appendix, January 2012, http://www.portlandonline.com/oem/index.cfm?c=53895&a=382005)

A significant portion of Oregon's natural gas passes through the CEI Hub. Also, three high voltage (115 kV and 230 kV) electrical transmission lines cross the area as well as feed the distribution network for the local area.

Economic Interdependencies with the Energy Sector

In August 2003, Americans got a dramatic "wake up call" concerning the vulnerability of electrical systems and the resultant regional and national consequences as a result of the Northeast Blackout. The blackout affected five states, 50 million people, and caused an estimated $4 to $10 billion in business interruption losses in the central and eastern US. The power outage

caused "cascading" failures to water systems, transportation systems, hospitals, and numerous other critical infrastructures (National Research Council, 2011).

Oregon's economy, like all other states, has complex interdependencies. The reliability of energy lifelines is vital to ensure the protection of public health and safety. Any prolonged or severe disruption of one or more energy system could put many lives at risk as well as strain the state's economy. To better understand the economic interdependencies with the energy sector, co-author Miles conducted a statewide economic study to evaluate the economic interdependencies of Oregon's energy sector by comparing the interdependencies of electricity, natural gas and liquid fuel as well as critical infrastructure with the rest of Oregon's economy. This work is part of a National Science Foundation-funded research project (Grant #0927356) entitled *"Repeat Disaster Impact to Infrastructure Networks and Their Effects on Economic Agent Recovery."* This part of the study was peer reviewed and is included as Appendix A.

The findings show that if available electricity, natural gas and liquid fuels were significantly reduced, the direct and non-direct dollar losses would have major socio-economic consequences to Oregon. In a scenario where all energy sectors are disrupted, there would be $0.39 of economy-wide impact for every $1.00 of lost output by the energy sector. The sectors with the largest financial impact are Services, followed by Wholesale/Retail, Construction, Non-Durable Goods, Electricity, Communications, Mining, Durable Goods, Petroleum, and Transport by Rail. The impact to Services is about an order of magnitude greater than the other sectors. For employment impacts, a minimum of 2.42 jobs would be expected to be lost for every direct job lost in the energy sector. Electric companies have the greatest monetary and employment impact potential of the three energy sources. In summary, the study concludes that the total impact from a Cascadia earthquake on the energy sector would include the direct damage to energy facilities, the loss of sales, losses from secondary effects, including job losses, and a multitude of cascading functional impacts which would potentially have economic impacts of their own.

Comparison with Other Economic Studies

After the 1994 Northridge, California earthquake, Tierney (1997) found that the second most common reason for business closure, behind having to clean up debris, was a loss of electricity. The most significant impacts were seen in the finance, insurance, and real estate and construction industries. Finance, insurance and real estate services were also impacted the most in the WWU study on Oregon energy disruption. A study by Tierney and Nigg (1995) compared the dependency of businesses to five types of infrastructure between Memphis, Tennessee and Des Moines, Iowa with respect to potential (Memphis; earthquake disruption) and actual (Des Moines; 1993 Midwest floods) disruption. *Table 4* (Memphis) shows the results of that study. In both cases, businesses depend most on electricity, while depending on natural gas third most. In the study of the business impacts from the 1993 Midwest floods, Tierney (1994) wrote the following, which provides further insight into the importance of energy infrastructure:

> "Overall, electricity was rated as the most critical lifeline service by both large and small businesses, with the former considering electric service more important than the latter. Large manufacturing and construction firms and both large and small companies in the finance, insurance, and real estate sectors were more likely than other businesses to rate electricity as critical to their operations. While small businesses generally considered

telephone service to be the second most critical lifeline, large businesses appeared to view telephones, water, sewer service, and natural gas as equally critical."

Table 4. Results of surveys to businesses in Memphis, Tennessee asking the degree of importance on five types of infrastructure (Tierney and Nigg, 1995).

LIFELINE SERVICES					
IMPORTANCE	Electric	Water	Natural Gas	Water Treatment	Telephone
Very Imp	82%	27%	18%	23%	78%
Important	14	34	29	32	17
Not Very Important	3	31	39	33	3
Not Imp at all	1	8	13	13	2
Total	100%	100%	99%*	101%*	100%

*Does not total 100% due to rounding

A study by Rose et al. (2007) on the economic impacts of electricity outage due to a terrorist attack on Los Angeles, California found that the services sector was most impacted by a significant margin. This is not surprising as the input-output analysis found that services and manufacturing are the two main business users of electricity.

None of the studies included direct dependence on liquid fuel. Nonetheless, the studies have confirmed the general validity of our findings and the importance of resilient infrastructure, as well as the significant economic impact that would arise due to energy disruption from a Cascadia earthquake in Oregon.

Section 4
Seismic Hazards at the CEI Hub

For this study, DOGAMI used earthquake parameters that reflect magnitudes ranging from 8 to 9. A hypothetical magnitude 8 or 9 earthquake would be located about 63 miles (100 km) west of the CEI Hub in Portland, Oregon just offshore from the city of Tillamook. Both earthquakes assume the distance is from the down-dip rupture limit of the Cascadia Subduction Zone, which is the eastern-most edge of the fault, to the CEI Hub (Witter et al, 2011). The hypothetical magnitude 9 earthquake would stretch from coastal Cape Mendocino, California to Vancouver Island, British Columbia (*Figure 10*).

Figure 10: Cascadia Subduction Zone showing the fault's western boundary (red dashed line), which is closest to the ground surface, and the easterly dipping fault plane (yellow) (DOGAMI, 2012).

Seismic Hazards in the CEI Hub Area

The primary seismic hazards that would impact the CEI Hub area are:

- Ground shaking
- Liquefaction (soil behavior phenomenon in which a saturated sand softens and loses strength during strong earthquake ground shaking)
- Lateral spreading (where surficial soil permanently moves laterally due to earthquake shaking)
- Landslides

- Co-seismic settlement (where the ground surface is permanently lowered due to seismic shaking)
- Bearing capacity failures (when the foundation soil cannot support the structure it is intended to support)

In addition, secondary seismic hazards can be initiated and include:

- Seiches (waves that oscillate in water bodies often initiated by ground shaking)
- Fire
- Hazardous material releases, such as fuel overtopping tanks by sloshing (occurs when liquid becomes agitated by ground shaking)

Liquefaction and lateral spreading hazards are of primary concern to the fuel supply waterfront facilities. For this reason, DOGAMI performed ground deformation analyses to better understand the nature of the hazard and the possible mitigation needs. A section on the deformation analyses is included in this study. Tsunamis are expected to damage the coastal areas, including ports along the coast and Columbia River mouth, but are not expected to cause significant damage in the Portland waterways. Following is a summary of these seismic hazards:

Active Fault Sources

Many earthquake faults capable of producing damaging earthquakes exist in the area of the CEI Hub. The most threatening fault is the Cascadia Subduction Zone fault (Cascadia fault) which lies just offshore of the Oregon coast (see *Figures 10 and 11*). The Cascadia fault has produced over 40 large magnitude earthquakes during this past 10,000 years, with the last major earthquake occurring on January 26, 1700. The 1700 Cascadia earthquake likely caused extensive ground shaking that extended from the Cape Mendocino area in Northern California to British Columbia, Canada, as well as a large tsunami. This tsunami first hit the low lying areas along the Pacific Northwest coast, then traveled across the Pacific Ocean to cause damage to Japan's coast.

Based on the 10,000 year record of past Cascadia earthquakes (Goldfinger, 2012), Oregon will certainly experience another magnitude 8-9 earthquake in its future. This future earthquake, which has the same type of subduction zone process as the March 11, 2011 East Japan magnitude 9 earthquake, will be accompanied by a coastal tsunami.

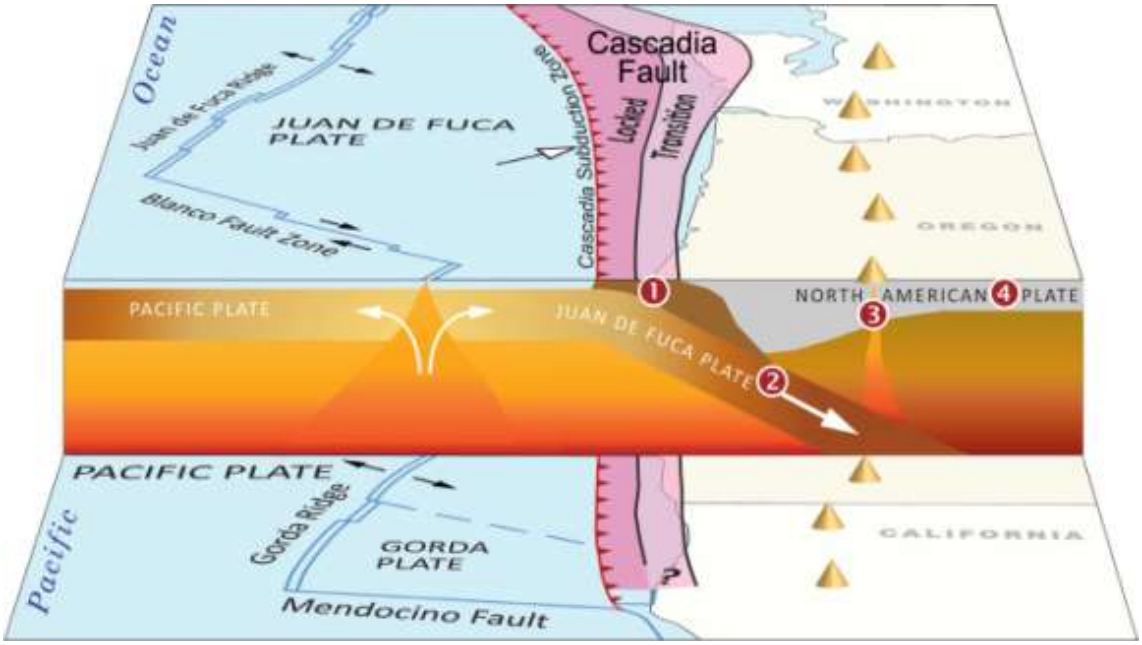

Figure 11:The Cascadia Fault is Oregon's most threatening fault and can produce a magnitude 9 earthquake and accompanying coastal tsunami waves. (modified from DOGAMI, 2010)

Based on data that was used to develop the U.S. Geological Survey's (USGS) probabilistic ground motion maps, the Portland Hills fault is located in the CEI Hub area and can produce a magnitude 7 earthquake (USGS, 2008). In addition, the likelihood of this earthquake occurring is approximately 1% in the next 50 years (USGS National Seismic Hazard Mapping Program: https://geohazards.usgs.gov/eqprob/2009/index.php) whereas a magnitude 9 Cascadia earthquake has a likelihood as high as 14% in the next 50 years (USGS, 2008).

Ground Shaking Characteristics

The USGS has determined the ground shaking characteristics caused by faults. The State of Oregon has adopted building codes that incorporate this information. All of Oregon is exposed to seismic hazards. Higher levels of ground shaking are expected for western Oregon due to the Cascadia fault on the Cascadia Subduction Zone. *Figure 12* shows Oregon's ground shaking seismic hazards with higher expected shaking levels represented by "hotter" (or red) colors. This is the 2008 USGS national seismic hazard maps for 0.2 second spectral acceleration for 2 percent probability of exceedence in 50 years with shaking expressed in percent gravity. This type of information is used by engineers for design purposes. The duration of shaking is not indicated by this map. Additional technical information on ground shaking characteristics is provided below. For a non-technical description of ground shaking, we suggest that you skip to the next section, earthquake intensity.

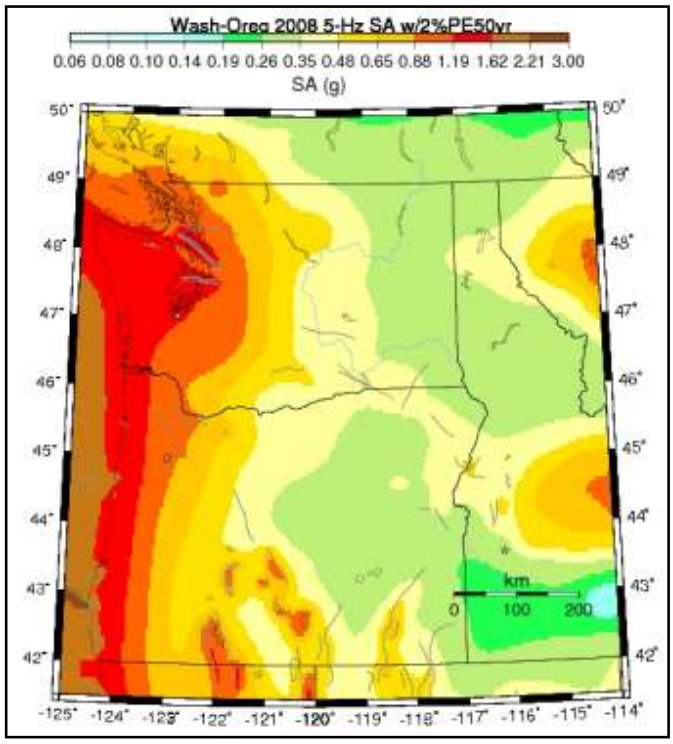

Figure 12: Ground shaking map of Oregon and Washington for rock conditions used in building codes. Red, orange, yellow areas indicate more shaking than beige, green areas.This map shows the shaking level from all possible earthquake sources, based on a probability of exceedance of 2% in the next 50 years.
http://earthquake.usgs.gov/hazards/products/conterminous/2008/maps/wus/pacnw/3hzSA.OrWa.jpg

For the CEI Hub, the ground motions induced by a magnitude 8 to 9 Cascadia earthquake are expected to produce significant damage, particularly in areas of weak soils and weak infrastructure. More specifically for a hypothetical magnitude 9 earthquake, the peak ground accelerations (PGA) in the CEI Hub at the ground surface would be expected to be on the order of 0.18 g (Clark and Roddey, 2005). This 0.18 g value was developed by the USGS national seismic hazard mapping project group as part of the Cascadia Region Earthquake Workgroup Cascadia earthquake scenario (http://earthquake.usgs.gov/hazards/). Earlier studies by Wong et. al (2000) provided a range between 0.15 and 0.20g at the ground surface. Based on past subduction zone earthquakes and on numerical modeling, strong shaking from a magnitude 8 earthquake is expected to last on the order of 80 seconds on firm rock sites (such as the Portland Hills) and about 120 seconds on soil sites (such as by the Willamette River (personal communication, Art Frankel, USGS). For a magnitude 9 earthquake, the duration of the shaking may be slightly longer than a magnitude 8 because about 32 times more energy is released.

The PGA values used for design purposes in the proximity of the CEI Hub are on the order of 0.36 g at the ground surface for sites with soils that commonly exist in the CEI Hub. This is based on a PGA value of 0.3 g on sites underlain by soft rock (defined as having a shear wave velocity of 760 m/s by the USGS). This value was determined using the USGS's web tools for a 975 year mean return time (https://geohazards.usgs.gov/deaggint/2008). The USGS method considers many fault sources. In this case, these fault sources are considered to be principal

sources: Cascadia megathrust, Cascadia intraplate, Western US crustal faults on a grid, crustal faults in Oregon and Washington, and the Portland Hills fault. For more information on the USGS method and the fault sources, please refer to the USGS national seismic hazard mapping project (http://earthquake.usgs.gov/hazards) and USGS Open-File Report 2008–1128, Documentation for the 2008 Update of the United States National Seismic Hazard Maps (USGS, 2008). For sites underlain by soil type Se, which is defined by the building code as soils that soil transmit shear waves at a velocity of 200 m/s or less for the upper 30m, shaking is expected to be stronger due to the site amplification effect in these types of soils. Soil type Se has been identified in geotechnical reports in the many parts of the CEI Hub. Using an amplification factor of 1.2, the PGA at the ground surface is expected to be about 0.36 g. The amplification factor is from the "Guide Specifications for LRFD Seismic Bridge Design", provided in Table 3.4.2.3.1 - Values of Fpga and Fa as a Function of Site Class and Mapped Peak Ground Acceleration or Short-Period Spectral Acceleration Coefficient (AASHTO, 2009).

Earthquake Intensity

The effects of an earthquake on people and objects is measured by the intensity scale, which in contrast to engineering ground motion characteristics used for design, is a scale designed for use by the general public. The intensity scale consists of a series of certain key responses such as people awakening, movement of furniture, damage to chimneys, and finally - total destruction. The Modified Mercalli Intensity (MMI) scale, shown in *Figure 13*, comprises 12 increasing levels of intensity that range from imperceptible shaking to catastrophic destruction, and is designated by Roman numerals. It does not have a mathematical basis; instead it is an arbitrary ranking based on observed effects. The MMI value assigned to a specific site after an earthquake is a more meaningful measure of severity for the non-scientist than the magnitude, which expresses the energy released by the earthquake on a logarithmic scale, because intensity refers to the effects actually experienced at that place. In general, lower MMI values relate to the manner in which the earthquake is felt by people. Higher MMI values are based on observed structural damage. (http://earthquake.usgs.gov/learn/topics/mercalli.php) (Wald et al, 1999)

	MMI value	Summary description used on maps	Description of shaking severity	Full description shortened From Elementary Seismology
	I	Not mapped	Not mapped	Not felt
	II	Not mapped	Not mapped	Felt by people sitting or on upper floors of buildings
	III	Not mapped	Not mapped	Felt by almost all indoors. Hanging objects swing. Vibrations like passing of lights trucks. May not be recognized as an earthquake.
	IV	Not mapped	Not mapped	Vibration felt like passing of heavy trucks. Stopped cars rock. Hanging objects swing. Windows, dishes, doors rattle. Glasses clink. In the upper range of IV, wooden walls and frames creak.
	V	Light	Pictures move	Felt outdoors. Sleepers wakened. Liquids disturbed, some spilled. Small unstable objects displaced or upset. Doors swing. Pictures move. Pendulum clocks stop.
	VI	Moderate	Objects fall	Felt by all. People walk unsteadily. Many frightened. Windows crack. Dishes, glassware, knickknacks and books fall off shelves. Pictures off walls. Furniture moved or overturned. Weak plaster, adobe buildings, and some poorly built masonry buildings cracked. Trees and bushes shake visibly.
	VII	Strong	Nonstructural damage	Difficult to stand or walk. Noticed by drivers of cars. Furniture broken. Damage to poorly built masonry buildings. Weak chimneys broken at roof line. Fall of plaster, loose bricks, tiles, cornices, unbraced parapets and porches. Some cracks in better masonry buildings. Waves on ponds.
	VIII	Very Strong	Moderate damage	Steering of cars affected. Extensive damage to unreinforced masonry buildings, including partial collapse. Fall of come masonry walls. Twisting, falling of chimneys and monuments. Wood-frame houses moved on foundations if not bolted, loose partition walls thrown out. Tree branches broken.
	IX	Violent	Heavy damage	General panic. Damage to masonry buildings ranges from collapse to serious damage unless modern design. Wood-frame structures rock, and if not bolted, shifted off foundations. Underground pipes broken.
	X	Very Violent	Extreme damage	Poorly built structures destroyed with their foundations. Even some well-built wooden structures and bridges heavily damaged and needing replacement. Water thrown on banks of canals, rivers, lakes, etc.
	XI	Not mapped because these intensities are typically limited to areas with ground failure		Rails bent greatly. Underground pipelines completely out of service.
	XII	Not mapped because these intensities are typically limited to areas with ground failure		Damage nearly total. Large rock masses displaced. Lines of sight and level distorted. Objects thrown into the air.

Figure 13: Earthquake Intensity Scale (http://quake.abag.ca.gov/shaking/mmi/)

A magnitude 9 Cascadia earthquake (Figure 14) would likely produce MMI values of VIII and IX along the coast in most locations except for areas with tsunami flooding and areas of unstable soils. Most areas with coastal tsunami flooding would experience major destruction with damage levels equivalent to MMI X to MMI XII values. Areas of unstable soils in western Oregon could experience major destruction reaching MMI IX to X, with very limited areas seeing even greater damage. The MMI values would decrease towards the east. The Willamette Valley would likely experience MMI VI and MMI VII with localized areas of MMI VIII associated with unstable soils. East of the valley would likely experience MMI V and lower.

Local earthquakes in 1877 and 1962 produced ground shaking levels as high as MMI VII in portions of Portland. (Bott and Wong, 1993)

PERCEIVED SHAKING	Not felt	Weak	Light	Moderate	Strong	Very strong	Severe	Violent	Extreme
POTENTIAL DAMAGE	none	none	none	Very light	Light	Moderate	Moderate/Heavy	Heavy	Very Heavy
INSTRUMENTAL INTENSITY	I	II-III	IV	V	VI	VII	VIII	IX	X+
WHAT HAPPENS AT EACH INTENSITY? *Text descriptions from http://quake.abag.ca.gov/shaking/mmi/*	Not felt.	II. Felt by people sitting or on upper floors of buildings. III. Felt by almost all indoors. Hanging objects swing. Vibration like passing of light trucks. May not be recognized as an earthquake.	Vibration felt like passing of heavy trucks. Stopped cars rock. Hanging objects swing. Windows, dishes, doors rattle. Glasses clink. In the upper range of IV, wooden walls and frames creak.	Felt outdoors. Sleepers wakened. Liquids disturbed, some spilled. Small unstable objects displaced or upset. Doors swing. Pictures move. Pendulum clocks stop.	Felt by all. People walk unsteadily. Windows crack. Dishes, glassware, knickknacks, and books fall off shelves. Pictures off walls. Furniture moved or overturned. Weak plaster, adobe buildings, and some poorly built masonry buildings cracked. Trees and bushes shake visibly.	Difficult to stand or walk. Noticed by drivers of cars. Furniture broken. Damage to poorly built masonry buildings. Weak chimneys broken at roof line. Fall of plaster, loose bricks, stones, tiles, cornices, unbraced parapets and porches. Some cracks in better masonry buildings. Waves on ponds.	Steering of cars affected. Extensive damage to unreinforced masonry buildings, including partial collapse. Fall of some masonry walls. Twisting, falling of chimneys and monuments. Wood-frame houses moved on foundations if not bolted; loose partition walls thrown out. Tree branches broken.	General panic. Damage to masonry buildings ranges from collapse to serious damage unless modern design. Wood-frame structures rack, and, if not bolted, shifted off foundations. Underground pipes broken.	Poorly built structures destroyed with their foundations. Even some well-built wooden structures and bridges heavily damaged and needing replacement. Water thrown on banks of canals, rivers, lakes, etc. Pipelines may be completely out of service.

Figure 14: Expected ground shaking from a Cascadia Subduction Zone earthquake with red as areas of highest shaking levels, which would result with the highest damage. (DOGAMI, Cascadia Winter 2012) (DOGAMI, 2012, http://www.oregongeology.com/pubs/cascadia/CascadiaWinter2012.pdf)

Potentially Unstable Soils

Near-surface soil deposits, those within the top 100 feet of the ground surface, can have a variety of ground responses when subjected to earthquake shaking. Soils with specific engineering properties, such as slow shear wave velocity, can increase or decrease the shaking levels depending on specific ground motion characteristics (e.g., frequency). The shear wave velocity of soil, which is related to the density of the soil, is the velocity at which specific seismic waves travel through the soil deposit. Some soils with slower shear wave velocity can also liquefy in a

process called liquefaction. (See Section 5) Soils with shear wave velocity of 1,200 feet per second (360 meters/second) or generally slower are typically found in valleys and near water bodies. (Wang et al, 1998) *Figure 15* is a statewide National Earthquake Hazard Reduction Program (NEHRP) soils map shows areas with potentially unstable soils with respect to earthquake shaking. Areas shown in red (Sf), orange (Se) and bold yellow (Sd) have the potential to amplify earthquake ground shaking. In addition, areas shown in red in western Oregon have the highest potential for liquefaction and lateral spreading. Areas shown in orange and dark bold yellow (often adjacent to areas in orange) in western Oregon have the potential for liquefaction. Eastern Oregon will not have significant liquefaction in a Cascadia earthquake because shaking will be much weaker there.

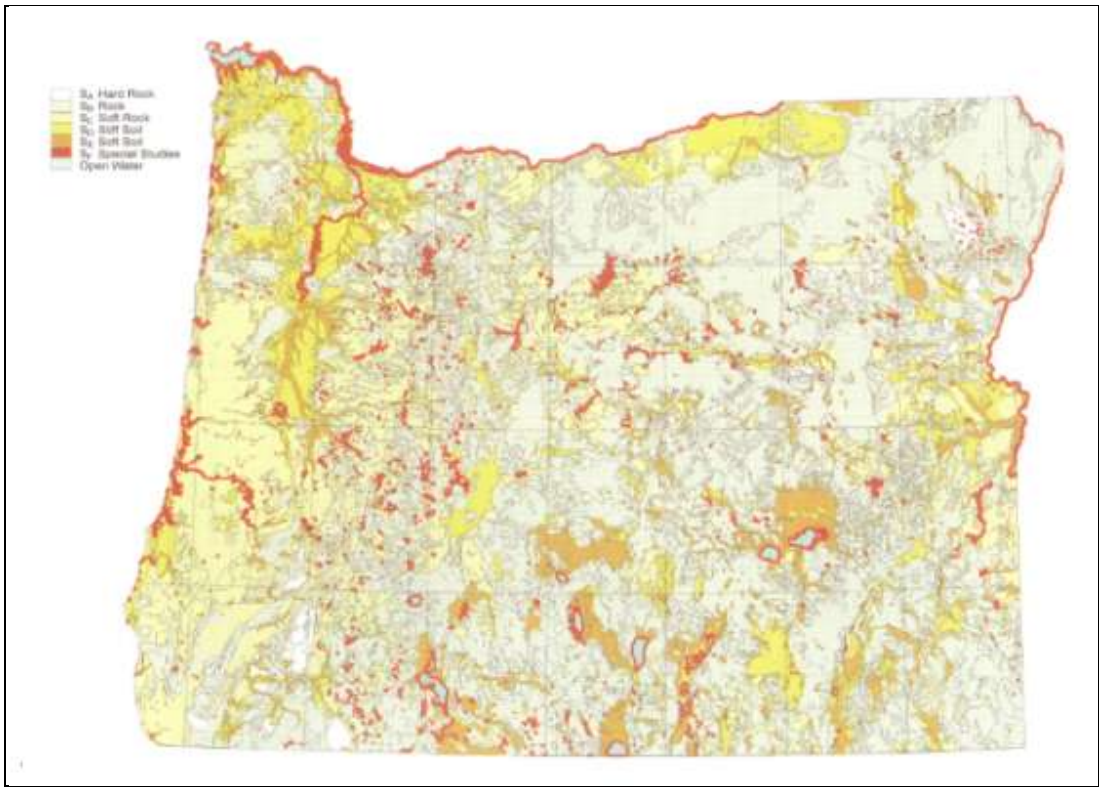

Figure 15: Statewide National Earthquake Hazard Reduction Program (NEHRP) soils map. Areas in red, orange and yellow have potentially unstable soils with respect to earthquake shaking. These areas can experience amplified ground shaking, liquefaction, and lateral spreading (Wang et al, 1998)

Figure 16 shows a portion of a relative earthquake hazard map of Portland area indicating areas with liquefaction, amplification of ground shaking, and landslide susceptibilities (Mabey et al, 1997). Areas in red and orange have a higher relative susceptibility to at least two of the hazards. In general, the areas by the rivers are susceptible to liquefaction and lateral spreading.

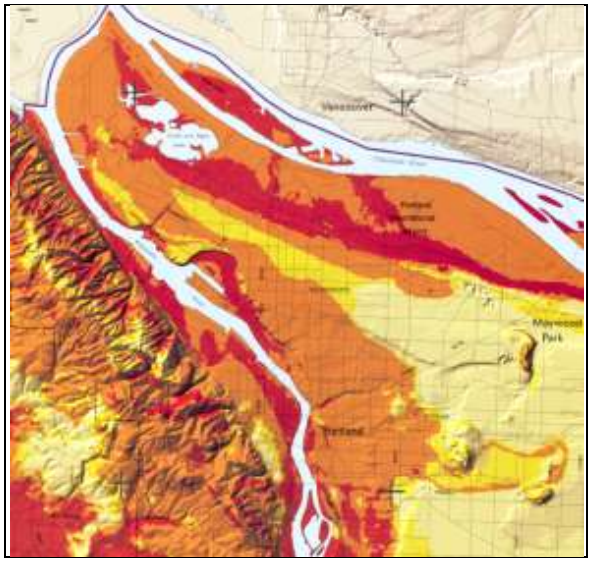

Figure 16: A portion of a relative earthquake hazard map of Portland area indicating areas with liquefaction, amplification, and landslide susceptibilities (in red, orange and yellow). (Mabey et al, 1997)

Liquefaction

Liquefaction can be triggered by earthquakes and occurs in loose, water-saturated, sandy soils and will result in liquefied soils with low strength (See *Figure 17*). Structures founded on or buried within liquefied soils can experience significant damage due to the reduction in soil strength. Buildings can sink several feet into the ground and buried pipes and tanks can float to the ground surface. (See *Figure 18*) The CEI Hub is adjacent to the Willamette River and has extensive deposits of highly liquefiable soils (See *Figures 19 and 20*, Mabey et al, 1996 and Mabey et al, 1993).. These soils (made of sand, silt, gravel and clay) have been naturally deposited by river activity or have been created from man-made activities, such as hydraulically placed material from river dredging (See *Figure 21*) or debris placed as landfill.

Figure 21: This photo was taken in the early 1900s and shows river dredging activity in the Guild's Lake area south and adjacent to the CEI Hub. Dredged material can be comprised of highly liquefiable soil. (Oregon Historical Society photo)

Lateral Spreading

Lateral spreading occurs when the ground permanently moves laterally due to earthquake shaking. (See *Figure 22*) Lateral spreading is common along river fronts because river deposited soils are often weak and water saturated, conditions that can increase susceptibility. Lateral spreading can occur on gentle slopes (e.g., less than 1 percent), on flat ground with a distant slope face, and by waterfront retaining structures. Lateral spreading often occurs in liquefied soils, but is not restricted to liquefied soils. The magnitude of lateral spreading can range from inches to several feet, and in extreme cases as in flow slides, hundreds of feet. Lateral spreading features include fissures and slumping. *Figures 23 and 24* are examples of lateral spreading from the 2010 magnitude 8.8 Chile earthquake.

The CEI Hub is adjacent to the Willamette River and has extensive deposits of soils highly susceptible to lateral spreads (*Figure 25*, Mabey et al, 1993). Due to the significant concerns about lateral spreading hazards in this area, DOGAMI performed dynamic analyses to model possible ground deformations. Results from a ground deformation analysis are located at the end of this section.

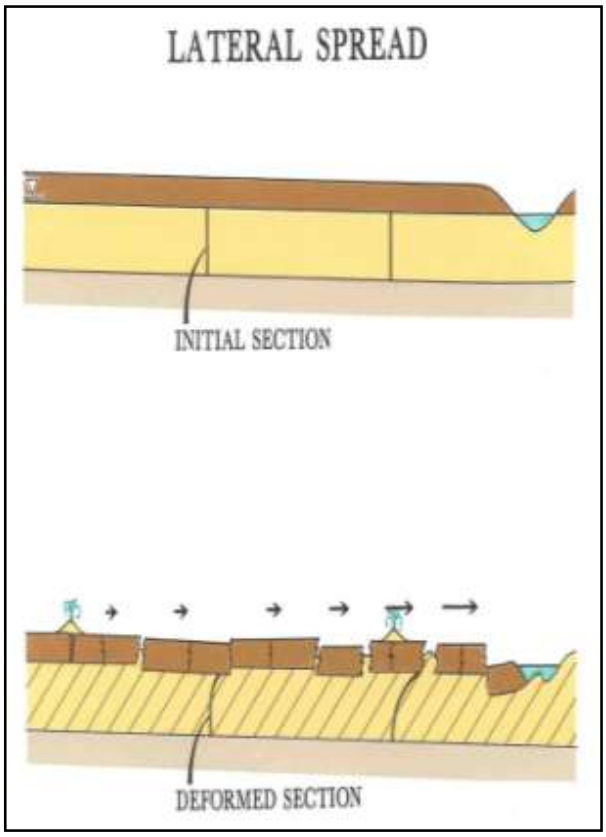

Figure 22: Lateral spreading process illustration (US Geological Survey)

Figure 24: Lateral spreading damage from the 2010 magnitude 8.8 Chile earthquake. (Technical Council on Lifeline Earthquake Engineering - TCLEE)

Co-Seismic Settlement

Co-seismic settlement is where the ground surface is permanently lowered due to seismic shaking and occurs in certain types of soft, loose soils, such as liquefied soils. The CEI Hub area has soils that are generally susceptible to co-seismic settlement, in some places, on the order of a few inches or more. When soils experience uniform settlement, structures are often unharmed. However, when soils experience differential settlement, structures can incur damage. For example, rigid pipe fittings often break when the surrounding ground shifts.

Bearing Capacity Failures

Bearing capacity failures can occur during shaking when the foundation soil cannot support the structure it is intended to support. This occurs when the sub-grade soils have not been engineered and constructed adequately. The CEI Hub area has soils that are generally susceptible to co-seismic bearing capacity failures, including from liquefied soils. When soils experience differential settlement, structures can tilt and incur damage. For example, tanks can tilt and internal floating roof apparatus can become inoperable.

Landslides

Landslides are land masses that move down slope and result in permanent ground deformation. Many types of landslides exist, including fast moving and slow moving types and can occur on steep ground to even level ground. Earthquakes can trigger thousands of landslides due to the ground shaking over a wide region and can cause extensive damage. The CEI Hub area has several mapped landslides including debris flows from the West Hills and rock falls and slumps along US Highway 30. These mapped landslides are likely from past rainfall events and not by past earthquake activity.

Seiches

Seiches are waves that oscillate in water bodies and can be initiated by ground shaking. Seiches can vary from minor (e.g., centimeters in height) to over 10 feet and last up to hours. Theoretically, the Willamette River in the CEI Hub area can experience a seismically-induced seiche.

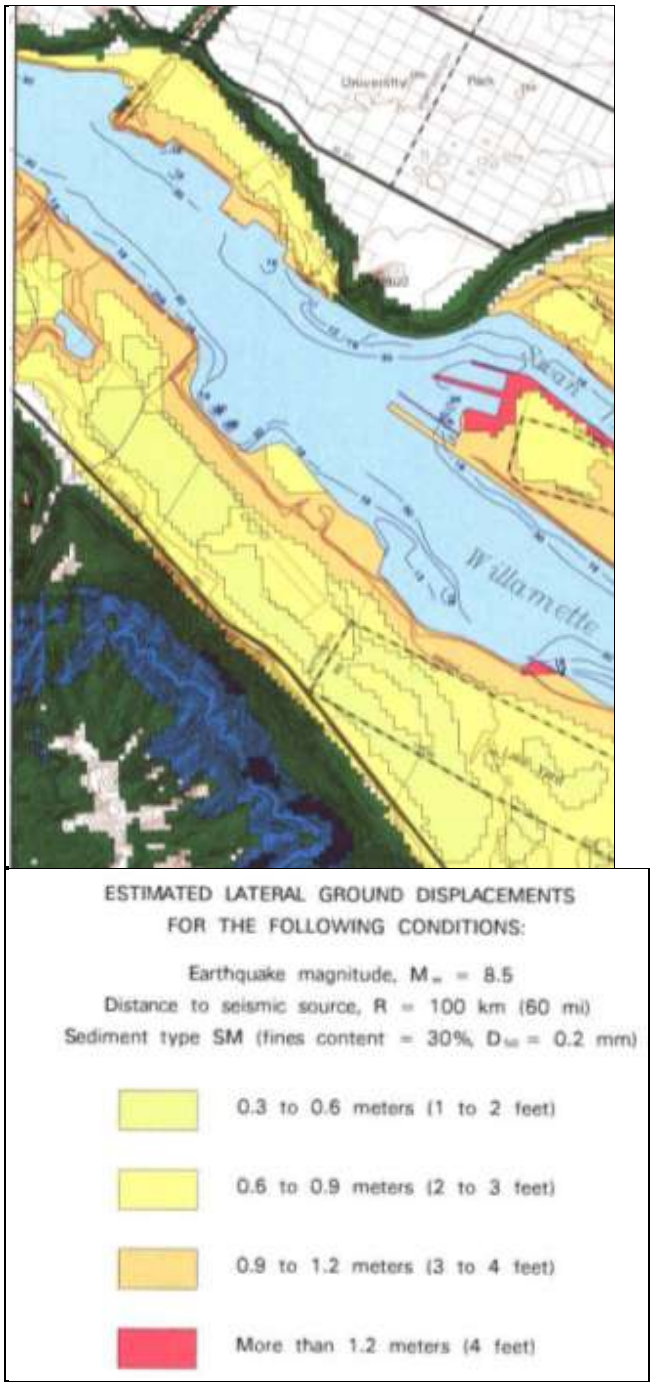

Figure 25: Lateral spreading susceptibility map of southern portion of CEI Hub (Mabey et al, 1993)

Figure 26: Welded steel water tank damaged in 1992 Landers, California earthquake. (Photo - Curt Edwards, Technical Council on Lifeline Earthquake Engineering - TCLEE)

Fires

Fires are often triggered as secondary effects from earthquakes. Numerous potential ignition sources are available in the CEI Hub area. Certain types of fires, such as fires with predominately petroleum fuel or transformer PCBs, require advanced fire specialists to contain. Water storage tanks may be damaged and the water supply system may be inoperable. (*Figure 26*)

Hazardous Material Releases

Hazardous materials are often released during earthquakes. Numerous potential sources for possible uncontrolled hazardous material releases exist in the proximity of the CEI Hub, both at and nearby the energy facilities. These materials can pose different types of hazards, such as being corrosive, explosive, combustible, poisonous, and/or toxic. A few examples are: petrochemicals, liquefied natural gas (LNG), chlorine gas, and anhydrous ammonia. Sloshing of hazardous materials in tanks can occur in earthquakes. Sloshing occurs when liquid becomes agitated by ground shaking. The CEI Hub has numerous tanks with liquid fuel and other products that are susceptible to sloshing. Waves and splashing of liquids can overtop tanks and/or damage tanks. (*Figure 27*)

Figure 27: Sloshing of crude oil during the 2010 Chile earthquake. Note the black oil stains on the outside of the fuel tank. (Wang photo)

Ground Deformation Analyses in the CEI Hub

The susceptibility for liquefaction and lateral spreading in the CEI Hub area has been evaluated in a number of past studies, including the development of liquefaction and lateral spreading susceptibility maps by DOGAMI (Mabey et al, 1993, Mabey et al, 1996). Studies have indicated a high potential for both. Liquefaction and lateral spreading can cause structures to move horizontally and vertically. The amount of potential horizontal movement of the land, termed lateral spreading, and the amount of potential vertical movement, or settlement, can be analyzed. The analyses can be performed on a site-specific basis using sub-surface data from the site or can be conducted using assumed parameters that represent the CEI Hub. Liquefaction and lateral spreading could cause significant damage to local facilities and the potential impact from the damage to certain facilities could be high.

DOGAMI reviewed selected site-specific work conducted by Bonneville Power Administration (BPA). Due to the engineering results from the BPA study indicating that the Willamette River bank soils can move towards the river by 10 to 25 feet in a Cascadia earthquake, DOGAMI contacted and collaborated with Dr. Steven Bartlett from the University of Utah (co-author) for a sensitivity study on lateral spreading to be conducted as part of this project. The sensitivity study incorporated soil properties obtained from the BPA study, and a variety of generic riverbank conditions that approximate the slopes at marine oil terminals in the CEI Hub. The ground deformation analysis is both summarized below and included in Appendix B.

BPA Study

Bonneville Power Administration (BPA) evaluated the liquefaction, liquefaction-induced settlement and lateral spreading potential of selected transmission tower and substation sites in the greater Portland area. The 2008 report, titled "*Liquefaction Assessment, Bonneville Power Administration Facilities, Portland Metropolitan Region*," includes the work conducted from

their investigation, provides summary information and includes subsurface data and analyses (BPA, 2008). A portion of their work and findings is summarized herein for two BPA sites. Although the BPA findings are site-specific for their facilities, their findings are generally consistent with findings from previous studies in the CEI Hub. Depending on the soils (underlying geology units and fill materials) and ground water conditions, the liquefaction susceptibility at other sites in the CEI Hub can be higher or lower than found at these BPA sites.

The 2008 BPA work included 11 cone penetration tests (CPT) and Lidar (light detection and ranging) technology which was used in their engineering analyses for liquefaction, liquefaction-induced settlement, and lateral spreading. For all of their sites, they used a ground motion input value of 0.2 g to evaluate for liquefaction.

One of the BPA study sites is the river crossing in the north end of the CEI Hub (*Figure 28*). The study group completed a CPT at the tower site that indicated soft to stiff clay and medium dense sand to silty sand to the maximum depth of exploration at 80 feet; the medium dense sand to silty sand occurs at depths of 7 to 31 feet and 44 to 66 feet, with the remainder of the profile being soft to stiff clay. The study said the depth to the groundwater at the site is expected to range from approximately 17 to 21 feet below the ground surface (BPA, 2008).

The tower site soils were interpreted to be susceptible to liquefaction. Their estimates indicated settlement from liquefaction will be around 12 inches. The results from the analyses of potential lateral spreading indicate that there could be 10 to 25 feet of lateral spreading of the surficial soils towards the Willamette River, depending on the magnitude and duration of strong ground shaking. These large displacements imply that there could be a flow of the liquefied material into the river channel that could result in even larger lateral spreading at the tower site. The potential for lateral spreading was analyzed using the methodology of Youd et al, (2002) (BPA, 2008).

The BPA study also evaluated a nearby substation (*Figure 28; see red pin on the map on right*) located in the Rivergate area between the Willamette and Columbia Rivers about one mile east of the Willamette River transmission crossing. The substation is located on nearly flat ground at an approximate elevation 46 feet. According to the study, the site appears to be fill soils situated on a cut-fill pad along the side of a low sloping hill above the abandoned, partially in-filled slough, which lies at an elevation of about 22 feet. The study indicates that the depth to ground water is approximately 30 feet below the ground surface. The site soils were interpreted to be susceptible to liquefaction at depths of more than about 30 feet. The study stated that the settlement from liquefaction will be around 0 to 2 inches. The results from the analyses of potential lateral spreading indicate that there could be up to 1 foot of lateral spreading of the surficial soils towards the slough to the north. (BPA, 2008)

Figure 28: Two towers in the CEI Hub are owned by BPA (center and right in photo on left, yellow pin in NW corner of map on right) and were analyzed in a BPA study conducted in 2008 to have the potential to move 25 feet towards the river during a magnitude 9 Cascadia earthquake. (The tower in the foreground - left–hand side of photo - is owned by an investor-owned utility.) (DOGAMI photo) (map: Google Earth)

Lateral Spreading Sensitivity Study

A number of geotechnical engineers have performed lateral spreading analyses to evaluate the potential for permanent ground deformation (PGD) for a variety of facilities in the CEI Hub. Many of these studies used a state-of-practice method developed by Youd, Hansen, and Bartlett in 2002 (Youd et al., 2002). This method provides mean (i.e., average) estimates of lateral spread PGD for cases where lateral spread is fully developed and not greatly affected by boundary conditions or lack of continuity in the liquefied zone for earthquakes with moment magnitudes, M_w, between 6 and 8 and ground slopes between 0.1 to 5.0 percent. Youd et al., (2002) have shown that the actual displacement may vary by a factor of 2 (plus or minus) of the mean estimate. In addition, this empirical method may under estimate the amount of PGD for cases where lateral spread is not fully developed due to changes in the subsurface conditions or lack of continuity in the liquefied zone. Further, its application to magnitude 9.0 subduction zone earthquakes has not been verified. Lastly, another limitation of the empirical approach of Youd et al. (2002) is its inability to estimate the effects that ground improvement may have on reducing PGD displacement. To answer this question, mechanistic or numerical modeling methods are required.

To help determine the potential range of PGD in the riverbank soils in the CEI Hub, and better understand the potential to mitigate future ground deformation, we conducted a numerical modeling study. This model is a generic sensitivity study where we vary the earthquake shaking characteristics and site parameters. This specialty study is technical in nature and is summarized

herein. Additional information on the input parameters, evaluation and results are presented in Appendix B.

The purpose of this sensitivity study was to determine a likely range of PGD in soils with slope conditions found along the lower Willamette River banks. Structures in areas with significant PGD are likely to incur damage. Depending on the specific structure, the amount of horizontal and vertical movement will affect the severity of the damage. This generic study does not represent any particular site in the CEI Hub. There likely exists sites more vulnerable to PGD in the CEI Hub that have a combination of soils with a higher susceptibility to liquefaction, steeper slopes and higher ground water conditions. For specific locales, site-specific evaluations are needed.

We selected representative acceleration time histories for M_w9.0 and M_w8.0 earthquakes and adjusted these time histories for use in the numerical model. The selected software was a nonlinear time domain analysis called FLAC (Fast Lagrangian Analysis of Continua) (Itasca, 2005). In-situ soil data from the BPA Rivergate South - Willamette River Towers site was used to develop the soil properties for the analyses in conjunction with other generic local data (BPA, 2008; CH2MHill, 2006).

The predicted results from the numerical modeling were also compared and calibrated with the lateral displacements results predicted by the Youd et al. (2002) regression model prior to completing the final runs. After numerous trial runs, we narrowed the earthquake motions input to six subduction zone earthquake time histories for the final computer runs. The estimation of horizontal displacement from liquefaction-induced lateral spread was performed for cases with and without ground improvement.

The modeling results indicate that the amount of PGD varies significantly with the ten different earthquake ground motion inputs and with varying slope conditions of 0.5, 1, 2, and 5 percent. The results from our sensitivity analysis, which models a fixed zone of liquefaction and ground water table at 5 m below the ground surface, are more sensitive to the input ground motions than the slopes. The PGD results range from negligible to extreme. Maximum PGD (on 5% slopes) for most input motions ranged from 0.2 m (8 inches) to 2.6 m (8.5 ft). One ground motion (1msoil, M_w9.0 earthquake) produced an extreme PGD result; the predicted displacements of the untreated soils range from 0.4 meters (1 foot) on a 0.5 percent slope to 17 meters (56 feet) on a 5 percent slope. Summary results of the lateral spread deformation analyses and the average displacement derived from the Youd et. al (2002) relations for both M_w8 and 9 earthquakes are presented in Appendix B for comparative purposes.

Although the results indicate that the soils are likely to move down slope towards the river, it is possible to mitigate the potential movement by strengthening the soil. Based on this deformation analyses, we estimated the amount of ground treatment required to mitigate the lateral spreading for two representative cases. According to our analyses, the required ground improvement to control deformation from lateral spreading could be achieved by increasing the composite undrained shear strength of the soil to about 1,000 psf using a soil mixing or other cementitious injection technologies. For soil densification technologies, the target improvement to achieve minimal lateral spread displacement is to densify the soil to a standard penetration test (SPT)

N_{160} blow count of 15, or greater, in the liquefiable zone. Nonetheless for actual sites, site-specific engineering studies would be required.

In summary, the evaluations in Appendix B verified that the soil in the CEI Hub could be vulnerable to damaging lateral spreading displacement during a Cascadia earthquake on a ground slope as low as 0.5 percent. In addition, for critical structures that cannot tolerate PGD, vulnerable soil conditions can be mitigated against lateral spreading using ground improvement. This is valuable information as we consider the many critical energy facilities located in the area.

Section 5
Energy Facilities and Vulnerabilities in the CEI Hub

Portland's critical energy infrastructure, including high voltage electricity transmission, fuel pipelines, tank farms, ports and facilities, is concentrated along the Willamette River in the critical energy infrastructure (CEI) Hub. Much of the existing infrastructure was constructed prior to current seismic safety specifications and many of the petroleum storage tanks, piers, marine docks and buildings may not be adequately hardened. This area consists primarily of man-made filled land overlying river sediments and is vulnerable to liquefaction and lateral spreading. The concentration of facilities and hazardous materials in this area has the potential to produce damaging cascading effects including fires from ruptured natural gas and fuel lines, hazardous material releases and debris blockage of the Willamette River.

There are a variety of structures at the oil terminals, natural gas facilities, and electrical substations, as well as transmission pipes for liquid fuel and natural gas, and transmission towers and lines for electricity. Most of the facilities include control buildings with control equipment, some with emergency generators and/or batteries. The fuel terminals often include: transmission and distribution pipelines, piers or wharves, tank farms, pipe and loading racks, pumps, electric distribution equipment, and many other components. The liquid fuel transmission system includes gate stations, and transmission and distribution pipes, including at the Columbia and Willamette river crossings. *Figure 29* shows infrastructure, including liquid fuel pipelines (dashed yellow), natural gas pipelines (yellow) and electrical transmission lines (pink) on potentially vulnerable soils in the CEI Hub. In addition to the major energy lines co-located in this area, water, waste-water, rail and a highway are located here. *Figure 29* is a close up of a larger map, which shows that the natural gas system has a loop configuration around the greater Portland area. Similarly, it shows that the electrical system includes a loop around the greater Portland area. The larger mapped can be accessed at:
http://pubs.usgs.gov/sim/3027/sim3027_front.pdf

Figure 29: Lifelines in the CEI Hub area, including liquid fuel and natural gas pipelines, and transmission lines. This is a close-up of a greater Portland area map showing co-located critical lifelines on various soil types. (modified from Barnett et al, 2009)
http://pubs.usgs.gov/sim/3027/sim3027_front.pdf

The electrical facilities include electric substations that feed into the region's power grid. Substations include control buildings with control equipment and back-up batteries, transformers, circuit breakers, and bus structures. The power system also includes transmission lines and transmission towers. The natural gas system includes gate stations, transmission and distribution pipes, and a liquefied natural gas (LNG) terminal, which includes tanks, liquefication and gasification processing equipment, and control equipment.

DOGAMI conducted evaluations of the facilities with varying levels of detail ranging from review of available engineering reports to conducting visual screening-level assessments. DOGAMI was assisted by professional specialists for much of the work (see acknowledgements). For example, DOGAMI worked with the local U.S. Coast Guard (USCG) and engineers from California's program called Marine Oil Terminal Engineering and Maintenance Standards (MOTEMS) to perform some of the visual screening level assessments of the piers and wharves in the CEI Hub. William R. Clark, USCG Port Security Specialist was DOGAMI's key point of contact. Martin Eskijian, MOTEMS Engineering Branch Supervisor (retired in 2011), Kendra Oliver, Senior Engineer, Petroleum Structures, and several other staff, provided technical expertise, which is described in Oil Terminal Facilities.

This section reviews the facilities included in the study. It also includes a discussion on building codes. Building codes regulate the seismic design criteria, which in turn, controls seismic vulnerability. This section also includes a more detailed discussion on waterfront dock structures, land-based structures, seismic pipeline vulnerability and co-located facilities in the CEI Hub.

CEI Hub Facilities: Liquid Fuel, Natural Gas and Electricity

All of the facilities in the CEI Hub are exposed to a variety of seismic hazards. The energy sector facilities in the CEI Hub include:

- All of Oregon's major liquid fuel port terminals
- Liquid fuel transmission pipelines and a transfer station
- Natural gas transmission pipelines and a transfer station
- Liquefied natural gas facility
- High voltage electric substation and transmission lines
- Electrical distribution substations

The EAP partners visited all relevant energy companies with facilities in the CEI Hub. DOGAMI and ODOE jointly conducted site visits with the terminal managers at these petroleum facilities: BP, Chevron, ConocoPhillips, KinderMorgan (KM) fuel terminals and KM pipeline, McCall Oil, Nustar, and Shell. MOTEMS senior engineer, Kendra Oliver, participated in the visits to BP, Chevron, McCall and Shell. The fuel facilities often include: transmission and distribution pipelines, piers or wharves, tank farms, loading racks, control buildings, electric distribution equipment, and many other components. The liquid fuel transmission system includes gate stations, and transmission and distribution pipes at the Columbia and Willamette river crossings. It is important to note that more than 90 percent of liquid fuels consumed in Oregon pass through the CEI Hub, as does a significant portion of NW Natural's natural gas. Thus, this area is critically important to Oregon residents, businesses and industrial firms.

Figure 30 show some of the facilities in the CEI Hub which are located near the Willamette River on soils that have been mapped as artificial fill or modified ground (Madin et al, 2008) and which are potentially unstable. Loose fills, such as those placed without compaction, are very likely to be susceptible to liquefaction (Kramer, 1996). (*Figure 31*)

Figure 30: Fuel tank farms and marine terminals along the Willamette River's edge near US Highway 30. For geographic reference to Figures 29 and 31, note the three parallel water inlets. (Basemap: Google Earth)

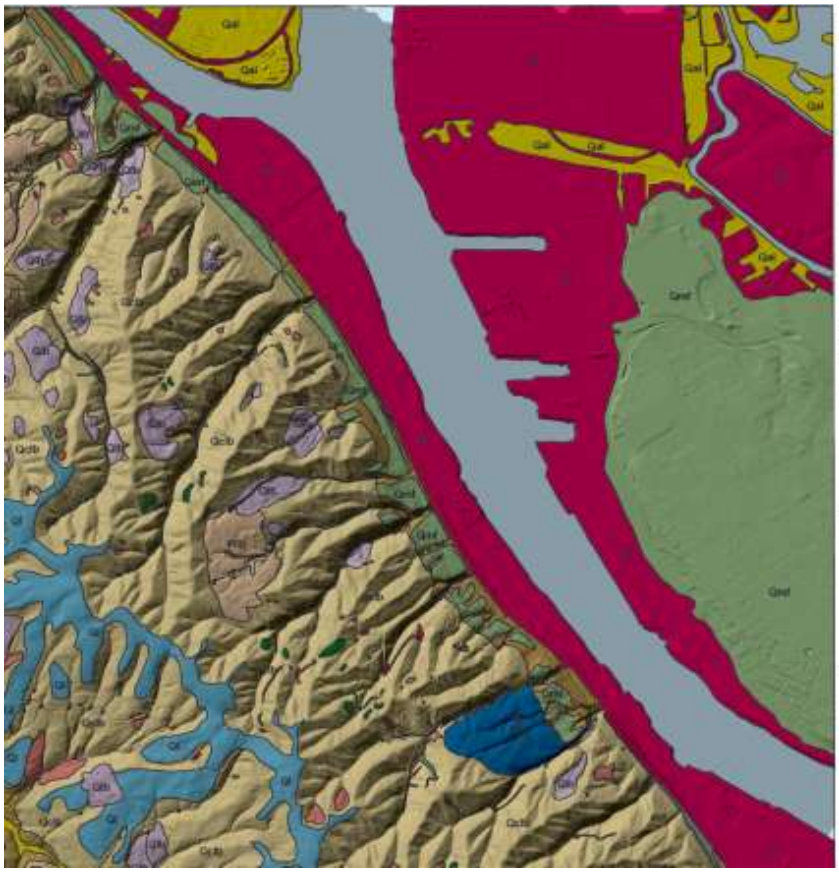

Figure 31: Surface geology map showing areas of fill materials (in pink) adjacent to the river. For geographic reference to Figures 29 and 30, note the three parallel water inlets. (Madin et al, 2008)

DOGAMI and OPUC conducted site visits with utility operators at Bonneville Power Administration, NW Natural, Portland General Electric (PGE), and Williams Northwest Pipeline electrical and natural gas facilities. (No PacifiCorp facilities are located in the CEI Hub.) BPA principal structural engineer, Leon Kempner Jr., provided technical expertise at all of BPA's electrical facilities. The electrical facilities include electric substations that feed into the region's power grid. Substations include control buildings with control equipment and back-up batteries, transformers, circuit breakers, and bus structures. The power system also includes transmission lines and transmission towers. The natural gas system includes gate stations, transmission and distribution pipes, and an LNG terminal, which includes tanks, liquefication and gasification processing equipment, and control equipment.

We also conducted selected site visits to important energy facilities located just outside of the CEI Hub. These included:

- Two large electrical substations on Front Street (*Figure 32*)
- A natural gas gate station on Sauvie Island

- Two Columbia County electric power plants that use natural gas (Port Westward and Beavers) are located next to the Columbia River. Both plants were developed on land susceptible to liquefaction triggered by a Cascadia earthquake; the soil at the newer plant was mitigated before construction.
- A liquid fuel terminal in Eugene that is dependent on the CEI Hub for its fuel and serves as an important distribution facility for Southern Oregon

Figure 32: Two large electric substations just south of the CEI Hub on Front Street that are separated by a railroad track (Basemap: Google Earth)

Some infrastructure in the CEI Hub facilities was built 100 years ago, to very antiquated standards while other infrastructure is new and built to the current state-of-practice standards. Because of the wide range of ages and associated construction practices, the seismic vulnerability of the facilities also spans a wide range. Based on visual observations, engineering judgment and limited information from the facility operators, major seismic vulnerabilities exist in the CEI Hub. Some critically important structures appear to be highly susceptible to significant damage in a major earthquake. In contrast, some structures are expected to have adequate seismic performance, including the new structures because of improved seismic design practices. Some existing structures have been strengthened or upgraded, such as evidenced by the newer dolphin structures used for mooring ships by older piers. No estimate has been made on the percentage of newer or upgraded structures.

Energy companies have operational interdependencies with the transportation and telecommunication sectors. To address seismic resilience for critical energy infrastructure operations and interdependencies, DOGAMI:

- Worked with the Oregon Department of Transportation (ODOT) to prioritize key bridges and highways in the CEI Hub for potential future upgrades to withstand Cascadia earthquake impacts. Highway 30 is essential for vehicular access to many of the CEI Hub energy facilities. Bridges are critical to supporting fuel deliveries from the CEI Hub to other parts of Oregon. In June 2012, ODOT issued its Oregon Seismic Lifeline Route Study, which includes Highway 30 and the I-405 bridge as tier 1 lifeline routes (See *Figure 33*). Co-author Wang was a steering committee member on the project. http://www.oregon.gov/ODOT/TD/TP/Reports/Lifeline%20Selection%20Summary%20Report.pdf
- Worked with ODOE and ODOT to ensure reliable alternate routes are identified and maintained to support distribution should the primary bridges for fuel deliveries become impassable. This included co-author Wang and Tova Peltz (ODOT geotechnical engineer) inspecting the Columbia River waterway in an air reconnaissance, as well as discussions with William Clark (USCG), and bridge engineers Albert Nako (ODOT) and David O'Longaigh (City of Portland Bureau of Transportation).
- Worked with OPUC and the investor-owned telecommunication providers in Oregon that the PUC regulates to promote reliable communications to energy companies located in the CEI Hub. This includes working with telecommunications providers to: 1) identify and resolve vulnerabilities to the system prior to an emergency, and 2) ensuring the rapid recovery of downed communication systems in the CEI Hub in the aftermath of an emergency. OPUC and DOGAMI have suggested to member of the telecommunication industry that they conduct seismic vulnerability assessments of their systems, including at Oregon Utility Safety Committee, OPUC's Energy Emergency Management Team and at invited talks, such as to the Oregon Telecommunications Association.

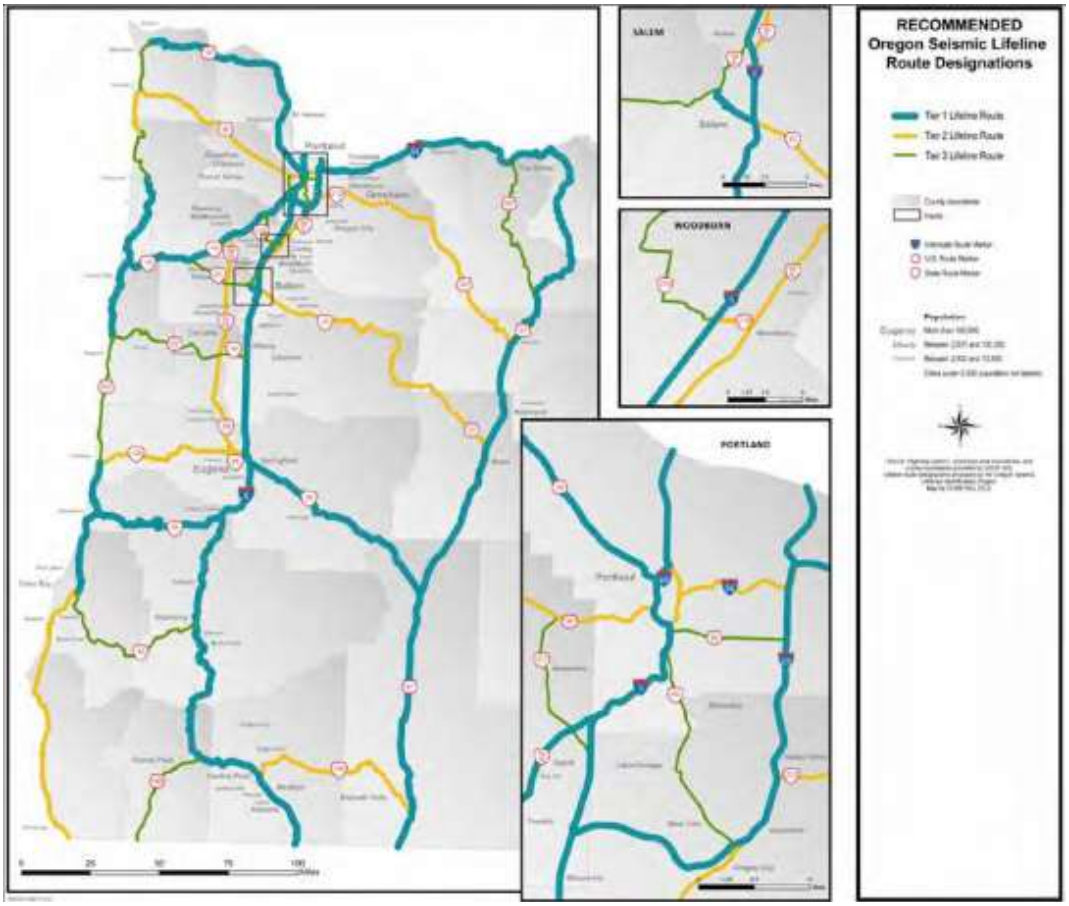

Figure 33 Map from the 2012 ODOT Oregon Seismic Lifeline Route Study, which includes Highway 30 and the I-405 bridge as tier 1 lifeline routes (Source: ODOT, 2012)

Oregon Building Code Influences in the CEI Hub

For the area of the CEI Hub, the City of Portland has responsibilities to enforce the requirements set forth by the building code. Building codes set forth minimum standards on new construction. Building codes are frequently upgraded to reflect new design knowledge including seismic hazards. These codes play a vital role in the seismic robustness of structures. If the code requires a high level of seismic design, then the new structure is designed and built to resist seismic forces. For existing structures, there are few, if any, regulations that require them to be upgraded to meet today's knowledge on seismic hazards. If past codes call for seismic design levels that are significantly lower than the levels in the current code, then those structures may have been designed with serious seismic deficiencies. DOGAMI reviewed the building code environment for facilities in the CEI Hub.

The history of Oregon's building codes is important because the structures in the CEI Hub have been built over the last century and the building codes can have a major influence on the seismic vulnerability of the exposed facilities. For buildings and certain other structures, the seismic design level is typically regulated by the building code. A history of Oregon's seismic building code is available at: http://www.cbs.state.or.us/external/bcd/programs/structural/Seismic_Codes-Oregon_History_020712.pdf (Oregon Building Codes Division, 2012).

Both Oregon and Portland have a complex building code history. The State of Oregon adopted its first building code in 1974. Building codes apply to new buildings, and not retroactively applied to existing buildings except under special conditions. Building codes that account for our basic understanding of the Cascadia fault and modern seismic loading conditions were not adopted until 1993.

Figure 34 illustrates the trend of increasing seismic load requirements in the past half-century. As a technical example, it specifically shows the increase to the seismic base shear for a low-rise shear wall building located in Portland, Oregon for an Occupancy Category III structure. Occupancy Category III as defined on Table 1-1 of the ASCE 7-05 publication includes certain facilities that handle hazardous fuels. Base shear is an important seismic loading parameter on structures. Note that the figure shows the required base shear value drops in 2004. This is because the 2004 Oregon Structural Specialty Code, which adopted the 2003 International Building Code, integrates new knowledge about seismic performance that previously used a more conservative approach. A shear wall building is a building that relies on certain walls designed to resist forces generated by an earthquake that are applied to the building. Ductility relates to the building's ability to be reshaped without breaking. The current construction requirements for "specialty" structures, such as piers, tanks, and loading racks are also contained within the current building code, which is the Oregon Structural Specialty Code (OSSC) adopted by the Oregon Building Code Division and local building departments, such as in the City of Portland.

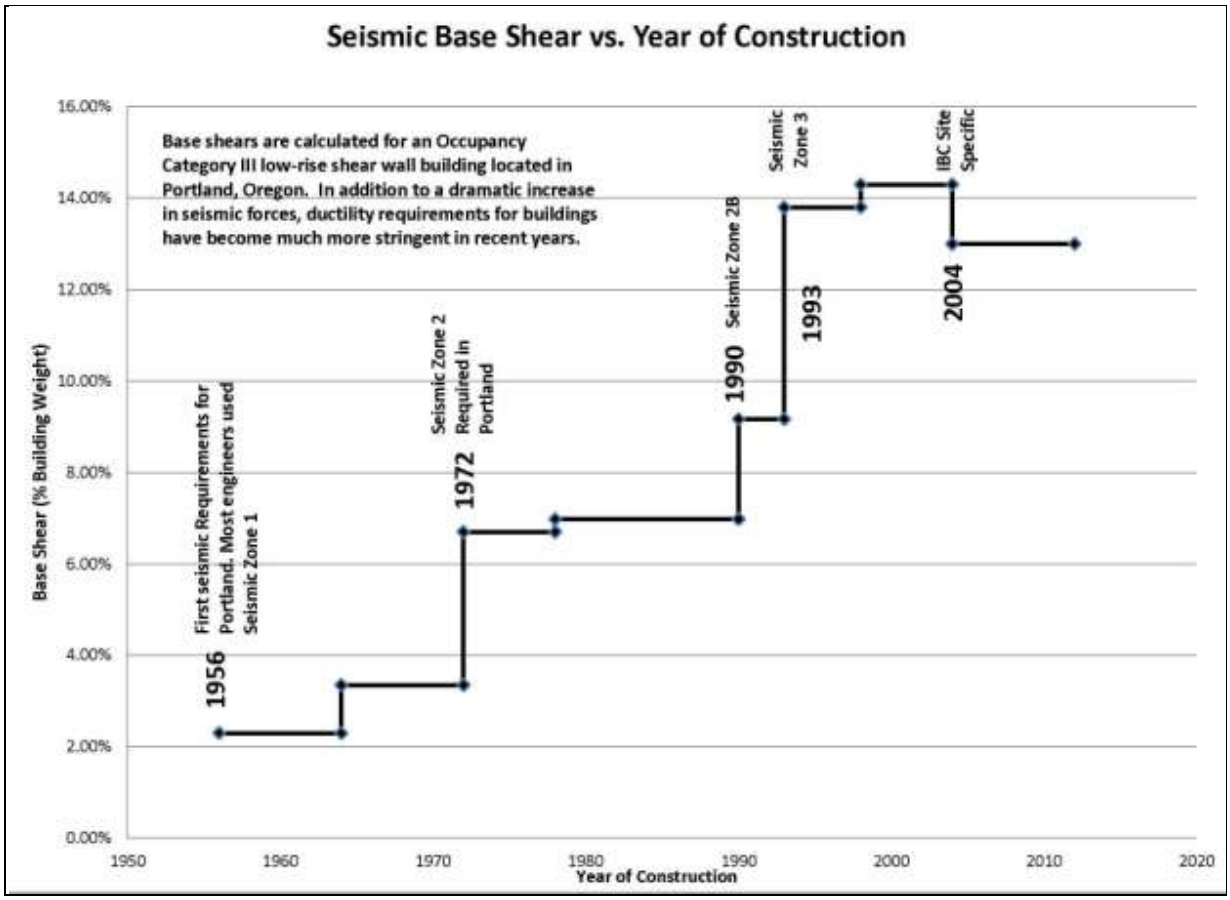

Figure 34: Seismic load requirements have increased over the decades to reflect the increasing understanding of Oregon's earthquake setting. For seismic design, 1993 was a landmark year. (Credit: KPFF consulting engineers)

Based on discussions with Jason Butler-Brown in the City of Portland Development Services department, facilities in the CEI Hub are required to obtain permits for new construction and conform with current building codes. Newly constructed structures are expected to have satisfactory performance in a design-level earthquake, that is, while they may sustain substantial structural damage, they should not collapse. It is possible for a structure to not be usable and still perform in a satisfactory manner that is in accordance with the building code. The level of compliance with past practices was not researched. In recent years, new building codes have been adopted as frequently as every three years. More recent building codes have progressively incorporated seismic design provisions. As an example, in October of 2010, the State adopted the 2010 Oregon Structural Specialty Code (OSSC), which refers to the 2009 International Building Code (IBC).

The first time geotechnical engineering reports were required to evaluate liquefaction potential and soil strength loss was in the 1996 OSSC which was based on the 1994 Uniform Building Code (UBC). At that time, it was widely accepted that silty soils were not prone to liquefaction. By approximately 2004, silty soils became widely recognized as being susceptible to liquefaction (Seed et al, 2003). As a result, the City of Portland began requesting that geotechnical

engineering reports evaluate the liquefaction susceptibility of silty soils (pers. comm. with Jason Butler-Brown, city of Portland geotechnical engineer on January 13, 2010). Therefore, structures constructed over soft silty soils that were granted permits by the City of Portland prior to 2004, such as those near the Willamette River, may have liquefaction vulnerabilities.

Although new buildings in the CEI Hub have been regulated by the City of Portland using the OSSC for decades, DOGAMI discovered that older building codes and practices did not adequately address many non-building structures that exist in the CEI Hub, such as tanks, pipes, and piers. This is based on discussions with state, city, and private sector engineers including Steve Judson (Oregon Building Codes Division), Jason Butler-Brown (City of Portland) and Kent Yu (Degenkolb Engineers and Oregon Seismic Safety Policy Advisory Commission). One explanation is because non-building structures typically hold few, if any, people and the focus of the building code has traditionally been on life safety.

In the early 2000s, non-building structures gained more attention in American Society of Civil Engineers (ASCE) 7, an engineering design document referenced by the OSSC and used by engineers. The 2004 OSSC referenced the 2003 International Building Code (IBC) and ASCE 7. For the first time the building code, through ASCE 7, specified more directly the design basis for a variety of non-building structures, including piers and wharves. Furthermore, it specified that the design shall account for the effects of liquefaction along with other marine based-loading criteria. In 2005, the ASCE 7-05 was published. It is considered to be a landmark design document because it specifies the loading criteria, including seismic design for a multitude of structures and structure types. By 2007, with the adoption of the 2007 OSSC and OSSC's reference to ASCE 7-05, ASCE 7-05 has gained significantly more influence among engineers designing non-building structures as a building standard. Design methods other than those in ASCE 7-05 are allowed by building officials.

Oil Terminal Facilities

The state EAP partners, which consists of ODOE, OPUC and DOGAMI, worked with the US Coast Guard (USCG) on the USCG's routine inspection of the petroleum terminals' port facilities, reviewed California's MOTEMS and conducted site visits with USCG personnel and MOTEMS engineers to better understand the seismic condition of the port structures, primarily the piers and the wharves for transporting liquid fuels.

Port Structures

Beginning in July 2009, EAP partners and USCG leadership and staff developed a working relationship to share information on the earthquake hazards to the port facilities in the CEI Hub that USCG regulates for port security. These include: BP, ConocoPhillips, Chevron, KinderMorgan, McCall Oil, and Nustar Energy. EAP partners arranged boat tours of ports for energy facilities, hosted earthquake table-top scenarios, and organized a meeting with Western Energy Institute and the USCG. The Western Energy Institute is a non-profit organization of energy sector businesses. They help develop memorandum of understandings (MOUs) between petroleum companies that deal with, for example, emergency situations. These MOUs could be helpful to the USCG in fulfilling their responsibilities on port security. In response to concerns raised at the Western Energy Institute meetings, the EAP partners alerted transportation officials about the need to have reliable transportation routes open during a major earthquake disaster.

EAP information was shared with transportation officials at the Oregon Department of Transportation (ODOT) at the Oregon Seismic Safety Policy Advisory Commission, the ODOT bridge section, and at a House Transportation committee legislative hearing held on May 24, 2010.

In December 2009, USCG Port Security Specialist William R. Clark arranged for ODOE and DOGAMI to meet with the USCG Facility Inspections Branch in their Portland office. The goal of the meeting was to determine whether USCG requests any information on the seismic condition of existing facilities and how they would address seismic disasters. At that meeting, it was determined that the USCG inspections did not include seismic information but would be willing to request information by selected port owners to assist the EAP partners. As a result of the meeting, DOGAMI developed two questions for the USCG to request seismic information on port facilities owned by the petroleum companies. The questions listed below were submitted to representatives at these six companies: BP, ConocoPhillips, Chevron, KinderMorgan, McCall Oil, and Nustar Energy.

In March 2010, the USCG provided the ODOE and DOGAMI with the responses from three of the six facilities, which include BP, Chevron, and ConocoPhillips. Terminal managers provided their responses via email, in part written by their engineers They range in detail and completeness and are provided below. No engineering reports were requested nor provided. For this report, very slight modifications to the responses have been made to help with clarity, such as renumbering the answers and correcting misspellings. Also, the names are each facilities have been removed and replaced with "*unnamed*". This action is consistent with the goals of the study, when possible, to respect the privacy of privately-owned energy sector operators when obtaining seismic vulnerability data. In late 2010, the USCG informed ODOE and DOGAMI that they never received responses from Kinder Morgan, Nustar or McCall Oil. Shell's port is not in operation and they were not included in the USCG request for information.

Question 1. What is the original construction date of the docks and waterfront structures (e.g., quay wall, anchored bulkhead, sheet-pile wall)? What level(s) of seismic design was used?

> Response 1. The *unnamed* Portland Terminal Dock was totally re-constructed in 1960 (approx). It should have been designed for seismic forces prescribed in the Uniform Building Code (UBC) at that time. Early (crude) provisions for seismic design were required in the UBC way back in the 1930's.
>
> A dock structural evaluation was completed in 2005. Part of its findings:
>
> Earthquake Load Analysis: A seismic analysis was performed on the existing structure, with the worst load condition being lateral earthquake forces perpendicular to the dock. These lateral forces are resisted by the batter piling at the wide bents (lines 23-58), and by bracing at the narrow bents (lines 1-22), except that the narrow bents at lines 17,18,19 have batter piles also. The methods outlined in IBC 2003 were used for seismic analysis, and this obviously results in higher lateral loads than what the dock was originally designed for. Our calculations indicate that the wide bents (lines 23-58) of the existing structure have adequate resistance for these seismic loads. However, the narrow braced

bents (lines 1-16, and 20-22) would be slightly overstressed due to these seismic loads and the bracing/connections would need to be reinforced. This would likely involve replacing the wood bracing with steel channels and adding some additional bolts. It's important to note that seismic upgrades to existing structures are typically only required when a structure is undergoing a change of occupancy or major design alteration, which is not the case here. So, while it's not legally required, we still recommend adding seismic reinforcing to the narrow dock area. This would increase the structure's resistance to seismic loads and help prevent failures in the product piping/spills into waterway.

Response 2. A comprehensive review of all of the local record drawings for the dock reveal the following:

The earliest drawing for the dock is from *unnamed*, dated June 1936, and it appears that the drawing may not have been an original construction drawing, but a modification. The dock could have been constructed several years earlier. Since the terminal had been in existence since about 1912, it is easy to believe that a wharf structure existed at that time.

In 1972 structural wood piling replacement and firewall improvements were made.

In 1974 major structural improvements were made. The work was performed under city of Portland permit 480690, 12/6/1973. The work added 3 reinforced concrete mooring sections, reconstructed the dock in entirety between bents #3 and #16, added two reinforced concrete dolphins at the head of the dock, and added a 40ft.x80ft.x8" thick reinforced concrete slab at the tanker unloading section. The work was designed and stamped by a licensed PE and work was completed to building codes in force at that time. Any seismic evaluation of the dock required by code would have been completed, however no specific seismic criteria was listed on design drawings.

In 1997 two significant steel-piled fenders were added to the upstream and downstream berths. The work was designed by a PE, Winzler and Kelly.

A new waterfront structure was added in 2007. A 100 ft. long sheet-pile wall was installed and armored with rip rap on the upstream side of the dock. The work was designed in accordance with the latest building codes in force and was permitted by the city or Portland. The downstream side of the dock do not include any significant improvements, e.g., quay wall, anchored bulkhead, or sheet-pile wall.

Response 3. The dock was completed 1993, no idea what level of seismic design was used. The sea wall was completed 2009 and was designed using a computer model to meet current UBC Seismic Zone 3 requirements.

Question 2. What is the post earthquake disaster restoration time for waterfront structures that handle fuel (e.g., operational capacity versus time curves)?

Response 1. The restoration time will depend on the extent of the damage. We'd establish a command post and us the IC system, then assess the damage. Any return to

normal operations would take place one component at a time, inspecting all equipment for leaks, etc.

Response 2. My professional opinion on the timing of a repair of a damage dock would rest entirely on the severity and breadth of the damage to critical marine facilities in the Port and the relative rank in priority that the *unnamed* fuel dock holds amongst all damaged facilities.

If damage were isolated to just the *unnamed* dock, I believe that significant damage could be repaired and the dock placed back in operation in 2 to 8 weeks, if emergency repairs were expedited.

Response 3. No idea.

Based on the information contained in the responses received, it was revealed that some CEI Hub ports were originally built around the early 1900s, and, most have had alterations, upgrades and additions over the decades, some recently. This is consistent with our field observations. Based on the above responses as well as discussions with terminal managers, the length of time to restore operations appeared to be difficult to estimate and is not well constrained.

MOTEMS and CEI Hub Ports

MOTEMS is a California program that regulates the state's petroleum companies' facilities (http://www.energy.ca.gov/2009_energypolicy/documents/2009-04-14-15_workshop/presentations/Day-1/03-Eskijian_Martin_MOTEMS.pdf). Earthquake experts consider the program's seismic regulations to meet a high standard (Percher and Bruin, 2009) . MOTEMS is part of the California Code of Regulations, Title 24, Part 2, Volume 2 of 2, 2007 California Building Code, Chapter 31F http://www.slc.ca.gov/Division_Pages/MFD/MOTEMS/MOTEMS_Home_Page.html. The MOTEMS program requires analysis and audits for every marine oil terminal in California. Seismic analyses are required based on the baseline inspection, current condition of the structure and site-specific ground motion input. Selected seismic-related portions include Division 1: Introduction; Division 2: Audit and Inspection; Division 3: Structural Loading Criteria; Division 4: Seismic Analysis and Structural Performance; Division 6: Geotechnical Hazards and Foundations; Division 7: Structural Analysis and Design of Components; Division 8: Fire Prevention, Detection and Suppression; Division 10: Mechanical and Electrical Equipment; and, Division 11: Electrical Systems. Over time, risks of catastrophic failures with environmental contamination, interruption of marine traffic, and serious long-term fuel shortage are being minimized in California.

MOTEMS requires all petroleum companies in the state to provide seismic information regarding their properties. MOTEMS division 2 prescribes the MOTEMS "audit" and requires as-built drawings, and, if not available, reconstructed drawings, along with an above and under-water inspection of facilities in California. If the initial drawings cannot be located, it will be difficult to determine the depth to fixity of the piles. Before any structural assessment can be made, soil conditions, including the presence or absence of potentially liquefiable layers needs to

be assessed with geotechnical borings. MOTEMS requires borings to a depth of 100 feet placed in strategic areas around or under the existing wharf/pier. As an example, some of the requirements for the seismic assessment of a marine oil terminal in California include:

- A site-specific seismic hazard study will be required to determine the appropriate response spectrum for the 72 and 475 year return period events. This is mandated for site class "F" and will probably be required with the soft river bottom and potential liquefaction and no shallow bedrock. However, one set of borings may be sufficient for many adjacent facilities to eliminate repetitive borings.

- The MOTEMS criteria (or ASCE u/w standards, Ref. 2) on an above and under-water inspection to the mudline is required. The criteria for the inspection requires that a registered civil or structural engineer to be in the water at least 25 percent of the dive time. As-built or "baseline" drawings may have to be constructed to evaluate the structural integrity of each facility if the original drawings are not available.

Martin Eskijian, MOTEMS Engineering Branch Supervisor (retired in 2011), and his staff provided expertise and assistance to the EAP. Mr. Eskijian provided assistance on one site visit comprised of a boat reconnaissance that included port facilities in Oregon in the CEI Hub. The EAP partners were invited to the MOTEMS northern California office in Hercules, California, where we visited the Chevron refinery in Richmond, California, the Tesero port facility in Vallejo, California, and participated as observers in a MOTEMS meeting with Shell. After that, MOTEMS senior engineer, Kendra Oliver, provided assistance on four terminal visits that included port facilities in Oregon in the CEI Hub.

The following photographs describe and illustrate some of the EAP partners' and MOTEMS engineers' major concerns about seismic readiness of the port structures operated by oil terminals in the CEI Hub. These issues largely fall under MOTEMS Divisions 3: Structural Loading Criteria, Division 4: Seismic Analysis and Structural Performance, Division 6: Geotechnical Hazards and Foundations, and Division 7: Structural Analysis and Design of Components.

Figure 35 shows steel plumb piles with lateral timber bracing as observed at facilities in the CEI Hub. MOTEMS does not permit the use of timber cross bracing to provide lateral restraint (seismic loading) for vertical piles. This was one of many major shortcomings of the observed facilities in the CEI Hub. With the large variation in water depth, dependent on dam release, tides and storms, the pile heights out of the water look high; buckling forces on the columns may well exceed current design standards and this may become critical for the seismic evaluation.

Figure 35: Lateral timber bracing for steel plumb piles in the CEI Hub is considered inadequate by California's MOTEMS standards. (DOGAMI photo)

MOTEMS provides liquefaction screening methodologies that could be used to evaluate whether or not there are slope stability issues, whether lateral spreading along the piers/wharves or trestles is likely, and the possibility of adverse seismic loading of the piles (e.g., out of phase with the inertial loads). It is possible that soil failures may be a significant contributor to compromising the structural integrity. If the seismic demand on the structural system (either above grade or below grade) is higher than the structural capacity and the structural integrity could be compromised, then upgrades would be required. MOTEMS allows for a dialogue between the operator and regulator on the proposed mitigation and schedule of mitigation; the regulator decides whether the time requested to rehabilitate is reasonable or excessive. *Figure 36* shows a foundation for a high traffic pier, shown in *Figure 37*, on highly liquefiable soils in the CEI Hub.

Figure 36: This under-designed foundation in part of an oil terminal pier in the CEI Hub is considered inadequate. Based on previous regional studies, boring logs from an adjacent facility, and on-site visual inspection of the surficial soils, this area has high susceptibility for liquefaction and lateral spreading. (DOGAMI photo)

Figure 37: The area by this pier in the CEI Hub is used to transport liquid fuel. Based on previous regional studies, boring logs from an adjacent facility, and on-site visual inspection of the surficial soils, this area has high susceptibility for liquefaction and lateral spreading. (DOGAMI photo)

Under the MOTEMS system, following on the seismic analyses of the port structure and the ground, a pipeline stress analysis may be required in order to be certain that no leaks will result from the seismic displacements. Facilities in the CEI Hub have flexible timber structures (some with pipelines under the piers) with hard points in locations that would likely indicate failure in a pipeline stress analysis.

During the site visits in the CEI Hub, DOGAMI and MOTEMS engineers observed many structures with pipelines with possible vulnerabilities, some of which were verified by the responses provided by the oil terminal facilities to the USCG. *Figure 38* shows transverse timber beams in seriously degraded condition, with one bolt connecting the beam to the steel plumb pile as observed during visual inspections. Some of the transverse beams support petroleum pipelines. The pile cap beam in the center of the photo, which should be level, has a clockwise rotation. Based on the professional judgment of DOGAMI and MOTEMS engineer Martin Eskijian from post-earthquake investigations, experience with engineering analyses, and from the body of knowledge in the earthquake profession, this configuration would be expected to fail in a moderate earthquake, without even considering lateral spreading or liquefaction.

Figure 38: This photo shows generally poor condition of transverse beams supporting petroleum pipelines and cap beam in the CEI Hub. Notice the clockwise rotation of the pile cap beam in the center of the photo. (DOGAMI photo)

Figures 39, 40, 41 and 42 illustrate some of the poor conditions observed of the oil terminal piers in the CEI Hub. Examples from working piers include: deteriorated concrete foundation, exposed rebar, split timber beams and broken timber piles.

Figures 39 and 40: The close-up photo on the right shows poor timber-to-concrete connection, broken concrete and exposed rebar. Energy sector companies should maintain and upgrade infrastructure to current standards in order to protect assets and limit down-time following an earthquake. (DOGAMI photos)

Figure 41: The connection on this pier in the CEI Hub appears to have deteriorated due to a split in the timber beam. This type of damage suggests that the condition of the structure may not be routinely monitored and maintained and that the overall pier is seismically vulnerable. (DOGAMI photo)

Figure 42: This pier in the CEI Hub appears to be poorly maintained with broken timber piles adjacent to working components of the pier. (DOGAMI photo)

Figure 43 shows a "hard point" (ie, fixed point that could concentrate stresses) for the petroleum pipelines, which may not be desirable due to structural displacement from an earthquake. In accordance to MOTEMS procedures, a pipe stress analysis should be performed, with the input seismic displacement and then the pipeline could be evaluated. In the case illustrated in *Figure 43*, it is unlikely that the ability to tolerate lateral motion was included in the original design.

Figure 43: "Hard point" fixity of petroleum pipeline is located under this pier in the CEI Hub and is considered to be seismically vulnerable. (DOGAMI photo)

It is common for waterfront structures that are under-designed to experience damage in earthquakes as evidenced by worldwide earthquakes. *Figure 44* shows a damaged pier from the 2010 Chile earthquake.

Figure 44: An example of a damaged pier in the 2010 Chile earthquake (Technical Council on Lifeline Earthquake Engineering – TCLEE - 2010)

As part of the EAP, the EAP partners considered possibly using MOTEMS seismic regulation as "best practices" in Oregon as a means to make Oregon petroleum terminals safer. DOGAMI held discussions with MOTEMS personnel, conducted a literature review, accompanied MOTEMS staff on tours of the port facilities in the CEI Hub, and toured California oil terminals to better understand the effectiveness of the program. Based on our findings, it appears that applying the seismic portion of MOTEMS to Oregon facilities and the CEI Hub facilities in particular would provide added safety.

Seismic Pipeline Vulnerability

The overall performance of oil and gas transmission pipeline systems in past worldwide earthquakes has been relatively good. However, failures have occurred in both older pipelines as well as modern pipelines, such as welded steel pipelines. Damage is typically concentrated in areas of unstable soils with permanent ground deformation (PGD) and/or liquefaction, including at river crossings and landslides.

For the EAP, DOGAMI did not obtain any information or reports on seismic vulnerability of existing pipelines in the CEI Hub from the City of Portland, facility owners, or regulators. Seismic vulnerability assessments can be conducted on specific pipelines, both above ground and buried, to address specific pipeline performance. A major liquid fuel transmission pipeline and two natural gas transmission pipelines that have river crossings at the southern tip of Sauvie Island, as shown on Figure 29 Lifelines in the CEI Hub area, as well as Columbia River crossings just north of the CEI Hub (refer to http://pubs.usgs.gov/sim/3027/sim3027_front.pdf) are in need of special attention.

Jason Butler-Brown, engineer at the City of Portland Bureau of Development Services, states that they do not review the structural design of proposed pipelines. Permits are reviewed and

issued for the excavation associated with the pipelines (on private property) and where pipelines are supported on structures that cross over private roadways or areas accessible by people (again on private property). Interstate fuel pipeline design is regulated under Title 49 of the Code of Federal Regulation. Part 192 of Title 49 of the Code of Federal Regulations addresses gaseous fuels, Part 193 addresses LNG and Part 195 deals with liquid fuels. These serve as minimum design standards and are applied to interstate pipelines connected to the CEI Hub.

Certain fuel pipelines are regulated for safety by the US Department of Transportation's Office of Pipelines and Hazardous Materials and Safety Administration (PHMSA) (http://www.phmsa.dot.gov/pipeline/regs). As part of this EAP, JR Gonzalez (former) the Administrator of the OPUC Safety, Reliability and Security Division informed Hossein Monfared, Pipeline Engineer, from PHMSA Western Region Office of Pipeline Safety that a liquid fuel transmission pipeline feeds petroleum tank farms situated on potentially liquefiable soils. This was part of a discussion to inquire about the content of PHMSA's audits. As an outcome of that discussion, DOGAMI discovered that, to date, PHMSA has not requested seismic information as part of their audits involving tank farms in Portland.

When soil liquefies, it behaves like a fluid and pipe embedded in it will be subjected to the buoyant force from below. This buoyancy due to liquefaction can occur at river crossings and sandy areas with high ground water tables. *Figure 45* is a schematic showing buoyancy forces (Fb) on a buried pipe with a burial depth of C (IITK, 2007). Pipes can fail due to buoyant forces.

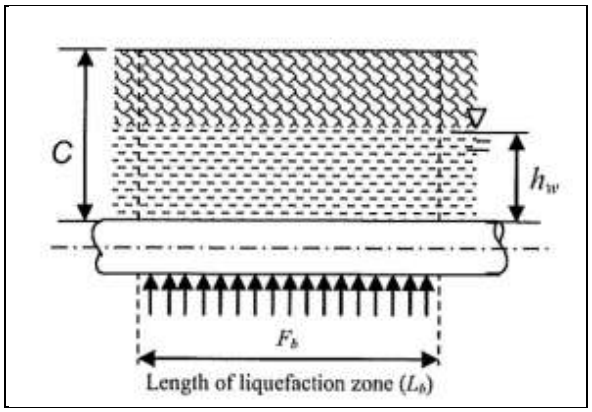

Figure 45: Buoyancy forces on a buried pipeline. (IITK, 2007)

In areas with permanent ground deformation (PGD), such as areas with lateral spreading (without the occurrence of liquefaction) or liquefied soils that have translated down slope towards the river channel (often referred to as a "free face"), the embedded pipe will be subjected to both compression and extensional forces. The total strain on the pipe can exceed the amount of strain the pipe can withstand creating unsafe pipeline conditions and even pipeline rupture. The maximum strain in the pipe both in tension and compression can be evaluated and compared with the allowable strain of the pipe. *Figure 46* is a schematic diagram that shows a pipeline perpendicular to the direction of PGD. *Figure 47* shows a pipeline that is parallel to the direction of PGD. In both figures, the area of unstable soils with PGD are illustrated before (purple zone) and after (gray zone) the ground movement. The actual pattern of PGD will depend on the earthquake ground motions, local soil conditions and the pipeline may cross the zone in any

direction. *Figure 48* shows areas of tension and compression due to longitudinal PGD (IITK, 2007).

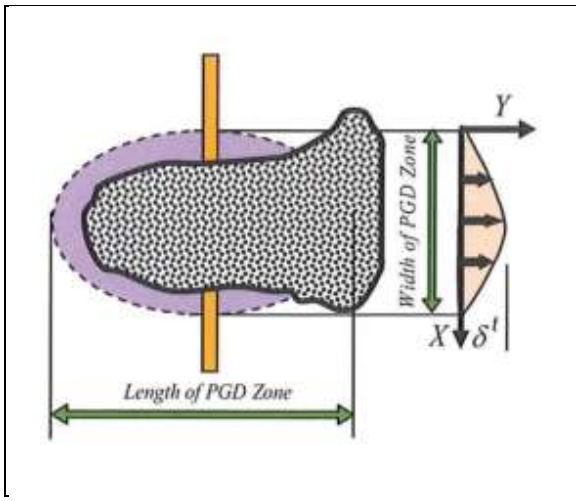

Figure 46: Transverse PGD schematic (IITK, 2007)

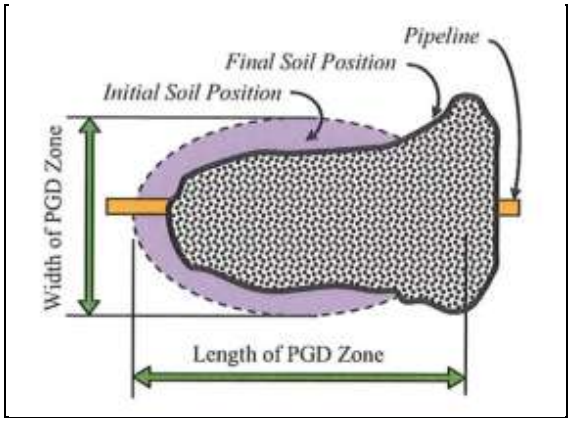

Figure 47: Longitudinal PGD schematic diagram (IITK, 2007)

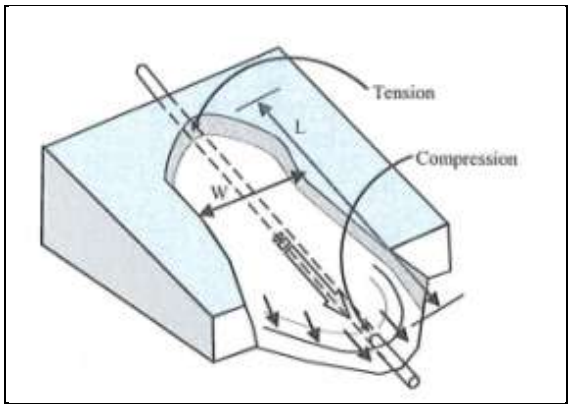

Figure 48: Areas of tension and compression from longitudinal PGD (IITK, 2007)

A variety of possible mitigation measures are available to improve the performance of pipes against PGD. Depending on the specific situation, some options might involve: soil improvement, increasing the load carrying capacity of the pipe system, reducing the friction between the pipe and soil, relocating the pipe, anchors to prevent uplift from buoyant forces, or special pipe joints or fittings that allow greater joint deflection, extension, or compression.

Non-Energy Facilities and Structures

Many other structures and facilities are located in the proximity of the CEI Hub. Structures include bridges over the Willamette River as well as other port facilities and overpasses that span the railroad tracks. Other industrial companies, including ones that handle petrochemicals and hazardous materials, are located in the CEI Hub. A major rail yard exists at the south end of the CEI Hub. A limited number of commercial and residential occupants are also located in the area. Although these facilities are not part of the energy sector and included in this study, it is important to be aware of these facilities and structures. They could become a concern after a Cascadia earthquake. For example, if the chemical company has a fire, it could spread to a nearby oil terminal, or vice versa.

Waterway Transportation to the CEI Hub

The navigational channel from the Columbia River mouth to the lower Willamette River is used to transport fuel by marine vessels. DOGAMI investigated the infrastructure and geologic conditions along the shipping channel and terminals and analyzed the situation based on discussions with engineers from the U.S. Corps of Engineers and ODOT and staff from the U.S. Coast Guard (USCG), engineering judgment from previous earthquake investigations, geotechnical engineering reports and publically available material. Our findings, which are preliminary and require additional studies, indicate that the shipping channel will be damaged and closed for river navigation until it is officially cleared for use by the USCG. Based on our findings, the likely damage includes four modes:

- Tsunami scour, damage and debris near the mouth of the Columbia River
- Underwater slope failures along portions of the steep banks of the navigable river channel
- Collapses of overhead structures such as bridges from earthquake shaking
- Broken buried pipelines at river crossing locations

Tsunami damage near the mouth of the Columbia River is based on tsunami hazard mapping (Priest et al, 1998) and DOGAMI's field observations of tsunami damage from the 2004 Sumatra and 2011 Tohoku Japan subduction zone earthquakes. Damage to the navigable river channel is based on the already marginally stable, underwater steep slopes that require periodic dredging to maintain the required channel depths during normal operating conditions. Based on discussions with the ODOT Bridge Section engineers and seismic bridge engineering practices, all of existing bridges including the bridge approach structures have been seismically under-designed compared to today's requirements and may incur damage (http://peer.berkeley.edu/events/caltrans-peer/files/Ashford_Abutment_2009_r1.pdf). Similarly, the pipe and transmission river crossings may be under-designed in particular to liquefaction and lateral spreading conditions. The structures that may be damaged and block the waterway extend from the Columbia River mouth to the fuel storage area in the CEI Hub. These structures, from west to east, include:

- 1966 Astoria-Megler Bridge crosses the Columbia River(*Figure 49*)
- Buried natural gas pipeline crosses the Columbia River to feed power plants (*Figure 50*)
- High voltage electrical transmission crossing the Columbia River (*Figure 51*)
- 1930 Lewis and Clark Bridge in the Longview, Washington area crosses the Columbia River (*Figure 52*)
- Several liquid fuel and buried natural gas pipelines at Columbia River and Willamette River crossings just north of the CEI Hub. Photo shows a natural gas gate station on Sauvie Island (*Figure 53*)
- High voltage electrical transmission crossing over Willamette River (*Figure 54*)
- 1931 St. Johns Bridge crosses Willamette River (*Figure 55*)
- 1908 BNSF rail bridge crosses Willamette River (*Figure 56*)
- 1973 Fremont Bridge, part of Interstate 405, crosses the Willamette River and is used for liquid fuel distribution by tank trucks (*Figure 57*)

Closure of the shipping channel would prevent marine vessels from delivering liquid fuel as well as emergency response and recovery equipment from being delivered.

Figure 49: The approach (foreground) to the 1966 Astoria-Megler Bridge that spans the Columbia River has major structural deficiencies according to ODOT Bridge Section. In a major Cascadia earthquake, the exterior (concrete) shear keys on the approaches would likely not withstand lateral displacement of the superstructure (approach deck) (DOGAMI photo)

Figure 50: A buried natural gas pipeline crosses underneath the Columbia River and supplies two Oregon power plants near Clatskanie, Oregon.(DOGAMI photo)

Section 6
Summary of Findings

To assess the overall seismic risk to the energy infrastructure in the CEI Hub, DOGAMI gathered information on the seismic hazards, the exposed facilities present in the CEI Hub, the seismic vulnerability of these facilities, and considered the potential consequences of earthquake-induced damage at the facilities. Our goal was to:

- Understand the facilities and system components that are present (what is "exposed")
- Assess the vulnerability of the exposed parts
- Assume failure of the highly vulnerable parts
- Evaluate the likely consequences

The consequences of the damage to the infrastructure must be considered to understand risk. For example, if a site experiences liquefaction that causes the bottom of a petrochemical tank to rupture spilling all of its contents, but the product is quickly contained and not in demand, then the consequences are manageable and the risk can be considered as low. In contrast, if a site experiences only minor shaking that temporarily jams a door opening to access fire suppressants and a fire grows to uncontrollable levels in an area with critical products, these consequences may be significant and the risk is considered as high.

Consequences can be immediate (e.g. those just described), short-term, long-term; direct or indirect; localized or far-reaching. Several examples taken from the 2010 Chile subduction zone earthquake are provided (Eidinger and Tang, in press). Limited water availability can impact immediate needs with respect to fire fighting capabilities as well as long-term needs for normal living conditions. (See *Figures 58 and 59*) In a similar vein, the lack of or limited electricity from a damaged transmission tower can impact businesses and the economy. *Figure 60* shows structural damage incurred from the 2010 Chile earthquake to a transmission tower at a major river crossing that serves a populated city. In addition, many interdependencies exist and cross cut many sectors of our society. This risk study takes initial steps to address likely consequences and interdependencies.

Seismic Risk in the CEI Hub

Figures 61 and 62 show the northern portion and southern portion of the CEI Hub where the major seismic vulnerable energy sector facilities—substations, river crossing, liquid fuel terminals, and an LNG storage facility—have been highlighted (yellow dashed lines). Also shown are potentially liquefiable soils in transparent red, existing mapped landslides in beige, and the Portland Hills fault is in red (Madin el al, 2008; Mabey et al, 1993; Burns et al, 2011; Beeson et al, 1991). Each of these highlighted facilities were visited. During our limited visual inspections we identified numerous structural elements with high seismic vulnerability that could cause serious damage and loss of function in a Cascadia earthquake. This includes the oil terminals, which have significant seismic vulnerabilities and limited redundancy.

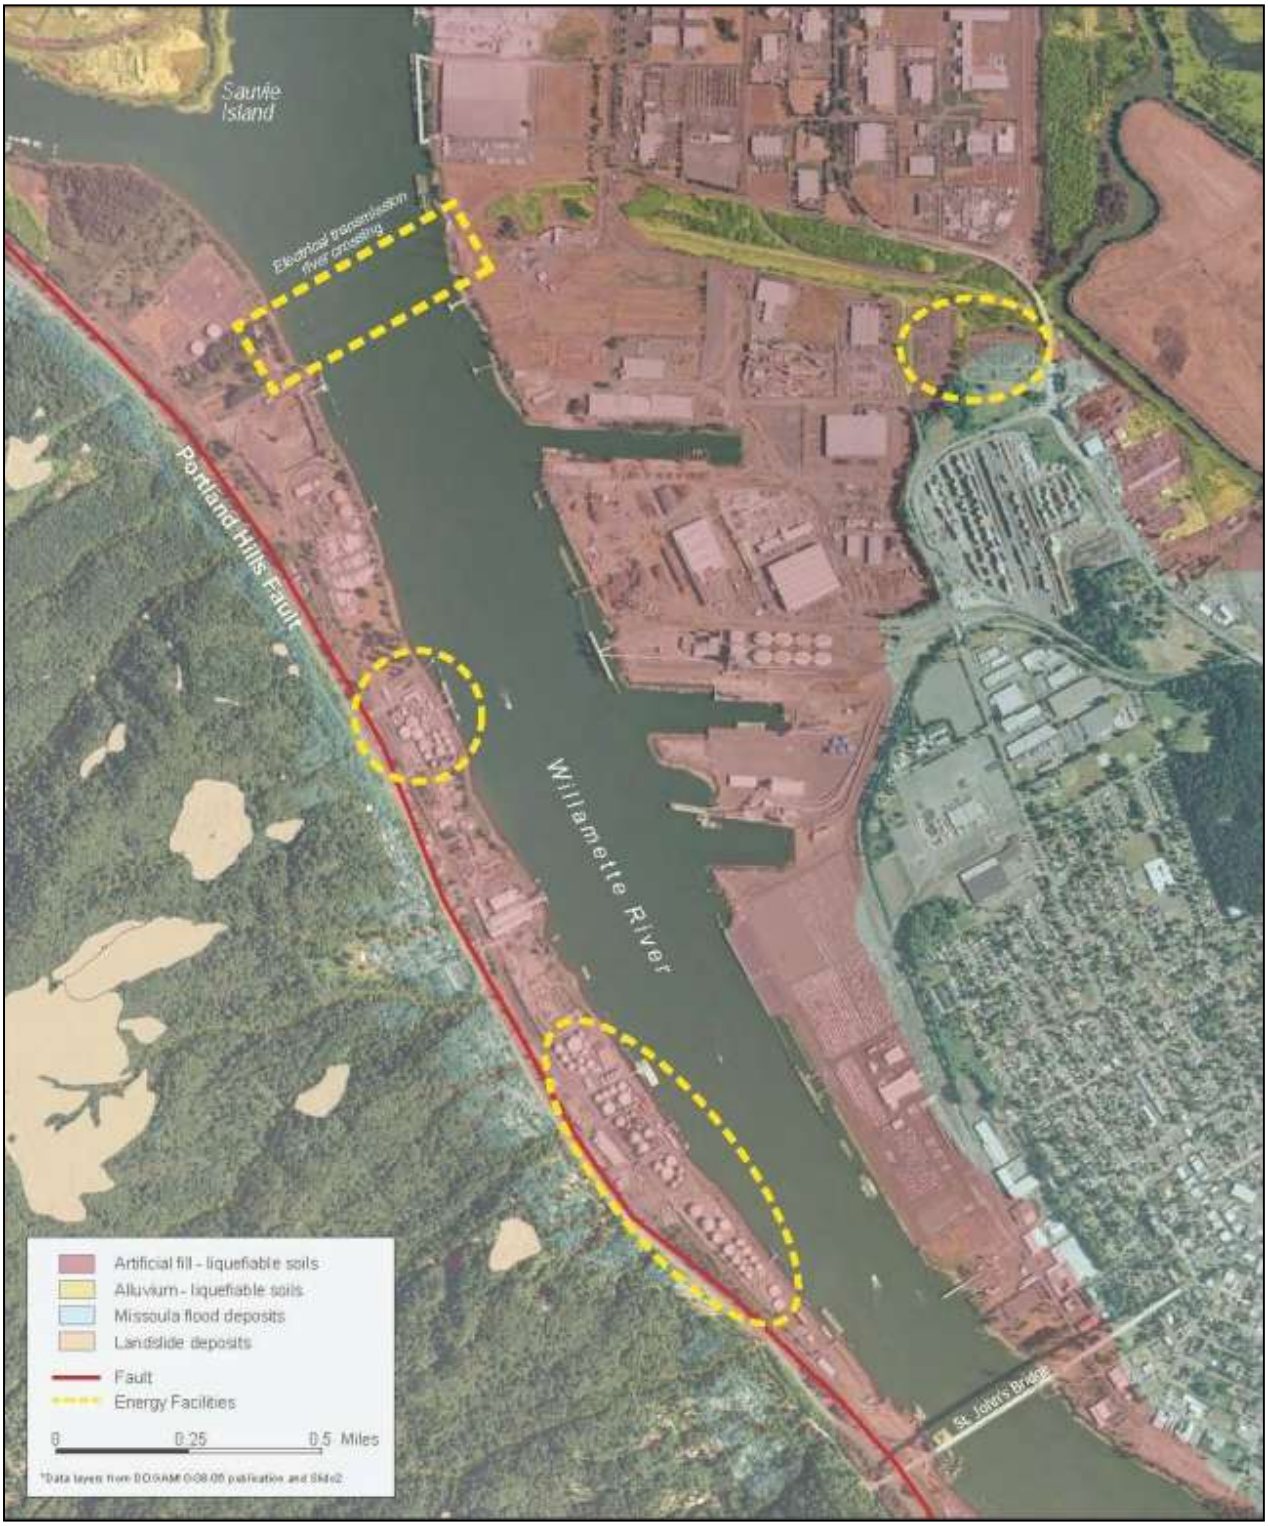

Figure 61: Northern portion of CEI Hub showing the major energy sector facilities vulnerable to damage in a Cascadia earthquake-- substations, river crossing, and liquid fuel terminals (yellow dashed lines) and potentially liquefiable soils (transparent red), existing mapped landslides (beige), and the Portland Hills fault (red). (DOGAMI)

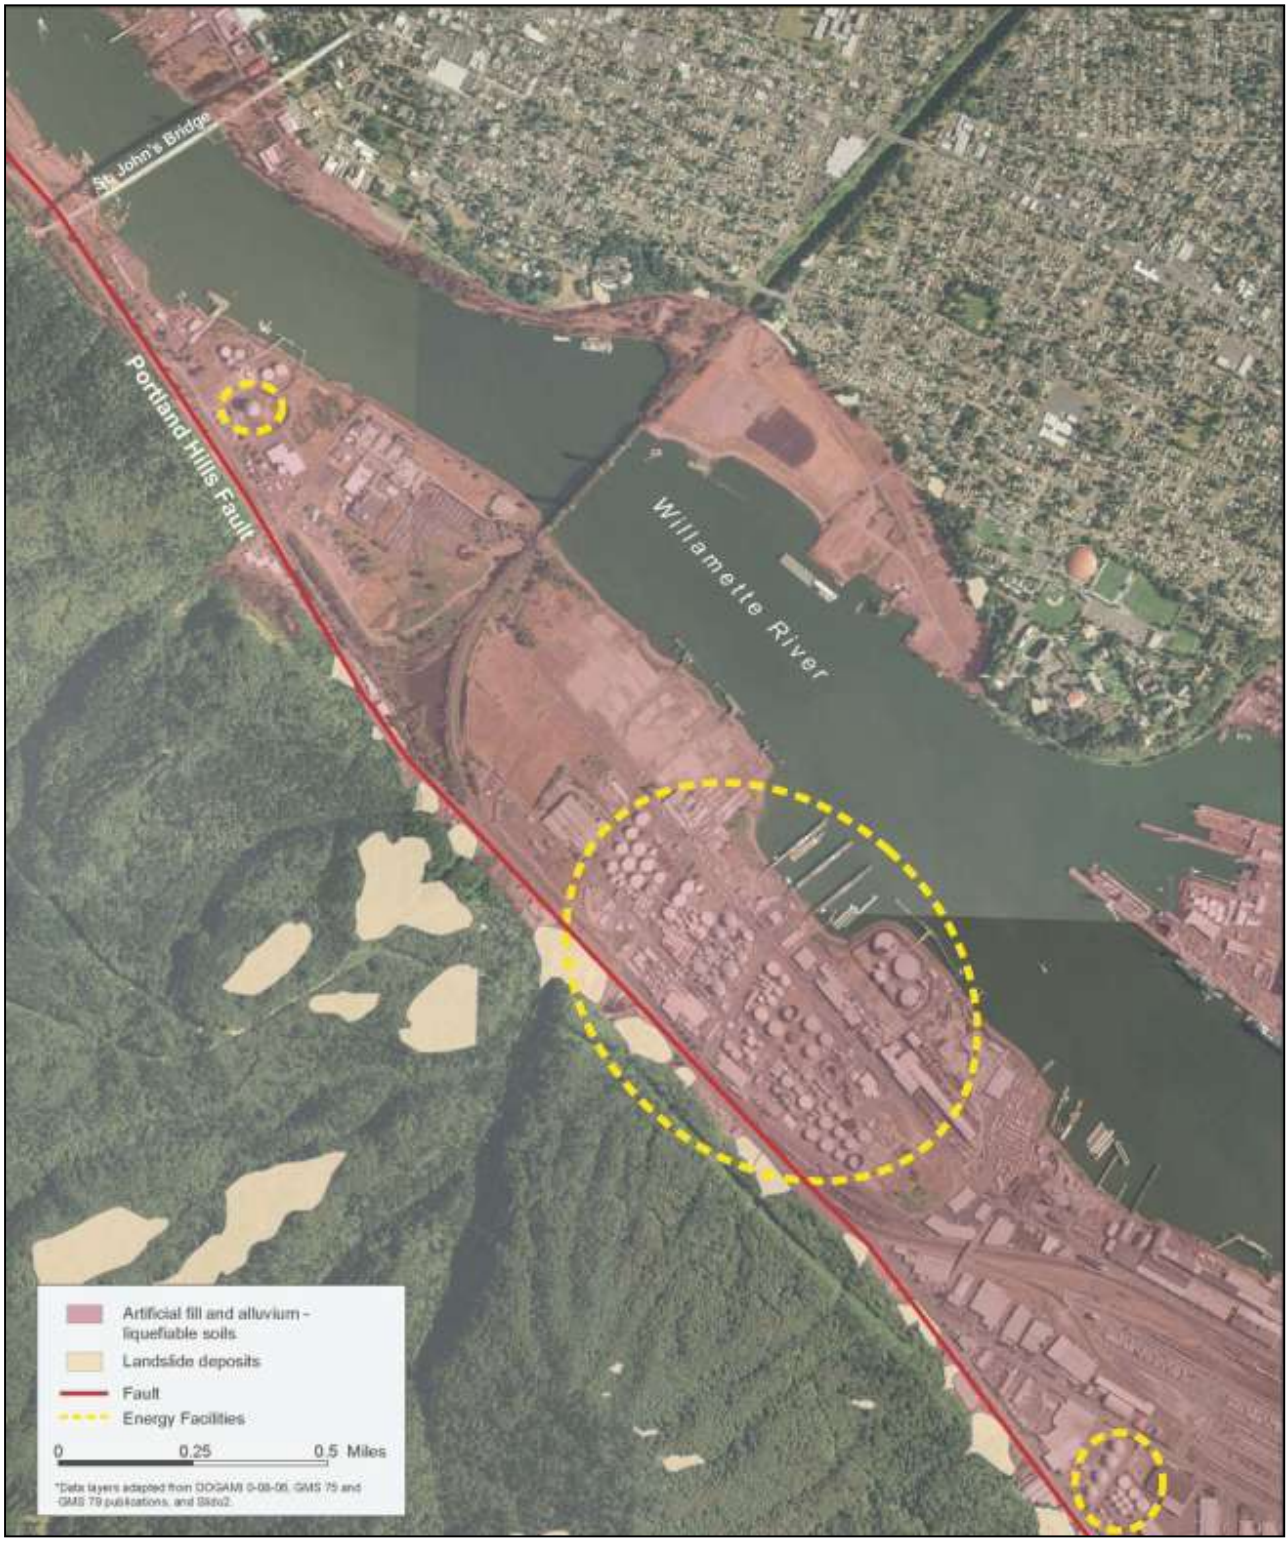

Figure 62: Southern portion of CEI Hub showing the major energy sector facilities vulnerable to damage in a Cascadia Subduction Earthquake -- LNG storage facility and liquid fuel terminals (yellow dashed lines), potentially liquefiable soils (transparent red), existing mapped landslides (beige), and the Portland Hills fault (red). (DOGAMI)

Based on the findings of this study, DOGAMI has identified the following as examples of high seismic risks to the energy sector with statewide importance. The first two risks are system-wide risks involving redundancies and interdependencies; the remaining risks are sector-specific seismic risks to liquid fuel, natural gas and electricity.

Lack of System Redundancies

DOGAMI determined that each energy source has a different level of redundancy in their transmission system. This determination was based on discussions with the EAP partners, interviews with personnel from the various energy sectors, and analyses of available data including maps, such as Earthquake Hazards of Lifelines along the Interstate 5 Urban Corridor: Woodburn, Oregon, to Centralia, Washington, and Earthquake Hazards of Lifelines along the Interstate 5 Urban Corridor: Cottage Grove to Woodburn, (Barnett el al, 2009), Western Electricity Coordinating Council (WECC, 2012) and US. Department of Transportation's National Pipeline Mapping System's Public Map Viewer (https://www.npms.phmsa.dot.gov/PublicViewer/composite.jsf). The redundancy of each of the systems influences the level of seismic resilience with more redundant systems favoring higher resilience. The transmission systems, such as the main electrical grid and transmission pipelines, are of key importance in the supply chain.

1. The electrical system has power generation facilities located throughout Oregon and has the most widespread and redundant transmission system. The level of redundancy surrounding and within the Portland metropolitan area is high because there exist a number of transmission systems and diminishes away from the Portland area.
2. The natural gas system in Oregon relies 100 percent on imported natural gas, most of it from the north, and has much less redundancy than the electrical system. The natural gas system has a loop configuration around the greater Portland area and this provides for some redundancy. If a break in the loop occurs, it is theoretically possible to provide natural gas to areas around the loop. The level of redundancy south of the Portland metropolitan area (e.g. Marion County) is considered to be low based on discussions with OPUC and the gas operator. In addition, the natural gas reserve capacity has limits.
3. Oregon's liquid fuel oil source relies 100 percent on imported fuel, most of it from the north, and has very limited redundancy and reserve capacity.

System Interdependencies

The three energy sources—electricity, natural gas, and liquid fuel—depend upon each other so if one system is inoperable, it will impact another. For example, all sources rely on electricity to operate their systems. Electricity is needed to power the control rooms for natural gas and liquid fuel transmission.

The energy sector also relies on the transportation and telecommunication sectors. For example, in order to transport liquid fuel to the marine oil terminals in the CEI Hub, ships enter through the Columbia River mouth and travel up the navigable waterway. If the river mouth is blocked by tsunami debris, the shipping channel is altered from sloughing of the underwater slopes or the shipping lane is blocked by downed electrical transmission lines or bridges, then moving fuel to the CEI Hub via the waterway would not be possible.

Liquid Fuel

Liquid fuel pipeline: The CEI Hub petroleum facilities receive liquid fuel via two methods: 1) the liquid fuel transmission pipeline, and 2) marine vessels. The transportation method and amounts vary due to product need, transportation costs, weather and other conditions. The liquid fuel pipeline was largely constructed in the 1960s when the regional seismic hazards were unknown and state-of-practice construction techniques at that time did not include any reference to seismic standards. The regional seismic hazards are now known to be high and the soils at the river crossings are susceptible to liquefaction and lateral spreading. The 1960s vintage pipeline design did not consider ground movements from lateral spreading at river crossings or the stresses to the pipelines induced by earthquakes that may cause pipe damage and multiple breaks. A pipe break would have a significant impact on all of the petrochemical facilities in the CEI Hub and could result in a statewide fuel shortage.

Shipping channel: The navigational channel from the Columbia River mouth to the lower Willamette River is used to transport fuel by marine vessels. DOGAMI conducted a preliminary investigation and found that the shipping channel would likely be damaged and closed for river navigation until it is officially cleared for use by the USCG. Based on our findings, the likely damage includes four modes:

- Tsunami scour, damage and debris near the mouth of the Columbia River
- Underwater slope failures along portions of the steep banks of the navigable river channel
- Collapses of overhead structures such as bridges from earthquake shaking
- Broken buried pipelines at river crossing locations

Closure of the shipping channel would prevent marine vessels from delivering liquid fuel as well as limit transport of emergency recovery equipment.

Marine terminals: All of the port facilities in the CEI Hub have significant seismic risks due to liquefaction, lateral spreading, and seiches. Some older piers were constructed without any seismic design provisions, have deteriorated, and may be damaged even in a moderate earthquake. If oil products are released and contaminate the navigable waterway, the waterway may be closed to river traffic thus impeding emergency response activities as well as the supply chain. The local capacity to fight fires and clean hazardous material spills is limited.

Fuel Tank Farms: All of the fuel tank farms in the CEI Hub have significant seismic risks due to the significant unmitigated liquefaction hazards largely posed by hydraulically-deposited river soils (also known as hydraulic fill) and native soils. Due to the long standing inadequate seismic hazard knowledge and the inadequate building code requirements, the majority of the tanks have been constructed without any or only limited seismic design criteria on unmitigated, potentially liquefiable soils. It was not until 2004 that city building officials required new construction projects, including tanks, to evaluate for liquefaction of silts. Based on discussions with City of Portland engineers from Bureau of Development Services and terminal operators, DOGAMI has identified only three existing tanks that have addressed liquefaction hazards.

Fuel supply: The fuel terminals in the CEI Hub on average have a three to five day supply in the tank farms for regular unleaded gasoline and diesel fuel. Fuel is stored in tanks and some tanks have seismic vulnerabilities (see *Figure 63*). Premium gasoline is subject to the daily delivery and heavily dependent on whether the intercompany pipeline on Front Avenue is operational. If the supply chain is disrupted by pipe breaks north of the CEI Hub and closure of the shipping channel to the west, fuel would quickly become scarce. Options to transport fuel from the east and south and by air are very limited.

Figure 63: The elements connecting the tops of these two tanks in the CEI Hub may cause damage to the tanks during shaking due to differential displacements. (DOGAMI photo)

Portland International Airport (PDX): The airlines operating at the PDX airport receive 100 percent of their liquid fuels from a terminal in the CEI Hub. There is limited on-site fuel supply at PDX. If the transmission pipe between the CEI Hub and PDX fails, then PDX would likely experience a shortfall and operations would be impacted.

Natural Gas

Natural gas pipelines: Oregon's largest natural gas service provider receives the majority of their natural gas from pipelines that cross under the Columbia River. One pipeline crosses the Columbia River to Sauvie Island and then crosses the Willamette River at Multnomah Channel near a gate station at the southern end of Sauvie Island and enters the CEI Hub. In addition to the CEI Hub, there are more natural gas pipelines at major river crossings, including crossings at the Columbia River between Washougal, Washington and Troutdale, Oregon and near Clatskanie, Oregon. The soils at these major river crossings are subject to liquefaction and lateral spreading hazards. Most of these pipelines are 1960s vintage and were constructed without seismic design provisions. The consequences of potential pipeline failures could be major for natural gas service territories and Oregon. Pipe breaks could lead to a natural gas shortfall in the state as well as explosions or fires. In addition to the above mentioned pipelines entering Oregon, there are more pipelines throughout the state.

LNG storage facility: The LNG storage facility in the CEI Hub was constructed in the late 1960s on what is strongly suspected to be highly liquefiable soils based on discussions with the operator and DOGAMI hazard maps. This facility, including the LNG tank built for the to

provide peaking gas supplies, could result in unsafe conditions during a major earthquake. Furthermore, although the facility has an on-site emergency generator, based on EAP partners' site inspection with the operator, it had seismic deficiencies and would likely not operate after a major earthquake.

At the February 13, 2012 OPUC hearing, the natural gas operator with facilities in the CEI Hub reported that they had not performed seismic vulnerability assessments of the natural gas system.

Electricity

Electrical facilities: Electrical facilities and systems have significant seismic risk due to ground shaking and ground failure, including liquefaction and lateral spreading. Seismically vulnerable facilities include substations and transmission in the CEI Hub as well as facilities outside of the CEI Hub, including power plants, substations and transmission lines. At the February 13, 2012 OPUC hearing, the investor-owned utility company with facilities in the CEI Hub reported that they had not performed seismic vulnerability assessments of the electrical system.

Major vulnerabilities in the CEI Hub include the control buildings, power transformers and other electrical equipment in yards at the substations, and transmission towers near the Willamette River. Damage is likely to occur to both the transmission system and the distribution system in the CEI Hub. Damage to the electrical grid will likely result in a blackout in the CEI Hub and elsewhere.

Bonneville Power Administration (BPA) has conducted a comprehensive seismic vulnerability study of their system and has had a long-term seismic mitigation program in place since 1993. BPA's long-term seismic mitigation program includes 1) investment protection (e.g. anchoring transformers), and 2) power system recovery of critical paths (e.g. hardening of equipment at one of multiple bays within a major substation). The first phase of BPA's mitigation program includes bracing and restraining critical equipment and seismically upgrading critical building facilities west of the Cascade Range. Seismic strengthening in the substation yard would typically include: anchoring high-voltage power transformers; bracing transformer conservators and radiators; replacing seismically vulnerable live tank circuit breakers with more robust dead tank circuit breakers; adding damping systems to existing live tank circuit breakers; hardening transformer bushing storage facilities; replacing rigid bus connections with flexible bus. These mitigation techniques will improve the reliability of seismic performance. Additional phases of the seismic mitigation program will include facilities east of the Cascade Range.

BPA has a critical 115 kV and 230 kV high voltage transmission river crossing in the CEI Hub as well as a substation. At the substation in the CEI Hub, some of the high-voltage equipment had been anchored and braced to withstand earthquake motions. BPA is in the process of conducting seismic strengthening of the control building and equipment inside the control building (e.g., brace computer floors, control cabinets, battery racks, ceiling, pipes, etc) and additional mitigation in the yard. BPA has conducted subsurface, liquefaction and lateral spreading analyses at one of the transmission tower sites at the Willamette River crossing and concluded severe ground movement up to 25 feet towards the river channel is possible. Until mitigated, it is likely that at least two transmission towers would experience extensive damage, be inoperable, require repair or replacement, and power lines could temporarily block river

traffic, including the pathway to the oil terminals. The BPA transmission towers at the Willamette River crossing are scheduled to be seismically analyzed, have a seismic mitigation design completed in 2013, and be mitigated by 2014.

Recent unpublished BPA Cascadia earthquake scenario studies of the existing transmission line system indicate that their main grid would require between 7 and 51 days to make emergency damage repairs to the transmission line system (Oregon and Washington) from a magnitude 9 Cascadia earthquake. This scenario assumes many ideal conditions (BPA employees and contractor resources are immediately available, all roads and bridges are passable, available fuel, etc), which is optimistic.

Impacts to Oregon

Based on visual observations, engineering judgment, limited analyses, and limited information from the facility operators, city records, and available literature, significant seismic risk exists in the CEI Hub. Some critically important structures appear to be susceptible to significant damage in a major earthquake with potentially catastrophic consequences. Multiple liquid fuel transmission pipe breaks and natural gas transmission pipe breaks are possible. Damage to liquid fuel, natural gas, and electrical facilities in the CEI Hub is likely. The waterway would likely be closed and require clean up.

Due to a combination of the existing seismic hazards, vulnerability of the exposed infrastructure and potential consequences, Cascadia earthquakes pose substantial risk to the CEI Hub and to Oregon. Not only are the energy sector facilities in the CEI Hub dependent on other sectors and systems in Oregon, including transportation and communication, they are interdependent upon each other. A major Cascadia earthquake and tsunami would likely produce an unprecedented catastrophe much larger than any disaster the state has faced.

Western Oregon will likely face an electrical blackout, extended natural gas service outages, liquid fuel shortage, as well as damage and losses in the tens of billions of dollars in a future major Cascadia earthquake. Preparing for a catastrophic disaster to become more resilient is needed to improve personal safety and security, and safeguard communities and businesses.

Section 7
Recommendations

The most critical call-to-action that DOGAMI has concluded from this study of the CEI Hub is this: Energy sector companies must **pro-actively integrate seismic mitigation** into their business practices for Oregon's energy sector to adequately recover from a magnitude 8.5 to 9 Cascadia earthquake in a reasonable time period.

Although energy sector companies have made efforts to prepare for seismic events, such as through emergency planning and complying with the current building codes, these efforts are limited and a timely restoration of energy sector services is questionable. As discussed in the Summary of Findings section, only one company has completed comprehensive seismic vulnerability assessments and instituted seismic mitigation plans. Energy sector companies must make earthquake mitigation an integral part of their overall business plan. This is not only prudent for the impact a large magnitude Cascadia earthquake would have on Oregonians and the environment; it is good business continuity management. Oregon homes, businesses and industries depend upon reliable energy sources. Liquid fuel, natural gas and electricity are critical to our economy, environment and everyday existence, and the energy sector must do more in order to assure those services and products in the event of a large earthquake.

Recommendations

In order for the energy sector to pro-actively integrate seismic mitigation into their operations, DOGAMI makes these four recommendations to both private and public energy sector stakeholders:

1. Energy sector companies should conduct ***Seismic Vulnerability Assessments*** on all of their systems or facilities, and should work with the appropriate local, state, tribal and federal government agencies and stakeholders to achieve timely completion of the assessments to understand existing vulnerabilities.
2. Energy sector companies should institutionalize long-term ***seismic mitigation programs;*** and should work with the appropriate local, state, tribal and federal government agencies and stakeholders to achieve timely and effective mitigation to ensure facility resilience and operational reliability.
3. The State of Oregon's ***Homeland Security Council*** should review the vulnerability and resilience of the energy sector to earthquakes and other natural disasters within the scope of their mission. This could involve the EAP partners (ODOE, OPUC, and DOGAMI) as well as ODOT, Building Codes Division, and the Oregon Seismic Safety Policy Advisory Commission (OSSPAC).
4. Energy sector companies and the State of Oregon should ***build Oregon's seismic resilience*** to a Cascadia earthquake. Adopting pro-active practices and a risk management approach will help achieve seismic resilience. Encouraging a culture of awareness and preparedness concerning the seismic vulnerability of the energy sector including long range energy planning should be conducted.

Recommendation #1: Conduct Seismic Vulnerability Assessments (SVAs)

To improve energy sector resilience to a catastrophic earthquake, energy sector companies will need to conduct Seismic Vulnerability Assessments (SVAs) of each individual energy facility in the CEI Hub and on a priority basis throughout Oregon. As part of the SVA, energy sector companies should identify key nodes or links at all of their facilities that, if they were to fail, would affect many customers over an extended duration. Companies should conduct an assessment to determine if the identified key nodes or links have high risk of failure during a magnitude 9 Cascadia earthquake. They should evaluate and prioritize the best mitigation options on their highest risk key nodes or links. Energy sector companies should consider a magnitude 8.5 to 9 Cascadia earthquake and tsunami during wet conditions (including co-seismic landslides, liquefaction and lateral spreading) as the basis of their assessments.

Following are suggestions regarding SVAs:

- Energy sector companies should use sector-appropriate guidelines and standards to conduct their SVAs. For example, the electric and natural gas companies can refer to the American Lifelines Alliance and the American Society of Civil Engineers or other industry guidelines and standards to conduct SVAs on facilities, systems, and components. (See *Table 3.*) This includes considering broader influences relating to: 1) co-location and interdependencies; 2) business continuity; 3) safety; 4) environmental damage/spills; 5) reliability of service; 6) other critical factors. The liquid fuel companies can refer to the Marine Oil Terminal Engineering and Maintenance Standards (MOTEMS), a regulatory program implemented by California State Lands Commission that incorporates seismic safety.
- Energy sector companies should conduct SVAs on all their facilities and systems, including liquefaction vulnerabilities, and report to the appropriate authorities and stakeholders within a pre-determined time frame providing an overview of their assessment. This should include their evaluation in their current state of their expected down time in a Cascadia earthquake, which establishes baseline information, as well as expected recovery rate, and expected dependence on other sectors.
- Energy sector companies should report to the appropriate authorities and stakeholders within a pre-determined time frame providing an overview of their seismic mitigation plan, costs, and implementation timeframes.
- All energy sector companies should share assessments and mitigation plan with their ratepayers and shareholders in order to increase awareness and set realistic expectations for the public. This action would help develop support for a funding plan that is both transparent and accountable.
- State agencies (ODOE, OPUC, and DOGAMI) responsible for the Energy Assurance Project (EAP) should provide technical guidance to energy sector companies to achieve reliable energy-related services.
- Energy sector companies and public agencies should look for opportunities for public-private sector partnerships to prepare for Cascadia earthquakes. This would include pilot projects involving SVAs, risk management tools, and mitigation. For example, the Bonneville Power Administration (BPA) has plans to mitigate transmission towers at the lower Willamette River crossing by 2014. There could be significant cost advantages if the privately-owned adjacent towers were upgraded in coordination with the BPA effort.

Although building codes for energy sector facilities are limited, many guidelines on how to design seismically resistant systems and conduct seismic vulnerability studies for systems are available. DOGAMI compiled the *Table 5* Seismic Engineering Reference List as a service to energy facility owners as part of the EAP. DOGAMI recommends energy companies to use the sector-appropriate references, adopt high seismic standards and build for high seismic performance. *Table 5* Seismic Engineering Reference List is useful for new and existing energy-related structures and contains some information on best practices. The list should be updated as new key references are made available.

TABLE 5: SEISMIC ENGINEERING REFERENCE LIST

This Reference List was developed by DOGAMI staff for this EAP study in March 2010. It includes current and useful references for seismic vulnerability studies and mitigation efforts at energy facilities. Companies should consult with facility engineers to determine appropriate references and guidelines to conduct seismic assessment and mitigation. This will depend on each facility and their proposed or existing structures. Companies should consider the ground conditions at their facility, in particular, site-specific liquefaction and lateral spreading potential. We have listed websites where available. Some references need to be purchased.

ALA Oil and Natural Gas Pipeline Systems Guidelines and Commentary (for scoping studies)

ALA Guideline for the Seismic Design and Retrofit of Piping Systems (for scoping study purposes; used to develop B31E)

For the EAP, DOGAMI considers the primary performance target as maintaining system reliability after a major Cascadia earthquake. Maintaining service reliability does not mean maintaining 100% operation. Instead it refers to minimizing the extent and length of service disruption and quick restoration of services to high priority customers (e.g., certain emergency facilities and critical infrastructure) and in logical geographic areas (e.g., large population centers

as opposed to tsunami inundated zones where people have been displaced). Other performance targets may also be important and largely depends on one's perspective. For the operator, protecting workers and preventing monetary losses may be the top priorities. As shown below, SVAs can be conducted to address one or more of these specific performance targets:

- Protect public and utility personnel safety
- Maintain system reliability
- Prevent monetary loss
- Prevent environmental damage (ALA, 2004)

Tables 6, 7 and *8* summarize examples of Seismic Vulnerability Assessments with varying scopes for liquid fuel, natural gas, and electricity. The tables are not meant to be all-inclusive.

As the first example in *Table 6*, SVAs of the liquid fuel sector could include engineering analyses of specific components, such as piers, tanks or loading racks. An SVA of the transmission system to deliver the fuel should be conducted. This would include assessing the transmission pipeline for vulnerabilities, such as river crossings, and assessing the reliability of the transportation route over water. An SVA of the facility itself could be conducted, including the waterfront structures, control building, tanks, pipes and loading racks. An SVA of the network system's interdependencies *on* other energy systems could be conducted, including the refineries, which are the upstream portion of the supply chain, the navigational waterway, and electricity for equipment such as pumps. The last example is an SVA of the system's interdependencies *by* other services, such as those who require fuel for emergency vehicles and emergency generators.

Liquid Fuel

Table 6: Seismic Vulnerability Assessment examples

Liquid Fuel **Scope of Seismic Vulnerability Assessments (SVA)**	**Example Target**
SVA of components	Pier, tank, or loading rack
SVA of transmission: pipelines and marine shipping	Transmission river crossings, Columbia river mouth tsunami damage
SVA of facility	Holistic analyses, including liquefaction potential
SVA of network system's interdependencies on others	Dependency on refineries, navigational waterway, electricity for pumps
SVA of network system's interdependencies by others	Emergency vehicles and generators

Natural Gas

Table 7: Seismic Vulnerability Assessment examples

Natural Gas **Scope of Seismic Vulnerability Assessments (SVA)**	**Example Target**
SVA of components	LNG storage tank
SVA of transmission path	Gate stations, bridge crossings, underground river crossings
SVA of network system	Holistic analyses
SVA of network system's interdependencies on others	Dependency on local communication systems
SVA of network system's interdependencies by others	Gas service reliability to hospital

Electricity

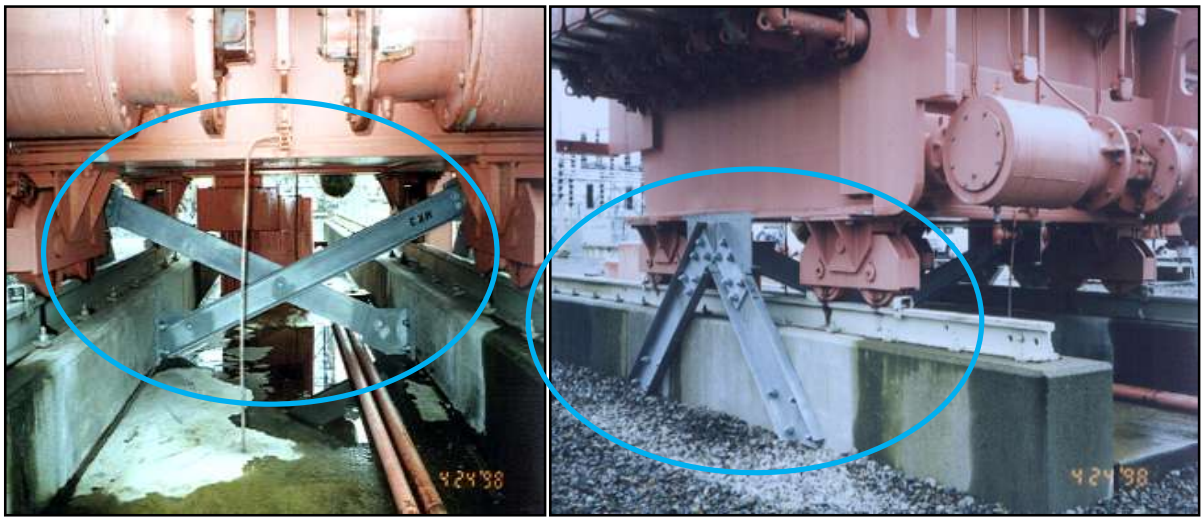
Table 8: Seismic Vulnerability Assessment examples

Electrical **Scope of Seismic Vulnerability Assessments (SVA)**	**Example Target**
SVA of components	Power transformer and switchyard equipment reliability
SVA of priority path	Path connecting critical substation components
SVA of network system	Holistic analyses including engineering data
SVA of network system's interdependencies on others	Dependency on local transportation systems
SVA of network system's interdependencies by others	Power disruption to water treatment plant and water systems to fight fires

Recommendation #2: Institutionalize Seismic Mitigation Programs

Mitigation programs should address life safety, environmental impacts, and recovery times as well as minimize potential damage. The Seismic Vulnerability Assessments should be followed by prioritized mitigation measures to protect critical links of the energy systems from irreparable damage as well as to ensure rapid recovery of energy services. After completing SVAs, energy companies should establish priorities and determine possible methods to reduce vulnerabilities and undesired effects. Assuming the costs associated with implementing the mitigation plans are significant, the high costs can be managed by implementing the mitigation plan over several years.

DOGAMI recommends energy companies in Oregon to develop and implement long-term mitigation plans and strategies to reduce damages from future disasters so as to maintain services. Following are suggestions regarding the development of seismic mitigation programs:



1) Consider benefits versus costs (e.g., using benefit-cost analyses) together with basic societal needs

2) Prioritize actions
3) Consider resilience (example: if there is redundancy in the system, then perhaps controlled/limited damage is acceptable)
4) Determine costs and funding source
5) Integrate plans and strategies into other company efforts, such as business continuity and emergency response planning
6) Provide updates to the appropriate authorities and stakeholders on their seismic mitigation plan, costs, and implementation timeframes.

The mitigation measures can range from changes to the energy system by strengthening, replacing, relocating, or adding redundant systems elsewhere. Liquefaction mitigation could involve a variety of approaches, including ground improvement techniques (e.g., dynamic compaction, stone columns, and compaction grouting) or specially designed liquefaction resistant foundations (e.g., pile or mat). A seismic mitigation program should consider a risk management approach in order to utilize funds efficiently for the best outcomes. Seismic mitigation program should also be integrated into the company's institutionalized programs, such as in the risk management or business continuity programs, and include stable funding. The following photos show two mitigation examples. *Figures 64 and 65* show a vulnerable battery configuration and a seismically ready battery rack for emergency purposes, which provides a reliable power source. *Figures 66* and *67* show an existing high voltage power transformer that has been seismically braced. *Figures 68* and *69* show improperly anchored transfomers. Protecting power transformers and other equipment that is difficult to replace should be a high priority.

Figures 64 and 65: Batteries should not be on a wheeled cart as in the photo on the left. Emergency batteries, as well as other components such as generators and communication devices, should be braced on an anchored rack to withstand Cascadia earthquake forces as in the photo on the right. (DOGAMI photos)

Figures 66 and 67: Left photo shows the front view of an existing transformer with seismic anchorage including steel cross bracing as mitigation. The right photo shows the side view of the same existing transformer with diagonal bracing. (Photos: Leon Kempner)

Figures 68 and 69: The photo on the left shows high voltage transformers (orange color) in the CEI Hub that require proper anchorage. The close-up photo on the right shows that the transformer is anchored, but the anchorage was poorly installed or poorly maintained as evidenced by the amount of grout that is missing. (DOGAMI photos)

Tables 9, 10 and *11* provide mitigation examples for the liquid fuel, natural gas, and electricity industries. The examples are not meant to be comprehensive, but rather convey basic ideas of possible weak areas coupled with possible strengthening methods. Companies will need to consider each and every facility, structure or system in a prioritized manner. Mitigation programs can involve short-term, medium-term, and long-term activities.

Mitigation measures for the liquid fuel sector (Table 9) could entail improving the strength of the ground at existing piers or wharves to control ground deformation from liquefaction and lateral spreading of the foundation soils. Mitigation could focus on the tank yards because of the liquefaction-induced ground settlement potential. The underlying soils and the foundation of the

tanks could be strengthened, the bottom of the tanks could be strengthened, or new tanks could be installed. Pipes with rigid connections could be mitigated by adding flexible connections or rerouting the pipe configuration. Similarly, emergency shut-off valves could be added to the pipe network in strategic places to isolate fuel and control damages. Control buildings could be mitigated by structural upgrades to the building and non-structural upgrades, such as strapping computers. The last example is that the loading racks could be mitigated to improve the operation of the pumps by providing a connection for an emergency generator.

Liquid Fuel

Table 9: Mitigation examples

Liquid Fuel	**Component Example**	**Mitigation Option Example**
Piers and wharves	Ground deformation from lateral spreading of soils	Improve ground to control ground failure
Tank yards	Ground settlement of tanks from liquefaction	Strengthen tank foundation
Piping	Pipes with rigid connections	Add flexible connections
Control building (inside)	Operations room	Strap computers
Loading racks	Electrical for pumps	Add connection for portable emergency generator

Natural Gas

Table 10: Mitigation examples

Natural Gas	**Component Example**	**Mitigation Option Example**
Gate station	Ground deformation from soil liquefaction	Ground improvement using drains and grout
LNG storage facility	LNG tank	Install base isolation system
Control building	Uninterruptible power supply (UPS)	Remove wheels and anchor rack
Control building (inside)	Back up batteries	Strap batteries on earthquake resistant battery rack Figure 9
Transmission pipe	Transmission pipes at river crossing	Strengthen soils to prevent liquefaction and lateral spreading

Electricity

Table 11: Mitigation examples

Electrical	Component Example	Mitigation Option Example
Substation control building	Structural stability of building	Add exterior shear walls
Substation control building (inside)	Stability of control equipment	Brace tall cabinets and communication trays
Substation yard	Power transformer	Anchor to prevent sliding (Figure 10)
Substation yard	Bus support structure	Add flexibility and slack to power connections between equipment
Transmission corridor	Transmission tower at river crossing	Strengthen foundation system for liquefaction

Recommendation #3: Oversight by Homeland Security Council

To secure a stable energy supply, Oregon must provide a resilient supply chain during normal operations as well as during extreme crisis conditions, such as after a Cascadia earthquake. In addition to performing mitigation activities on energy facilities, vulnerabilities of essential transportation and telecommunication systems that support energy sector operations and recovery need to be addressed in order to ensure that the energy sector is not hindered by interdependencies with other critical infrastructure. DOGAMI recommends the State of Oregon's ***Homeland Security Council*** review the vulnerability of the critical energy sector in Oregon and consider action within the scope of their mission to improve the resilience of the system to natural disasters. Important considerations would include the energy sectors' interdependencies with each other as well as with the transportation, telecommunication, and other critical sectors. The Council could involve the EAP partners (ODOE, OPUC, and DOGAMI) as well as other agencies and commissions, including ODOT, Building Codes Division, and the Oregon Seismic Safety Policy Advisory Commission (OSSPAC). The Council could consider long term energy planning and goal setting efforts and requiring accountability on progress in seismic energy security and reliability.

Seismic Energy Security Efforts

As part of this study, the EAP partners considered who could ensure that adequate progress is being made towards achieving reliable energy sector services after a major Cascadia earthquake. We identified a number of existing relevant organizations that could address reliability of services in the energy sector. We concluded that the current efforts being made by existing organizations were inadequate as they mostly focused on emergency response and not on reliability of energy sector services. As an example, Oregon Emergency Management's (OEM) Oregon Emergency Response System (OERS) includes Emergency Support Function #12 — which focuses on restoration of damaged energy systems and components during a potential or actual emergency or major disaster (http://www.oregon.gov/OMD/OEM/plans_train/docs/eop/esf_12.pdf). We considered recommending the formation of a new group with this specific focus but quickly determined rather than creating another group, that tapping into an existing organization would be

preferable. We determined that group of a high-level individuals who could make major decisions and create new policies was preferred. As such, we identified the Homeland Security Council as the best option. Its membership consists of: (a) Four members from the Oregon Legislative Assembly; (b) The Governor; (c) The Adjutant General; (d) The Superintendent of State Police; (e) The Director of the Office of Emergency Management; and (f) Additional members appointed by the Governor who the Governor determines necessary to fulfill the functions of the council, including state agency heads, elected state officials, local government officials, a member of the governing body of an Indian tribe and representatives from the private sector (http://www.oregonlaws.org/ors/401.109). In May 2012, OPUC and DOGAMI met with the General Mike Caldwell, director of OEM, and OEM staff to explore whether or not the Homeland Security Council would be an appropriate group to take on this task. At the meeting, we learned that the Homeland Security Council had limited productivity, was recently downsized, but also received very positive feedback on it as a likely appropriate group to address seismic security of the energy sector.

The EAP partners initiated efforts to evaluate possible emergency land, air and river transportation routes, including by air reconnaissance with the assistance of the Civil Air Patrol (CAP), in August 2010. Based on the initial findings, DOGAMI recommends that the Council examine the transportation and telecommunication sectors to better understand and address shortcomings in critical operational interdependencies. Reliable critical transportation routes during earthquake disasters are vital for emergency response and recovery, including fuel distribution. Information on telecommunication frameworks and seismic preparedness guidelines are provided in Appendix C: Telecommunications: Seismic Codes and Guidelines.

The Council could work with Building Code Division, OSSPAC, engineering and construction industries and other key stakeholders to identify and rectify existing gaps in the seismic provisions of the current building codes. For example, the current codes do not require facilities that are operating well beyond their design life to be re-examined even when there are significant public safety concerns.

Recommendation #4: Build Oregon's Seismic Resilience

Oregon energy facilities are generally prepared for most natural hazards, such as localized severe winter storms. However, the energy sector is not prepared for a catastrophic Cascadia earthquake disaster. The CEI Hub is one critical part of a state economy that is within a disaster-prone area. If damaged, Oregon's economy could result with catastrophic consequences. To date, there are inadequate safety protocols to protect Oregon from significant earthquake impacts to the CEI Hub as this study has shown. On the state level, Oregon is considered to have low resilience to a major Cascadia earthquake.

In contrast, on a national level, the U.S. will be able to absorb the shock from a major Cascadia earthquake and tsunami. Oregon would be assisted by many others, including the federal government, the non-profit sector, and a variety of private companies. Many energy sector organizations that operate in Oregon would have extensive assistance from their own companies as well as other energy sector companies that have mutual aid agreements in place. In order to build seismic resilience for critical energy infrastructure operations and interdependencies in Oregon, we need to pursue the recommendations listed on the following pages. In additional to

the recommendations, Oregon can adopt a risk management strategy. The concept of "resilience," which is a relatively new term in disaster preparedness, is described below.

"Resilience" has a variety of definitions. One definition of resilience is the capacity of a system or a structure to absorb and recover from a shock (Bruneau et al, 2005; http://mceer.buffalo.edu/research/resilience). Resilience can be defined to include four elements:

1. ***Robustness*** - strength, or the ability of elements, systems, and other units of analysis to withstand a given level of stress or demand without suffering degradation or loss of function;
2. ***Redundancy*** - the extent to which elements, systems, or other units of analysis exist that are substitutable, i.e., capable of satisfying functional requirements in the event of disruption, degradation, or loss of function;
3. ***Resourcefulness*** - the capacity to identify problems, establish priorities, and mobilize resources when conditions exist that threaten to disrupt some element, system, or other unit of analysis (resourcefulness can be further conceptualized as consisting of the ability to supply material - i.e., monetary, physical, technological, and informational - and human resources to meet established priorities and achieve goals); and
4. ***Rapidity*** - the capacity to meet priorities and achieve goals in a timely manner in order to contain losses and avoid future disruption. (http://mceer.buffalo.edu/research/resilience/resilience_10-24-06.pdf)

In 2011, the National Research Council (NRC) released a report, *"National Earthquake Resilience."* This report included the following list and *Table 12* addressing resilience:

- Relevant hazards are recognized and understood.
- Communities at risk know when a hazard event is imminent.
- Individuals at risk are safe from hazards in their homes and places of work.
- Disaster-resilient communities experience minimum disruption to life and economy after a hazard event has passed. (NRC, 2011)

The National Research Council's report made these observations on what condition a state with high resilience should be in following a catastrophic earthquake:

- *No systematic concentration of casualties.* Important or high-occupancy structures (e.g. schools, hospitals, and other major institutional buildings; high-rise commercial and residential buildings) do not collapse, and significant numbers of specific building types (e.g. hazardous unreinforced masonry structures) do not collapse. There are no major hazardous materials releases that would cause mass casualties.

- *Financial loss and societal consequences are manageable, not catastrophic.* Damage to the built environment is reduced to avoid catastrophic financial and societal losses due to overwhelming cost of repair, casualties, displaced populations, government interruption, loss of housing, or loss of jobs. Community character and cultural values are maintained following disasters; there is not wholesale loss of iconic buildings (including those designated as historic), groups of buildings, and neighborhoods of architectural, historic, ethnic, or other significance.

- *Emergency responders are able to respond and improvise.* Roads are passable, fire suppression systems are functional, hospitals and other critical facilities are functional. It is noteworthy that during the 9/11 attacks, New York City's response was hampered by the need to set up a new Emergency Operations Center as the existing one had been located in the World Trade Center.

- *Critical infrastructure services continue to be provided in the aftermath of a disaster.* Energy, water, and transportation are especially critical elements. Telecommunications are also very important. Continued service is needed for critical facilities such as hospitals to function, as well as for residents to remain sheltered in their homes.

- *Disasters do not escalate into catastrophes.* Infrastructure interdependencies have been anticipated and mitigated, so that disruptions to one critical infrastructure do not cause cascading failures in other infrastructures (e.g. levee failures in New Orleans escalated the disaster into a catastrophe). Fires are quickly contained and do not develop into major urban conflagrations that cause mass casualties and large-scale neighborhood destruction.

- *Resources for recovery meet the needs of all affected community members.* Resources for recovery are available in an adequate, timely, and equitable manner. To a large extent, local governments, non-profit organizations, businesses, and residents would have already materially and financially prepared for a major disaster (e.g. are adequately insured; have undertaken resilience activities on their own and in cooperation with others). Safety nets are in place for the most vulnerable members of society.

- *Communities are restored in a manner that makes them more resilient to the next event.* Experience is translated into improved design, preparedness and overall resilience. High-hazard areas are rebuilt in ways that reduce, rather than recreate, conditions of disaster vulnerability (NRC, 2011).

Table 12: Resilience applications to social, ecological, physical, and economic recovery by time period. (National Research Council - NRC, 2011)

Timescale	Emergency Response	Health & Safety	Utilities	Buildings	Environmental /Ecological	Economic
Immediate < 72 hours	Tactical emergency response	Deal with casualties/ Reunite families	Use of emergency back-up systems	Remove Debris	Limit further ecological damage	Maintain supply of critical goods & services
Emergency 3-7 days	Strategic emergency response	Provide mass care	Begin service Restoration	Provide shelter for homeless	Remove debris	Prioritize use of resources/ substitute inputs/conserve
Very short 7–30 days	Selective response	Fight infectious outbreaks	Continue restoration	Provide shelter for homeless	Protect sensitive ecosystems	Shore-up or over-ride markets
Short 1-6 months	Assist in recovery	Deal with post-traumatic stress	Complete service restoration	Provide temporary housing and business sites	Deal with ensuing problems	Cope with small business strain
Medium 6 months–1 year	Reassess for future emergencies	Deal with post-traumatic stress	Reassess for future emergencies	Provide temporary housing and business sites	Initiate remediation	Cope with large business strain/recapture lost production
Long >1 year	n.a.	Reassess for future emergencies	Mitigation for future events	Rebuild & Mitigation	Mitigation for future events	Cope with business failures/ mitigation

For the EAP, DOGAMI developed the resilience triangle graph with the resilience triangle shown in green. (*Figure 70*) The basic principle of the resilience triangle is that the smaller the triangle, the higher the resilience. Higher resilience requires minimal reductions in critical lifeline services after a disaster, speedy recovery of those services, and an overall improved service level as a result of rebuilding damaged systems and implementing better systems. Chile and Japan have high levels of earthquake resilience on the basis of their performance after the 2010 magnitude 8.8 earthquake in Chile and 2011 magnitude 9.0 earthquake in Japan (notwithstanding the nuclear energy issues). At the current stage, Oregon's energy sector has low resilience and is expected to have significant loss of energy sector services and a slow recovery time.

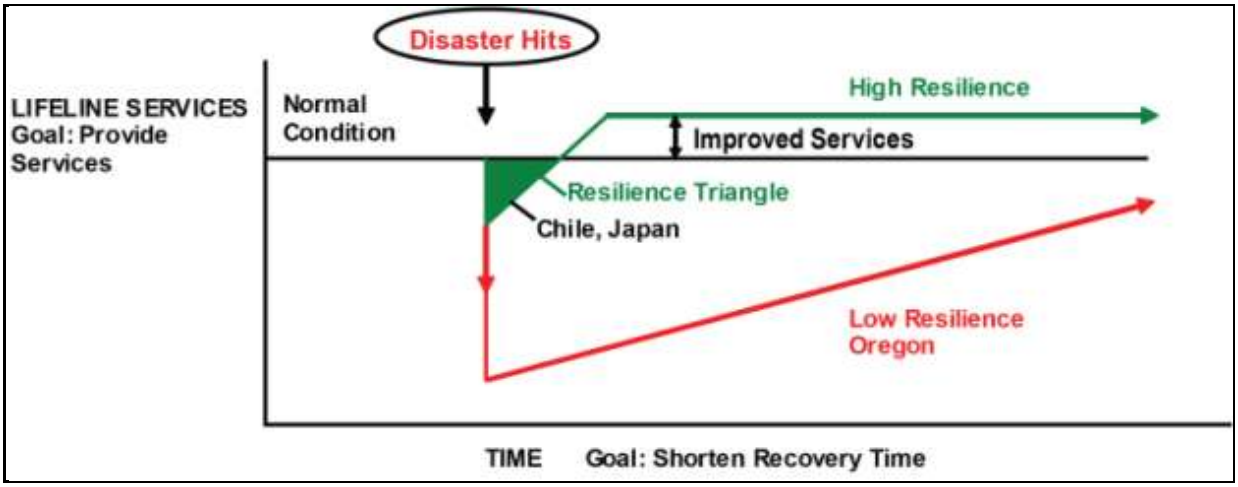


Figure 70: DOGAMI Resilience Triangle illustrates that high resilience is due to a combination of low losses, quick recovery and services improved to a higher level than before the disaster (DOGAMI modified from Bruneau et al, 2005)

Recommended Practices for Building Seismic Resilience

The following list is composed of suggested practices for energy sector companies. These suggestions are not prioritized and are not all-inclusive. The first four suggestions concern emergency response and recovery; the remaining suggestions pertain more to pre-disaster planning.

- Energy sector companies should have specific memorandums-of-understanding (MOUs) in place with energy sector organizations and nearby businesses/industries to assist one another during emergency situations. This would include MOUs with industry partners throughout the US who can be called upon for assistance. These MOUs must be in place and coordinated in advance of an earthquake.
- Energy sector companies should have essential spare parts readily available to repair damaged equipment and keep equipment operational. For example, electrical utilities should have an adequate supply of insulators on hand as insulators are susceptible to breakage during earthquakes. Oil companies should have fuel hoses available to keep equipment operational on a temporary basis.
- Energy sector companies should maintain safe conditions following a major Cascadia earthquake, and if necessary, have earthquake-resistant emergency generators, fuel cells or battery banks to power critical operations. Existing generators in flood prone areas may require relocation to higher points or placement in water-proof vaults.
- Energy sector companies should consider where they would set up company emergency headquarters if current facilities are unavailable. A reliable facility outside the CEI Hub and, perhaps, east of the Portland area, may be a good choice to serve as a control center following a Cascadia earthquake. The energy sector may want to establish a regional emergency operation center—perhaps a virtual clearing house—to help coordinate restoration of energy sector services.
- Both the public and private sector should assess what resources may be needed to continue critical energy operations following a Cascadia earthquake. They should

proactively make provisions to minimize the impact, rather than rely on a robust response operation. Existing entities, including the Department of Homeland Security (DHS) Fusion Center, DHS U.S. Coast Guard Area Maritime Security Committees, and the Oregon Emergency Response System Council should consider taking steps to reduce potential damage to the energy sector before a Cascadia earthquake, which requires partnering to ensure readiness.

- Energy sector companies should review and learn pertinent information from prior earthquakes, such as the 2004 magnitude 9.1 Sumatra earthquake, 2010 magnitude 8.8 Chile earthquake, and 2011 magnitude 9.0 Japan earthquake. Although it can be difficult to extract practical information depending upon the country and situation of the prior earthquake, two non-profit organizations provide sources of information on impacts from major earthquakes. These include: 1) American Society of Civil Engineers that publishes lifeline information, including the energy sector, on "Technical Council of Lifeline Earthquake Engineering" after major worldwide earthquakes (http://www.asce.org/Content.aspx?id=2147488653) , and 2) Earthquake Engineering Research Institute's (EERI) that has the Learning from Earthquakes Program (http://www.eeri.org/projects/learning-from-earthquakes-lfe/). The EERI focus is broad (geosciences, emergency response, building, and more).
- Energy sector companies should turn to industry-specific seismic documents to help evaluate and improve existing components and systems and design new construction. The goal is to reduce and control potential damage. For example, the Marine Oil Terminal Engineering and Maintenance Standards (MOTEMS) is a regulatory program implemented by California State Lands Commission that incorporates seismic safety for the liquid fuel industry's oil terminals. *Figure 71* shows a seismic instrument at a facility regulated by MOTEMS. The American Lifelines Alliance and American Society of Civil Engineers provide similar seismic guidelines for the electrical, natural gas and liquid fuel industries.
- Energy sector companies should look for engineering solutions that are industry appropriate. For example: Liquid fuel companies could construct new tanks and piping to withstand liquefaction hazards by strengthening the underlying soils, designing robust foundations and installing flexible piping connections. Seismically mitigation for existing important tanks could also be conducted. Natural gas companies could consider in-ground LNG tanks such as those commonly built in Japan. In-ground tanks can be designed to address buoyancy forces in liquefiable soils. Oil and gas companies could design their systems to be able to isolate certain blocks of areas using control valves in order to better control or contain damage. Isolating areas prone to liquefaction to prevent cascading damage is a possibility. Electrical companies could build micro-grids for important facilities or districts so areas could be isolated and continue to operate if the main grid goes down. A micro-grid in Sendai, Japan performed well after the 2011 earthquake (http://spectrum.ieee.org/energy/the-smarter-grid/a-microgrid-that-wouldnt-quit).
- Energy sector companies should determine target performance levels to provide service after a Cascadia earthquake, and in time, achieve those performance objectives. For example, after a winter storm, an electricity company may determine that a target performance level to restore 75 percent of customers' within 24 hours, 90 percent within 48 hours, and 100 percent within one week is achievable. Energy sector companies

should evaluate the cost to achieve the "target" by using sound methods (e.g., benefit cost assessments to verify that the upgrades are cost effective). Any targets that are discovered to be unachievable (e.g., after reasonable mitigation efforts have been made) after should be adjusted on an iterative basis. For a Cascadia earthquake, target time frames should be longer than under typical downtime events, due to the expected widespread damage and interdependencies. Seismic mitigation efforts and temporary workarounds should be factored into this target performance level. For example of a possible workaround, temporary piping or hoses can be installed to bypass damaged pipes for liquid fuel or damaged oil terminal piers to address for fuel supply and distribution services. Restoration goals would likely vary between the heavy commercial areas in the Portland metro area, the heavily populated I-5 corridor, rural areas, and coastal areas. As an example, after 10 years of mitigation implementation, a target performance level for electricity restoration might be set for the Portland metro area at 75 percent restored by 48 hours, 90 percent by 4 days, 95 percent after 1 week and about 100 percent after 1 month. For the coastal area above the tsunami inundation zone, the target might be at 75 percent restored by 5 days, 90 percent by 2 weeks, 95 percent after 2 months and about 100 percent after 4 months. (These restoration rates for electricity are not recommendations, but provided as illustrations.)

- Energy sector companies should institutionalize comprehensive seismic mitigation plans that include costs and implementation timeframes.
- Both the public and private sectors should improve the available redundancy in systems where little or no redundancies are currently available. For example, oil companies should explore building expanded or new fuel terminals on stable ground (i.e., not susceptible to liquefaction). Likewise, natural gas companies should consider building redundancy into the natural gas system south of the greater Portland metropolitan area. The proposed Palomar transmission line to connect an eastern Oregon natural gas pipeline in Molalla and the proposed LNG terminal in Coos Bay are two options under recent consideration.
- Energy sector companies with co-located facilities can look at joint opportunities to make ground improvements to mitigate liquefaction.
- Energy sector companies should discuss the length of time for restoring services with critical customers such as water treatment plants. If the projected restoration time is too long for critical customers, those customers might be encouraged to find other emergency power sources such as emergency generators with ample fuel supply or alternative energy sources. Similarly, energy sector companies could discuss the anticipated restoration time for geographic areas such as along the Oregon coast. It may be prudent to install systems for emergency electricity purposes in distributed geographic regions expected to have slower restoration of services, for example, in Coos Bay, Newport, and Astoria.

Figure 71: This photo shows an example of an oil company in California that is following best practices learned from other earthquakes. The white box contains an accelerometer that records site-specific data. Having the recorded ground motion data will allow engineers to better understand the performance of the structures at the oil terminal and help them evaluate the structural performance and improve future designs. (DOGAMI photo)

Risk Management Approach

A major Cascadia earthquake and tsunami will deliver a simultaneous shock to many of the energy systems that Oregonians depend on to support our lives and communities. As damaging as a Cascadia earthquake will be, prudent investments in resilient energy infrastructure can save lives, minimize a catastrophe and accelerate economic recovery. Creating resilience by using an earthquake risk management strategy is recommended. (*Figure 72*)

Earthquake risk management includes five components:

1. Hazard identification
2. Risk assessment
3. Engaging stakeholders
4. Risk prioritization, and
5. Risk mitigation.

The approach should be holistic and realistic— it is not possible to eliminate the risk of damage and impacts, but it is possible to reduce the expected damage to a controllable level. Because Cascadia earthquakes occur infrequently, adopting a long-term view of building resilience is reasonable.

Figure 72: Earthquake Risk Management Strategy (Wang, 2010)

As part of this project, DOGAMI, OPUC and ODOE (the EAP partners) promoted seismic awareness of Oregon's critical energy infrastructure. We developed productive relationships with other state agencies, federal agencies, energy sector companies, associations, emergency response organizations and other major stakeholders regarding seismic preparedness giving about 60 presentations. We conducted table-top exercises and extensive outreach, including:

- 2009 EAP partner hosted fuel sector table-top held at NWN headquarters
- 2010 DOGAMI testimony to House of Representatives Transportation Committee
- 2010 DOGAMI testimony to House of Representatives Veterans and Emergency Services Committee
- 2010 Interagency Hazard Mitigation Team meeting held at the Oregon Emergency Management
- 2011 Energy Assurance: Lessons from Japan's Earthquake Disaster symposium held at the Oregon Capitol. Sponsored by OPUC and DOGAMI, co-sponsored by Cascadia Region Earthquake Workgroup and Oregon Seismic Safety Policy Advisory Commission. Speakers included Senate President Peter Courtney, Representative Deborah Boone, Susan Ackerman (PUC Commissioner), Chris Goldfinger (scientist), Kit Miyamoto (engineer). Participants included Vicki McConnell (director of DOGAMI), General Mike Caldwell (director of OEM), Carmen Merlo (director of Portland Bureau of Emergency Management), Eric Corliss (COO of Oregon Red Cross).
- 2011 EAP partners joint presentation to Oregon Emergency Response System held at the Oregon Emergency Management
- 2011 Pacific Northwest Economic Region Annual Summit, Disaster Resilience Energy Assurance session, co-organized by Alice Lippert, Program Manager, the U.S. Department of Energy's Energy Assurance Program and co-moderated by Ken Murphy, the then FEMA Region X Administrator (http://www.pnwer.org/2011AnnualSummit/LongAgenda.aspx).

These efforts were minimal, however, considering the task at hand. In order to build resilience in Oregon's energy sector, it is necessary to increase awareness on the risk to the energy sector and Oregonians from a Cascadia earthquake. There needs to be a cultural shift by Oregonians to become an earthquake preparedness culture. More transparency and accountability in the energy sector on Cascadia preparedness is required.

Encourage a Culture of Earthquake Preparedness

Since the terror attacks in the US on September 11, 2001, Americans have become much more aware of and supportive of security precautions. Rather than wait for an earthquake disaster to strike, Oregon should take precautions today and become better prepared.

It is not a question of *if* a large magnitude Cascadia earthquake will occur, but *when* it will occur. This study has demonstrated that Oregon's CEI Hub is vulnerable to a Cascadia earthquake, and its failure will impact our supply and sources of liquid fuel, natural gas and electricity throughout Oregon. Oregonians have experienced gas shortages during the 1970s, and power outages during winter storms.. Following a Cascadia earthquake, there will likely be *no* gas available to the public for a considerable period of time. During a winter storm, power outages last hours to days long. After a Cascadia earthquake, many Oregonians could be without heat and electrical power for months.

Oregonians should heed this study's findings, that:

- A Cascadia earthquake will occur.
- Oregon's CEI Hub – where critical energy infrastructure is located in a six-mile stretch of land – is vulnerable to a Cascadia earthquake.
- Oregon's resilience to a Cascadia earthquake is low.
- Energy sector companies must adopt best practices and pro-actively integrate seismic mitigation efforts into their business operations to prepare their facilities and systems to absorb and recover from a Cascadia earthquake and to sufficiently restore critical electric, natural gas and liquid fuel services to Oregon homes, businesses and industries in a reasonable time period.
- More stringent oversight on seismic preparedness in the energy sector (liquid fuel, electricity and natural gas) may be needed. ###

Section 8
Acknowledgments

Funding for this project was provided the US Department of Energy (US DOE) under Award Number #DE-OE0000124 through the Oregon Department of Energy. Alice Lippert of US DOE was a most helpful supporter and partner. Oregon's Energy Assurance Project (EAP) members were invaluable partners, including JR Gonzalez (formerly Administrator of Safety, Reliability and Security Division), Rick Carter, and Immanuel Runnels (intern) from the Public Utility Commission of Oregon and Deanna Henry, Rebecca O'Neil, Ann Grim and Ken Niles (administrator, Nuclear Safety Division) from the Oregon Department of Energy. Special thanks to Deanna Henry and JR Gonzalez for their collaborative leadership role; Rebecca O'Neil for her project management; and Ann Grim for her invaluable support with technical writing. Support and guidance was provided by Don Lewis (formerly DOGAMI assistant director).

The report has been developed using a collaborative process and has been reviewed in its entirety, in sections and in various draft stages by persons according to perspectives and expertise. The following individuals, who do not necessarily endorse the conclusions or recommendations, participated in the review process: peer reviews were conducted by the EAP partners including Deanna Henry, Rebecca O'Neil, JR Gonzalez, and Rick Carter. Ian Madin of DOGAMI provided detailed review and editing. Peer reviews of the report summary were conducted by Brad Moyes of KPFF, Allison Pyrch of Shannon and Wilson, Tricia Sears of the City of Portland (former), and Edward Wolf, independent writer.

We thank the reviewers of the economic interdependency study, which is summarized in Section 3 and included in Appendix A:

- Stephanie Chang, Professor, University of British Columbia
- Hart Hodges, Professor, College of Business and Economics, Western Washington University
- Adam Rose, Professor, Coordinator for Economics, Center for Risk and Economic Analysis of Terrorism Events, University of Southern California
- Anne Wein, Economist, US Geological Survey

Contributors

We received contributions from many organizations and individuals, which have been grouped as follows: major contributors, federal agencies, state of Oregon, city of Portland, and organizations and individuals.

Major contributors

We thank the personnel from all of the major Oregon energy sector companies in the CEI Hub who collaborated with us on this project. Please refer to Table 1 to see a list of key individual contributors.

We received major engineering contributions from organizations and individuals, including from members of the American Society of Civil Engineers (ASCE) Technical Committee on Lifeline

Earthquake Engineering (TCLEE) on engineering specialty topics, including waterfront structures, liquid fuel facilities including tanks and pipes, electrical systems, and bridges. ASCE TCLEE members are denoted with an asterisk (*).

Waterfront Structures:
Martin Eskijian, California State Lands MOTEMS Engineering Branch Supervisor (retired 2012)
Kendra Oliver, California State Lands MOTEMS, Senior Engineer, Petroleum Structures
*Allison Pyrch, Shannon and Wilson

Liquid Fuel Facilities, including Tanks and Pipes:
*Tom Cooper, TW Cooper Inc, Consultant
Douglas G. Honegger, D.G. Honegger Consulting, Consultant
*Pete McDonough, Questar, Engineer
Tom O'Rourke, Cornell University, Civil Engineering Professor
*Solomon Tesfamariam, University of British Columbia, Civil Engineering Assistant Professor

Electrical Systems:
*Leon Kempner, Bonneville Power Administration (BPA), Structural Engineer
*John Eidinger, GE Engineering Systems, Consultant
*Anshel Schiff, Precision Measurement Instruments, Consultant

Bridges:
Bruce Johnson, ODOT, State Bridge Engineer
Albert Nako, ODOT, Bridge Engineer

Federal Agencies

Bonneville Power Administration (BPA)
Christy Munro, Ryan Egerdahl, Kim Leathley, Thorsten Bartling (formerly BPA), Erik Westman, Rodney Ross, Mark Jones, and Chris Robinson

Federal Emergency Management Agency (FEMA) Region X
Ken Murphy

National Earthquake Hazards Reduction Program (NEHRP) Advisory Committee on Earthquake Hazard Reduction (ACEHR)
Chris Poland and Tom O'Rourke

US Army Corps of Engineers
Don Chambers and David Scofield

US Coast Guard
William Clark and John Newcomer from Portland Sector

US Geological Survey (USGS)
Art Frankel, Evelyn Roeloffs, and Woody Savage (retired)

US Department of Transportation's Office of Pipelines and Hazardous Materials and Safety Administration (PHMSA) Western Region Office of Pipeline Safety
Hossein Monfared

State of Oregon

Senate President Peter Courtney and Cameron Smith from the Governor's office provided leadership support.

Oregon Emergency Management (OEM)
General Mike Caldwell, Dave Stuckey, Dennis Sigrist, Althea Rizzo, and John Lewis and members of the OEM Oregon Emergency Response System (OERS)

Oregon Department of Transportation (ODOT)
Nancy Murphy, Tova Peltz, Amanda Pietz, Jan Six, and Tony Stratis

Public Utility Commission of Oregon (OPUC)
Commissioners Susan Ackerman (Chair), John Savage, and Stephen Bloom

Oregon Seismic Safety Policy Advisory Commission (OSSPAC)
All the members of the commission provided support, in particular, Kent Yu of Degenkolb; Jay Raskin of Ecola Architects, Bryce Ward of EcoNorthwest, and Stan Watters of Port of Portland.

Oregon Building Codes Division
Richard Rogers and Steve Judson

Oregon State University
Chris Goldfinger and Scott Ashford

Oregon Department of Geology and Mineral Industries (DOGAMI)
Many staff members from DOGAMI including Director Vicki McConnell, Don Lewis (former), Ian Madin, Bill Burns, Deb Schueller, Tracy Pollock (former), and Geneva Beck

City of Portland

Carmen Merlo, Patty Rueter (retired), and Tricia Sears of Portland Bureau of Emergency Management (PBEM); Amit Kumar and Jason Butler-Brown of Development Services; Grant Coffey of Portland Fire Department; Teresa Elliott of Water Bureau; and David OLongaigh of Bureau of Transportation

Organizations and Individuals

American Society of Civil Engineers TCLEE members:

- Bill Byers, BNSF, civil engineer (retired)
- Reggie DesRoche, Georgia Tech University, Civil Engineering Professor
- Stephen Dickenson, New Albion Geotechnical Inc, Principal Engineer
- Curt Edwards, Psomas, Vice President
- Alexis Kwasinski, University of Texas at Austin, Assistant Professor
- Nason McCullough, CH2M Hill, Geotechnical Engineer

- Alex Tang, L&T Consulting, Consultant
- Mark Yashinsky, Caltrans, Bridge Engineer

Robert Dalrymple, Civil Engineering Professor, Johns Hopkins University
Dave Dittmer, Port of Portland
Bo Downen, Public Power Commission
Ken Goettel, Goettel and Associates
Seiki Harada, HMC
Brandon Hardenbrook, Deputy Director, Pacific Northwest Economic Region (PNWER)
Mark Koelling of Hayward Baker Inc.
Chuck Meyer, Western Electric Institute (WEI)
Kit Miyamoto of Miyamoto International
John Plechinger, PacifiCorps, Manager, Disaster and Risk Planning
Brett Phillips, PGE, Civil Engineer, Manager of Substation Engineering
Paul Schedler, PGE, Civil Engineer, Substation Engineering
Wayne Schulz, pilot, Citizen Air Patrol

Portland's Local Emergency Planning Committee **(**LEPC) and Emergency Communications for Hazardous Operations (ECHO) members provided assistance including John Shaw of Portland Community College; John C. Ratliff of Kanto Corporation; Brian Bailey, Siltronics, Jan Secunda; Darise Weller; and Edd Scott. Portland Harbor Community Advisory Group members provided assistance including Jim Robison, group chair.

Appendix A
Oregon Economic Interdependency Assessment of the Energy Sector

Scott B. Miles, Associate Professor, and Alexis Blue, Graduate Student, Resilience Institute, Western Washington University

The goal of the study included in this appendix was determine the economic interdependencies of Oregon's energy infrastructure with itself, broader critical infrastructure, and Oregon's commercial economy. This study characterizes critical infrastructure and commercial economy for the entire state at a county resolution. Characterizing the interdependencies quantitatively facilitates the general understanding of potential economic ripple effects of earthquake-induced disruption of energy infrastructure on the State of Oregon. The primary task of the study was to model the effects of lower sales of electricity, fuel and natural gas -- the three Oregon Energy Assurance sectors –to other critical infrastructure industries and the rest of Oregon's economy. Limitations in this study approach are discussed in the analysis overview.

The objectives of this study were the following:

1. Aggregate industries to represent energy and critical infrastructure sectors to characterize the interdependencies of power, natural gas, and fuel industries with other critical infrastructure industries, and Oregon's commercial economy
2. Develop an energy infrastructure-focused input-output table for the State of Oregon
3. Analyze the economic impacts of financial loss within the created energy infrastructure sectors for a range of energy infrastructure financial loss scenarios

Analysis Overview

The study used input-output analysis to understand economic interdependencies between energy infrastructure sectors and other sectors, as well as to estimate economic impacts of various energy infrastructure financial loss scenarios. The financial loss scenarios are used as a rough proxy for energy infrastructure disruption. The analysis described below does not model physical infrastructure disruption or cascading functional impacts.

The software tool and data set called IMPLAN by MIG Inc., was used to conduct the input-output analysis of this study (http://implan.com/). IMPLAN data is a compilation of data for describing employment, employee compensation, proprietary income, other property income, indirect business taxes, output, inter-institutional transfers, and household and government purchases. For this study, the data is reported at the state level, even though the data is available at a finer resolution. IMPLAN was used to model the impact of negative sales as a proxy for infrastructure disruption. IMPLAN models how this loss of sales and jobs flows back through inter-industry purchasing.

Interdependency Assessment

The interdependency assessment was conducted using the 2008 IMPLAN database (the latest dataset available at the time of the study) with no additional or modified data. IMPLAN data describes 440 North American Industry Classification System (NAICS) industry classes in the dataset. The 440 NAICS industries were aggregated into 19 sectors for the purpose of this

analysis. The first priority of the aggregation was to group industries associated with each respective energy infrastructure sector (petroleum, natural gas, and electricity), while grouping the remaining industries in sectors typically used in similar input-output studies. The energy infrastructure groupings were based on input and review from the Oregon EAP Team. The 19 sectors for grouping the 440 NAICS industries are listed in Table A1.

After aggregation, an input-output (I-O) analysis was conducted to produce the input-output table shown as Table A2. The inside 19 by 19 matrix of the table (labeled 1 through 19) shows amount of sales and purchases between the 19 sectors. The columns represent the purchasing of inputs (payments) to create the respective sector's products or services. The rows indicate the selling of outputs (receipts) by each sector. The second to last row, labeled "Value Added" indicates the combination of payments for labor, profits, and imports. The sum of all intermediate inputs plus value added equals the last row, labeled "Total Inputs." The second to last column of Table 5 is labeled "Final Demand," which includes sales to consumption (by consumers), investments, governments, and exports. Final demand plus the sum of all intermediate outputs equals the final column, labeled "Total Outputs." The value in the cell of the intersection of the last row and last column is referred to as gross output. Gross output is equal to gross state product (net output) plus intermediate consumption.

Table A1: Sectors in Interdependency Assessment

Note: * Value Added = Employee Compensation + Proprietor Income + Indirect Business Taxes + Other Property Type Income

The same information in Table A2, except for value added and final demand amounts, is provided in Figure A1 in graphical form, with the increasing dollar values represented by increasingly hotter colors from blue (cool) to red (hot). Note the hot colors, represent values of $100 million or greater, where maximum values listed in Table A2 are in the tens of billions. The threshold was chosen in order to easily visualize lower values.

Figure A2 presents the information of Table A2 in bar chart form to emphasize the relationship between each respective energy infrastructure sector and the rest of the Oregon economy to understand whether the particular energy sector is more or less dependent on the other 18 individuals sectors than each of the 18 sectors are on the respective energy sector. The outputs of each energy sector are represented by a dark color (blue for petroleum, red for electricity, and purple for natural gas, respectively) and inputs of the remaining sectors by a lighter respective shade. A higher dark bar (e.g., dark blue for 01 Petroleum) at the x-axis location of another sector (e.g., 08 Transport by Truck, represented by light blue) means that the transportation by truck sector purchases more petroleum than the petroleum sector purchases from the transportation by truck sector. In other words, the transportation by truck sector is more dependent on the petroleum sector than the petroleum sector is dependent on the transportation by truck sector. Figures A3, A4, and A5 show the same information as Figure A2 but include inputs and outputs for only one respective energy sector.

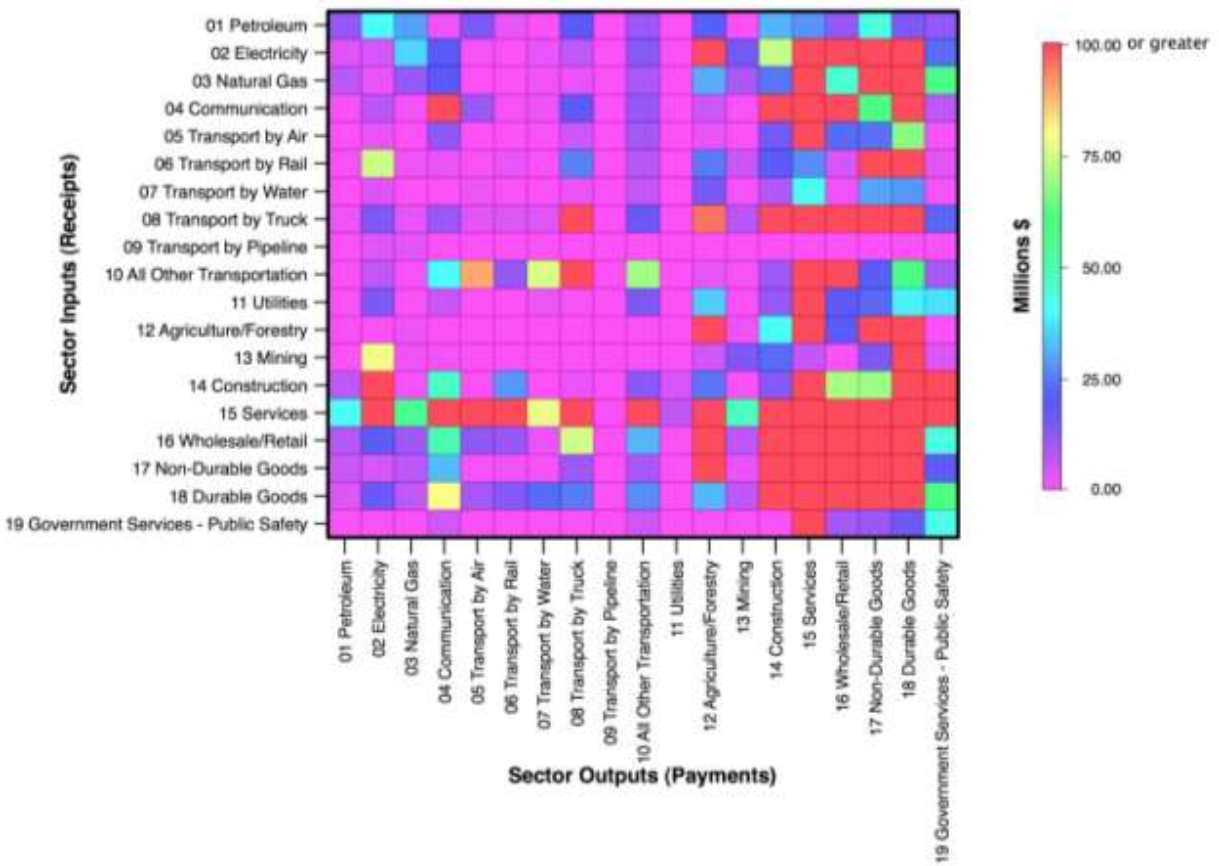

Figure A1. Visual representation of the input-output table of Table A2. Hotter colors (red, orange) indicate higher dollar value. Red indicates $100 million or greater.

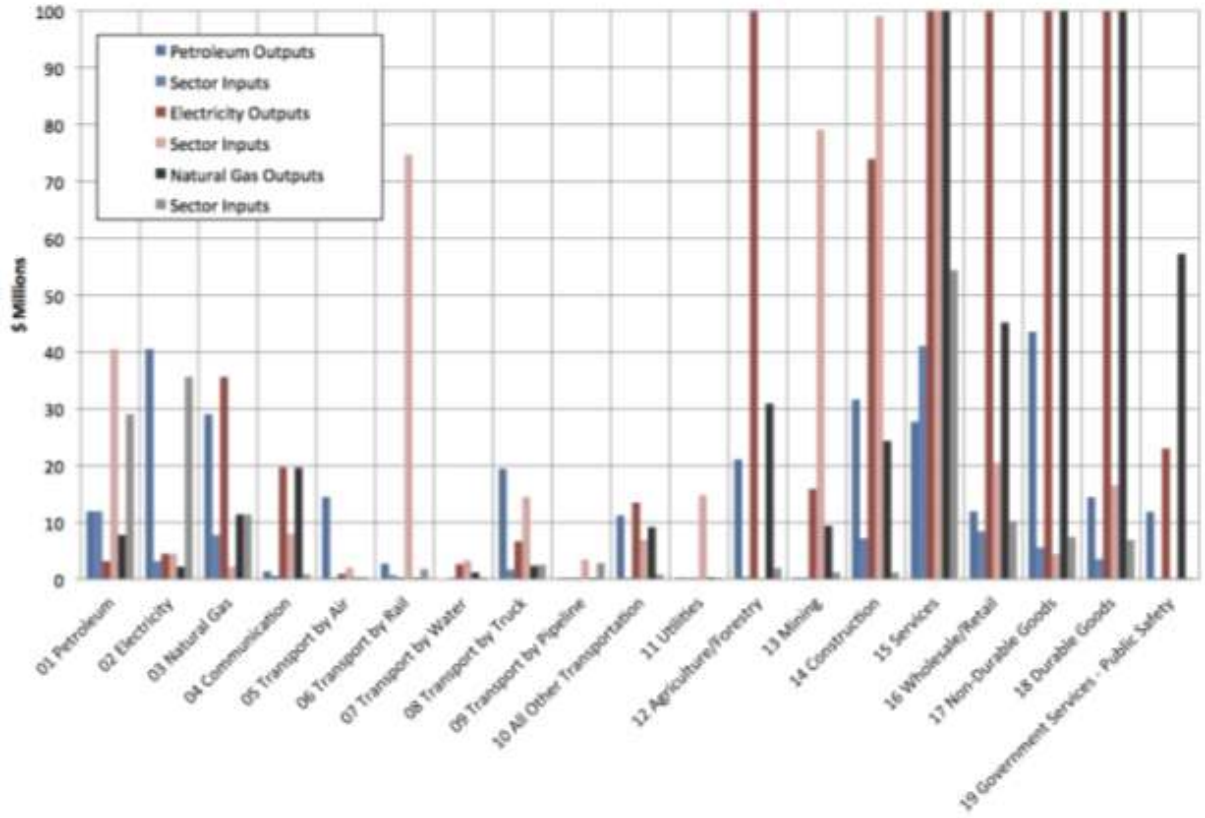

Figure A2. Petroleum, electricity and natural gas outputs (receipts) and inputs (payments) with respect to all analyzed sectors. Note: Vertical scale is capped at $100 million to facilitate comparison.

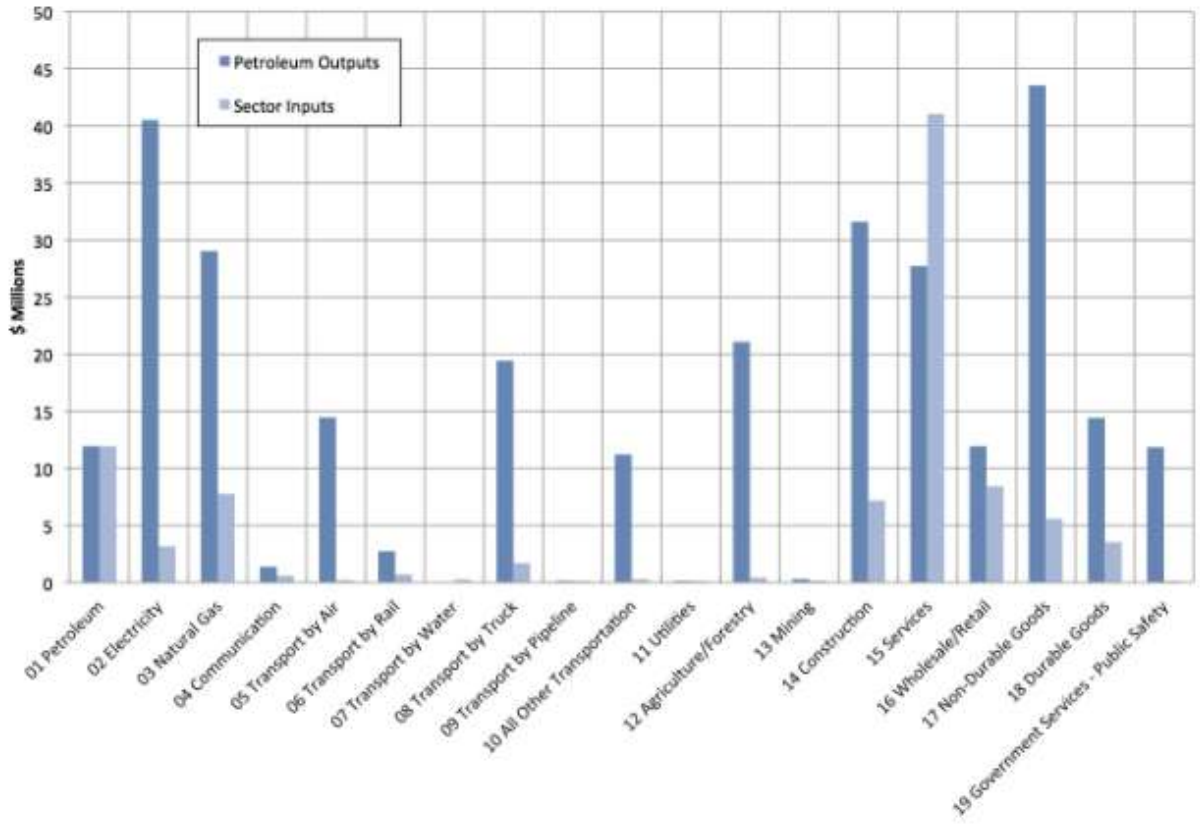

Figure A3. Petroleum outputs (receipts) and inputs (payments) with respect to all analyzed sectors.

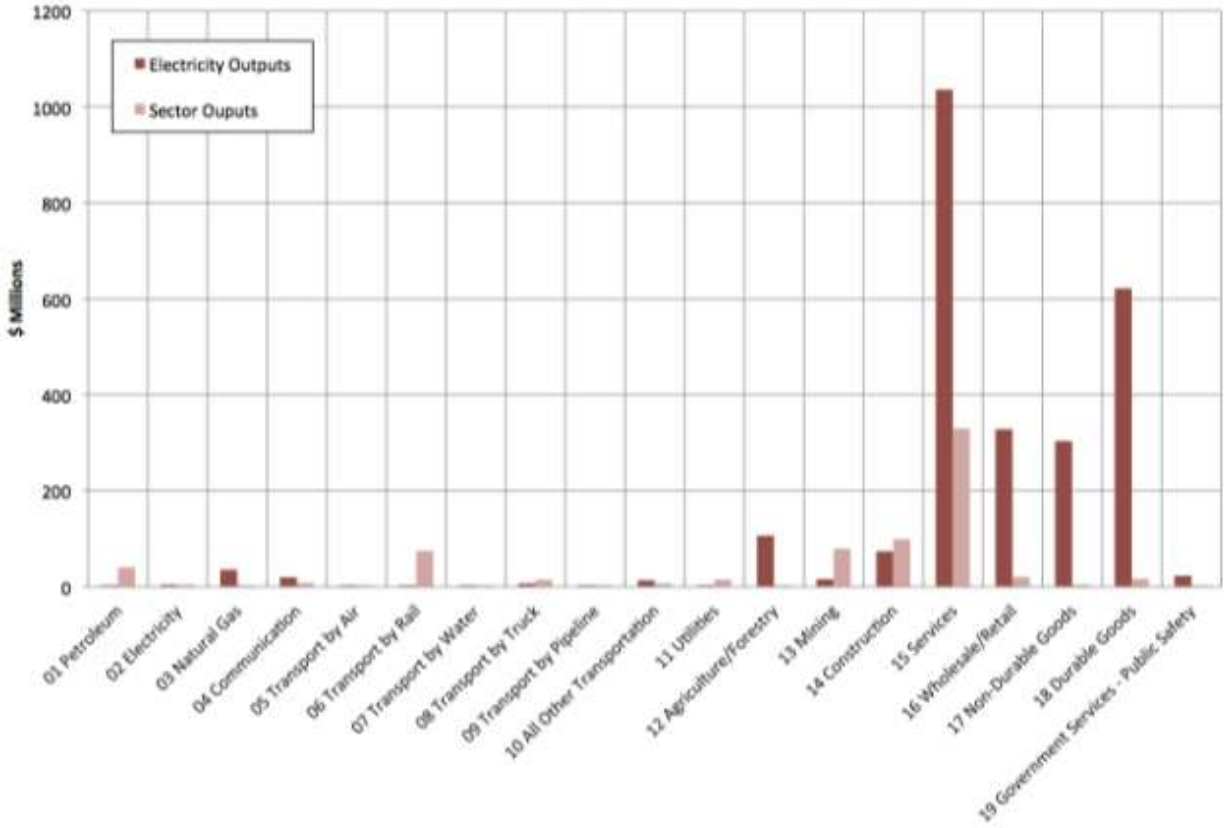

Figure A4. Electricity outputs (receipts) and inputs (payments) with respect to all analyzed sectors.

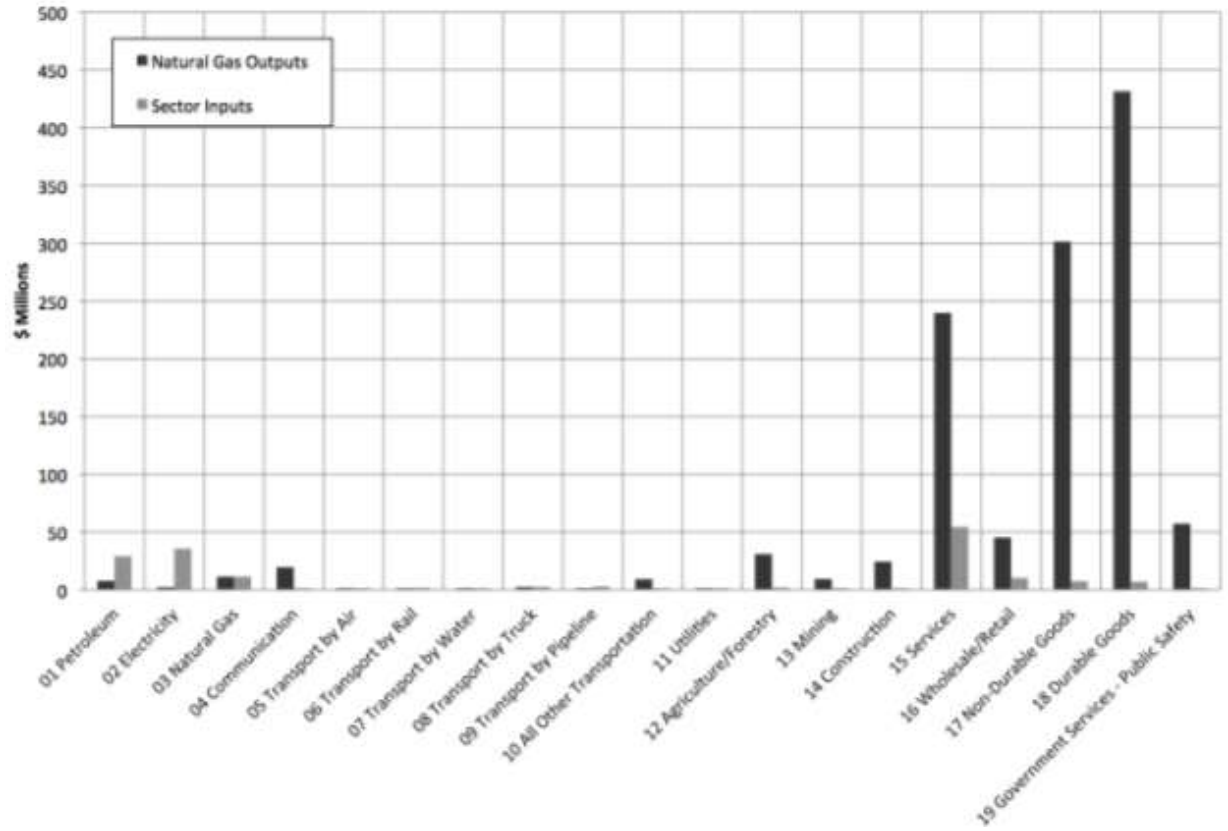

Figure A5. Natural gas outputs (receipts) and inputs (payments) with respect to all analyzed sectors.

Petroleum: Figures A2 and A3 show that the petroleum sector has relatively high unequal monetary relationships with several sectors. The electricity, natural gas, transport by air, transport by truck, other transportation, agriculture/forestry, construction, non-durable goods, durable goods, and government services are significantly more dependent on the petroleum sector than the other way around. The only other strong dependency of the petroleum sector on another sector is between it and the services sector.

Electricity: Figures A2 and A4 show that the electricity sector is more dependent on the transport by rail and mining sectors than the reverse. This is also minimally the case for the petroleum and construction sectors. Alternatively the agriculture/forestry, services, wholesale/retail, non-durable goods, and durable goods sectors are more dependent on electricity than the reverse

Natural Gas: Figure A2 and A5 show that there are strong monetary relationships with communications, agriculture/forestry, construction, services, wholesale/retail, non-durable goods, durable goods, and government services sectors are all more dependent on the natural gas sector than the other way around. The inverse is true for the petroleum and electricity sectors.

Impact Analysis

A suite of scenarios was developed to estimate the impacts of reduced levels of energy sector products being purchased *over the course of one year* (in this case 2008, the most recent year available for IMPLAN) as an approximate proxy for energy infrastructure loss. The impact analysis does not model the impact of physical or functional loss of the energy infrastructure, only loss of purchases of sector goods and services. The analysis also does not represent when within the year loss in purchases occurs. The results of the analysis are only representative of purchases loss within the year and don't include any losses in subsequent years. The scenarios analyzed using IMPLAN are summarized in Table A3. The values in Table A3 are percent reduction in purchases. In order to avoid divide by zero errors in IMPLAN, zero was approximated using a value close to zero. Table A4 lists, in the second column, the total output when each energy infrastructure sector purchases are normal (based on 2008 data in IMPLAN), which represents no hazard impact. The remaining columns to the right show the reduction in output for 75 percent, 50 percent, 25 percent and 0 percent of normal purchase levels to approximate hazard impacts.

Input-output analysis has some associated limitations in modeling economic impacts. For this particular application, again, input-output modeling does not model functional relationships of infrastructure. The loss modeled is financial in the form of reduced purchases of some good or product – in this case related to an energy infrastructure sector. Changes in inputs and, thus, outputs cannot be represented at any temporal resolution less than a year. Data for input-output analysis are only available a few years after the year the data describes. (In this case, the most recent data available are for 2008.) No consideration is made within the analysis for price effects, substitutions, or economies of scale. A basic input-output model, such as used here, is a demand-side model and so assumes that supplies are infinite. As a result, the absolute and relative financial relationships of purchases (inputs) and receipts (outputs) are reliable. The limitations in the context of modeling the influence of supply disruptions (such as a reduction of energy infrastructure service in a disaster) will results in significant under-estimation of actual loss. The predicted loss should be considered a lower-bound. Due to limitations of this interdependency model, the actual losses could be orders of magnitude higher because of supply-side and functional dependencies.

Table A3. Percent operability for the respective energy infrastructure sector

	Fuel	Electricity	Nat'l Gas
Baseline	100%	100%	100%
All 75	75	75	75

*The computations in the 0% scenario have been approximated and theoretically should be the negative equal value of the 100% scenario

Figure A6 shows the total impact (direct + indirect + induced) for all energy infrastructure loss scenarios. The three energy infrastructure types, as well as all infrastructure types simultaneously, are listed along the x-axis (all, electricity, natural gas, and petroleum) with each scenario listed in decreasing percent of operability (75%, 50%, 25%, 0%). The greatest amount of loss of any scenario is expectedly for all energy sectors with purchases 0% or normal for the year, at close to $7 billion dollars, with about $2.6 billion of that loss being non-direct (indirect + induced). The greatest loss associated with just one energy infrastructure sector is close to $7 billion (with about $2 billion of that non-direct loss) and is for the electricity purchases at 0% of normal scenario. Notice that the ratio between non-direct and direct loss is constant.

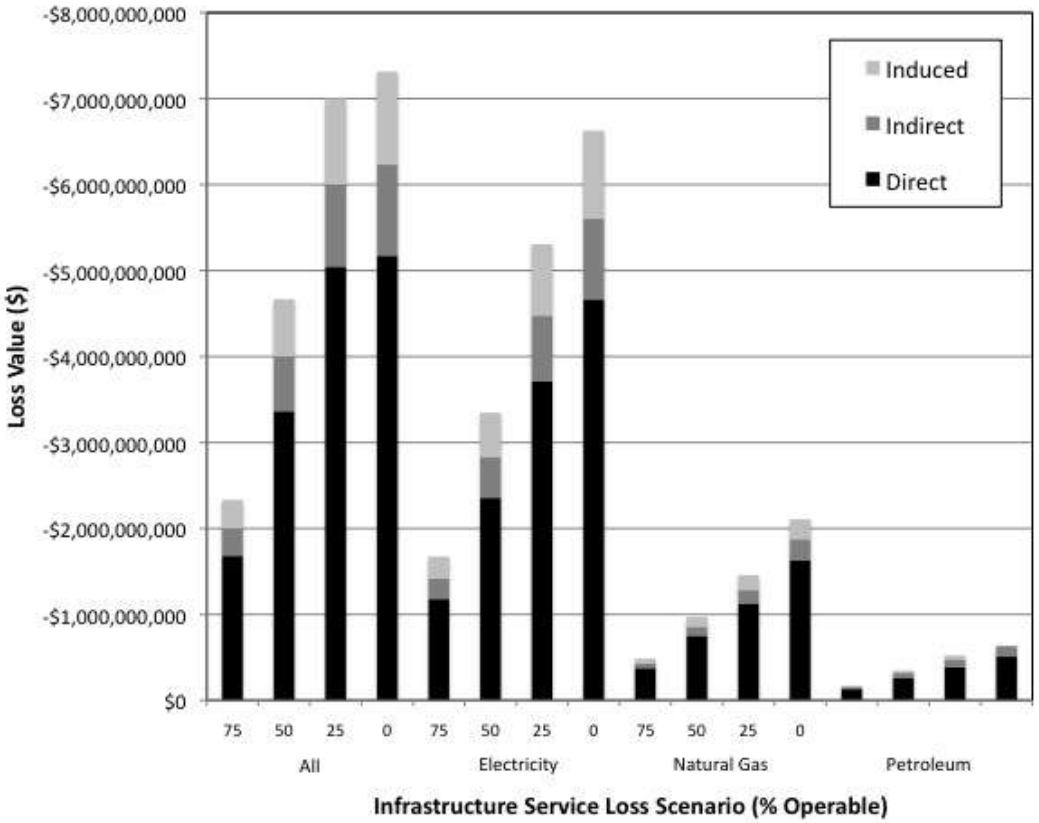

Figure A6. Total impact, including direct, indirect, and induced, for all energy infrastructure disruption scenarios.

Table A5 shows the indirect dollar losses and multipliers related to the disruption of each energy infrastructure (including all at once) with respect to output and employment. The second column of Table A5 shows the value in dollars of non-direct (indirect + induced) loss for each dollar of assumed direct loss. The direct loss is assumed as part of the energy infrastructure disruption scenarios. Thus, if $100,000 of direct loss were suffered for all energy infrastructure, an additional $39,000 would be lost as a result of non-direct loss. Similarly, the third column shows how many non-direct jobs are lost as result of one direct job lost. Thus if 1,000 jobs are lost as a result of disruption to all energy infrastructure, an additional 2,420 non-direct jobs would be lost. It is important to note that the two columns are not coupled. For example, $100,000 of direct loss to all energy infrastructure does not result in 242,000 non-direct jobs lost.

Table A5. Indirect Dollar and Jobs Loss Relationship For Energy Sectors. Data are preliminary.

	All		Petroleum		Electricity		Natural Gas	
Sector	In-Direct Loss for Every Dollar of Direct Loss	In-Direct Jobs Lost for Every Direct Jobs Lost	In-Direct Loss for Every Dollar of Direct Loss	In-Direct Jobs Lost for Every Direct Jobs Lost	In-Direct Loss for Every Dollar of Direct Loss	In-Direct Jobs Lost for Every Direct Jobs Lost	In-Direct Loss for Every Dollar of Direct Loss	In-Direct Jobs Lost for Every Direct Jobs Lost

If the available electricity, natural gas and liquid fuels were significantly reduced, then the non-direct dollar losses would have major socioeconomic consequences to Oregon. In the hypothetical scenario that 100% energy infrastructure is disrupted, a minimum of $0.39 of non-direct loss would be expected for every dollar of loss up to a maximum of the aggregate output value of the energy sectors. The sectors most impacted for this scenario are Services, followed next by Wholesale/Retail, followed by Construction, Non-Durable Goods, Electricity, Communications, Mining, Durable Goods, Petroleum, and Transport by Rail. The impact to Services is about an order of magnitude greater than the other sectors. For employment impacts, under the same scenario, a minimum of 2.42 jobs would be expected to be lost for every direct job lost in the energy sectors. Again, the greatest impacted by this scenario, by an order of magnitude, is the Service industry, followed again by Wholesale Retail, as well as Construction. The impact to services is very similar across the individual energy sector disruption scenarios. Most significant is the finding that the Electricity sector has the greatest monetary and employment impact potential of the three energy sectors.

The scenarios from this study have not been linked with specific studies of energy sector impacts from a Cascadia earthquake, and it is not possible to relate any of the modeled scenarios to estimated damage and losses to the energy sector due to a Cascadia earthquake.

Improving the energy sector's resilience to major disasters, in particular a Cascadia earthquake would require mitigation actions to reduce the restoration time of energy services. The total impact from a disaster to the energy sector would include the direct damage to the energy facilities, the loss of sales (such as by amounts as shown in the scenarios), non-direct losses and non-direct job losses (as shown in Table A5), and a multitude of cascading functional impacts, which would also potentially have economic impacts of their own.

Comparison with Other Studies

After the Northridge earthquake, Tierney (1997) found that after debris clean up, loss of electricity was the most commonly cited reason for business closure (Table A6). The most significant impacts were seen in the finance, insurance, and real estate industries (FIRE; classified as services in the current study) and construction. FIRE services were also impacted the most in the current study on Oregon energy disruption. In a study by Tierney and Nigg (1995) comparing the dependency of businesses to five types of infrastructure between Memphis, TN and Des Moines, IA with respect to potential (Memphis; earthquake disruption) and actual (Des Moines; 1993 Midwest floods) disruption. Table A7 (Des Moines) and Table A8 (Memphis) shows the results of that study. In both cases, businesses depend most on electricity, while depending on natural gas third most. Lastly, in the study of the business impacts from the 1993 Midwest floods, Tierney (1994) wrote the following, which provides further insight into the importance of energy infrastructure amongst other required business resources and the impacts of the services sector (FIRM) from these disruptions:

> Overall, electricity was rated as the most critical lifeline service by both large and small businesses, with the former considering electric service more important than the latter. Large manufacturing and construction firms and both large and small companies in the finance, insurance, and real estate sectors were more likely than other businesses to rate electricity as critical to their operations. While small businesses generally considered telephone service to be the second most critical lifeline, large businesses appeared to view telephones, water, sewer service, and natural gas as equally critical.

A study by Rose et al. (2007) on the economic impacts of electricity outage due to a terrorist attack on Los Angeles, CA found that the services sector was most impacted by a significant margin. This is not surprising as the input-output analysis found that services and manufacturing are the two main business users of electricity.

None of the above studies included direct dependence on liquid fuel. Looking at Table A6, one could conjecture that a few factors leading to business closure are related to lack of access to liquid fueling, putting disruption of fuel near the top of the factors. Even so, what studies have been done confirm the general validity of the findings of the current study and the importance of resilient infrastructure, as well as the significant economic impact that would arise due to energy disruption from a Cascadia earthquake in Oregon. The general lack of studies of the dependence of and impacts to businesses from energy infrastructure disruption suggests the importance and innovation of this study.

Table A6. Ranked factors determined to have lead to business closures after the 1994 Northridge earthquake (Tierney, 1997).

Reason	Percentage
Needed to Clean-up Damage	65.2
Loss of Electricity	58.7
Employees Unable to Get to Work	56.4
Loss of Telephones	49.8
Damage to Owner or Manager's Home	44.4
Few or No Customers	39.9
Building Needed Structural Assessment	31.5
Could Not Deliver Products or Services	24.0
Loss of Machinery or Office Equipment	23.7
Building Needed Repair	23.4
Loss of Inventory or Stock	21.9
Loss of Water	18.2
Could Not Get Supplies or Materials	14.9
Building Declared Unsafe	10.1
Could Not Afford to Pay Employees	9.5
Loss of Natural Gas	8.7
Loss of Sewer or Waste Water	5.3
Other	15.8
Number of Businesses That Closed	617

Table A7. Results of surveys to businesses in Des Moines IA asking the degree of importance on five types of infrastructure (Tierney and Nigg, 1995).

Appendix B
Lateral Spreading Sensitivity Study

by Steven Bartlett, PE, University of Utah and Yumei Wang, PE, DOGAMI

Introduction

The potential amount of ground deformation resulting from liquefaction-induced lateral spread in the Critical Energy Infrastructure (CEI) Hub in Portland, Oregon was jointly evaluated. The University of Utah was the lead modeler, and DOGAMI was the lead in framing the sensitivity study and provided some of the input variables including the geotechnical soils data. The evaluations were done using empirical equations developed by Youd et al. (2002) and by nonlinear numerical modeling using a finite difference computer program called FLAC (Fast Lagrangian Analysis of Continua) (v.5) developed by Itasca, 2005. The lateral spread evaluations were done using several earthquake time histories and slope conditions for two cases of soil conditions: (1) unimproved ground, and (2) improved ground. Unimproved ground denotes analyses performed for the existing ground conditions that have not been modified by any type of ground improvement technology. Improved ground denotes analyses that were done to estimate the potential reduction in lateral spread displacement that might be achieved by modifying the properties of the potentially liquefiable soil using some type of ground improvement technology (e.g., stone columns, rammed aggregate piers, etc.).

Seismic Input

The evaluations involved selection of representative acceleration time histories for magnitude 9.0 (M9.0) and magnitude 8.0 (M8.0) earthquakes and slightly adjusting them for use in the numerical modeling. A total of ten subduction zone earthquake time histories were considered for the final numerical analyses (Figure B1). Two of these are synthetic time histories obtained from Art Frankel of the US Geological Survey (1msoil and 1ssoil), and the remaining eight time histories are from other subduction zone earthquakes from the 1985 Chilean and 1985 Mexican earthquakes. Each candidate time history was analyzed using both of its horizontal components. All candidate time histories were scaled to a peak ground acceleration (pga) value of 0.3 g to be more representative of the expected strong motion for a 1000-year return period event (Figure B2). For example, the pga value for a deterministic Cascadia M9.0 event is about 0.18 g; however, when this event is considered in probabilistic terms at a 1000-year return period, the expected pga increases to approximately 0.3 g for rock and stiff soil sites. In addition to the 0.3-g scaling of pga, the candidate time histories were baseline-corrected to ensure that no artificial displacement occurs when analyzing the records in the numerical model.

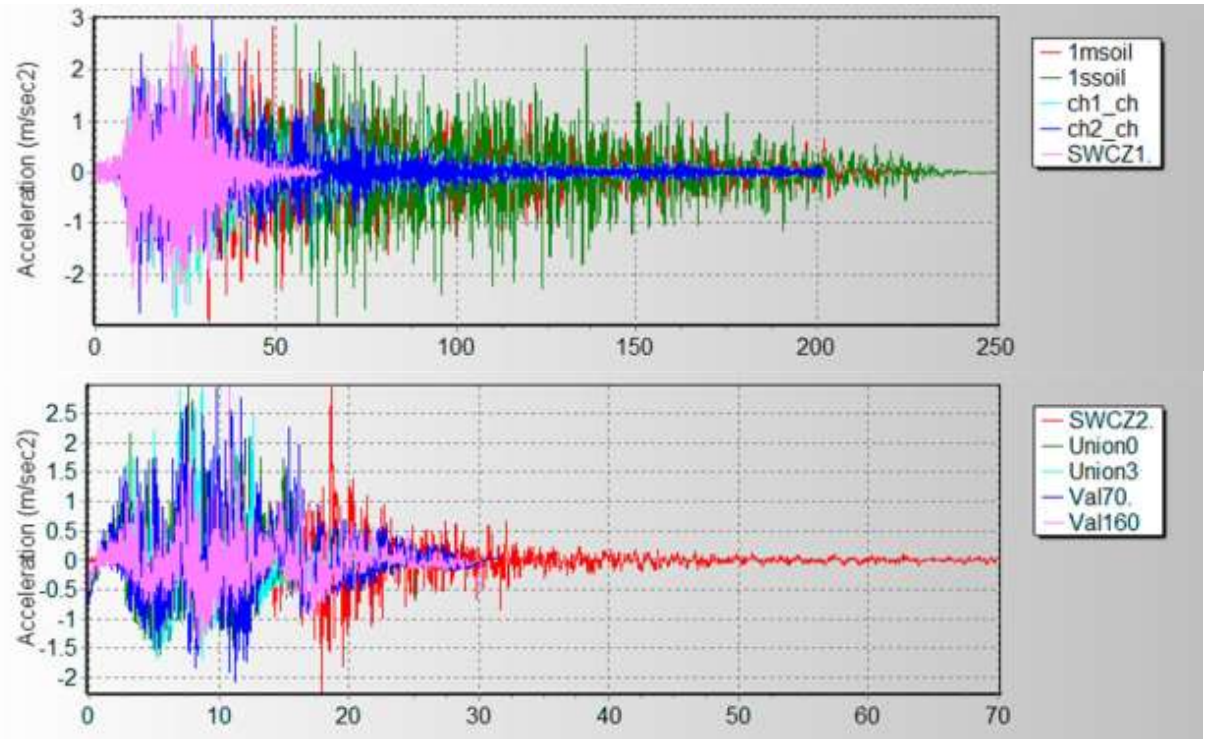

Figure B1. Representative time histories used in FLAC analysis

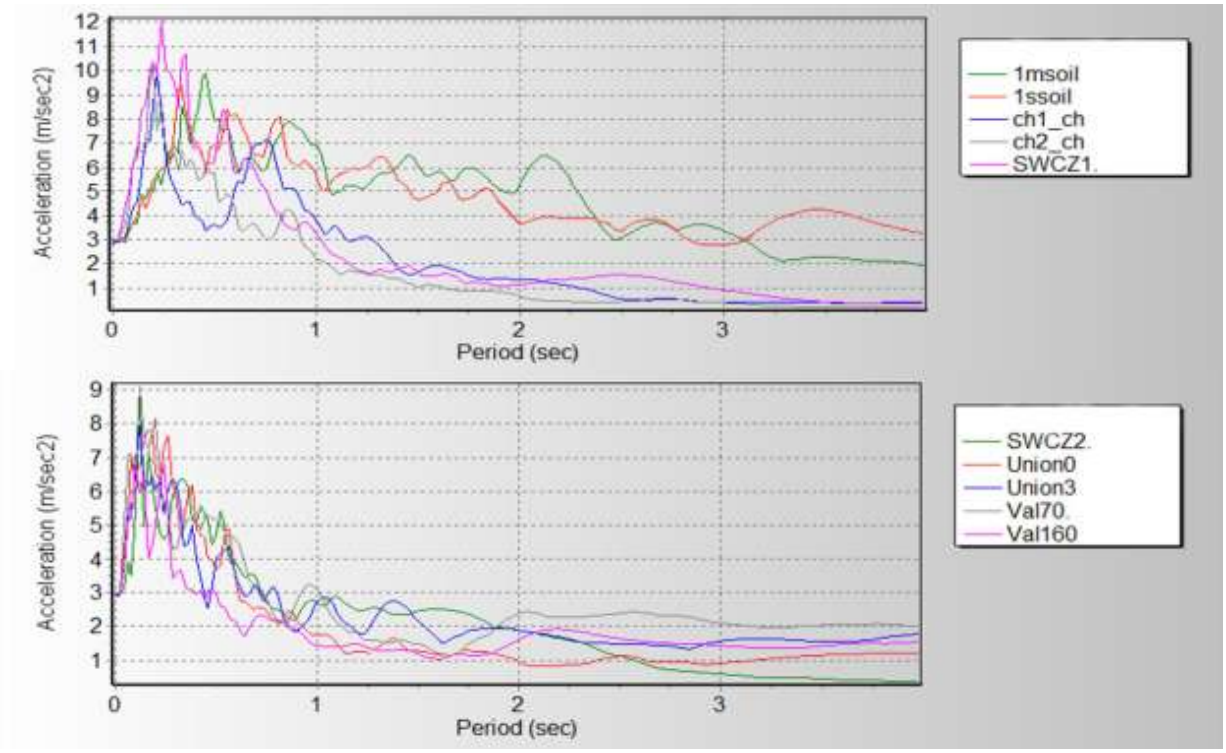

Figure B2. Acceleration response spectra for the time histories used in FLAC analysis

Subsurface Conditions

In-situ soil data from a BPA tower site in the CEI Hub were used to develop representative soil profiles and used in conjunction with other generic soil properties from the area (BPA, 2008; CH2MHill, 2006). Figure B3 shows in-situ soil data (cone penetrometer soundings) from the CEI Hub, which were used in the evaluations. From a lateral spread viewpoint, the primary zone of interest is that from about 21 to 46 feet deep. Much of this zone has q_{c1}values of 60 tons / sq. foot, and except for the zone between 38 to 40 feet, the soils appears to be granular and susceptible to liquefaction due to their low penetration resistance. (Note that materials with penetration resistance greater than 60 tons / sq. foot were not considered in the evaluations because they are probably not susceptible to damaging lateral spread displacement due to their higher density and strength.)

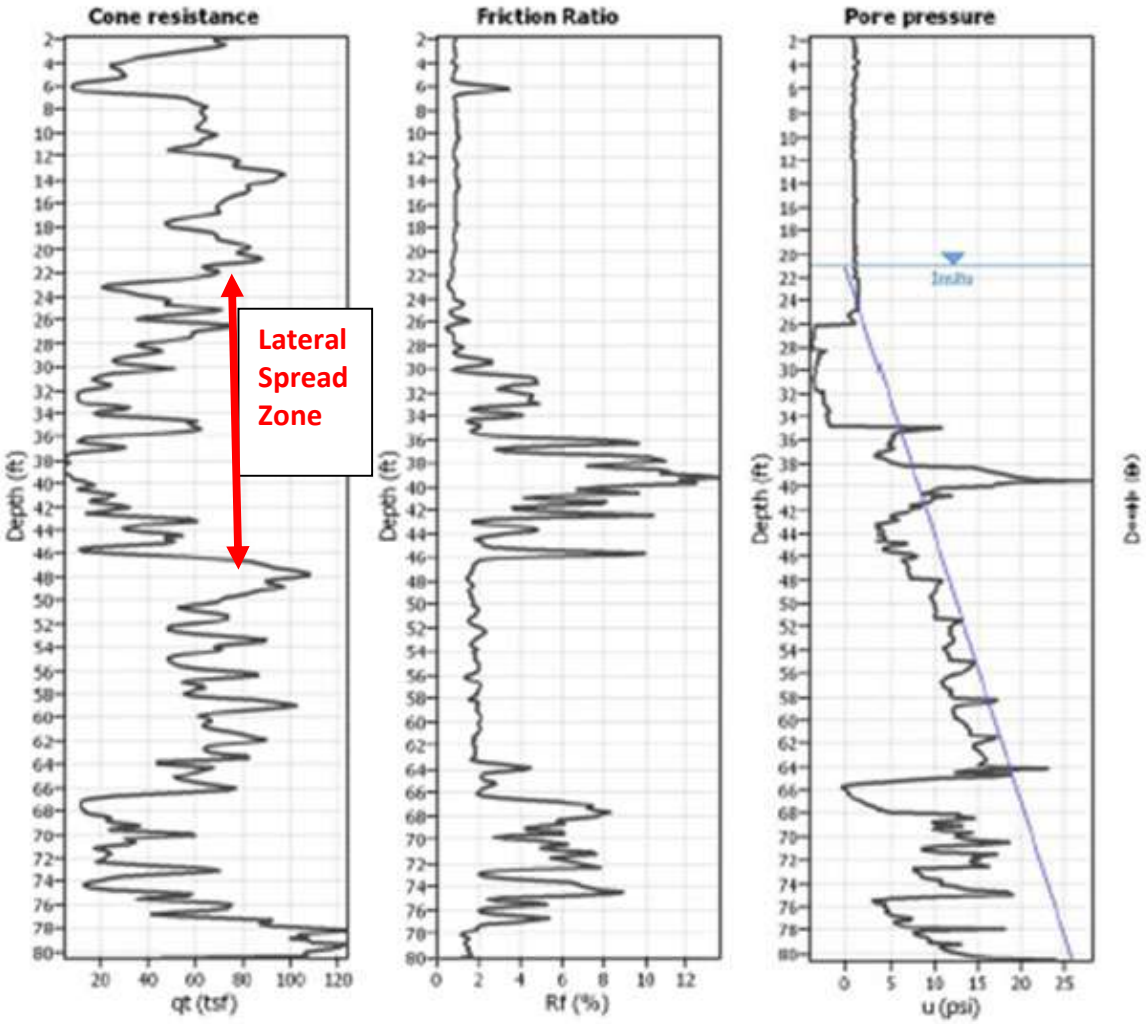

Figure B3. Soils layering and profile considered in FLAC analyses (modified from BPA, 2008)

Numerical Model

Figure B4 shows the FLAC cross sectional model that was used in the parametric analyses. It has the following dimensions 1,000 m wide; height at left and right edges was varied to evaluate a range of ground slope angles from 0.5 to 5 degrees; 5 m depth to ground water table; depth to base of lateral spread zone 12.5 m (41 feet) and 7.5 m (25 feet) of lateral spread zone. Note that because of the mesh spacing of the developed model, the lateral spread zone depth and thickness varies slightly from that shown in Figure B3. These slight differences do not significantly affect the modeling results.

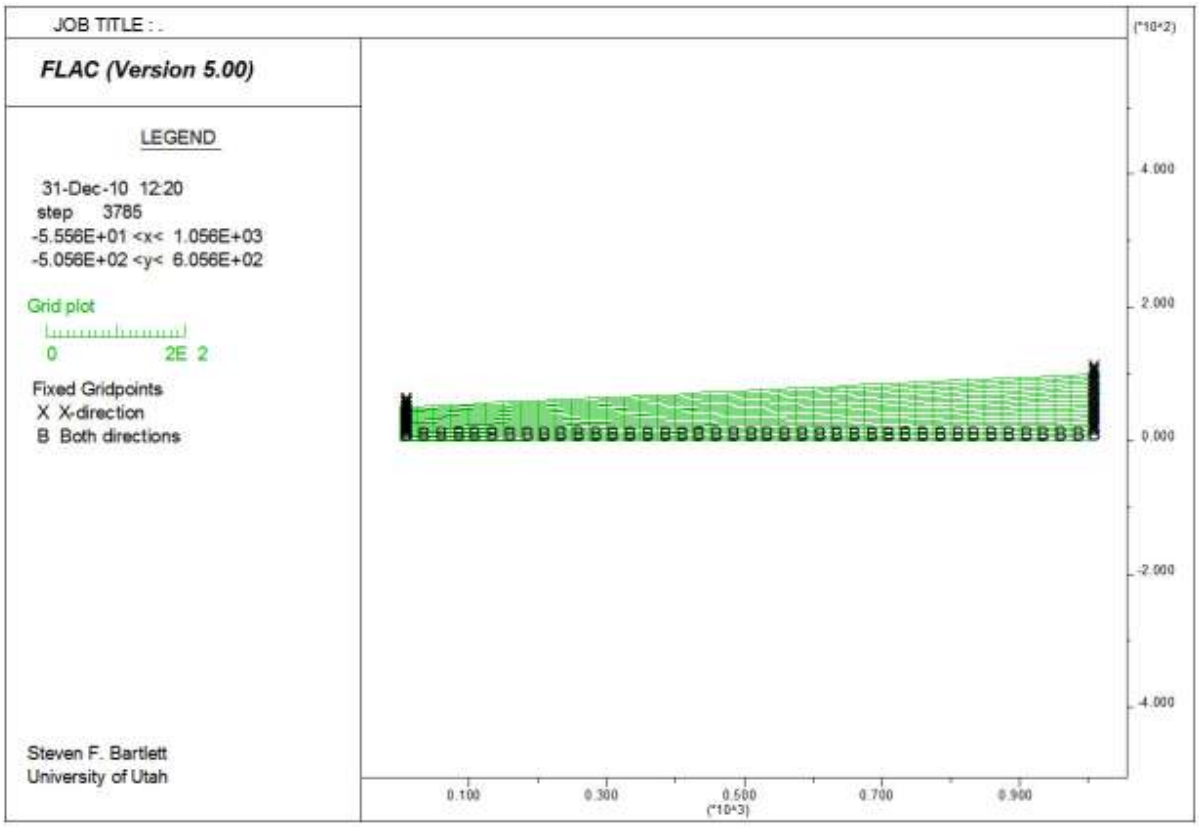

Figure B4. The FLAC model of a slope from the CEI Hub deformation analysis. This is an example run with the modeled slope gently sloping towards the left.

The following modeling approach was used to analyze the potential lateral spread displacement at the site:

- The model was first brought to static equilibrium for the groundwater conditions to calculate the state of in situ stress in the soil profile before the onset of the earthquake and liquefaction.
- The soil properties of the subsurface soils were set to a drained friction angle of 32 degrees and the initial (maximum) shear modulus was calculated based on a subsurface shear wave velocity of 150 m/s (500 feet/s).

- The candidate time histories were input at the base of the FLAC model and the earthquake motion was propagated through the model. Slight scaling of the time history was done to ensure that the 0.3 g was produced at the surface of the model without liquefaction effects present in the model.
- Each candidate time history was analyzed using both a positive polarity (+) and a negative polarity (-) to evaluate the sensitivity of lateral spread displacement to the polarity of the record.
- Liquefaction effects were introduced in the modeling using the following approach and assumptions:
    - Liquefaction is triggered approximately when the first 0.1 g acceleration spike is encountered in the candidate time history based on liquefaction triggering analyses.
    - Maximum shear strength and soil stiffness values for the soil profile were used at the onset of strong motion.
    - These values were linearly degraded to residual values to represent complete liquefaction at the time when the first 0.1 g acceleration spike occurred in the respective time history.
        - The initial shear modulus at the beginning of the earthquake record was degraded to 10 percent of its initial value at complete liquefaction.
        - The friction angle of the liquefied soil was degraded from its peak value of 32 degrees at the beginning of the earthquake record to 6 degrees when complete liquefaction was encountered. This residual value was selected because it allows the residual strength to be approximately 10 percent of the initial mean effective stress under hydrostatic conditions, which is a reasonable estimate of the residual strength for loose, liquefied sand.
- The lateral spread horizontal displacement was calculated for each of the candidate time histories. The slope of the FLAC model was varied from 0.5 to 5 degrees for each of the candidate time histories to account for potential variation of slope in the CEI Hub.
- The FLAC model results were also compared against displacements predicted from the Youd et al. (2002) regression equation to evaluate the reasonableness of the FLAC model.

Lateral Spread Displacement Estimates for Unimproved Ground

Using the modeling approach described above, a parametric study was conducted to estimate the order of magnitude and characteristics of the possible lateral spread displacement for unimproved ground. Table B1 shows the main parameters used in the study, as well as the deformation results for the various earthquakes and ground slope cases. In addition, the FLAC results are compared and complemented with empirically derived mean estimates of horizontal displacement obtained from the empirical relationships developed from the Youd et al. (2002) for M9.0 and M8.0 earthquakes (Figure B5). Note that Youd et al. (2002) found that actual

displacements can vary by a factor of 2 from the mean estimate. Thus for example, the upper bound lateral spread displacement for a 5 percent slope and a M9.0 event is approximately 10 m based on a mean estimate of about 5 m for that same event.

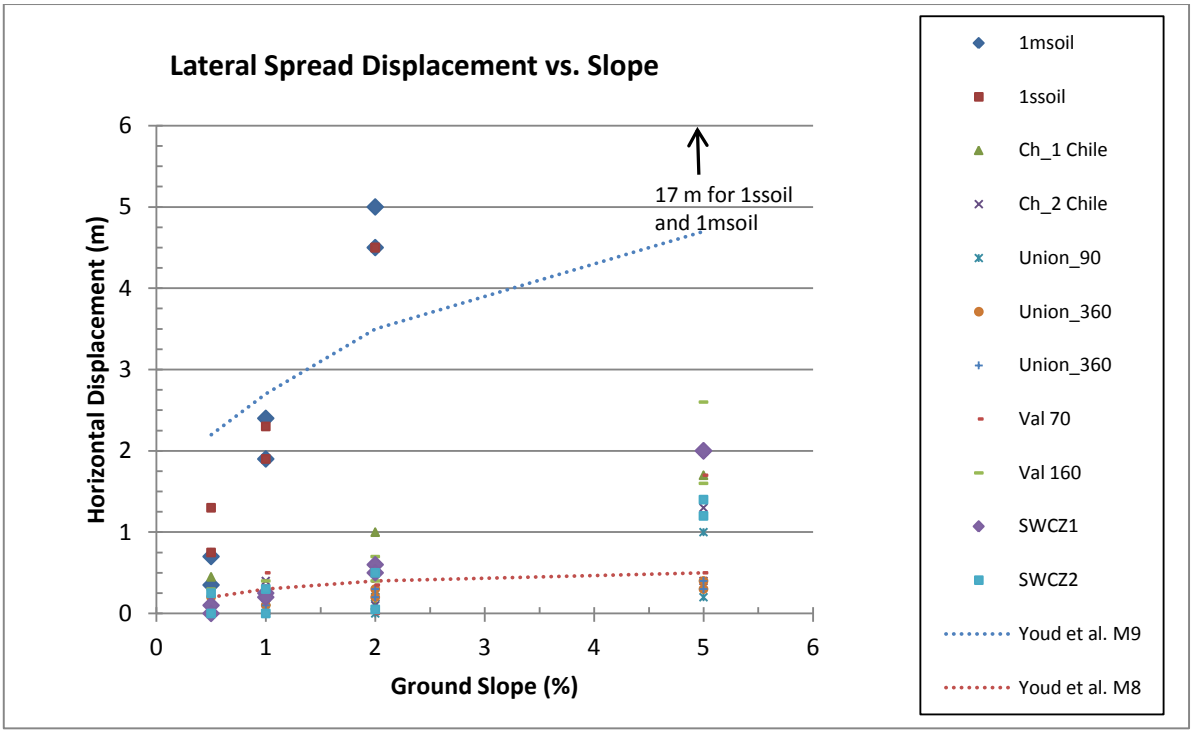

Figure B5. Estimates of horizontal displacement versus ground slope for M9.0 and M8.0 earthquakes compared with mean estimates from Youd et al. (2002) regression equation.

The FLAC modeling results for records 1msoil and 1ssoil produce about 17 m of predicted ground displacement for a M9.0 event on a 5 percent slope. This is somewhat higher than the 10 m upper bound estimated by the Youd et al. (2002) regression equation. The reason for the relatively large displacement produced by the FLAC model can be seen by comparing the magnitude and duration of the strong motion represented by histories 1msoil and 1ssoil with the other candidate time histories used in the modeling. The 1msoil and 1ssoil records both have strong motion duration that exceeds 200 s and ground accelerations that exceed 1 m/s^2 (0.1 g) for much of the record (Figure B1). The amplitude and duration of strong motion for these two records are notably higher than the other records used in the evaluations. Certainly the amount of lateral spread displacement would decrease if these records were used unscaled instead of the 0.3-g scaling that was used. However, we choose to use the scaled time histories for these events and evaluate the corresponding ground improvement needed to remediate the lateral spread, as discussed in the next section.

Lateral Spread Displacement Estimates for Improved Ground

The soil properties used in the FLAC model were modified to represent the case where the ground has been improved by some type of ground improvement technology. For these analyses, the soil properties were modified accordingly to represent the effects of improved ground in the lateral spread zone.

- The friction angle in the liquefied zone was increased from its residual value in the FLAC model to a value where deformations became small. From this, the shear strength required to ameliorate the lateral spread was calculated.
- The residual shear modulus for the treated zone was set equal to 30 percent of the initial unliquefied value of the shear modulus, G.
- The shear strength of the improved ground required to mitigate the lateral spread was uniformly distributed throughout the potential lateral spread zone.
- It was assumed that excess pore pressure generation from cycling (partial liquefaction) does not affect the shear strength of the improved ground.

The evaluation of improved ground was not repeated for all cases. Instead, representative time histories were used to estimate what treatment was required to mitigate the lateral spread hazard. The selected time histories were: (1) 1msoil, which was selected to represent a M9.0 event at a distance of 100 km, and (2) SWCZ1, which was selected to represent a M8.0 event at a distance of 100 km. These particular earthquake records were selected because they produced displacement near the upper bound displacement for the unimproved ground case (Figure B-5); hence they represent a conservative case to analyze the effects of improved ground.

The results of the improved ground evaluations presented in Table B-2. These analyses show that the improved soil must have a minimum composite strength of about 30 to 50 kPa (600 to 1000 psf) to mitigate the lateral spread hazard for a M9.0 event. The analyses also show that the improved soil must have a minimum composite strength of about 20 to 45 kPa (400 to 900 psf) to mitigate the lateral spread hazard for a M8.0 event. We anticipate that if these composite strengths can be obtained using ground improvement, then the expected lateral spread displacement will be 0.05 m (2 inches), or less. These preliminary evaluations were done using limited geotechnical data and simplifying assumptions. More detailed, site specific evaluations can be made for the individual facilities.

Appendix C
Telecommunications: Seismic Codes and Guidelines

All companies with facilities in the CEI Hub are encouraged to conduct seismic vulnerability assessments that include interdependencies on other systems, such as telecommunication systems. Telecommunication systems are not only important for communication systems, but also many different types of systems, such as pipeline and electrical systems, need telecommunications to operate. Telecommunication systems can help monitor and control data and systems so many systems are dependent on them. Seismic codes and guidelines for telecommunication systems are provided below. The list should be updated as new key references are made available.

Telecommunications

To increase service reliability, facilities should incorporate redundancy of wired, wireless and radio services (see figure; PBX = Private branch exchange for private telephone network)

Preface

This report addresses four questions about land in the Portland Harbor area. It supports the City of Portland's efforts to update its Economic Opportunities Analysis, plan for the land use in the Harbor area, and address issues related to the development and conservation of West Hayden Island.

ECONorthwest was the lead consultant to the City on this evaluation, assisted by subconsultants Maul Foster & Alongi, and Bonnie Gee Yosick LLC. This consultant team had substantial and appreciated assistance from many sources, but especially: City of Portland Bureau of Planning and Sustainability, Port of Portland, Port of Vancouver, Working Waterfront Coalition, and BST Associates.

Despite the assistance, ECONorthwest and its subcontractors alone are responsible for the report's contents. The report has been reviewed by City staff and an advisory committee, but the views expressed are those of the consultants and may not be shared by others who contributed to or reviewed this report.

Throughout the report ECONorthwest has identified sources of information and assumptions used in the analysis. Within the limitations imposed by uncertainty and the project budget, staff at ECONorthwest and the Bureau of Planning and Sustainability at the City of Portland have made every effort to check the reasonableness of the data, methods, and assumptions and to test the sensitivity of the results to changes in key assumptions. Any forecast of the future is uncertain. The fact that ECONorthwest and its team members evaluate the assumptions in this report as reasonable does not guarantee that those assumptions will prevail.

PSC Recommended Draft - June 2012
EOA Section 1 Appendix C

Summary

This evaluation starts from the assumption, embedded in the economic development policies of all local governments in the region, that the retention, expansion, and relocation to the region of industrial sectors is something that the region desires. It addresses the capacity of industrial land in the Portland Harbor area to accommodate future development, both for new public marine terminals and private marine-dependent businesses. It addresses *four questions posed by the City*:

1. Are the methods the City used to estimate the location and amount of vacant, partially vacant, and potentially buildable industrial land in the Portland Harbor area likely to yield reasonable estimates?
2. Given the estimated land supply in the Portland Harbor area, how suitable for a public marine terminal are the few sites identified by the City as having the best potential to accommodate such a terminal?
3. If those sites do not develop as marine terminals (for whatever reasons) to what extent can the Port of Vancouver play a role in accommodating forecasted cargo demand in the Portland region?
4. Finally, if existing vacant land in the harbor area and in Vancouver is estimated to be insufficient to accommodate forecasted or desired transshipment or industrial activity, what is the potential for more efficient use of industrial land in the Portland Harbor study area? That question implies answering the question: What does more efficient use of industrial land mean, and how would it be measured?

SUPPLY OF VACANT OR UNDERUTILIZED INDUSTRIAL LAND

The methods used for the City's evaluation of the supply of vacant land in the Harbor Area are sound, state of the practice, and produce results that have been confirmed by independent methods. When looking for where in the Harbor Area is vacant land that could potentially be assembled into a 100-acre (or, at a minimum, a 50-acre) site with waterfront access? the City correctly identified the two sites with greatest potential: Atofina and Time Oil.

POTENTIAL FOR MARINE TERMINAL SITES

Public marine terminals have specific land use requirements that are difficult to find. Ideally, sites must be large and flat, inside of an industrial zone, have significant shoreline on a navigable river, be served by both rail and truck, and free of contamination, wetlands, or other environmental constraints. Excluding West Hayden Island, there are no sites in the Portland Harbor that meet these ideal requirements, though there are a few sites that come close. This should not imply that West Hayden Island meets all the ideal site requirements (in fact West Hayden Island lacks sufficient truck access, and is constrained by wetlands), but is simply stating that the West Hayden Island site is outside the boundary of our study area. The questions are: how close do they come, and is there a way to cost-effectively develop these sites as productive public marine terminals?

The City of Portland identified the two sites in the Portland Harbor that are most likely to be suitable for development of a new public marine terminal: the Atofina site, and the Time Oil site. Of these two sites, development is technically possible on either, but there are major hurdles that would add significant costs. Both sites have some level of contamination, both sites would require negotiation and property acquisition from numerous property owners, and both sites are smaller than desirable, which precludes the possibility of an onsite rail loop. Ultimately, issues related to the Superfund cleanup of the Willamette River make all sites in the Portland Harbor very challenging (if not altogether unfeasible) for development in the near future.

ROLE OF VANCOUVER IN PROVIDING HARBOR-AREA INDUSTRIAL LAND

Recent forecasts suggest that under mid-range assumptions about cargo demand, the Port of Portland's existing marine terminals will reach the limits of their capacity (for at least some cargo types) in the next several decades. Once these facilities meet their capacity, the Port will need to develop new facilities, or else turn away demand. The Port of Vancouver shares many of the same attributes that make the Port of Portland an attractive place for marine shipping. Thus, the Port of Vancouver is a logical place to site new marine terminals, if sites are unavailable in the 4,000-acre Portland Harbor.

Projecting future land needs to accommodate demand for public marine terminals is difficult, and even the best forecasts suggest a wide-range of potential outcomes. Given mid-range (and presumably most likely) scenario for future demand, the Port of Vancouver may, in theory, have

enough developable land to accommodate regional growth in cargo volumes through 2040. The assumptions in variation of the mid-range forecasts show the Portland-Vancouver Region needing an additional 200 to 600 acres for new terminals by 2040: there is vacant industrial land with water-access that is in that range. In practice, however, competing demands for Port of Vancouver lands, policies and competition among affected jurisdictions, and the potential for higher growth in cargo volumes all make it possible, if not likely, that the land controlled by the Port of Vancouver would not be able to accommodate all of the regional demand for marine cargo. The "high" forecast of cargo demand, for example, is three times the mid-range demand.

From a regional perspective, it makes little difference whether terminal development occurs in Portland or Vancouver. Both cities function as part of the same regional economy, and share the same infrastructure and labor pool. At a local level, however, if demand for public marine terminals is shifted from Portland to Vancouver, the City of Portland would lose some industrial jobs and the income they generate to Vancouver.

POTENTIAL FOR INCREASED EFFICIENCIES IN THE USE OF LAND

Typical measures of efficiency of land use include employment, real market value, and built space. Harbor industrial development tends to have low floor-area ratios (FAR) and a relatively low number of jobs per acre. Thus, typical measures of efficiency would all tend to improve if industrial land were converted to other commercial uses. But industrial lands in general, and harbor lands in the case of this study, are clearly an important piece of the regional economy. Therefore, we suggest two alternative measures of efficiency that are more appropriate for harbor industrial land: value added and tonnage of cargo.

Data from recent years show some measures of economic output have been increasing faster than vacant land is being converted to developed land, and other measures have not. The region should continue to track these measures and adopt policies with the intention of increasing measures of economic output faster than vacant land is converted to developed land. This seems like an objective that could appeal to people with different interests: economic development, environmental amenity, or smart growth.

EOA Section 1 Appendix C

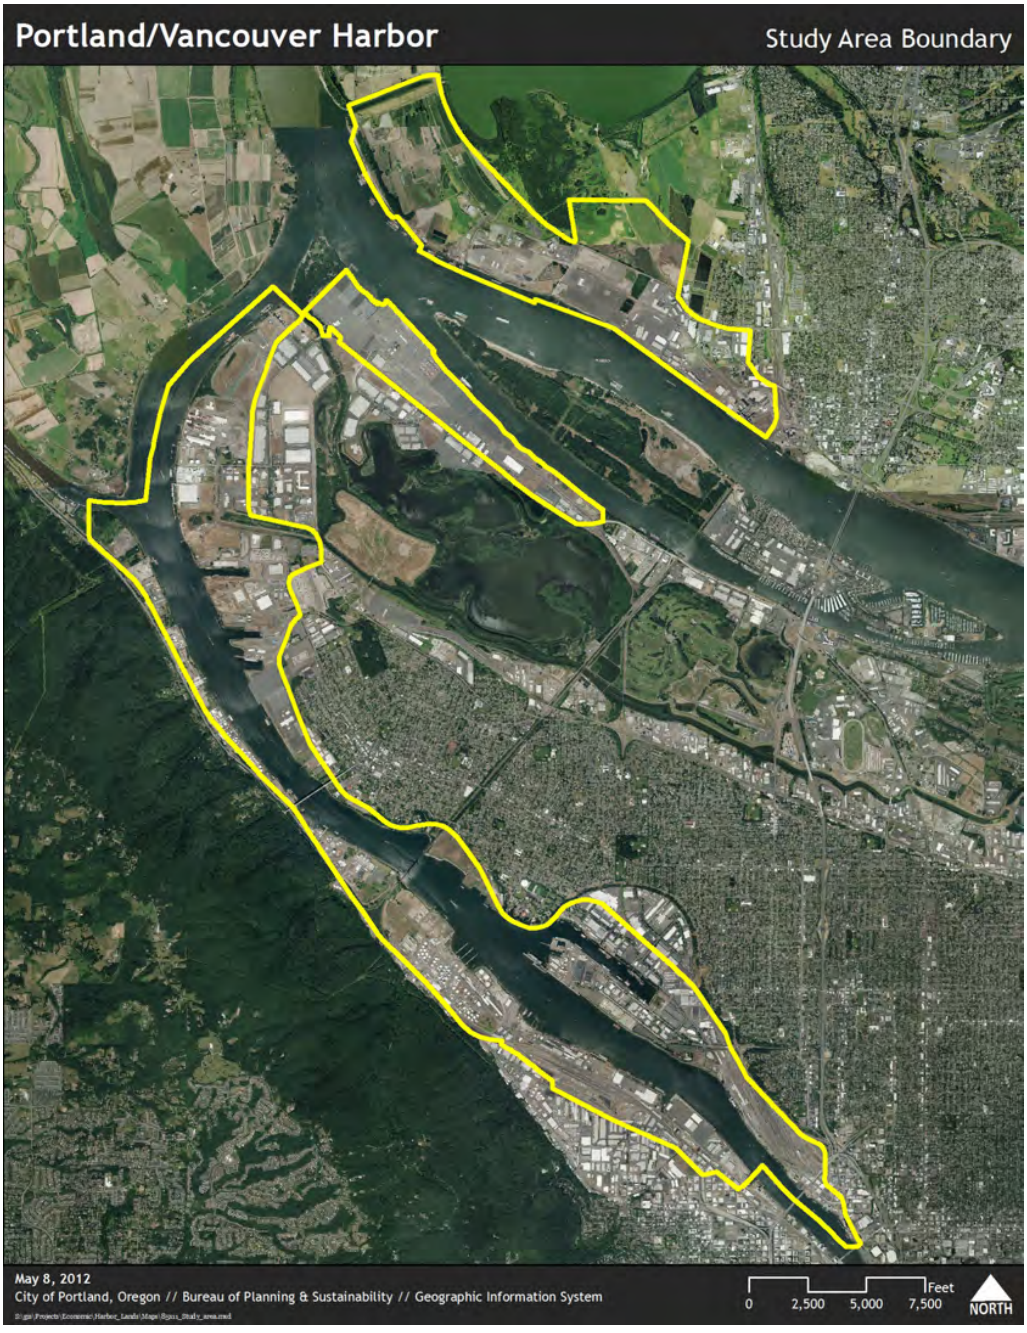
Chapter 1 INTRODUCTION

Section 1.1 describes events leading to this study and what the City hopes to learn from it. The City wants to evaluate the potential for the Portland Harbor to support economic activity. It has four questions about the capacity of land in the Portland Harbor to support future economic activity: (1) about the supply of vacant and underutilized land in the harbor area for marine terminals or water-dependent industrial uses; (2) about the land needs and potential land available for new port terminals; (3) about the role of Vancouver as a regional port; and (4) about potential changes in the use of industrial land (one aspect of which is referred to as "land efficiency"). **Section 1.2** describes how the rest of the report is organized.

1.1 BACKGROUND AND PURPOSE

The City of Portland (City) is the center of a large regional economy: there are about one million jobs in the seven-county metropolitan area, and almost 400,000 jobs within the city limits.



Many factors have contributed to the growth of the Portland economy, but one important factor is its ability to transport goods. Portland benefits from accessibility by highways (at the intersection of Interstates 5 and 84), rail (two Class 1 railroads - Union Pacific and BSNF, and short-line railroads), air (Portland International Airport), and sea (the Columbia and Willamette rivers).

The Portland Harbor is an industrial area located along the Willamette River that relies on the confluence of transportation infrastructure in the City (Exhibit 1.1). It contains about 4,000 acres of land located south of the Columbia River, west of I-5, and on both the east and west shores of the Willamette River. River-related industrial activities operate as a partnership between public marine terminals (owned and operated by the Port of Portland) and private businesses, including many marine-dependent industries. Key industrial sectors in the Portland Harbor include construction, manufacturing, warehousing, and transportation.

Over the past decade several studies of the Portland Harbor have been completed. The 2010 *West Hayden Island Economic Foundation Study* (prepared by Entrix for the City of Portland) summarized the conclusions of these studies:

> *"Portland Harbor serves as an economic engine for the metro regional economy… Past studies indicate that cargo and manufacturing activities dependent on waterborne transportation contribute significantly to the metro region's economy. These studies indicate that marine-related economic activity generates from 20,000 to 100,000 jobs and from $1.4 to 3.4 billion annually in regional income."*

Exhibit 1-1. Portland Harbor study area

Source: City of Portland, Bureau of Planning, 2011.

Another recent study, *Portland's Working Rivers: The Heritage and Future of Portland's Industrial Heartland* (2008 report prepared by Carl Abbott for the Working Waterfront Coalition) describes the impact of the harbor on the City. Some of its conclusions:

- The Portland Harbor is the nexus of a multi-modal system. The Willamette and Columbia rivers serve marine terminals, ocean shipping lines, barge lines, and bulk handling facilities. These waterborne facilities connect to railroads, interstates, commercial and general airports, and pipelines.
- Approximately 90% of harbor sites have access to rail routes, improving efficiency of transporting large loads from sea to land.
- Cargo forecasts by the Port of Portland further highlight the importance of the harbor: the volume of trade through Portland is expected to double by 2035.

In 2004, four river-related districts (Northwest Industrial District, Swan Island / Central Eastside, Rivergate, and Columbia Corridor) had employment about equal to the metropolitan area's three other industrial districts: the Sunset Corridor and 217 Corridor (where the electronics and computer industry is concentrated), and the Milwaukie/Clackamas Corridor (with a mix of manufacturing and distribution).

The importance of the harbor to the regional economy would be sufficient reason for the City to evaluate the harbor's needs for continued operation and expansion. But additional issues motivate the current evaluation. First, the City is in the process of concluding an extensive study of the City and regional economy (its *Economic Opportunities Analysis*, or EOA) as required by state land-use law. Second, the City has been engaged in studies of West Hayden Island, where there is a question about which land should be made available for future port development and which should preserved as natural areas.[1] Answering that question depends in part on whether alternative areas in or near the Portland Harbor study area have land that is appropriate and sufficient for the water- and port-related development that is expected or desired.

Thus, though several studies of development issues in the Portland Harbor area have occurred in the last five years, the City wanted an evaluation to (1) synthesize and evaluate the findings of previous studies as they relate to the harbor economy and industrial land uses, and (2) address three specific questions related to the development of industrial land in the Portland Harbor.

To that end, the City asked ECONorthwest (ECO) to re-examine the inventory of existing harbor lands, both in Portland and the broader region (including Vancouver). This report addresses the capacity of industrially-designated land in the harbor area to accommodate future development,

[1] A current proposal for West Hayden Island is to devote 300 acres of land for marine terminal development, while setting aside 500 acres for open space.

both for new public marine terminals and private marine-dependent businesses. It addresses four questions posed by the City, each new question building from the answer of the question preceding it:

1. Are the methods the City used to estimate the location and amount of vacant, partially vacant, and potentially buildable industrial land in the Portland Harbor area likely to yield reasonable estimates?
2. Given the estimated land supply in the Portland Harbor area, how suitable for a public marine terminal are the few sites identified by the City as having the best potential to accommodate such a terminal?
3. If those sites do not develop as marine terminals (for whatever reasons), to what extent can the Port of Vancouver play a role in accommodating forecasted cargo demand in the Portland region?
4. If existing vacant land in the harbor area and in Vancouver is estimated to be insufficient to accommodate forecasted or desired transshipment or industrial activity, what is the potential for more efficient use of industrial land in the Portland Harbor study area? That question implies answering the question: What does more efficient use of industrial land mean, and how would it be measured?

By answering these questions, this report helps the City move forward in its planning processes. It provides information to help with assumptions that the City's *Economic Opportunities Analysis* may be making about industrial land supply and the efficiency (density) at which that land is likely to develop. It helps the City assess the importance of West Hayden Island as a site for future development of new public marine terminals by evaluating the (limited) potential of suitable sites for such development elsewhere in the Portland Harbor.[2]

[2] This report does not, however, include any analysis regarding the applicability of its findings to state, regional or local planning policies: such information will presumably be provided as part of any additional analysis by the City.

1.2 ORGANIZATION OF THIS REPORT

This report has three additional chapters and three appendices:

Chapter 2, Framework and Methods: Summary of economic concepts underlying the analysis, and specific methods used to answer the four questions that are the focus of this report.

Chapter 3, Analysis: Current and likely future conditions for key factors affecting economic activity in the Portland Harbor.

Chapter 4, Summary of Findings: Briefly restates the important conclusions of our analysis.

Appendix A: Research Methods: Framework for understanding and methods for conducting our analysis (more detail than is provided in Chapter 2 of the main report).

Appendix B: Port Terminal Site Evaluation Criteria: Used by Maul Foster & Alongi, Inc. to evaluate the feasibility of potential sites in the Portland Harbor.

Appendix C: Analysis of Harbor Land Capacity and Demand, Portland and Vancouver: Provides greater detail (including a wealth of tables) on the data-driven methods used, in part, to determine the potential for the Port of Vancouver to accommodate forecast demand for the Portland Harbor, if there are insufficient sites in Portland to accommodate all of the expected demand.

Appendix D: Mapping Analysis: Presents the results of the City's visual survey of aerial maps of the Portland Harbor to classify the lands in one of several categories.

Chapter 2 FRAMEWORK AND METHODS

Section 2.1 discusses a *framework* for evaluation: concepts that underlie any evaluation of this type. It discusses (1) the role of industrial activity in the economy, (2) definitions of industrial use and industrial land, (3) factors relating to the supply of and demand for industrial land, and (4) the concept of land efficiency: what is it, why does it matter, and how is it measured. **Section 2.2** is more specific about the *methods* used for the evaluation (review of previous studies, secondary data, case studies, interviews) and how they are used to address this study's four questions. **Appendix A** provides a more detailed description of our framework and methods.

2.1 FRAMEWORK

2.1.1 WHY CARE ABOUT INDUSTRIAL LAND?

This study starts from the assumption, embedded in the economic development policies of all local governments in the region, that the retention, expansion, and relocation to the region of industrial sectors is something that the region desires. Industrial activity and employment is mainly classified as export oriented ("traded sector") and is likely to have jobs at higher than average wages.

2.1.2 DEFINING INDUSTRIAL LAND AND USERS

- **Industrial land:** What is commonly referred to as "industrial" land is land designated by a local government (in its comprehensive plan, and implemented by its zoning ordinances) to allow (but not necessarily require) industrial uses. In the Portland Harbor, the City does strictly limit non-industrial uses, and allows only river-related and river-dependent industry.
- **Harbor land:** A smaller subset of industrial land pertinent in this study is "harbor" land. For this study, we use the City's definition of the "Portland Harbor." A map of the Portland Harbor is shown previously in Exhibit 1-1.
- **Industrial users:** A recent analysis of industrial land published by the American Planning Association[3] used NAICS codes to define "industrial use" in urban areas, including a "strict" definition of construction, manufacturing, wholesale trade, and transportation and warehousing. This list, however, does not necessarily reflect the types of businesses that require industrial land. For example, many jobs in the construction industry are not physically located at a

[3] Howland, Marie. 2011. "Planning for Industry in a Post-Industrial World: Assessing Industrial Lands in a Suburban Economy." Journal of the American Planning Association. Winter, Vol 77, No 1. pp 39-53.

central, industrial location, but instead operate on sites throughout the region. Therefore, one should not focus exclusively on a list of NAICS codes to identify the range of businesses that could have demand for industrial land in Portland.

- **Public marine terminals:** Our analysis treats public marine terminals (i.e., the Port of Portland facilities) differently from other uses of harbor industrial land. These port terminals function as public infrastructure, facilitating economic activity for other industries in the region.

2.1.3 SUPPLY OF AND DEMAND FOR INDUSTRIAL LANDS

The total amount of land inside the Portland city limits is essentially fixed. Thus, for the City of Portland, the question of land supply focuses on how much land is vacant, partially vacant, or underutilized, and how much land is constrained (by environmental contamination, environmental overlays, and other issues).

In general, industrial land must accommodate most job growth in "industrial" sectors. It must also accommodate some job growth in "non-industrial" sectors. In other words, not all jobs in "industrial" sectors use industrially-designated land, and not all industrially-designated land is used by "industrial" sectors.

Analysis of land *supply* is about estimation, not forecasting. The use of "data layers" from Geographic Information Systems (GIS) is the standard technique for such estimation. Because it is estimation, the uncertainty is not about the future, but about the data and assumptions that are used to describe what is on the ground now. Our evaluation consists of a review of the data and assumptions.

Factors affecting supply and demand are not independent. Businesses and developers choose the land with the best value. Price makes a difference. In the Portland Harbor land may be more expensive (cost per acre) than at the region's periphery. But land in the Portland Harbor is also close to the downtown, labor markets, port terminals, and interstate highways. If it is only a little more expensive, it may still be a preferred location for growth. If it becomes too expensive, then prospective industrial users may locate elsewhere, on land that provides a better value (for example, because lower land cost and congestion are judged to more than offset the higher costs of being more distant from a preferred location). Businesses that need water access would have an incentive to bid more for land providing that access, and other businesses would find better value in alternative locations.

2.1.4 "EFFICIENT" USE OF INDUSTRIAL LAND

Efficiency is a measurement of how much output is produced per unit of input. In this case, the City's concern is about the amount of economic activity (output) generated per acre of land (input).

Traditional measures of efficiency

Typical measures of efficiency of land use include employment, real market value, and built space. These measures look at the amount of economic activity occurring on a property, but give relatively low marks to industrial development. Compared to an office tower, an acre of industrial development is likely to have much lower assessed value, employment, and gross square footage of built space. Thus, measures of the efficiency of employment land based on any of these measures in the numerator would all tend to improve if industrial land were converted to commercial uses.

But industrial lands (and harbor lands) are clearly important to the regional economy. If every jurisdiction allowed vacant industrial land to convert to commercial uses on the assumption that some other jurisdiction would provide the industrial land, the regional supply of industrial land would get smaller quickly. Land with port access is a particularly important and relatively rare component of all regional industrial land. Marine terminals provide access to other markets, facilitating commerce, and allowing traded-sector businesses to export their goods to other markets.

Alternative measures of the output component of efficiency

To evaluate the efficiency of the use of industrial land in the Portland Harbor, one needs a definition of efficiency that makes sense for industrial land. We suggest two alternative measures of efficiency that are most appropriate for harbor industrial land: value added, and tonnage of cargo.

- **Value added**: Value added is defined as the value of outputs (per unit or in the aggregate) minus the cost of inputs purchased from other firms used to create output.[4] Proponents of the industrial and manufacturing sectors point to its potential for high "value added." One measure of the efficiency of a fixed supply of industrial harbor land would be the amount of value added generated per acre for businesses located in the harbor.
- **Cargo:** There is a reasonable argument that much of the industrial land in the Portland Harbor area serves a regional need for

[4] In that sense, value added is a measure of a firm's contribution to GDP. Another way to think about this is that everything that a firm itself puts into the production of a product (primarily the labor of its employees and capital) "add value" to the raw materials and intermediate goods and services it purchases to make its final product.

transshipment. Therefore, a regional measure of transshipment activity might be appropriate for measuring the efficiency of such land. Some measure of cargo (e.g., tonnage, volume, value, berth utilization) is an obvious choice. Because data are more readily available for tonnage of cargo, that is an alternate measurement of land-use efficiency in the Portland Harbor that we examine in this report. If the City were interested in tracking these alternative efficiency measures in the future, then tracking multiple measures of cargo (i.e., tonnage and value) would provide a more complete picture of cargo trends.

2.2 METHODS

2.2.1 GENERAL DATA SOURCES AND TECHNIQUES

To conduct our analysis, we used the following data sources:

- **Existing studies**. Extensive analysis has been conducted regarding the Portland Harbor, industrial land, and port terminals. These efforts result in a library of reports and studies addressing different aspects of the regional economy. Appendix A includes a list of recent (or ongoing) studies that were reviewed in our analysis.
- **Secondary data sources**. ECO incorporated many secondary data sources into its analysis.[5] As with "existing studies," the objective is to leverage past research efforts to answer the questions posed in this study. Appendix A includes a list of the secondary data sources used in our analysis.
- **Interviews**: Many people in the Portland area have special knowledge of, and interest in, the Portland Harbor. ECO interviewed individuals from both the public and private sectors, and reviewed notes on past interviews that had been conducted for recent related studies.

2.2.2 EVALUATING CITY METHODS USED TO ESTIMATE PORTLAND HARBOR BUILDABLE LAND SUPPLY

ECONorthwest used the following methods to address this question:

[5] Secondary data sources are ones collected and readily available by someone other than the user (in this case ECONorthwest). Typical secondary sources are government agencies (e.g., U.S. Census, ODOT, Metro, Port of Portland).

- Review of studies summarizing industrial and harbor land supply: *Industrial Districts Atlas* (2004) and *Harbor ReDI Industrial Sites Analysis* (2009).
- Review of GIS shape files and cross-referencing to staff aerial analysis of harbor lands and Google Earth aerial photos (August 2011).
- Discussion of methods and BPS staff, and comparison to standard methods for developing land inventories and identifying buildable land.

2.2.3 ADDRESSING THE POTENTIAL SITES FOR NEW MARINE TERMINALS

To determine which sites might best accommodate a public marine terminal, we began by identifying the technical site requirements for a marine terminal. ECO interviewed representatives of the Port of Portland to identify their ideal site requirements, as well as which of these requirements could be reduced while still accommodating a working port facility. Members of the ECONorthwest team with experience running west coast ports looked for creative ways to adjust these site requirements to create a working terminal on smaller or otherwise constrained sites.

BPS staff identified sites that could potentially meet these criteria, based upon an aerial analysis of existing development in the Portland and Vancouver harbors.[6] ECO, reviewed the sites identified by the City of Portland, and toured the sites, conducting a visual inspection, documenting conditions affecting the suitability of each site for the proposed development.

2.2.4 ADDRESSING THE ROLE OF VANCOUVER IN HARBOR INDUSTRIAL LAND SUPPLY

We began by attempting a data-driven analysis. In principle, if we knew the capacity of existing marine terminals in Portland and Vancouver, and subtracted the forecast future demand for these areas, then we could identify the amount of demand that could not be accommodated by existing facilities. This demand (in tons of cargo) could then be translated into the acres of land necessary for new terminals to accommodate this growth. Comparing the required acres to support new terminals with the available land supply in the Portland Harbor and in Vancouver, we could identify how much of Portland's demand might need to be accommodated

[6] Aerial photos were taken in 2010 and 2011.

in Vancouver, and whether or not Vancouver had sufficient land to accommodate it.

This analysis established a high and low boundary for the potential land need. We also defined a "most-likely" scenario that falls between the two extremes. In order to give these numbers more context, and to help us arrive at the most-likely scenario, we conducted numerous interviews with representatives of the ports of Portland and Vancouver.

2.2.5 ADDRESSING THE POTENTIAL FOR INCREASED EFFICIENCIES

The City is interested in knowing if industrial land in the Portland Harbor can be used more efficiently in the future. To answer, we looked at recent economic trends in the Portland Harbor and in the City of Portland as a whole for changes in land-use efficiency for industrial users. For this analysis, we considered several measures of output in an efficiency measure: employment, real market value, value added, and tonnage.

We began by identifying all parcels in the Portland Harbor using GIS. We examined data from two different years: 2002 (one of the earliest years that data are available using North American Industry Classification System codes), and 2008 (the most recent year Quarterly Census of Earnings and Wages data are available). Comparing data from the two years we calculated the change in developed acreage in the Harbor, the corresponding change in real market value, and the net change in employment.[7]

We also collected data from different sources for two alternative measures of output (for the denominator): value added and cargo (volume, tonnage, and value). Unlike employment and real market value, data for value added and cargo tonnage is not tracked at a parcel-specific level. Instead, data is available at the regional, City, zip code or Census tract level. For our analysis, we used Port of Portland data on historical levels of cargo tonnage in the Portland Harbor, and the IMPLAN economic model for the zip codes that most closely align with the boundaries of the Portland Harbor for value added. We used the same years (2002 and 2008) as were used for other measures of efficiency.

[7] The time period used in this analysis, 2002 to 2008, does have limitations. Only having data for two years, doesn't allow for a detailed view of trends during the interim years. Moreover, a six-year period is relatively short, and may not be indicative of long-term trends. Nonetheless, these years allowed us to make the most efficient use of available data for our analysis. Moreover, the analysis focused on comparing how these different measures of efficiency changed relative to each other over the same period of time, and not on establishing long-term trends for each measure.

Chapter 3 ANALYSIS

Section 3.1 addresses whether or not the methods used by the City to estimate the location of buildable land in the Portland Harbor area yields reasonable estimates: it concludes that they are. **Section 3.2** addresses the potential for land in Portland Harbor (not including West Hayden Island) to accommodate a new Port terminal. It finds that the two areas that might have enough vacant land to be assembled into a development site of sufficient size are relatively constrained: they could, theoretically, accommodate small terminals of various types, but some of the costs of development would be high relative to alternative sites. **Section 3.3** addresses the potential for the Port of Vancouver to accommodate regional demand for expanded Port facilities. It concludes that under the most-likely scenario, the Port of Vancouver has about the right amount of land to accommodate the bulk of the region's forecast growth in marine cargo through 2040, but that alternative and reasonable assumptions lead to the conclusion that more land than what the Port of Vancouver now controls will be needed. **Section 3.4** addresses the potential for increased efficiency for the use of industrial land in the Portland Harbor. It concludes that value added and tonnage of cargo per acre are more appropriate than traditional measures of efficiency for harbor industrial lands, and that recent historical trends demonstrate the Portland Harbor has become more efficient by most efficiency measures.

3.1 EVALUATION OF METHODS USED BY THE CITY TO ESTIMATE BUILDABLE LAND

The question is whether the methods used by BPS to identify vacant and buildable land are likely to be accurate. Will they systematically over or under estimate the land supply? In particular, are they likely to miss areas of vacant, buildable land that are big enough for a marine terminal (sites of at least 50 acres of contiguous vacant of underutilized land that has river access and could be serviced)?

To begin to answer these questions, we looked at recent studies that sought to determine the supply of buildable land in the Portland Harbor. Exhibit 3-1 summarizes the findings of the City of Portland Economic Opportunities Analysis (EOA), including the first draft (Hovee, 2009), and final report (Hovee, 2012), as well as the West Hayden Island Economic Foundation Study (Entrix, 2011), and the City of Portland Bureau of Planning and Sustainability's internal effort to quantify buildable lands, described in Exhibit 3-2 as "BPS Aerial Survey."

Exhibit 3-1. Summary of previous study estimates of Portland Harbor buildable land supply

		City of Portland Harbor Land Supply		Parcels of Size: (3)	
Study	Year	Gross Acres (1)	Effective Acres (2)	50-250 Acres	250+ Acres
EOA Draft 1, Hovee	2009	266	61	0	0
EOA, Hovee, BPS	2012	326	108	0	0
Entrix, Inc.	2010	299	<50	2	0
BPS Aerial Survey	2011	590	178	3	0

Compiled by the City of Portland Bureau of Planning and Sustainability, from the following original data sources:
City of Portland Economic Opportunities Analysis, (E.D. Hovee and Company, 2012), and first draft (2009)
West Hayden Island Economic Foundation Study (Entrix, 2011)

Notes:
(1) Total acres of vacant land, without regard to environmental or contamination constraints
(2) Total acres adjusted for environmentally sensitive land, contaminated land, or land with insufficient infrastructure
(3) Number of individual parcels or polygons of the stated acreage

Although these recent studies come to different conclusions on the amount of vacant, buildable land, all of the studies show a relatively small supply of effective acres, ranging from less than 50 acres in the Entrix study, to 178 acres in the BPS Aerial Survey. For the purpose of identifying sites for public marine terminals, we need to consider not only the total acreage, but the size of the individual parcels Scattered small parcels of vacant land cannot accommodate a marine terminal, a single site (typically of 50 acres or more) is needed. These recent studies show that no more than three such sites are present in the Portland Harbor.

The City asked ECONorthwest to confirm that the methods used to identify these sites were reasonable. Some simple ideas and calculations help to answer that question:

- The state of the practice for land inventories is quite advanced. The Oregon statewide planning program's requirements for "buildable land analysis" (from the mid-1970s) spurred the use of Geographic Information Systems (GIS) throughout the state. All large cities and Metropolitan Planning Organizations in Oregon have been developing their GIS tools and datasets for over 25 years. Metro is looked to as a leader in the country on the use of GIS for land-use evaluation. The City of Portland has advanced its data in parallel with Metro. Databases that started as crude approximations have improved substantially. They have been reviewed and updated many times; data from more and more sources have been added (e.g.. tax assessment, public works); computer power and software have improved; digitized mapping of aerial photographs now allows accurate registration of those photographs to underlying layers of thematic maps. In short, the data are current and accurate, and the

ability to manipulate and summarize them is substantial, fast, and technologically reliable.

- The Portland Harbor area is not big by regional standards. The detailed BPS GIS data put it at just over 4,000 acres. As a back-of-the-envelop corroboration using different datasets and tools, ECO used Google-Earth to draw the approximate boundaries of the study area (Exhibit 1-1 above) and calculate areas: the result was 4,100 acres, the equivalent of a square 2.5 miles on a side. Just inspecting aerial photographs would allow one to find large, undeveloped acreages.
- The City has conducted three extensive studies of industrial and harbor land that resulted in detailed mapping: *Industrial Districts Atlas* (2004), *Harbor ReDI Industrial Sites Analysis* (2009), and the GIS-based inventory (2011). The 2011 inventory maps and data table are included as an Appendix to this report.
- ECO has worked on a dozen buildable land evaluations, and has written many reports on the steps for working from "all land" to "vacant, buildable land." ECO's conversations with BPS staff led to the conclusion that staff had used state-of-the-practice techniques. In summary, (1) from "all land" the land not in parcels is removed (e.g., water bodies, street and other rights of way); (2) of the land in parcels, the land that is developed and judged unlikely to redevelop easily (usually based on the value of improvements) is removed; (3) from the undeveloped or under-developed land, the land with physical or policy constraints is removed (e.g., wetlands, in flood ways, steep slopes).

All of the previous points strongly suggest that the information about the supply of developable industrial land in the Portland Harbor area that BPS has generated is very reliable. The buildable land inventory using GIS data that was done for the update of the Economic Opportunity Analysis looks reasonable by the tests we noted.

But despite good intentions and good analysis, there are details in any such analysis that require assumptions, and the assumptions can make a difference to the outcomes. For example:

- Which constraints are absolute, and which are restrictive? Does a slope of more than 10% preclude industrial development? 15%? What if the average slope on a large parcel is 10%, but half of the parcel has slopes less than 5%? What about soil contamination: can the site be remediated, or is the extent of the contamination and legal complexities such that the site is effectively off the market for the foreseeable future?
- When is land "underutilized"? Some vacant areas around buildings may be necessary for vehicle movement, production staging, or

occasional storage. Are large parking lots "vacant" or are they an essential part of the operations in the buildings adjacent to them? A low value for improvements does not necessarily mean that the owner has any interest in redevelopment.

- Ownership patterns. What might look like relatively large areas of vacant land on an aerial photograph may be in many parcels with many different owners. Land assembly and development may be very difficult. This point is illustrated by the findings in Exhibit 3-1, which show up to three sites with at least 50 acres using the BPS methods (ignoring parcel boundaries and looking at aerial photographs), but no sites of that size when using the methods in the Economic Opportunities Analysis (which did look at parcel boundaries).

For the Harbor Area land evaluation, our evaluation is that the buildable land inventory using GIS data that was done by BPS to update of the Economic Opportunity Analysis has generally made inclusionary rather than exclusionary assumptions: we think that is appropriate. BPS did not, for example, eliminate from its search for large, buildable parcels those with arbitrarily defined thresholds for buildability (e.g., proximity to services or the river, steep slopes, contamination), or those that had a particular ownership. All those parcels are still part of the dataset from which large sites were identified. The result, as Section 3.2 shows, is that the large sites identified have several challenges for development: challenges that were not screened out by earlier assumptions about buildability criteria. In other words, on that score, the methods used by BPS were inclusive, and the result is that there would be less chance of screening out land that might eventually prove to be capable of contributing to a large site for a marine facility.

An assumption that BPS did make, and that all buildable land evaluations that we are familiar with also make, is that developed parcels are, in general, not buildable parcels. They can, of course, become buildable parcels if their buildings are removed. Thus, it is theoretically possible that parcels that look developed (from assessment data, aerial photographs, and field surveys) could eventually be part of a land assembly large enough to accommodate a large marine terminal. The kind of detailed, property-level analysis needed to make judgments about land redevelopment and site assembly is not done as part of a regional or city buildable land evaluation.

But there is still the issue of "underutilized" land. A buildable land dataset, like the one BPS has developed, will be quite good (after field testing—and there has been plenty in the Harbor Area over the last 10 years) at distinguishing developed parcels from vacant parcels in most cases. But it is more difficult to determine when a generally vacant parcel is underutilized, and more difficult still to determine whether parcels that are

developed have underutilized remainders that might be considered as vacant and eligible for consolidation into a larger, developable site.

The documentation of the City of Portland's GIS-based Development Capacity Model[8] says that it (1) identifies (and presumably flags as undevelopable) "constrained" properties (i.e., significant environmental or historic resources), and (2) identifies developed parcels "significantly underutilizing their allowed development capacity (using less than 20% of available capacity, not including any development bonuses or incentives)" [that determination can be over-ridden by a judgment by BPS staff that a property is "likely" or "not likely" to redevelop]. The dataset has detailed information on parcel attributes (around 100 attributes per parcel), including building footprint (which allows a calculation of the amount of land not currently developed as a building). It has an algorithm for calculating "site area" by combining the acre of contiguous "underutilized" lots. In short, this is an extensive and well-documented dataset.

The BPS identification of potentially developable sites in the Portland Harbor did not rest entirely on technical analysis using GIS. Additional analysis done as part of the specific to the Harbor Lands Inventory also relied extensively on a review of aerial photographs, with staff performing a visual inspection of all sites along the Willamette River to ensure that any large areas of apparently vacant land had been included in the database of potential terminal sites, and that all of the sites identified by GIS appeared to have the development potential that was suggested by the data. Additionally, BPS staff made reasonable efforts to acquaint themselves with the sites, talking to Port of Portland officials, and visiting the areas, to make sure that the BPS analysis was grounded in a solid understanding of what was actually occurring on key sites in the Portland Harbor. In short, land uses and vacant lands identified in the visual survey were compared with the GIS/BLI data to ensure there were no large information gaps.

As a final check on the site inventory, we relied on our familiarity with the study area, the City documents cited above, and aerial photographs to see whether there were any large areas of vacant or underutilized land besides the two (Atofina and Time Oil sites) that the City identified as the best candidates for a new marine terminal. On the west bank of the Willamette River, we found nothing beyond the Atofina site: the north reach has only a narrow strip of mainly developed land; the south reach has a wider land area but is entirely developed along the waterfront. We found the following candidates on the east bank:

[8]http://www.portlandonline.com/cgis/metadata/viewer/display.cfm?Meta_layer_id=52965&Db_type=sde&City_Only=False

- Swan Island Industrial Park. Land at the south edge on the NE bank of the Willamette River could be classified as underutilized: it is an operation for transshipment of aggregate (10 acres). But even if the parking and storage on both sides of the site is counted, the site would still fall way short of the minimum threshold of 50 acres.
- McCormick and Baxter site, SE of BNSF bridge on east side of the Willamette River. Depending on what land is counted (e.g., backing out land for rail right of way, some existing buildings), this site may be 50 – 70 acres in size. This site was excluded from the City's analysis, primarily because it was recently proposed to be rezoned as EG2 in the River Plan, which (although it allows industrial development) does not allow rail yards, and requires greater setbacks and landscaping than other industrial zones (like IH for heavy industrial). Conversations with BPS staff indicate that the EG2 zone designation is one element of the River Plan that has been challenged, and there is a good chance that a revised River Plan will not propose the EG2 zoning for the site, which would make this site potentially available for marine terminal development.
- "Underutilized" land north of St. John's Bridge on east side of the Willamette. What may seem underutilized from a high-level aerial photograph is actually space for parking new cars from Asia—this is the Port of Portland's Terminal 4 operation (about 260 acres total, handling autos, forest products, steel, and dry and liquid bulks). This site is already part of the Portland area's supply of marine terminals and cannot be counted to add new capacity, unless it were redeveloped. Evaluating that possibility is beyond the scope of our study.
- Sites in the Terminal 5 and Terminal 6 area. There are some sites for infill (e.g., 50 acres off North Lombard in Terminal 6) but there is no water frontage available for a new terminal. Evaluating redevelopment of Port terminals is beyond the scope of our study.
- Kelly Point Park. About 50 acres at the confluence of the Willamette and Columbia Rivers, abutting Port properties of Terminals 5 and 6 is park land that is not available for development.

Of all the sites examined (beyond the Atofina and Time Oil sites already identified by BPS), the only one that met the minimum size requirements (and was not parkland) was the McCormick and Baxter site. The development potential of this site was studied extensively by the City in the past, and the results are described in the *McCormick & Baxter Site Reuse Assessment: Final Report* (June, 2001). The site could have potential for marine terminal development, but (as detailed in the 2001 site assessment) it is heavily constrained in several areas: relatively shallow water at the shoreline, inability to expand to adjacent parcels due to existing uses (Metro

open space and University of Portland campus), isolation from truck routes that require traveling through residential neighborhoods and up a relatively steep bluff, other infrastructure insufficiencies, and significant liens and encumbrances. While the challenges are substantial, they are not necessarily insurmountable, and the other sites identified by BPS face some similar challenges.

Ultimately, the site was excluded from further analysis, because it is less likely that adjacent lands could be assembled into the site, due to the adjoining zoning, and because past brownfield remediation work on the site was carried out in a way that limits future industrial uses, unlike the Atofina and Time Oil sites. Our brief review of the site constraints suggest it is at least as constrained as the Atofina and Time Oil sites, and would not be a better site for marine terminal development, due to the access constraints mentioned above. Thus, our answer to question posed is:

- BPS has used appropriate measures to identify vacant and buildable land.
- The two sites it has identified as meeting the minimum size requirements for a new marine terminal (Atofina and Time Oil) appear to be the two best sites that meet that size requirement with vacant land. Any other location would require assembling and redeveloping properties that now have buildings on them.[9]

3.2 POTENTIAL SITES FOR NEW MARINE TERMINALS

This section addresses the question: How suitable for a public marine terminal are the few sites in the Portland Harbor that have been identified by the City as having the best potential to accommodate such a terminal? Through previous planning efforts,[10] the City of Portland Bureau of Planning and Sustainability (BPS) identified the following minimum criteria to meet forecasted demand for new marine terminal sites in the Portland Harbor:

- Industrial zoning
- Deep-water harbor access
- Railroad access

[9] Whether such redevelopment could be, in some cases, financially feasible is a question beyond the scope of this study.

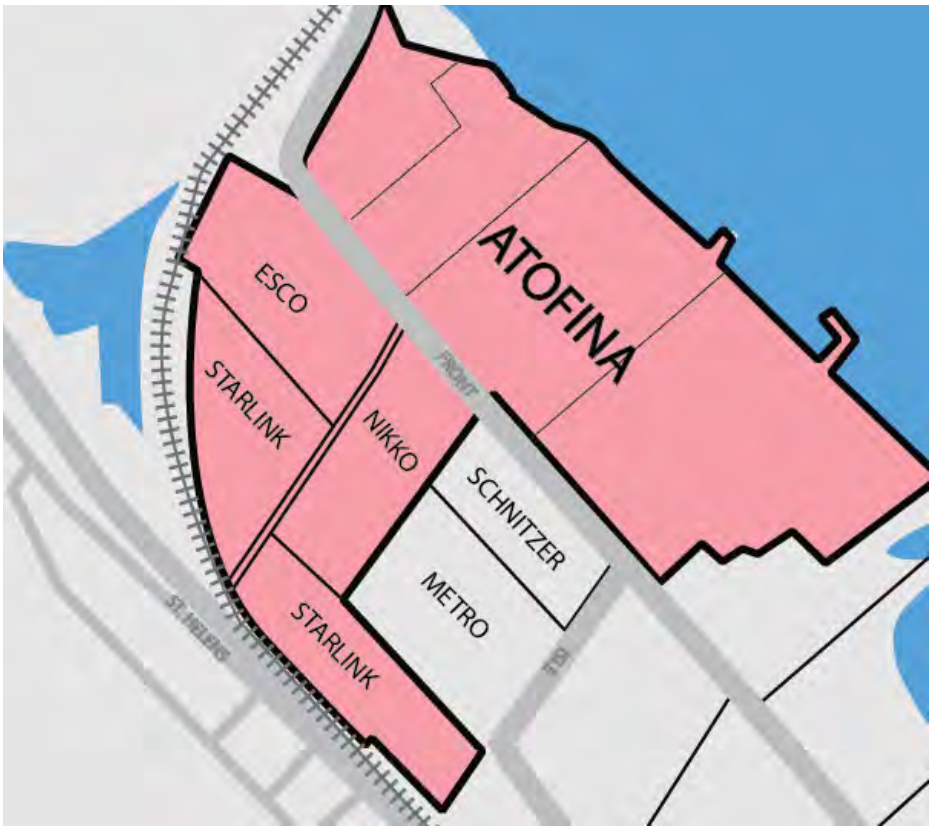
[10] West Hayden Island Economic Foundation Study, prepared by Entrix and Bonnie Gee Yosick LLC for the City of Portland Bureau of Planning and Sustainability, May 2010. City of Portland Economic Opportunities Analysis: Working Draft, prepared by E.D. Hovee and Company, LLC for the City of Portland Bureau of Planning & Sustainability, June 2011.

- Truck street access
- Vacant (unimproved or unoccupied brownfield) site-assembly area approaching 100 acres.

Using the methods described in Section 3.1 above, BPS staff identified only two sites that could potentially meet all these criteria. These are the two largest vacant sites in the Portland Harbor area: the 59-acre Atofina site, and the 43-acre Time Oil site. Both are brownfields, and both could potentially be assembled with nearby vacant sites.

This analysis looked only at vacant sites. It is always possible that some sites that are non-vacant today could be redeveloped as marine terminals in the future. When considering the opportunity to redevelop non-vacant sites, it is important to look at the net impact in economic activity. In other words, redeveloping existing sites would only be beneficial to the economy if the new use of the site were more efficient and able to accommodate more economic activity (whether measured by employment, output, cargo volumes, etc.) on the same acreage. Evaluating all non-vacant sites in the Portland Harbor to attempt to determine which might be most likely to redevelop in the future was beyond the scope of our analysis.

The ECONorthwest team reviewed the two vacant sites identified by the City of Portland, and evaluated maps of the Portland Harbor, including zoning, infrastructure and aerial photographs. Our preliminary review confirmed the City's findings: most of the Portland Harbor has active development on it, and these two sites have the greatest opportunity to accommodate new public marine terminals.



Staff from ECONorthwest and Maul Foster & Alongi toured these sites with BPS staff, documenting conditions affecting the suitability of each site for the proposed development. Key factors considered in the evaluation were: site access, existing uses, natural features, and contamination / remediation. After conducting this site visit, Maul Foster & Alongi developed a set of criteria for evaluating site feasibility for typical port terminals (see Appendix B).

Using these criteria, Maul Foster & Alongi evaluated the potential opportunities and constraints of these sites to accommodate development of a public marine terminal. A cursory site visit is insufficient to make a final determination of site feasibility. Nonetheless, the methods are consistent with the scope and budget, and are sufficient for identifying major opportunities and constraints for these potential sites, and for making a preliminary determination of site feasibility. Further investigation of these sites could be conducted to refine our feasibility findings.

3.2.1 ATOFINA

The Atofina site is a collection of parcels under several ownerships, which total approximately 114 acres (59 acres in the four main Atofina parcels, and an additional 55 acres in adjacent parcels across Front Ave.). The parcels are zoned heavy industrial (IH), and are bordered by industrial uses. The site is adjacent to SR 30 and fronts the Willamette River within the Portland Harbor. Exhibit 3-2 shows a map of the Atofina site.

Exhibit 3-2. Atofina site

Source: ECONorthwest, 2011.

The parcels that the Atofina site comprises have the following owners:

- Atofina: four vacant parcels totaling 59.14 acres
- Schnitzer: an 8.32-acre parcel, currently occupied by Air Liquide America Corporation
- Metro: a 10.43-acre parcel housing the regional solid waste transfer station
- Nikko (Gould Electronics): a 9.21-acre parcel, which is partially occupied by an operating RCRA C hazardous material landfill
- ESCO: a 10.51-acre parcel, which is a former landfill

- Starlink (Aventis Cropscience USA LP; Rhone Poulenc Ag): two significantly contaminated parcels totaling 16.42 acres, currently under remediation.

Access

Water depth in the Willamette River near the Atofina site ranges from 30 to 40 feet. The site has historically been used as a bulk-commodity manufacturing and shipping terminal. The waterside parcels (Atofina) provide a total of 2,700 feet of shoreline, and currently accommodate three existing piers on leases from the State of Oregon, Department of State Lands.

The aggregated Atofina site is served by a rail siding from the BNSF mainline. The siding is approximately 2,200 feet in length with three road 'at grade' crossings. While the site has rail access, it appears to be of insufficient size to accommodate a loop track, which would hamper efforts to build an efficient, modern port facility. Highway 30 access has been somewhat hampered by the closure of local streets accessing the highway.

Existing uses

Current industrial uses on the Schnitzer property as well as the Metro property seemingly eliminate 18.75 acres, while the existing Gould Superfund disposal site on the Nikko property reduces the available footprint by an additional 9.21 acres. The Nikko property contains an operational on-site 4.5-acre containment facility (Subtitle C closed hazardous waste landfill), and is approximately 25 to 30 feet higher in elevation than the surrounding property, with a structured fill containing 77,000 cubic yards of contaminated materials. The former ESCO landfill received non-recyclable wastes (e.g., foundry sand, slag, demolition debris) from ESCO's foundry operations from approximately 1953 to 1983. The landfill was closed with the approval of the Oregon Department of Environmental Quality (DEQ) and the Oregon State Health Division in 1983. The Starlink properties are undergoing extensive investigation and remediation.

Natural features

The property generally rises in grade from the Front Street ROW in the east to the rail ROW in the west, and has considerable natural gain exclusive of the Subtitle C landfill mass. Along the north and northwest perimeter of the site is a berm with a steep slope leading up to the BNSF main line on its approach to the rail bridge. Across the rail line, North Doane Lake and an environmental conservation land designation wrap the 'site' to the north and west.

The waterside parcel is partially within the FEMA Special Flood Hazard Area or was partially inundated by a 1996 flood event. The area is in a low to moderate earthquake hazard exposure area.

Contamination and remediation

The Atofina parcels are being remediated by Legacy Site Services (LSS), as the Atofina agent, under a consent order with DEQ, requiring source control and a site-wide feasibility study. The source control measures include both groundwater and stormwater migration controls. The site is included in the area of the Lower Willamette River that was designated a Superfund site in 2000 by the Environmental Protection Agency. Final remediation plans for the Portland Harbor Superfund site have not been determined. The potential liability for remediation of the Superfund adds a high level of risk for all affected properties, making prospective real estate transactions or development unlikely.

Other constraints

In addition to these property encumbrances the Atofina site is transected by Front Avenue (Service Level B; Priority Truck Route; peak-hour volume average of 106 vehicles and an average daily traffic volume of 640 vehicles, of which 92% are automobiles). Front Avenue separates the Atofina-owned parcels from the remainder of the site. Front Avenue provides primary access to the adjacent Siltronic site and is a public right of way. The Siltronic property does have alternate direct highway access to US 30, but there is an 'at-grade' rail crossing, and it does not readily serve the current land use configuration for the site. In addition to the Front Avenue ROW there is a pipeline easement adjacent to the east side of the street ROW.

While the total aggregated acreage appears to adequate for serving as a barge or bulk facility, current encumbrances, uses, and rights of way limit the useable area to 59 acres: the four parcels owned by Atofina to the East of Front Avenue, fronting the Willamette River.

Site assessment

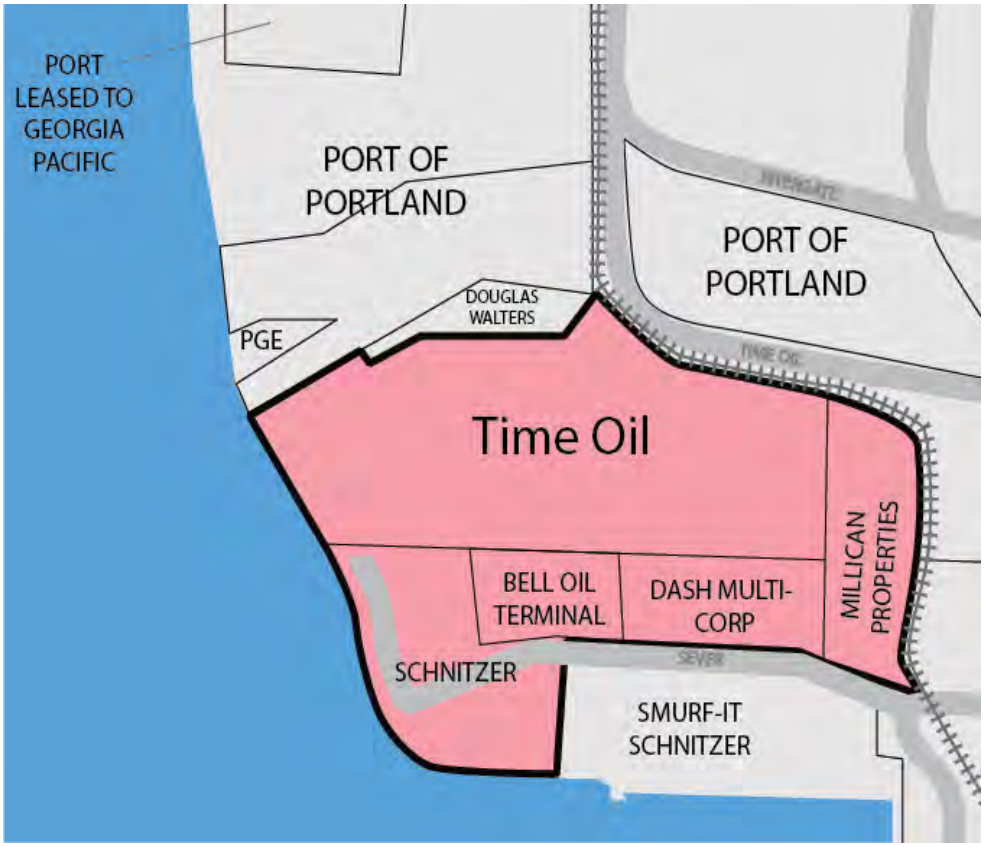
Significant changes would need to be overcome to develop this site as a productive public marine terminal. To develop the entire site, NW Front Avenue would need to be closed, requiring additional infrastructure investments to provide alternative access to the Siltronic property. Without closing NW Front Avenue, this site is practically limited to 59 useable acres, with limited road and rail siding access.

While the site has rail access, site size and dimensions are insufficient to accommodate a rail loop track. Providing adequate rail service for the site is

even more challenging if development is limited to the 59 acres east of NW Front Avenue.

If NW Front Avenue were closed to accommodate development of the 114-acre site, the properties owned by Metro and Schnitzer are in active use, and would be unlikely to relocate. Property acquisition for the remaining parcels would be challenging, as it would require negotiations with five different private property owners. While acquiring these properties would provide additional acreage for development, acquisition would also involve additional costs as well as need for environmental remediation on these sites.

Ultimately, the site may be suitable for break bulk commodities, such as project cargoes, but the uncertainty of the planned and ongoing environmental remediation on the Atofina parcels--in addition to the uncertain liability for the Lower Willamette River Superfund remediation--probably make the cost of the land prohibitively high. The site *could* be big enough for a terminal, but the cost of preparing the site to accommodate such a terminal will make the effective land price very high relative to other industrial properties.



3.2.2 TIME OIL

The Time Oil site includes several separately owned parcels totaling approximately 84.2 acres. The subject parcels are adjacent to the Willamette River within the Portland Harbor and are zoned heavy industrial (IH) with a 'River' overlay designation. The site is bordered by industrial uses and also an area governed by a soon-to-expire natural resource management plan. Exhibit 3-3 shows a map of the Time Oil site.

The Time Oil site comprises parcels with the following owners:

- Time Oil: 43.41 acres
- Schnitzer Investment Corporation: 13.79 acres
- Bell Oil: 6.04 acres
- Dash Multi Corporation: 9.82 acres
- Millican Properties: 11.12 acres

Exhibit 3-3. Time Oil site

Source: ECONorthwest, 2011.

In addition to the aggregated property initially considered for the Time Oil site, there appears to be additional parcels totaling approximately 57 acres to the east of the Time Oil site, and bounded by Time Oil Street and Burgard Street. Including these parcels (not shown in Exhibit 3-3), the total potential aggregate site would be approximately 139 acres.

Access

Water depth in the Willamette River ranges from 30 to 40 feet. The aggregated site has approximately 1,400 feet of shoreline (pier head): the Time Oil parcels with 550 lineal feet, and the Schnitzer parcel with 850 lineal feet.

Historically there have been two piers on the parcels. The side channel serving the Schnitzer parcel is navigable, and is likely to be addressed in the Portland Harbor cleanup project.

The Time Oil site is served by a rail siding from the Union Pacific Railroad mainline of approximately 2,500 feet in length with two road 'at-grade' crossings and on-site railroad access. While the site has rail access, it appears to be of insufficient size to accommodate a loop track, which would

hamper efforts to build an efficient, modern port facility. Access to the specific site would require use of a private or Port-owned right of way, connecting to either Rivergate Blvd. or Burgard St., ultimately connecting to N Lombard St, a district collector and priority truck roadway.

Existing uses

Current industrial uses on the Schnitzer property appear to be temporary in nature. The Bell Oil Terminal is inactive; the Millican parcel is underutilized, and the Dash Multi Corp parcel is an operational tire recycler. There are several existing structures on the Time Oil and Schnitzer site, and evidence of removal of liquid storage tanks. The western half of the site is in a floodplain.

Contamination and remediation

Like most properties in the Portland Harbor, sediment in the adjacent channel and berthing area have known or suspected contamination. The upland properties have known or suspected contamination and are in various regulatory phases of investigation and remediation. The site is included in the area of the Lower Willamette River that was designated a Superfund site in 2000 by the Environmental Protection Agency. Final remediation plans for the Portland Harbor Superfund site have not been determined. The potential liability for remediation of the Superfund adds a high level of risk for all affected properties, making any real estate transactions or development highly unlikely.

Other constraints

To the north of the subject site there are high-tension power lines; a small parcel owned by PGE and a series of parcels owned by the Port of Portland with the presence of wetlands (some of these wetlands have environmental conservation zoning). The site is generally flat with mild slope to the river.

Site assessment

The Time Oil site faces challenges that would need to be overcome to be developed as a productive public marine terminal. While the core of the site (57 acres) has only two different private property owners, the remainder of the site is divided into several different owners. Depending on the desired use and scale of a proposed port terminal, additional property to the east of the site may need to be acquired. The number of private properties and owners makes site assembly a challenge, but not an insurmountable obstacle.

Compared to the Atofina site, the Time Oil site appears to have fewer challenges to redevelopment: it does not require closing a public street, it

appears to have less severe environmental contamination, and the possibility exists to acquire a larger aggregate site. The contamination is mainly along the river, not upland. It may be possible that lower lying contaminated land could be used as fill on other parts of the site and capped under the footprint of a new building.

The site would be a viable candidate for a marine terminal with the appropriate aggregation of key properties. Aggregating 80 to 140 acres would accommodate the transshipment of break bulk and some bulk commodities. Property configuration to make 1,400 feet of pier face accessible is critical to its usability. This site could be explored further for marine terminal use. It will be difficult, however, to negotiate any real estate transactions for this site while the liability for the Lower Willamette River Superfund remediation remains uncertain.

3.2.3 IMPLICATIONS

Public marine terminals have specific land use requirements that are difficult to find. Ideally, sites must be large and flat, inside of an industrial zone, have significant shoreline on a navigable river, be served by both rail and truck, and free of contamination, wetlands, or other environmental constraints. There are no sites in the Portland Harbor that meet these ideal requirements, though there are a few sites that come close. The questions are: how close do they come, and is there a way to cost-effectively develop these sites as productive public marine terminals?

The City of Portland identified the two sites in the Portland Harbor that are most likely to be suitable for development of a new public marine terminal: the Atofina site, and the Time Oil site. Of these two sites, development is technically possible on either, but there are major hurdles that would add significant costs. Both sites have some level of contamination, both sites would require negotiation and property acquisition from numerous property owners, and both sites are smaller than desirable, which precludes the possibility of an onsite rail loop.

Of the two sites, the Time Oil site is most suitable for development, as it does not have certain challenges faced by the Atofina site. The development of the Atofina site is further restricted by NW Front Ave. that bisects the site, and provides primary access to the Siltronic property. With this road in place, the site is limited to just 59 acres. Vacating the road would be costly, and would likely require significant infrastructure investments to be made to provide access to the Siltronic property. Even if the road were vacated, property on the other side of the road is contaminated or in active use. And the nature of the contamination on the Atofina site is considered to be more severe than contamination elsewhere in the Portland Harbor.

Ultimately, issues related to the Superfund cleanup of the Willamette River make all sites in the Portland Harbor unfeasible for development in the near future. Until a final agreement is reached, determining the specific liability for all property owners in the Harbor, there is too much cost uncertainty to negotiate a reasonable price for the land acquisition that would be necessary to assemble a site large enough for a new public marine terminal.

3.3 ROLE OF VANCOUVER IN HARBOR INDUSTRIAL LAND SUPPLY

The third question we were asked by the City is: What role can the Port of Vancouver play in accommodating forecast demand for cargo volumes in the Portland region? To answer this question, we reviewed estimates from recent studies on the current capacity and forecast demand for cargo in the region, and augmented this data-driven analysis through interviews with port officials. A more detailed description of our analysis is found in Appendix C: Analysis of Harbor Land Capacity and Demand, Portland and Vancouver.

3.3.1 EXISTING CAPACITY

The Port of Portland has four marine terminals located along the Willamette and Columbia Rivers. These terminals accommodated 575 ocean-going vessels in 2010, though over the past two decades it was not uncommon for the Port to accommodate 800 to 1,000 ocean-going vessels in a year. Not counting cargos received or shipped via inland barges, the Port of Portland shipped over 13 million short tons of cargo in 2010.

While the Port's existing marine terminals have excess capacity, that capacity is limited. As demand increases over time, the Port will reach a point when existing facilities are unable to accommodate the demand that is forecasted. If the Port is unable to find new ways to improve the efficiency of existing terminals, or find suitable sites to build new terminals, then the Port of Portland may miss potential cargo opportunities. The Port of Vancouver, located across the Columbia River from the Port of Portland, could accommodate some unmet demand.

Exhibit 3-4 summarizes the estimated capacity of public marine terminals in the Port of Portland. Total capacity for all cargo types in the Port of Portland is estimated to be over 21,000,000 metric tons. This capacity is significantly above current cargo volumes for all cargo types, except for grain, which saw a reduction in capacity when the Port closed the terminal

4 grain elevator in recent years, and is unable to accommodate historical levels.

Exhibit 3-4. Estimated capacity of public marine terminals, and recent peak cargo volumes, Port of Portland

Cargo Type	Estimated Capacity	Recent Peak Volume	Peak Year
Automobiles (units)	675,000	460,000	2006
Containers (TEUs)	700,000	330,000	1995
Metric Tons			
Automobiles	889,000	606,000	
Containers	3,999,000	1,885,000	
Breakbulk	2,100,000	1,130,000	2007
Grain	4,100,000	5,400,000	1995
Dry Bulk	10,700,000	5,460,000	2008
Liquid Bulk	-	-	N/A
Total	**21,788,000**	**14,481,000**	

Source: Estimates of capacity are from Port of Portland, reported in West Hayden Island Economic Foundation Study (Entrix, 2010), and confirmed through interviews with Port of Portland officials.
Reported recent peak cargo volumes are from Port of Portland Marine Terminal Statistics, 1980-2010.

3.3.2 FORECAST OF FUTURE CARGO VOLUMES

Our analysis did not include forecasting future cargo demand for the region. Instead, we were tasked with obtaining and reviewing the most recent forecasts. These forecasts were contained in the *Portland and Vancouver Harbor Forecast Update* (BST Associates, 2012). These forecasts were based on a 2010 study by BST Associates, but were refined to specifically call out cargo demand for the City's of Portland and Vancouver, and were updated with the most recent economic data.

Exhibit 3-4 shows the *capacity* of *existing public* marine terminals. Exhibit 3-5 shows the forecast *demand* for *existing and future public and private* marine terminals (measured as cargo volume) in the City of Portland in 2040. The forecast demand ranges from 28 million to 43 million metric tons. For context, in 2010 (the most recent year for which data is available) the Port of Portland reports it moved 13 million tons of cargo. Even the low scenario forecasts demand to be more than double 2010 levels by the year 2040, with an average annual growth rate of 1.5% per year.

Exhibit 3-5. Forecasted cargo volume, public and private, City of Portland, 2040

Cargo Type	Low	Medium*	High
Automobiles (units)	811,000	912,500	1,014,000
Containers (TEUs)	379,000	452,500	526,000
Metric Tons			
Automobiles	1,076,000	1,206,000	1,336,000
Containers	2,162,000	2,583,500	3,005,000
Breakbulk	1,132,000	1,242,000	1,352,000
Grain	6,686,000	9,078,000	11,470,000
Dry Bulk	10,278,000	14,093,500	17,909,000
Liquid Bulk	6,912,000	7,461,500	8,011,000
Total	**28,246,000**	**35,664,500**	**43,083,000**

Source: Low and High forecasts were made by BST Associates for the *Portland and Vancouver Harbor Forecast Update* (2012).
*Medium scenario is calculated by ECONorthwest as the average of the BST low and high scenarios.

Note that 2040 is an arbitrary date. It is not a key milestone. Demand for cargo does not stop growing for some assumed reason in 2040. It is simply the last date for which there is a forecast for cargo demand. Thus, our advice is not to focus on exact tonnage requirements, or exact acres needed to accommodate demand in 2040. It is more important to focus on the big picture. The City of Portland has a limited supply of land suitable for marine terminal development, and this supply will not increase. Demand for cargo has increased steadily for decades, and is forecast to continue to do so in the future. Over a long-enough period, the City will use its capacity to accommodate future growth. As it does, land prices will increase and redevelopment will become more possible than it appears now.

Nonetheless, the inevitable reduction of vacant land available for water-dependent uses in the Portland Harbor area is the motivation for considering ways to use the land efficiently, and whether neighboring jurisdictions might accommodate some additional amount of the forecasted growth. Looking at the 2040 gives good idea of how close the City (and the region) is to reaching its full capacity for public marine terminals.

3.3.3 CAPACITY SHORTFALL

Comparing the capacity of existing facilities with the forecast demand provides an estimate of the potential capacity shortfall for the Port of Portland is in 2040. Two factors complicate this analysis: (1) private marine terminals also handle a portion of the City's cargo volume, and there are not accurate estimates of the capacity of private terminals in the City; and (2) if the growth in cargo volumes comes from a different mix of clients and commodities than the terminals are currently handling, then the existing facilities may not be able to accommodate the new opportunities, which

means these facilities may not reach 100% of their capacity before new terminals are needed.

Our analysis needed to make assumptions on how to deal with these two issues. Variations in assumptions, combined with the wide range of the BST forecasts for cargo demand in 2040, result in an even wider range of estimates for capacity shortfall. To bookend our analysis, we created assumptions that would give us the lowest and highest possible shortfall, and then selected assumptions for a "most-likely" scenario.

The lowest shortfall scenario assumes the low demand forecast from BST, and assumes that existing facilities would be able to operate at 100% efficiency to accommodate forecast demand, and that private terminals will be able to continue accommodating cargo at their recent peak levels. The highest shortfall scenario uses the high demand forecast from BST, and assumes that existing facilities would continue operating at their historical peak levels, with all additional demand coming from new market opportunities that require new terminals. The most-likely scenario uses assumptions that fall between the range of these two bookends. Key assumptions for the most-likely scenario are existing facilities operate at 90% of capacity (i.e. to accommodate the forecast growth in cargo, we do not assume that existing facilities are able to use 100% of their capacity, since part of the growth in cargo volumes may be due to new users and new commodities that cannot use existing facilities), and we use the medium demand scenario, calculated as the average of the low and high scenario by BST Associates.

The results of these three scenarios are shown below in Exhibit 3-6. Note that the potential capacity shortfall ranges from less than 200,000 metric tons in the low shortfall scenario to more than 17 million metric tons in the high scenario. Ultimately, our most likely scenario shows a potential shortfall of 5,760,000 metric tons, with all of the shortfall occurring in dry bulk, grain, and automobiles.

Exhibit 3-6. Potential capacity shortfall, City of Portland, public and private marine terminals, 2040 (metric tons)

Cargo Type	Low	High	Most Likely
Automobiles (units)	(136,000)	(554,000)	(310,000)
Containers (TEUs)	-	(196,000)	-
Metric Tons			-
Automobiles	(187,000)	(730,000)	(410,000)
Containers	-	(1,120,000)	-
Breakbulk	-	-	-
Grain	-	(4,370,000)	(2,390,000)
Dry Bulk	-	(10,949,000)	(2,960,000)
Liquid Bulk	-	-	-
Total	**(187,000)**	**(17,169,000)**	**(5,760,000)**

Source: Calculated by ECONorthwest, with demand forecasts from BST Associates (2012).

3.3.4 LAND NEED FOR NEW PORT TERMINALS

Translating cargo volumes into acres for port terminals is challenging, and depends on a host of variables for which we have little or no data for this analysis. Will the terminal need rail access, if so will it need a dedicated rail loop, or will it be able to share rail infrastructure with adjacent terminals? Would another rail configuration like a ladder track work?[11]

The composition of the demand is important as well. For example, if you have demand for 10 million pounds of dry bulk, will that all be the same commodity type? If not, you may not be able to use the same terminal (for example a coal exporter and potash exporter may need to have completely separate terminals even though they are both dry bulk and would have very similar needs. Even the ownership of the cargos makes a difference (e.g., one exporter with a throughput of 10 million tons of potash may require different facilities, than 5 exporters each handling 2 million tons of potash a piece).

Because of the many variables, it is difficult to translate the potential shortfall numbers shown in Exhibit 3-6 into the number of terminals that would be needed to service that demand, and even more difficult to translate the number of terminals into acres. For the purposes of our analysis, we first looked to recent studies to find an industry standard or a rule of thumb for the size of marine terminals for various cargo types. The three sources we looked at were the *West Hayden Island Economic Foundation Study* (Entrix, 2010), the Draft Report on *Operational Efficiencies of Port/Terminal World Wide* (Worley Parsons, 2012), and the Maul Foster and Alongi evaluation criteria included with this report as Attachment B.

Unfortunately, there is little consensus among these sources on the land needed for each terminal. This is because the unique characteristics of each site, the needs of each unique user and commodity, and the market conditions and technologies available at the time existing facilities were built result in a wide-range of variables that are difficult to control for. In short, no conclusive rule of thumb exists, and if it did exist, it would not necessarily be applicable to each of the sites in the Portland and Vancouver harbors. Nonetheless, for the purposes of our analysis, we needed to make some assumptions on the acreage requirements for new terminals for various commodities. We again sought to use different assumptions to present a high and low bound on our analysis, and then to select

[11] Representatives of businesses in the Portland Harbor, as well as Port Officials, and other consultants with expertise in marine terminal development and cargo forecasts have stressed that there is no equal substitute for a loop track, and that other rail configuration such as a ladder track will not work, for attracting new port users in a competitive global economy.

assumptions in the middle of the range that we believe resulted in a most-likely scenario.

The details of these scenarios are shown in Appendix C: Analysis of Harbor Land Capacity and Demand, Portland and Vancouver. The most-likely scenario uses our most-likely capacity shortfall estimates, and assumptions on throughput (tons per acre of terminal land) from the *Operational Efficiencies of Port/Terminal World Wide* (Worley Parsons, 2012), based on tons per acre for case study ports in North America and Europe. It is optimistic, however, to think that all new terminals would achieve the level of efficiency identified in the Worley Parsons draft report, so we have shown another column for the "practical" (i.e., more conservative assumption of land need) land need, based on an average value of the assumptions in the various supporting documents used in our analysis. A final column was added to show the land need if a dedicated rail loop is included with the terminals that would require rail access. Exhibit 3-7 shows the results of our most likely scenario, with at least 170 acres of land needed, and up to 470 acres if rail access is included.

Exhibit 3-7. Acres of land needed for new public marine terminals in the City of Portland, 2040

Cargo Type	Capacity Shortfall (Tons)	New Terminal Space Needed	Acres Needed		
			Minimum	Practical	w / rail
Automobiles	(410,000)	Yes	120.0	270.0	270.0
Containers	-	No	-	-	-
Breakbulk	-	No	-	-	-
Grain	(2,390,000)	Yes	30.0	50.0	100.0
Dry Bulk	(2,960,000)	Yes	20.0	70.0	100.0
Liquid Bulk	-	No	-	-	-
Total	**(5,760,000)**		**170**	**390**	**470**

Source: Calculated by ECONorthwest
Note: This table estimates acreage needed, not the number of terminals needed. Terminal size can range from 150 to 200 acres for automobiles and containers, to as small as 5 acres for liquid bulk. Depending on terminal size assumptions, the acreage need for automobile cargo could be accommodated by anywhere from one to five terminals in the City of Portland.

Comparing the demand for land for public marine terminals in the City of Portland shown in Exhibit 3-7, with the supply of land in the Portland Harbor shown in Exhibit 3-1, shows an insufficient land supply. As described in Sections 3.1 and 3.2, the Portland Harbor has the potential for two (or perhaps three, if the barriers to development at the McCormick and Baxter site can be overcome) sites to accommodate public marine terminals. These sites (Atofina and Time Oil) have serious development constraints, and even if these constraints can be overcome, they would each only be able to accommodate one terminal of practical size.

The Portland Harbor probably has insufficient land to accommodate the forecast growth for public marine terminals in the City of Portland. An optimistic scenario would show the Portland Harbor with capacity to

accommodate perhaps two terminals of relatively small size (and without a modern rail loop to serve these terminals). A more conservative outlook (and a real possibility) is that the two potential sites in the Portland Harbor may be unable to overcome their significant barriers to redevelopment, which would mean the Harbor may not have any capacity to accommodate future development of marine terminals.

Given the expected growth in demand over the next 30 years, there are few easy solutions to accommodate the City of Portland's anticipated shortfall in land for public marine terminals. The City can take action to address the existing constraints to facilitate redevelopment, or look elsewhere for buildable land for public marine terminals. The following section addresses the latter solution: looking outside of the City of Portland for land for new marine terminals.

3.3.5 PORT OF VANCOUVER DEVELOPABLE LAND

This analysis presupposes that from a regional perspective, there is no benefit to having port development occur in Portland vs. Vancouver. Leadership for the ports, and for the cities, counties, and states they are located in, may have different opinions. Indeed many public policies exist that emphasize the importance of retaining and attracting industrial jobs, like those created by marine terminal development. However, the purpose of this analysis was to determine if it was *technically* possible (as opposed to *politically* desirable) to accommodate future marine terminal demand at the Port of Vancouver.

Additionally, our analysis assumed that the type of port users that would be attracted to the Port of Portland if land were available, would find the Port of Vancouver equally as attractive if there were no developable sites in Portland. This assumption may be true for many, but not necessarily all public marine terminal users. Portland and Vancouver are similar in many ways, sharing the same regional infrastructure and labor pool. But differences do exist between the two jurisdictions, and more so for specific sites within each jurisdiction. For the purposes of our analysis, we have assumed land at the Port of Vancouver would be an acceptable substitute for potential marine terminal users unable to find developable land in the Port of Portland.

Ideally, our analysis for the supply and demand for public marine terminals in the Port of Vancouver would have used the same methods as were used for the Port of Portland. Unfortunately, our analysis was constrained by both data limitations, and time/budget. Thus, we were asked to conduct a less rigorous analysis of the Vancouver land supply, making use of the best available data, gathered mostly from conversations and correspondence with officials from the Port of Vancouver.

ECO interviewed officials with the Port of Vancouver to understand their long-term plans for harbor industrial lands, and the challenges and opportunities that would arise from a greater share of regional industrial development locating in Vancouver versus Portland.

The Port of Vancouver is located along the banks of the Columbia River, with access to the same markets and same multi-modal transportation infrastructure as the Port of Portland. The port handles more than 500 ocean-going vessels each year, as well as river barges, with total annual cargo of more than 5 million metric tons.

The Port of Vancouver has room to grow. An analysis of aerial photos of Port land indicate roughly 750 vacant acres. The Port of Vancouver sent a memorandum to the City of Portland that further clarified their intentions for these 750 acres. The land includes approximately 450 acres of undeveloped greenfield land called Columbia Gateway. Approximately 350 acres of this property is planned to be developed as maritime, and the remaining 100 acres planned for heavy industrial. In addition, the port has 110 acres of available undeveloped light industrial land called Centennial Industrial Park. The light industrial properties could be available for development within 12-14 months, while the Columbia Gateway area is not expected to be ready for development for another 8-15 years. The Centennial properties are not waterfront parcels.

Terminal 5, now under development, added 200 acres of heavy industrial and maritime land. All but four acres of this property is river-dependent maritime land. The maritime portion has been, or will be, filled with rail infrastructure, new tenants, and cargos, including wind energy exports and a dry bulk exporter with up to 16 million ton export capacity. The sole industrial tenant is a rail-dependent propane distributor.

The Port of Vancouver is in a period of rapid growth and is currently undertaking a number of public and private development projects, including the West Vancouver Freight Access project. This public rail improvement project will create a unit train facility, more than doubling the miles of track within the port, along with adding a new, grade separate entrance from the BNSF Railway mainline. This project will increase capacity from 45,000 rail cars per year, to more than 160,000 per year, with 40 percent less delay.

Given the Port of Vancouver's holdings of vacant land, the recent dredging of the Columbia River to a depth of 43 feet, and ongoing investment in new rail infrastructure (i.e., the West Vancouver Freight Access project), the Port of Vancouver is well positioned to capture growth in the future. Officials from the Port of Vancouver believe that neither the Port of Portland or the Port of Vancouver have sufficient land and resources to accommodate **all** of the region's future growth on their own.

Instead, ports on both sides of the Columbia River will need to supply land for new public marine terminals.

The Port of Vancouver's undeveloped, unpermitted maritime and industrial land will accommodate some regional growth – from those businesses selecting the Washington business environment and requirements. Using the BST forecasts of cargo demand for the City of Vancouver, we conducted a similar capacity shortfall analysis for Vancouver as we did for Portland (as was described in sections 3.3.1 to 3.3.4).

Combining these analyses allows us to view the regional demand for and supply of land for public marine terminals. The result of this analysis is shown in Exhibit 3-8. Our most likely scenario shows that regional cargo volumes in 2040 could require between 210 and 570 acres of land for new marine terminals.

Exhibit 3-8. Acres of land needed for new public marine terminals in the Portland Metro Region (including Portland and Vancouver), 2040

Cargo Type	Capacity Shortfall (Tons)	New Terminal Space Needed	Acres Needed		
			Minimum	Practical	w / rail
Automobiles	(570,000)	Yes	160.0	370.0	370.0
Containers	-	No	-	-	-
Breakbulk	(90,000)	No	-	-	-
Grain	(2,390,000)	Yes	30.0	50.0	100.0
Dry Bulk	(2,960,000)	Yes	20.0	70.0	100.0
Liquid Bulk	-	No	-	-	-
Total	**(6,010,000)**		**210**	**490**	**570**

Source: Calculated by ECONorthwest with demand forecasts from BST Associates, and other assumptions based on conversations with officials from the Port of Portland and Port of Vancouver, as well as supporting documents including: *Operational Efficiencies of Port/Terminal World Wide* (Worley Parsons, 2012) and *West Hayden Island Economic Foundation Study* (Entrix, 2010).
Note: This table estimates acreage needed, not the number of terminals needed. Terminal size can range from 150 to 200 acres for automobiles and containers, to as small as 5 acres for liquid bulk. Depending on terminal size assumptions, the acreage need for automobile cargo could be accommodated by anywhere from one to seven terminals in the Portland Region.

If each new port terminal requires a dedicated rail loop, the total acreage needed to accommodate regional cargo volumes in 2040 exceeds the current supply of 350 acres of vacant developable land at the Port of Vancouver planned for marine terminal development.[12] However, the Port of Vancouver has about 200 acres of vacant developable land that could technically accommodate marine terminal development, but is planned for other industrial uses. But about 100 acres of this amount is part of

[12] It is important to note that these projections are based on our "most-likely" scenario. The range of possible assumptions that could be used in this analysis is significant. When using our most conservative assumptions, our analysis showed a regional land need as low as 70 acres, and our most aggressive assumptions resulted in a land need of over 2,250 acres.

Centennial Industrial Park and are not on the waterfront parcels or linked to waterfront parcels, so 100 acres might be a more appropriate estimate. If these acres were included in the total supply, then the Port of Vancouver comes close to having a supply of land to accommodate regional cargo demand through 2040.

While this scenario is technically possible, it may not politically feasible or consistent with adopted policies of the affected jurisdictions: Vancouver's land supply could fall short. The high and low demand forecasts differ by + or – 20% from the most-likely forecast, and assumptions about whether a new terminal has rail loop access or not can easily double the need for land. Portland and Vancouver probably have adequate land now to accommodate a low-demand forecast with few new terminals sized for loop trains. But in our simulations, high demand plus loop-train access at all new terminals led to a overall land shortfall of almost 1,500 acres. If only 350 acres at the Port of Vancouver are available for marine terminal development (its current estimated based on policy) then unmet demand for public marine terminals in the region would be around 1,100 acres.[13]

3.3.6 IMPLICATIONS

The most recent forecasts for future cargo demand show the Port of Portland will be unable to accommodate forecast demand by 2040 without adding new capacity. However, the extent of that capacity shortfall depends on the assumptions used. Interviews with officials from the Port of Portland, and the author of the most recent cargo forecasts indicate that although actual tonnage for specific cargo types may differ from the forecasts, long-term trends have shown past forecasts for total cargo volume to be fairly accurate, and the most recent forecasts should be seen as reliable.

Taken at face value, these forecasts suggest that additional port capacity will likely by utilized in the future; however, accurately and reliably forecasting the future is impossible. Although our forecasts (and the BST forecasts which underpin them) include a broad range of assumptions, reflecting the high degree of uncertainty, there is no way to guarantee that the future will fall within our forecast range, let alone our "most-likely" scenario. No one knows exactly how demand for port facilities in the lower

[13] Although this is the "high-scenario," it is not also "highly unlikely." BST Associates, authors of the cargo forecasts used in this analysis, note that the high-scenario calls for 3.1% growth in cargo volumes per year, which is actually lower than the 4.1% average annual growth experienced on the Columbia River between 1962 and 2011.

Columbia will change in the future. Economist HE Haralambides effectively summarizes the difficulty forecasting port demand, stating:[14]

> "As a result of intertwined and extended hinterlands; abundant land infrastructure and short-sea feedering networks; continuously evolving liner shipping networks; and the infamous `mobility' of the container, demand is very volatile and unpredictable. Port market shares are unstable; investments in one region or country have an impact on another … In such a `fluid' environment, how could one forecast port demand with any degree of credibility?"

Competitive and volatile environments do not support reliable forecasting because outcomes depend on many randomly moving variables. Ultimately, whether or not demand for additional port facilities on the lower Columbia materializes will depend on market conditions – demand (what's produced and consumed in the Portland region), supply (what technologies are used to ship goods, what competing port capacity exists), and price. These factors will inevitably change over the next 30 years in ways that no one can predict, which means any attempt to forecast them should be taken with a grain of salt.

In other words, individual cargo types fluctuate year to year and are difficult to predict with accuracy, but long-term historical trends show that demand for total cargo volumes is less volatile, more predictable, and tends to grow at a pace that is linked to the global economy. While the Port's four public marine terminals are not operating at 100% of capacity today, it is very likely that they will reach the limits of their capacity in the next several decades, as demand increases. Once these facilities reach capacity, the Port of Portland will need to develop new facilities, or else turn away demand.

The Port of Vancouver shares many of the same attributes that make the Port of Portland an attractive place for marine shipping. Thus the Port of Vancouver is a logical place to site new marine terminals, if sites are unavailable in Portland.

From a regional perspective, it makes no difference whether terminal development occurs in Portland or Vancouver. Both cities function as part of the same regional economy, and share the same infrastructure and labor pool. However, at a local level, if demand for public marine terminals is shifted from Portland to Vancouver, the City of Portland would lose out on high-paying industrial jobs (and some of the residents that fill those jobs), which would have a detrimental effect on the Portland economy, and a

[14] Haralambides, H.E. (2002), Center for Maritime Economics and Logistics, "Competition, Excess Capacity, and the Pricing of Port Infrastructure".

positive impact on Vancouver's. In other words, some amount of economic activity (measured any number of ways: jobs, wages, output, value added, etc.) would occur in Vancouver, rather than Portland, and Portland would miss out on the resulting direct, indirect, and induced economic benefits.

Given the most recent forecasts of demand, and reasonable assumptions on current capacity and the likely size of new terminals, it would appear that the Port of Vancouver has a surplus of vacant industrial land to accommodate their likely future demand, and should the Port of Portland be unable to accommodate forecast growth, the Port of Vancouver could accommodate some (and perhaps all) of that growth. However, officials from the Port of Vancouver stress that a regional strategy will be necessary to respond to future demand for public marine terminals in the region, and if actual cargo volumes reflect the high-scenario projections from the BST forecasts, then the region is likely to have a significant shortfall of suitable land for new public marine terminals.

3.4 POTENTIAL FOR INCREASED EFFICIENCIES

What is the potential for more efficient use of industrial harbor land? The total amount of land inside the Portland city limits is essentially fixed. Unless submerged land is filled to create new dry land, the only way the City can get more land is to expand its boundaries, which is unlikely to occur due to the constraints of surrounding land. Therefore, the City is interested in using its supply of industrial land as efficiently as possible to accommodate the most economic activity.

3.4.1 RECENT TRENDS IN EFFICIENCY OF PORTLAND HARBOR LANDS

We examined trends in efficiency in the Portland Harbor using several measures. Because of data limitations (see Chapter 2 and Appendix A) we focused our analysis on the period between 2002 and 2008. We calculated the economic activity in the Portland Harbor for these years, measured in terms of employment, real market value, value added, and cargo tonnage. We then divided each of these measures by the number of developed industrial acres in the Portland Harbor for each year to get a measure of land efficiency: i.e., some amount of some measure of economic activity, per acre. We then looked as the change in that measure of efficiency over this period of time.

Recent trends in the Portland Harbor show different results, depending on the measure of efficiency used. These results are summarized in Exhibit 3-9.

Exhibit 3-9. Measures of economic activity per acre, Portland Harbor, 2002 and 2008

	2002	2008	AAGR
Value Added	$1,147,614	$1,217,173	1.0%
Real Market Value	$776,715	$838,091	1.3%
Employment	6.21	5.75	-1.3%
Cargo Tonnage	3,873	4,928	4.1%

Real Market Value: Metro RLIS
Employment: Oregon Employment Department, Quarterly Census of Employment and Wages
Cargo Tonnage: Port of Portland
Acreage: Metro RLIS and Multnomah County Office of Assessment and Taxation

From 2002 to 2008, developed industrial land within the Portland Harbor increased from 2,757 acres to 2,863 acres, an average of 18 acres per year. Value added, real market value, and cargo tonnage all grew at a faster pace than developed industrial acres. By those measures, land was used more efficiently. Employment in the Portland Harbor, however, declined over that period (both in absolute terms, and per acre of developed industrial land). The measure of efficiency that is chosen makes a difference when evaluating trends in land use efficiency.

The next section explains each of these measures in more detail.

Employment

Employment density is a traditional measure of land-use efficiency. In fact, it is typically the basis for forecasting supply of and demand for employment land for all jurisdictions across the State, as they conduct periodic Economic Opportunity Analyses that are required by State law.

For our analysis, we obtained employment data from the Oregon Employment Department for all businesses in the City of Portland for 2002 and 2008. We used GIS software to isolate all employment located within the Portland Harbor for these two years. Total employment in the Portland Harbor declined from 17,134 to 16,466 over this period, a decline of roughly 111 jobs per year (or -0.7% per year).

The Oregon Employment Department QCEW data do have limitations that are worth noting:

- Although the geocoding process OED uses produces accurate results, it is possible that the exact location of some employers could be wrong by one or two hundred feet. This means that some employment in the Portland Harbor may appear outside the harbor boundary when using QCEW data, and conversely, some employment that is actually outside of the Portland Harbor may appear inside the harbor boundary.

- Some firms have multiple locations, but may only report employment at one location (such as at a company headquarters). Depending on how a company reports multi-site employment, all of the company's employment may be incorrectly reported as being inside or outside of the Portland Harbor boundary.

- QCEW data represents the number of *covered workers*. The data excludes members of the armed forces, the self-employed, proprietors, domestic workers, unpaid family workers, and railroad workers covered by the railroad unemployment insurance system. In the case of the Portland Harbor, the most important of these omissions is likely railroad workers. Other studies have shown a significant economic impact from railroad activity in the Portland Harbor, but these workers are excluded from the data.

We do not wish to imply that tracking employment density as a measure of economic activity is wrong or pointless. It is indeed an important measure, and one that the policy-makers, and the general public find useful for understanding the scale of economic activity. Despite the limitations listed above, the QCEW data is widely recognized as one of the most accurate employment data sources updated on an annual basis with site-specific data on all industries. We are just acknowledging that employment isn't the **only** measure of economic activity, and due to its limitations, other alternative measures may prove more useful for evaluating the economic performance of the Portland Harbor.

Real market value

Real market value is another typical measure of land-use efficiency. The relationship is a fundamental principle of urban economics: higher prices reflect the relative scarcity of some type of land or location, and that relative scarcity causes developers to substitute capital for land (i.e., to build more intensively). Higher-value development typically translates into higher assessed values and property taxes, which is seen as a benefit to local governments.

For our analysis, we obtained real market value for all parcels in the Portland region from Metro RLIS data for 2002 and 2008. Using GIS software, we calculated the sum of the real market value of all parcels within the Portland Harbor. The Harbor saw real market values grow from $2.14 billion in 2006 to $2.40 billion in 2008, an average annual increase of 1.9%. However, the US Consumer Price Index grew by 3.0% per year over this same time period, indicating that real market value in the Portland Harbor grew at less than the pace of inflation.

Data on real market value for this time period should be treated cautiously. The local and national real estate markets were booming during

this period. Multnomah County real estate values grew at above average rates: more than 8% during this period. The region has now had three consecutive years of declining real market values since 2008; a detailed analysis of property values in the Portland Harbor would probably mirror these broader regional trends. Over a long period (long enough to include the ups and downs of several business cycles—say, 20 years) inflation-adjusted changes in real market value in the Portland Harbor might be a useful indicator of land-use efficiency. For shorter periods, it is not a measure that can be used without interpretation.

Value added

Value added is a measure of economic activity that is not commonly used to measure land use efficiency. Value added, simply defined, is the difference between the sale price and the production cost of a good or service.[15] It is directly comparable to Gross Domestic Product (GDP) at the national level. Value added only considers the final cost of goods and services (the total of four components: wages, business income, other income, and indirect business taxes), and excludes the value of intermediate goods, to avoid double counting.

While value added is a good measure of economic activity at a regional level, the data are not typically collected at smaller geographic levels, and certainly are not available as time-series data at a parcel-specific level. This presents challenges for using value added as a measure of efficiency for the Portland Harbor.

We used the IMPLAN economic modeling software to obtain value added information for the smallest geographic areas possible (zip codes). ECO used the IMPLAN forecast of value added for the four zip codes that overlap the Portland Harbor for 2002 and 2008. Using a geographic boundary that is close to, but not exactly the same as, that of the Portland Harbor means that the measure of value added per gross developed acre should not be viewed as accurate in an absolute sense. But because our geographies and data sources were consistent in both years, the measure is still useful for observing trends over time.

Our analysis showed value added in the zip codes approximating the Portland Harbor increased from $3.16 billion in 2002 to $3.48 billion in 2008, an increase of 1.6% per year. However, the US Consumer Price Index grew by 3.0% per year over this same time period, indicating that value added in the Portland Harbor grew at less than the pace of inflation.

[15] More accurately, the production costs are the outside purchases of materials and services, but do not count payments to employees for wages, salaries, and benefits. Thus, a lot of value added is a "return to labor;" it also includes returns to land and capital.

Cargo

The Port of Portland tracks cargo tonnage on a monthly basis and publishes annual data, dating back 30 years. While the data are only available for Port of Portland public marine terminals, and not privately-operated terminals, they are a good proxy for cargo shipped in the Portland Harbor, and the most comprehensive historical data available. The Port data show cargo volumes (measured in short tons[16]) increased from 10.7 million in 2002 to 14.1 million in 2008, an increase of 4.8% per year. Over this period, cargo volumes experienced more robust growth than any of the other efficiency measures used in this analysis. In other words, despite a decline in employment, and modest gains in real market value and value added, the Portland Harbor saw strong growth in cargo volumes per developed acre of industrial land.

Note that is not the same as saying that land in the Portland Harbor is what generated or somehow caused that tonnage to go through the Port.

3.4.2 OPPORTUNITIES FOR INCREASED EFFICIENCIES

The available data provide limited answers for understanding the potential for industrial land in the Portland Harbor to be used more efficiently. To supplement them, we interviewed key stakeholders in the Portland Harbor to solicit their input on (1) ways to measure efficiency, (2) challenges to improving efficiency, and (3) strategies to overcome those challenges.

To conduct these interviews as efficiently as possible, ECO staff met with about a dozen members of the Working Waterfront Coalition (WWC), rather than conducting separate interviews with similarly qualified individuals. Established in 2005, the WWC is an organization of businesses concerned about the environmental health and economic vitality of the Portland Harbor. Members of the WWC who were interviewed for this project, included representatives of the following businesses and organizations:

[16] 2,000 pounds per ton, as opposed to metric tons (1,000 kilos, about 2,200 pounds).

- The Greenbrier Companies
- CalPortland
- Northwest Pipe Company
- Schwabe, Williamson & Wyatt
- Kinder Morgan
- Smart Decisions
- Port of Portland
- Perkins Coie
- Schnitzer Steel
- Columbia Pacific Planning
- Evraz Oregon Steel Mills

Group members had different views based on their individual experiences in the Portland Harbor, yet the group as a whole agreed on most key points. Although no votes were taken at the meeting, the following points seemed to achieve consensus:

- **The Portland Harbor has many attributes that provide a competitive advantage for water-dependent industrial activity**. The Harbor benefits from its amazing connectivity: the confluence of two rivers, access to domestic markets via two major rail lines, inland waterways via the Columbia/Snake River system, and I-5 and I-84, and access to global markets via the Pacific Ocean. Having all of this connectivity in the heart of the City of Portland, with strong local policies in place to preserve harbor land for industrial use, creates a special place for water-dependent industrial firms. Members of the WWC recognize the importance of the Portland Harbor, and are committed to maintaining and enhancing its competitive advantages.
- **The constrained land supply is an issue**. Members of the WWC recognize that the industrial harbor land supply in the Portland region is fixed, and vacant developable land is rare and constrained. They believe this limitation is an important issue, and one that will become more important over time.
- **Businesses adjust to these constraints by taking measures that have the effect increasing output on an existing site (i.e., of increasing land efficiency).** Such measures include extra shifts, better machinery, tighter processing procedures, and more.
- **There are bigger public policy issues that are affecting demand for new development in the Portland Harbor**. While members of the WWC were concerned about the constrained land supply, they were more concerned with issues affecting demand: Superfund liability and a burdensome permitting process.
    - **Superfund liability**. The specter of the Superfund is hanging over the heads of all property owners in the Portland Harbor. They know that their liability for the Willamette River cleanup effort will be significant, but they do not know what their individual liability will be, or when a final agreement will be

reached. Members of the WWC expressed concern that it is nearly impossible to sell land in the Portland Harbor for new industrial development until a final agreement has been reached on the Superfund liability.

- **Permitting process**. Members of the group believe the local permitting processes to be time consuming, costly, and uncertain. Such beliefs are typical of most cities. But members of the group who operate facilities across the globe expressed their view that Portland's permitting process is more costly and difficult than most other places they do business. An implication for land efficiency is that permitting, its other intended benefits notwithstanding, makes private sector efforts to improve sites and increase efficiency more difficult. Thus, the City should be sure that the intended benefits are worth the tradeoff, and adjust its permitting process if they do not appear to be.

- **Traditional measures of efficiency do not apply for harbor industrial land, and alternative measures should be used**. Regarding the efficiency of land use, members of the WWC supported the conclusions of this report, that traditional measures (employment, real market value, and FAR) are ill suited for measuring the performance of water-dependent industrial land. The group suggested other measures of economic output, such as value added and cargo tonnage, are more appropriate measures of land-use efficiency in the Portland Harbor.

3.4.3 IMPLICATIONS

In our opinion, the main value of this attempt to measure land-use efficiency was to show what a slippery notion it is, and why simple statements about that efficiency are more likely to derive from opinion and a simple causal model than from an even semi-rigorous empirical analysis. In other words, things are complicated.

For example, many would say that land is being used more efficiently if it accommodates more employees. That kind of definition would be consistent with land-use planning practice and law in Oregon. By that measure, land use efficiency in the Portland Harbor decreased from 2002 to 2008.

But an alternative view—and one more likely to be taken by economists—is that labor (employment) and land are both inputs to a production process. They may be substitutes, or at least there is no necessity that they move together. If a business can use less land and even less labor and still increase its production, it is getting more efficient. If a lot

of businesses in an area are increasing their output on the same land they have always been on, then "land efficiency" can be said to be increasing.

In Portland Harbor the data shows mixed results. Despite declining employment, and growth in real market value and value added that is less than the rate of inflation, the Portland Harbor experienced an increase in efficiency as measured by cargo tonnage. If the City is interested in generating the most economic activity on the fixed supply of harbor industrial land, then value added and cargo tonnage may be more appropriate measures than employment. But these measures are inconclusive on whether the harbor increased in land use efficiency from 2002 to 2008.

That last point leads to a suggestion for policy discussion: instead of talking broadly about "land efficiency," talk specifically about changes in certain economic output per acre. Accept that there are different measures of output, and track several of them. That is what we did above. Our conclusion is that some measures of economic output have been increasing faster than vacant land is being converted to developed land, and other measures have not. The region should continue to track these measures, and adopt policies with the intention of increasing measures of economic output faster than vacant land is converted to developed land. This seems like a good objective for people with different passions: economic development, environmental amenity, or smart growth.

Finally, our simple analysis does not answer other questions that could be important for policy, such as (1) What is causing the increase or decrease in economic activity? (2) How does that change compare with other areas in the Portland region, or with other port areas in the U.S.? and (3) What policies would allow for even greater growth?

PSC Recommended Draft - June 2012
EOA Section 1 Appendix C

Chapter 4 SUMMARY OF FINDINGS

This report focused on issues related to the demand for and supply of land for water-dependent industrial employment in the Portland Harbor (about 4,000 acres of land along the Willamette River, from approximately the I-405 Bridge north of downtown to the confluence of the Willamette and Columbia Rivers). Its main conclusions are:

- The City and its partner agencies have spent years in study and data development for the study area. The City's mapping of vacant parcels is detailed and support its conclusion that outside of land already in Port of Portland Terminals, the best potential sites in the study area of a location and size that a new marine terminal would require are Atofina and Time Oil.
- These two sites meet mandatory criteria for minimum size (more than 50 acres) and location (frontage on the Willamette River) for a new marine terminal. That makes them *possible* sites, but not necessarily *likely* sites. The analysis in this report reconfirms findings of previous studies: small size and a lot of site constraints (especially the need to deal with the legal liabilities of prior soil contamination) make development of these sites for a marine terminal challenging.
- Even using the most detailed and recent data available, it is difficult to predict future land needs for public marine terminals with precision. While the potential land need through 2040 varies greatly depending on key assumptions, the most-likely scenario shows that the Port of Vancouver may, in theory, have enough developable land to accommodate regional growth in cargo volumes through 2040. In practice, however, competing demands for Port of Vancouver lands, competition among and public policies of affected jurisdictions, and the potential for higher growth in cargo volumes all make it possible, if not likely, that the land controlled by the Port of Vancouver would not be able to accommodate all of the regional demand for marine cargo.
- Regarding the efficiency of land use, for the time periods evaluated, we found a decline in employment, modest growth in real market value and value added (though less than the rate of inflation), and stronger growth in cargo volumes per developed acre of industrial land. The mixed results of the various measures of economic activity prevent us from drawing a strong conclusion. The region should continue to track these measures, and adopt policies with the intention of increasing measures of economic output faster than vacant land is converted to developed land. This seems like an objective that could appeal to people with different interests: economic development, environmental amenity, or smart growth.

Appendix A Research Approach

Section A.1 describes why getting clear about definitions and assumptions at the beginning of a study is important. **Section A.2** discusses a *framework* for evaluation: concepts that underlie any evaluation of this type. It discusses (1) definitions of industrial use and industrial land, (2) factors relating to the supply of and demand for industrial land, (3) the role of industrial activity in the economy and (3) the concept of land efficiency: what is it, why does it matter, and how is it measured. **Section A.3** is more specific about the *methods* used for the evaluation (review of previous studies, secondary data, case studies, interviews) and how they are used to address four key questions: about land supply for water-dependent uses, a new marine terminal, the role of Vancouver in the regional land supply for marine terminals, and land efficiency.

A.1 OVERVIEW

The purpose of research on public policy issues to provide information to a public debate about public action. The research *informs* decisions; it does not *make* decisions. Those decisions are usually made by elected and appointed officials on behalf of the citizens they represent.

Some of the issues that require action are controversial. People and groups have different opinions about the extent of the problem, its causes, and best ways it can be mitigated. Ultimately, most solutions that get adopted are a result of debate and compromise. Fundamental to a productive debate about problems and solutions are (1) an agreement on definitions, and (2) clarity about assumptions. Many discussions fail to lead to consensus on action because there was never consensus on definitions. Moreover, it is common for evaluation results to depend more on the assumptions selected than on the data collected in support of those assumptions.

Thus, the analysis in this report starts by trying to describe clearly the context for the questions being asked. That context is a foundation from which to identify data sources and analytical methods. Stated another way, the methods used for evaluation should be consistent with generally accepted ideas about how a regional economy and industrial development work. What do theory and prior empirical work suggest are fundamental contributors to (causes of) economic activity and industrial development, and which of those factors are most closely related to the questions this study is addressing?

Section A.2 provides a *framework* for evaluation: evaluation concepts that underlie any evaluation of this type. Section A.3 then discusses more specific *methods* for data collection and analysis that are consistent with that framework.

A.2 FRAMEWORK FOR THE EVALUATION

This section discusses a *framework* for evaluation. It discusses (1) definitions of key concepts used in the analysis, (2) the role of industrial activity in the economy, (3) factors relating to the supply of and demand for industrial land, and (4) the concept of land efficiency: what it is, why it matters, and how it is measured.

A.2.1 WHY CARE ABOUT INDUSTRIAL LAND?

No city or region exists that does not engage in economic activity. A concentration of economic activity is a defining characteristic of all cities.

A substantial but inconclusive literature investigates which economic activities provide the greatest net benefits to cities. Most of that literature assumes, at least implicitly, that (1) specialization allows consumers to get a variety of goods and services at lower prices; (2) if places specialize where they have comparative advantages, they will (a) produce goods more efficiently and be more competitive, but (b) have to trade to get everything they want; and (3) trading requires having something to trade; it means exporting some goods and services so that that money is available to pay for imports. It is that logic that leads economic development specialists to emphasize the importance of growing and retaining local firms that export goods and services: the payment for those exports brings money into the local economy that, among other things, allows purchases of desired goods and services not provided in the local economy.

Whether industrial activity generates larger economic benefits than other economic activities is a matter of debate in the professional literature of development economics.[1] Most economic development practitioners, however, believe that:

- Manufacturing is central to a strong regional economy (for a variety of reasons related to assumptions about greater value added, export

[1] See a recent debate sponsored by *The Economist* on the motion "This house believes that an economy cannot succeed without a big manufacturing base." (http://www.economist.com/debate/days/view/714; accessed 24 August 2011). The opening remarks of the moderator stated "Our topic for the next few days is one that has divided economic practitioners and commentators for as long as anyone can remember: how important is manufacturing?" Hypothetically, if the U.S. were manufacturing more products being sold abroad, its debt would be less. But are global and U.S. economic conditions such that manufacturing is the comparative advantage of the U.S.; maybe it should be exporting services (e.g., financial, accounting, medical, engineering, and so on) instead. Pro and con arguments are posted on-line and readers vote. Readers voted 3 to 1 in favor of the proposition.

orientation, multiplier effects, average wages, and employment social diversity) and their missions.[2]

- By extension, the supply of land to accommodate manufacturing (i.e., industrial land) is important: too little industrial land hinders the growth or utilization of regional economic capacity. It is not uncommon for economic development discussions to include a statement that a region lacks sufficient land for industrial development at what someone has judged to be reasonable prices.

While proponents of manufacturing and industrial development have arguments and data to support their beliefs, so do groups that have different opinions about the importance of manufacturing relative to other sectors. Some of their arguments: too much industrial land could impose opportunity costs on the regional economy and hinder the growth or utilization of regional economic capacity; land markets and resulting land price should be allocating land to highest and best use, and that preserving land for industrial users at the exclusion of non-industrial users would reduce regional economic well-being.

The disagreement between groups stems from different assumptions about the value of industrial uses on particular parcels of land relative to alternative uses. In debates about public policy on land use and development, advocates for any particular use usually argue that:

- Their preferred use of the lands in question generates greater net benefits for a region than the other potential uses.
- Regions should preserve lands for their preferred use even if other users are willing to pay higher prices for these lands. Stated differently, all sides frequently assume that their uses produce positive externalities for a local economy that justify the effective subsidy associated with keeping other users that might pay more for the lands at issue.
- Where the alternative use would pay *less* for land than their preferred use, their arguments go the other way: the preferred uses generate greater net benefits to a region because the alternative uses will not generate sufficient positive externalities to offset the lost consumer and producer surplus that results from requiring the land to be used for purposes that the market prices do not show to be the highest and best use.

[2] One should note, however, the likelihood of self-selection bias here: local economic development has typically been funded with a mission to retain and attract manufacturing jobs, and people attracted to the field of economic development are likely to start with or acquire that point of view.

The arguments for public-sector involvement in urban land markets (e.g., planning, zoning, urban renewal) are based fundamentally on arguments about external effects that are not incorporated into the market price of land transactions. Proponents for policies favoring industrial land (or any type of land use[3]) might make both sides of the argument: because of the important external benefits of industrial use (1) protect industrial land from being converted to uses that will pay more for that land, and (2) do not prohibit industrial uses from converting other land to industrial uses when it is willing to pay more for the land than those other uses.

This study cannot resolve the longstanding debate about the net benefits of industrial uses and land relative to other uses and land. Rather, *this study starts from the assumption, embedded in the economic development policies of all local governments in the region, that the retention and expansion of industrial sectors is something that the region desires*. The City of Portland specifically addresses industrial land uses in its Comprehensive Plan and Zoning Code. The Urban Development goal of the Comprehensive Plan calls for industrial sanctuaries, where industrial land is preserved for manufacturing purposes exclusively. This stance is reiterated in Goal 5: Economic Development, which identifies retention of industrial sanctuary zones, including maximizing linkages with and within these areas, as a primary objective. These policies are implemented via the city's zoning code, which restricts certain commercial uses in industrial zones and only permits changes to Industrial and Employment Comprehensive Plan designations, if stringent criteria are met. These policies demonstrate the City of Portland's commitment to protecting industrial lands for industrial use. With this commitment in mind, this study then investigates land and in the Portland Harbor to see what capacity they have (given different assumptions about user types and changes in technology and operations) to accommodate industrial users.

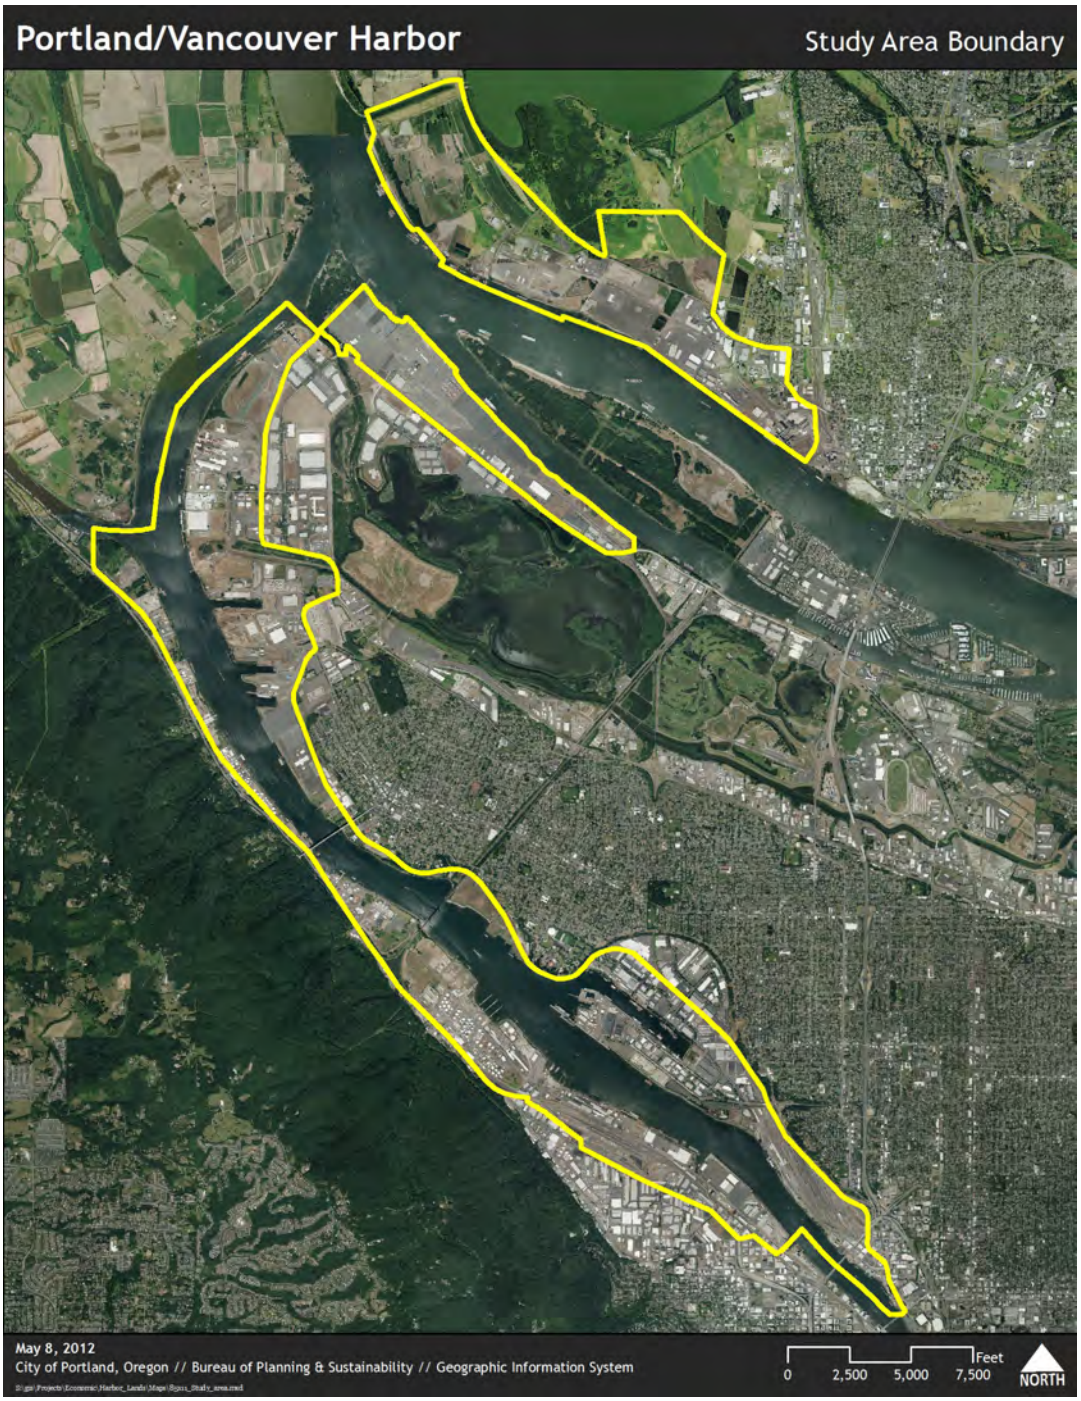
A.2.2 DEFINING INDUSTRIAL LAND AND USERS

A.2.2.1 Industrial land

What is commonly referred to as "industrial" land is land designated by a local government (in its comprehensive plan, implemented by its zoning ordinances) to allow (but not necessarily require) industrial uses.[4] Thus, land may be defined by public policy (e.g., plan or zone designation) or by actual uses. Such definitions may lead to an identification of roughly the

[3] For example, the fundamental argument for the preservation for West Hayden Island is that such preservation has external natural and social benefits that make the land more valuable to the region in its natural state than in development.

[4] Much of the overview in section A.2.2 is drawn from previous work ECO has done on industrial lands, especially work for the City of Tukwila, WA.



same land, but they are not identical. Industrial uses exist on land not zoned for those uses, and non-industrial uses exist on lands zoned industrial. Either definition, or both, may be appropriate for a particular policy issues.

A smaller subset of industrial land pertinent in this study is "harbor" land. That land could be defined in any of several ways. It could be, for example, land parcels that are within the boundaries defined for this study and also:

- With docking facilities
- Abutting a navigable waterway
- With active water-dependent industries (however "water-dependent" may be defined
- Owned by the Port of Portland
- Any combination of the above.

For this study, we use the City's definition of the "Portland Harbor," based on land designated industrial by the City's Comprehensive Plan in close proximity to the Willamette River. A map of the City's harbor lands is shown below in Exhibit A-1.

Exhibit A-1. Map of harbor lands in Portland

Source: City of Portland, 2011.

A.2.2.2 Industrial users

All industrial users

Land is designated industrial because it meets, or is intended to meet, the needs of the industrial users. These needs typically include proximity to transportation routes (interstate roadways, rail, water ports, airports),

relatively low-cost land (to accommodate the relatively large land needs of many industries), and a location that reduces conflict with other uses.

Industrial users are usually identified as a collection of sectors from the North American Industrial Classification System (NAICS). A recent analysis of industrial land published by the American Planning Association[5] used NAICS codes to define "industrial use" in urban areas. It described a *strict* definition and *loose* definition. The industries included in both definitions are shown in Exhibit A-2.

Exhibit A-2. NAICS codes presumed to be highly correlated with industrial land use

NAICS	Industry
Strict Definition	
23	Construction
31-33	Manufacturing
42	Wholesale trade
48-49	Transportation and warehousing
Loose Definition	
23	Construction
31-33	Manufacturing
42	Wholesale trade
48-49	Transportation and warehousing
221	Utilities
444	Building material and garden equipment and supplies dealers
511	Publishing industries (except Internet)
517	Telecommunications
518	Internet service providers, web search portals, and data processing services
562	Waste management and remediation services
811	Repari and maintenance
812	Personal and laundry services

Source: *Planning for Industry in a Post-Industrial World*, Marie Howland. See text for full citation.

These sectors share some basic characteristics. First, they are often referred to as part of the "traded" sectors, presumably because they have a greater propensity to be export-oriented and involved in direct creation of physical goods.[6] Second, they generally have the same building and land needs and site requirements. They cannot typically locate in high-rise office space or in storefront retail space, or in converted homes. This limitation is in part related to possible external effects that can make them unattractive neighbors; they can generate more noise, dust, smells, and visual impacts than other uses. (But many industrial uses can have *fewer* external impacts

[5] Howland, Marie. 2011. "Planning for Industry in a Post-Industrial World: Assessing Industrial Lands in a Suburban Economy." Journal of the American Planning Association. Winter, Vol 77, No 1. pp 39-53.

[6] But note that this distinction has always been fuzzy and is getting blurrier in today's economy. Many businesses in the Services sector are export-oriented: e.g., business services and tourism. Moreover, the notion of "basic" is also fuzzy and increasingly questioned.

of some types than businesses in other sectors have: e.g., on traffic). The limitation also relates to their general need for cheap land and proximity to transportation routes.

The industrial sectors shown in Exhibit A-2 are defined by industrial activities, but the list does not necessarily reflect the types of businesses that require industrial land. For example, many jobs in the construction industry are not physically located at a central, industrial location, but instead operate on sites throughout the region. Similarly, many utility jobs in the region are often in office towers in the Central City, and do not require industrial land. Therefore, the list of NAICS codes that constitute industrial uses (as defined by the American Planning Association) do not necessarily reflect the range of businesses that would have demand for industrial land in Portland.

Water-dependent industrial users

For this analysis, more important than "all industrial" users is the subset of industrial users that are either "water dependent" or "water related." Every type of job must, by definition, fit into one of 17 broad ("two-digit") NAICS categories. But at the most detailed level (six-digit) there are about 1,175 categories. If one wants information about "water-dependent" employment, one must define it as some combination of NAICS codes, and those codes, even at the finest level of disaggregation, may have firms that one might call water-dependent and others one would not. No standard data source defines business this way; one has to either combine NAICS codes or do primary research (e.g., site evaluations of phone surveys).

Even seemingly obvious NAICS codes like 3366, ship and boat building, may not be completely populated by water-dependent firms: smaller pleasure boats may be built or refurbished for shipping by truck or rail. And codes that may appear to have little to do with water (e.g., 3112, oil seed and grain milling) may have reasons to be close to the water because of the importance of bulk shipment. This report does not conduct analysis that requires a definition of water-dependent industrial users, and because of the difficulties of defining water-dependent industries by NAICS codes, we have not attempted to do so.

The City of Portland defines river-dependent uses as those that can be carried out only on, in, or adjacent to a river because they require access to the river for waterborne transportation or recreation. Included is any development, which by its nature, can be built only on, in, or over a river. The zoning language, however, does not distinguish specific water-dependent industrial uses.

Public marine terminals

Our analysis treats public marine terminals (i.e., the Port of Portland facilities) differently from other users of harbor industrial land. These port terminals function as public infrastructure, facilitating economic activity for other industries in the region. In this report, we examine certain questions related to broader harbor industrial land efficiencies, and other questions related to land supply specifically for new public marine terminals.

A.2.3 EVALUATING THE SUPPLY OF AND DEMAND FOR INDUSTRIAL LANDS

This section looks at how cities answer critical questions like: How much developable industrial land is there? How is it likely to be used? Will it be enough for the expected demand in the future?

A.2.3.1 Supply of industrial land

The total amount of land inside the Portland city limits is essentially fixed. Unless submerged land is filled to create new dry land, the only way the City can get more land is to expand its boundaries. But such expansions are unlikely, because the City is mainly surrounded by rivers, protected areas (Forest Park), and incorporated municipalities.

Thus, for the City of Portland, the question of land supply focuses on how much land is vacant, partially vacant, or underutilized, and how much land is constrained (by environmental contamination, environmental overlays, and other issues).

The Bureau of Planning and Sustainability (BPS) at the City of Portland has done extensive work to characterize the land supply in the Portland Harbor. It uses state-of-the-practice procedures (e.g., GIS data layers) consistent with Oregon planning law (e.g., statutes and administrative rules for statewide Goals 9 and 14).

Exhibit A-4 shows the typical process for categorizing and evaluating land supply. In summary:

- All land is either fully developed or not.
- If not, it is either (1) under development (in the pipeline), (2) buildable, or (3) not buildable (because of prohibitive physical or policy constraints.
- If buildable, a parcel of land may be (1) fully vacant, (2) partially vacant, or (3) potentially redevelopable.

- Buildable land in any of those categories has a *capacity* to accommodate new development. That capacity is defined by public policy and may be partially constrained by public policy.

Exhibit A-4. Conceptual framework for buildable land inventory and capacity analysis

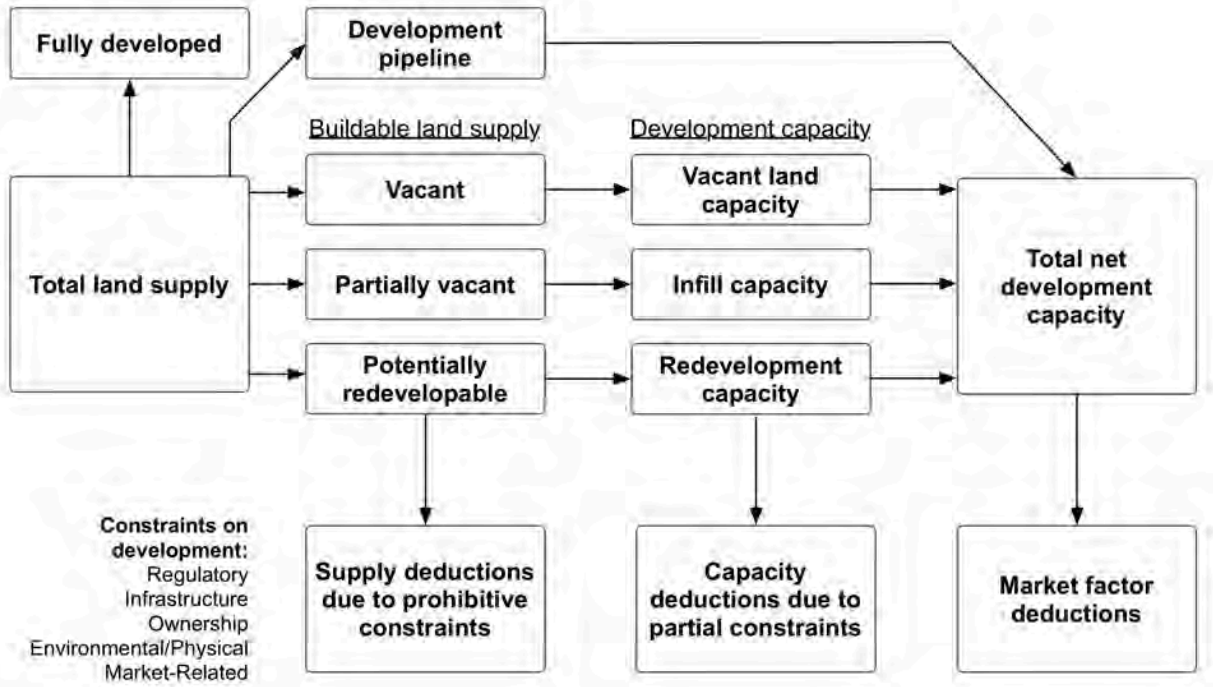


Fig. 7-4 Land supply and capacity analysis process. *Source: Moudon and Huber 2000. This material is used by permission of John Wiley & Sons, Inc.*

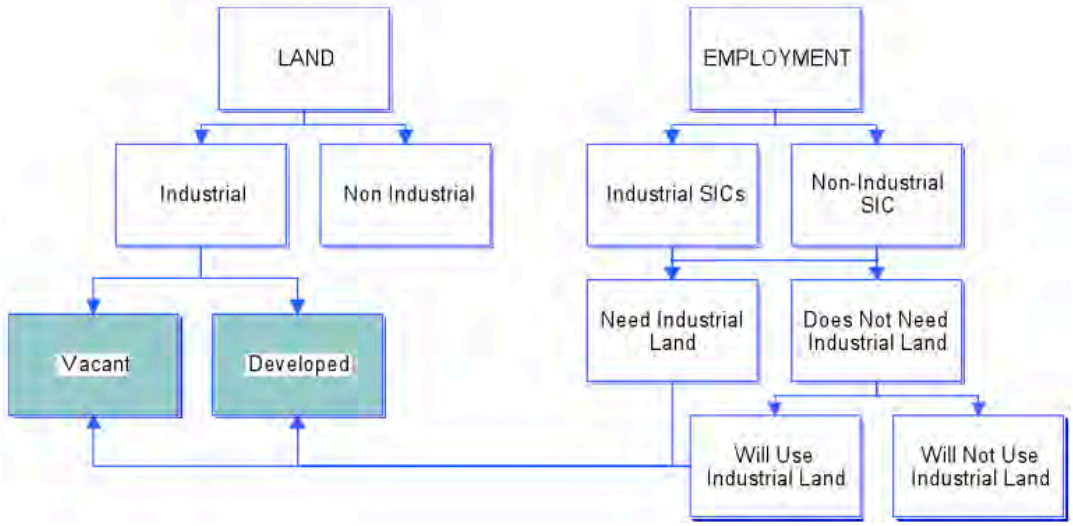
The concepts and definitions illustrated in Exhibit A-4 are relatively well understood in Oregon planning practice. Our investigation suggests that the extensive work by BPS on the land supply in the Portland Harbor generally accepts these concepts, even if its definitions and methods are slightly different.

A.2.3.2 Demand for industrial land

Forecasting demand for industrial demand begins by identifying what types of users will consider locating on land designated industrial. In general, industrial land must accommodate most job growth in "industrial" sectors. It must also accommodate some job growth in "non-industrial" sectors.

Not all jobs in "industrial" sectors use industrially-designated land. For example, a head office of a manufacturing company may be in a downtown office/commercial zone rather than in an industrial part of a city. Another



example is that some firms in the industrial sectors are allowed to locate in general commercial or mixed-use zones and may do so.

Not all industrially-designated land is used by "industrial" sectors. Some businesses that are referred to by the NAICS system as "services" need industrial land (for example, auto repair) because they share the same need for a location where land is cheap and where their activity is compatible with the surrounding neighborhood. In addition, non-industrial uses that don't necessarily *require* the characteristics of industrial land (low price, access to transportation, etc.) may nevertheless locate there if (1) they are not prohibited from doing so, and (2) the market conditions allow them to out-bid industrial uses. Big-box retailers with sufficient drawing power may not need surrounding retail: they can stand alone in industrial areas, where they may find cheaper land and better access to customers and suppliers. Services may locate in an industrial area to serve food and other convenience needs of industrial workers. Residential uses may also find an industrial area attractive if the environmental effects of industry are not too deleterious and the location is convenient for residential living. Most significantly, given the focus of this study, professional offices and other commercial uses may locate on industrial land because they can out-bid industrial uses.

This is one of the City of Portland's concerns: that large amounts of industrial land will convert to non-industrial uses. The City has already taken actions to alleviate this concern. Existing policies in the City's Comprehensive Plan and Zoning Ordinance (see Section A.2.1 of this document) aim to prevent the use of industrial land for non-industrial uses. Industrial sanctuary zones, for example, preserve land zoned as industrial for industrial purposes exclusively. The code does, however, allow for conditional use of industrial land for non-industrial purposes in these same areas.

Exhibit A-5 shows this relationship between "industrial" uses (as measured by industrial employment) and "industrial" land, and why studies of industrial land like this one are tricky.

Exhibit A-5. How industrial and non-industrial businesses use industrial land

Source: ECONorthwest, 2011.

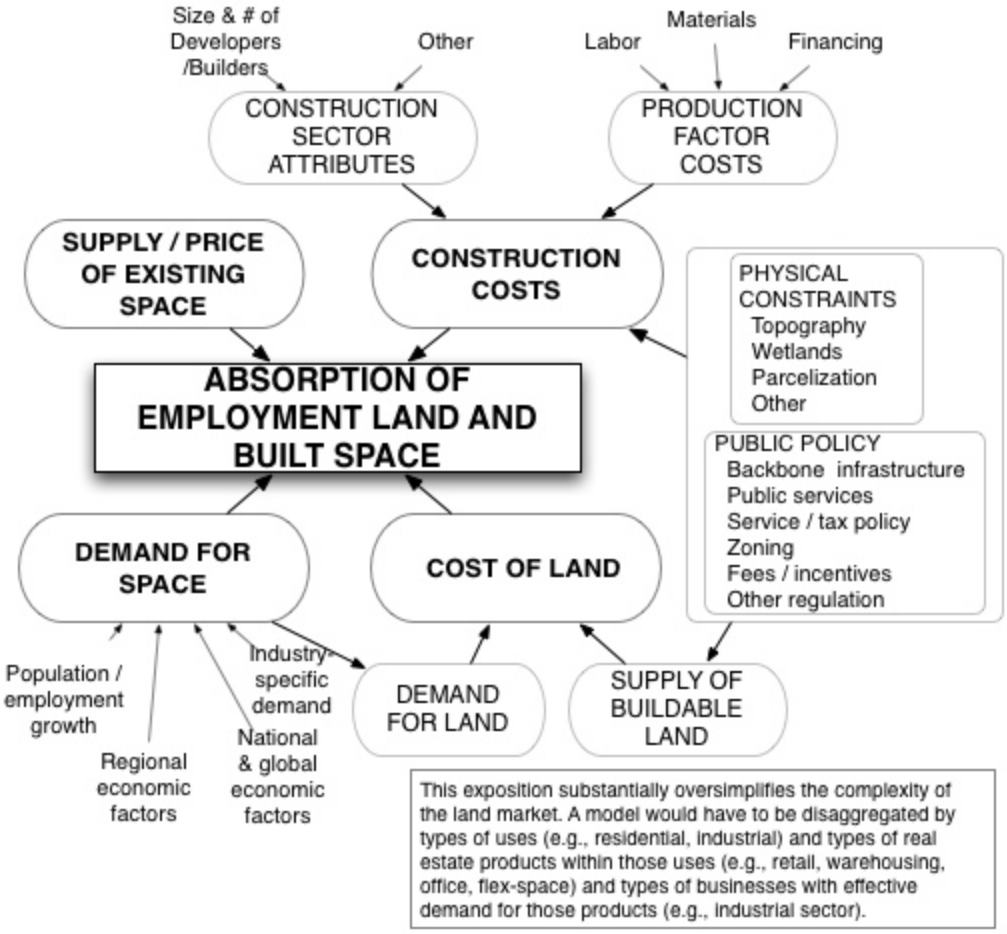
On the "Land" side, the analysis in this study is concerned with only land designated as industrial, and is concerned with both vacant and developed industrial land. On the "Employment" side, the study cannot limit itself to industrial NAICS codes[7]: non-industrial users use industrial land. It also cannot limit itself to a subset of businesses that in some sense "need" industrial land, because many businesses that fail to meet whatever need criteria we might develop will still be users of industrial land.

In Oregon, state law requires that cities provide adequate land for 20 years of forecasted economic growth (Goals 9 and 14 of the statewide planning goals). As a matter of practice, (1) the common measure of economic growth used in a 20-year forecast is employment, and (2) some estimate of employees per developed acre, by broad industry type (e.g., retail, office commercial, industrial), is used to convert forecasted future employment to needed acres of land.

For several reasons related to market conditions and public policy, it is possible for (1) employment density to increase over time, and (2) an increasing amount of new employment-related development to occur as an intensification of development on an already developed parcel (rather than as new development on a "greenfield" parcel). If a region uses its land more "efficiently" (due to public policies, market forces, or a combination of both), then the ratio of employees per acre should increase, which would reduce the amount of demand for land in the forecast period.

[7] Formerly SIC codes, as shown in Exhibit A-3.

While employment is typically the measurement used to forecast demand for land, it may not be the best measurement for forecasting industrial land demand. Later, this appendix discusses other measurements that could be used to forecast demand, and to measure land efficiency.



A.2.3.3 Comparing supply and demand

Factors affecting demand and factors affecting supply are not independent: in theory those factors interact to result in a market clearing price. Businesses and developers do not necessarily choose the cheapest land or the best (most expensive) land: they choose the land with the best value. In other words, price makes a difference. Below are some key points that describe how factors of supply and demand interact to determine where industrial development occurs:

- In any production processes, businesses try to economize on scarce (relatively expensive) resources by finding substitutes or changing the production process. For example, if serviced lands become scarcer, their prices should increase and businesses will substitute other factors (e.g., equipment) for land. In other words, as land gets scarcer, its price should rise and it should get used more intensively.
- With a fixed supply of total land, the supply of vacant, buildable land will decrease as development occurs.
- As the supply decreases (and as the real costs of providing services to that land increase), the price of land for new development will increase.
- As the price increases, users of land (businesses and developers) will try to economize on the use of land. They may do that by (1) using the available land in Portland more intensively, (2) choosing locations in other cities in the region more distant from the center that have more and less expensive buildable land, or, if no land elsewhere in the region has the desirable attributes at an affordable price, then (3) locating somewhere other than the Portland region.

Exhibit A-6 shows some of the many factors that affect the absorption of employment built space and land.

Exhibit A-6. Factors affecting the price and absorption of vacant land

Source: ECONorthwest, 2011

In the Portland Harbor, for example, land may be more expensive (cost per acre) than at the region's periphery. But land in the Portland Harbor is also close to the downtown, labor markets, port terminals, and interstate highways. If it is only a little more expensive, it may still be a preferred location for growth. If it becomes too expensive, then prospective industrial users may locate elsewhere, on land that provide a better value. If there is no land within the Portland region that provides this value, then the prospective industrial users may locate in other regions instead of Portland.

In an idealized market, such a value differential would be spotted by developers and businesses. In their efforts to secure the land they would bid up its price until it had little net advantage relative to all other land. In that idealized situation, all industrial land is equally suitable and every sub-area will, over time, get its share of new development.

But more realistically, a particular firm may have particular needs that are best met by land at a certain location. Though businesses on average

may be filling to pay only, say, $5 per square foot for the land, such a firm may be willing to pay, say, $8 per square foot. Thus, the question becomes one of making some assessment of whether the particular package of land attributes for properties in the Portland Harbor is going to be especially desired by some subset of businesses (e.g., water-dependent businesses).

A.2.4 "EFFICIENT" USE OF INDUSTRIAL LAND

Efficiency is a measurement of how much output is produced per unit of input. Thus, an efficiency measure requires a numerator (output) and a denominator (input). In this case, we care about the amount of economic activity (output) generated per acre of land (input). The denominator—acres—is relatively clear in theory and straightforward to measure. Thus, the bigger challenge is in choosing and measuring the numerator: economic activity. This section describes the various ways to measure efficiency of industrial land, and why some of these measures may be more appropriate than others.

If land use in an area becomes more efficient, then any given amount of economic activity will require less land than it would have otherwise. In an area with a fixed supply of industrial land, like the Portland Harbor, it makes sense to consider ways to use the land more efficiently to accommodate more economic activity. Typical measures of efficiency, however, may not be ideal for evaluating industrial land and marine terminals.

A.2.4.1 Traditional measures of efficiency

Typical measures in the numerator of an efficiency measure of land use include employment, real market value, and built space. These measurements look at the amount of economic activity occurring on a property. In general, advocates of economic development would prefer larger buildings, with higher value, and more employees to locate on a given parcel of land. But these measures of efficiency tend to give relatively low marks to industrial development.

Harbor industrial development tends to have low floor-to-area ratios (FAR) and a relatively low number of jobs per acre. Compared to an office tower, an acre of industrial development is likely to have much lower assessed value, employment, and gross square footage. Thus, measures of the efficiency of employment land based on any of these measures in the numerator would all tend to improve if industrial land were converted to commercial uses.

But industrial lands in general, and harbor lands in the case of this study, are clearly an important piece of the regional economy. If every

jurisdiction allowed vacant industrial land to convert to commercial uses on the assumption that some other jurisdiction would provide the industrial land, the regional supply of industrial land would get smaller quickly and, at the margin, industrial expansion would be slower than it would have been. Land with port access is a particularly important and relatively rare component of all regional industrial land. Marine terminals provide access to other markets, facilitating commerce, and allowing traded-sector businesses to export their goods to other markets.

In the context of the discussion in A.2.1 above, land with port access is necessary for the development of port and port-related facilities, and such facilities may have large external benefits for the region. Since the benefits are external (and, by definition, cannot be readily captured by owners of the land), they do not influence the price that private developers will pay for land. Thus, land prices that industrial users are willing to pay for land in the Portland Harbor probably do not reflect the full value to the Portland region of having that land in industrial use.[8]

A.2.4.2 Key issues for measuring efficiency

Regardless of what measure of economic activity is used in the numerator for calculating efficiency, there are fundamental issues that present challenges for defining and measuring efficiency and changes in efficiency for industrial land.

Efficient use of land versus efficient production of goods and services

Fundamental to land-use planning regulation in Oregon is the assumption that sprawl is inefficient, and that reducing sprawl saves valuable natural land (for farming, forestry, and the provision of ecosystem services) and promotes more intensive use of urban land (i.e., more density). This system intends to promote more efficient use of land. Denser development, however, does not necessarily mean more efficient production of goods and services for all types of businesses. Put another way, a public-sector mandated increase in certain measures of intensity of industrial land use (e.g., minimum FAR) may or may not increase the efficiency of a particular operation (measured by value added, employment, etc.).

This issue is critical when discussing land-use efficiency in the Portland Harbor. For some (perhaps many) industrial businesses located in the

[8] Proponents of other uses could make the same argument: that their external benefits are substantial and not capitalized in land value. A full technical evaluation of the relative net benefits would require extensive empirical work, is unlikely to be definitive, and is beyond the scope of this study.

Portland Harbor, pressure to develop at greater density is unlikely to increase the efficiency of their operations.

Site-specific land efficiency versus regional land efficiency

Site-specific efficiency refers to the economic activity on an individual site. If a user of a one-acre industrial parcel were to double some measure of economic activity (e.g., employment, value added, etc.) without developing more land, one could call that an example of increasing the efficiency of industrial land as a factor of production. This is often what is meant by increasing efficiency.

But what if a parcel serves the regional economy: in other words, what if it provides external benefits? For example, a warehouse may allow other businesses in the region to transport their goods. The warehouse could appear unchanged over time by many measures of economic activity (e.g., assessed value, employment, FAR), but it may be accommodating more goods for other businesses in the region, allowing these businesses to grow.

There are at least three implications. First, standard measures of economic activity like employment may be the wrong ones. The warehouse and its employment may not have changed: it may be that both are now more efficient because the warehouse is now processing more goods because of increases in demand, changes in technology, or some other factor. Second, even if the production per acre for that warehouse were to remain the same in terms of tons or cubic feet of cargo processed, the value of that cargo may have increased (so an argument can be made that efficiency should be measured as value, not tonnage). Third, and related, even if the value of cargo did not change much, its transshipment is a necessary component of what may be a different and rapidly growing industrial sector that is contributing to the regional economy.

An example of this regional land efficiency is the Port of Portland itself. A port's economic impacts extend well beyond its land and the land that surrounds it. In Oregon, the economy of eastern Oregon and Washington depend on the port facilities in the Portland area to ship grain and other products. Looking just at measures of production on land around a port can easily miss the point: a port is a regional facility that may benefit many businesses a great distance from the port. Thus, it may be "efficient" for a port to have relatively low-density uses that allow efficient transportation of goods, facilitating economic growth throughout the region.

Economies of scale and threshold effects

For many enterprises, as they grow for small and start-up to bigger and established, they achieve economies of scale. There are start-up costs that they have to incur, and there are relatively fixed ongoing operating costs

that must be amortized. It is common for costs per unit of output (or, in the case of transshipment) throughput to decline.

Economies of scale (because of declining marginal costs) almost certainly exist for port facilities. There is a large initial capital investment in facilities: once they are there, they can be used more intensively at a low additional (marginal) cost per unit of activity (e.g., tonnage handled). As more facilities, even of different types are available, the per-unit cost of operation and maintenance can decrease, and the attractiveness of and demand for the facilities may increase for users.

Politically, getting to some scale is probably important for users and for higher levels of government (state and federal) that provide financial assistance to ports: in the case of Portland especially, for dredging the Columbia River. In other words, there may be subtle or not-so-subtle threshold effects: if port operations drop below some level, its ability to sustain even those lower levels of activities may be seriously diminished.

Markets versus public policies

Many economists would argue that the best judges of the efficiency of a particular industrial use at a particular site are the owners and managers of the use in question. If they believe that they can operate more efficiently by adding employees, buildings, or equipment to their site, they will do so. If they believe they can profitably increase production without adding land, they will do so. If their land and land around their site has locational characteristics that make it particularly valuable for certain types of production, and if there are a number of businesses involved in that type of production, its price will rise, and the price is a measure of the increasing value (efficiency) of the land in production.

That argument, however, does not address a concern of cities like Portland about that market-based process: what if non-industrial and non-water-dependent commercial uses (e.g., offices and retail) outbid industrial uses for the land? Yes, the land value has increased (as have the cities' property-tax revenues), but perhaps at a greater cost to the regional economy.

A.2.4.3 Alternative measures of the output component of efficiency

In short, to address the question about the efficiency of the use of industrial land in the harbor area, one needs a definition of efficiency that makes sense for industrial land. Such a definition must make sense not only in theory, but also in the context of the data and methods that are available for measuring efficiency. We suggest two alternative measures of efficiency

that are most appropriate for harbor industrial land: value added, and tonnage of cargo.

Value added

Proponents of the industrial and manufacturing sectors point to its potential for high "value added." Value added means that the value of outputs (per unit or in the aggregate) less the cost of inputs purchased from other firms used to create output.[9] In economic terms, industrial activity is a "goods-producing" activity, and is generally considered to have strong potential for value added. A service industry, in contrast, tends mainly to sell transformed labor services. There is value added, of course, but this value added is often lower than in a goods-producing setting.[10]

Setting aside cross-sector comparisons, value added may be a better measure of output over time *within* sectors than employment or built square footage. A measure of the efficiency of a fixed supply of industrial harbor land would be the amount of value added generated per acre for businesses located in the harbor.

Cargo

There is a reasonable argument that much of the industrial land in the Portland Harbor area serves a regional need for transshipment. Therefore, a regional measure of transshipment activity might be appropriate for measuring the efficiency of such land. Some measure of cargo (e.g., tonnage, volume, value) is an obvious choice. Because data are more readily available, we suggest tonnage of cargo as an alternate measurement of land-use efficiency in the Portland Harbor.

The economic activity occurring on a parcel is only part of the impact that land has on the regional economy. Many users of harbor industrial land facilitate economic activity throughout the region. While most measures of efficiency fail to measure this broader impact, tonnage of cargo is a measurement that is consistent with the idea that port facilities have broader regional economic benefits.

---

[9] In that sense, value added is a measure of a firm's contribution to GDP. Another way to think about this is that everything that a firm itself puts into the production of a product (primarily the labor of its employees and capital) "add value" to the raw materials and intermediate goods and services it purchased to make its final product.

[10] Often lower, but not always lower. Service sectors that use highly-trained human capital may have high productivity and high value added. In addition, as technology increases the productivity of physical capital, less manufacturing and construction activity is required to produce the same output. Communication systems, for example, are much more productive than they were in the past, but require much less "brick and mortar" type activities and, hence, less construction activity.

Methodologically, such an analysis should be done for the Portland Harbor in the aggregate, not for individual businesses or parcels. For this measure, it does not matter how much cargo occurs on a given parcel; it matters how much the amount of tonnage per developed acre of land is increasing.

A.3 METHODS

Section A.2 is a *framework*: it is about definitions and concepts related to the issues this study is investigating. It is a basis for selecting specific methods (data and analytical approaches) for addressing the four questions posed:

- Are the methods the City used to estimate the location and amount of vacant, partially vacant, and potentially buildable industrial land in the Portland Harbor area likely to yield reasonable estimates?
- How suitable for a public marine terminal are the few sites in the Portland Harbor that have been identified by the City as having the potential to accommodate such a terminal?
- What role can the Port of Vancouver play in accommodating forecast demand for cargo volumes in the Portland region?
- What is the potential for more efficient use of industrial harbor land?

We describe the methods we used to answer those questions in the rest of this section.

A.3.1 GENERAL DATA SOURCES AND TECHNIQUES

To conduct our analysis, we used the following data sources:

- **Existing studies**. Extensive analysis has been conducted regarding the Portland Harbor, industrial land, and port terminals. Local governments and service districts in the region (e.g., Metro, the City of Portland, the Port of Portland) are constantly evaluating past economic growth patterns, and planning for future economic development opportunities. These efforts result in a library of reports and studies addressing different aspects of the regional economy. These recent (as well as ongoing) efforts contain useful information for the analysis. *The scope for this study emphasized synthesizing and interpreting existing data over collecting new data*. Thus, ECO reviewed these related research efforts, and pulled their key findings into the analysis where appropriate.

  The City of Portland provided ECO with a list of over 30 recent, relevant documents. After an initial review of all of these documents,

ECO selected a subset of documents of particular value to its analysis:

- Portland Economic Opportunities Analysis (2010)
- West Hayden Island Economic Foundation Study (2010)
- West Hayden Island: Marine Cargo Forecasts & Capacity Assessment (2010)
- Portland Vancouver Trade Capacity Analysis (2006)
- West Hayden Island Planning Document
- Oregon Commodity Flow Forecast (2005)
- Portland's Working Rivers: The Heritage and Future of Portland's Industrial Heartland (2008)
- Port of Portland annual reports

ECO focused on data and text related to historical trends and future projections for economic growth: in the region in general and the Portland Harbor in particular.

- **Secondary data sources**. ECO incorporated many secondary data sources into its analysis.[11] As with "existing studies," the objective is to leverage past research efforts to answer the questions posed in this study. Examples of secondary data sources we used are:
  - Buildable Lands Inventory (City of Portland). This source includes multiple data layers in the City's Geographic Information System (GIS)
  - Port of Portland Marine Terminal Statistics
  - Multnomah County Assessment & Taxation
  - RLIS (Metro)
  - Quarterly Census of Employment and Wages
  - IMPLAN
- **Interviews**: Many people in the Portland area have special knowledge of, and interest in, the Portland Harbor. ECO interviewed individuals from both the public and private sectors, and reviewed notes on past interviews that had been conducted for recent related studies. Interviewees included:

[11] Secondary data sources are ones collected and readily available by someone other than the user (in this case ECONorthwest). Typical secondary sources are government agencies (e.g., U.S. Census, ODOT, Metro, Port of Portland).

- Port of Portland officials
- Port of Vancouver officials
- Authors of relevant studies and reports
- Members of the Working Waterfront Coalition
- Other local economic development professionals

Data from these sources were used to address the three specific questions that are the focus of this study. The next sections explain how.

A.3.2 EVALUATION OF PRIOR EFFORTS TO IDENTIFY LAND SUPPLY IN THE PORTLAND HARBOR

The City asked ECO to evaluate whether the methods the City used to estimate the location and amount of vacant, partially vacant, and potentially buildable industrial land in the Portland Harbor area likely to yield reasonable estimates? More specifically, the question was whether it is reasonable to assume that the two sites that the City identified (Atofina and Times Oil) are the only two in the Harbor study area (as defined in Exhibit A-1) that are of a size and location that they *might* be suitable for a new Port of Portland marine terminal?

To answer that question we needed an estimate of the minimum feasible size of a marine terminal. Maul, Foster & Alongi provided that estimate (documented in Section 3.2 of the report and Appendix B): 50 acres. We then looked for 50 acres of vacant land with waterfront access in the study area by:

- Reviewing studies summarizing industrial and harbor land supply: *Industrial Districts Atlas* (2004) and *Harbor ReDI Industrial Sites Analysis* (2009).
- Reviewing GIS shape files and cross-referencing to Google Earth aerial photos (August 2011).
- Discussing methods with BPS staff, and comparing those to standard methods for developing land inventories and identifying buildable land.

A.3.3 ADDRESSING THE POTENTIAL SITES FOR NEW MARINE TERMINALS

Much of the analysis in this report deals with the supply of harbor industrial lands in general: it includes both public and private ownership and uses of the land. This task deals specifically with land supply for new, public, marine terminals.

To determine which sites might best accommodate a public marine terminal, we began by identifying the technical site requirements for a marine terminal. ECO interviewed representatives of the Port of Portland to identify their ideal site requirements, as well as which of these requirements could be reduced while still accommodating a working port facility. ECO compared these site requirements with the findings of the Worley Parsons, a consultant to the City evaluating the potential site design of a new marine terminal on West Hayden Island. Finally, ECO turned to internal team members with experience running west coast ports, and looked for creative ways to adjust these site requirements to create a working terminal on smaller or otherwise constrained sites.

BPS staff identified only two sites that could potentially meet these criteria. ECO, reviewed the sites identified by the City of Portland, and evaluated maps of the Portland Harbor, including zoning, infrastructure and aerial photographs. Our preliminary review confirmed the City's findings, that most of the Portland Harbor has active development on it, and these two sites have the greatest opportunity to accommodate new public marine terminals.

The ECONorthwest Team, including Maul Foster & Alongi, Inc., toured these sites with BPS staff. Maul Foster & Alongi, Inc. conducted a visual inspection of the sites, documenting conditions affecting the suitability of each site for the proposed development. Key factors considered in our analysis were: site access, existing uses, natural features, and contamination/remediation. After conducting this site visit, we developed a set of criteria for evaluating site feasibility for typical port terminals. This set of criteria is included with this document as Appendix C.

Using these criteria, Maul Foster & Alongi evaluated the potential opportunities and constraints of these sites to accommodate development of a public marine terminal. A cursory site visit is insufficient to make a final determination of site feasibility. Nonetheless, our methods are consistent with our scope and budget, and are sufficient for identifying major opportunities and constraints for these potential sites, and making a preliminary determination of site feasibility.

A.3.4 ADDRESSING THE ROLE OF VANCOUVER IN HARBOR INDUSTRIAL LAND SUPPLY

The third question we were asked by the City is: What role can the Port of Vancouver play in accommodating forecast demand for cargo volumes in the Portland region? To answer this question, we used a combination of interviews with port officials and reviews of past reports.

We began by attempting a data-driven analysis. In principle, if we knew the capacity of existing marine terminals in Portland and Vancouver, and subtracted the forecast future demand for these areas, then we could identify the amount of demand that could not be accommodated by existing facilities. This demand (in tons of cargo) could then be translated into the acres of land necessary for new terminals to accommodate this growth. Comparing the required acres to support new terminals with the available land supply in the Portland Harbor and in Vancouver, we could identify how much of Portland's demand might need to be accommodated in Vancouver, and whether or not Vancouver had sufficient land to accommodate it.

The specific steps in our analysis, and detailed tables showing our results are contained in Appendix C: Analysis of Harbor Land Capacity and Demand, Portland and Vancouver. In short, we relied on the following data sources:

- Capacity of existing facilities: Estimates for the public marine terminals in the Port of Portland were taken from the *West Hayden Island Economic Foundation Study*, prepared by Entrix for the City of Portland in May 2010. These estimates were produced in interviews conducted by Entrix with Port of Portland staff. For estimates of capacity of private terminals in the City of Portland, as well as all terminals in the City of Vancouver, we relied on historical data on cargo volumes reported by BST Associates in their *Portland and Vancouver Harbor Forecast Update*, prepared for the Port of Portland in February 2012. Our estimates were confirmed and refined through interviews with Port of Portland officials.

- Future cargo demand: Estimates of cargo demand for all public and private terminals in the cities of Portland and Vancouver in the year 2040 were taken from the BST Associates *Portland and Vancouver Harbor Forecast Update*. These forecasts included a low and high scenario.

- Acreage necessary for new terminals: Estimates of the acreage required for new marine terminals were taken from a variety of sources, including the *West Hayden Island Economic Foundation Study* (Entrix, 2010), the Draft Report on *Operational Efficiencies of Port/Terminal World Wide* (Worley Parsons, 2012), and the Maul Foster and Alongi evaluation criteria included with this report as Attachment B.

- Available land supply: Finally, estimates of available land in the Portland Harbor are based on our own analysis of developable sights, described in Sections A.3.2 and A.3.3. Estimates of available

land in Vancouver, were based on the *West Hayden Island Economic Foundation Study* (Entrix, 2010), and verified through GIS analysis, and conversations with officials from the Port of Vancouver.

The data-driven method described above has many advantages: it is a logical way to conduct the analysis, it relies on the best and most recent data and forecasts, and with any one-set of assumptions used in the analysis, it results in a definitive answer of the acres of land needed for new terminal development. However, there is one major limitation to this method: it relies on so many assumptions, which can be pulled from such a broad range, with each assumption compounding on all previous assumptions, that using different sets of reasonable assumptions can create largely different results.

Therefore, our analysis uses the data to establish a high and low boundary for the potential land need, and describes a "most-likely" scenario that falls between the two extremes. In order to give these numbers more context, and to help us arrive at the most-likely scenario, we also conducted numerous interviews with representatives of the ports of Portland and Vancouver.

A.3.5 ADDRESSING THE POTENTIAL FOR INCREASED EFFICIENCIES

Section A.2.4 provides a context for defining and evaluating the efficiency of the use of industrial land. This section builds on that context to describe specific data and analytical techniques that this study uses.

The City is interested in knowing if industrial land in the Portland Harbor can be used more efficiently in the future. To answer we looked at recent economic trends in the Portland Harbor and in the City of Portland as a whole for changes in land-use efficiency for industrial users. For this analysis, we considered several measures of output in an efficiency measure: employment, real market value, value added, and tonnage.

Ideally, we would like to have data with a long time series (20 – 30 years) for each efficiency measure. But changes in the type, definition, and collection of data make it impossible to get consistent time-series data for both the numerators and denominators of efficiency measures. Our method is an approximation based on available data. We create different measures of efficiency for two different time periods: (1) 2002 – 2008, when detailed and consistent data are available on both output and land area, and (2) 1960 - 1997 when the Port of Portland did occasional studies of its land and activity.

For 2002- 2008 we began by identifying all parcels in the Portland Harbor using GIS. We examined data from two different years: 2002 (one of the earliest years that data are available using NAICS codes), and 2008 (the most recent year QCEW data are available). Comparing data from the two years we calculated the change in developed acreage in the Harbor, and the corresponding change in real market value, and employment.

We also collected data from different sources for two alternative measures of output (for the denominator): value added and cargo (volume, tonnage, and value). Unlike employment, and real market value, data for value added and cargo tonnage is not tracked at a parcel specific level. Instead, data is available at the regional, City, zip code or Census tract level. For our analysis, we used Port of Portland data on historical levels of cargo tonnage in the Portland Harbor, and the IMPLAN economic model for the zip codes that most closely align with the boundaries of the Portland Harbor for value added. We used the same years (2002 and 2008) as were used for other measures of efficiency.

In summary, we created various measures of change in land-use efficiency between 2002 and 2008.

This method has limitations. Six years is not a long time to observe economic trends and changes in land-use efficiency if one is hoping to use those trends as a basis for long-run forecasts. Moreover, the period includes the recent recession, which began in 2007. Ideally, our analysis would include years before 2002, as well as years later than 2008. However, data after 2008 are not yet available, and data before 2002 have significant limitations. Prior to 2000, employment was recorded by SIC codes, rather than NAICS. The change in classification makes comparing data across this time period difficult and unreliable for time-series analysis. Additionally, land-use data, including data from the County Assessor is less accurate prior to 2000, as GIS and other technology had not yet been widely adopted.

For a long-run look at trends, we used yet another method based on cargo tonnage as a measure of output. The Port of Portland conducts periodic studies of land use and development in the Portland Harbor. The earliest Port study dates back to 1960, with additional studies in 1990 and 1997. Additionally, various data sources, including the Port of Portland, the US Department of Transportation, and the Corps of Engineers track cargo tonnage that is shipped through the Portland Harbor. Comparing these datasets, we were able to calculate the tons of cargo that were shipped per developed acre in the Portland Harbor from 1960 through 1997, and observe trends over this 37-year period.

Appendix B Criteria for Evaluating Potential Sites for Marine Terminals

One of the four questions that this study addressed was, "How well do the characteristics of the Atofina and Time Oil sites (the two identified by the City as meeting the minimum requirements for size and waterfront access) match the characteristics that would be needed to create a reasonable probability the sites could be developed as marine terminals?" To answer that question the consultant team had to specify those characteristics. Team member Maul, Foster & Alongi created the evaluation criteria summarized in the table that follows. Those criteria are used in the evaluation reported in Section 3.2 of the main report.

Marine Terminal Criteria

Criteria	Considerations	Comments
Water Access	Depth	Both berth and channel water depth are limiting considerations on vessel size and ultimately cargo type: (1) Barge: 15 to 20'; (2) Bulk: 35 to 52'; (3)Break Bulk: 30 to 40'
	Dredge Maintenance	Ability to maintain navigational depth through routine dredging. It is a function of siltation rate, cost, regulatory hurdles and physical restraints such as the presence of contaminated sediments.
	Pier Face Capacity	Vessel length and number of number of berths determine cargo type: ▪ Barge: 200 to 500' ▪ Bulk: 330 to 1200' ▪ Break Bulk: 400 to 800
Land side transportation	Mainline Rail	Multiple rail service is desirable for competitive rates.
	Rail Siding	On site useable rail siding with sufficient on site car storage. The requirements for train length storage awaiting loading or unloading is a function of the cargo type. Bulk facilities including autos require 9.000 to 12,000 feet of track, whereas specialty project cargos can be managed on much smaller sidings and onsite storage track systems.
	Road	Proximity and ease of access to interstate freeway systems is an important criterion for marine terminals. Access should be on designated, all-weather truck routes with high levels of service including the access ramps to the interstate system.
Size	Total Acreage	Minimal acreage for cargo handling is required for various cargo types:* ▪ Barge: 10 to 75 acres (Mixed, bulk and project cargos) ▪ Bulk: 10 to 200 acres (Liquid and dry commodities) ▪ Break Bulk: 20 to 100 acres (Project cargos; autos)

Criteria	Considerations	Comments
Size (continued)	Unity of Ownership	Total acreage is a critical consideration and the assembly of property is often hampered by cost and timely assembly.
	Configuration	Parcel shape for marine terminals has an impact on terminal operating efficiency, most notably distance to pier face from remotest staging area. Configurations vary with cargo type and loading techniques. Dry conveyor and liquid piping configurations as well as auto handling are somewhat more forgiving.
Physical	Slope and elevation	Generally speaking facilities need to have minimal elevation change and slope. Bank heights have practical limitations, but fixed pier systems can be engineered to accommodate water to upland elevation differentials.
	Utilities	Power demands are limited to electricity for equipment operation and "at berth" vessel operations for on board systems to avoid ship engine fuel burn consistent with zero discharge environmental goals. Stormwater management is also a prime concern, but can readily be managed on most sites.
	Encumbrances	Encumbrances include easements, public rights of way and other deed restrictions that restrict or otherwise limit a site's efficient use.
Regulatory	Zoning	Appropriate zoning is required consistent with local land use regulations. In Portland, although several zoning classifications may be appropriate for some aspects of marine terminals, the heavy industrial (IH) zone allows for the widest range of primary and assessor uses necessary for marine terminals; such as rail yards or handling of hazardous materials.
	Overlay Regulations	While Oregon does not have shoreline regulations, the City of Portland has overlay zones which may impose additional restrictions and protections.

Criteria	Considerations	Comments
Environmental and Natural Resources	Contamination	Shipping terminals have historically been in industrial sites which quite frequently have been exposed to contamination. Remediation of these sites are typically held to a long time industrial use standard and as a result continuing industrial use for shipping are wholly compatible with industrial level cleanup standards. However it should be noted that previously remediated sites are likely to have deed covenants on future use such as restrictions on potable water wells (not an encumbrance in a serviced urban environment), penetrations into protective caps and disruption of in situ treatment processes.
	Flood Plain	Flood plains are a consideration as most shipping terminals are at elevations that are often included in exposure areas.
Cultural & Historic	Historical and Cultural Significant Sites	Like critical areas, industrial properties that have been historically used for industrial purposes are unlikely to present any encumbrances for cultural and historical uses.

*Acreages vary considerable depending on the precise cargo handling and storage requirements. Storage and handling approaches that dramatically affect the required acreage include: on site storage in rail cars, bulk tanks and silos; warehouses and open air facilities, as well as handling mechanisms such as cranes, loading ramps and bulk material (dry and liquid) conveyors. These ranges are generally useable for the cargo category, but need to be further refined for a specific cargo. In selecting a site, one would err to the higher side of the range to afford the maximum market flexibility. The planned use of rail storage sidings has the single greatest impact on size, and materially affects a site's usability.

Appendix C Analysis of Harbor Land Capacity and Demand, Portland & Vancouver

The City of Portland asked us: to what extent can the Port of Vancouver play a role in accommodating forecast cargo demand in the Portland region? This question is addressed Section 3.3 of the main report. This appendix provides additional tables with more detail than was presented in the main report. Our analysis finds that the Portland Harbor has very limited capacity to accommodate future demand for public marine terminals, but that the Port of Vancouver may technically have sufficient capacity to accommodate all forecast demand for cargo for both the cities of Portland and Vancouver through the year 2040.

C.1 DISCLAIMER

All of this analysis described in this appendix depends on estimates of current variables that are uncertain, and forecasts that are even more uncertain, and themselves dependent on a wide range of possible assumptions. Like any analysis of future economic conditions, this one is built upon many layers of assumptions: each assumption widens the range of potential outcomes, and each layer of assumptions compounds on the previous layer to provide an even wider range of potential results. That fact does not necessarily make the analysis irrelevant: it can definitely inform public policy about possible and likely futures. Despite the uncertainty inherent in this analysis, it is helpful for bookending the potential land need for public marine terminals. Assumptions in the middle of the range give conclusions that should be useful for planning purposes, even if actual results may vary.

C.2 DEMAND FOR MARINE CARGO

We were tasked with obtaining and reviewing the most recent forecasts. These forecasts were contained in the *Portland and Vancouver Harbor Forecast Update* (BST Associates, 2012). These forecasts were based on a 2010 study by BST Associates, but were refined to specifically call out cargo demand for the City's of Portland and Vancouver, and were updated with the most recent economic data. Exhibit C-1 shows the forecast demand for public and private marine terminals in the City of Portland in 2040.

Exhibit C-1. Forecast cargo demand, public and private marine terminals, City of Portland, 2040

Cargo Type	Low	Mid-Range	High
Automobiles (units)	811,000	912,500	1,014,000
Containers (TEUs)	379,000	452,500	526,000
Metric Tons			
Automobiles	1,076,000	1,206,000	1,336,000
Containers	2,162,000	2,583,500	3,005,000
Breakbulk	1,132,000	1,242,000	1,352,000
Grain	6,686,000	9,078,000	11,470,000
Dry Bulk	10,278,000	14,093,500	17,909,000
Liquid Bulk	6,912,000	7,461,500	8,011,000
Total	**28,246,000**	**35,664,500**	**43,083,000**

Calculated by ECONorthwest with source data from BST Associates (2012).

Exhibit C-2 shows the forecast demand for public and private marine terminals in the City of Vancouver in 2040.

Exhibit C-2. Forecast cargo demand, public and private marine terminals, City of Vancouver, 2040

Cargo Type	Low	Mid-Range	High
Automobiles (units)	159,000	197,000	235,000
Containers (TEUs)	-	-	-
Metric Tons			
Automobiles	226,000	278,500	331,000
Containers	-	-	-
Breakbulk	534,000	568,500	603,000
Grain	3,808,000	4,109,000	4,410,000
Dry Bulk	5,931,000	11,663,500	17,396,000
Liquid Bulk	510,000	802,500	1,095,000
Total	**11,009,000**	**17,422,000**	**23,835,000**

Calculated by ECONorthwest with source data from BST Associates (2012).

BST Associates estimates that the regional demand for cargo at marine terminals will range from 39,255,000 to 66,918,000 metric tons in 2040, with roughly two thirds of the demand coming from Portland, and the remainder from Vancouver. Dry bulk is forecast to be the cargo type with the most demand (as measured by tonnage) in 2040, comprising just over half of total tonnage in the region.

C.3 EXISTING CAPACITY

Estimates of existing cargo capacity are difficult to obtain, particularly since our analysis looked at multiple geographies (Portland and Vancouver), and multiple ownerships (public and private). We used two methods to bookend our estimates of existing capacity, based on two different assumptions (1) assuming current facilities operate at 100% of maximum capacity before new terminals are needed, and (2) assuming all

growth in demand is from new opportunities that require new facilities, and current facilities continue to operate at current levels.

The Port of Portland provided us with estimates of maximum capacity, as well as annual historical cargo volumes for each cargo type for public marine terminals in the City of Portland. These estimates of capacity are shown in Exhibit C-3.

Exhibit C-3. Existing cargo capacity, public marine terminals, City of Portland

Cargo Type	Estimated	Recent Peak Volume	Peak Year
Automobiles (units)	675,000	460,000	2006
Containers (TEUs)	700,000	330,000	1995
Metric Tons			
Automobiles	889,000	606,000	
Containers	3,999,000	1,885,000	
Breakbulk	2,100,000	1,130,000	2007
Grain	4,100,000	5,400,000	1995
Dry Bulk	10,700,000	5,460,000	2008
Liquid Bulk	-	-	N/A
Total	**21,788,000**	**14,481,000**	

Calculated by ECONorthwest with source data from the Port of Portland, 2012.
Note: Recent peak volume for grain is no longer applicable, as the Terminal 4 grain elevator has closed since 1995 when the peak was measured.

For private marine terminals in the City of Portland, we compared historical data for total cargo volumes for the years 2000 and 2010 from the BST report with anecdotal data and conversations with the Port of Portland to determine the estimated current capacity. Key assumptions are that all historical liquid bulk cargo, and that none of the automobile and container cargo shown in the BST report for the City of Portland is handled by private marine terminals. For private marine terminals we only used one method for estimating existing capacity, under the assumption that existing facilities do not have significant excess capacity, and that recent historical peaks are a reasonable estimate of capacity.

Exhibit C-4. Existing cargo capacity, private marine terminals, City of Portland

Cargo Type	Estimated	Notes
Automobiles (units)	-	No private auto terminals
Containers (TEUs)	-	No private container terminals
Metric Tons		
Automobiles	-	
Containers	-	
Breakbulk	250,000	Conversation with Port of Portland.
Grain	3,000,000	Existing private terminals are old and nearing obsolesence
Dry Bulk	1,500,000	Conversation with Port of Portland, recent historical peak.
Liquid Bulk	8,280,000	BST reports citywide liquid bulk in 2000.
Total	**13,030,000**	

Source: ECONorthwest, informed by "Portland and Vancouver Harbor Forecast Update" (BST Associates, 2012) and conversations with officials from the Port of Portland.

For the City of Vancouver, we were unable to obtain estimates of capacity from the Port of Vancouver or from the Port of Portland. Nor were we able to obtain detailed historical data by cargo type isolating public terminals from private terminals. Instead, we relied on the BPS report, which reported cargo volumes for just two years: 2000 and 2010. In our evaluation of Port of Portland public marine terminals (described previously in this section), we found that the recent peak volumes were equal to 66% of the total capacity. We applied that same percentage to the recent peak volumes for the City of Vancouver to estimate the total capacity, shown in Exhibit C-5. One adjustment, however, had to be made. The Port of Vancouver is in the planning process of developing a potash terminal, which will have capacity for up to 16 million tons of dry bulk. We added this capacity to the estimated capacity shown in Exhibit C-5.

Exhibit C-5. Existing cargo capacity, public and private marine terminals, City of Vancouver

Cargo Type	Estimated	Recent Peak	Peak Year
Automobiles (units)	90,000	60,000	2010
Containers (TEUs)		-	
Metric Tons			
Automobiles	137,000	91,000	
Containers	-	-	
Breakbulk	531,000	354,000	2000
Grain	5,544,000	3,696,000	2010
Dry Bulk	17,556,000	1,037,000	2010
Liquid Bulk	1,110,000	740,000	2000
Total	**24,878,000**	**5,918,000**	

Source: ECONorthwest, informed by "Portland and Vancouver Harbor Forecast Update" (BST Associates, 2012) and conversations with officials from the Port of Portland.

C.4 CAPACITY SHORTFALL

Determining the capacity shortfall should be as simple as subtracting the existing capacity from the projected demand. However, we have two different estimates of capacity, and three different estimates of demand. And since we are interested in identifying the shortfall for public marine terminals, we also need to make assumptions for what portion of future demand for what cargo types will be accommodated by private terminals.

We created three scenarios for cargo capacity: low, high, and most likely. These scenarios are based on the following assumptions:

- The low shortfall scenario takes the estimates of facility capacity and subtracts the low BST forecast for 2040 demand. This assumes that all existing facilities are pushed to 100% of capacity to accommodate the forecast future demand.
- The high scenario takes the recent peak volume for facility capacity, and subtracts the high BST forecast for 2040 demand. This assumes that all facilities continue to operate at their current levels and that all additional demand will need to be accommodated in new facilities.[1]
- The most-likely scenario takes the estimates of facility capacity and reduces them by 10% (this reduction reflects the fact that some forecast demand will be from new market opportunities that will not be able to take advantage of existing facilities, and therefore despite forecasting a capacity shortfall in the aggregate, not all existing facilities will be operating at 100% of capacity), then subtracts the mid-range demand forecasts (that we calculated as the average of the high and low BST forecasts). This scenario assumes that demand will fall in the middle of the range that BST forecast, and that existing facilities will be able to accommodate some of the future growth, but will never operate at 100% of capacity.

Exhibits C-6 through C-8 show the forecast of the cargo capacity shortfall for public marine terminals in 2040 for each of these three scenarios. In Exhibit C-6, we see the shortfall for the City of Portland public marine terminals could range from 187,000 metric tons to more than 17 million metric tons, with the medium scenario showing some shortfall for automobiles, grain, and dry bulk cargoes.

[1] Since the recent historical peak for grain for public marine terminals in the City of Portland is not applicable, due to the removal the Terminal 4 grain elevator, we used the estimated capacity for grain in this scenario.

Exhibit C-6. Forecast cargo capacity shortfall, public marine terminals, City of Portland, 2040

Cargo Type	Low	Medium	High
Automobiles (units)	(136,000)	(310,000)	(554,000)
Containers (TEUs)	-	-	(196,000)
Metric Tons		-	
Automobiles	(187,000)	(410,000)	(730,000)
Containers	-	-	(1,120,000)
Breakbulk	-	-	-
Grain	-	(2,390,000)	(4,370,000)
Dry Bulk	-	(2,960,000)	(10,949,000)
Liquid Bulk	-	-	-
Total	**(187,000)**	**(5,760,000)**	**(17,169,000)**

Calculated by ECONorthwest with source data from Portland and Vancouver Harbor Forecast Update" (BST Associates, 2012) and conversations with officials from the Port of Portland.

Exhibit C-7 shows the forecast cargo capacity shortfall for public marine terminals in the City of Vancouver could range from less than 100,000 to 1.9 million metric tons, with the medium scenario showing a shortfall of 250,000.

Exhibit C-7. Forecast cargo capacity shortfall, public marine terminals, City of Vancouver, 2040

Cargo Type	Low	Medium	High
Automobiles (units)	(69,000)	(120,000)	(175,000)
Containers (TEUs)	-	-	-
Metric Tons		-	
Automobiles	(89,000)	(160,000)	(240,000)
Containers	-	-	-
Breakbulk	(3,000)	(90,000)	(249,000)
Grain	-	-	(714,000)
Dry Bulk	-	-	(359,000)
Liquid Bulk	-	-	(355,000)
Total	**(92,000)**	**(250,000)**	**(1,917,000)**

Calculated by ECONorthwest with source data from Portland and Vancouver Harbor Forecast Update" (BST Associates, 2012) and conversations with officials from the Port of Portland.

Exhibit C-8 shows the combined shortfall for public terminals in the City of Portland and City of Vancouver for the year 2040. The total shortfall is estimated to range from 279,000 metric tons to more than 19 million metric tons, with a medium scenario showing a shortfall of 6 million metric tons.

Exhibit C-8. Forecast cargo capacity shortfall, public marine terminals, Portland / Vancouver region, 2040

Cargo Type	Low	Medium	High
Automobiles (units)	(205,000)	(430,000)	(729,000)
Containers (TEUs)	-	-	(196,000)
Metric Tons			
Automobiles	(276,000)	(570,000)	(970,000)
Containers	-	-	(1,120,000)
Breakbulk	(3,000)	(90,000)	(249,000)
Grain	-	(2,390,000)	(5,084,000)
Dry Bulk	-	(2,960,000)	(11,308,000)
Liquid Bulk	-	-	(355,000)
Total	**(279,000)**	**(6,010,000)**	**(19,086,000)**

Calculated by ECONorthwest with source data from Portland and Vancouver Harbor Forecast Update" (BST Associates, 2012) and conversations with officials from the Port of Portland.

C.5 TERMINAL SIZE

We were asked to translate the forecast cargo capacity shortfalls (described in Section C.4) into acres of land for public marine terminals. To accomplish this, we need assumptions on the size of public marine terminals.

As stated in Section C.1, all of this analysis suffers from a high degree of uncertainty and a wide range of possible assumptions. This aspect of the analysis (converting tons of cargo into acres of land for new terminals) is probably the most uncertain. There is no accepted rule of thumb for the minimum size of marine terminals, let alone the standard or average size. Some aspects of marine terminal size can scale with cargo volumes (e.g., an automobile terminal moving 100,000 cars may require roughly half the acreage of an automobile terminal moving 200,000 cars.). However, other aspects of terminal size may not scale proportionately to cargo volume.

We attempted to assemble recent studies from the City of Portland to see what we could learn about the likely size of marine terminals that would be needed to accommodate future demand in the City of Portland. The West Hayden Island Economic Foundation Study (Entrix 2011), provided a summary of site characteristics for marine-related land uses, including an acreage approximation for terminals of various cargo types in the Portland Harbor and other west coast harbors. The Operational Efficiencies of Port/Terminal World-Wide (Worley Parsons, 2011 – Draft) provides other assumptions for terminal sizes for automobiles, grain, and dry bulk, based on case studies from North American and European terminals. The Worley Parsons analysis also provides a range of potential throughput per acre based on these case study ports.

Ultimately, we looked at both of these sources of data, and the Criteria for Evaluating Potential Sites for Marine Terminal produced by Maul, Foster & Alongi as part of the consultant team for this study (included as Appendix B to this same report) to determine a range of reasonable terminal sizes. These assumptions are shown in Exhibit C-9. We show both a minimum size, and a practical, case study-supported size. Note that the size for these marine terminals does not necessarily reflect land required for rail infrastructure to support these terminals.

Exhibit C-9. Summary of assumptions on acreage requirements for public marine terminals by cargo type

	ENTRIX		Worley Parsons		For This Analysis	
Cargo Type	Minimum	Practical	Minimum	Practical	Minimum	Practical
Automobiles	75	100	47	150	50	150
Containers	50	200			50	200
Breakbulk	15	50			15	50
Grain	40	50	15	45	30	50
Dry Bulk	5	100	30	30	20	70
Liquid Bulk	5	20			5	20

Source: ECONorthwest, with original data and input from:
West Hayden Island Economic Foundation Study (Entrix, 2011)
Operational Efficiencies of Port/Terminal World-Wide (Worley Parsons, 2011- Draft)
Appendix B: Criteria for Evaluating Potential Sites for Marine Terminal (Maul, Foster & Alongi, 2012)

Other experts and stakeholders may have different opinions on what is truly a practical size for a new marine terminal. The assumptions used in this analysis, are not asserted as the definitive answer for what size terminal is best for any and all new marine terminals. These assumptions simply reflect the range of terminal sizes that were reported as reasonable and practical in the two source documents that we reviewed. For this reason, in the rest of this document, we refer to the "practical" terminal sizes in Exhibit C-9, as "case study supported" terminal sizes.

C.6 EVALUATION OF LAND NEED FOR PUBLIC MARINE TERMINALS

Determining the land needed for public marine terminals is as simple as multiplying the demand shortfall (in metric tons) by a ratio of tons per acre for cargo size. However, the estimate of shortfall does not tell us how many terminals will be needed. If for example, we see a shortfall of 10 million tons of dry bulk, it could potentially be accommodated in one terminal, or in many terminals. For each of the terminals, they could be operating at 100% of capacity, or at only a small fraction of capacity (if they were sized to accommodate future growth, beyond the 2040 horizon). Additionally, we have multiple scenarios for the cargo capacity shortfall (low, medium, and high), and multiple measures of cargo size (minimum, and case study-

supported). One final challenge is that some terminals will require rail access, and if a dedicated rail loop is needed, then it will require about 100 acres of land, regardless of our other assumptions on minimum or case study-supported terminal size.

In this section, we present results only in terms of the minimum number of acres needed to absorb the capacity shortfall, and do not estimate the number of terminals the acreage equates to. We ultimately provide assumptions for determining the number of terminals required to accommodate the projected cargo capacity shortfall.

Exhibits C-10 through C-12 show projected capacity shortfall, needed acreage to fulfill the shortfall, and whether new terminal space is needed for the six cargo types under the lowest scenario in the City of Portland, City of Vancouver, and the two combined. This scenario uses the low estimate of cargo capacity shortfall and assumes the minimum acreage requirement for each cargo type.

For the City of Portland automobile shortfall, we used an estimate of throughput per acre from the Operational Efficiencies of Port/Terminal World-Wide (Worley Parsons, 2012), which used case study examples to show that automobile terminals can achieve 2,688 autos per acre. For the City of Vancouver automobile shortfall, we assumed the 89,000 metric tons, could be accommodated by improved efficiencies at their existing facility, and would not be sufficient demand to necessitate development of a new terminal. Exhibits C-10 through C-12 show the results of the lowest scenario for public marine terminals in Portland and Vancouver.

Exhibit C-10. Lowest Scenario, Forecast land need for new public marine terminals, City of Portland, 2040

Cargo Type	Capacity Shortfall (Tons)	New Terminal Space Needed	Minimum Acres Needed
Automobiles	(187,000)	Yes	51.0
Containers	-	No	-

The previous set of tables show that in the lowest scenario, demand for new public marine terminals in Portland and Vancouver could be as low as 51 acres. Exhibits C-13 through C-15 show the opposite bookend, the highest scenario. This scenario uses the high estimate of cargo capacity shortfall, assumes low estimates of throughput per acre for automobile terminals, and assumes terminals for dry bulk, grain, and containers require a dedicated rail loop.

Exhibit C-13. Highest Scenario, Forecast land need for new public marine terminals, City of Portland, 2040

Portland and Vancouver Harbor Forecast Update" (BST Associates, 2012)
Conversations with officials from the Port of Portland

The previous set of tables for the highest scenario show that up to 1,457 acres of land could be needed to accommodate the 19 million metric tons of cargo capacity shortfall. Given the assumptions about minimum and case study-supported terminal size shown in Exhibit C-9, a shortfall of this size would probably require on the order of 10 new terminals of average size.

Both the lowest and highest scenarios are possibilities, but unlikely.[2] These scenarios do help to show the extreme ends of the spectrum, but it is better to focus our attention on the medium scenario. For this scenario, we used the medium estimate of cargo capacity shortfall, and assumed all demand for each cargo type in each City could be accommodated by one terminal.

Exhibit C-16 shows our medium forecast of acres needed for public marine terminals in the City of Portland in 2040. It shows a total land need ranging from 170 to 470 acres, depending on the size and efficiency of new terminals, and the need for dedicated rail infrastructure.

[2] This is not to imply the underlying "high-scenario" cargo forecast from BST is unreasonable. In fact, the forecast demand for cargo in the high scenario averages 3.1% growth per year, which is less than the 4.1% per year that has been experienced on the Columbia River between 1962 and 2011. However, the compounding assumptions for capacity (existing facilities only operate at current levels, and accommodate none of the future growth), terminal size (rail loops for every terminal), and number of terminals (e.g., 3 new auto terminals to accommodate total demand of less than 1,000,000 tons per year), all combine to make this scenario unrealistic.

Exhibit C-16. Medium Scenario, Forecast land need for new public marine terminals, City of Portland, 2040

Cargo Type	Capacity Shortfall (Tons)	New Terminal Space Needed	Acres Needed

The combination of demand for public marine terminals in the cities of Portland and Vancouver are shown in Exhibit C-18. It forecasts a need for 210 to 570 acres.

Exhibit C-18. Medium Scenario, Forecast land need for new public marine terminals, cities of Portland and Vancouver, 2040

Conversations with officials from the Port of Portland

In Exhibits C-10 through C-18 we purposely showed estimates of "acres needed" and not "number of terminals needed." Moving from cargo to land adds uncertainty; moving from acres to terminals adds even more. Exhibit C-9 is a basis for the conversion, but it shows a range of possible terminal sizes.[3] Moreover, terminals may not be used to capacity, technologies may change, and so on. That said, a rough application of estimates of terminal size supported by the case studies (in acres, Exhibit C-9) to estimates of needed acres under medium assumptions (Exhibit C-18), yields estimates of number of new terminals needed by 2040 as follows: automobiles, 1 – 4 terminals; grain, 1 – 3 terminals; dry bulk, 1 – 3 terminals.

[3] The ranges in Exhibit C-9 are based on all available data sources: existing terminal sizes at the Port of Portland and Vancouver, conversations with officials at both ports, and case studies included in the report on Operational Efficiencies of Port/Terminal World-Wide (Worley Parsons, 2011 Draft). Ultimately, however, these assumptions were a judgment call on the part of ECONorthwest, and represent our best guesses for a lowest, highest, and medium scenario.

C.7 IMPLICATIONS

The City of Portland identified the two sites in the Portland Harbor that are most likely to be suitable for development of a new public marine terminal: the Atofina site, and the Time Oil site. Of these two sites, development is technically possible on either, but there are major hurdles that would add significant costs. Both sites have some level of contamination, both sites would require negotiation and property acquisition from numerous property owners, and both sites are smaller than desirable, which precludes the possibility of an onsite rail loop. Depending on the specific parcels that would be acquired and aggregated to make development of these sites possible, each site could range in size from 50 to 100 acres, for total developable acreage of 100 to 200 acres.

When considering the potential cargo capacity shortfall, the two sites in the Portland Harbor could potentially accommodate the one dry bulk and one grain terminal that are anticipated to be needed. These terminals are expected to require between 20 and 200 acres, which matches fairly well with the capacity of the two potential sites. However, if these potential terminals require a dedicated rail loop, or if they are unable to overcome the barriers to redevelopment at each site, then the forecast capacity shortfall will need to be accommodated elsewhere in the region.

Assuming each new port terminal requires a dedicated rail loop, it would appear that the total acreage needed to accommodate regional cargo volumes in 2040 exceeds the current supply of 350 acres of vacant developable land at the Port of Vancouver planned for marine terminal development.[4] However, the Port of Vancouver has about 200 acres of vacant developable land that could technically accommodate marine terminal development, but is planned for other industrial uses. If these acres were included in the total supply, then it would appear that the Port of Vancouver would have about the right supply of land to accommodate regional cargo demand through 2040. While this is technically possible, that does not mean that it is politically feasible or consistent with adopted policies of the affected jurisdictions.

While it is possible that the Port of Vancouver could accommodate the regional demand for cargo through 2040, it is also possible that Vancouver's land supply could fall far short. Using the high-scenario demand forecasts, and assuming rail loop access for all terminals, the region could have a

[4] It is important to note that these projections are based on our medium scenario. The range of possible assumptions that could be used in this analysis is significant. When using our most conservative assumptions, our analysis showed a regional land need as low as 70 acres, and our most aggressive assumptions resulted in a land need of over 2,250 acres.

shortfall of up to 1,457 acres. If only 350 acres at the Port of Vancouver are available for marine terminal development, as is their current stated policy, then that would leave over 1,100 acres of unmet demand for public marine terminals in the region.

Our analysis finds that the Portland Harbor has very limited capacity to accommodate future demand for public marine terminals, but that the Port of Vancouver has capacity to accommodate some (but not necessarily all) forecast demand for cargo for both the cities of Portland and Vancouver through the year 2040 under our medium scenario.

Appendix D Mapping Analysis

As part of the background research for the Harbor Lands Contract, Bureau of Planning and Sustainability staff conducted a visual survey of aerial maps of the Portland Harbor to classify the lands in one of several categories. The first reason for undertaking this review was to provide the consultant for the Harbor Lands Analysis, ECONorthwest (ECO), with a visual representation of current Portland Harbor development so that they could analyze this and confirm potential sites to consider for assembly into larger parcels. The second reason for this effort was to help validate the initial acreage findings of the draft Economic Opportunities Analysis (EOA).

Lands were split into various development types, including buildings, other structures/tanks, exterior work/storage areas, loading & maneuvering areas, parking areas, rail yards, vacant land and a few residual categories (see chart below). Once these lands were categorized, they were compared with the lands that are considered environmentally constrained or brownfields. The intent was to specifically consider whether vacant lands predominantly had one of these constraints applied to them. While the visual survey and analysis was initially considered to cover the lands that staff wanted ECO to review along the harbor, it was also refined to incorporate the boundary of the EOA for the Portland Harbor sub-geography to determine whether the acreage was significantly different. The findings are provided in a table attached to this summary.

Within the Portland Harbor sub-geography, the visual survey identified a total of 590 acres of lands that were considered vacant. However, of this acreage, approximately 412 acres either contained medium or high level natural resources (174.4 acres), were existing brownfields (145.2 acres), or were brownfield sites with resources as well (92.6 acres). This left approximately 174 acres that were not constrained. This number exceeds the amount of unconstrained vacant land determined by Hovee (108 acres). This is partially due to the fact that the visual survey included vacant portions of otherwise developed parcels, and was not constrained by lot lines. Thus vacant portions of lots were included in the aerial survey that were not included in the EOA. Within the EOA update, Hovee had separated out the Harbor Access Lands from the larger Columbia Harbor subgeography. In either case, the unconstrained land represents a minority of the overall vacant land in the harbor.

For the ECO analysis, the maps helped illustrate the potential vacant sites that could be looked in greater detail in their report. This led to the consideration of the Time Oil and Atofina sites as possible areas for consideration of a marine terminal. The report includes the analysis on these sites.

Introduction

This report provides a summary update of the marine cargo forecasts for the Portland-Vancouver area from the April 2010 report, "West Hayden Island Marine Cargo Forecasts & Capacity Assessment". . The marine cargo forecasts are unconstrained, which assumes that the necessary marine terminals and rail capacity will be in place to meet market demand.

The method for updating the prior forecast involved several steps. Current cargo volumes were updated by commodity and region using the most recent available data[1]. Volumes for 2011 were estimated based upon data from individual ports, the Pacific Maritime Association, U.S. Department of Agriculture, and other industry and government sources.

The forecasts include all public and private terminals for the following sub-regions:

- Portland Harbor,
- Vancouver Harbor.

The April 2010 forecast was based on an existing base of commodities that were moving through Lower Columbia River and PNW ports. It was a conservative forecast in that it excluded market opportunities. A key effort in this update was to consider the potential market opportunities that are being evaluated by individual ports in the PNW, defined to include all ports in Oregon and Washington. Potential new market opportunities included: ores, minerals, grain, containers and liquid bulks. These market opportunities were provided by the ports individually or allocated by BST Associates. As a result, the cargo opportunities that are expected at Portland and Vancouver are not expected to occur at the same level or on the same schedule.

In addition, the new market opportunities are based on reaching threshold volumes based upon current market expectations. When these thresholds are reached, the cargo volumes were constrained at that level. This explains the forecasts remaining at a fixed level later in the forecast period.

For each commodity group, two growth scenarios were considered. The high-growth forecast included all of the market opportunities currently under consideration. The low growth forecast included a portion of the market opportunities as well as baseline cargo volumes. An assumptive, most likely forecast would trend between the high and low, depending on market conditions.

The results of the forecast are presented below.

[1] 2010 data was available for commodities moving on international routes and 2009 for commodities moving on domestic routes.

Cargo Forecast Detail

This section briefly summarizes the factors impacting growth for each commodity group at the Portland Harbor.

Containers

The low growth scenario reflects near-term growth and intensified competition from ports in Canada and on all-water routes (after completion of the Panama Canal improvements).

Under the high growth forecast, container volumes are expected to increase due to increased market share of imports and exports to/from the Midwest region.

The revised annual growth for containers for the period from 2008[2] to 2040 ranges from 379,000 TEUs (low) to 526,000 TEUs (high) as compared with the April 2010 forecast, which ranged from 379,000 TEUs (low) to 614,000 TEUs (high).

Table 1-1: Portland Harbor Container Forecast (1,000 TEUs)

	April 2010 Study		2012 Update		Difference	
	Low	High	Low	High	Low	High
2008	245	245	245	245	-	-
2040	379	614	379	526	-	(88)
Compound Annual Growth Rate						
2008-2040	1.4%	2.9%	1.4%	2.4%		

Source: BST Associates

Autos

The revised auto forecasts reflect expected changes in production locations. Some Japanese auto manufacturers have announced that they are shifting production to North America. This will impact import volumes in the coming years. However, additional import volumes are expected from other auto manufacturers (e.g., Hyundai and manufacturers in China and India et al.), which is expected to increase imports.

In addition, auto exports from North American producers (from both foreign transplant and U.S. producers) are also expected to increase through the forecast period.

The revised annual growth autos for the period from 2008 to 2040 ranges from 811,000 units (low) to 1.0 million (high) as compared with the April 2010 forecast, which ranged from 925,000 units (low) to 1.4 million (high).

[2] The year 2008 was used as the starting year in the comparisons because it represents the last actual year of data for the 2010 forecast and is also the last pre-recession year.

Table 1-2: Portland Harbor Auto Forecast (1,000 Units)

	April 2010 Study		2012 Update		Difference	
	Low	High	Low	High	Low	High
2008	408	408	408	408		
2040	925	1,364	811	1,014	(114)	(350)
Compound Annual Growth Rate						
2008-2040	2.6%	3.8%	2.2%	2.9%		

Source: BST Associates

Breakbulk (including logs)

Under the low growth scenario, the forecast is slightly higher in the near-term due to increased forest product exports, which are expected to be relatively robust and then decline as the domestic housing industry begins to recover.

Under the high growth forecast, breakbulk volumes are expected to remain at higher levels. Log exports are projected to continue at a more rapid rate through approximately 2018 and then level out. Other breakbulk cargoes are also expected to grow, especially commodities such as steel and forest products, as U.S. and international economies improve.

The revised annual growth for breakbulk cargoes for the period from 2008 to 2040 ranges from 1.1 million tons (low) to 1.4 million tons (high) as compared with the April 2010 forecast, which ranged from 1.0 million tons (low) to 1.3 million tons (high).

Table 1-3: Portland Harbor Breakbulk Forecast (1,000 Metric Tons)

	April 2010 Study		2012 Update		Difference	
	Low	High	Low	High	Low	High

2040	1,010	1,295	1,132	1,352	122	57
Compound Annual Growth Rate						
2008-2040	0.1%	0.9%	0.5%	1.0%		

Source: BST Associates

Grain and related products

Grain and related products include wheat, barley, corn, soybeans, soy meal, beet pulp pellets and like products.

Pacific Northwest grain and oilseed exports have shown impressive growth over the past decade due primarily to exports of corn, soybeans and like products. This has primarily occurred at ports other than Portland and Vancouver (e.g., Kalama, Seattle, Tacoma, Grays Harbor and Longview).

The high growth scenario takes into account additional growth opportunities for grain exports, reflecting the shift of production from the Mississippi River Basin north and west into the Northern Plains, which is closer to Asia via PNW ports. Potential also exists for Canadian grain producers to shift cargo from Canadian export gateways to the PNW.

The revised annual growth rates for grain and related cargoes for the period from 2008 to 2040 ranges from 6.7 million tons (low) to 11.5 million tons (high) as compared with the April 2010 forecast, which ranged from 5.6 million tons (low) to 7.1 million tons (high).

Table 1-4: Portland Harbor Grain Forecast (1,000 Metric Tons)

	April 2010 Study		2012 Update		Difference	
	Low	High	Low	High	Low	High
2008	5,676	5,676	5,676	5,676		
2040	5,647	7,059	6,686	11,470	1,039	4,411
Compound Annual Growth Rate						
2008-2040	0.0%	0.7%	0.5%	2.2%		

Source: BST Associates

Dry bulk cargoes

Dry bulk cargoes include a wide variety of products, such as minerals, ores, chemicals, fertilizers, wood chips, gypsum, limestone, manufactured products and like products. In addition, there is strong interest in minerals and ores, among other bulk exports.

The expected growth in dry bulks is due to exports of potash, ores, coal and other commodities. Although there is uncertainty regarding volumes and export locations, the underlying basis of the export opportunity is sound for several reasons:

- There is strong international demand for these commodities,
- The regional transportation system is in place to move these commodities,
- North American producers (in the U.S. and Canada) have substantial supplies of key commodities, and
- U.S. and Canadian exports can be delivered via Pacific Northwest ports at prices below the required delivered price.

The revised annual growth rates for dry bulk cargoes for the period from 2008 to 2040 ranges from 10.3 million tons (low) to 18.0 million tons (high) as compared with the April 2010 forecast, which ranged from 6.5 million tons (low) to 10.0 million tons (high).

Table 1-5: Portland Harbor Dry Bulk Forecast (1,000 Metric Tons)

Liquid bulk cargoes

The liquid bulk trades in the Pacific Northwest are dominated by petroleum, including crude oil and refined petroleum products. Other important commodities include chemicals, fertilizers and other liquid bulk products.

One significant change that is expected to impact liquid bulks is a shift in the source of crude oil for regional refineries. Refineries in the region are also expected to begin receiving crude oil by rail from North Dakota, which may impact waterborne volumes.

New opportunities for liquid bulk cargo are also considered; most notably LNG imports and/or exports.

The liquid bulk cargo forecast remains the same for the revised 2012 forecast and the April 10, 2010 forecast.

Table 1-6: Portland Harbor Liquid Bulk Forecast (1,000 Metric Tons)

All cargoes

The primary differences in the revised 2012 forecast and the forecast prepared in April 2010 are due to the following factors:

- Decreases in expected cargo volumes for containers and autos due to changing industry conditions.
- Increases in breakbulk, grains and dry bulk cargoes due to consideration of new market opportunities.
- There was no change in the liquid bulk cargo forecast.

The revised annual growth rates for all cargoes on a metric ton basis for the period from 2008 to 2040 ranges from 28.0 million tons (low) to 43.0 million tons (high) as compared with the April 2010 forecast, which ranged from 24.0 million tons (low) to 32.0 million tons (high).

Table 1-7: Portland Harbor Summary Cargo Forecast (1,000 Metric Tons)

	Apr-10		2012 Update		Difference

Sub-region Forecasts

Portland Harbor - Low Growth Scenario

Under the low growth forecast, the volume for the Portland Harbor is projected to reach 28.3 million tons in 2040, with an average annual growth rate of 1.0 percent between 2008 and 2040. See Figure 1-1. This amounts to an increase of 7.5 million tons between 2010 and 2040.

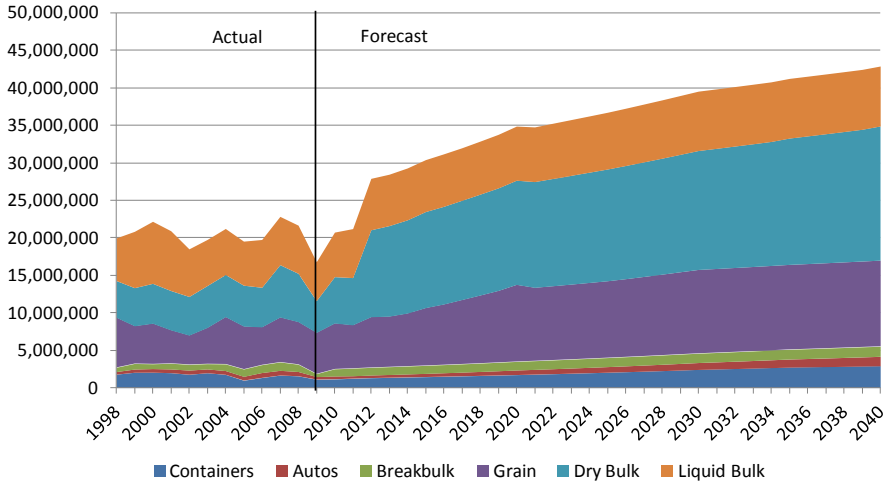

Figure 1-1: Portland Harbor Marine Cargo Forecast
Low Growth Scenario (metric tons)

Portland Harbor - High Growth Scenario

Under the high growth forecast, the volume for the Portland Harbor is projected to reach 43.0 million tons in 2040, with an average annual growth rate of 2.5 percent between 2010 and 2040. See Figure 1-2. This amounts to an increase of 22.2 million tons between 2010 and 2040.

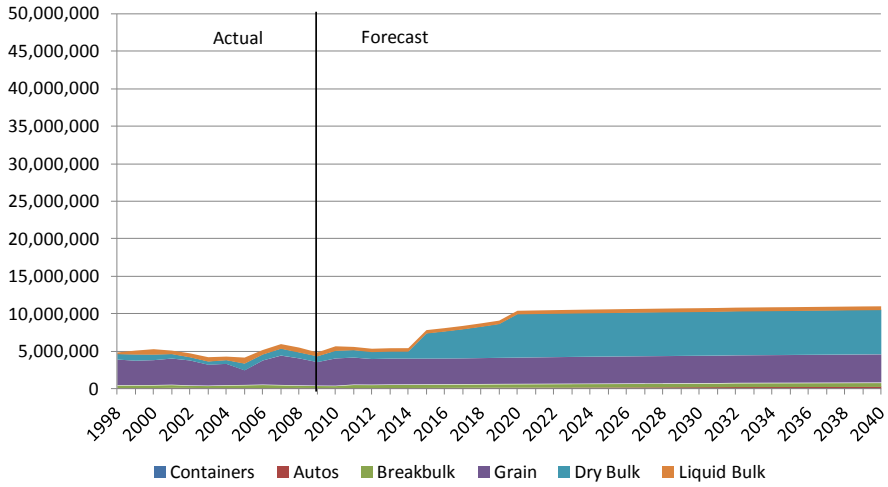

Figure 1-2: Portland Harbor Marine Cargo Forecast
High Growth Scenario (metric tons)

Vancouver Harbor - Low Growth Scenario

Under the moderate growth forecast, the volume for the Vancouver Harbor is projected to reach 11.0 million tons in 2040, with an average annual growth rate of 2.2 percent between 2010 and 2040. See Figure 1-3. This amounts to an increase of 5.3 million tons between 2010 and 2040.

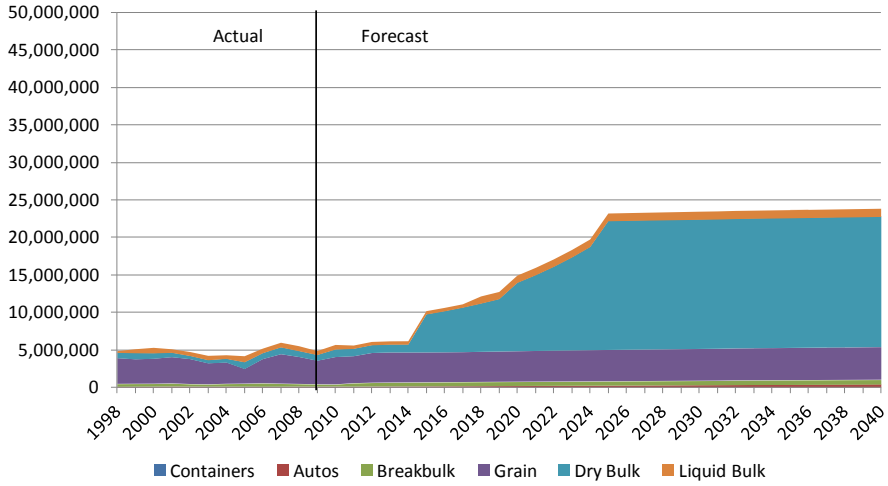

Figure 1-3: Vancouver Harbor Marine Cargo Forecast
Low Growth Scenario (metric tons)

Vancouver Harbor - High Growth Scenario

Under the high growth forecast, the volume for the Vancouver Harbor is projected to reach 23.9 million tons in 2040, with an average annual growth rate of 4.9 percent between 2010 and 2040. See Figure 1-4. This amounts to an increase of 18.2 million tons between 2010 and 2040.

Chapter 1
Executive Summary

The Pacific Northwest economy is inextricably tied to domestic and international markets. Efficient performance of the inland transportation system, especially in its linkage to the public and private port system, is critical to the economic health of the region.

Approximately every five years the Washington Public Ports Association (WPPA) and Washington State Department of Transportation (WSDOT) sponsor an update to the Washington State Marine Cargo Forecast. The most recent forecast was completed in March 2009, and provided unconstrained forecasts of cargo projected to move through public and private marine terminals on Puget Sound, the Washington Coast, and the Lower Columbia River in Washington and Oregon.

In the past two decades an increasing percentage of the commerce moving through Pacific Northwest ports has been carried by rail. The most recent two Marine Cargo Forecast studies have also included analyses of rail capacity. These rail capacity analyses modeled the various mainline rail segments in Washington, taking into account the projected marine cargo volumes as well as growth in domestic train traffic and passenger train traffic. Key outputs of these analyses were prioritized lists of rail system projects that would help to solve existing and anticipated capacity constraints.

The most recent marine cargo forecast was completed in the middle of the 2009 economic recession, a time of unusually sharp declines in marine cargo and rail traffic. However, since that report was completed rail traffic has rebounded to pre-recession levels. In addition, many of the ports in the region are anticipating major increases in cargo, especially exports of dry bulk such as grain, minerals, ores, and other bulk commodities. The anticipated volumes of these new cargos could significantly impact the mainline rail system in the northwest, impacting the marine cargos as well as passenger traffic and domestic cargo.

BST Associates (BST) and MainLine Management (MLM) were retained to prepare the following 2011 update to the 2009 report. The purpose of this analysis is to update the marine cargo forecasts, to compare the projected level of rail traffic with the capacity of the various mainline segments in the region, and to produce a prioritized list of projects to alleviate anticipated capacity constraints. An important addition to the 2011 analysis is the inclusion of the mainline rail system in Oregon.

The report was prepared at the request of the Ports of Everett, Seattle, Tacoma, Grays Harbor, Longview, Kalama, Vancouver and Portland. Additional entities participated in the preparation, including the Washington State Department of Transportation, Oregon Department of Transportation, and Washington Public Ports Association. The Class I railroads also participated in a review of the analysis, but this is not a Class I railroad product.

Marine Cargo Forecasts

The marine cargo forecasts produced for this analysis are unconstrained, which assumes that the necessary marine terminals and rail capacity will be in place to meet market demand. The method for updating the 2009 forecast involved several steps.

- First, cargo volumes were updated by commodity and region using the most recent data available.
- Second, the forecasts provided in the 2009 Marine Cargo Forecast were then updated based upon adjusted trends and forecast growth rates. A key part of this step was the inclusion of potential market opportunities that are being evaluated by individual ports.
- Finally, the mode of inland transportation was estimated for each scenario by commodity, sub-region and growth scenario.

Potential new market opportunities included: ores, minerals, grain, containers and liquid bulks. For each of the commodity types two growth scenarios were projected: the high-growth forecast included all of the market opportunities currently under consideration, while the moderate growth forecast included a portion of the market opportunities (approximately one half).

A summary of cargo projections through the year 2030 is presented below

Commodity Forecasts

Containers

In the 2009 marine cargo forecast, container traffic was projected to reach 10.4 million TEUs in 2030, with an average annual growth rate of 5.2 percent between 2010 and 2030.

Under the revised moderate growth forecast, containers are projected to reach 8.3 million TEUs by 2030 (4.1 percent annual growth). Under the revised high growth forecast, containers are projected to reach 12.3 million TEUs by 2030 (6.1 percent annual growth).

Breakbulk/Neobulk

In the 2009 marine cargo forecast, these commodities were projected to increase by an average annual 1.5 percent, reaching 11.1 million tons in 2030.

Under the moderate-growth scenario, breakbulk/neobulk cargoes are expected to grow by an average annual rate of 1.2 percent from 2010 to 2030, reaching 10.5 million tons in 2030. Under the high growth forecast, breakbulk/neobulk cargoes grow by an average annual rate of 2.2 percent from 2010 to 2030, reaching 12.7 million tons 2030.

A key difference between the 2009 study and the current one is that log exports grew rapidly over the past year and are expected to remain strong through the mid-term (approximately five years).

Grain and Related Products

Pacific Northwest grain and oilseed exports have shown impressive growth over the past decade, growing from approximately 20 million metric tons in 2000 to 34 million metric tons in 2010. Wheat, corn and soybeans are the most important commodities, but other products such as soybean meal and dried distiller's grains (DDGS) have become increasingly important.

BST Associates forecasts that Pacific Northwest grain and oilseed exports will increase from 34.1 million metric tons in 2010 to 39.1 million tons (moderate growth scenario) and 53.3 million metric tons in 2030 (high growth scenario).

Dry Bulk Cargoes

The 2009 forecast projected relatively modest gains in bulk traffic, with volumes expected to reach 31.8 million tons in 2030, or at an average annual growth rate of approximately 1.0 percent between 2010 and 2030. However, the dry bulk forecast was based upon the existing commodity base and did not anticipate the strong interest in additional export cargo opportunities.

Under the revised moderate growth forecast, dry bulk cargoes are expected to reach 97.1 million tons in 2030 (average annual growth of 6.8 percent per year between 2010 and 2030). Under the revised high growth forecast, dry bulk cargoes could reach 155.3 million tons in 2030 (average annual growth of 9.3 percent per year between 2010 and 2030). Growth is driven by increasing mineral and ore exports, among other commodities.

Liquid Bulks

The liquid bulk trades in the Pacific Northwest, which is dominated by crude oil, is expected to gradually change as regional refineries shift their source from Alaska to other domestic and foreign suppliers. The 2009 forecast projected modest growth for liquid bulk traffic, expecting volumes to reach 48.4 million tons in 2030 (0.8 percent annual growth).

Under the revised moderate growth forecast, liquid bulk cargoes are expected to reach 42.4 million tons in 2030 (0.2 percent per year), reflecting the changed sourcing patterns. Under the high growth forecast, liquid bulks are expected to reach 51.6 million tons in 2030 (1.2 percent per year). The high growth forecast incorporates new LNG imports/exports.

Sub-Region Forecasts

Lower Columbia Oregon and Oregon Coast

The Lower Columbia Oregon and Oregon Coast sub-region is projected to reach 44.6 million tons in 2030 under the moderate growth forecast (2.6 percent annual growth from 2010 to 2030) and 70.5 million tons in 2030 under the high growth forecast (5.0 percent annual growth).

Rail traffic is projected to reach 26.3 million tons in 2030 under the moderate growth forecast, and 47.5 million tons in 2030 under the high growth forecast.

Lower Columbia Washington

The Lower Columbia Washington sub-region is projected to reach 49.4 million tons in 2030 under the moderate growth forecast (4.3 percent annual growth) and 82.5 million tons in 2030 under the high growth forecast (7.0 percent annual growth).

Rail traffic is projected to reach 43.0 million tons in 2030 under the moderate growth forecast, and 74.9 million tons in 2030 under the high growth forecast.

Puget Sound and Washington Coast

The Puget Sound and Washington Coast sub-region is projected to reach 141.0 million tons in 2030 under the moderate growth forecast (2.6 percent annual growth) and 192.3 million tons in 2030 under the high growth forecast (4.2 percent annual growth).

Rail traffic is projected to reach 84.8 million tons in 2030 under the moderate growth forecast, and 131.6 million tons in 2030 under the high growth forecast.

Rail Capacity Assessment

This section summarizes the rail capacity analysis. As noted above, rail volumes fell markedly during the recent recession, but they recovered strongly in 2010, reaching pre-recession levels. Coupled with this rapid pace of recovery, there are significant opportunities for growth in rail traffic, particularly in bulk train exports of minerals, ores and grain.

The rail forecasts include a projection of the number of trains under moderate and high growth scenarios, under both average and peak operating conditions. The rail forecasts are driven by the marine cargo forecast, but also include domestic freight traffic and passenger train volumes. Domestic traffic and passenger traffic was based on studies prepared for WSDOT and ODOT as well as on discussions with rail service providers.

The analysis assumes that existing trains absorb most of the growth in rail traffic before new trains are added. However, operational requirements sometimes necessitate new train starts, and this is included in the forecast. The capacity of the various main line segments was estimated based upon discussions with rail service providers, recent studies and consultant judgment.

Table 1-1 summarizes study results. Under the moderate growth scenario, the only segments that experience sustained capacity constraints are the Vancouver to Pasco and the Everett to Blaine lines. Under the high growth scenario, the constraints on the Vancouver to Pasco and the Everett to Blaine segments occur earlier. In addition, constraints are expected in the Pasco to Spokane, Vancouver to Kalama/Longview, and King Street Station to Everett lines. These results assume that a series of physical improvements are completed, and that certain operational protocols are changed.

Source: MainLine Management

In order for rail capacity to meet the of projected freight volumes, the authors of this report recommend a series rail system improvements. These projects generally fall into two categories, mainline improvements and port access improvements. However, the projects labeled as port access improvements also provide benefits to the mainline system. Reducing the amount of time that it takes for trains to move between the port terminals and the mainline reduces delays on the mainline system, and thereby increases mainline capacity.

The recommended mainline projects include:

- **Peninsula Junction to North Portland Junction, Portland**. (Funding is in place to complete preliminary engineering and the NEPA analysis, but not construction.)
- **Vancouver, WA Freight Rail Bypass**. (Construction is under way, and is anticipated to be complete in 2013.)
- **Point Defiance Bypass, Tacoma to Nisqually**. (Construction of Phase 1 is under way; Phase 2 is anticipated to be complete 2016.)
- **Blakeslee Junction Improvements, Centralia. (**Phase 1A & 1B are partially funded, and the funds have all been moved to a future biennium. Phases 2-5 are not funded.)

- **Third main line Kalama to Kelso –WSDOT Passenger Plan Option 3.** (North portion is funded, engineering is under way).
- **Vancouver to Kelso - WSDOT Passenger Plan Option 4**. (funding is in place for several of these projects, engineering is under way)

The recommended port access projects include:

- **Port of Vancouver, WA Freight Access Project**. (First phases are finished, entire project is scheduled to be complete in 2017)
- **Unit Train Staging/Storage Yard near Woodland**. (No action currently under way.)
- **Cowlitz River Bridge – Longview**. (Partial funding is in place to begin preliminary engineering and the NEPA analysis, with remaining funding expected in January 2010. Construction not funded.)
- **Bullfrog Junction Realignment, Tacoma.** (Preliminary planning is complete, project proponents are seeking funding.)

Growth in the volume of export bulk trains is expected to increase the demands on existing rail capacity in the region, and even moderate growth will require BNSF and UP to assess the capacity requirements necessary to meet the growing demand. Both railroads have the ability to increase capacity through a combination of physical and operational improvements, and should be able to meet growing demand well into the future.

Chapter 2
Marine Cargo Forecasts

This section provides summary of the marine cargo forecast. These summaries are presented by commodity group and by sub-region in the Pacific Northwest. The marine cargo forecasts are unconstrained, which assumes that the necessary marine terminals and rail capacity will be in place to meet market demand.

The method for updating the 2009 forecast involved several steps. First, current cargo volumes were updated by commodity and region using the most recent data (2010 for commodities moving on international routes and 2009 for commodities moving on domestic routes). Volumes for 2011 were estimated based upon data from individual ports, the Pacific Maritime Association, U.S. Department of Agriculture, and other industry and government sources.

Commodity handling groups were defined to include:

- Containers,
- Neobulk/breakbulk cargoes – breakbulk, autos and logs,
- Grain and related products – wheat, barley, corn, soybeans, soy meal, beet pulp pellets and like products,
- Dry bulk cargoes – minerals, ores, chemicals, fertilizers, wood chips, manufactured products and like products,
- Liquid bulk cargoes – crude oil, petroleum products, chemicals and like products.

The forecasts include all public and private terminals, which were divided into the following sub-regions:

- Lower Columbia River Oregon and Oregon Coast,
- Lower Columbia River Washington,
- Puget Sound and Washington Coast.

Second, the forecasts provided in the 2009 Marine Cargo Forecast were updated based upon adjusted trends and forecast growth rates. In addition, a key effort in this update was to consider the potential market opportunities that are being evaluated by individual ports. This process included a discussion with participating ports and the Class I railroads and literature review of industry resources.

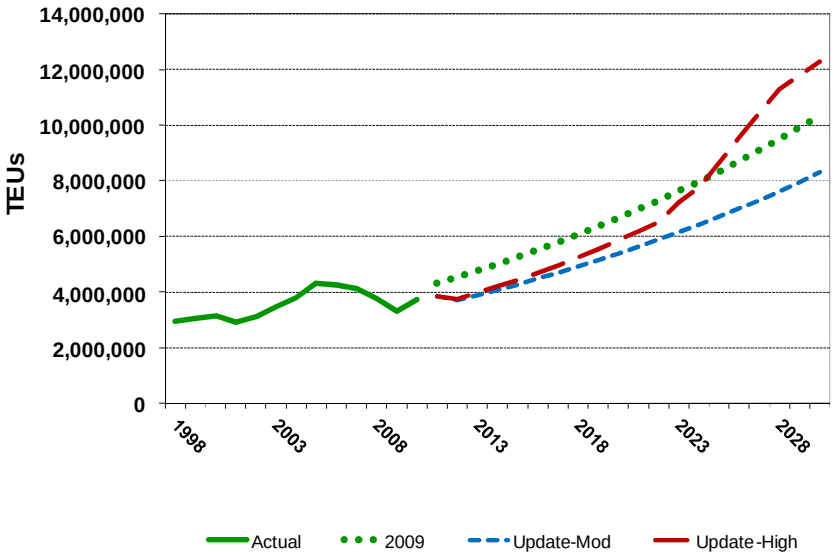
Potential new market opportunities included: ores, minerals, grain, containers and liquid bulks.

For each commodity group two growth scenarios were projected. The high-growth forecast included all of the market opportunities currently under consideration. The moderate growth forecast included a portion of the market opportunities (approximately one half).

Third, the inland mode of transportation was estimated for each growth scenario, commodity, and sub-region.

The results of the forecast are presented below.

Containers



The revised Pacific Northwest container forecast is presented in Figure 2-1. The moderate-growth forecast is lower than the forecast presented in 2009 due to revised expectations about near-term growth and intensified competition from ports in Canada and on all-water routes (after completion of the Panama Canal improvements).

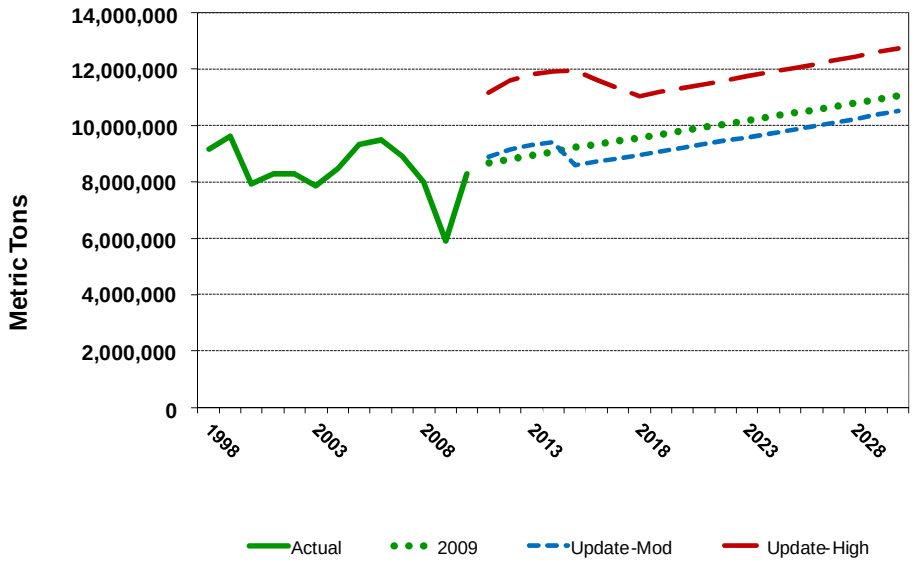
In the 2009 marine cargo forecast, containers were projected to reach 10.4 million TEUs in 2030, with average annual growth rate of 5.2 percent between 2010 and 2030. The revised forecast projects that container volumes will increase by:

- 4.1 percent under the moderate growth forecast, reaching 8.3 million TEUs, and,
- 6.1 percent under the high growth forecast, reaching 12.3 million TEUs,

Under the high growth forecast, container volumes are expected to increase at a slower rate than anticipated in the 2009 marine cargo forecast through 2020. However, the volumes expected for Puget Sound and Lower Columbia Oregon ports are comparable to the volumes expected in the prior forecast in 2030 (approximately 10 million TEUs). In the high growth scenario, container traffic is assumed to commence in Coos Bay in 2023 and increase to 2030.

Figure 2-1: Pacific Northwest Container Cargo Trends and Forecast

Source: Individual ports, BST Associates



Break and Neobulk Cargoes

The revised forecast for Pacific Northwest breakbulk and neobulk cargoes is presented in Figure 2-2. In the 2009 marine cargo forecast, these commodities were projected to increase by an average annual 1.5 percent, reaching 11.1 million tons in 2030.

Under the moderate-growth scenario, the forecast is slightly higher in the near-term than in the 2009 forecast, mainly due to increased log exports, which are expected to be relatively robust and then decline as the domestic housing industry begins to recover. Under the moderate growth forecast, breakbulk/neobulk cargoes are expected to grow by an average annual rate of 1.2 percent from 2010 to 2030, reaching 10.5 million tons in 2030.

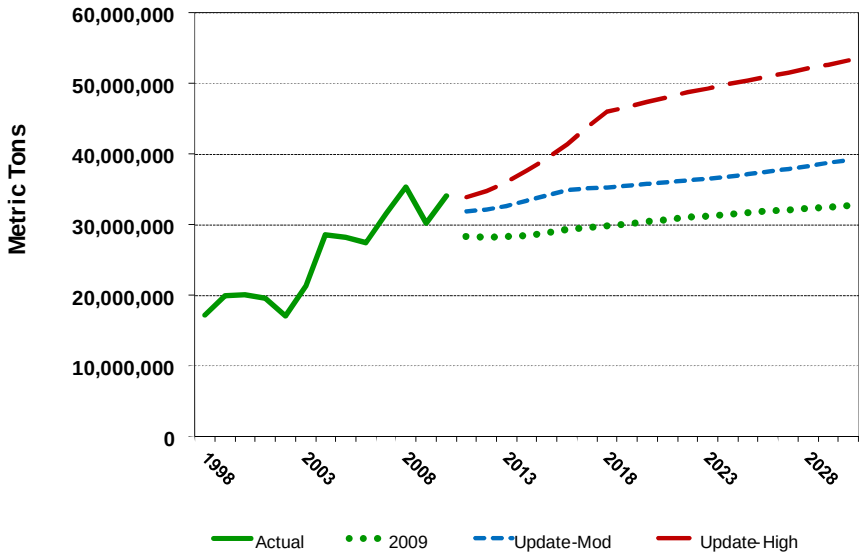
Under the high growth forecast, breakbulk and neobulk volumes are expected to remain at higher levels. Log exports are projected to continue at a more rapid rate through approximately 2018 and then level out. Under the high growth forecast, breakbulk/neobulk cargoes grow by an average annual rate of 2.2 percent from 2010 to 2030, reaching 12.7 million tons 2030.

Figure 2-2: Pacific Northwest Breakbulk and Neobulk Cargo Trends and Forecast

Source: BST Associates

Grain and Related Products

Pacific Northwest grain and oilseed exports have shown impressive growth over the past decade, increasing from approximately 20.1 million metric tons in 2000 to 34.1 million metric tons in 2010, or at an average annual growth rate of 5.4 percent per year.



The 2009 forecast projected relatively modest gains in grain traffic, with volumes expected to reach 32.7 million tons in 2030. However, the forecast was based upon the reduced volumes in 2009 and did not anticipate the rapid increase in export volumes that occurred in 2010 (an increase of 4 million tons).

The revised Pacific Northwest forecast for grain and related products is presented in Figure 2-3. The new EGT elevator in Longview and expansion projects planned or under way in Portland, Vancouver, and Kalama will provide most of the capacity needed to absorb the forecast growth. The elevators in Seattle and Tacoma are operating at or near capacity and do not have expansion plans. Increased capacity is also being added at the AGP facility at the Port of Grays Harbor, and the proposed bulk port at Cherry Point north of Bellingham may include a grain facility.

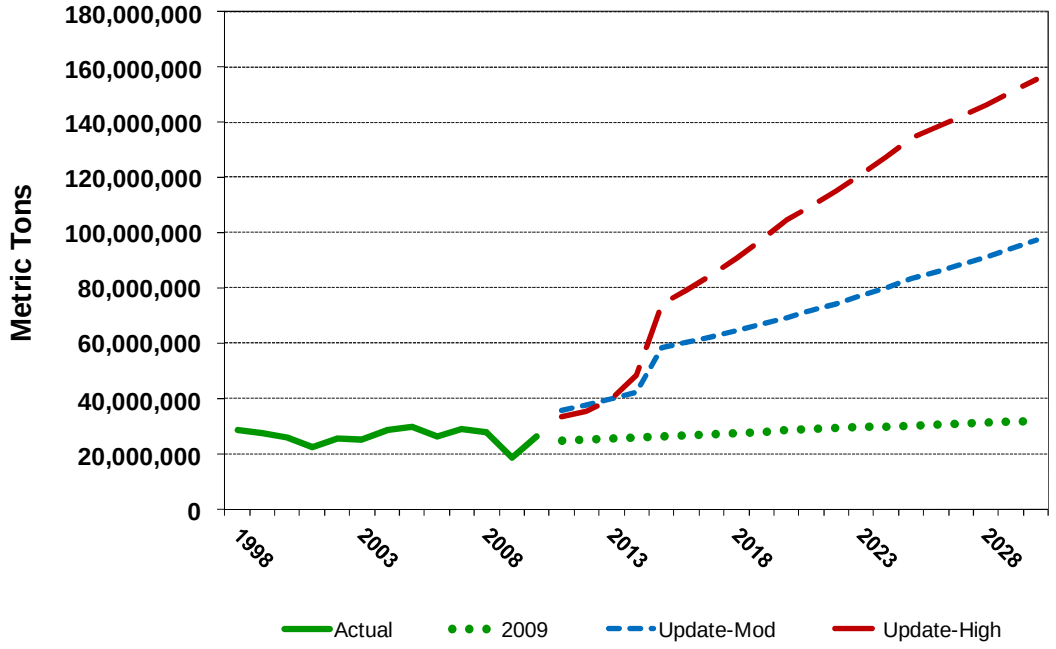
Under the revised forecast, grain and related products are expected to reach:

- 39.1 million tons in 2030 under the moderate growth forecast, with average annual growth of 0.7 percent per year between 2010 and 2030,
- 53.3 million tons in 2030 under the high growth forecast, with average annual growth of 2.2 percent per year between 2010 and 2030.

Figure 2-3: Pacific Northwest Grain & Oilseed Trend and Forecast

Source: BST Associates, US Department of Commerce and WISERTrade data

Dry Bulk Cargoes



Dry bulk cargoes include a wide variety of products, such as woodchips, petroleum coke, potash, soda ash, gypsum, limestone, metal ores, and others. In addition, there is strong interest in coal, potash and ore exports. The revised Pacific Northwest forecast for dry bulk cargoes is presented in Figure 2-4.

The 2009 forecast projected 1.0 percent annual growth in bulk traffic, with volumes expected to reach 31.8 million tons in 2030. That forecast did not anticipate the rapid increase in dry bulk exports that actually occurred, where volumes jumped from 18.8 million tons in 2009 to 26.2 million tons in 2010.

Under the revised forecast, dry bulk cargoes are expected to reach:

- 97.1 million tons in 2030 under the moderate growth forecast, with average annual growth of 6.8 percent per year between 2010 and 2030,
- 155.3 million tons in 2030 under the high growth forecast, with average annual growth of 9.3 percent per year between 2010 and 2030.

Figure 2-4: Pacific Northwest Dry Bulk Cargo Trends and Forecast

Source: BST Associates

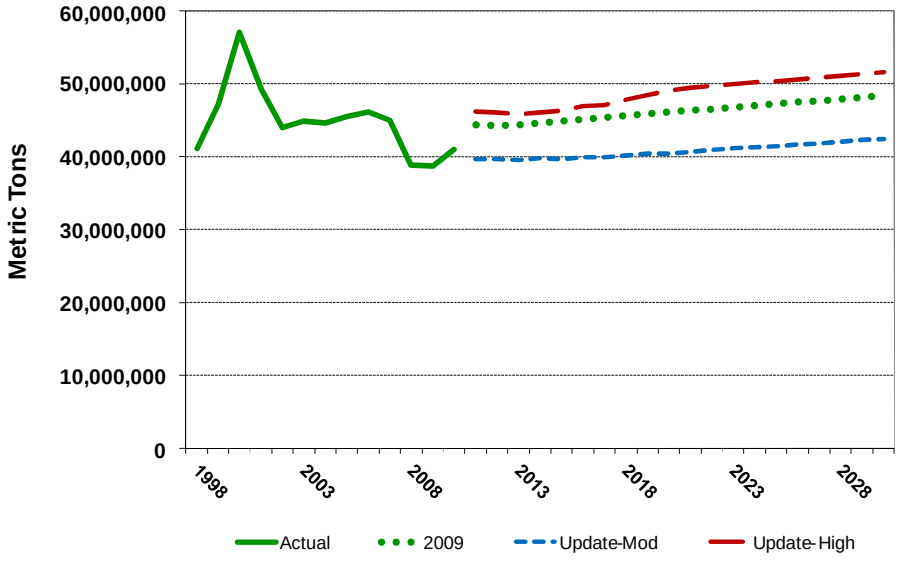
The expected growth in dry bulks is due to exports of potash, ores, coal and other commodities. Although there is uncertainty regarding volumes and export locations, the underlying basis of the export opportunity is sound for several reasons:

- there is strong international demand for these commodities,
- the regional transportation system is in place to move these commodities,
- the U.S. and Canada have substantial supplies of key commodities, and
- U.S. and Canadian exports can be delivered via Pacific Northwest ports at prices below the required delivered price.

Liquid Bulks

The liquid bulk trades in the Pacific Northwest are dominated by petroleum, including crude oil and refined petroleum products. Other important commodities include chemicals, fertilizers and other products.

The revised forecast for Pacific Northwest liquid bulk cargoes is presented in Figure 2-5. Under the revised forecast, liquid bulk cargoes are expected to reach:



- 42.4 million tons in 2030 under the moderate growth forecast, with average annual growth of 0.2 percent per year between 2010 and 2030,
- 51.6 million tons in 2030 under the high growth forecast, with average annual growth of 1.2 percent per year between 2010 and 2030.

The 2009 forecast projected that liquid bulk traffic would reach 48.4 million tons in 2030, with average annual growth of approximately 0.8 percent between 2010 and 2030.

One significant change that is expected to impact liquid bulks is a shift in the source of crude oil for regional refineries. Under both the 2009 forecast and the current forecast the volume of crude oil from Alaska is expected to decline. The 2009 forecast assumed that the decline in domestic waterborne volumes from Alaska would be made up through a combination of waterborne foreign receipts and imports by pipeline. Under the current forecast the refineries in the region are also expected to begin receiving crude oil by rail from North Dakota, which may impact waterborne volumes. Under the moderate growth scenario, liquid bulk projections are lower to account for this shift.

New opportunities for liquid bulk cargo are also under consideration; most notably LNG imports (or perhaps exports) are being considered in Coos Bay and Astoria. The high growth scenario reflects these opportunities.

Figure 2-5: Pacific Northwest Liquid Bulk Forecast

Regional Forecasts by Commodity

This section summarizes expected growth for each sub-region and commodity group.

Lower Columbia Oregon and Oregon Coast

Under the moderate growth forecast, the volume for the Lower Columbia Oregon region is projected to reach 44.6 million tons in 2030, with an average annual growth rate of 2.6 percent between 2010 and 2030. See Figure 2-6.

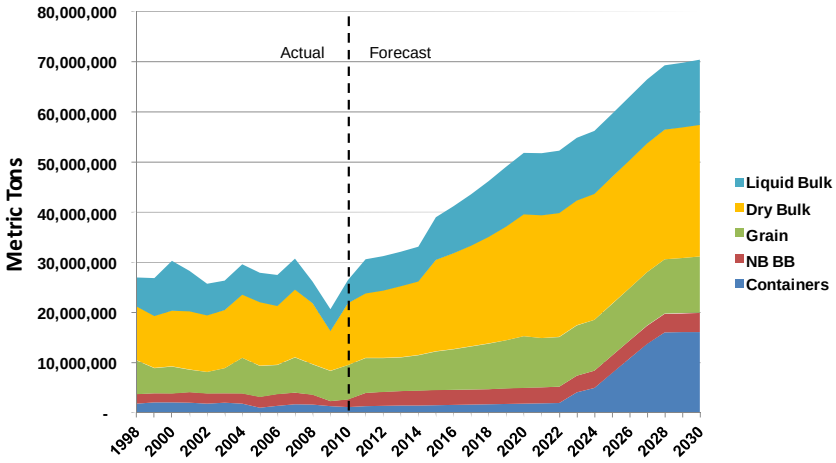

Figure 2-6: Lower Columbia Oregon and Oregon Coast Forecast
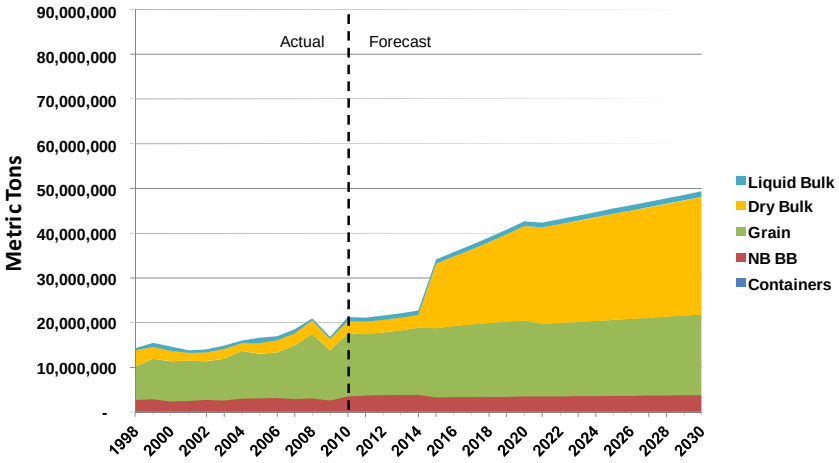
Moderate Growth Scenario

Source: BST Associates

Under the high growth forecast, the volume for the Lower Columbia Oregon region is projected to reach 70.5 million tons in 2030, with an average annual growth rate of 5.0 percent between 2010 and 2030. See Figure 2-7.

Figure 2-7: Lower Columbia Oregon and Oregon Coast Forecast
High Growth Scenario



Source: BST Associates

Lower Columbia Washington

Under the moderate growth forecast, the volume for the Lower Columbia Washington region is projected to reach 49.4 million tons in 2030, with an average annual growth rate of 4.3 percent between 2010 and 2030. See Figure 2-8.

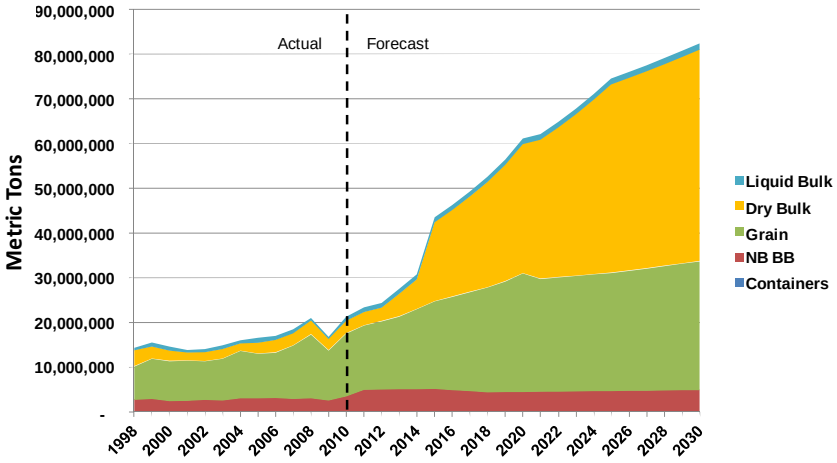


Figure 2-8: Lower Columbia Washington Forecast
Moderate Growth Scenario

Source: BST Associates

Under the high growth forecast, the volume for the Lower Columbia Washington region is projected to reach 82.5 million tons in 2030, with an average annual growth rate of 7.0 percent between 2010 and 2030. See Figure 2-9.

Figure 2-9: Lower Columbia Washington Forecast
High Growth Scenario

Puget Sound and Washington Coast

Under the moderate growth forecast, the volume for the Puget Sound and Washington Coast region is projected to reach 141.0 million tons in 2030, with an average annual growth rate of 2.6 percent between 2010 and 2030. See Figure 2-10.

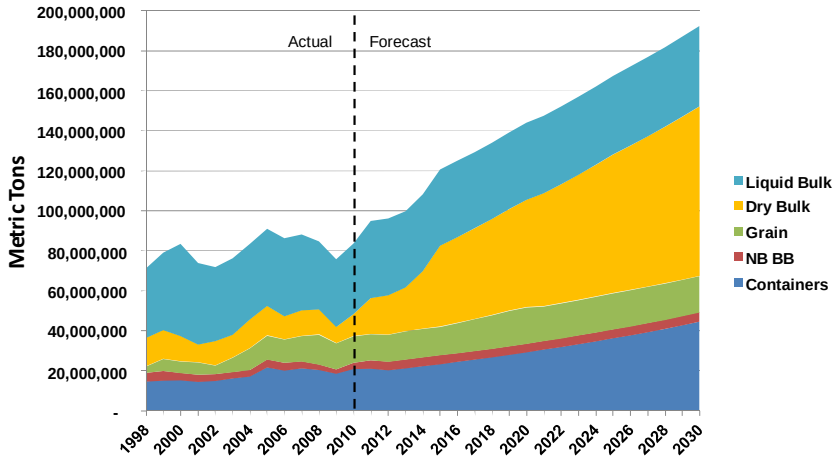

Figure 2-10: Puget Sound and Washington Coast Forecast
Moderate Growth Scenario

Source: BST Associates

Under the high growth forecast, the volume for the Puget Sound and Washington Coast region is projected to reach 192.3 million tons in 2030, with an average annual growth rate of 4.2 percent between 2010 and 2030. See Figure 2-11.

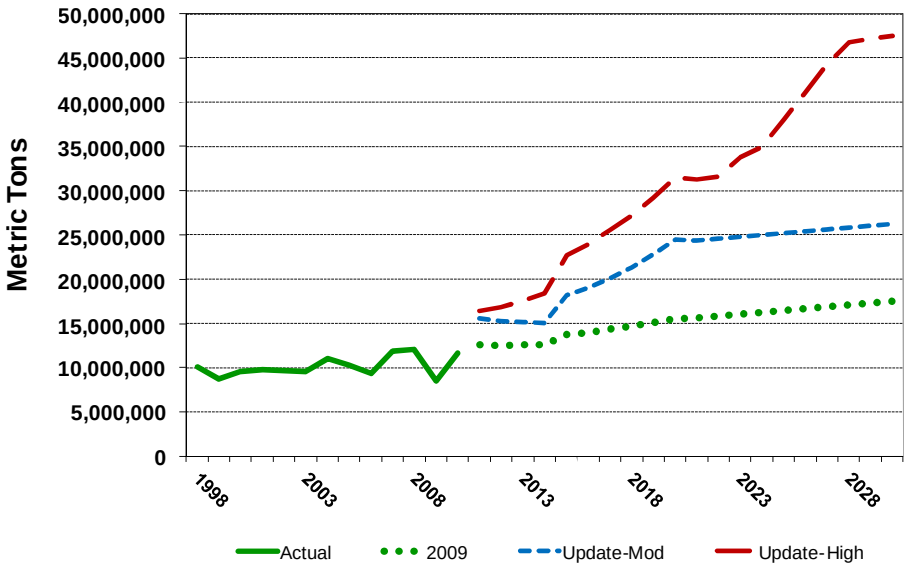
Rail Forecasts by Region



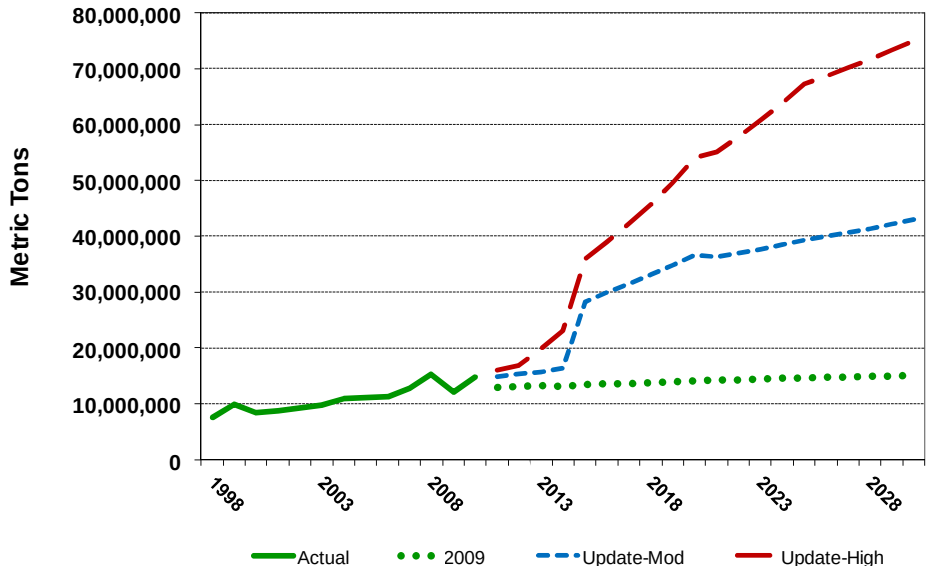
This section summarizes expected growth in rail traffic by sub-region.

Lower Columbia Oregon and Oregon Coast

Rail traffic in the Lower Columbia Oregon and Oregon Coast sub-region is projected to grow as follows:

- A rail traffic projection for Oregon ports was not undertaken in 2009. However, using a similar process as that undertaken for Washington state ports, marine-related rail volumes would have been expected to increase from 11.7 million tons in 2010 to 17.5 million tons in 2030, or at an average annual growth rate of 2.0 percent.
- Under the current moderate growth forecast, marine-related rail traffic in this region is projected to reach 26.3 million tons in 2030, with an average annual growth rate of 4.1 between from 2010 and 2030.
- Under the high growth forecast, marine-related rail traffic in this region is projected to reach 47.5 million tons in 2030, with an average annual growth rate of 7.3 percent between 2010 and 2030. (See Figure 2-12)

Figure 2-12: Lower Columbia Oregon and Oregon Coast Rail Traffic Forecast



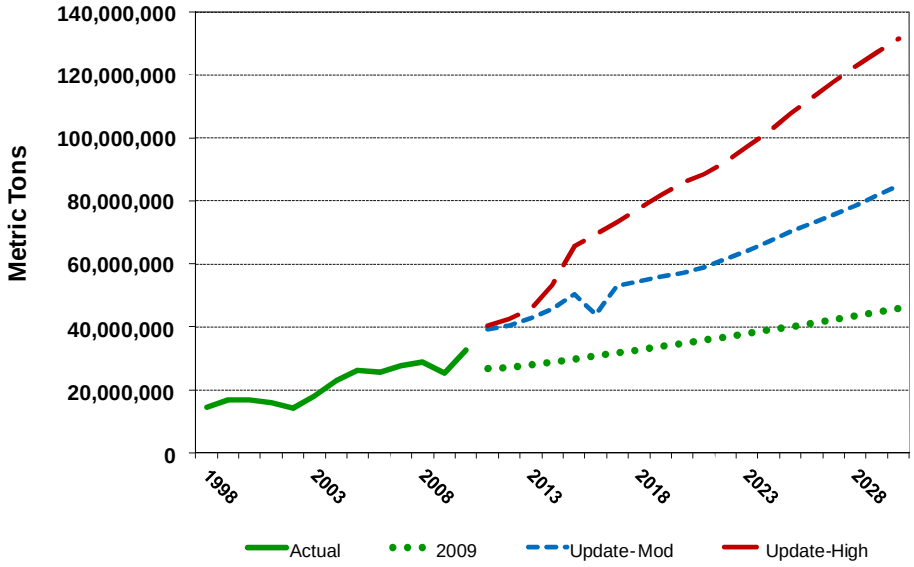
Source: BST Associates

Lower Columbia Washington

Rail traffic in the Lower Columbia Washington sub-region is projected to grow as follows:

- In the 2009 Marine Cargo Forecast, rail volumes were expected to increase modestly from 14.8 million tons in 2010 to 15.1 million tons in 2030, or at an average annual growth rate of less than 0.2 percent.
- Under the moderate growth forecast, marine-related rail traffic in this region is projected to reach 43.0 million tons in 2030, with an average annual growth rate of 5.5 percent between 2010 and 2030.
- Under the high growth forecast, marine-related rail traffic in this region is projected to reach 74.9 million tons in 2030, with an average annual growth rate of 8.4 percent between 2010 and 2030. (See Figure 2-13)

Figure 2-13: Lower Columbia Washington Rail Traffic Forecast



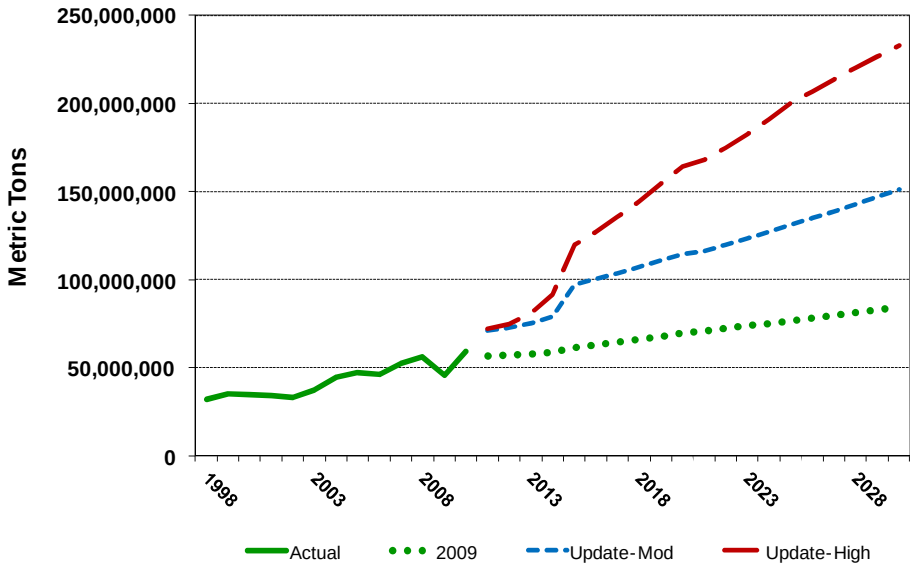
Source: BST Associates

Puget Sound and Washington Coast

Rail traffic in the Puget Sound and Washington Coast sub-region is projected to grow as follows:

- In the 2009 Marine Cargo Forecast, rail volumes were expected to increase from 32.6 million tons in 2010 to 45.9 million tons in 2030, or at an average annual growth rate of 1.7 percent.
- Under the moderate growth forecast, marine-related rail traffic in this region is projected to reach 84.8 million tons in 2030, with an average annual growth rate of 4.9 percent between 2010 and 2030.
- Under the high growth forecast, marine-related rail traffic in this region is projected to reach 131.6 million tons in 2030, with an average annual growth rate of 7.2 percent between 2010 and 2030. (See Figure 2-14)

Figure 2-14: Puget Sound and Washington Coast Rail Traffic Forecast



Source: BST Associates

Pacific Northwest Region

Rail traffic in the Pacific Northwest region is projected to grow as follows:

- In the 2009 Marine Cargo Forecast, rail volumes were expected to increase from 59.2 million tons in 2010 to 78.5 million tons in 2030, or at an average annual growth rate of 1.4 percent.
- Under the moderate growth forecast, marine-related rail traffic in this region is projected to reach 151.1 million tons in 2030, with an average annual growth rate of 4.8 percent between 2010 and 2030.
- Under the high growth forecast, marine-related rail traffic in this region is projected to reach 232.8 million tons in 2030, with an average annual growth rate of 7.1 percent between 2010 and 2030. (See Figure 2-15)

Chapter 3
Assessment of Rail Capacity

The following chapter provides an assessment of rail capacity. A primary objective of the rail capacity update is to identify and prioritize capacity improvements that would help mitigate main line capacity conflicts as rail traffic grows. This chapter was prepared by MainLine Management (MLM).

Assumptions

Key assumptions about baseline conditions, train sizes and forecasts for domestic cargoes are summarized in the following section.

Baseline Conditions

Based on discussions with rail service providers, the rail traffic volumes in 2008 were considered representative of volumes occurring in 2010. More importantly, data was available for rail traffic operations for major rail line segments for 2008. As a result, 2008 was used as the baseline condition for 2010.

Train Sizes

Assumptions on train sizes are based upon discussions with rail providers, terminal operators and consultant experience:

- Unit grain sizes are expected to remain at approximately 110 cars.
- Unit coal trains are expected to remain at 115 to 120 cars.
- Export potash trains operate with 170 cars, approximately 8,500 feet in length.
- Container trains of 8,000 to 8,500 feet from the Puget Sound ports will continue to be operated as long as volumes are available and service requirements can be maintained. Otherwise, international container trains are sized to meet import demand and service requirements.
- Manifest trains will continue to operate at a maximum train size of approximately 7,000 feet.

Forecasts

The rail forecasts include a projection of the number of trains under moderate and high growth scenarios under both average and peak operating conditions.

The forecasts are driven by the marine cargo forecast, which is documented in Chapter Two. For other rail cargo (domestic traffic and passengers), the following assumptions were used:

- Forecasts for passenger trains were taken from studies prepared for WSDOT and ODOT.
- Merchandise trains are projected to grow at 2 percent annually.
- Domestic intermodal trains are projected to grow at 3.5 percent annually.

Figure 3-1: Map of Rail System

Absorption

Currently, many of the existing trains in the region do not run at their maximum potential length. It is assumed that traffic growth will usually be absorbed by existing trains before new trains are deployed. However, this assumption recognizes that service requirements sometimes necessitate new train starts even though existing trains are not running at maximum length.

Capacity by Mainline Segment

This section presents an assessment of the projected demand-capacity relationships at the key line segments over the study forecast period (through 2030). The line segments include:

- Pasco, WA to Vancouver, WA (BNSF)
- Hinkle OR to Portland, OR (UP)
- Pasco, WA to Spokane, WA (BNSF)
- Spokane, WA to Sand Point, ID (BNSF)
- Hinkle, OR to Eastgate, ID (UP)
- Vancouver, WA to Kalama/Longview, WA (Joint line)
- Kalama/Longview, WA to Tacoma, WA (Joint line)
- Tacoma, WA to Seattle, WA (Joint line)
- Seattle, WA to Everett, WA (BNSF)
- Everett, WA to Vancouver, BC (BNSF)
- Everett, WA to Spokane, WA via Stevens Pass (BNSF)
- Auburn, WA to Pasco, WA via Stampede Pass (BNSF)

In each of the following rail segment analyses, graphics are presented to illustrate the growth in rail traffic and growth in rail segment capacity. The increases in capacity indicated by the graphs reflect: 1) improvements that are currently planned or under way, and 2) other potential improvements that the consultants consider to be feasible. With the exception of projects that are contractually obligated under passenger rail plans, other improvements are up to the discretion of the individual railroads, and would likely be added only as needed to meet market demand.

Pasco, WA to Vancouver, WA (BNSF)

BNSF has undertaken several improvements along the section of mainline from Pasco to Vancouver. All meet/pass sidings between Pasco and Wishram (near the middle of the Columbia Gorge) are at least 8,000 feet in length. Between Wishram and Vancouver, six of 11 existing sidings are 8,000 feet in length or longer. BNSF has a priority plan to extend sidings that are not currently 8,000 feet in length, as demand requires.

Figures 3-2 and 3-3 illustrate the consultants' opinion of the capacity of this line segment as well as the projected train volumes under the moderate and high growth scenarios. The analysis implies that:

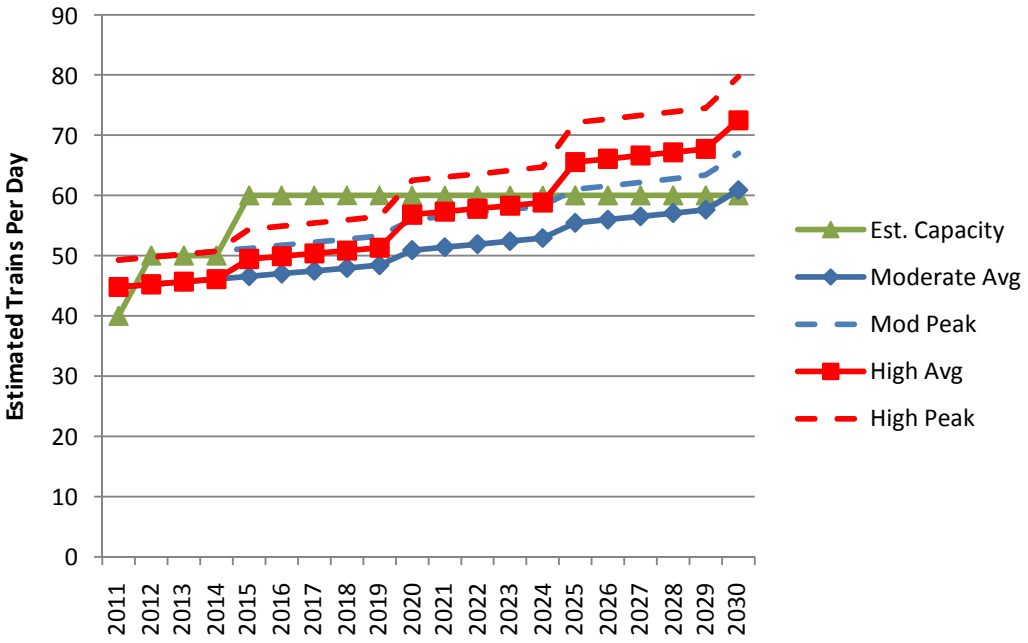
- Pasco to Wishram
  - Under the high growth scenario, capacity will be reached by 2020 (peak daily traffic) and 2025 (average daily traffic).
  - Under the moderate growth scenario, capacity will be reached by 2025 (peak daily traffic) and 2030 (average daily traffic).

- Wishram to Vancouver:
  - Under the high growth scenario, capacity will be reached by 2024 (peak daily traffic) and 2025 (average daily traffic).
  - Under the moderate growth scenario, capacity will be reached by 2030 (peak daily traffic).

However, the capacity on this route can be enhanced beyond previous study assumptions through a combination of siding extensions and revised operating protocols, as discussed below.

The Pasco to Vancouver route hosts Amtrak trains, and is subject to implementation of Positive Train Control (PTC), as mandated by Congress. Industry analysis of the implementation of PTC indicates that it may negatively impact capacity, especially on line segments in which "fleeting"[1] is used. This is because PTC requires a larger safety zone for following trains than is required under the existing Centralized Traffic Control (CTC).

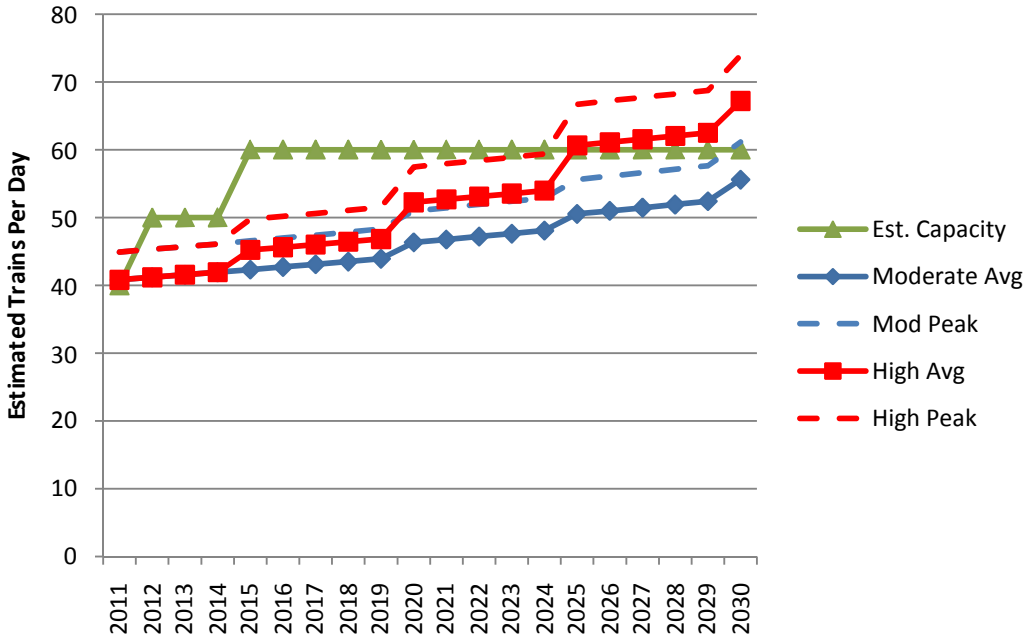
BNSF is evaluating a plan that would change the traffic flows and volumes on this segment over time. Under this plan, full export bulk trains would move westbound through the Columbia River Gorge. Empty bulk trains from Portland and Vancouver would move eastbound through the Gorge, but empty export bulk trains from Kalama north (i.e., Longview, Grays Harbor, Tacoma, Seattle, etc.) would be routed to Auburn and then over Stampede Pass. Most of the other train types that currently use the Gorge would continue to do so.



If implemented, this plan would create the opportunity for significant fleeting of westbound trains through the Columbia River Gorge.

One area of concern is the single track BNSF rail bridge over the Columbia River at Pasco. The estimated capacity in the segment analysis assumes that BNSF will be able to operate a sufficient number of trains over the bridge to meet the projected long-term demand. Congestion, however, could be expected to be a problem in near the end of the forecast period.

Two potential increases in capacity are illustrated in Figures 3-2 and 3-3. These include adoption of the new operating plan, connecting individual sidings into sections of double-track main line, and the addition of siding extensions.



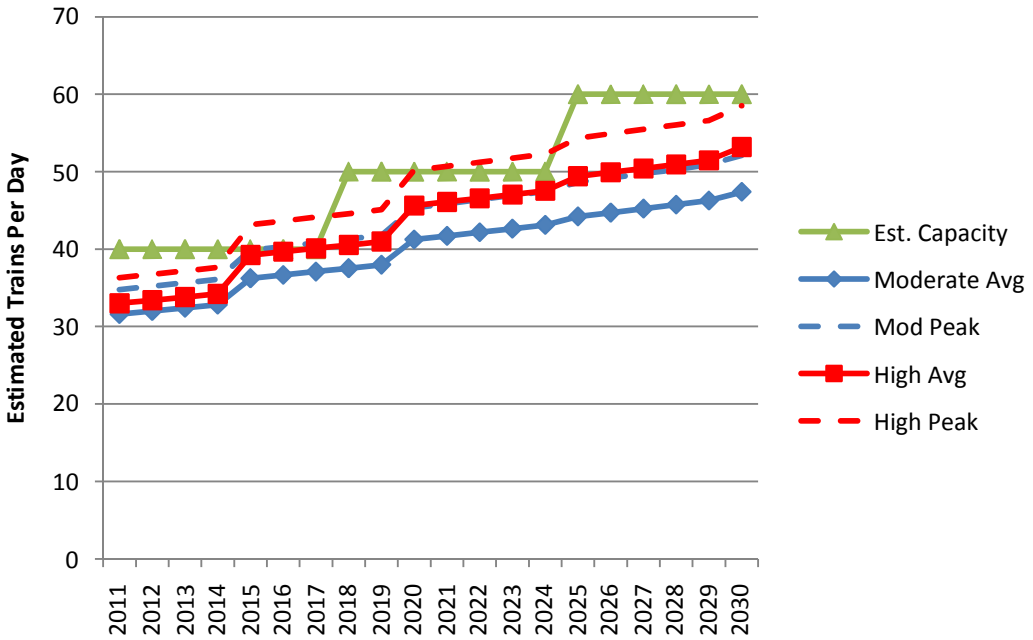
[1] "Fleeting" is a term used to describe train movements in which a series of trains are operated in one direction, and then in the other direction. This minimizes meet/pass requirements and can increase the practical capacity of a line segment.

Figure 3-2: Rail Corridor Capacity – Pasco to Wishram (BNSF)

Source: MainLine Management

Figure 3-3: Rail Corridor Capacity – Wishram to Vancouver BNSF

Source: MainLine Management



Hinkle, OR to Portland, OR (UP)

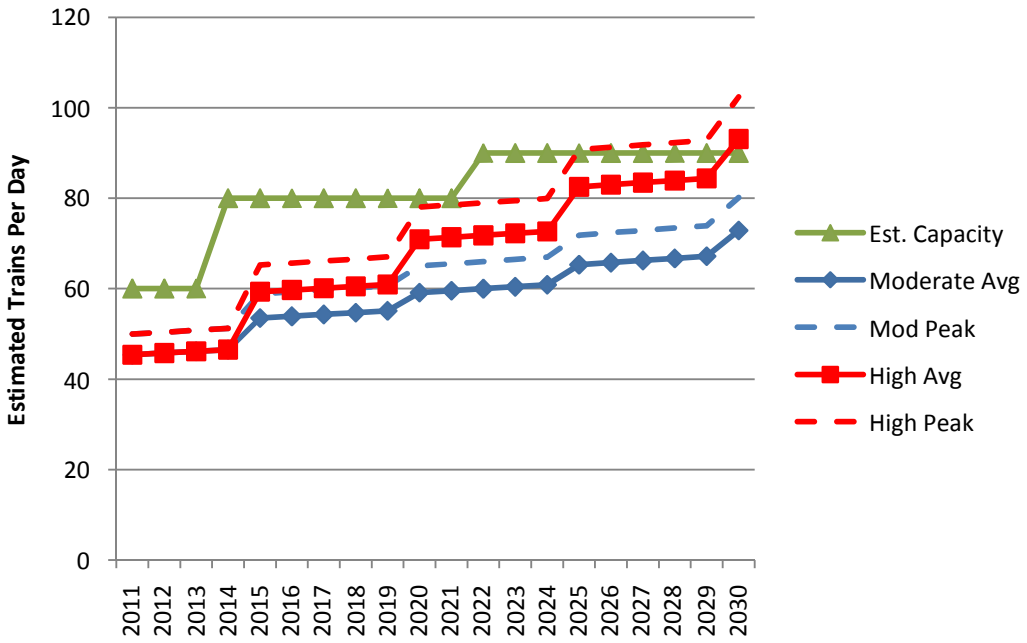
The UP main line runs along the Oregon side of the Columbia River between Hinkle and Portland, and is similar to the BNSF line on the Washington side of the Columbia River between Vancouver and Pasco.

Options for increasing capacity on this segment are similar to those for the BNSF. These include fleeting of trains, along with siding expansion where constructable.

As Figure 3-4 demonstrates, no capacity constraints are expected under either the moderate or high growth scenarios. The capacity improvements illustated in the graph are based on connecting individual sidings into sections of double-track main line, and the addition of siding extensions, and possible fleeting of trains.

Figure 3-4: Rail Corridor Capacity, Hinkle to Portland (UP)

Source: MainLine Management



Pasco, WA to Spokane, WA (BNSF)

Between Pasco and Spokane all sidings are 8,000 feet in length or longer and capacity exists to operate several more trains in each direction on the segment. As a result of the projected growth in export traffic, BNSF is planning for capacity expansion on this segment. In the consultant's opinion, such an expansion would likely involve combining key sidings into long sections of double-track and adding high-speed crossovers to increase operational flexibility.

As shown in Figure 3-5, the analysis implies that the Pasco to Spokane segment will reach capacity by 2025 (peak) and 2030 (average) under the high growth scenario, but there are no capacity constraints under the moderate growth scenario.

Capacity increases illustrated in the graph result from connecting individual sidings into sections of double-track main line.

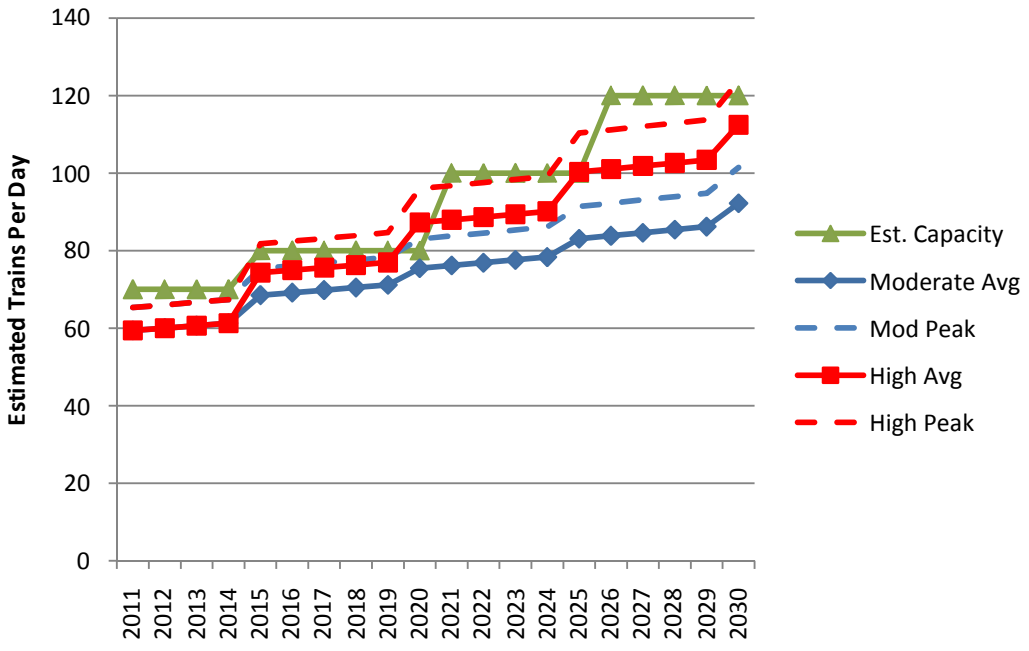
Figure 3-5: Rail Corridor Capacity – Pasco to Spokane (BNSF)

Source: MainLine Management

Spokane, WA to Sand Point, ID (BNSF)

There are two main line segments between Spokane, Washington and Sand Point, Idaho, one operated by the BNSF and one by the UP.

Most of the BNSF corridor features multiple main tracks, but there are short stretches of single track between Irvin and Otis Orchard, WA (3.1 miles), Rathdrum and Athol, ID (11.1 miles with a siding at Ramsey) and between Algoma and Cocolalla, ID (2 miles). It is likely that BNSF can increase the capacity of this segment to meet demand, primarily by double-tracking the remaining single track segments between Spokane and Sandpoint, although some of those sections present certain difficulties and enhanced costs.



A capacity concern that may materialize over the long-term for BNSF is the single track bridge across Lake Pend Oreille. The train volumes indicated in the 2030 projections may require fleeting of traffic across the bridge. In addition, fleeting of trains may create the need for additional storage track on either side of the bridge to stage trains before crossing.

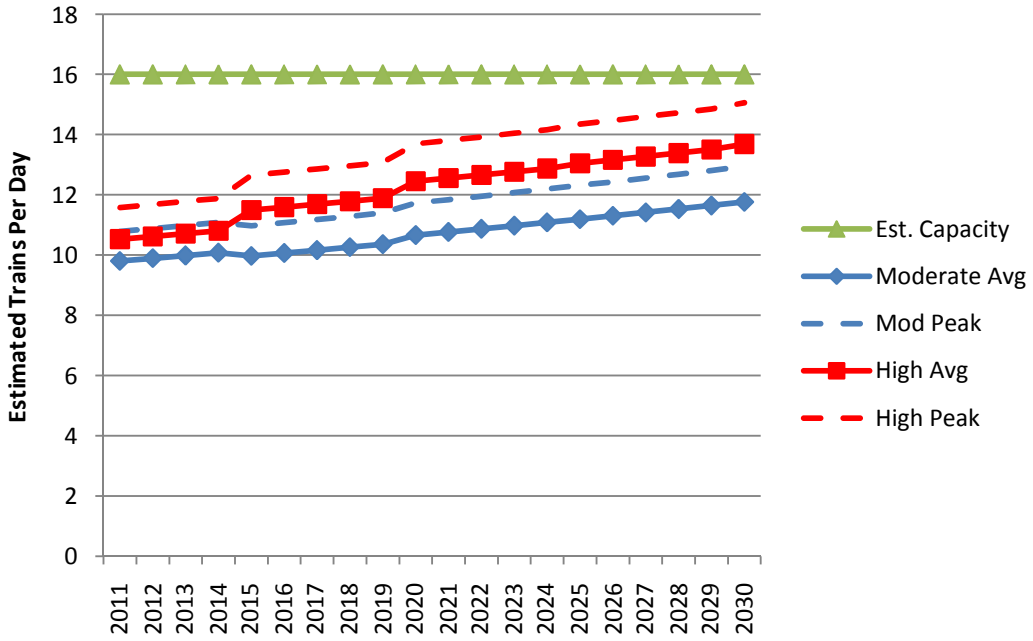
As shown in Figure 3-6, the analysis implies that the Sandpoint to Spokane segment has sufficient capacity under average conditions, but may be constrained under peak conditions. Under the moderate growth scenario, there are no sustained capacity constraints.

Capacity increases illustrated in the graph result from double-tracking three single-track segments, adding a third main line in key locations, and potentially adding staging tracks at either end of the Lake Pend Oreille Bridge.

The UP segment between Spokane and Sand Point is included in the next section of this chapter, Hinkle, OR to Eastgate, ID.

Figure 3-6: Rail Corridor Capacity – Spokane to Sand Point (BNSF)

Source: MainLine Management



Hinkle, OR to Eastgate, ID (UP)

This segment of mainline is a key route for Canadian cargo exported through Pacific Northwest ports, such as potash, which originate on the Canadian Pacific Railway and are interchanged with the Union Pacific at Eastport, Idaho.

Much of this segment consists of a single track operation operated by Track Warrant Control, which is non-signalized. The distance between meet/pass sidings limits capacity, but current available capacity is sufficient to meet projected traffic volumes under both growth scenarios, as shown in Figure 3-7.

The UP may be able to increase capacity by constructing additional meet/pass sidings if warranted by growth in cargo traffic. However, these potential increases in capacity are not included in Figure 3-7.

Figure 3-7: Rail Corridor Capacity, Hinkle to Eastgate

Source: MainLine Management

Vancouver, WA to Tacoma, WA

Plans to increase volumes of intercity passenger rail have driven the infrastructure expansion proposals for this segment. The analysis of this segment is divided into two sections:

- Vancouver to Longview/Kelso, and
- Longview/Kelso to Tacoma.

The most significant capacity usage on this segment occurs in the Kalama/Longview area due to grain trains leaving/entering the main lines at Kalama and to yard operations at Longview Junction. In both cases, considerable main line capacity is consumed by trains slowly entering/departing the main lines to/from export grain facilities or while they are stopped to work in yard areas.

With the projected increase in loaded and empty bulk trains over this segment, it is possible that BNSF will consider fleeting loaded bulk export trains through the Gorge and running empty bulk trains eastbound over Stampede pass, as discussed above in the Vancouver to Pasco section. Empty and full export bulk trains on the UP system would continue to operate through the Gorge in both directions.

One potential capacity expansion project that may be revisited is the construction of a unit train staging/storage yard near Woodland. At one time this improvement was on the list of passenger-related improvements under consideration by WSDOT, but was cut when that plan was downsized. With the number of export bulk trains projected for this segment, an area for staging loaded bulk trains near Kalama may prove beneficial from a rail operating and service perspective.

Another potential project is to add a second single-track rail bridge to span the Cowlitz River or to replace the existing single-track Cowlitz River Bridge with a new double-track bridge. This bridge is located on the branch line that connects marine terminals at the Port of Longview as well as other industrial customers to the I-5 Corridor main line. The recent Port of Longview Master Plan demonstrated the need to for this project, and it was also identified in the SR432 Highway and Rail Improvement Project.

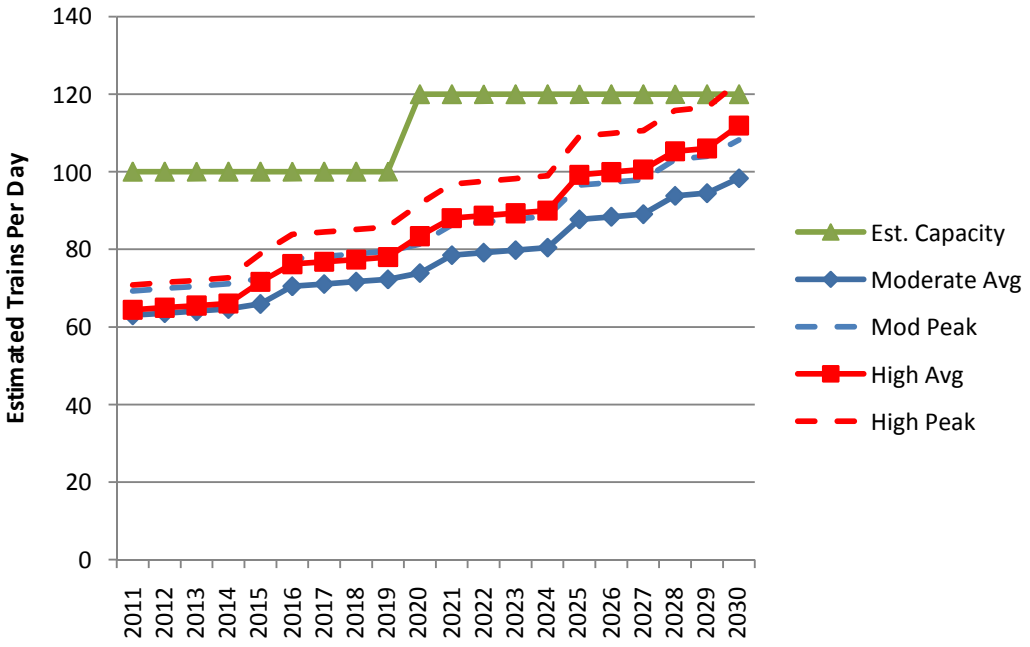
Passenger-related capacity improvements in the updated WSDOT *Amtrak Cascades Mid-Range Plan* focus on the Kalama/Longview area, and include adding a third main track that bypasses existing congestion points.

The following sections discuss the Vancouver to Tacoma segment in two parts, Vancouver WA to Kalama/Longview and Kalama/Longview to Tacoma.

Vancouver, WA to Kalama/Longview, WA (Joint Line)

Much of the congestion on this segment occurs at Vancouver, and between Vancouver and Kalama/Longview. At Vancouver, through traffic on intersecting main line routes compete for line capacity with operations at the Vancouver Yard, and with trains entering and leaving the Port of Vancouver. Additional passenger train operations are likely to aggravate these conflicts unless sufficient mitigation is constructed to improve efficiency for all train operations in the Vancouver Terminal area.

Between Vancouver and Longview numerous trains arrive and depart the main line to access marine terminals and other customers in the Kalama/Longview area. These trains arriving and departing the mainline move at slow speeds, aggravating congestion issues on this segment.



WSDOT's *Amtrak Cascades Mid Range Plan* (Options 3 and 4)[2] will continue to provide the rail capacity needed over time to ensure that intercity passenger growth can occur in conjunction with projected freight growth. The directional operation of loaded and empty bulk trains by BNSF, coupled with the planned passenger rail improvements, should reduce the impact of growing freight and passenger traffic.

In the consultants' opinion, the construction of a third main track through the Kalama/Longview area will be needed in the long-term, as well as construction of a bulk train staging and storage facility near Woodland.

As shown in Figure 3-8, the analysis implies that there is no capacity problem for the section of mainline from Vancouver to Longview under the moderate growth scenario. Under the high growth scenario, capacity is reached by 2030 during peak operations.

Capacity improvements reflected in this graph include completion of the Vancouver Bypass, the new Port of Vancouver Access Route, and the Option 3 passenger improvements (including construction of the third main track between Kalama and Kelso). Other improvements may include completion of third main track between Martin's Bluff and Rocky Point, and expansion of the Cowlitz River Bridge at Longview. In addition, construction of improvements at North Portland Junction will compliment these improvements, even though the junction is not located within this segment.

Figure 3-8: Rail Corridor Capacity – Vancouver (WA) to Kalama/Longview With Passenger Improvements

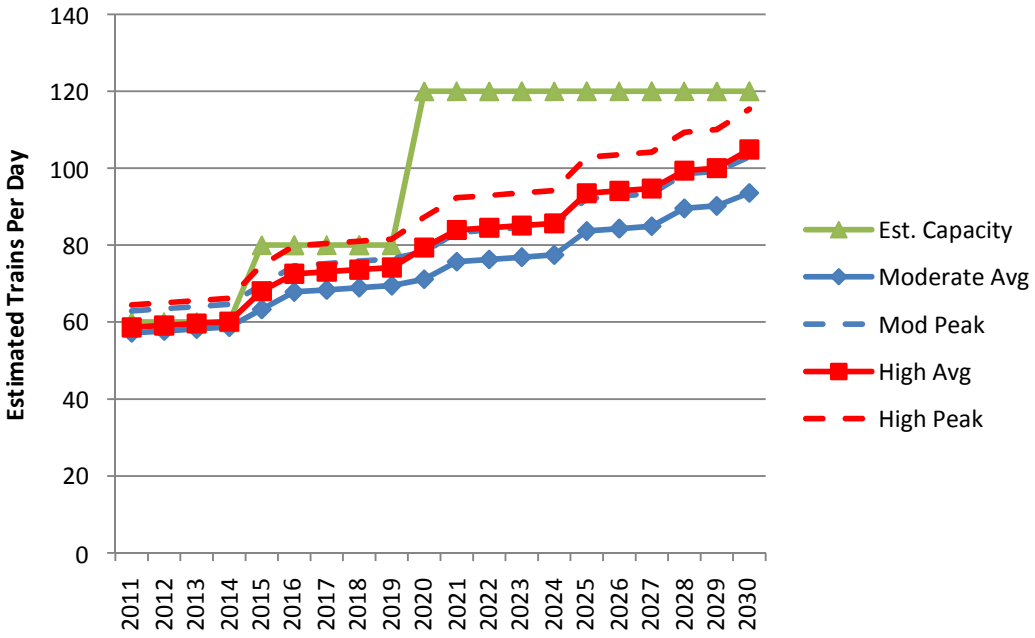
[2] For a full list of projects, please access the Amtrak *Cascades* Mid-Range Plan at http://www.wsdot.wa.gov/NR/rdonlyres/83B17378-CDC8-4D57-AA60-4CD64BAF6D94/0/AmtrakCascadesMidRangePlan.pdf



Kalama/Longview, WA to Tacoma, WA (Joint Line)

Two single track tunnels near Tacoma (Nelson-Bennett Tunnel and Ruston Tunnel) are the primary capacity constraints between Longview/Kalama and Tacoma. However, the Point Defiance Bypass, which is planned to be completed by 2017, will alleviate mainline capacity constraints by shifting passenger trains from the existing main line to an alternate route between Nisqually and Reservation Interlocking in Tacoma. In addition, planned CTC high-speed crossovers will provide additional flexibility for train operations across this segment.

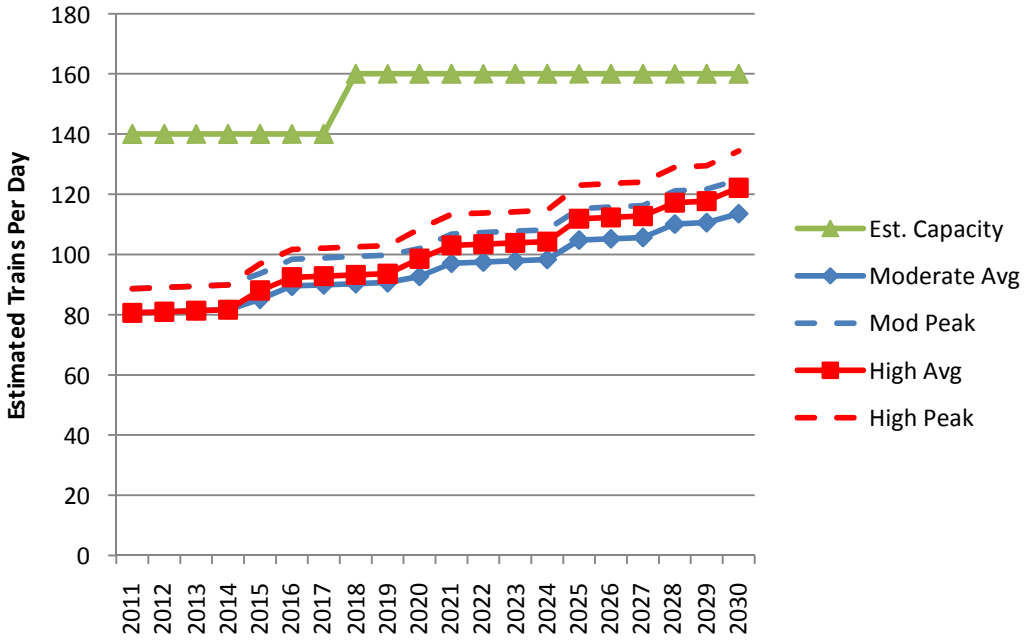
Capacity improvements illustrated in Figure 3-9 include completion of the Point Defiance Bypass and the addition of high-speed crossovers. These two projects will allow the Longview/Kalama to Tacoma segment to operate at or below capacity over the 20-year forecast period under both the moderate and high growth scenarios.

In addition, the Blakeslee Junction rail project would allow faster access and egress between the mainline and the Puget Sound and Pacific Railroad branch at Centralia. This project was originally considered for WSDOT's Amtrak *Cascades* list of passenger-related capacity improvements. Completion of this project would also accommodate additional cargo opportunities at the Port of Grays Harbor.

Figure 3-9: Rail Corridor Capacity –Kalama/Longview to Tacoma With Point Defiance Bypass

Source: Mainline Management

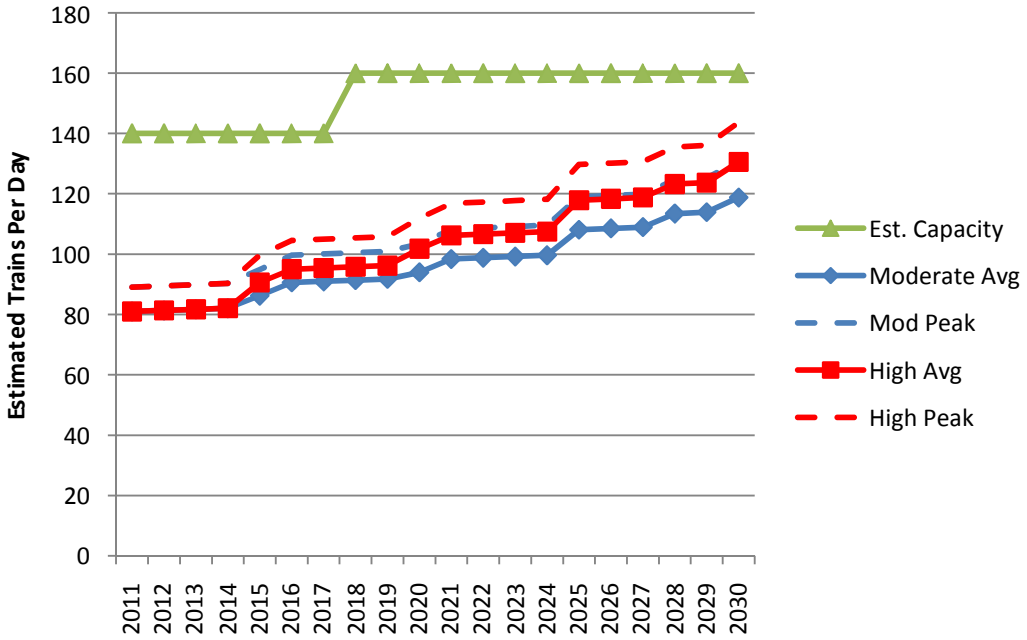
Tacoma, WA to Seattle, WA (Joint Line)



According to Sound Transit there are no conflicts between passenger and freight operations between Tacoma and Seattle, and the level of service provided by BNSF is very good. The Point Defiance Bypass project will further improve freight and traffic flows through Tacoma, and between Tacoma and Seattle.

Improvements at King Street Station in Seattle have improved the efficiency of freight and passenger operations in the Seattle area. BNSF is constructing a third main track approximately five miles long between Kent and Auburn. Approximately half of this track is on either side of the wye that accesses the Stampede Pass line. Presumably the purpose of this additional main line is to facilitate efficient freight operations between the existing main lines, Auburn Yard, and Stampede Pass. Given the potential to route empty bulk trains over Stampede pass, this additional track is needed to minimize the impact to current and projected commuter and intercity passenger trains.

The capacity of this segment was analyzed in two parts - Tacoma to Auburn and Auburn to King Street Station. The primary reason for splitting the analysis this way is that the traffic mix is likely to be different on each part if the BNSF routes empty bulk trains over Stampede Pass; the mix of loaded and empty bulk trains between Tacoma and Auburn would be slightly different than the mix north of Auburn.

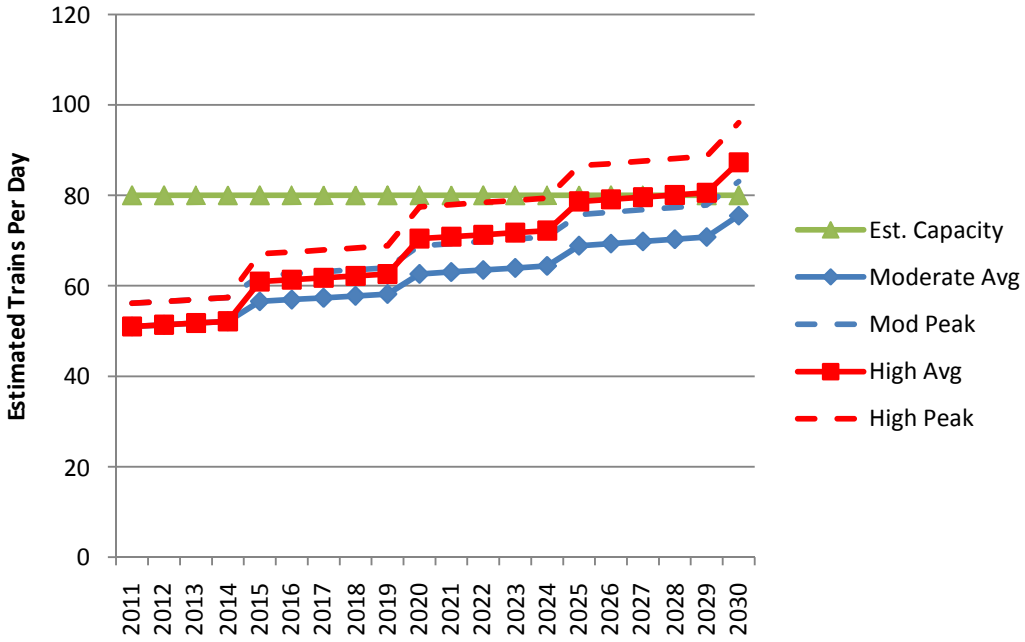


As shown in Figures 3-10 and 3-11, there are no capacity constraints under high-growth or moderate-growth scenarios.

Figure 3-10: Rail Corridor Capacity – Tacoma to Seattle
Joint Line Tacoma to Auburn

Source: MainLine Management

Figure 3-11: Rail Corridor Capacity – Tacoma to Seattle
Joint Line Auburn to Seattle



Source: MainLine Management

Seattle, WA to Everett, WA (BNSF)

Capacity expansion on this line segment is driven by passenger rail service requirements, with no freight-related improvements currently planned. Under the agreement between Sound Transit and BNSF for commuter train operations over this segment, Sound Transit purchased "slots", which guaranteed specific passenger volumes and service levels. Under this agreement BNSF must ensure that these passenger service requirements are met, regardless of freight demand.

As shown in Figure 3-12, however, growth in export bulk trains destined north of Everett could result in capacity constraints, starting between 2020 and 2023 under the high growth scenario. That may result in BNSF proactively constructing additional capacity improvements to meet the requirements of the slot purchase arrangement with Sound Transit. Under the moderate growth scenario, there are no capacity constraints until 2030 (under peak operations).

Figure 3-12: Rail Corridor Capacity – King Street Station to Everett

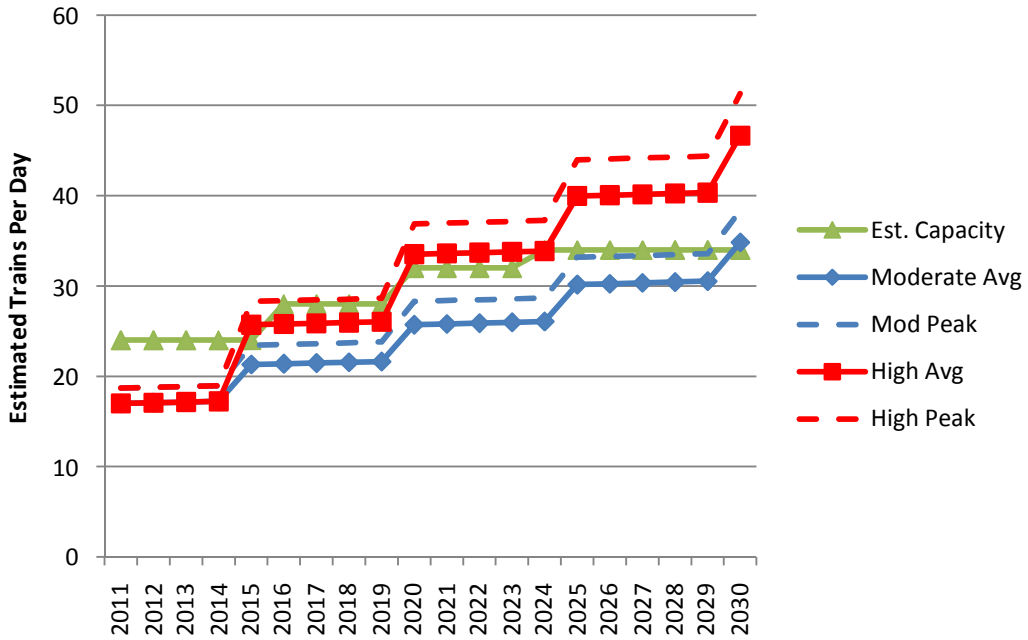
Source: MainLine Management

Everett, WA to Vancouver, BC (BNSF)

Capacity improvements currently planned for the Everett to Vancouver mainline segment are driven largely by passenger service. Three of the projects that are currently being designed or constructed include:

- Siding upgrade and extension at Stanwood,
- Siding upgrade and extension at Mount Vernon,
- Construction of a new siding at the Swift Customs Facility.

The siding extensions and upgrades at Stanwood and Mount Vernon would allow more efficient meet/pass operations involving freight and passenger operations. The new siding at Swift (Blaine) would allow additional capacity for freight train customs inspections while keeping the main line open for other train operations, including passenger.



In addition to these improvements, BNSF recently constructed a 10,000 foot siding north of the border at Colebrook, BC. Colebrook is the location where the BNSF ties into the rail line that accesses the Deltaport and Westshore port facilities. Prior to construction of this siding BNSF had no meet/pass locations between the border and Brownsville, BC.

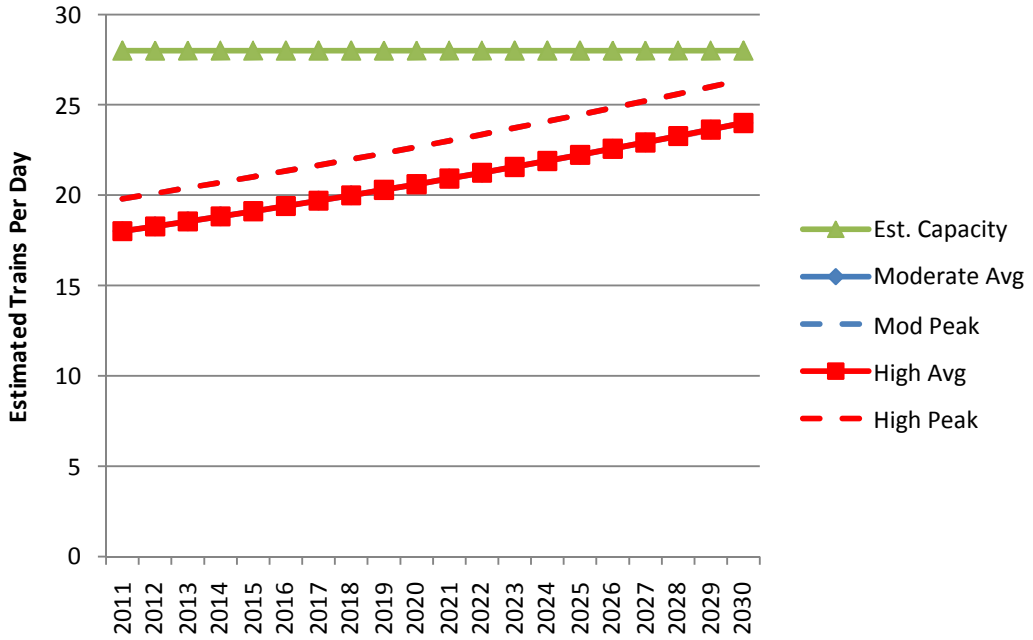
As shown in Figure 3-13, growth in export bulk commodities may lead to sustained capacity constraints along this segment. These constraints are projected to start between 2020 and 2025 under the high growth scenario, and between 2029 and 2030 under the moderate growth scenario.

The increases in sustainable capacity illustrated in Figure 3-13 reflect the consultants' view of potential improvements. Given the track profile of this segment, these potential improvements include the addition of new sidings and the extension of existing sidings.

In addition to the physical improvements, additional capacity improvements on this segment may be possible through the use of fleeting. Although this analysis does not assume a change in operating protocols, growth in the number of bulk trains may necessitate the use of fleeting operations. At lower traffic growth levels, targeted siding expansions would likely be able to accommodate traffic growth over the 20-year horizon.

Figure 3-13: Rail Corridor Capacity – Everett to Vancouver (BC)

Source: MainLine Management



Everett, WA to Spokane, WA via Stevens Pass (BNSF)

The primary capacity constraints on this segment are the approaches to the Cascade Tunnel under Stevens Pass and the throughput of the tunnel. The approaches include heavy curvature and steep grades (i.e. 2.2 percent), which require slow operation. Additionally, the tunnel restricts capacity because the air in the tunnel must be flushed between trains. Flushing takes approximately 40 minutes following eastbound trains and 20 minutes following westbound trains. The maximum sustained capacity through the tunnel is estimated at approximately 28 trains per day, with surge capacity of 30 to 32 trains per day.

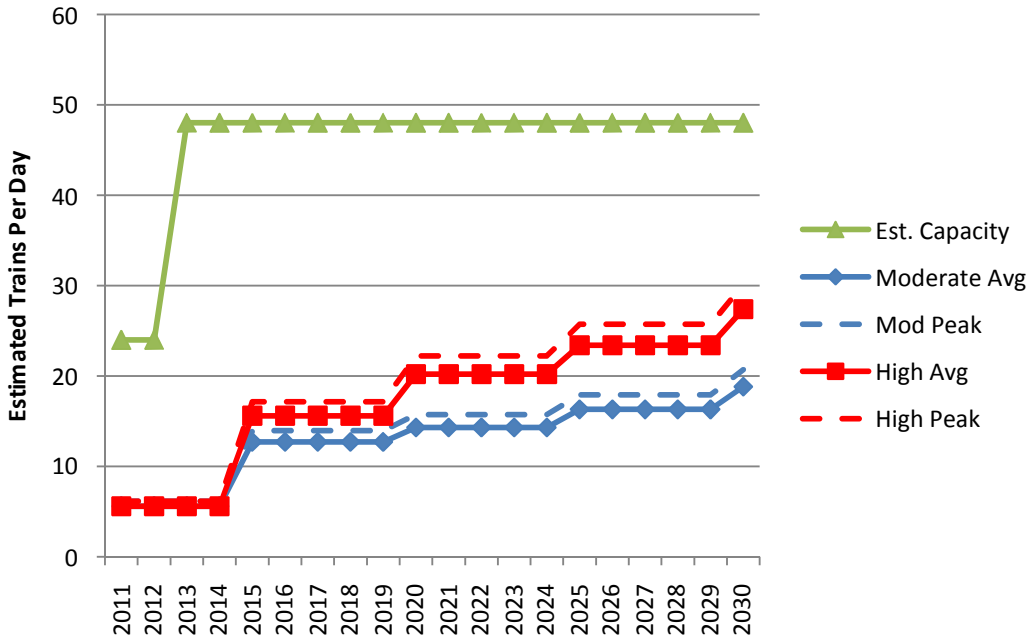
BNSF currently operates trains of up to 8,000 feet in length via Stevens Pass so long as they do not exceed 5,500 tons without Distributive Power (DPU)[3]. With DPU, trains via Stevens Pass can be increased to 7,000 tons, resulting in fewer trains. BNSF has indicated that Stevens Pass capacity will be reserved for intermodal traffic and Amtrak.

As shown in Figure 3-14, capacity of this line segment will likely not be exceeded over a 20-year horizon under the high growth scenario.

Figure 3-14: Rail Corridor Capacity – Everett to Spokane via Steven Pass (BNSF)

Source: MainLine Management

[3] With distributive power (DPU), remotely controlled helper engines are placed in the middle or at the end of trains.



Auburn, WA to Pasco, WA via Stampede Pass (BNSF)

As discussed in the Pasco to Vancouver segment analysis section, BNSF has indicated the potential for Stampede Pass being utilized as a "directional" route for empty bulk trains. The trains using the pass would be those generated on the BNSF system from Kalama north, thereby relieving the BNSF Columbia Gorge route of eastbound empty bulk trains, except for those originating in Portland and Vancouver. It is unclear when this routing protocol would occur, but it will likely be driven by route congestion on the Columbia Gorge segment. If the route does become an eastbound routing for empty BNSF bulk trains, it is also possible that BNSF would utilize the route for eastbound merchandise trains that originate from Everett, Seattle and Tacoma and are destined for the Pasco processing yard.

At some point, increased train operations will likely require upgrading the signal system on the Stampede Pass line to full CTC. The route currently has limited CTC but is predominantly dispatched utilizing Track Warrant Control (TWC). However, if the preponderance of traffic utilizing the route is eastbound only, TWC would likely be sufficient for some time into the future.

As Figure 3-15 demonstrates, use of Stampede Pass as described creates significant additional capacity. The increase in capacity reflects that, under the new operating protocol, the majority of trains using Stampede Pass will move eastbound.

Project Priorities

A key element of this analysis was the development of a prioritized list of system improvements that would allow the capacity of the regional rail system to match increasing demand.

These projects generally fall into two categories, mainline improvements and port access improvements. However, the projects labeled as port access improvements also provide benefits to the mainline system. Reducing the amount of time that it takes for trains to move between the port terminals and the mainline reduces delays on the mainline system, and thereby increases capacity.

Four projects recommended in the previous report are currently in the construction or detailed planning phase, with completion for each ranging from 2012 through the 2017/2018 timeframe. Completion of these four projects will provide a solid foundation for passenger and freight capacity in the Pacific Northwest. Three of these projects are primarily mainline improvements:

- Vancouver WA Freight Rail Bypass.
- Point Defiance Bypass, Tacoma to Nisqually.
- Third main line Kalama to Kelso (WSDOT Mid-Term Passenger Plan Option 3).

The fourth project is primarily a port access improvement:

- Port of Vancouver USA Freight Access Project.

In addition to these projects, certain main line segments will likely require additional capacity enhancements due to projected growth in rail traffic. Both the BNSF and UP likely have the ability to add the capacity needed through a combination of infrastructure expansion and changes to operations.

Six additional capacity improvement projects that would enhance overall rail operations under the moderate and high growth forecasts are listed below. Three of these projects are listed as mainline projects and three are port access. As described above, however, port access improvements also benefit mainline capacity. Descriptions of each of the projects are provided below the lists

The mainline projects include:

- Portland - Peninsula Junction to North Portland Junction,
- Vancouver to Kelso - WSDOT Passenger Plan Option 3 and 4,
- Centralia - Blakeslee Junction.

The **Peninsula Junction to North Portland Junction** project is a key series of improvements that are needed to improve both passenger and freight train capacity in the Portland area. Among other things, these projects would include reconfiguring the connection between the UP and BNSF at North Portland Junction and easing the curvature at Peninsula Junction. This would reduce congestion on the Columbia Gorge routes of both the BNSF and UP, as well as on the I-5 Corridor, and would allow for faster passenger train speeds. These improvements near the south end of the Columbia River Bridge would complement current projects at the north end of the bridge, including the Vancouver Bypass project, the West Vancouver Access project and upgrades of the main line in Vancouver. Funding is currently in place to complete preliminary engineering and the NEPA analysis, but not construction.

The improvements included in the **WSDOT Passenger Plan Options 3 and 4**[4] between Vancouver and Kelso include the completion of a third main line between Martin's Bluff and Rocky Point and a new siding near Kalama, which will be necessary to reach projected passenger train volumes.

The **Blakeslee Junction** project would improve access/egress efficiency between the I-5 Corridor main lines, and both the Puget Sound and Pacific Railway (PSAP) and Tacoma Rail lines at Centralia. Growth in the number of unit trains moving to and from the Port of Grays Harbor via the Puget Sound and Pacific has increased congestion at the interchange. This project includes a number of elements designed to increase the speed of trains through the interchange, and to increase the capacity of the Grays Harbor branch line. This will benefit both freight and passenger trains. The project is divided into five phases. Early planning has been completed on the project, but only partial funding for Phase 1A and 1B are available. Construction will require additional funding.

In addition, the Puget Sound and Pacific has recently obtained the necessary permits to construct a meet/pass siding on the Grays Harbor branch line. This siding should also improve capacity on the I-5 Corridor mainline through Centralia by providing a place off of the mainline for Grays Harbor trains to wait.

The additional port access projects that are recommended include:

- Unit Train Staging/Storage Yard near Woodland.
- Cowlitz River Bridge – Longview.
- Bullfrog Junction Realignment – Tacoma.

A **Unit Train Staging/Storage Yard near Woodland** would also increase the efficiency of both the BNSF and UP routes through the Columbia River Gorge routes and the I-5 Corridor. The BNSF currently stages unit grain trains in Pasco for movement to export terminals on the Lower Columbia River, Puget Sound, and Grays Harbor. The distance between the Pasco staging yard and the export terminals increases the potential for train delays. A storage yard in Woodland would reduce the distance to the export terminals. This project would also benefit passenger trains by reducing conflicts with slower-moving freight trains. This project is not currently in the planning phase.

The **Cowlitz River Bridge** provides access from the I-5 Corridor mainline at Longview Junction to most of the marine terminals and industrial customers in Longview. This single-track bridge is nearly 90 years old, and projected growth in traffic along the Longview branch line may require the addition of a second line. Options include adding a second single-track bridge or replacing the existing bridge with a new double-track bridge. This project would reduce congestion on the I-5 Corridor mainline (benefitting both passenger and freight trains) and increase the capacity of the Longview branch line. It was also identified in the recent Port of Longview Master Plan as a critical link. The project is estimated to cost $36 million; partial funding is in place for preliminary engineering and NEPA analysis, with the remaining funding expected in January 2012. Construction is not funded.

The **Bullfrog Junction Realignment** project would increase the efficiency of access/egress between the I-5 Corridor mainline and the Port of Tacoma. All of the rail lines serving industries and port facilities on the Tacoma Tideflats currently funnel through the Bullfrog Junction area,

[4] See footnote 2 on Page 30

seriously limiting the number of trains that can enter or leave the port area. In addition, yard activities in the area often use the mainline, reducing mainline capacity on the I-5 Corridor. The Bullfrog Junction area includes a number of chokepoints, including the junction itself, a single single-track bridge over the Puyallup River, and others. A preliminary plan for realignment was developed in 2006, and project proponents are now seeking funding for design and construction.

Conclusion

Growth in the volume of export bulk trains is expected to increase the demand on existing rail capacity in the region. Even moderate growth will require BNSF and UP to assess the capacity requirements necessary to meet the growing demand. Both railroads have the ability to increase capacity through a combination of physical and operational improvements, and should be able to meet growing demand well into the future.

Table 5-1: Current and Projected Number of Trains, by Line Segment

		Moderate Growth				High Growth			
	2011	2020		2030		2020		2030

Oregon Freight Plan Modeling Analysis Technical Memo

Prepared for the ODOT Freight Mobility Unit

Prepared by the ODOT Transportation Planning Analysis Unit

August 2010

This Page Intentionally Left Blank

Executive Summary

The purpose of the Oregon Freight Plan analysis is to gain an understanding of the spatial land use and transportation implications of different economic conditions. This analysis illustrates the variation in statewide and regional activity and commodity flow in order to help evaluate the risk associated with economic volatility on alternative Freight Plan strategies. Decision makers will be able to better assess the robustness of freight strategies and avoid the creation of barriers that may prohibit the freight industry from reacting nimbly to economic change.

The StateWide Integrated Model 2 (SWIM2) was used for this analysis. Four model scenarios were produced: business-as-usual Reference; Optimistic Economic Forecast; Pessimistic Economic Forecast; and High Transportation Cost. Highlights of the analysis findings include:

- Future demands on the freight system will be large, even if economic growth is muted. Economic inertia causes the dominant commodity mix and geographic flow patterns in Oregon to remain intact, with relatively small changes over time under various scenarios.
- Higher per-mile highway transportation costs result in less congestion, providing the impetus for shippers to increase the length of individual truck tours to increase operating efficiency Higher transport costs result in reduced miles of travel and hours of travel statewide.
- Households relocate to reduce transport costs, causing urban density to rise and statewide auto miles of travel to fall.
- Commodities have unique and diverse patterns and logistics. Transportation services used to move these commodities are just as varied. Maintaining access to markets is key to economic competitiveness. Larger urban areas produce the state's top commodity Machinery, Instruments, Transportation Equipment, and Metals. Oregon production of Food and Kindred Products occurs in Central, East, and Northwest Oregon. Forest or Wood Products are produced in Southwest, South, and Central Oregon.
- Some regions have dominant industries, making them more susceptible to economic risk associated with these industries. This is evident for the dominant urban industry of Machinery, Instruments, Transportation Equipment and Metals, and the Eastern Oregon dominance of Food and Kindred Products
- The net results of thousand of shippers and buyers of goods and services are complex and at times counter intuitive. Modeling the dynamic nature of these forces provides valuable insight into the collective Oregon freight system needs.
- Oregon sells goods outside the state: Oregon is projected to export nearly 60% of goods produced in terms of value.
- Oregon buys goods from outside the state: Oregon is projected to import about 70% of all goods consumed within the state. This heavy global trading will require reliable highway, rail, air, and waterway systems.
- Assessing system performance and economic impacts is multifaceted. Attention must be given to regional issues, commodity characteristics, industry logistics, and employment patterns when evaluating alternative strategies.
- The largest commodity flows are on the I-5 and I-84 corridors, with significant flows on US-97 and US-20
- Highway traffic congestion will increase in the future under all scenarios. A slower economy will reduce congestion growth rates and an increase in transportation cost will slow congestion growth even more

Oregon Freight Plan Modeling Analysis

Introduction

The purpose of this analysis is to gain an understanding of the spatial land use and transportation implications of different economic conditions. This analysis illustrates the variation in statewide and regional activity and commodity flow in order to help evaluate the risk of economic volatility to alternative Freight Plan strategies. The focus is not identifying the causes and effects on particular industries or commodity groups. The objective is to illustrate the variation of forecasted statewide and regional activities and commodity flows and the risk associated with economic uncertainty. This information will be used to evaluate alternative Freight Plan strategies and support formulation of policies sustaining the economic resilience of Oregon's freight system. Decision makers will be able to better assess the robustness of freight strategies and avoid the creation of barriers that may prohibit the freight industry from reacting nimbly to economic change.

Modeling Analysis Overview

The ODOT Transportation Planning Analysis Unit has a variety of tools available for analysis. The second generation StateWide Integrated Model (SWIM2) was used for the Freight Plan analysis to evaluate future conditions and identify implications for freight movement in Oregon. SWIM2 is an integrated model, incorporating land use, the economy and the transportation system into one dynamic environment. This tool supports analysis that accounts for the intricate connections and feedbacks amongst these three areas of activity. More information on the history, development and characteristics of the SWIM2 is provided in Appendix A.

SWIM2's integrated framework makes it ideal for illustrating economic activity, commodity flow patterns, travel and land use patterns at the state and regional level. This analysis tool is used to explore the potential risks to the Oregon freight system by evaluating the impacts of various economic forecasts on Oregon freight patterns. Further detailed analysis at the transportation facility level or within specific metropolitan areas would require additional time and analytical tools, such as metropolitan travel demand models.

The approach to this analysis is to use SWIM2 to evaluate hypothetical scenarios in order to provide a broad spectrum of potential futures. These alternative futures serve as "book ends," providing a range of conditions to be considered for long-range freight planning. This enables decision makers to identify areas of concern and formulate strategies to mitigate such conditions, if they were to arise. This supports the goal of creating a nimble long-range plan in the face of uncertainty. Information from scenario analysis will reveal how different areas of the state are affected, as well as the state as a whole. Decision makers will be able to better assess the robustness of freight strategies and avoid the creation of barriers that may prohibit the freight industry from reacting nimbly to change.

The first step of analysis is to create a Reference scenario representing business-as-usual, with which the other scenarios will be compared. This makes it easier to evaluate alternative futures when comparing conditions to a future based on current laws, general patterns and conditions.[1] Three other analysis scenarios were created using SWIM2: Optimistic Economic Forecast, Pessimistic Economic Forecast and a High Transportation Cost scenarios. The initial planned analysis included a forth

[1] An example of other statewide planning analysis can be found in the "Oregon Transportation Plan," adopted September 20, 2006.

scenario with higher levels of activity in key industries. However, once the Optimistic scenario was reviewed, the analysis team determined this additional scenario would not be different enough from the Optimistic scenario to significantly contribute to the analysis. The model was run out to year 2027 instead of 2035 to reduce runtime and expedite analysis. By year 2027 the long-range trends were evident enough to form robust analytical conclusions.

The following section presents detailed descriptions of the analysis scenarios and key findings. Brief descriptions of the Oregon Freight Plan scenarios are as follows. It should be noted that this analysis did not account for the impact of the economy or higher transport costs on freight mode split. Brief descriptions of the Oregon Freight Plan scenarios are as follows:

Reference Scenario: "business-as-usual" forecast of Oregon activity based on current trends and policies. Oregon's economy grows in accordance with the Office of Economic Analysis state forecast; the rest-of-the-world grows at rates consistent with national forecasts. Urban growth boundaries maintain 20-year land supplies. Projects in the Statewide Transportation Improvement Plan and Oregon Transportation Investment Act programs are built, but limited additional modernization will occur; the system will be operated similar to today. Transportation costs will remain stable. This forecast assumes the economy suffers no major shocks over the next twenty-five years. It grows smoothly over time and follows a similar pattern of long-run activity observed over the past 20 years; accounting for the current recession's dampening effects. SWIM2 industry output grows at a compound annual growth rate (CAGR) of 2.0%.

Optimistic Scenario: assumes a higher average economic growth rate than the Reference scenario, resulting from optimistic assumptions associated with changes in technology, faster productivity gains, and lower inflation. SWIM2 industry output grows at a CAGR of 2.7%.

Pessimistic Scenario: assumes a lower average economic growth rate than the Reference scenario, resulting from pessimistic assumptions associated with changes in technology, slower productivity gains, and higher inflation. SWIM2 industry output grows at a CAGR of 1.2%.

High Transport Cost Scenario: assumes the variable cost per-mile for highway transportation increases three-fold. The cause of such an increase is unspecified. It is treated as an increase in generalized network costs, which could be caused by higher fuel prices (all else being equal), mileage taxes, or emission taxes. The assumption is the higher costs are global, apply equally to all highway vehicles, and do not put Oregon at a competitive disadvantage. The higher transport costs were added to the Pessimistic scenario to reveal the added effects of higher transport costs when coupled with a weak economy.

Oregon Freight Plan "Business-As-Usual" Reference Scenario

The Freight Plan Reference scenario represents a forecast based on "business-as-usual" for Oregon. It serves as the basis of comparison for the other analysis scenarios. The Reference activity modeled using SWIM2 represents a likely future of Oregon activity given current trends and policies. Any forecast beyond a few years is subject to variability in the literal sense. However, such forecasts are quite useful when comparing system performance when specific changes occur, such as economic conditions or public policy. The scenarios can be used to reveal how long term trends are affected by change in terms of direction and magnitude, As such, they are helpful for "what if" analysis needed for long-range planning, such as the Oregon Freight Plan. The Reference scenario represents activity consistent with the most recent state forecasts of economic conditions, land use patterns, and transportation system investment. This scenario serves as a reasonable and understandable basis of comparison for other potential futures.

In order to create the Reference scenario, the following inputs were used:

- Employment figures are consistent with the "Oregon Economic and Revenue Forecast, March 2009" produced by the Office of Economic Analysis, Oregon Department of Administrative Services.[2]
- Outside of Oregon forecast is consistent with the IHS Global Insight forecast used for the Oregon March 2009 economic forecast. This forecast assumes the economy suffers no major mishaps over the next twenty-five years. It grows smoothly over time and follows a similar pattern of long-run activity observed over the past twenty years.
- Statewide commodity flows are consistent with the base year updated "Oregon Commodity Flow Forecast," October 2009[3].
- Transportation system maintenance, preservation and improvement assumptions are consistent with the current Statewide Transportation Improvement Plan (STIP), Metropolitan Transportation Improvement Plans (MTIP), and local capital improvement plans. Longer-term investment assumptions are consistent with the Oregon Transportation Plan (OTP), and Transportation System Plans (TSP.)
- Transportation costs are assumed to remain fairly stable over time in real [4]terms, consistent with IHS Global Insight national forecast.
- Urban growth boundaries maintain 20-year land supplies.
- Variation caused by business cycles is not forecasted, only average annual changes over time.

Further detail on the structure of the SWIM2 can be found in Appendix A. No significant changes to the SWIM2 structure were made for this analysis, only model input data were altered.

[3] https://www.oregon.gov/ODOT/Planning/Pages/OMIP.aspx
[4] "real" in this sense means inflation adjusted

Industry Employment and Output

Table 1 illustrates employment shares by industry category across the state. Personal & Other Services cover the largest proportion of jobs across the state, with Retail Trade coming in at a close second. These two industries plus Finance, Insurance, Real Estate (FIRE), Business & Professional Services; and Health Services include over half of the state employment. Over eighty-five percent of the total state employment falls into the top 11 industry categories presented in Table 1. The statewide share of employment remains fairly stable over time across the industries; with the exception of Personal & Other Services increasing from 17% in year 2015 to 24% in 2035. Retail Trade has a slightly reduced proportion of employment over time, changing from 18% in year 2015 to 15% in year 2030.

Table 1. Statewide Employment by Industry: Percent of Total Employment

	Standard Industry Classification (SIC)	2015	2025	2035
1	Personal & Other Services & Amusements	17%	21%	24%
2	Retail Trade	18%	16%	15%
3	FIRE, Business & Professional Services	10%	10%	11%
4	Health Services	7%	6%	6%
5	Government	6%	6%	5%
6	Agriculture & Mining	6%	5%	5%
7	Other Durables	4%	5%	5%

9	Lower Education	5%	5%	5%
10	Wholesale Trade	4%	5%	4%
11	Transport	4%	4%	4%
12	Electronics & Instruments	3%	2%	2%
13	Other Non-Durables	2%	2%	2%
14	Communications & Utilities	2%	2%	2%
15	Higher Education	2%	2%	1%
16	Accommodations	1%	1%	1%
17	Lumber & Wood Products	2%	1%	1%
18	Food Products	1%	1%	1%
19	Home-based Services	<1%	1%	1%
20	Pulp & Paper	<1%	<1%	<1%
21	Forestry & Logging	<1%	<1%	<1%

Table 2 presents economic activity with respect to the value of industry output statewide.[5] Oregon economic activity by output value is fairly concentrated in the Wholesale Trade and Distribution industry. The share of this industry's output is expected to grow to nearly a fourth of the total value of output. The top three largest industries in terms of industry output: Wholesale Trade; FIRE, Business

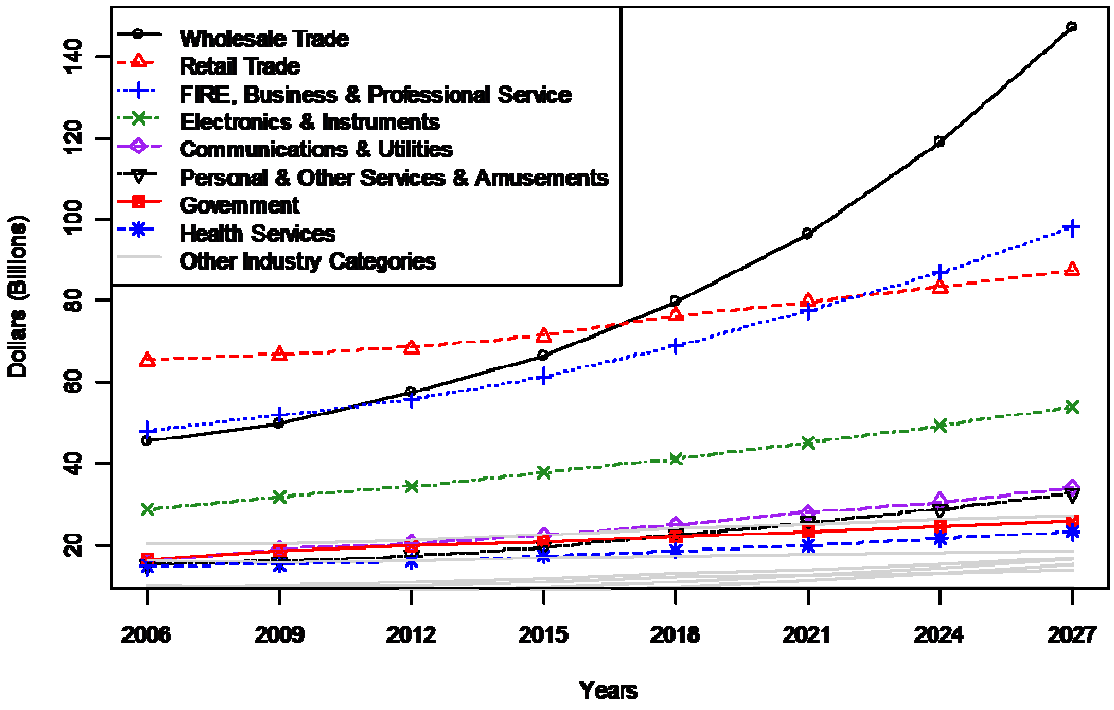
[5] The value of industry output is a common measure of economic activity, more commonly referred to as gross state product. For purposes of this memo, the term "industry output" will be used to differentiate between SWIM2 forecast output and other state forecasts for gross state product.

& Professional Services; and Retail Trade, make up about half of the total value of industry output for Oregon.

Personal Services has a much larger share of the state's employment than the state's industry output. This indicates a more labor-intensive, lower wage sector. Conversely, Wholesale industry's labor has a higher proportional impact on the state economy per employee.

Table 2. Statewide Industry Output by Industry: Percent of Total Output Value

	Standard Industry Classification (SIC)	2015	2025	2035
1	Wholesale Trade	16%	21%	23%
2	FIRE, Business & Professional Services	15%	15%	15%
3	Retail Trade	17%	15%	14%
4	Electronics & Instruments	9%	9%	8%
5	Communications & Utilities	5%	5%	5%
6	Personal & Other Services & Amusements	5%	5%	5%
7	Construction	5%	5%	4%
8	Government	5%	4%	4%
9	Health Services	4%	4%	4%
10	Other Durables	4%	3%	3%
11	Transport	3%	3%	3%
12	Lower Education	2%	2%	3%
13	Other Non-Durables	2%	2%	2%
14	Agriculture & Mining	3%	2%	2%
15	Food Products	2%	2%	1%
16	Pulp & Paper	1%	1%	1%
17	Lumber & Wood Products	1%	1%	1%
18	Accommodations	1%	1%	1%
19	Higher Education	1%	<1%	<1%
20	Forestry & Logging	<1%	<1%	<1%
21	Home-based Services	<1%	<1%	<1%



The next four largest industries include: Electronics & Instruments; Communications & Utilities; Personal & Other Services & Amusements; and Construction: which account for another 25% of total industry output value. The remaining fourteen industry groups account for the 25% of industry output by value.

Table 3 presents the top Oregon industries by employment and value of industry output for the state side-by-side. These eight industries represent over two thirds of the state employment and over three fourths of total industry output. These industries cover a broad set of freight needs, while the concentration of industries varies by Oregon location.

Table 3. Top Industries for Employment and Industry Output Value				
	Reference Scenario Year 2015			
	Share of State Employment	Rank	Share of Industry Output Value	Rank
Personal & Other Services & Amusements	17%	1	5%	6
Retail Trade	18%	2	17%	3
FIRE, Business & Professional Services	10%	3	15%	2
Health Services	7%	4	4%	9
Government	6%	5	5%	8
Wholesale Trade	4%	10	16%	1
Electronics & Instruments	3%	12	9%	4
Communications & Utilities	2%	14	5%	5
Total Statewide Share	67%		76%	

Figure 1 illustrates the change in the value of output by industry group over time for the largest industries of Oregon as presented in Table 3. These eight industry groups represent the top five industries by employment and industry output. The top three groups are Retail Trade; Wholesale Trade; and FIRE, Business and Professional Services. Retail Trade is expected to remain a large part of the Oregon economy into the future, but growth will be moderate. Wholesale Trade is expected to grow the fastest, and become the dominant industry in the future. FIRE, Business and Professional Services is expected to grow at a healthy rate and increase its future share of Oregon industry activity. Electronics and Instruments is expected to grow at a steady rate, similar to Retail Trade. The remaining four industries are expected to retain their share of activity into the future at moderate growth rates.

Figure 1. Industry Output Values Over Time

Some of these industries are more susceptible to business cycle fluctuations in industry output and employment than others. These patterns are revealed in the Optimistic and Pessimistic scenarios presented later in this memo, as well as at the regional level when results are reviewed for the ACTs.

Highway Travel Patterns

Table 4 presents the average truck travel times and distances reported out of SWIM2. Statewide travel patterns are expected to change, given the "business-as-usual" patterns continue into the future. Average truck tour[6] travel time is expected to increase about eight percent over the next twenty-five years, while tour travel distance is expected to decrease about ten percent. Congestion means truck tours are less efficient, serving fewer stops per tour, leading to larger than necessary increases in truck vehicle miles traveled (VMT) and vehicle hours traveled (VHT.) Auto travel patterns are expected to change as well. Average auto tour travel times are forecasted to increase thirteen percent, while average distance is expected to decrease about six percent. The rising travel times and decreasing distances indicate increasing congestion faced by highway users in the future, given Oregon continues with business-as-usual.

Table 4. Reference Scenario: Forecast Average Travel Times and Trip Distances

	Trucks		Autos	
	Average Tour Travel Time	Average Tour Distance	Average Tour Travel Time	Average Tour Distance
2012	12 hours	380 miles	30 minutes	15 miles
2027	13 hours	345 miles	34 minutes	14 miles
Change	8% increase	10% decrease	13% increase	6% decrease

Total statewide VMT are expected to rise at a CAGR of about two percent. Total statewide VHT are expected to rise at a CAGR of about three percent. Table 5 presents forecast growth for VMT and VHT along side major economic indicators Change in VMT closely follows economic activity, a pattern observed in past studies as well. The higher growth rate for hours traveled indicates the effect of increasing congestion.

Table 5. "Business-As-Usual" Forecast Compound Annual Growth Rates 2010 – 2035

	Statewide	Trucks	Autos
Vehicle Miles Traveled	2.0%	2.3%	1.9%
Vehicle Hours Traveled	3.1%	3.1%	3.1%
Industry Output	2.0%		
Employment	1.4%		
Population	1.4%		

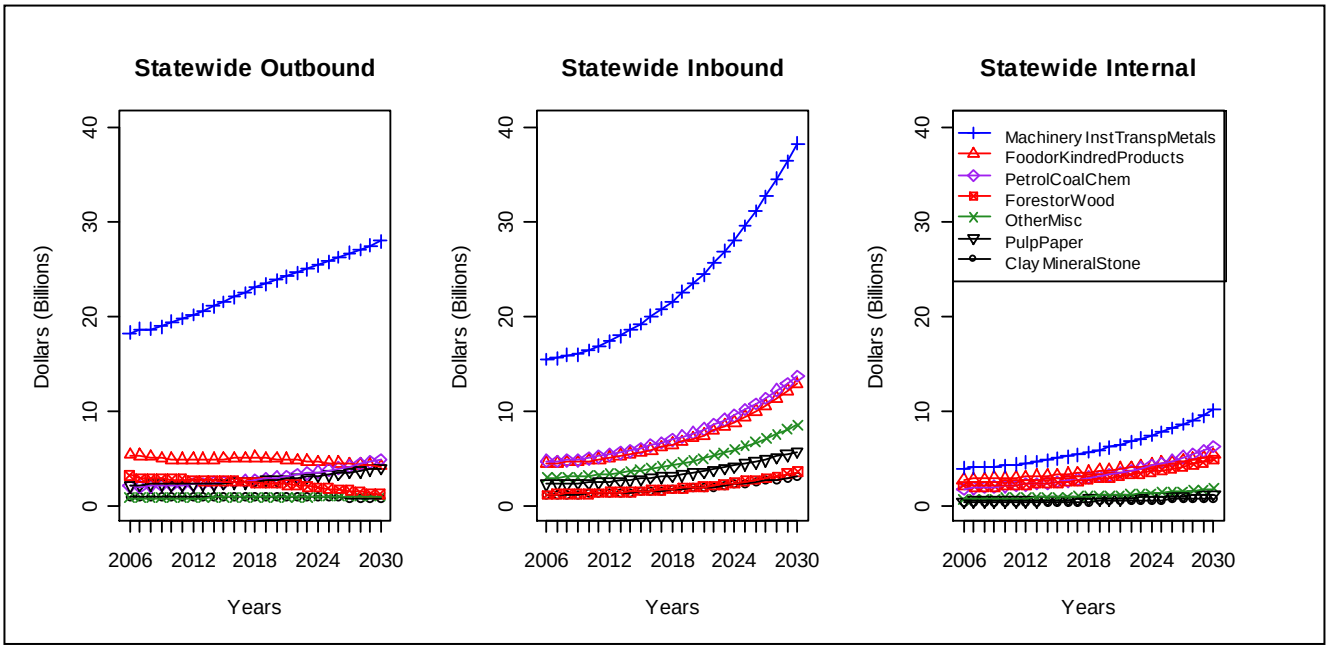
Statewide VMT for trucks are expected to increase faster than auto VMT (2.3% vs. 1.9%), while VHT are forecasted to increase at a CAGR of 3.1% for trucks and autos alike. The difference in growth rates between miles traveled and travel time reveal the effects of increasing congestion.

[6] Travel is modeled as "tours" instead of trips to reflect the logistic behavior of trucks and autos. A tour starts at "home base," includes trips that start and stop within the tour, ending back at home base.

Reference Scenario Commodity Flow

Figure 2 illustrates commodity movement from, to and within Oregon for all freight modes, including exchanges with both foreign and domestic trade partners. Commodities outbound are produced in Oregon for sale elsewhere. Inbound commodities represent commodities used on Oregon production activity as well as goods for final sale. The largest commodity group by value is the Machinery, Instruments, Transportation Equipment and Metals category, for all three directions of movement. Outbound and internal flows of Food and Kindred Products are expected to maintain a steady rate over time, but inbound flows will increase. Other Miscellaneous goods include textiles, leather, furniture, mattresses, and miscellaneous manufactured products. This commodity group is expected to increase in the rate of inbound goods. Figure 2 reveals Oregon inbound goods are expected to grow faster than Oregon outbound goods. This may be caused by Oregon's relatively high level of economic activity in service industries relative to manufacturing.

Figure 2. Oregon Commodity Flow by Direction



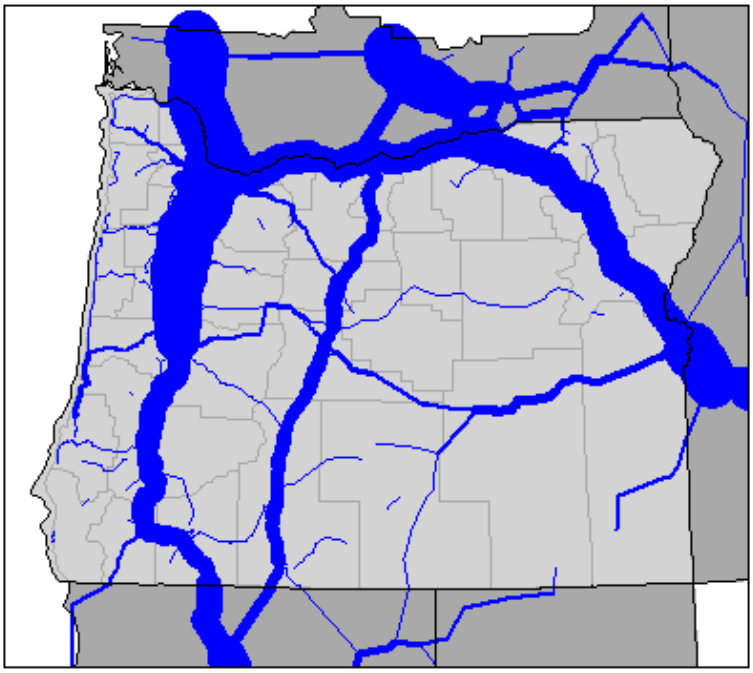


Figure 3 illustrates the relative flow of all commodities via highways in Oregon and into the bordering areas. The importance of the interstate corridors is evident. Figures 4 through 10 show average daily statewide highway (trucks) commodity flow by value and tonnage for years 2012 and 2027 for each of the seven commodity groups. Over three-fourths of commodity flow is via truck. Detailed description of commodity flows by truck and other freight modes, such as rail, air and water are provided in the Commodity Flow Forecast Update. Detailed listing of how commodities are classified and grouped is provided in Appendix B.[7] Note that the figures are not scaled relative to each other. Doing so conceals activity in the lower volume commodities.

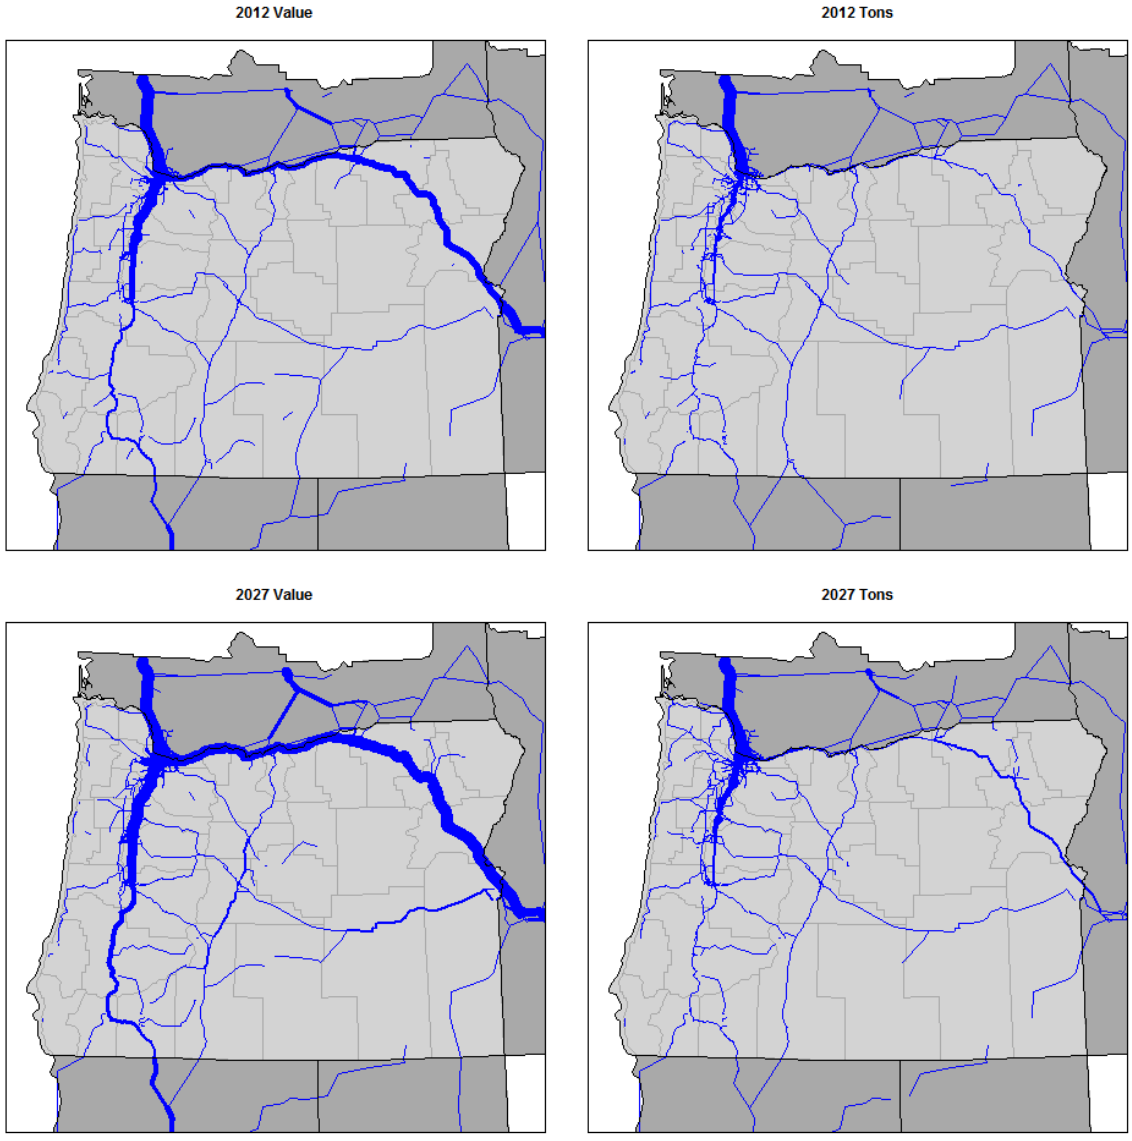
Figure 3. Highway Commodity Flows

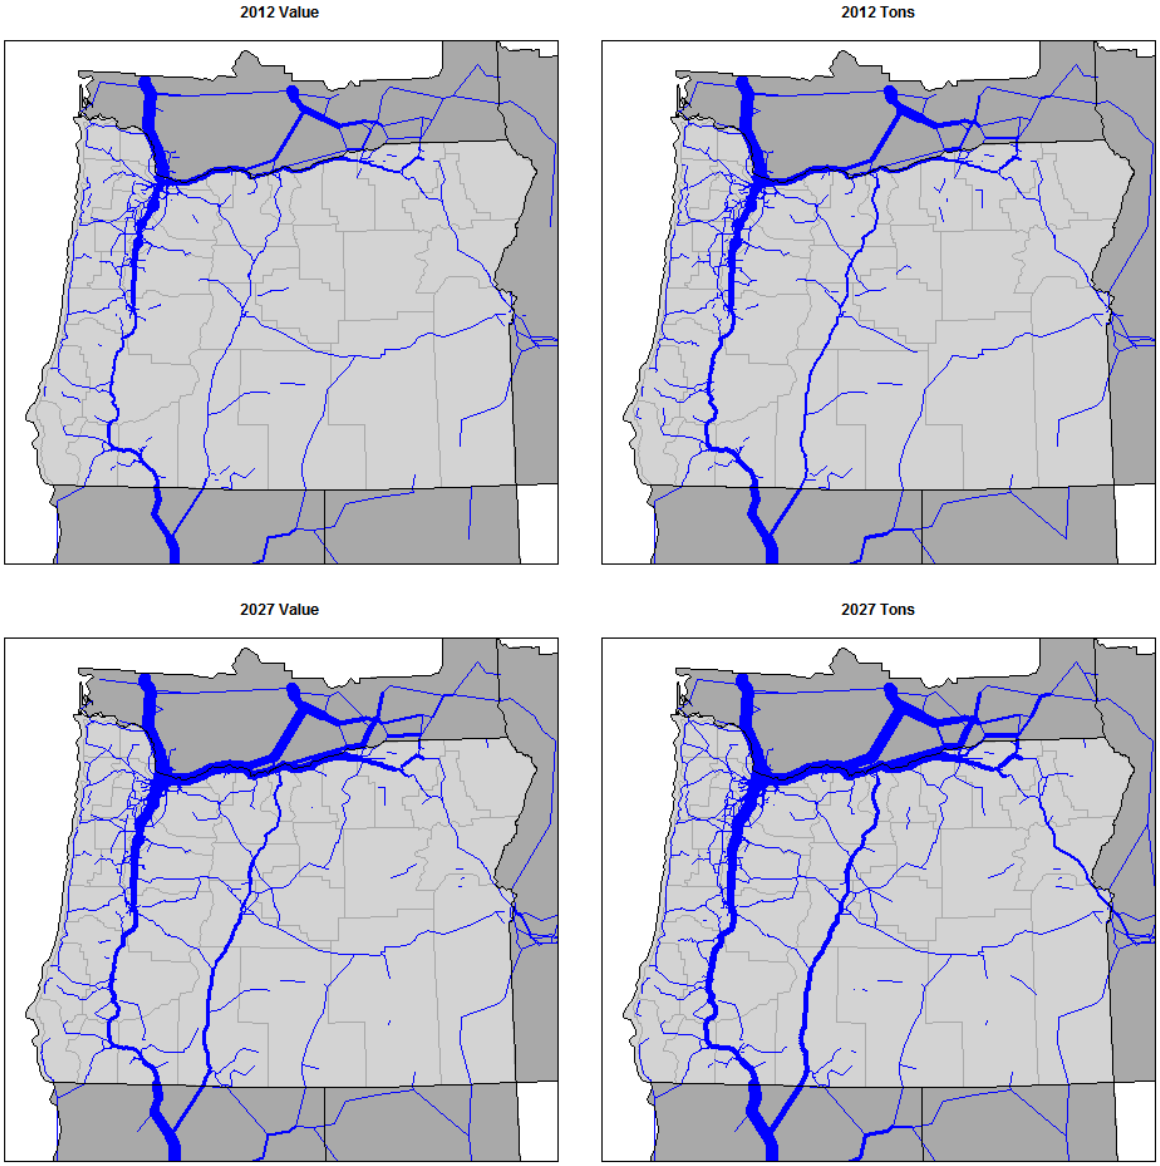


[7] SWIM2 uses the SCTG commodity classification, which is a little different from the STCC commodity classification used for the CFF. This report often uses 7 Commodity Groups, which are can be compared across classification systems. Further detailed description of the codes can be found in :SCTG Commodity Codes" booklet, 2007 Commodity Flow Survey, USDOT
https://www.bts.gov/archive_publications

Figure 4 presents highway flows for the Machinery, Instruments, Transportation Equipment and Metals commodity group. Commodities within this category include base metal in primary or semi-finished form; articles of base metal; machinery; electronic and other electrical equipment; motorized and other vehicles (including parts); transportation equipment; precision instruments and apparatus. This commodity group is the largest group by value for flows outbound, inbound and internal to the state (as previously shown in Table 2).

The value maps illustrate commodity flow in terms of total value of goods moving on an average day. The tons maps illustrate this same movement but in terms of weight in tons. The industries producing these commodities are predominantly located in the urban areas of the Willamette Valley, with some located in Bend, Astoria, and Medford. These goods are primarily trucked to Washington and Eastern states. It is evident in these flow maps the Machinery, Instruments, Transportation Equipment and Metals commodity group tends to be higher in value and lower in weight. Commodity flows by value predominantly move in the Willamette Valley corridor and on I-84. However, the heavier goods movement within this commodity group tends to flow in the Willamette Valley I-5 corridor and north of Portland. Future flows magnify this pattern, with the addition of a notable amount of additional flows on the southern portion of the I-5 corridor and I-84. Also evident is an overall increase in forecast

Figure 4. Machinery, Instruments, Transportation Equipment, Highway Flows



flows on the non-interstate highway system. These flows are forecast to increase in all three directions – outbound, inbound and internal.

Figure 5 presents highway flows for the Food and Kindred Products commodity group. Commodities within this category include live animals and fish; cereal grains; animal feed; meat, seafood; milled grain products; alcoholic beverages; and tobacco products. This group represents a wide range of products in terms of value and weight. As a group, the commodity represents a mid-range value per unit weight. Food and Kindred products are the second highest commodity group in terms of value for Oregon after Machinery.

Dominant production of these agriculture and food products is in the eastern and central areas of the state, as well as northwest Willamette Valley to Astoria. The flow maps reveal the most active highway corridors include the north-south I-5 corridor, particularly in the Willamette Valley area and southern central Washington State. However, there is considerable flow toward California from I-5 and US-97, as well as movement from the Portland area on I-84 to I-82 heading north into Washington. This pattern holds into the future and reveals even more commodity flows are forecast for this industry

Figure 5. Food and Kindred Products Highway Flows

in Oregon. Outbound flows are expected to remain the same level into the future, while inbound and internal flows are expected to increase a little in the future.

Figure 6 presents highway flows for the Petroleum, Coal, and Chemicals commodity group. Goods classified in this group include crude petroleum; gasoline and aviation fuel; fuel oils; pharmaceutical products; fertilizers; and plastics and rubber. This commodity group represents a mix of goods, and is characterized as a medium value-to-weight commodity. Commodity flow is predominantly from outside the state and flows in from the north on I-5 to the Willamette Valley corridor. There are flows east of Portland on I-84 and heading north into Washington State via US-97 and I-82.

Forecast flows for this commodity group appear to follow the current patterns of flow, with more flows moving south on I-5 from the Medford area into California as well as the southern portion of the Willamette Valley I-5 corridor between Salem and Eugene. The flows between Salem and Eugene show up on the value map and less on the tonnage map, implying the increased commodity flows are likely from the higher value, lower weight categories within the commodity group, such as pharmaceutical products. Statewide flows are expected to increase in the future at fairly low rates for outbound and internal, but inbound flows are expected to increase noticeably, at the same rate as Food and Kindred Products.

Figure 6. Petroleum, Coal and Chemicals Highway Flows

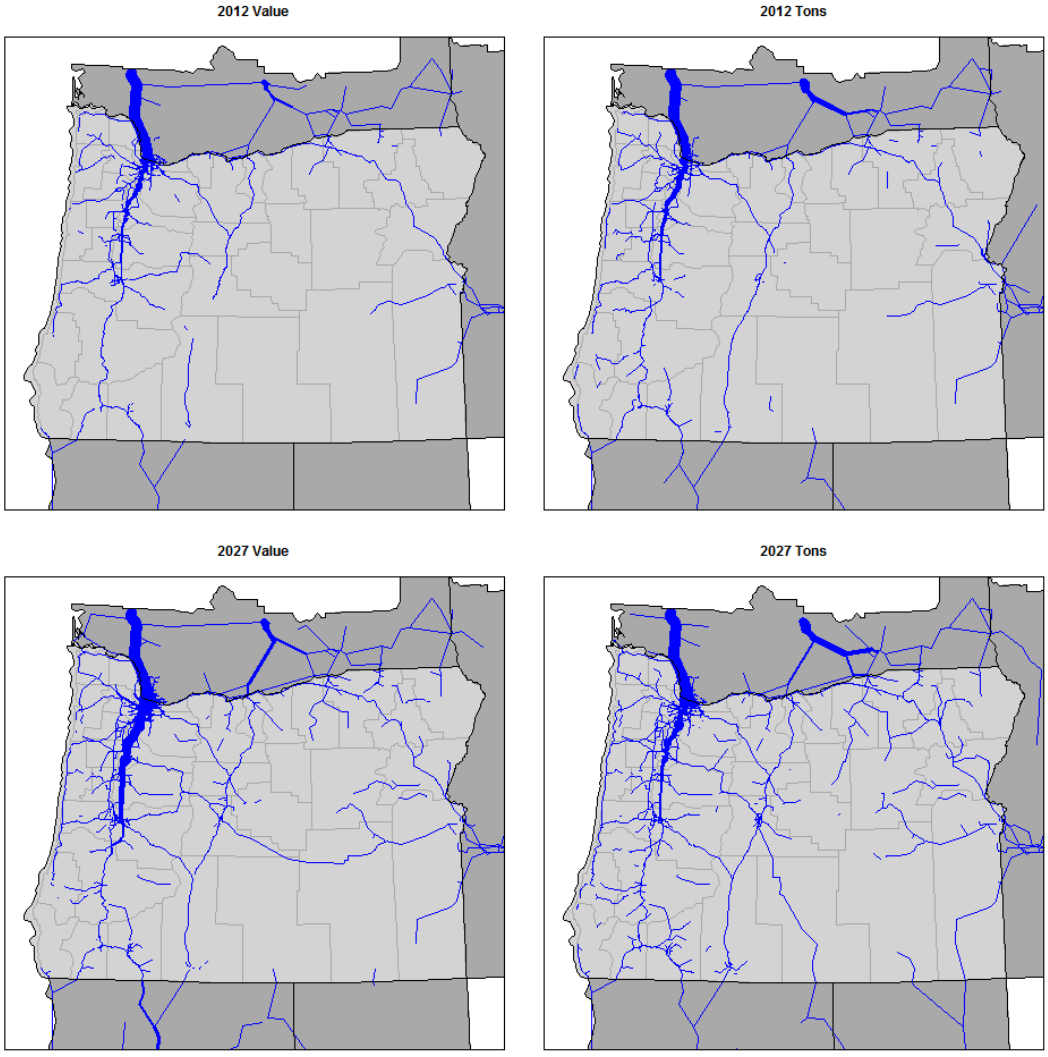


Figure 7 presents highway flows for the Other/Miscellaneous commodity group. Goods classified within this group include textiles; leather, articles of textiles or leather; furniture; mattresses; and miscellaneous manufactured products. Flows of this commodity group range across the entire state. More flows are concentrated in the Willamette Valley corridor of I-5. There is a notable high-value flow of this commodity on I-84. Lower value flows occur within the southern half of the I-5 corridor. Large lower value flows are forecast for this commodity group on the entire I-5 corridor, especially the southern portion. Significantly more high-value flow is forecast on the I-84 corridor, especially between the I-82 connection and Oregon/Idaho boundary. Statewide this commodity group is not expected to increase in outbound flows. However, inbound and internal flows are forecast to increase across the state.

Figure 7. Other Miscellaneous Goods Highway Flows

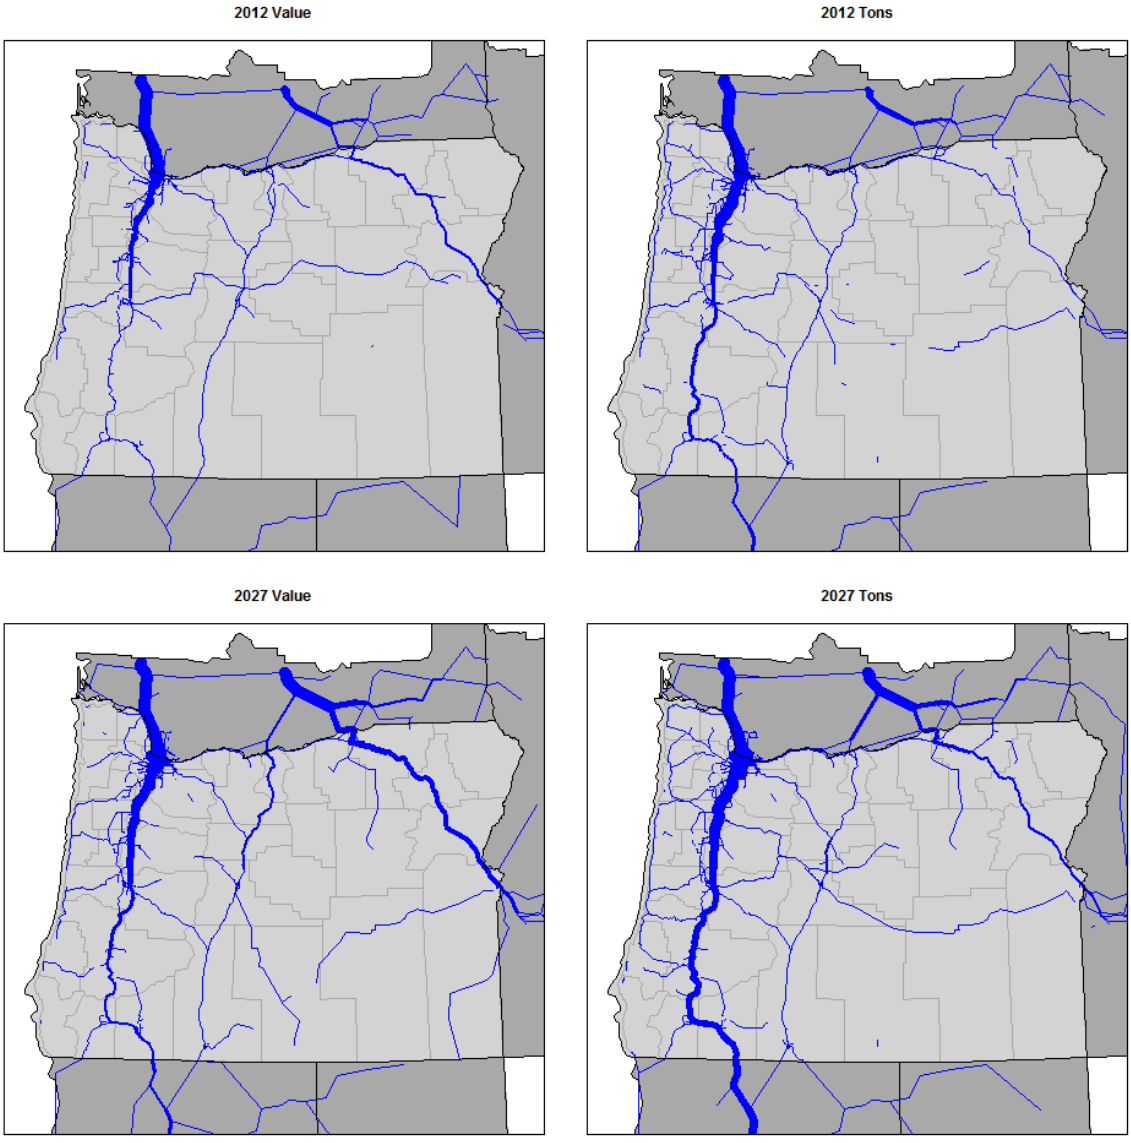

Figure 8 presents truck flows for the Pulp and Paper Products commodity group. Goods classified in this group include newsprint; paperboard; paper or paperboard products; and printed products. Northwest Oregon is a heavy production area for these products. Truck flows of this commodity group are concentrated in the upper Willamette Valley corridor of I-5 and further north into Washington State. The value maps reveal there is movement for this commodity dispersed across a wide range of locations in the state. Less movement is revealed when viewing flows by weight, as indicative of low value-to-weight goods. However, southern I-5 reveals some lower value-to-weight flows, while I-84 exhibits some higher value-to-weight flows in this commodity group. The central and southern ACTs have notable flows related to this commodity group, which is carried across the state. Statewide growth in this commodity category is expected to grow a little, although this is one of the more slowly growing groups. Flow is expected for grow for all directions of movement, outbound, inbound and internal.

Figure 8. Pulp and Paper Products Highway Flows

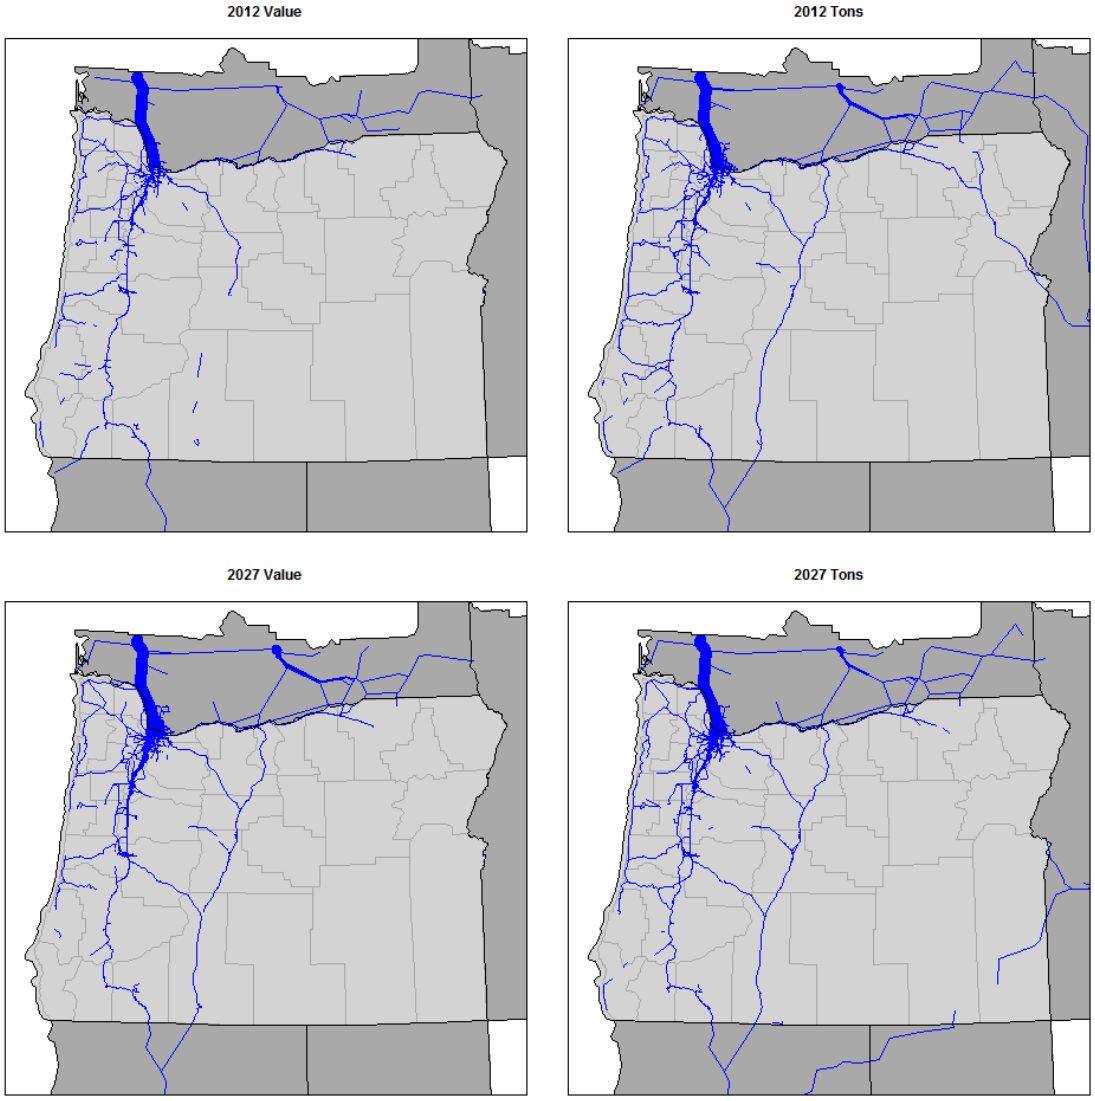

Figure 9 presents flows for the Forest or Wood Products commodity group. Goods classified within this group include logs and other wood in the rough and wood products. Production of these goods is concentrated in the southeast corner of the state. Whether you view this commodity by value or weight, the corridor of I-5 between Roseburg and Portland accommodates a large proportion of the daily flows for this commodity group, with links to the coast and the west side of the Cascades. There is significant amount of flow from the Cascades on US-20 toward Salem. The flow is more pronounced when looking at movement in tons, since this commodity group typically has a low value-to-weight ratio. Outbound flows are expected to remain about the same over time. Some increase in inbound flows is expected, but internal flows are anticipated to significantly increase at rates similar to Food and Kindred Products. This forecast flow is evident in the year 2027 flow maps which illustrate increased flows in the Willamette Valley corridor and continuing south on I-5 to the city of Roseburg. Flows between Salem and the Cascades increase in magnitude on the US-22 corridor, as well as on a segment of US-26 linking US-97 to the Portland area. There are noticeable increases in flows from several corridors leading to I-5 from the Coast Range, including US-26 west of Portland and OR-18 through Yamhill county.

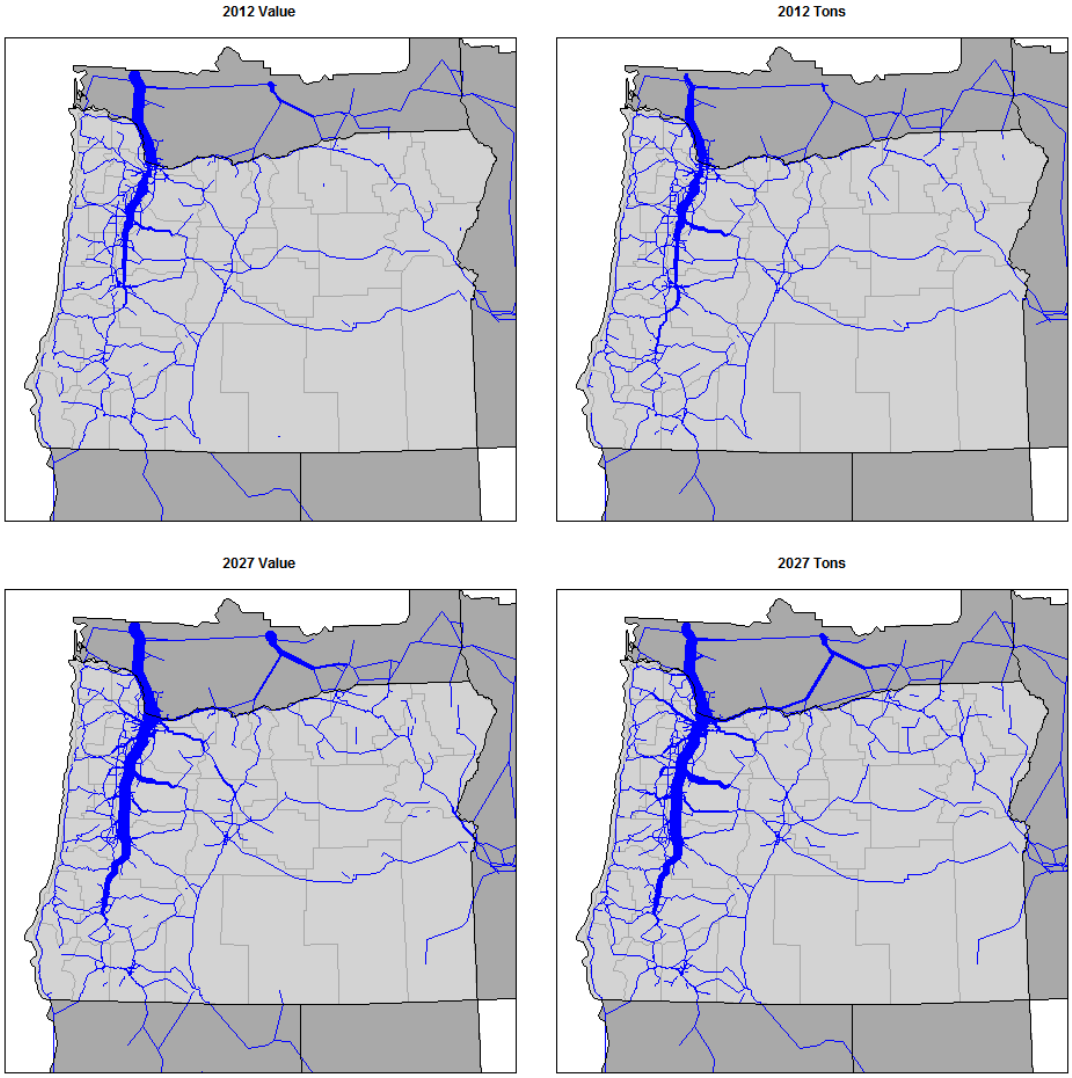
Figure 9. Forest or Wood Products Highway Flows



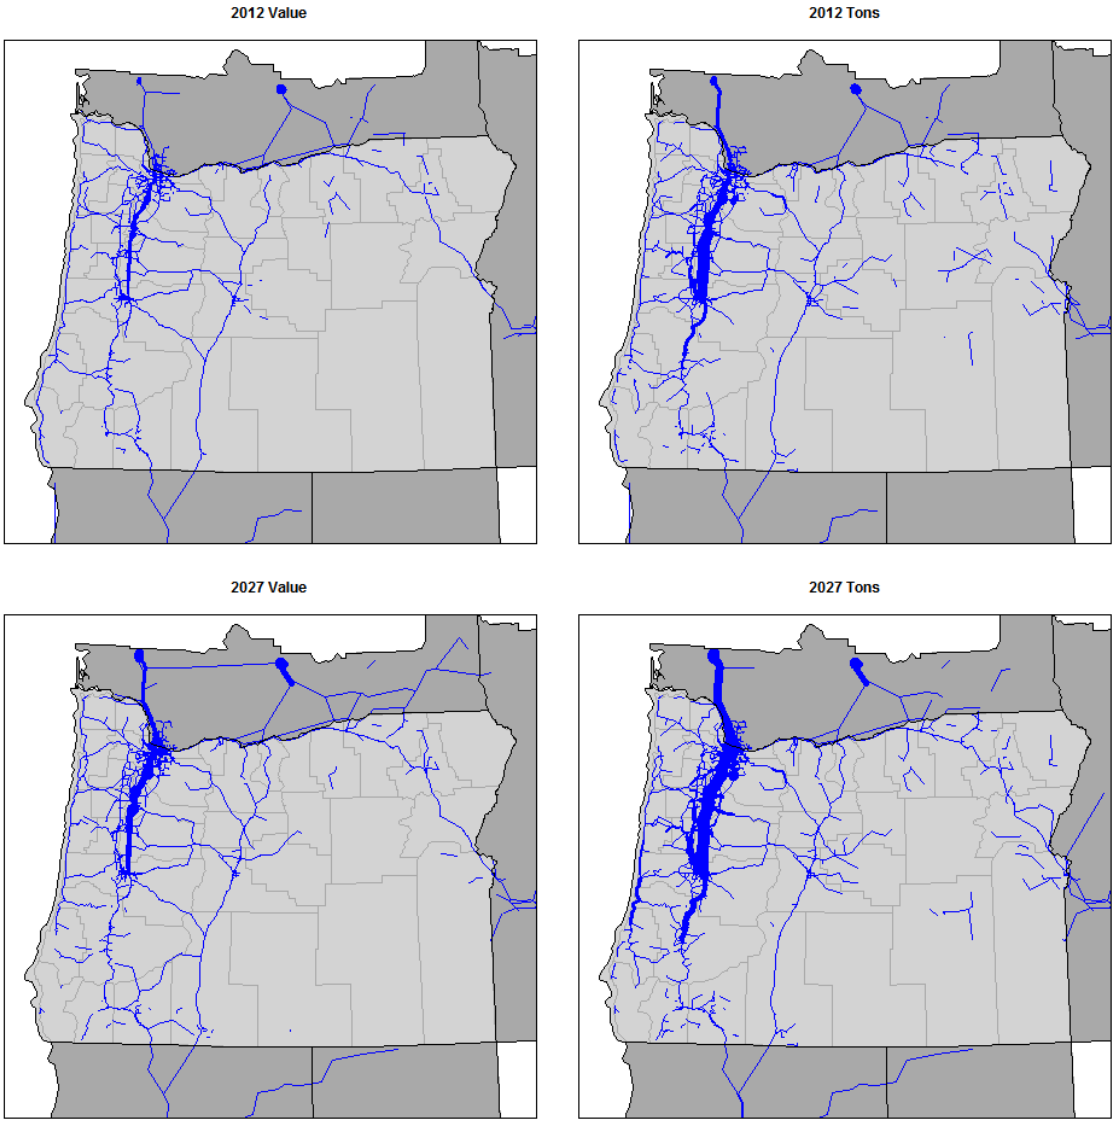


Figure 10 presents flows for the Clay, Mineral and Stone commodity group. Goods classified within this group include monument or building stone; natural sands; gravel and crushed stone; nonmetallic minerals; metallic ores and concentrates; and nonmetallic mineral products. This commodity group overall is a low-value high-weight group. This has pavement maintenance and preservation implications as the number of heavy trucks increases on specific highway segments, as well as the need for awareness of the effects of weight restrictions on bridges that could disrupt commodity movement and transport costs. Very little is outbound flow, of which the higher value, lower weight goods appear to dominate. The greatest share of flows is in the Willamette Valley corridor, although there is measurable flow on the southern half of I-5 between Eugene and Roseburg. These patterns are expected to hold into the future, revealing overall increases in forecast commodity flow for this group. The year 2027 map reveals increased flow by weight for sections of US-26, US-22, OR-99, and US-101.

Figure 10. Clay, Mineral and Stone Highway Flows

Oregon Freight Plan Analysis Scenarios

Freight is the Oregon economy in motion. In order to evaluate future risk to the freight system, several scenarios were created to observe regional differences and statewide patterns associated with future economic unknowns. SWIM2 was altered to create hypothetical future conditions in order to create analytical "bookends," from which to evaluate a range of reasonably possible long-run conditions. The purpose of these scenarios is to provide information to decision makers formulating freight policy to serve the needs of Oregon freight movement now and into the future. It should be noted that the model results do not reflect the impact of the economy and high transport costs on mode split. Estimating these impacts requires additional analysis.

Three hypothetical scenarios were produced using SWIM2, in addition to the Reference scenario:[8]

- Optimistic economic forecast
- Pessimistic economic forecast
- High transport costs

The Optimistic and Pessimistic forecasts provide a reasonable range of economic conditions that Oregon could experience over the next twenty-five years. Oregon industries rely on the transportation system for obtaining the factors of production needed to do business and get their goods to market. When economic activity changes, so do the demands placed on the transportation system. The High Cost scenario adds additional transportation costs to the Pessimistic scenario to reveal the long-range implications associated with this area of risk.

Several evaluation metrics were formulated to reveal the effects of changing underlying economic conditions at the statewide and regional level. These metrics were used to compare conditions in the analysis scenarios relative to the Reference scenario. Performance was evaluated with respect to:

- Transportation System – miles traveled, hours traveled, trip costs, commodity flow
- Economic Welfare – industry output, commodity value, and production costs

Analysis results were evaluated statewide as well as regionally, based on the twelve Oregon Area Commissions on Transportation (ACT) geographic boundaries. Variations in national and statewide economic conditions result in different regional conditions. Such differences arise from unique regional industry mix and commodity flows, which can be obscured when conditions are evaluated at the statewide level. Results at the ACT level are presented in a section after the statewide results.

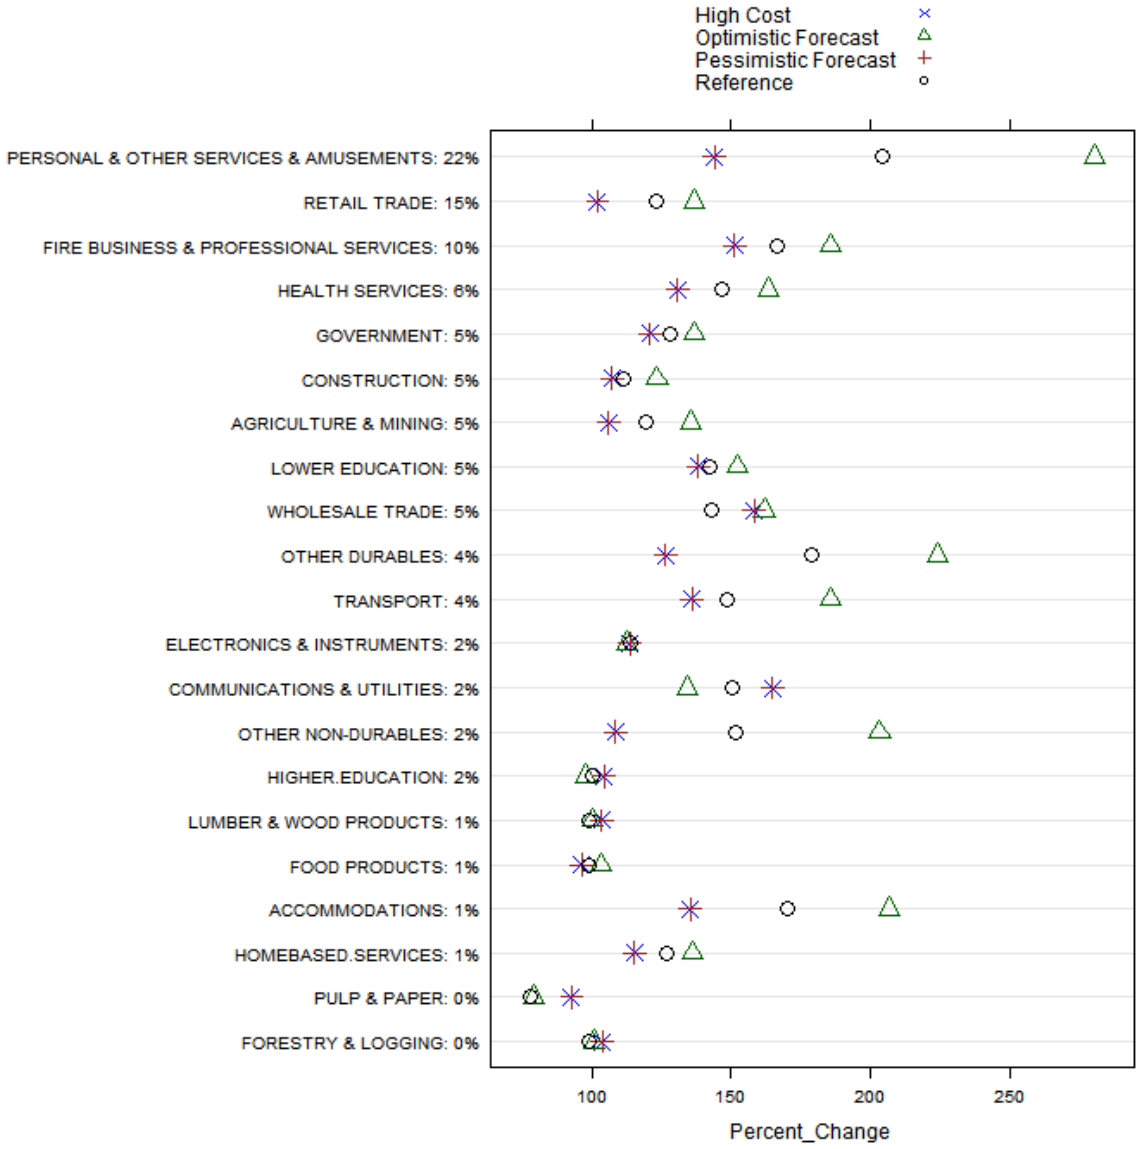
Industry Employment and Output

Figure 11 illustrates statewide employment growth from all four scenarios. As with industry output, the blue x's representing results from the High Cost scenario are hidden under the red crosses of the Pessimistic scenario, indicating little statewide change despite regional differences. Oregon industries with employment most affected by economic uncertainty are discretionary services (Personal and Other Services; Accommodations) and some manufacturing (Other Durables; Other Non-Durables).

[8] A fourth scenario to evaluate growth in key Oregon industries was planned for this analysis. However, after reviewing the Optimistic forecast data, the differences between the planned industry scenario and the Optimistic scenario were too slight to warrant a separate SWIM2 scenario run. The information desired for the industry scenario is provided by the Optimistic scenario.

The employment levels of Electronics and Instruments; Communications and Utilities; Lumber and Wood Products; Food Products; Forestry and Logging, and Government and Education sectors are more stable amidst economic uncertainty.

Figure 11. Percent Change in State Employment by Industry from 2006 to 2027, All Scenarios (including percent of total employment by industry)



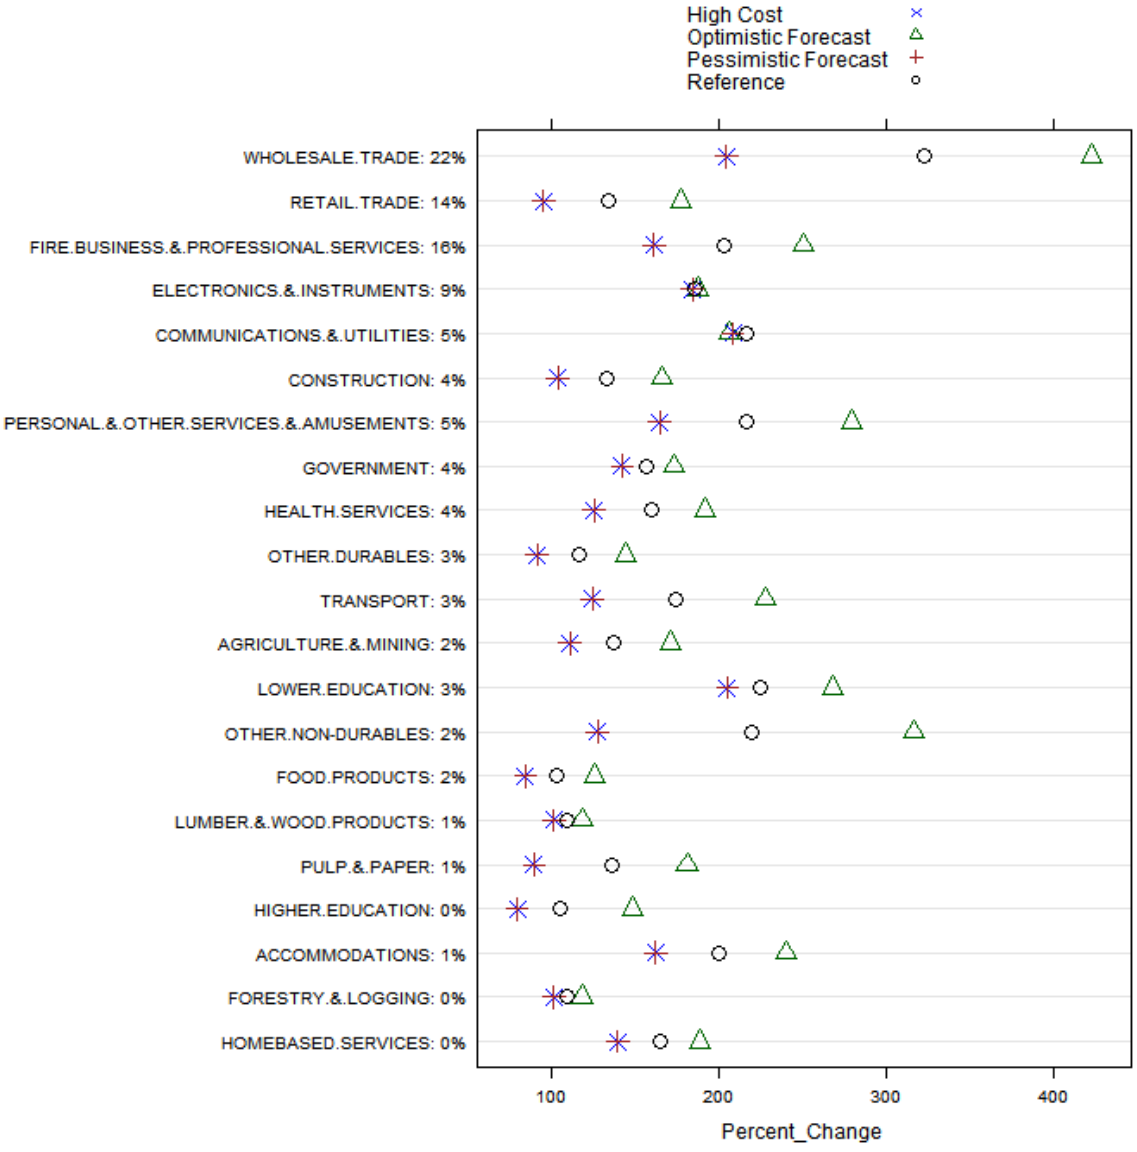


Figure 12 illustrates statewide industry output growth for all four scenarios. The blue x's representing results from the High Cost scenario are hidden under the red crosses of the Pessimistic scenario. This indicates higher transportation costs do not significantly affect statewide industry output relative to the underlying economic conditions, although region allocation of these industries across the state varies somewhat as higher travel costs lead to activity concentrations. Oregon industries most affected by economic uncertainty are Wholesale Trade, Other Non-Durables; Personal and Other Services, and Transport Services. In contrast, Electronics and Instruments; Communications and Utilities; Lumber and Wood Products; Forestry and Logging; and Food Products industry output are very stable in the midst of economic uncertainty.

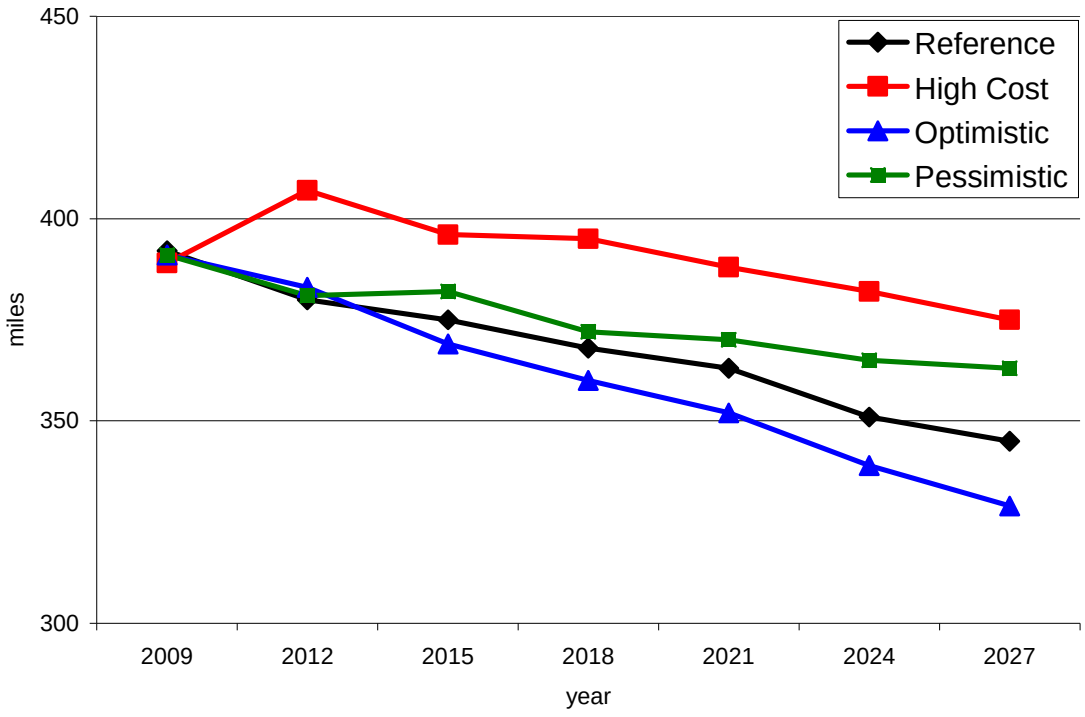

Figure 12. Percent Change in Industry Output by Industry from 2006 to 2027, All Scenarios (including percent of statewide output by industry)

Highway Travel Patterns

Truck movements within SWIM2 represent how trucks link trips over the course of a typical day, loading and off-loading cargo at several stops that are linked together as tours. We find that average truck tour distances decrease over time as congestion increases. The rate at which the decline occurs is affected by economic conditions. Figure 13 presents the forecast average truck tour distances for all four scenarios. The Reference scenario reveals the current average tour distance of 390 miles is expected to decline about twelve percent, to 345 miles. When the economy is strong, the average decline is larger, about sixteen percent. When the economy is slower, the average truck tour distances do not decline as quickly, especially when additional transportation costs are imposed on highway users, the distances are more stable over time. This illustrates how firms adapt to increasing congestion. When congestion is present, more trucks are put on the road in order to deliver the same quantity of goods within reliable delivery times to meet customer needs. While additional trucks improve service to customers, it exacerbates congested conditions and leads to overall increases in VMT. Indeed, looking at the VMT growth rates by scenarios, the lowest overall VMT growth occurs under the High Transport cost scenario. The limited congestion in this scenario allows longer and fewer tours, delivering more cargo per tour, meeting delivery times using fewer trucks, leading to the lowest overall VMT growth. Conversely, congestion leads to shorter tours to meet delivery times on a less reliable system, number of trucks used increases as well, resulting in higher total truck VMT.

Figure 13. Average Truck Tour Travel Distance

Truck travel time also changes under different economic conditions. Figure 14 illustrates forecasted average truck tour travel times for all four analysis scenarios. Under the "business-as-usual" Reference scenario, the average travel time is expected to increase about twelve percent, from about 11.6 hours to 13 hours. This pattern is more pronounced when the economy is strong, with expected travel times increasing eighteen percent, to 13.8 hours. When the economy is muted, travel times do not change as much. Travel times are forecast to increase about seven percent over twenty years in the Pessimistic scenario. The High Cost scenario, average tour time is forecasted to rise less, about three percent. Truck hours of travel are reduced when economic activity is lighter and even more so when the transport costs per mile are higher. VHT increases the least over time in the High Transport Cost scenario, where longer tours/fewer trucks more efficiently serve the demand for moving goods. In the more congested Optimistic and Reference scenarios, VHT increases significantly more than VMT.

Figure 14. Average Truck Tour Travel Time

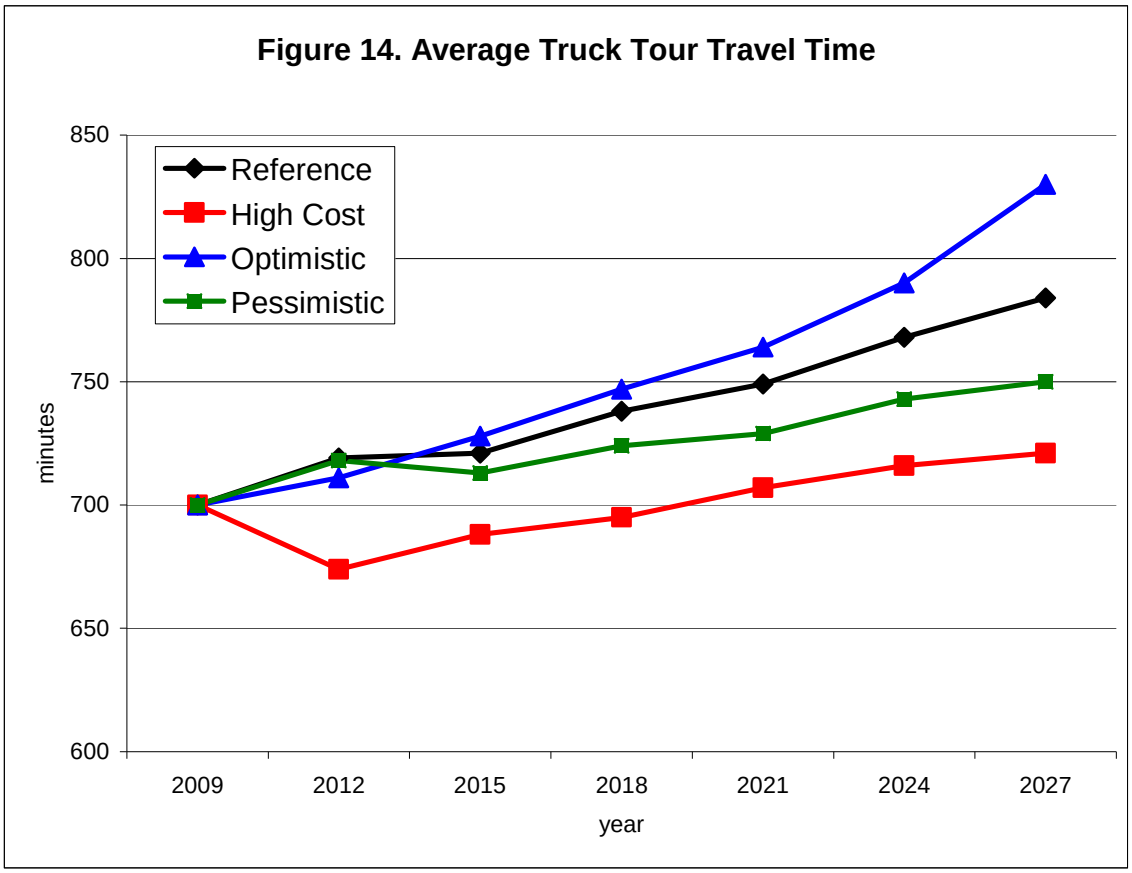

Table 6 illustrates the difference in compound average growth rates for VMT and VMT for all four scenarios. The relationship between economic growth and congestion is evident, as is the effect of higher transportation costs.

Table 6. Compound Average Growth Rates for Truck Vehicle Miles Traveled and Vehicle Hours Traveled: All Scenarios

Scenario	Truck Vehicle Hours Traveled	Truck Vehicle Miles Traveled
High Cost	1.4%	1.1%
Pessimistic	1.7%	1.3%
Reference	3.1%	2.3%
Optimistic	1.2%	3.0%

Auto tour distances and travel times are also responsive to different economic conditions. Table 7 provides auto tour travel statistics for all four scenarios. Auto tours show little variation in length among the four scenarios, with the exception of the High Cost scenario. Average auto tour distance starts out at 15 miles and is forecasted to be 14 miles by 2027 for the Reference, Optimistic, and Pessimistic scenarios. Auto tour distance is significantly reduced when there are higher transport costs, dropping to an average of 11 miles per tour.

Auto tour travel time does change. Table 7 reveals auto tour travel time increases when the economy is strong and decreases when economic activity is more muted, as observed with trucks. Increased per-mile transport costs combined with slower economic conditions result in a noticeable drop in travel times. Total VMT drops when the economy is slower, freeing up capacity and reducing congestion, resulting in faster travel times.

Table 7. Auto Tour Travel Statistics: Distance, Time, Compound Average Growth Rates (CAGR) of Auto VMT and VHT - All Scenarios

		Year 2027 by Scenario			
	Year 2010	Reference	Optimistic	Pessimistic	High Cost
Tour Distance	15 miles	14 miles	14 miles	14 miles	11 miles
Tour Travel Time	30 minutes	34 minutes	36 minutes	32 minutes	25 minutes
VMT CAGR	-	3.1%	4.3%	2.0%	0.6%
VHT CAGR	-	1.9%	2.8%	1.2%	-0.1%

Slower economic conditions alone have little effect on reducing average auto tour distance, but a measurable effect on travel time (half the increase in travel time of the Reference). Tour characteristics do not significantly change, but the number of tours drops due to decreased economic activity. Adding a three-fold increase in per-mile transport costs reduced tour distance, more than twenty percent below the Reference tour distance. Only a small portion of that reduction is attributable to reduced economic activity. Households and businesses are able to respond to changing economic conditions by relocating. This results in densification of urban areas as households choose homes closer to their workplaces and other areas of activity requiring travel, such as shopping.

As with trucks, change in overall auto VMT and VHT is reduced when per-mile transport costs increase. In the case of autos, the model suggests change in overall VMT and VHT could remain close to current levels with the introduction of a three-fold per-mile cost increase.

Analysis Scenarios Commodity Flow

The Optimistic and Pessimistic forecasts provide a reasonable range of economic conditions that Oregon could experience over the next twenty-five years. Oregon industries rely on the transportation system for obtaining the factors of production needed to do business and get their goods to market. When economic activity changes, demands placed on the transportation system change as a result. The High Cost scenario adds additional transportation costs to the Pessimistic scenario to reveal the long-range effects of this additional area of risk.

Figures 15, 16, and 17 illustrate the difference in highway commodity flows across the state for the three analysis scenarios compared to the Reference. The Reference scenario is represented by the blue layer.

Figure 15 presents the Optimistic scenario highway commodity flows in a green layer placed under the blue Reference flows in order to reveal the magnitude of the difference beween the two scenario flows. One can quickly see there is a noticeable difference between the two scenario flows in the I-84 corridor in terms of value and tonnage. Beyond that, the differences by value are spread across the state on highways from the coast and a few in southern Oregon. The differences between scenarios by weight are evident in the I-5 corridor south of Salem and a few state highways leading to the higher volume highways.

Figure 15. Commodity Flows for Optimistic Scenario Relative to Reference Scenario

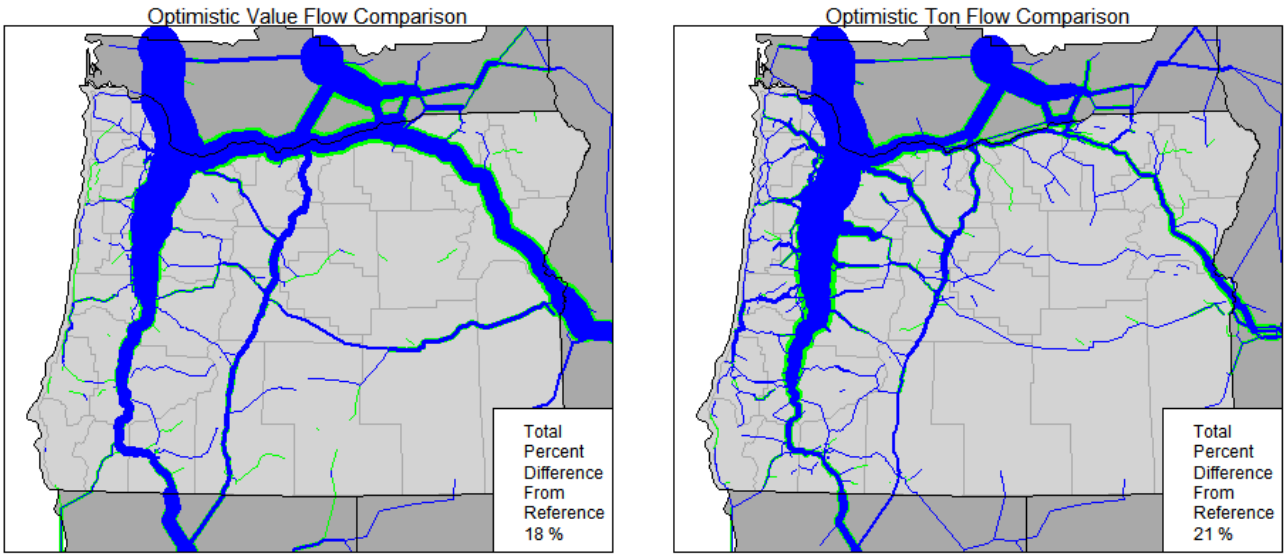

Figure 16 presents the Pessimistic scenario flows in a similar manner. Once again, blue represents the Reference scenario flows and red the Pessimistic scenario flows. Overall, the Pessimistic scenario shows slightly larger declines (-22% in value, -26% in tonnage) than the Optimistic scenario gains (18% in value, 21% in tonnage) in commodity flow. Looking at the difference in flows by commodity value, the greatest reduction in flows is on I-84 between Portland and The Dalles. Pessimistic scenario flow reductions become less pronounced as commodities disperse onto other highways into Washington State, further east on I-84 and onto US97 through central Oregon. The southern

Willamette Valley and further south on I-5 also reveal reduced flows by value under this Pessimistic scenario, which become more pronounced near the California border and on into California. When looking at flow differences by weight, the two most pronounced differences are on the mid-state section of I-5 between Salem and Roseburg and I-84 between Portland and the City of The Dalles, the same areas demonstrating increased flows in the Optimistic scenario. This indicates commodity flows on these sections are more responsive to economic conditions.

Figure 16. Commodity Flows for Pessimistic Scenario Relative to Reference Scenario by Value and Tonnage

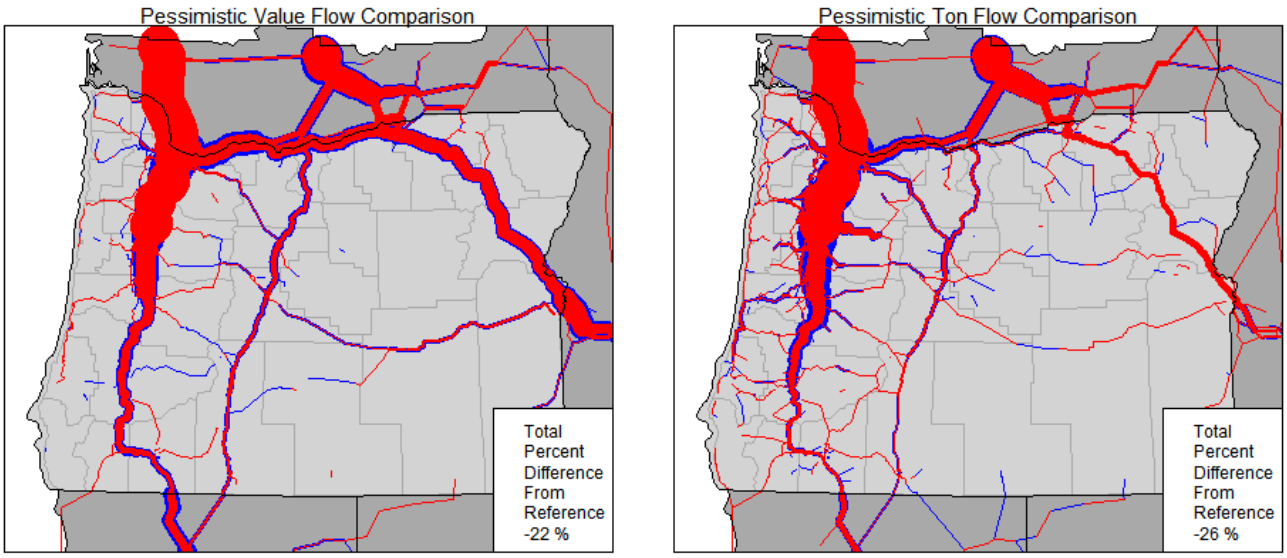

Figure 17 presents the High Cost scenario flows. This difference map looks very similar to the Pessimistic scenario map. The higher transport costs added to the slower economic conditions result in shifts in the location of economic activity, resulting in reduced flows in the I-84 corridor, US26 between Portland and US97, and US97 between I-84 and Bend. Higher transport costs induce higher concentrations of activity in the urban areas of the Willamette Valley. Clearly economic conditions affect commodity flow patterns. However, even when the economy slows, commodity flows are significant.

Tables 8 and 9 illustrate how the share of commodity flows by group may vary under different economic conditions statwide. The tables also reveal the relative rank of commodities in terms of value and weight. For example, Forest or Wood Products represent the largest commodity group by weight (37%), but has a small share of flows by value (5%.) Machinery, Instruments, Transportation Equipment, and Metals is the largest commodity group by value (49%), but has a small share of flows by weight (4%). Comparing the shares across all four scenarios reveals the commodity shares by weight are stable under different economic conditions, varying no more than one percentage point. The exception is Machinery & Instruments, which has a stable absolute value of flow under all scenarios, but the statewide share drops when the economy is strong as other commodity production picks up. When the economy is slower, this commodity group's share increases as other commodity activity drops. This is largely offset by slight declines in a number of other areas, particularly the large Forest or Wood Products commodity group, where a one-percent change translates into large tonnages, and the reduced demand for other largely inbound raw materials such as the Petroeum,Coal and Chemicals.

Figure 17. Commodity Flows for High Cost Scenario Relative to Reference Scenario by Value and Tonnage

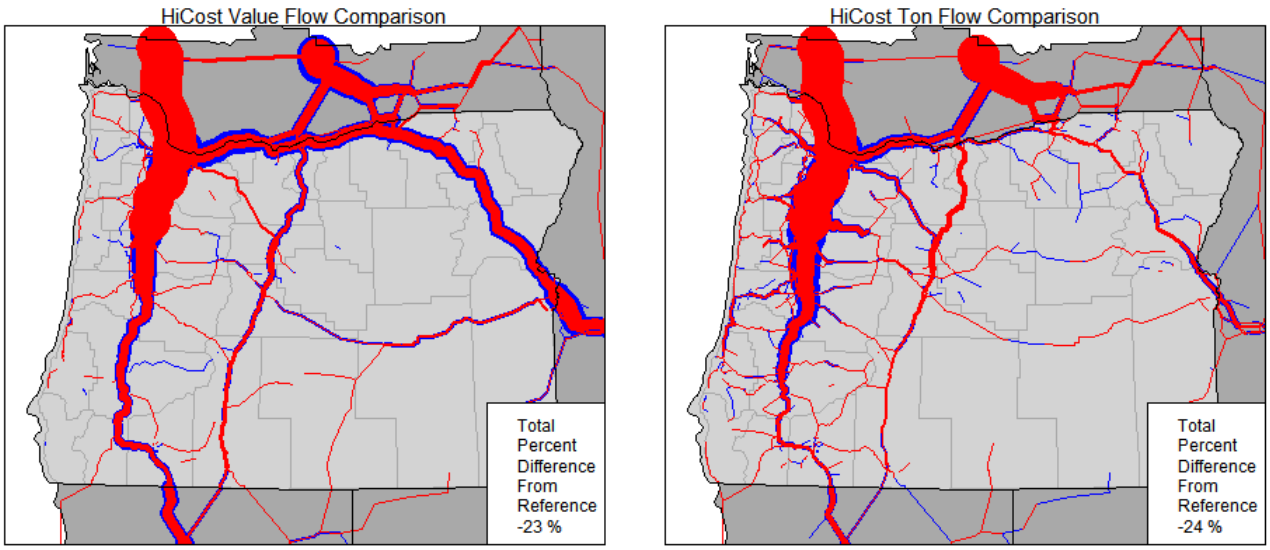

Table 8. Share of Total Statewide Commodity Flow by Weight for all Four Analysis Scenarios*

	Reference	High Cost	Pessimistic	Optimistic
Forest or Wood Products	37	36	37	36
Petroleum Coal Chemicals	25	26	24	25
Clay Minerals Stone	16	16	16	16
Food & Kindred Products	12	12	12	13
Machinery, Instruments, Transp Equip, Metals	4	5	5	4
Pulp Paper Products	4	3	3	4
Other Misc	2	2	2	2

* columns may not sum to 100 due to rounding

Table 9. Share of Total Statewide Commodity Flow by Value for all Four Analysis Scenarios*

	Reference	High Cost	Pessimistic	Optimistic
Machinery Instruments, Transp. Equip. Metals	49	55	54	46
Other Misc	17	14	14	18
Food & Kindred Products	12	12	12	13
Petroleum, Coal, Chemicals	10	8	9	11
Pulp, Paper Products	6	5	5	7
Forest, Wood Products	5	5	5	5
Clay, Minerals, Stone	1	1	1	1

* columns may not sum to 100 due to rounding

Figures 18 – 24 illustrate the differences in commodity flows on Oregon highways for seven commodity groups across the three analysis scenarios for year 2027. Each figure displays the difference from the Reference scenario for commodity value and tonnage. The first row of maps presents results for the High Cost scenario. The second row presents results for the Pessimistic scenario and the third row for the Optimistic scenario. Results in red indicate a reduction in flows compared to the Reference scenario, while green represents an increase in flows relative to the Reference scenario. The lower right corner of each map reports the statewide percent difference compared to the Reference scenario in terms of value adjusted by lane miles of travel and absolute valuel. This provides a sense of magnitude of the difference between scenarios.

Figure 18 presents commodity flows for Machinery, Instruments, Transportation Equipment and Metals for the three analysis scenarios. This commodity group is a high-value, low-weight group. For both the Pessimistic and High Cost scenarios, flows are reduced significantly, despite less decline in growth than other commodities as indicated by its ranking in Table 7. The decreased flows with respect to the Reference are illustrated in red. The greatest reduction in flows in terms of value is on I-5 north of Portland and in the Willamette Valley. But, there are also reductions along the I-84 corridor. I-5 North of Portland realizes the largest declines in terms of value in these scenarios. In absolute terms, the decreased commodity flow for this group is 14% less than the Reference flows for the Pessimistic scenario and 15% less for the High Cost scenario.

The differences between the Pessimistic and High Cost scenario are interesting to note. Added transportation costs results in greater reductions in commodity flow along the I-84 corridor, but less of a reduction in flows on I-5 south of the Willamette Valley. Higher transportation costs result in more flows on smaller interior state highways shown as green on the High Cost Value Flow Comparison map, but less of a difference from the Reference scenario in flow along the central US97 highway. A large segment of southern US97 has more commodity flow for this group relative to the Reference in terms of comodity value. There is a larger decline in tonnage flows along US20 running east of Bend when transport costs are higher. These changes likely reflect consolidation of shipping activity in urban areas, with less intercity flows, except between major urban centers, such as Bend and the Willamette Valley.

The Pessimistic scenario results indicate increased flow for this commodity group on US199 from Grants Pass to the California border and several state highways from I-5 to the coast as shown in green. A slower economy results in reduced flows for this commodity for all of US97 in central Oregon and several highways connecting to I-5, including US20 across the state toward Idaho.

Overall, commodity flows for this group increase by an absolute amount of 9% in the Optimistic scenario. There is increased commodity value on the I-84 corridor east of Portland and increased tonnage on I-5 north of Portland. There is a general pattern of increased commodity flow across Oregon highways, but there are some decreased flows relative to the Reference scenario. I-5 south of Salem realizes a small net reduction in flows all the way to the California border, indicating a shift from trade to South of the state to trade with Northern (low-value goods) and Eastern (high-value goods) markets. Flows also decrease on US26 west of Portland and east of Portland all the way to US97. Also, flows increase on US199, even more than they did in the Pessimistic scenario. On the I-84 corridor east of Hermiston, there are small decreases in commodity flow by weight, when the net difference by value is positive for the entire corridor.

Figure 18. Difference in Commodity Flow for Analysis Scenarios Compared to Reference Scenario: Machinery and Instruments, Transportation Equipment, and Metals

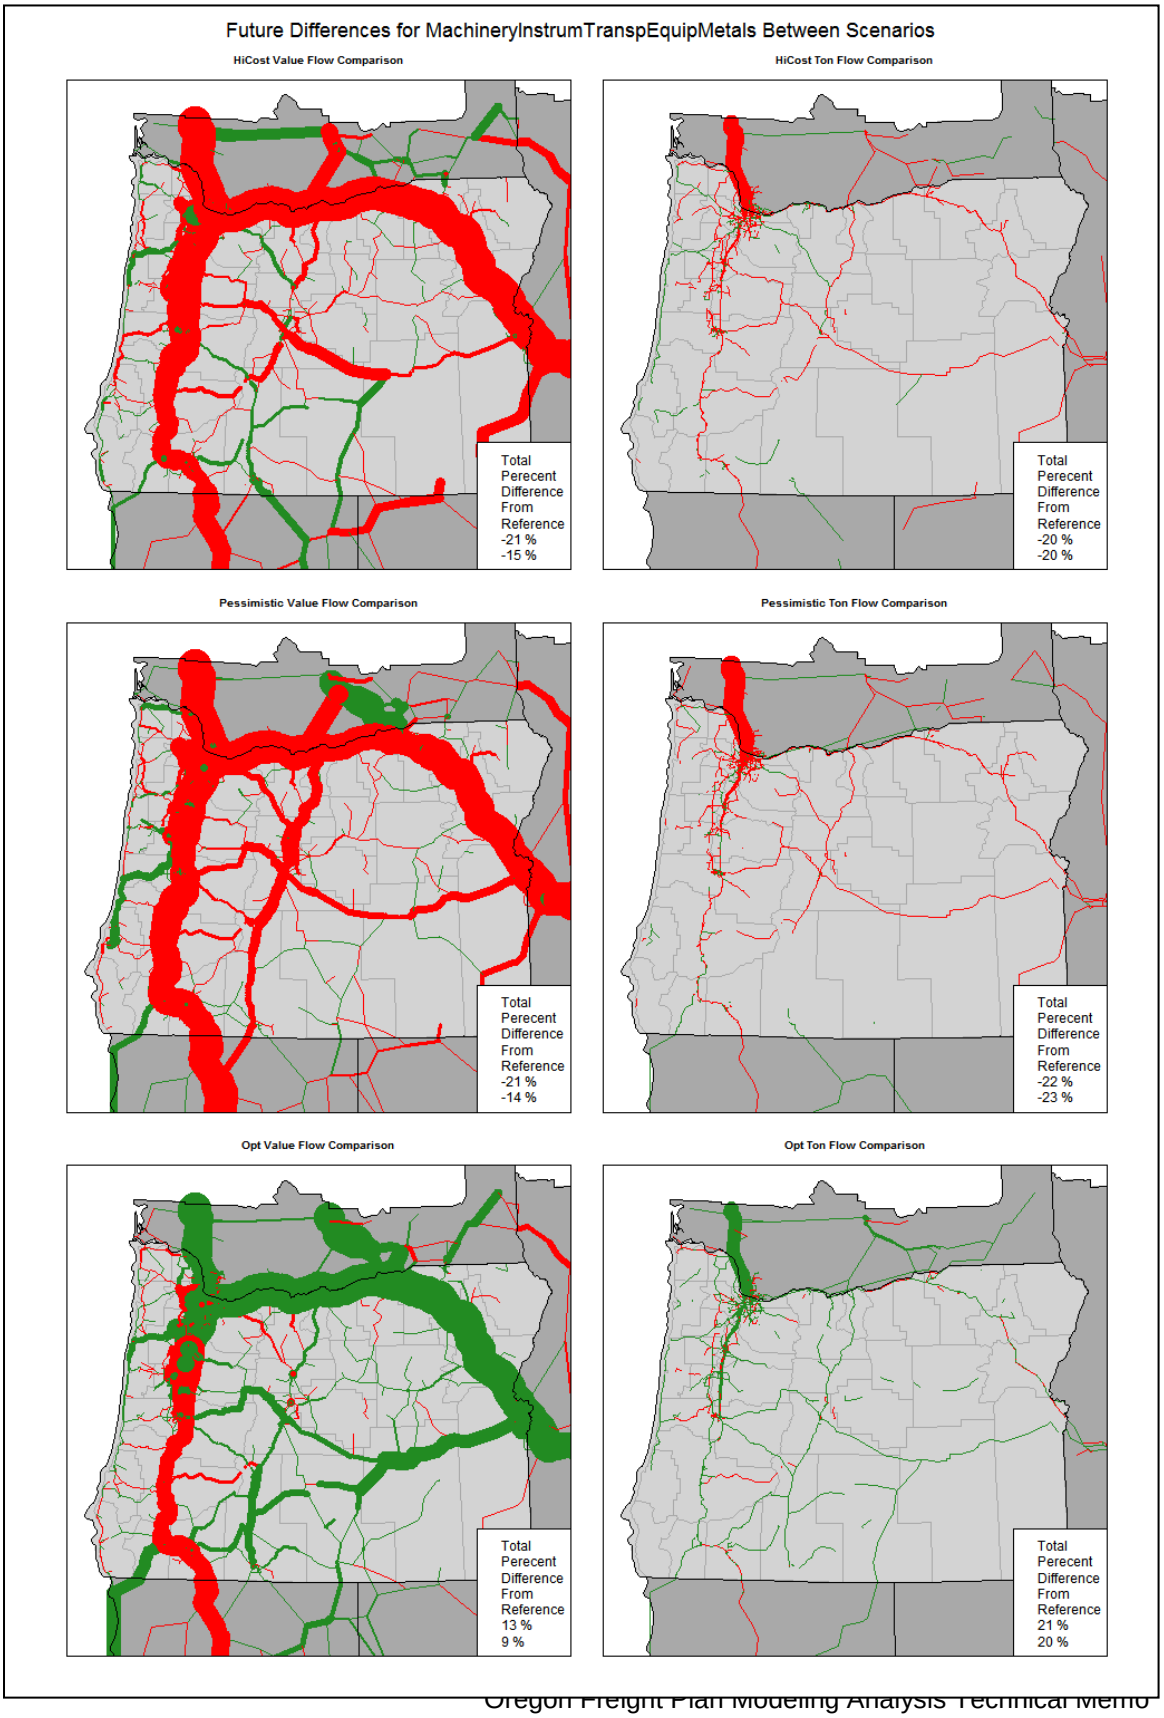

Figure 19 presents commodity flows for Food and Kindred Products for the three analysis scenarios. For both the High Cost and Pessimistic scenarios, flows are reduced across the state, although retaining its existing share of freight flows in the smaller economy. The greatest reduction in flow is on I-5 north of Portland and east of Portland on I-84 up to the Hermiston area, approaching the connection with I-82 heading north into Washington. There are also reductions in flow on US97 heading north toward I-82, as well as other routes, demonstrating some reduction in north-bound commodity flows for this group. These patterns are very similar in terms of commodity value and weight, with some greater reduction in flows on US97 by weight. Flows further south on I-5 and US97 show an larger reduction in flows relative to the Reference scenario. In terms of absolute value, the statewide reduction in flows for this commodity group is 24%.

There are no obvious differences in flow patterns for Food and Kindred Products when higher transport costs are included. This implies the greatest influence on this commodity group is economic conditions.

The results are quite the opposite for the Optimistic scenario, which represents a 27% increase in commodity flow in terms of absolute value with respect to the Reference scenario. Commodity flow increases on the main corridors of I-5 and I-84. The largest increases occur north of Portland on I-5, I-84 between Portland and I-82 via US 97 and the I-84/I-82 intersection at Hermiston. There are significantly more flows in the Willamette Valley I-5 corridor which continue further south and increase in size as the California border is approached. There are increased flows to a lesser extent on US20 east of Bend and US97 from I-84 to Bend, as well as highways connecting the Oregon coast to the I-5 corridor. The increased flows are noticeably greater in magnitude when looking at flows by weight on the I-5 corridor south of Portland. Interestingly, the Pessimistic scenario shows a decline on US97 that is not mirrored as gains in the Optimistic scenario.

Figure 19. Difference in Commodity Flow for Analysis Scenarios Compared to Reference Scenario: Food and Kindred Products

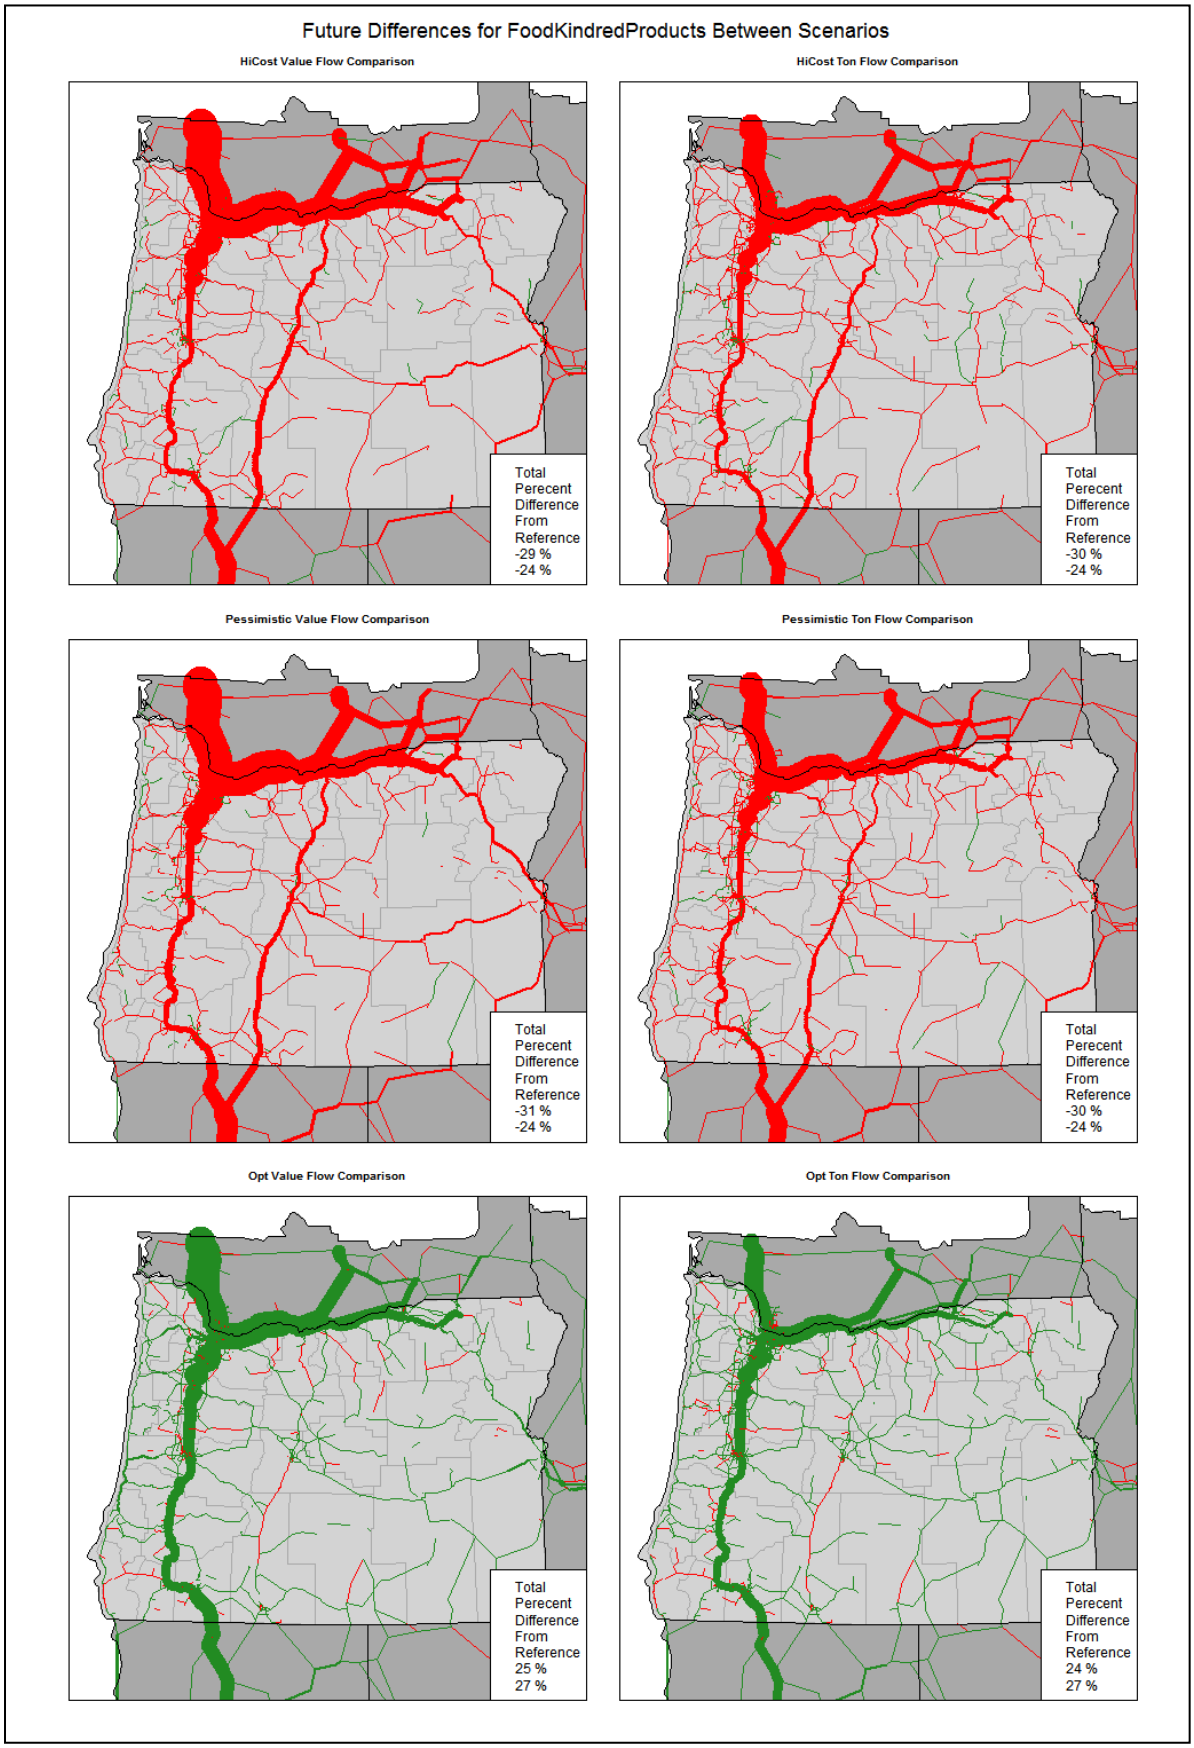

Figure 20 presents commodity flows for Other Miscellaneous Products for the three analysis scenarios. For the High Cost and Pessimistic scenarios, commodity flow is reduced across the state. The greatest reduction in flow is north of Woodburn on I-5 and into Washington State, with some reduction also on I-84 between the intersection with I-82 and the Idaho border. The reduction in flow is more pronounced by weight on the I-5 corridor in the upper Willamette Valley area starting in the vicinity of Salem. The addition of higher transport costs to a lagging economy resulted in greater reduction in flows on I-84 and US97 north of Bend and less reduction in flows on the I-5 corridor. Slower economic conditions do not alter the share of statewide commodity flows for this group; it remains 14% by value and 2% by weight (as presented earlier in Tables 6 and 7.) However, lane miles of commodity flow by value for the High Cost scenario is 37% lower than the Reference scenario, while the Pessimistic scenario is 30% lower. This demonstrates the freight consolidation effect, which reduces total truck VMT when transportation costs are higher.

The Optimistic scenario results in a greater share of commodity flows for this group in terms of value, rising to 18% of the statewide commodity flows. The most significant increased flows are on the I-5 corridor starting near Salem and continuing north to Portland and into Washington State. There are large increases in flows in terms of weight on the entire I-5 corridor. There is some additional flow on I-84, but the greatest increase in terms of value is between I-82 and LaGrande and in terms of weight between Portland and I-82. This commodity group represents a range of products in terms of value and weight which creates this variation in the weight and value flow patterns. Further insight on these patterns will be provided in the ACT profiles.

Figure 20. Difference in Commodity Flow for Analysis Scenarios Compared to Reference Scenario: Other Miscellaneous Goods

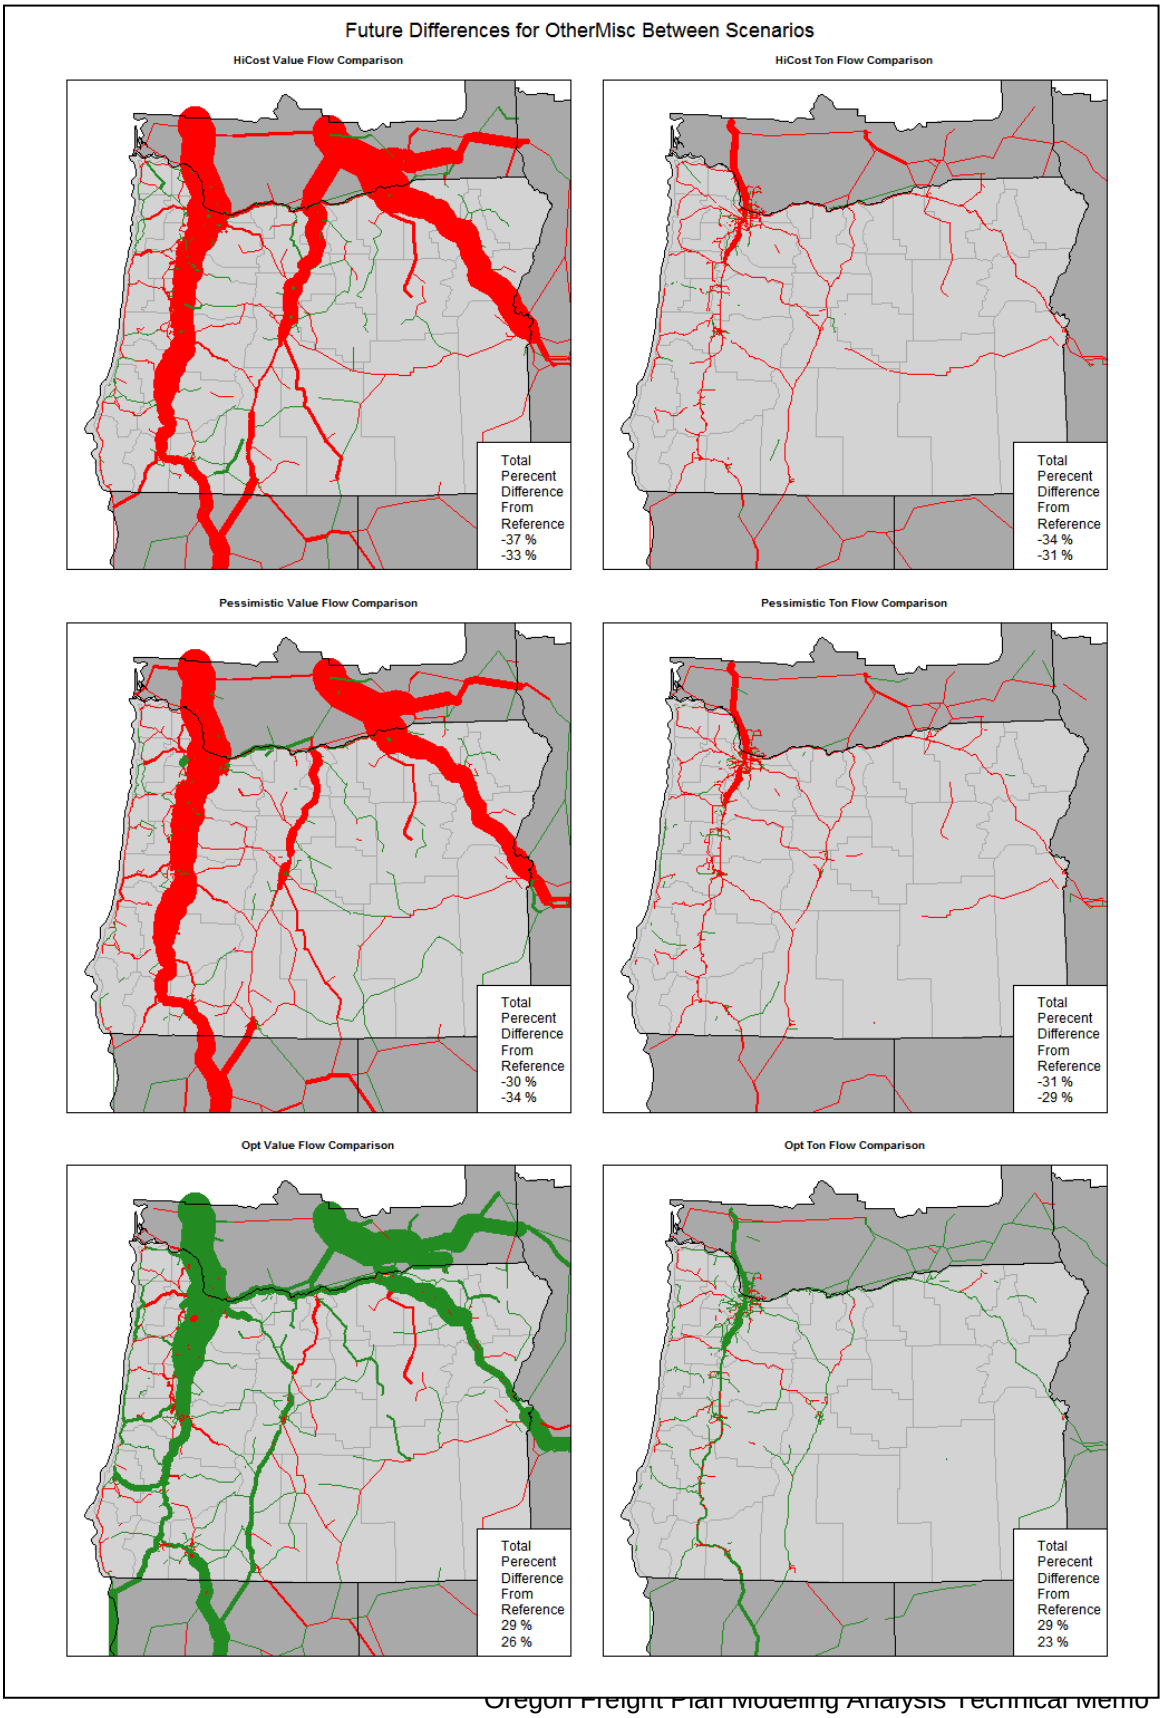

Figure 21 presents commodity flow for the Petroleum, Coal and Chemicals group. The fuels component of this commodity group is largely inbound flows, rising and falling in step with the overall economy, and higher-value chemicals. Evaluating this group in terms of value reveals flows are reduced on the I-5 corridor, especially in the Willamette Valley corridor when the economy contracts. The addition of higher transport costs reduces flows north of Portland on I-5 even more than reduced economic activity alone. The results are different when evaluating this group in terms of weight.

Reduced economic activity, as represented in the Pessimistic scenario, results in significant reduction of flow by weight north of Portland on I-5 and some reduction on I-5 in the Willamette Valley and further south. However, there is increase flow by weight on the I-84 corridor between the I-82 intersection near Hermiston and the Idaho border. When higher transport costs are added to a slow economy, as represented in the High Cost scenario, the results are quite different. Willamette Valley flows on I-5 are mostly higher than the Reference scenario, except for some segments within the corridor. The higher flows on I-84 are no longer present when higher transport costs exist, but US97 experiences increased commodity flow with higher transport costs.

Commodity flows from Idaho north to Washington via the I-84 corridor until intersecting with I-82. These flows increase somewhat for the heavier commodities within this group during slower economic times, likely reflecting the competitive advantage of other states relative to Oregon. Note that flows do not increase in terms of value on this corridor. For the purpose of the Freight Plan, the actual response of this commodity is less important than the realization that the freight plan strategies must support the economic resilience of Oregon firms and national freight flows.

The Optimistic scenario results in greater flows on I-5 north of Portland, with increased flows to a lesser extent on I-5 south of Portland for the Willamette Valley corridor both in terms of value and weight. The magnitude of flow increase is greater in terms of commodity value, than weight. In absolute terms, flows are 9% higher than the Reference scenario in terms of value and 20% higher in weight. Flow increases on the I-84 corridor between I-82 and Idaho in terms of weight, but very little in terms of value. Once again, this likely reflects activity of other states shipping relatively heavy, low value commodities within this group.

Figure 21. Difference in Commodity Flow for Analysis Scenarios Compared to Reference Scenario: Petroleum, Coal, and Chemicals

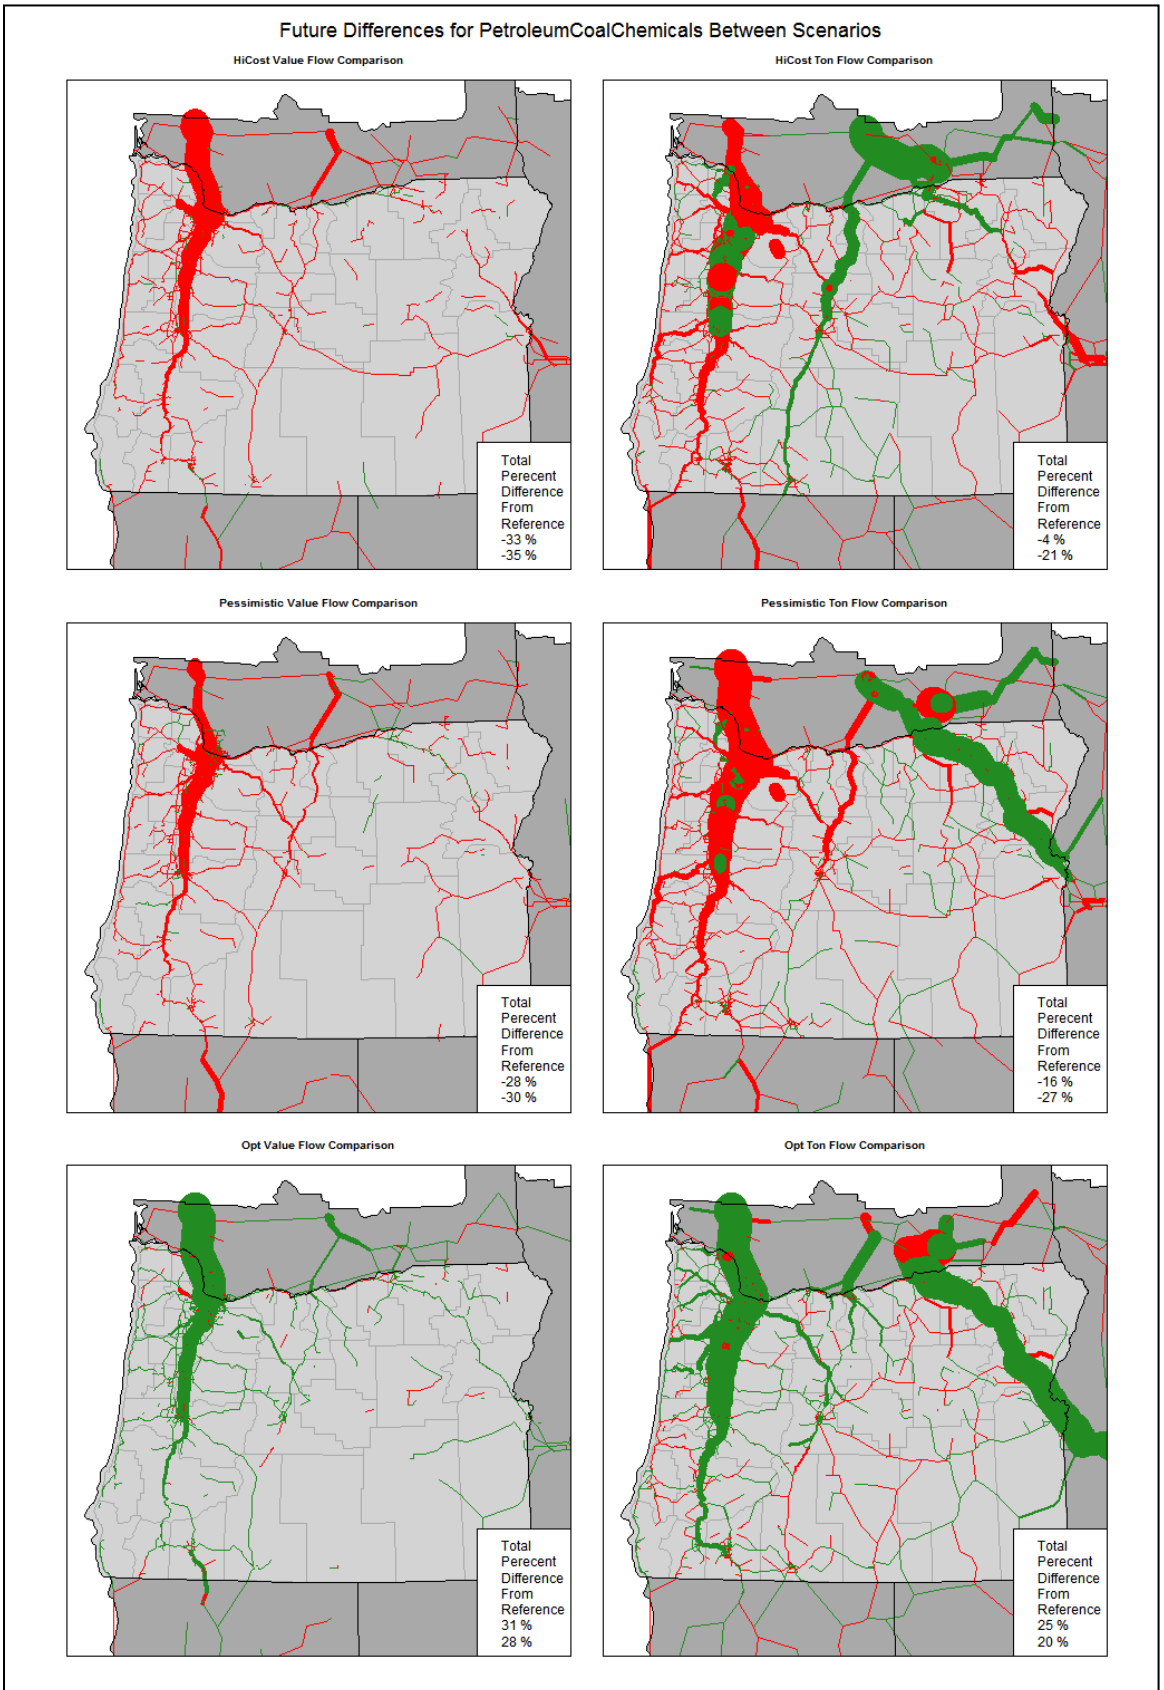

Figure 22 presents commodity flow for Pulp and Paper Products group. When economic activity slows, the greatest reduction in commodity flow for this group occurs north of Portland on the I-5 corridor. There is some reduction in flows on the I-5 corridor south of Portland to a lesser extent. Reductions can be seen on US 97, US 26 east of Portland and OR58 from Eugene to US97. A small increase in flow appears on OR31 in the Pessimistic scenario, but disappears when higher transportation costs are incurred. There are fairly small differences between the High Cost flows and the Pessimistic flows, indicating economic conditions have more influence on this particular commodity than transportation costs.

The Optimistic scenario mirrors the Pessimistic scenario. Additional flow occurs north of Portland on the I-5 corridor, with increases on the I-5 corridor south of Portland as well to a lesser extent. There is also more flow on US97 and US26 north of Bend in terms of weight, not so in terms of value. The source of such differences is illuminated further in the ACT Profile section, where production activity and flows are discussed by ACT.

Figure 22. Difference in Commodity Flow for Analysis Scenarios Compared to Reference Scenario: Pulp and Paper Products

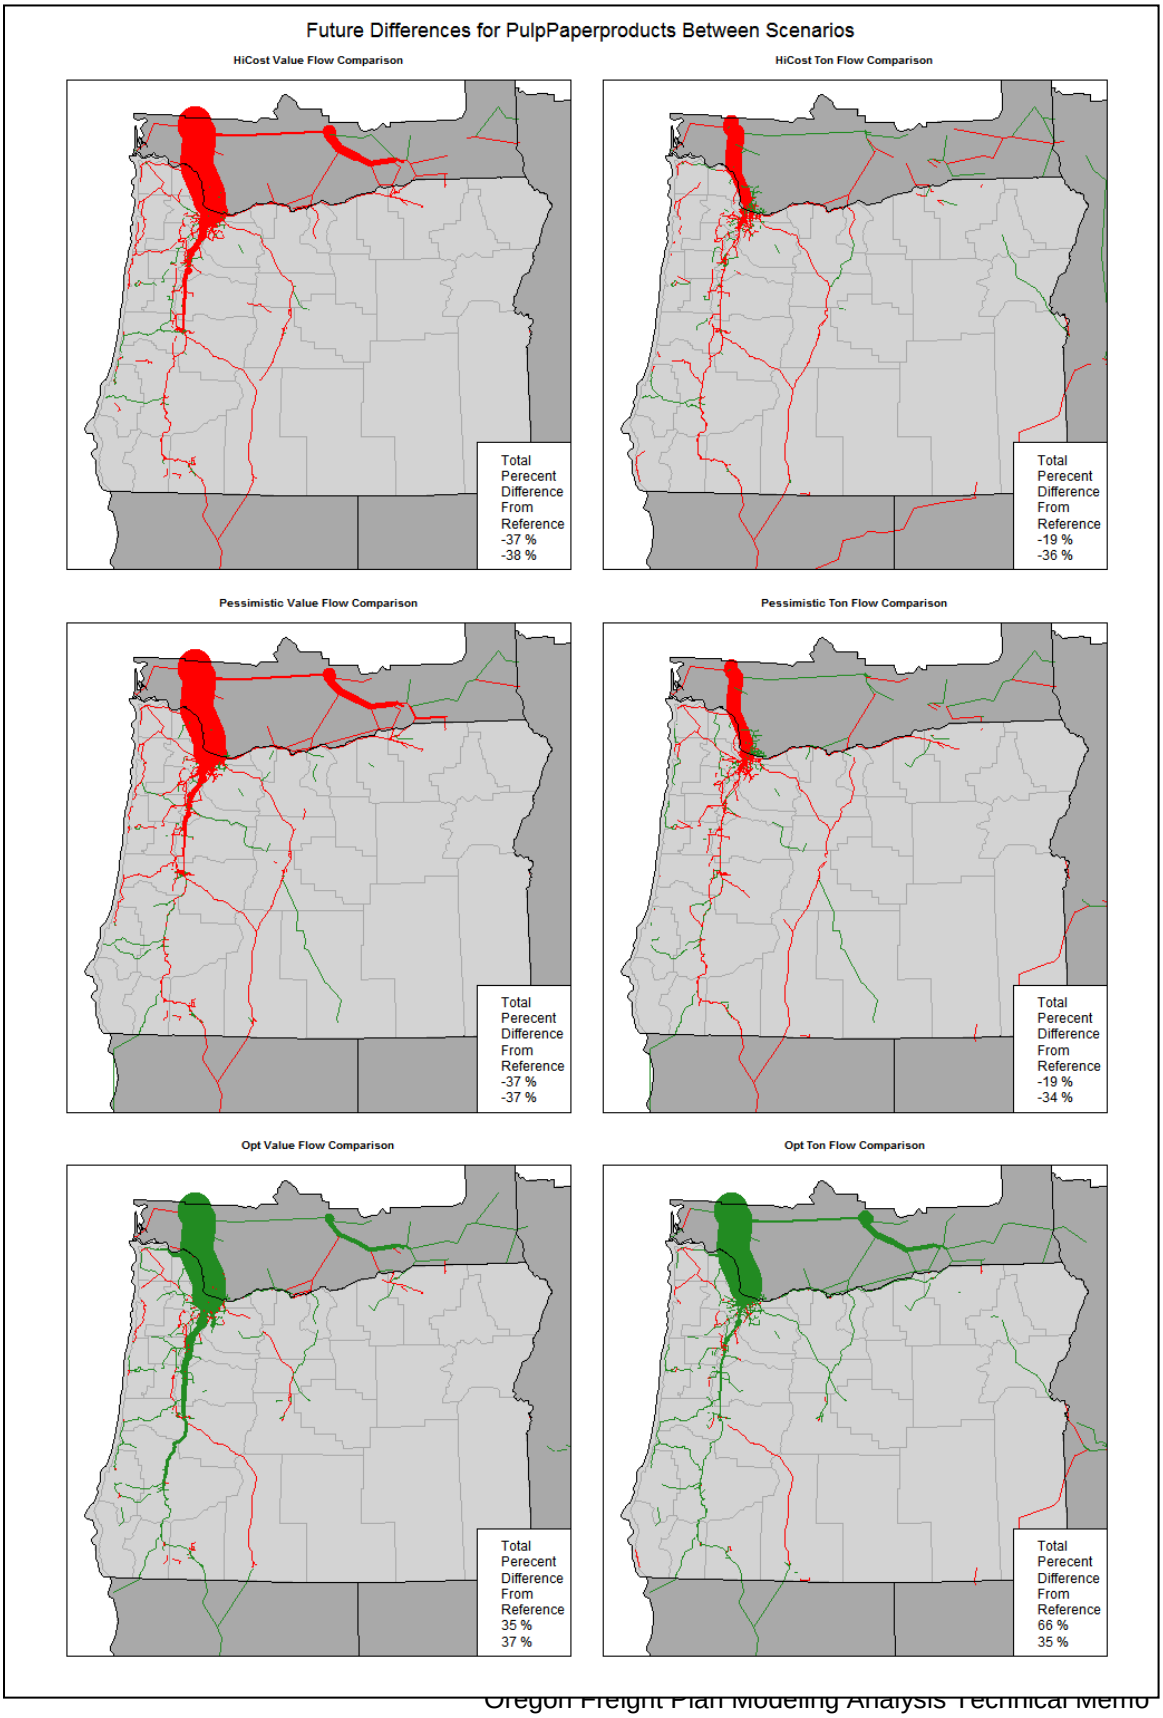

Figure 23 presents commodity flow for the Forest or Wood Products group. This commodity group is a relatively low-value, high-weight group. This group relies on the I-5 corridor for movement. When economic activity wanes, as represented in the Pessimistic scenario, flows are significantly reduced, 25% in absolute terms by weight and value. The greatest reduction in flow occurs on the I-5 corridor through the Willamette Valley south of Portland, with sizeable reduction in flows north of Portland and south of Eugene to Roseburg. There are further reductions in flow across the entire state. The addition of transportation costs do not appear to alter these results at the statewide level to a noticable extent.

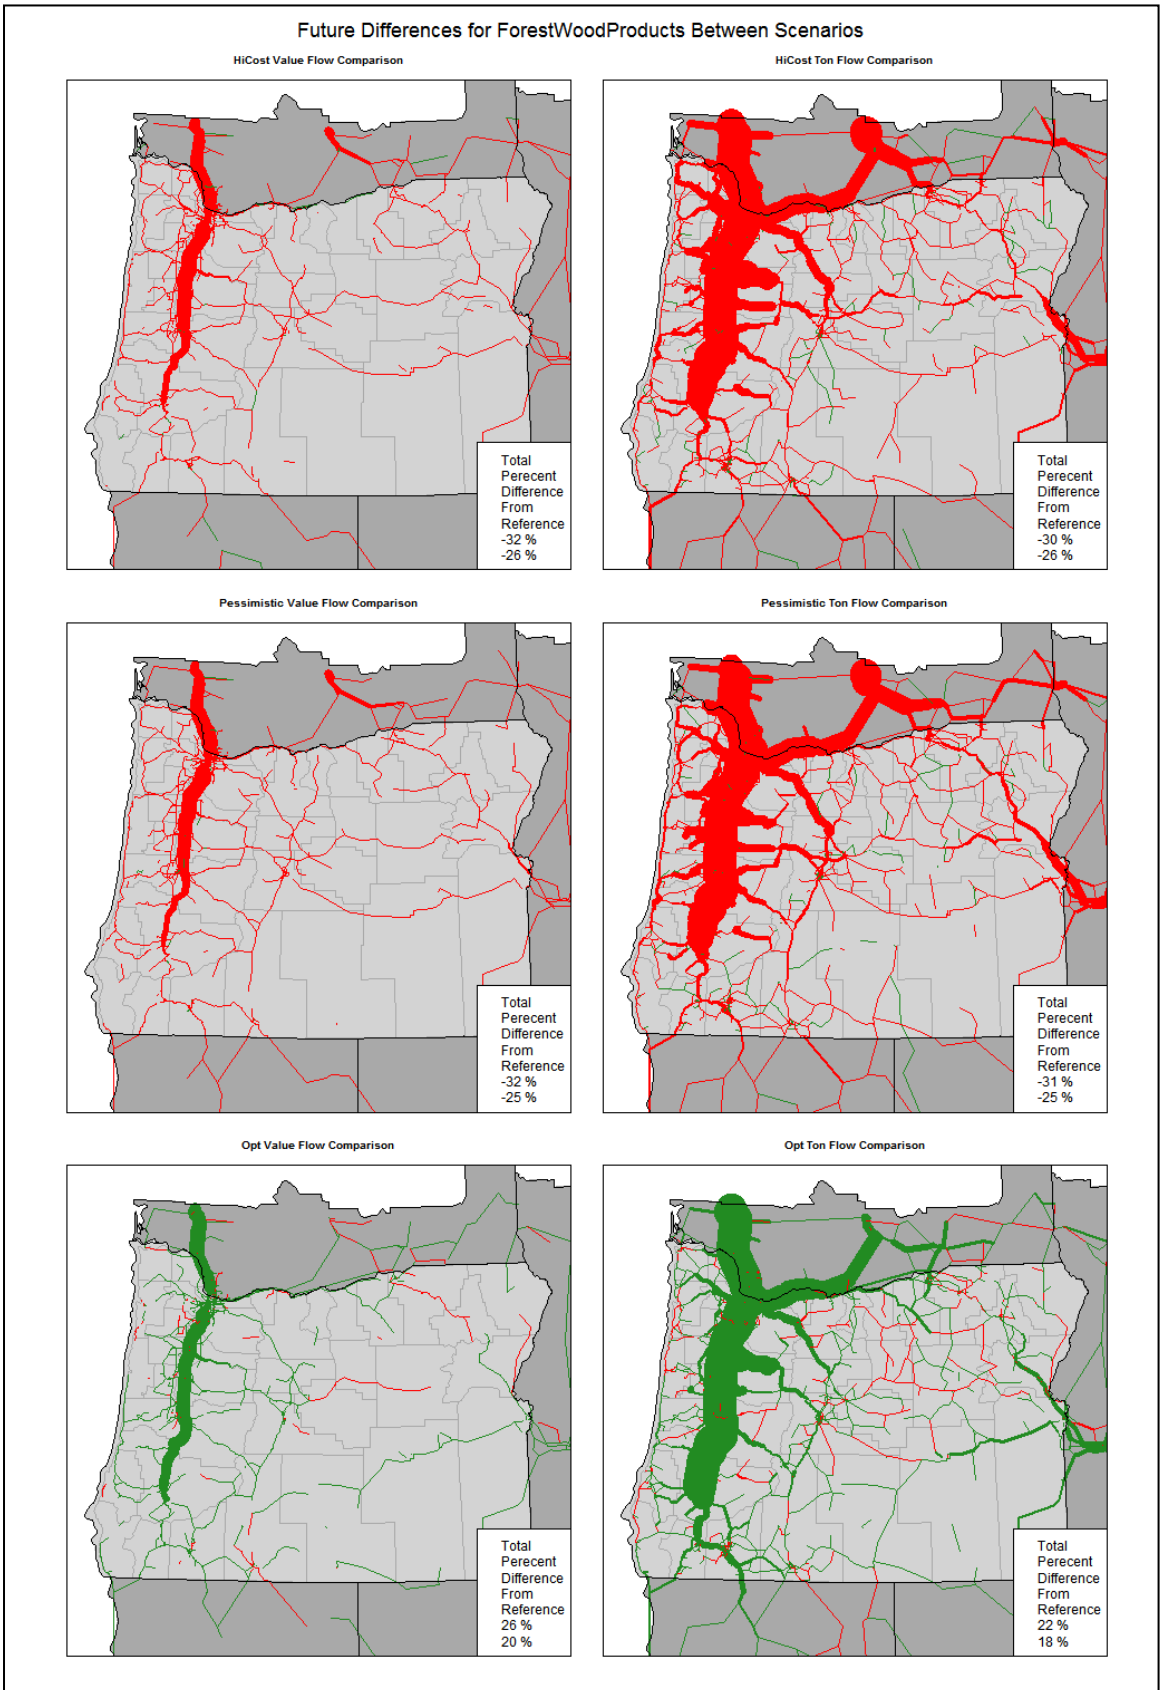
A similar, yet opposite effect occurs for the Optimistic scenario. Flows increase on the I-5 corridor north of Portland, further south in the Willamette Valley and further down to Roseburg. The increase in flows are more pronounced in terms of value compared to weight. There are also notable increases in flows on I-84 and US26 east of Portland and US22 east of Salem.

Figure 23. Difference in Commodity Flow for Analysis Scenarios Compared to Reference Scenario: Forest or Wood Products



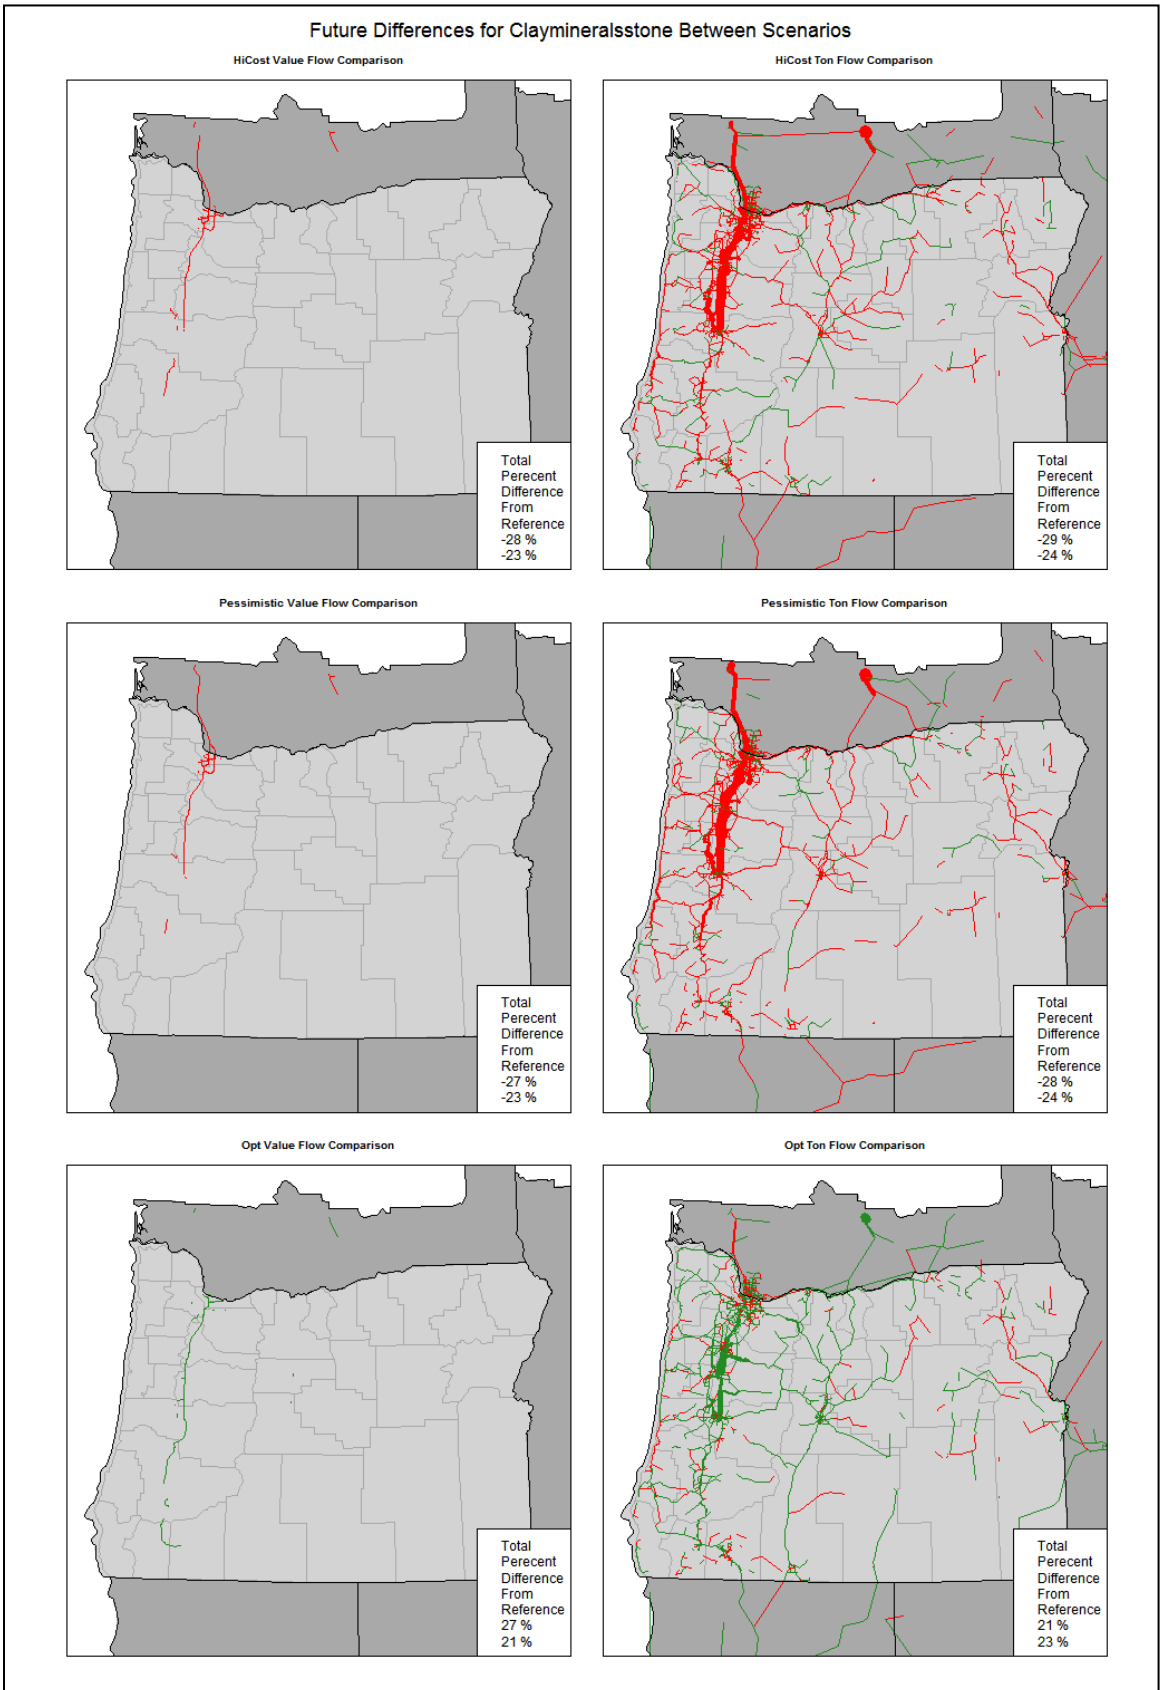


Figure 24 presents commodity flow for the Clay, Minerals and Stone group. This group is a low value, high weight group, representing one percent of statewide commodity flow in terms of value, and sixteen percent by weight. Thus, the change in flows are most evident when looking at tonnage flows. When economic activity wanes, as represented in the Pessimistic scenario, the bulk of flow reduction occurs in the Willamette Valley corridor. There is notable reduction in flows on the Oregon coast US 101 in the area of Coos Bay and Reedsport and some further north to Newport. US 97 north of Bend realized reduced flows as well. The addition of higher transportation costs results in similar patterns, but a net result of a little less reduction in flows compared to the Pessimistic scenario.

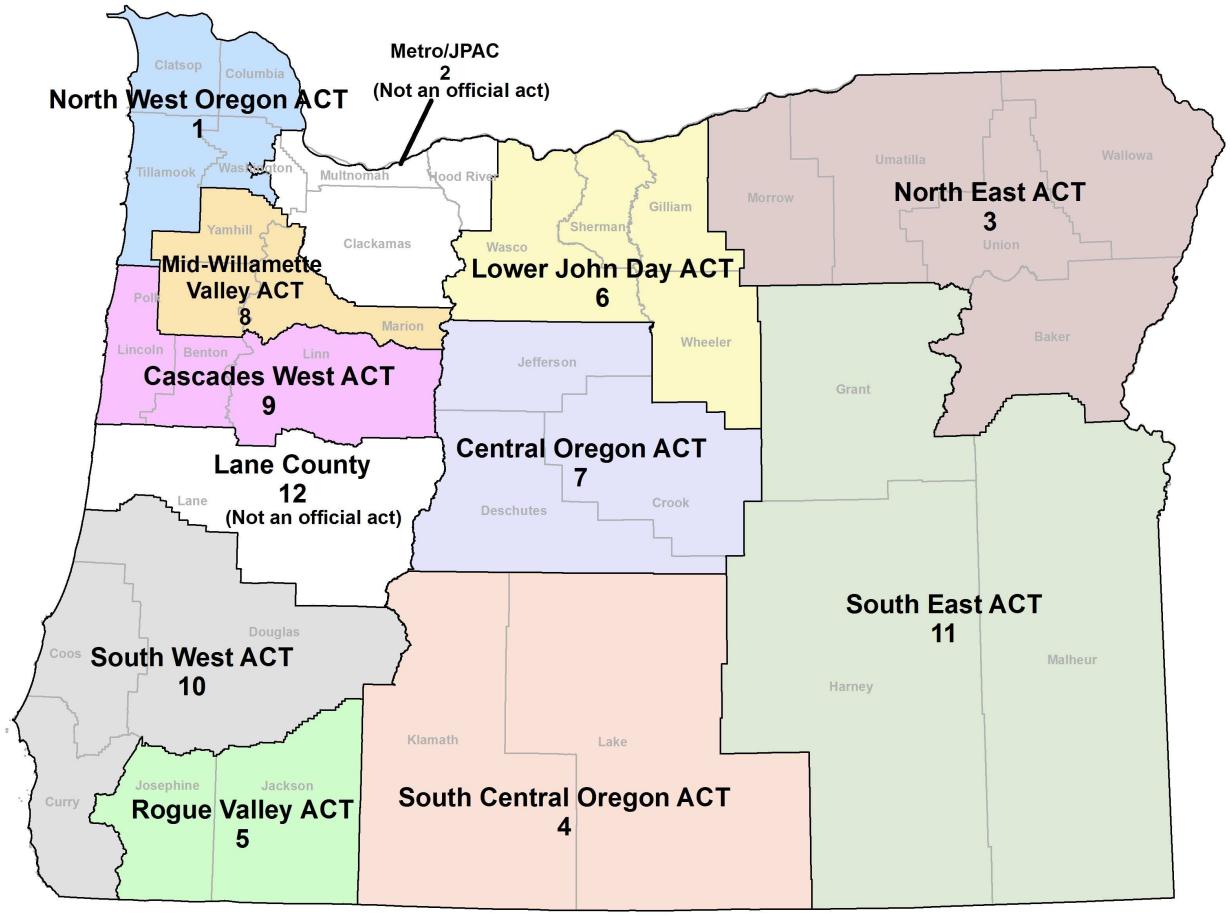
When the economy expands, as represented in the Optimistic scenario, flows for this group increase on the I-5 corridor predominantly in the Willamette Valley, notably in the vicinity of Salem and Eugene. Flows increase on US 97 north of Bend and OR 224 east of Portland. Flows north of Portland are less than the Reference scenario as the demands for this commodity change under new economic conditions.

Figure 24. Difference in Commodity Flow for Analysis Scenarios Compared to Reference Scenario: Clay, Minerals, and Stone



ACT Profiles

This section presents brief summaries of regional patterns in order to highlight the differences between areas of Oregon that may be obscured when reporting at the statewide level. The State of Oregon is divided into 12 Area Commissions on Transportation (ACTs) as illustrated in Figure 25. Regional patterns are evaluated at the ACT level for this analysis. For reporting purposes, several ACTs are grouped together because of the close regional economic interactions and similar use of highway corridors. ACT profiles are provided for the following:

- Northwest Oregon (ACT1)
- Willamette Valley (ACTs 8, 9, & 12)
- Central Oregon (ACTs 6 & 7)
- Portland Area (ACT2)
- Southwest Oregon (ACTs 4, 5, & 10)
- Eastern Oregon (ACTs 3 & 11)

Figure 25. Oregon Area Commissions on Transportation

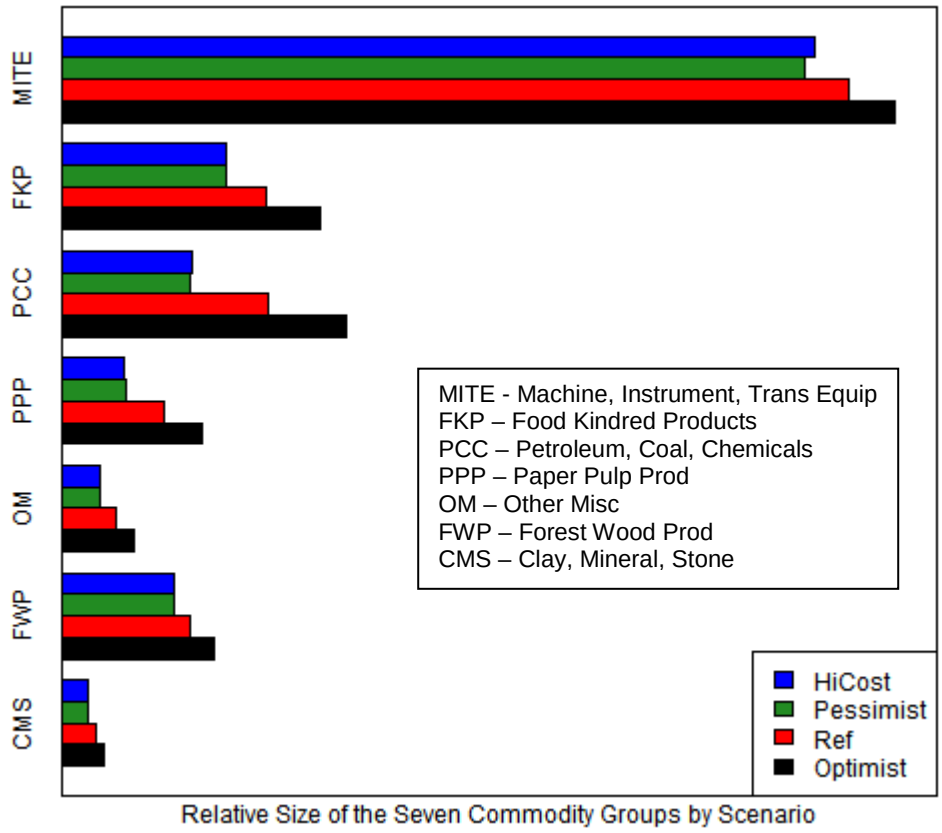
For each of the six ACT groups profiled, four graphics will be presented to illustrate economic and freight activity for each area:

- Commodity production within the ACT group, indicated by the share of statewide production for each commodity group for each scenario
- Map of commodity flows produced by the ACT group destined to other ACTs and outside of the state [9]
- Table of highway corridors utilized to transport ACT goods to destination markets, i.e., the percentage of ton-miles for each commodity group produced by the ACT groups and moved by truck
- Forecast change in ACT group industry growth rates for output and employment, compared to the statewide rate for each scenario

ACT Profile Overview

ACT group profiles will also include commodity production levels for all four scenarios. Results are reported for seven commodity groups, presented in Table 10. Goods classified within the Machinery, Instruments, Transportation Equipment and Metals represent the largest share of statewide commodity flows by value, but very low in terms of weight. Forest and Wood Products represent the largest share of statewide commodity flows by weight, but very low in terms of flows by value. Figure 26 is provided as a reference of comparison for the ACT groups.

Table 10. Commodity Groups by Share of Statewide Production*



Commodity Group	Abbreviation	Statewide Share by Value	Statewide Share by Weight
Machinery, Instruments, Transport Equipment, and Metals	MITE	49	4
Other Miscellaneous	OM	17	2
Food & Kindred Products	FKP	12	12
Petroleum, Clay, Coal, & Chemicals	PCC	10	25
Paper & Pulp Products	PPP	6	4
Forest & Wood Products	FWP	5	37
Clay, Mineral & Stone	CMS	1	16

* Shares are from the Reference scenario. For more information on how the shares compare across all four scenarios, see Tables 6 and 7 in the previous section.

Figure 26 illustrates commodities produced and how they may vary under different economic conditions. This figure is provided for each ACT group. This can be used as a reference when evaluating ACT commodity production patterns. For example, the Northwest ACT's largest commodity group, Pulp and Paper Products, represents six percent of statewide commodity production by value, Over ten percent of this commodity group is produced within the Northwest ACT, making it a significant industry for the Northwest ACT, while remaining a relatively small sector for Oregon as a whole.

[9] Commodity consumption by ACT was evaluated. The ACTs followed similar consumption patterns to that of the state; no distinct differences were evident at the ACT level.

Figure 26. Range of Oregon Commodity Production Value: All Scenarios

Each ACT group profile includes a map of production flows destined to locations outside of the ACT. These maps allow the reader to quickly gauge the relative importance of other ACTs as destination markets, as well as export markets outside of Oregon. The relative importance of each commodity group to an ACT is evident by observing the relative size of the commodity pie pieces. Variation in commodity share of the ACT production across the four scenarios is also provided. The relative highway network flows for commodities transported by truck are also shown on the map to illustrate relative importance of corridors.[10]

A table reporting the share of commodity flows by ton-miles across Oregon's major corridors is presented for each ACT group. Each ACT has unique production activity and critical routes. However, the need to get goods to markets outside of Oregon is clearly needed by all areas of the state. Oregon is projected to ship approximately 60 percent of the value of goods it produces, out side state borders. On the other hand, Oregon is projected to ship roughly 70 percent of the value of goods consumed from outside of Oregon. This heavy global trading will require reliable highway, rail, and waterway networks. Table 11 illustrates the importance of the interstate corridors, since these corridors are used to move 53 to 73 percent of each commodity group flowing within Oregon.

Finally, each ACT profile will include industry growth figures similar to those presented earlier for the entire state. The ACT figures will be presented with the statewide figures to quickly reveal how the ACT differs from the state in general.

[10] To reduce the number of figures, network value flows are only shown for the Reference scenario. Flows for other scenarios are very similar to the Reference.

Table 11. Oregon Statewide Commodity Flow by Corridor, in Ton-Miles							
	Machine, Instrument, Trans Equip	Food Kindred Products	Petroleum, Coal, Chemicals	Paper Pulp Products	Other Misc	Forest or Wood Products	Clay, Mineral, Stone
I-5	37%	35%	40%	52%	54%	42%	46%
I-84	36%	29%	13%	8%	18%	9%	7%
US-97	3%	10%	9%	5%	7%	3%	3%
US-26	4%	4%	5%	6%	3%	7%	5%
US-20	4%	3%	3%	1%	2%	5%	4%
I-205	3%	2%	3%	5%	2%	2%	3%
US-101	1%	1%	3%	2%	1%	3%	5%
OR-30	2%	1%	2%	7%	1%	2%	1%
OR-22	1%	1%	1%	1%	1%	6%	3%
OR-126	1%	1%	1%	1%	1%	2%	2%
OR-99	1%	0%	1%	1%	0%	1%	2%
OTHER	7%	13%	19%	11%	10%	18%	19%
TOTAL	100%	100%	100%	100%	100%	100%	100%

Northwest ACT (ACT 1)

The Northwest ACT includes Clatsop, Columbia, Tillamook and about two-thirds of Washington County. About 165,000 people currently reside in this area, representing 4% of Oregon's total population. Figure 27 presents a profile of the commodities produced in this ACT by value. There are large inventories of forested land in this ACT, supporting the Pulp and Paper Products (PPP) commodity production, a dominant area of activity for the Northwest ACT. While it may be small in terms of population, this ACT produces 11-13% of the Pulp and Paper Products produced in Oregon, with Pulp and Paper making up 12-18% of the Northwest ACT commodity production. It is important to note that demand for goods in this commodity group is affected by economic conditions, creating fluctuations in commodity production across scenarios. The other commodity groups remain fairly stable across scenarios for the Northwest ACT.

Figure 27. Northwest ACT Commodity Production by Value: All Scenarios

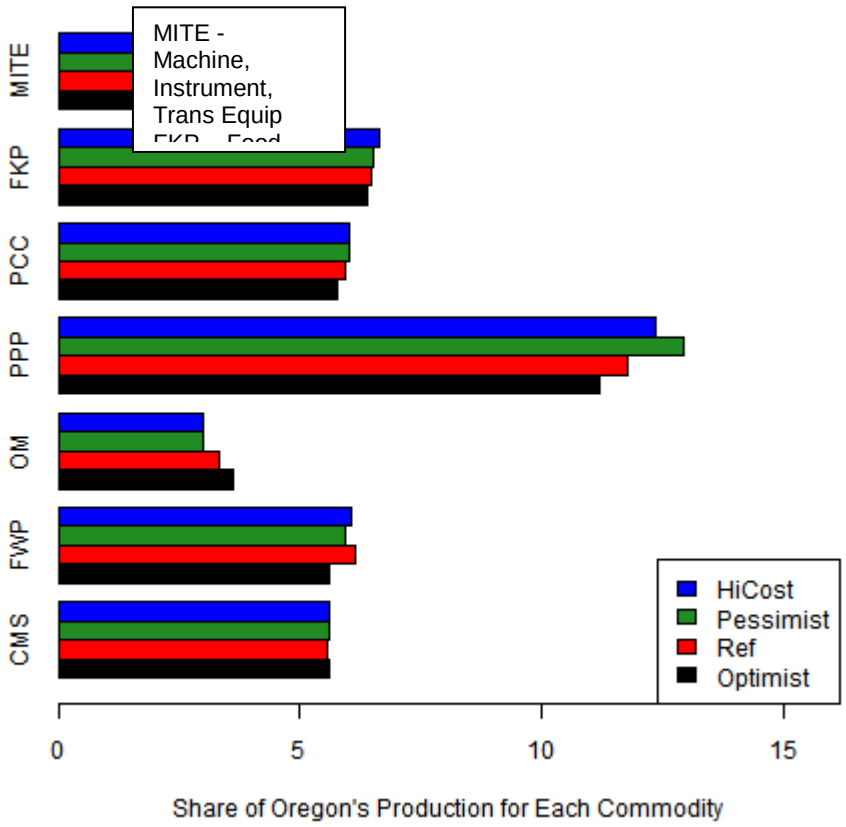


Figure 28 illustrates the destinations for commodities produced in the Northwest ACT. This ACT produces more than 4% of statewide commodities, with the exceptions of Other Miscellaneous Goods, and Machinery, Instruments, and Transportation Equipment. Since the ACT population share is 4%, this demonstrates the Northwest ACT is a relatively heavy producer of goods. The majority of Pulp and Paper products is shipped outside of Oregon. The Northwest ACT produces about 6% of Oregon's Forest and Wood Products, the majority of which is destined to the Portland area.

The upper right-hand corner of Figure 28 provides a table of shares by commodity group for the ACT economy, as well as the legend for the radar plot of commodity categories. The range of shares in this table reveals the variation in production shares across the four analysis scenarios. One can quickly see the most variation occurs in the production of the Machinery, Instruments, and Transportation Equipment group and Petroleum, Coal and Chemicals group. The lower right-hand corner of Figure 28 illustrates the relative shares of commodities destined outside of Oregon. One can quickly see that the largest export for the Northwest ACT in terms of value is Machinery and Instruments, followed by Food and Kindred Products.

Figure 28. Commodity Flow From Northwest ACT to All Destinations

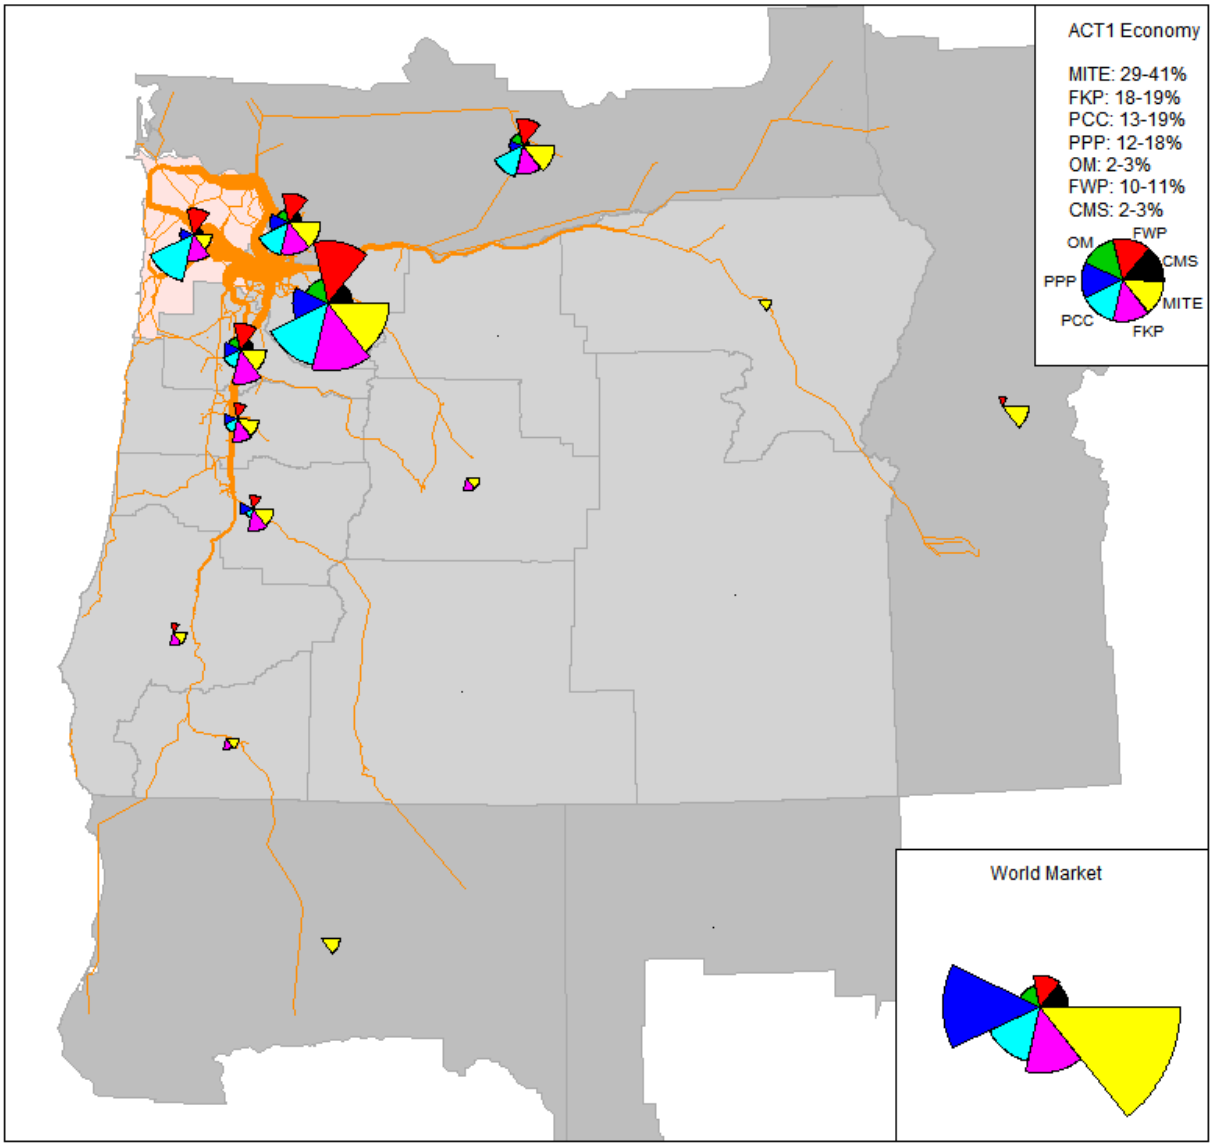

Figure 28 illustrates the relative destination flows of commodities produced in the Northwest ACT. This radar plot illustrates Northwest ACT commodity destinations for all 12 Oregon ACTs, as well as Vancouver, Washington and markets outside of Oregon to the north, south and east for all transportation modes. It is immediately apparent the top three commodities produced in the Northwest ACT, Machinery and Instruments; Food and Kindred Products; and Petroleum, Coal and Chemicals

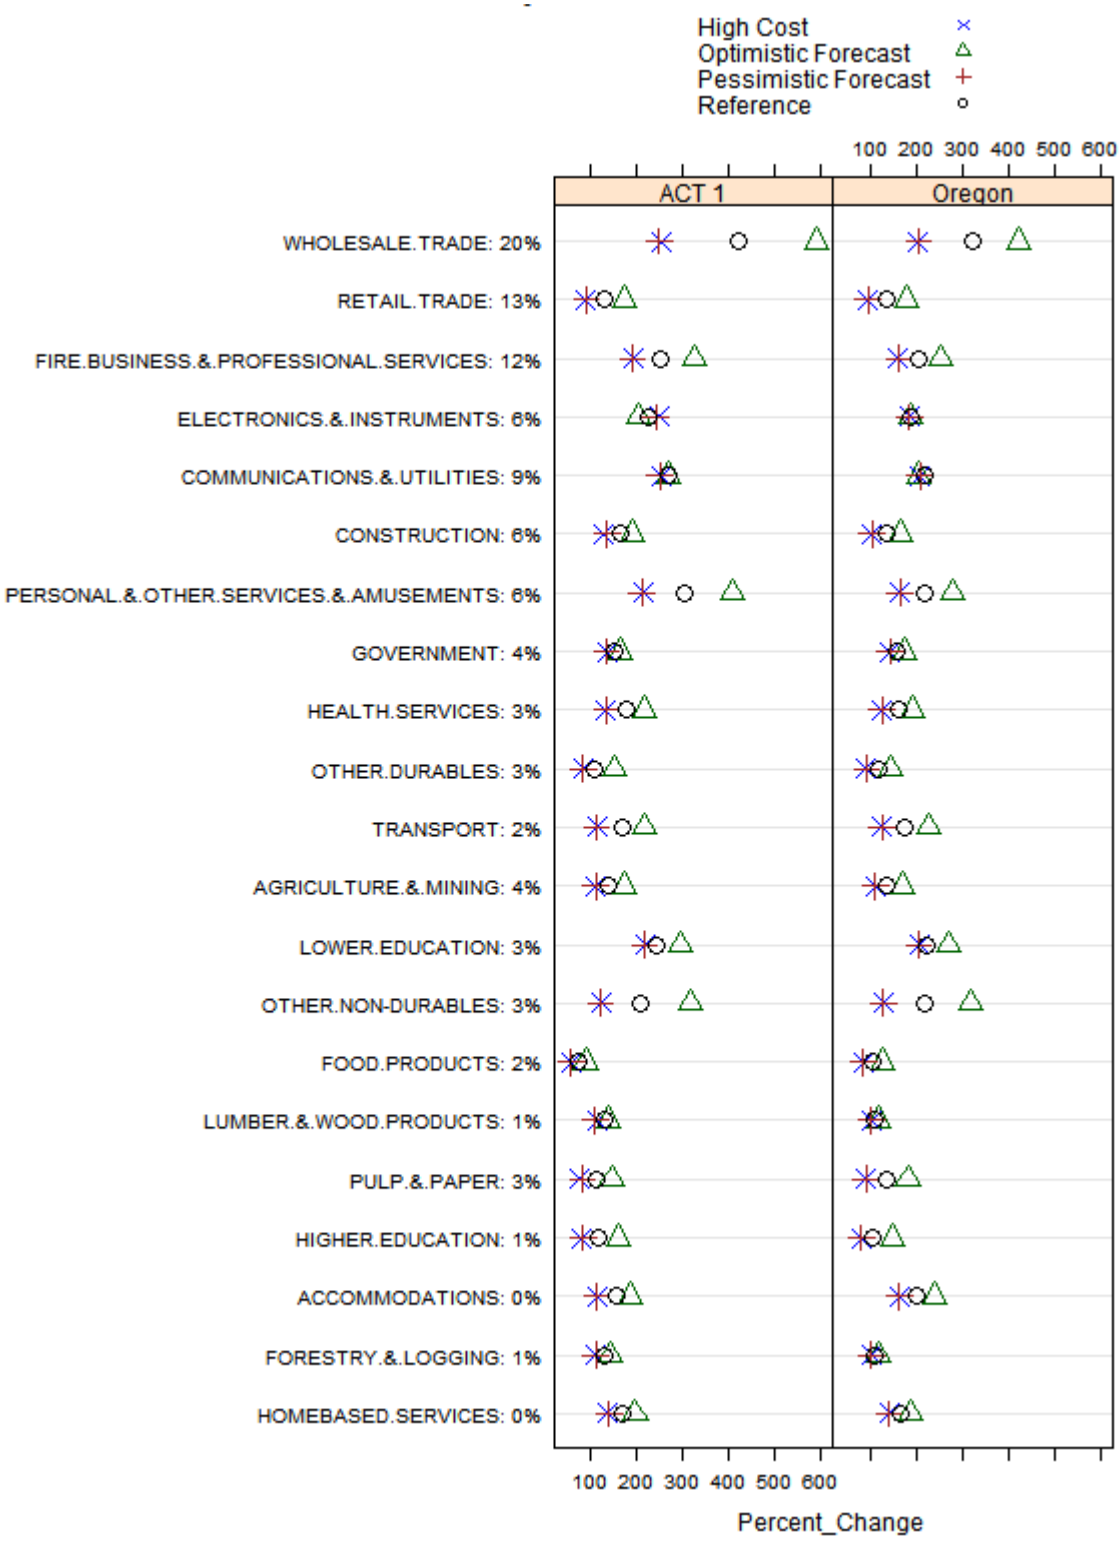
are predominantly destined for the urban areas of Portland, Vancouver, Washington and the Willamette Valley ACTs. The remaining commodity sectors make up the balance of the ACT economy and are distributed fairly evenly across Oregon and the World Market based on relative size of these destination markets. The orange highway network flows represent commodities carried via truck only. To gain better insight into corridors of significance to each ACT, Table 12 provides the share of commodity ton-miles by highway corridor.



Given the location of the Northwest ACT, a relatively small number of corridors dominate commodity highway movement. The Northwest ACT relies on US-30, US-26 and US-101 to get goods to the interstate and other modes such as rail, air and water facilities. Table 12 illustrates the relative significance of the corridors utilized to transport goods to market from the Northwest ACT.

Table 12. Northwest ACT Commodity Flow by Corridor, in Ton-Miles

	Machine, Instrument, Trans Equip	Food Kindred Products	Petroleum, Coal, Chemicals	Paper Pulp Products	Other Misc	Forest or Wood Products	Clay, Mineral, Stone
I-5	25%	30%	13%	25%	30%	17%	21%
US-30	20%	11%	24%	41%	19%	14%	13%
US-26	14%	15%	22%	9%	15%	22%	14%
US-101	6%	8%	10%	5%	9%	9%	13%
OR-47	6%	4%	6%	3%	3%	8%	8%
I-84	11%	12%	1%	2%	5%	2%	2%
OR-6	3%	5%	9%	1%	3%	6%	3%
OR-22	2%	3%	2%	1%	5%	6%	5%
OR-103	1%	1%	1%	1%	1%	3%	4%
OTHER	12%	11%	12%	12%	10%	13%	17%
TOTAL	100%	100%	100%	100%	100%	100%	100%

Twenty-year industry growth for the Northwest ACT is similar to that of the state as a whole. Figure 29 presents the percent change over twenty years of industry output for the ACT and state by industry group for all four scenarios. The industries are listed in order of ACT share of output and the shares are listed after the industry name. The top five industry groups represent sixty percent of total ACT industry output. The industries subject to the most economic volatility are Wholesale Trade; Personal and Other Services; and Other Non-Durables; combined they represent 29% of industry activity in the Northwest ACT. Growth in Wholesale Trade; FIRE, Business and Professional Services; Personal and Other Services is greater than the state as a whole.

Figure 29. Northwest ACT Percent Change in Output by Industry from 2006 to 2027, All Scenarios (including percent of statewide output by industry)

Portland Metro Area (ACT 2)

The Portland Metro Area contains the majority of Oregon's population, representing about 40% of statewide population. A large amount of commodity production for the state comes from the Portland Metro area: about sixty percent of statewide production of Machinery and Instruments and Other Miscellaneous goods and around fifty percent of Pulp and Paper Products, as illustrated in Figure 30. Production activity for Forestry or Wood Products is fairly low in this area. Growth rates for Other Miscellaneous, Pulp and Paper Products, and Petroleum, Coal and Chemicals are subject variation due to economic conditions.

Figure 30. Portland Metro Area Commodity Production by Value: All Scenarios

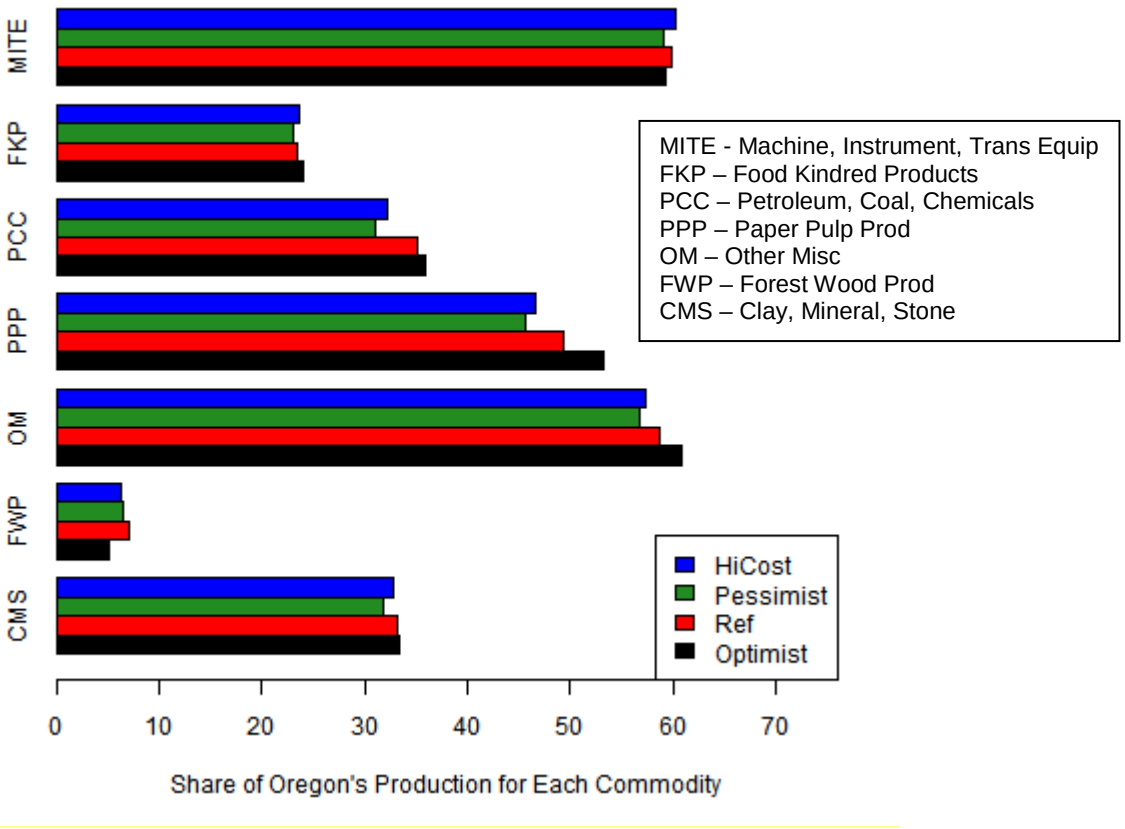


Figure 31 illustrates the destinations of commodities produced in the Portland Metro area for all transport modes. Sixty-two to seventy-six percent of the value of goods destined to market is Machinery and Instruments, which is predominantly destined to export markets, but consumed within the state as well. Other commodity production in Portland represent relatively small proportion of production in terms of value, none making up more than 15% of the Portland economy.

Figure 31. Commodity Flow From Portland Metro ACT to All Destinations

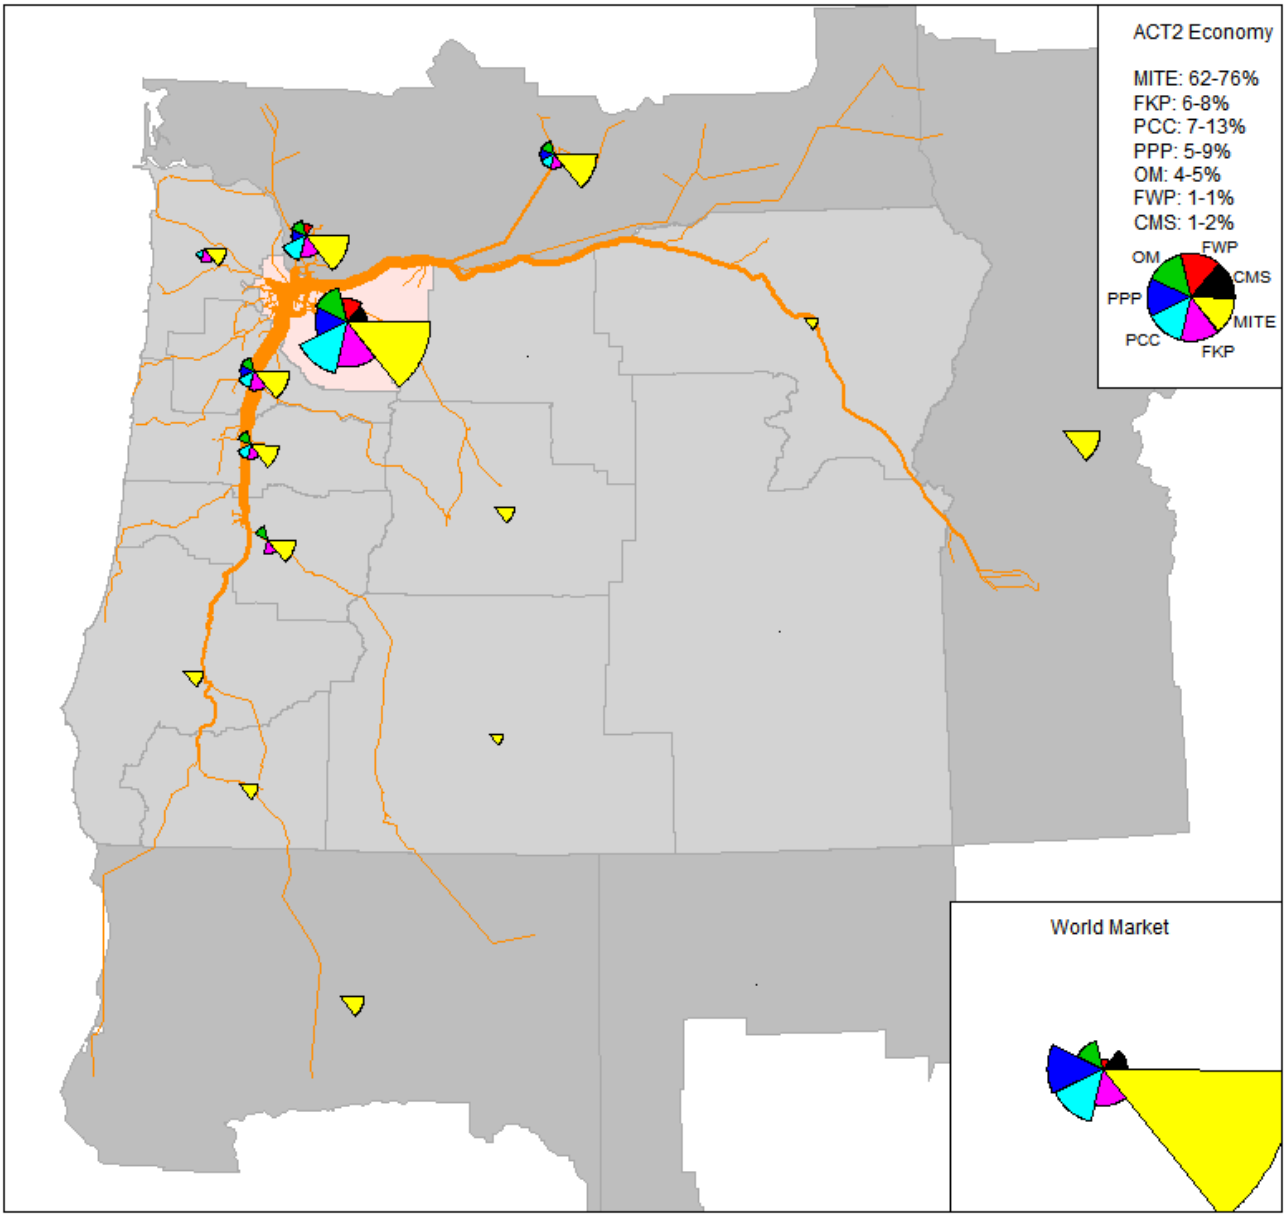

Table 13 presents the relative significance of highway corridors used to transport goods to market for the Portland Metro Area. The Portland Area relies significantly on US-26 and I-205, as well as throughways I-5 and I-84 for its highway commodity flows. Additionally, the Port of Portland and the rail network are critical to the area's (and State's) freight movement to markets. Depending on commodity group, between thirteen and twenty-eight percent of goods travel on other surrounding highways that flow into the main interstate corridors.

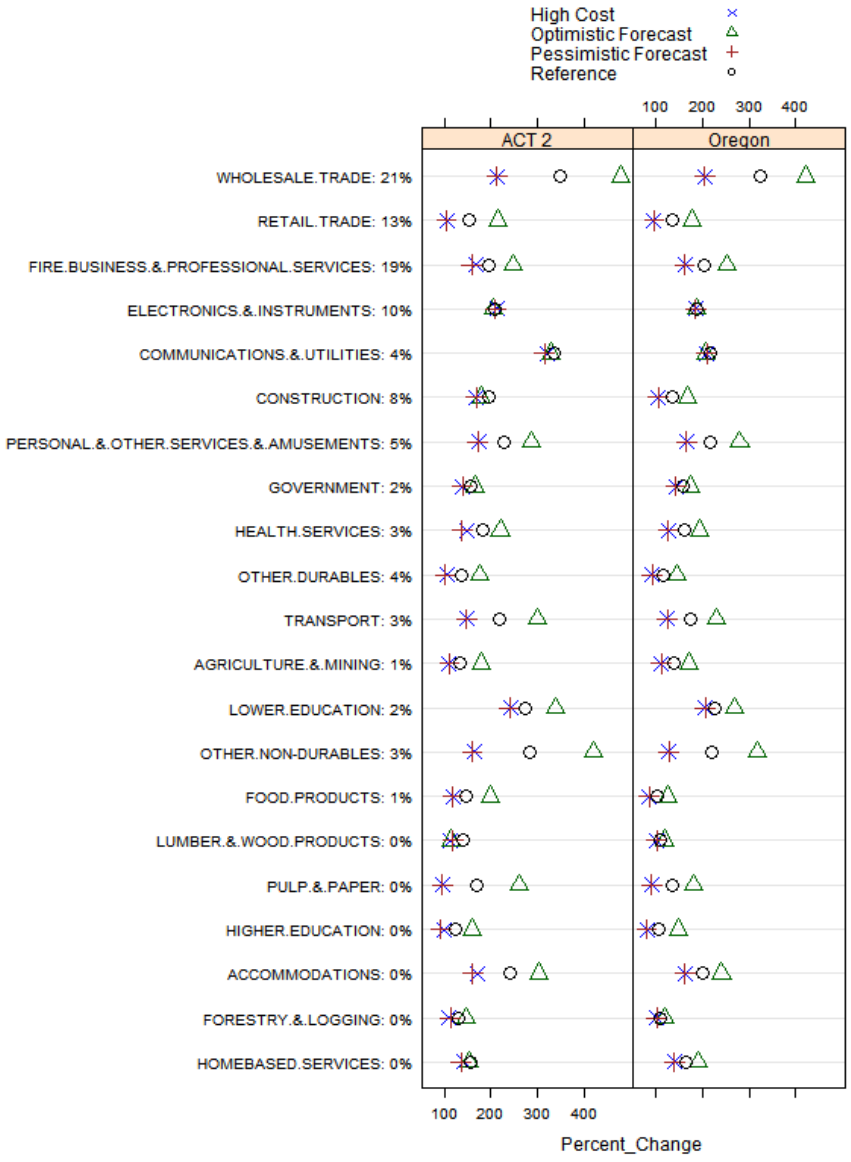

Figure 32 presents the percent change in output by industry over twenty years for all four scenarios. Over half of Portland's industry activity occurs within the industries of Wholesale Trade, Retail Trade and FIRE, Business and Professional Services (percentages are listed after the row's industry title).

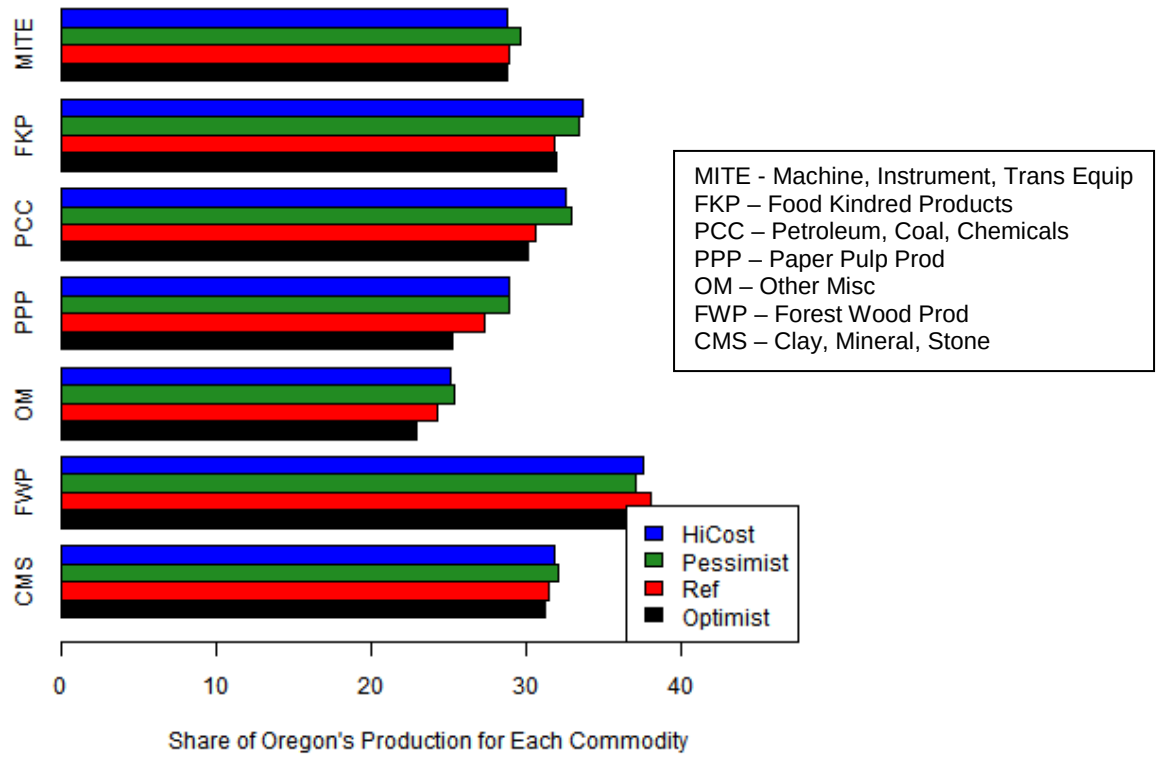
Under the Optimistic scenario, the Wholesale Trade and Retail industries increase more than the state as a whole. Communications and Utilities, Transportation, Lower Education, Other Non-Durables, Food Products, Pulp and Paper, and Accommodations grow more over time than the state in its entirety.

Table 13. Portland Metro Commodity Flow by Corridor in Ton-Miles

	Machine, Instrument, Trans Equip	Food Kindred Products	Petroleum, Coal, Chemicals	Paper Pulp Products	Other Misc	Forest or Wood Products	Clay, Mineral, Stone
I-5	34%	33%	41%	46%	60%	47%	39%
I-84	38%	41%	9%	12%	12%	11%	12%
US-26	8%	6%	12%	8%	6%	11%	12%
I-205	7%	5%	10%	15%	9%	5%	10%
OTHER	13%	15%	28%	19%	13%	26%	27%
TOTAL	100%	100%	100%	100%	100%	100%	100%

Figure 32. Portland Metro Area Percent Change in Output by Industry from 2006 to 2027, All Scenarios (including percent of statewide output by industry)



Willamette Valley Area (ACTs 8, 9, & 12)

The Willamette Valley area includes three ACTs: Mid-Willamette Valley, Cascades West, and Lane County, bound together by similar geography and use of the transportation network. All of these ACTs utilize I-5 as their major shipping artery along with the rail-line which runs alongside I-5. Direct access to these corridors enables Willamette Valley firms to quickly ship to areas along I-5 and to markets outside of Oregon. The Willamette Valley ACTs make up 28% of Oregon's Population (Mid-Willamette – 12%, Cascades West – 6%, and Lane County – 10%).

Figure 33 presents a profile of the commodities produced in the area by value. The magnitude of commodity production within these ACT's is consistent with its population share and balanced across many commodities. Production is somewhat pronounced in Forest and Wood Products, about thirty-five percent of state production, while Other Miscellaneous goods is less prominent. Willamette Valley is exposed to the effects of economic uncertainty given production shares for commodities sensitive to economic conditions, such as Pulp and Paper Products; Other Miscellaneous Goods; Petroleum, Coal and Chemicals; and Food and Kindred Products.

Figure 33. Willamette Valley Area Commodity Production by Value: All Scenarios

Figures 34, 35 and 36 map the destinations for commodities produced in the three Willamette Valley area ACTs. Unlike the rest of Oregon, nearly half of the goods produced in the Willamette Valley area are destined outside of the state, while close to half remains in the Willamette Valley and Portland Metro area. This pattern results in heavy reliance on the I-5 corridor for these ACTs, as well as OR18 and OR22 for the Mid-Willamette Valley ACT, US20, OR34 and OR58 for Cascades West ACT, and OR126 and US20 and OR58 for Lane County ACT. Detail regarding ACT reliance on specific highway corridors is provided in Tables 14, 15, and 16.

TOTAL	100%	100%	100%	100%	100%	100%	100%

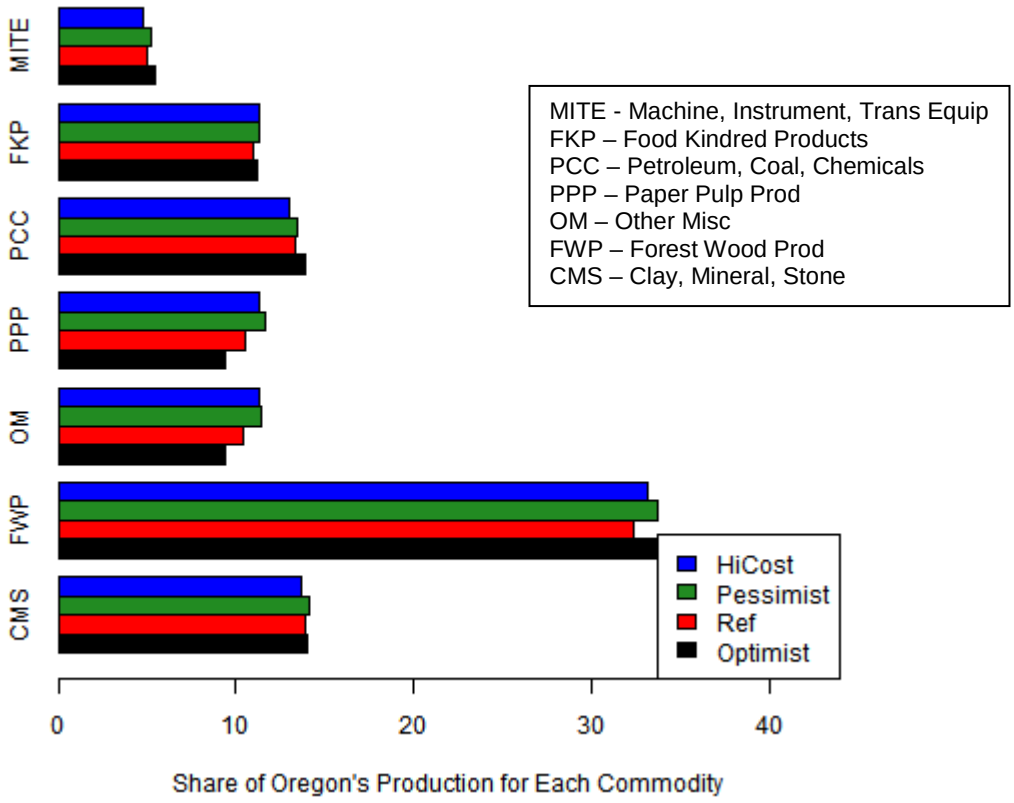
Figure 37 presents the percent change in industry output over twenty years for all four scenarios. There is more variation across scenarios in Wholesale Trade activity in the Mid-Willamette Valley and Cascades West ACTs than the Lane County ACT or the state. The Electronics and Instruments group varies very little across scenarios, with the exception of the Lane County ACT. Construction activity in the Mid-Willamette Valley and Cascades West ACTs vary more across scenarios than the state or Lane County ACT. Mid-Willamette Valley ACT Construction activity varies more across scenarios than the state or the other two Valley ACTs. On the other hand, there is less variation in Other Non-Durables in the Mid-Willamette Valley than Cascades West, Lane County ACT and the state. Finally, higher education grows more for the three Willamette Valley ACTs under strong economic conditions that the state as a whole, which is understandable considering the number of universities in the area.

Figure 37. Willamette Valley ACTs Percent Change in Output by Industry from 2006 to 2027, All Scenarios (including percent of statewide output by industry)



Southwest Oregon (ACTs 4, 5 & 10)

Southwest Oregon, consisting of Southwest ACT (10); Rogue Valley ACT (5); and South Central Oregon ACT (4), makes up about 15% of Oregon's population, including Rouge Valley MPO (RVMPO). Figure 38 provides a profile of the commodities produced in the area in terms of value. Southwest Oregon's economy is predominantly focused on Forest and Wood Products, with a full third of Oregon's statewide production coming out of this area.

Other commodity production shares more closely match the population share for the area, except for the relatively low share of Machinery and Instruments production, only five percent of Oregon's total production. However, this group is a high value commodity that represents a large proportion of the Southwest Oregon economy (South Central Oregon 12-18 percent; Rogue Valley ACT 32 – 41 percent; and South West ACT 18 to 22 percent of total commodity value produced).

Figure 38. Southwest Oregon Commodity Production by Value: All Scenarios

Figures 39, 40, and 41 map the destinations of commodities produced in the three Southwest ACTs. This area of the state requires well maintained local state routes to support access to the interstate routes to get commodities to distant markets. Machinery and Instruments; Food and Kindred Products; and Forest and Wood Products are primarily destined out of the immediate area to the World Market and larger population centers within Oregon.

Tables 17, 18 and 19 illustrate the relative importance of highway corridors used to transport goods to market for the Southwest Oregon area. To ship these commodities to destination markets, this area relies on Oregon routes (OR-140, OR-199, OR-126, and OR58,), as well as the interstate system (I-5, US-97, and US-101.)

Figure 42 presents the percent change in industry output over twenty years for all four scenarios. South West Oregon follows the state trends very closely. Two industries that vary under different economic conditions play a significant role in the South West economy: Wholesale Trade and Personal & Other Services & Amusements, making up over 30 percent of the regional economy. Fluctuations in these industries impact regional production and employment. Note that the South Central Oregon Act (4) realizes greater variability in the Pulp and Paper industry than the state in general.

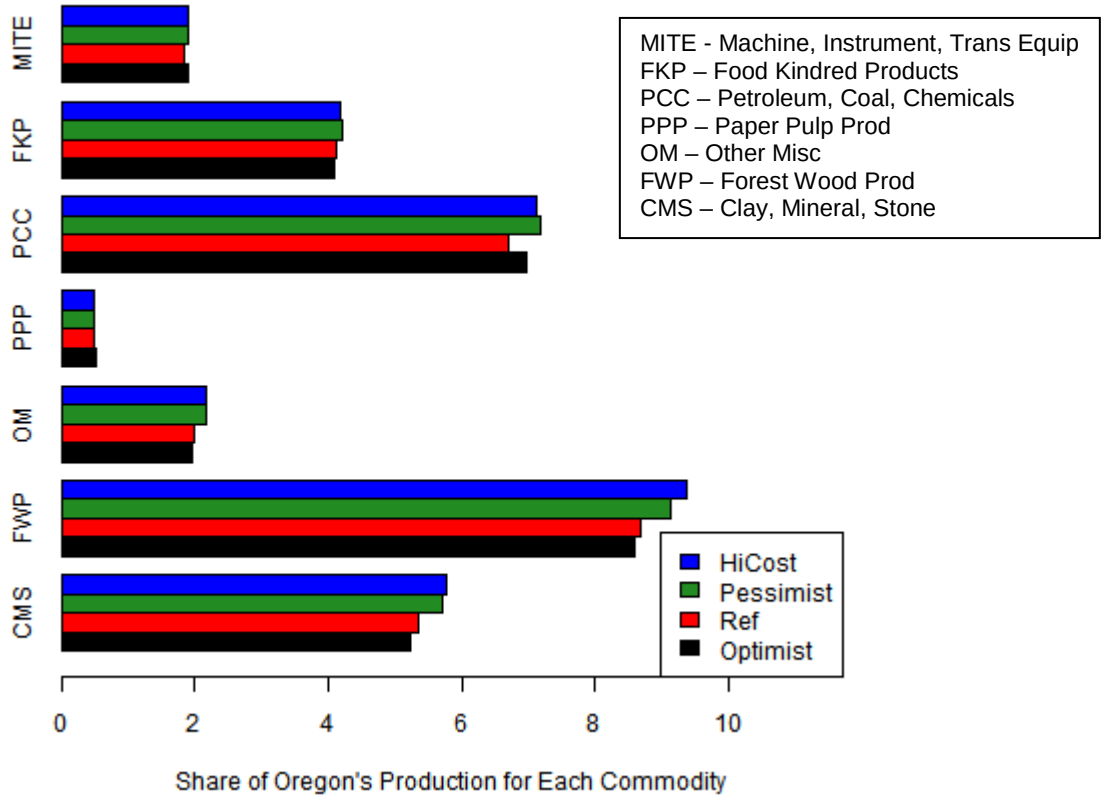

Figure 42. South West Oregon Percent Change in Output by Industry from 2006 to 2027, All Scenarios (including percent of statewide output by industry)

Central Oregon (ACTs 6 & 7)

Central Oregon includes two ACTs: Lower John Day (6) and Central Oregon (7.) Lower John Day ACT population center is the City of The Dalles along the Columbia Gorge. Central Oregon ACT includes the cities of Bend, Redmond and Prineville. Together, these two ACTs represent about 7% of Oregon's population, over eighty percent of which are located in the Central Oregon ACT. Figure 43 provides a profile of the commodities produced in the area in terms of value. Central Oregon's economy is predominantly focused on Forest and Wood Products and Petroleum, Coal and Chemicals group. This area produces a disproportionately high share of statewide production of Forest and Wood products. The share of commodity production remains fairly stable as economic conditions change, compared to other areas of Oregon.

Figure 43. Central Oregon Commodity Production by Value: All Scenarios

Figures 44 and 45 illustrate the destinations of commodities produced in the two Central Oregon ACTs. The Lower John Day ACT economy is dominated by production of Food and Kindred Products and Petroleum, Coal and Chemicals. Together these two groups cover between sixty and seventy percent of the commodity production in this ACT. Figure 44 includes commodity flows for all modes, so the port activity within the ACT is included. One can see the predominant destination for Petroleum, Coal and Chemicals is to the north, with internal destinations in the Portland area, internally within Lower John Day Act and to the east in the North East ACT. Food and Kindred Products are predominantly destined for the Portland and Vancouver area, and other population centers of the state. Machinery and Instruments group represents about twenty percent of the ACT economy, with destination markets to the north, Portland and Vancouver, and the Willamette Valley. Shipping via the Columbia River is important to the Lower John Day ACT, including the rail line. More

detail related to activity at the ports is available from other research done in support of the Oregon Freight Plan.

Several highway corridors are important for commodity flows for this area. Table 20 illustrates the relative importance of highway corridors used to transport goods to market for the Lower John Day ACT. A large share of goods are shipped to the Portland/Vancouver area and out of state, making both I-5 and I-84, US97, US26, US20 and US-197 important corridors for Central Oregon.

Figure 44. Commodity Flow From Lower John Day ACT to All Destinations

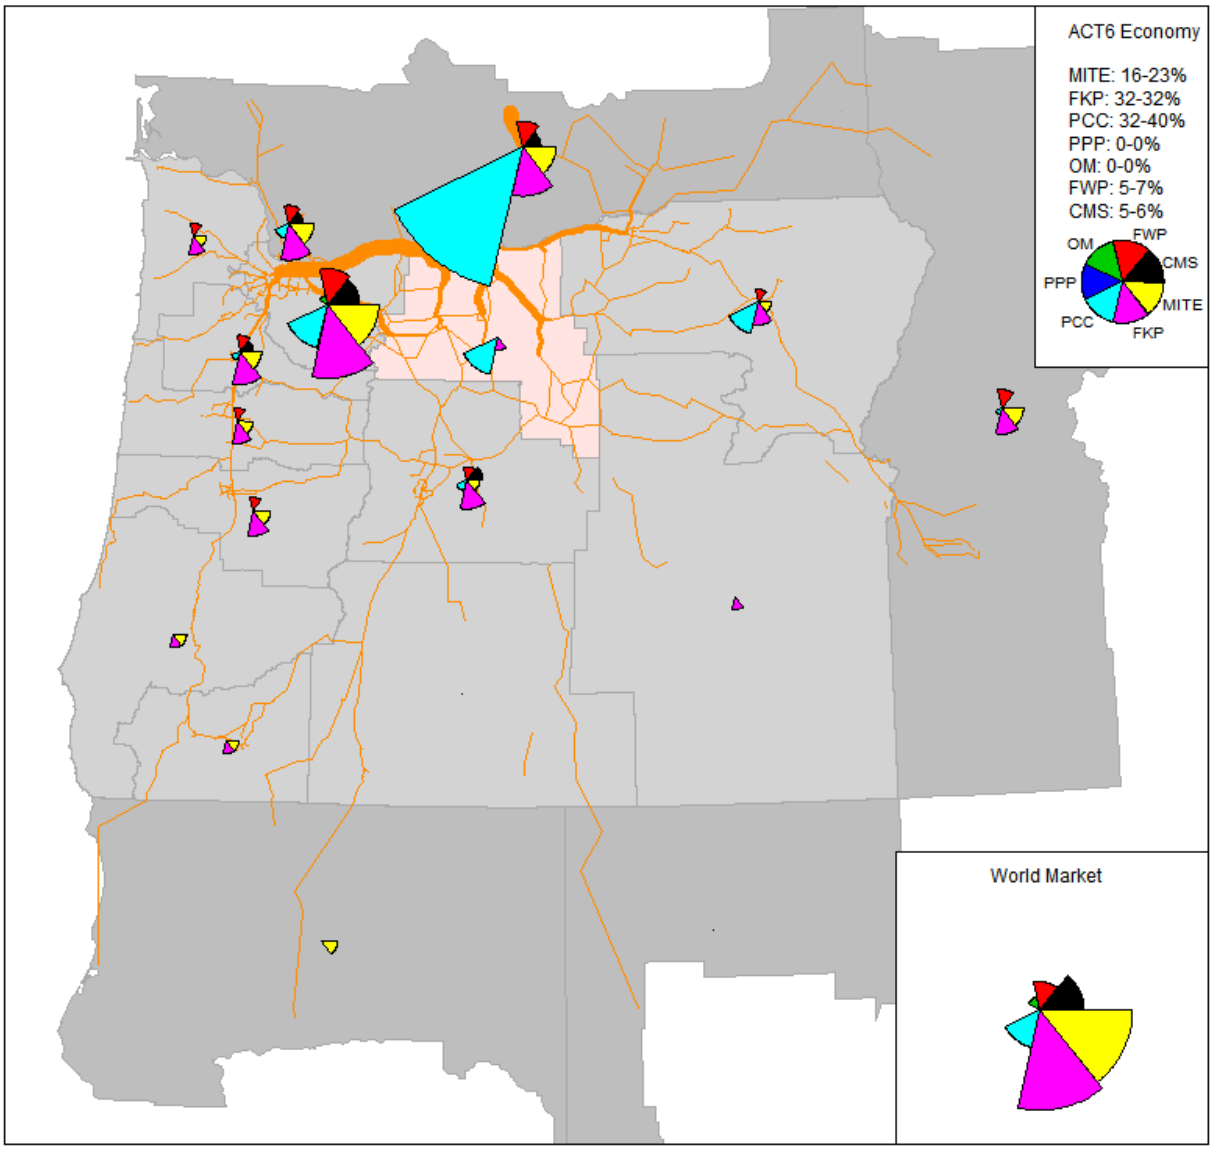

Table 20. Lower John Day ACT Commodity Flow by Corridor in Ton-Miles

TOTAL	100%	100%	100%	100%	100%	100%	100%

Figure 45 illustrates the destinations of commodities produced in the Central Oregon ACT. The Central Oregon ACT economy is dominated by four commodity groups: Machinery and Instruments; Forest or Wood Products; Petroleum, Coal and Chemicals; and Food and Kindred Products. These four groups make up over eighty percent of the economy. Destination markets for Machinery and Instruments are mostly the Portland area and out of state, Forest or Wood Products and Petroleum, Coal and Chemicals are shipped within the Central Oregon ACT, Portland, and out of state. Food and Kindred Products are destined for Portland, the Willamette Valley region, within the ACT itself, as well as outside of the state.

Most goods are transported via truck, as can be seen in Figure 45 by the orange highway network flows. Table 21 illustrates the relative significance of highway corridors used to transport Central Oregon goods to destination markets. Significant corridors for this area include US-97, US-26, and US-20.

Table 21. Central Oregon ACT Commodity Flow by Corridor in Ton-Miles

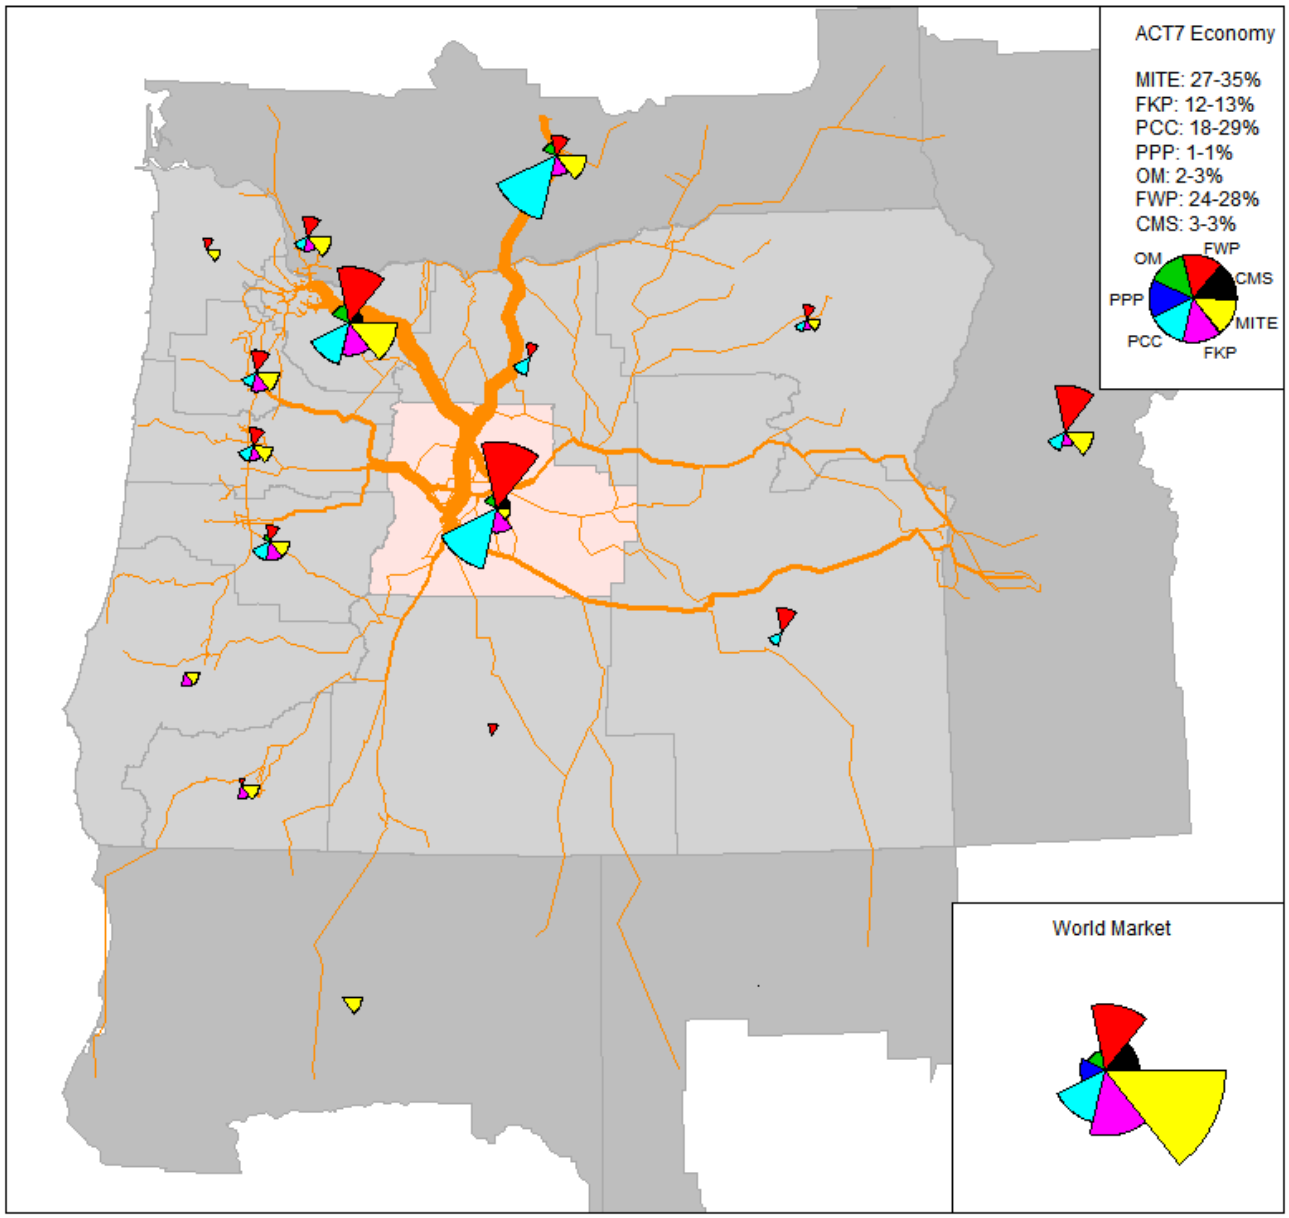
Figure 45. Commodity Flow From Central Oregon ACT to All Destinations



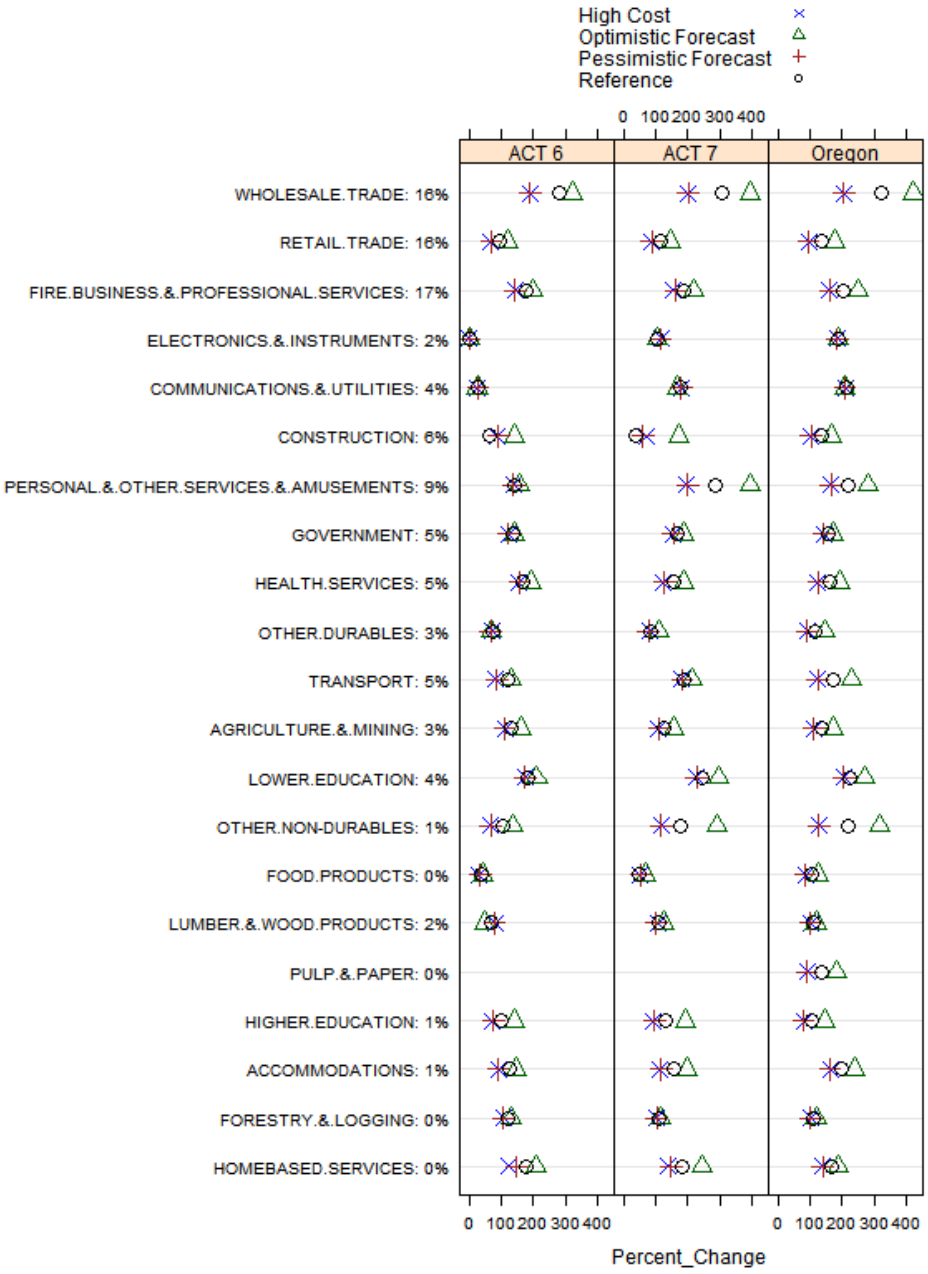


Figure 46 presents the change in industry output over twenty years for the Central Oregon ACTs and the state by industry group for all four scenarios. Central Oregon's Industry is more focused then Oregon as a whole, which exposes the region to economic variability. Wholesale Trade; Retail Trade; FIRE, Business and Professional Services; and Personal and Other Services make up nearly sixty percent of the industry output for the Central Oregon ACT. The variation in industry activity for this area is similar to the state as a whole, with a couple of exceptions. Wholesale Trade grows a little less that the state over the forecast twenty years. Change in Construction activity in the Central Oregon ACT (7) is higher than the entire state for the Optimistic Scenario. Personal and Other

Services, and Other Non-Durables industries are very stable in the Lower John Day ACT, but vary more for the Central Oregon ACT than the state as a whole.

Figure 46. Central Oregon Area Percent Change in Output by Industry from 2006 to 2027, All Scenarios (including percent of statewide output by industry)

Eastern Oregon (ACTs 3 & 11)

The Eastern Oregon area represents the least populous part of the state, less than four percent of state population, but more than one third of the area in land. Population centers include Pendleton, LaGrande and Baker City in the North East ACT (3), Ontario and Burns in the South East ACT (11.) A good deal of the land is used for agricultural production activity, such as producing Food and Kindred Products. Figure 47 illustrates the production shares for the state from Eastern Oregon. The Food and Kindred Products group produced in Eastern Oregon represents about 20 percent of the total statewide production. A relatively large share of Clay, Mineral and Stone; and Petroleum, Coal and Chemicals commodity groups are produced within this region as well.

Figure 47. Eastern Oregon Commodity Production by Value: All Scenarios

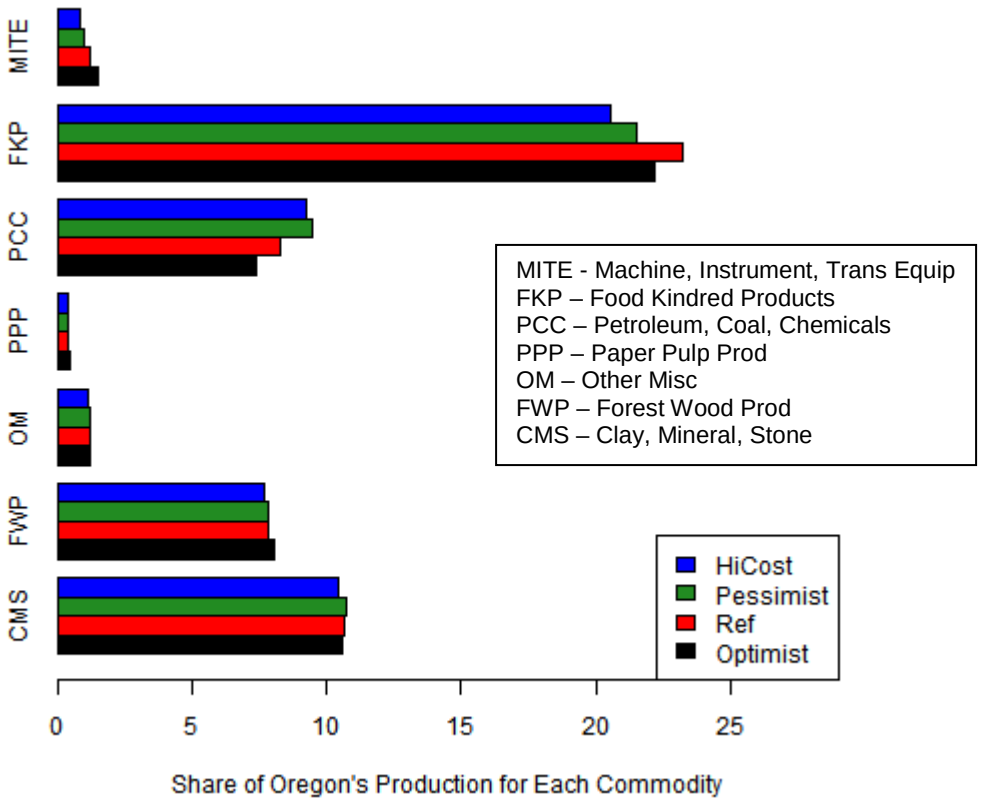

Figure 48 maps the destinations of commodities produced in the North East ACT. Food and Kindred Products make up over half of the ACT economy. A proportion of these goods are consumed within the ACT, but most are destined out of state or to the Portland/Willamette Valley area. The other commodities of regional significance are Petroleum, Coal and Chemicals; and Forest or Wood Products, most of which are destined outside of the state, within the ACT or to the Portland area. Machinery and Instruments represent more than ten percent of the regional economy, but this is a relatively small share in terms of statewide production (less than three percent.)

The Oregon highway flows illustrated in orange in Figure 48 demonstrate the relative significance of corridors on which ACT goods flow. Table 22 provides more detail by specific highways. I-84 (and I-82), along with US-97 and OR-11 are relied upon by the North East ACT to get goods to market destinations.

Figure 48. Commodity Flow From North East ACT to All Destinations

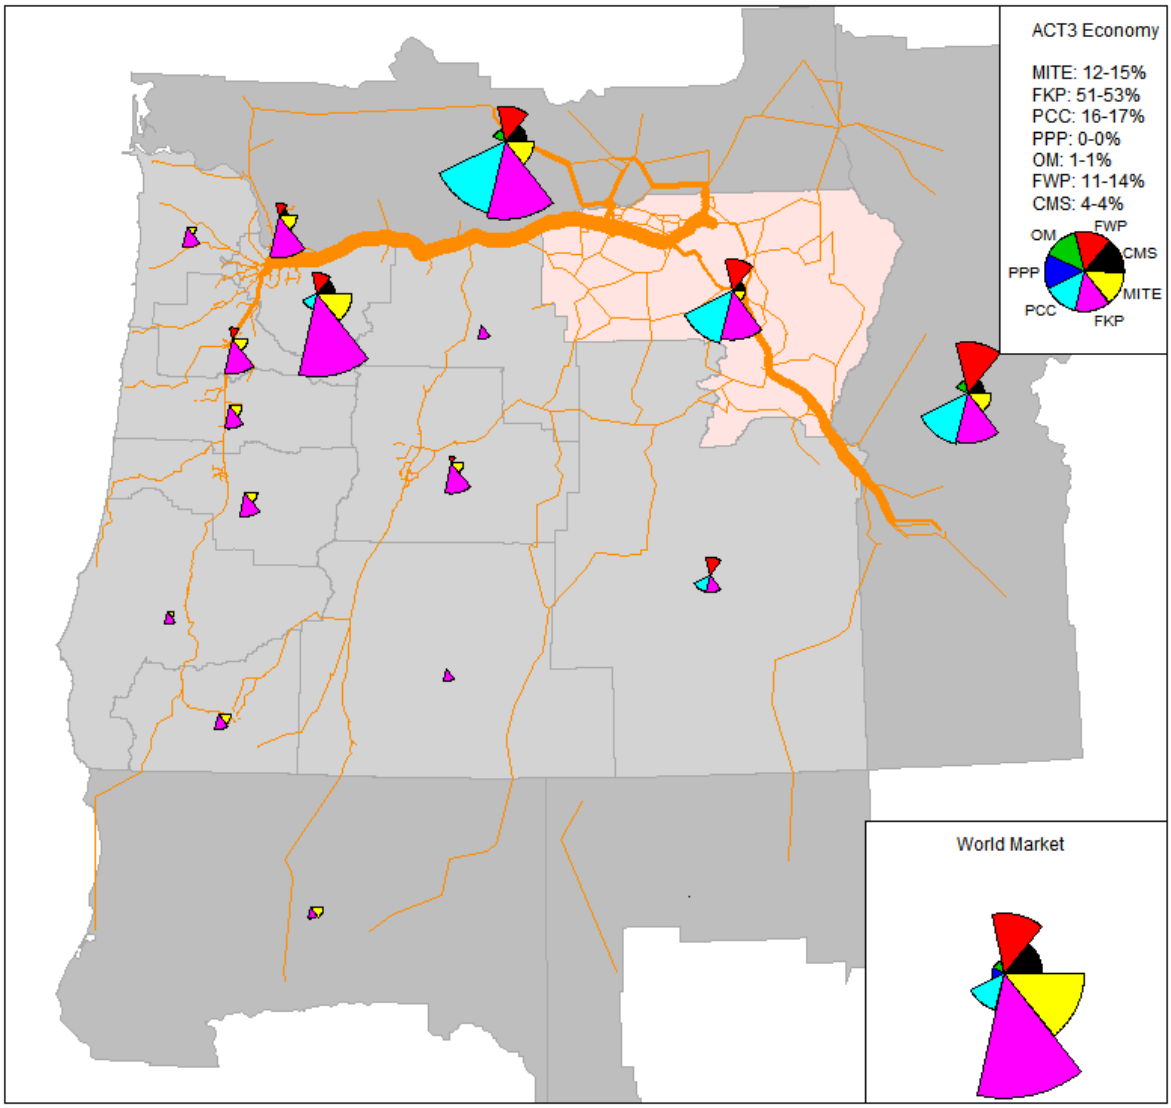

Table 22. North East ACT Commodity Flow by Corridor in Ton-Miles							
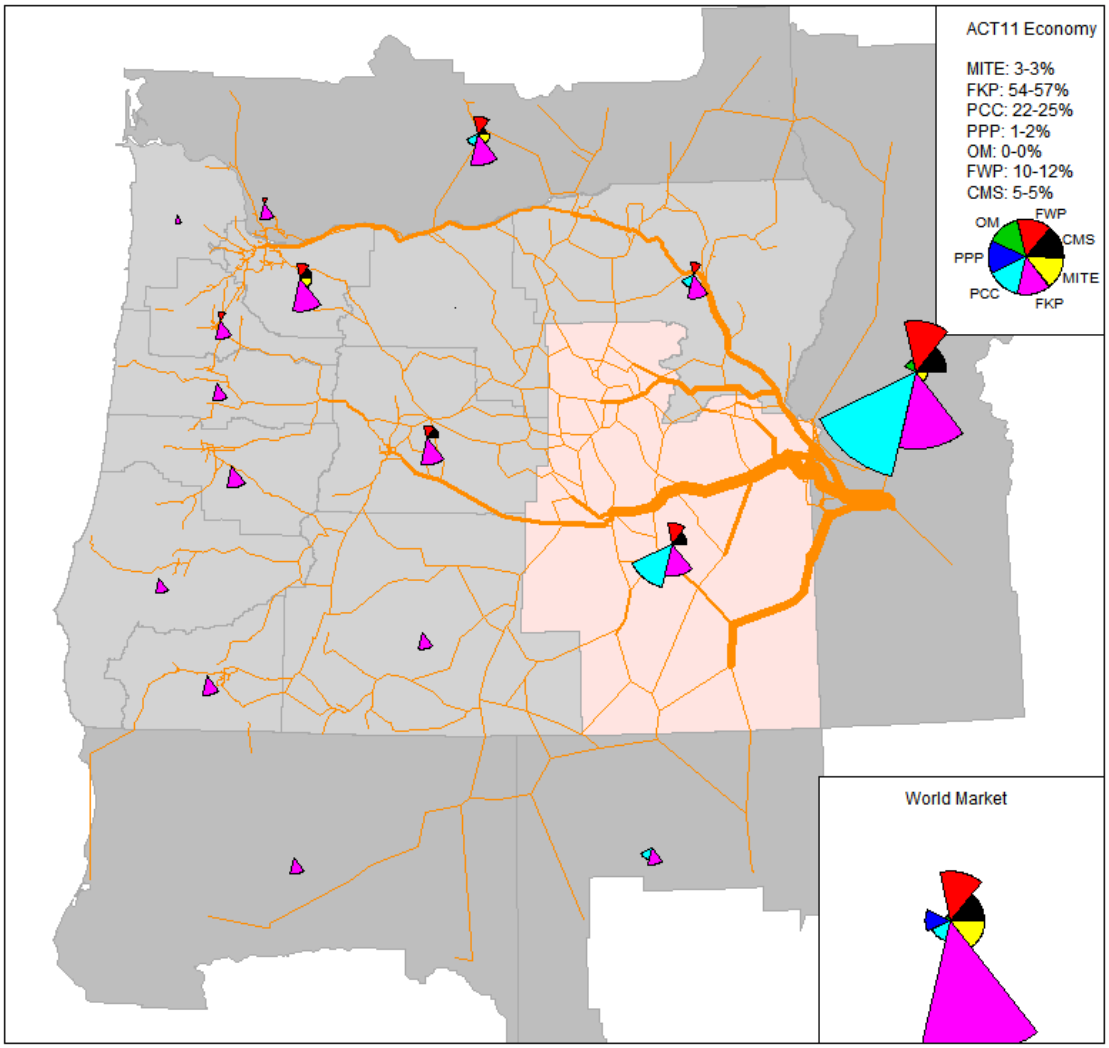
	Machine, Instrument, Trans Equip	Food Kindred Products	Petroleum, Coal, Chemicals	Paper Pulp Products	Other Misc	Forest or Wood Products	Clay, Mineral, Stone
I-84	75%	67%	60%	64%	70%	55%	47%
I-82	5%	2%	7%	7%	5%	5%	2%
US-97	4%	6%	2%	3%	5%	2%	1%
OR-11	1%	8%	3%	5%	4%	4%	8%
OR-207	1%	2%	5%	1%	2%	7%	7%
OTHER	14%	15%	23%	20%	14%	27%	35%
TOTAL	100%	100%	100%	100%	100%	100%	100%

Figure 49 illustrates the destinations of commodities produced in the South East ACT. Food and Kindred Products play a dominant role in the South East ACT economy, representing over fifty percent of commodity production. This commodity group is predominantly destined to markets outside of Oregon, but Figure 49 demonstrates a significant amount is destined within the state. The second largest commodity group for the South East ACT is Petroleum, Coal and Chemicals group, which represents over twenty percent of the ACT commodity production. A large share of this commodity remains within the ACT, most of which destined out-of-state. Forest or Wood Products make up about ten percent of the ACT commodity production, destined to surrounding ACTs, but predominantly out-of-state.

The highway commodity flows illustrated in orange in Figure 49 reveal the relative significance of highway corridors on which South East ACT goods flow. Table 23 provides more detail by specific highways. I-84, US-20, US-26, and OR-395 are key facilities for getting goods to destination markets for this ACT.

Figure 49. Commodity Flow From South East ACT to All Destinations



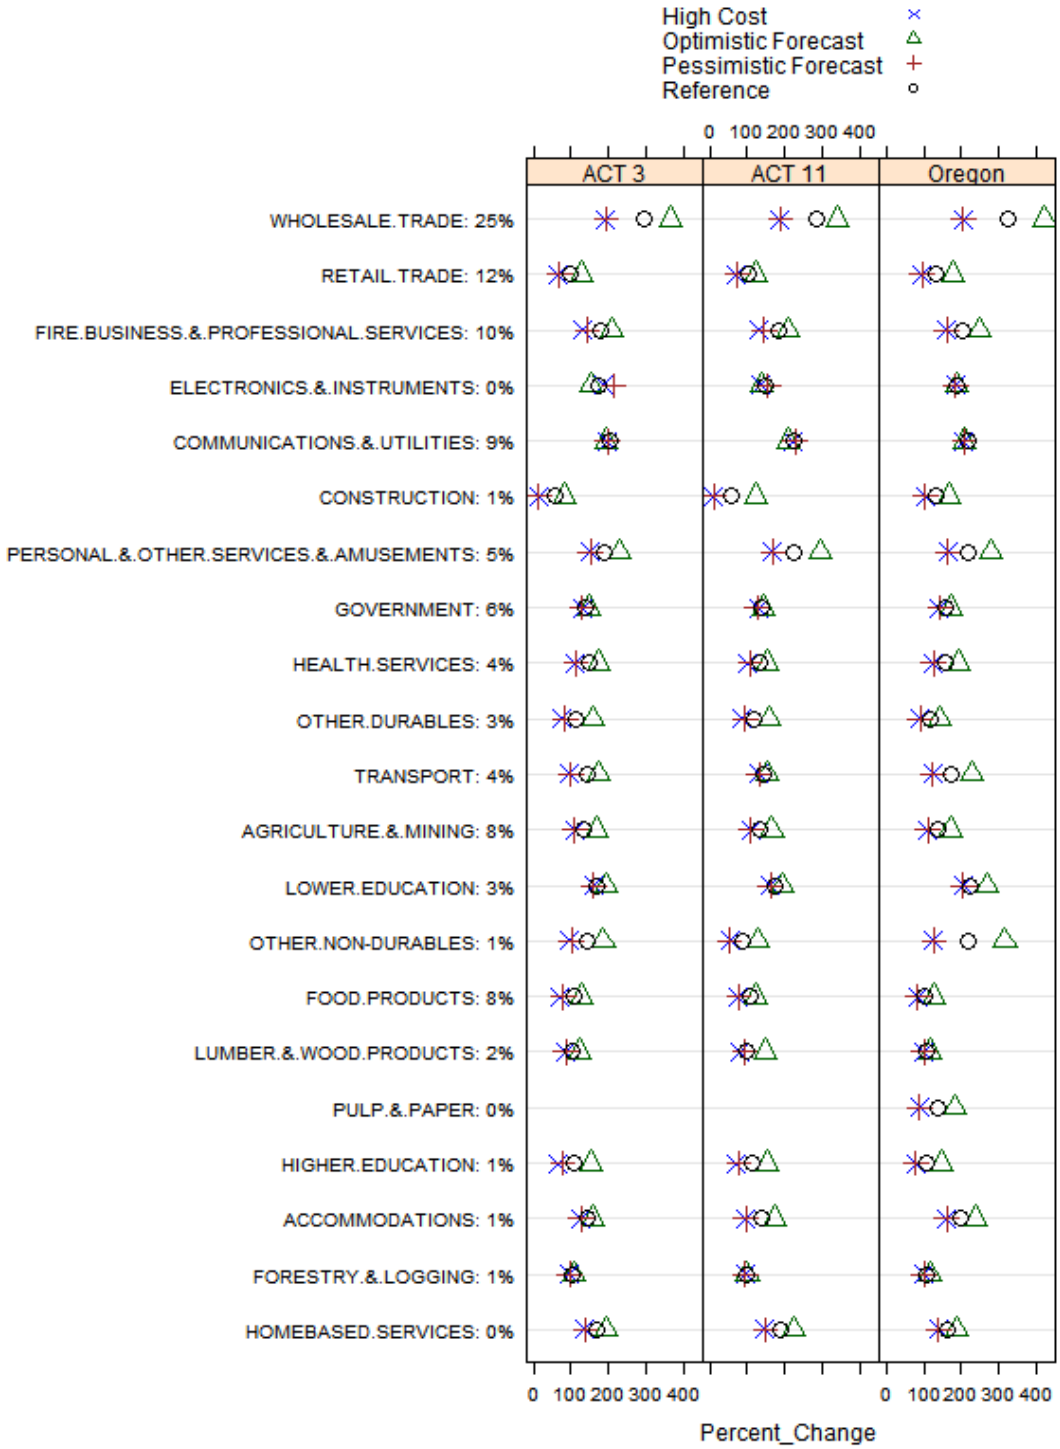


Table 23. South East ACT Commodity Flow by Corridor in Ton-Miles

TOTAL	100%	100%	100%	100%	100%	100%	100%

Figure 50 presents the change in industry output over twenty years for Eastern Oregon ACTs and the state by industry group for all four scenarios. Eastern Oregon's Industry mix is dominated by three industries. Wholesale Trade (25%), Retail Trade (12%), and FIRE, Business and Professional Services (10%) make up nearly fifty percent of the industry output of Eastern Oregon. Variation in industry growth for these three sectors is dependent on economic conditions, similar to the state. Eastern Oregon industry growth is consistent with statewide patterns. Communications and Utilities, Agriculture and Mining, and Food Products represent another 25% of ACT production, with less growth variation under different economic conditions.

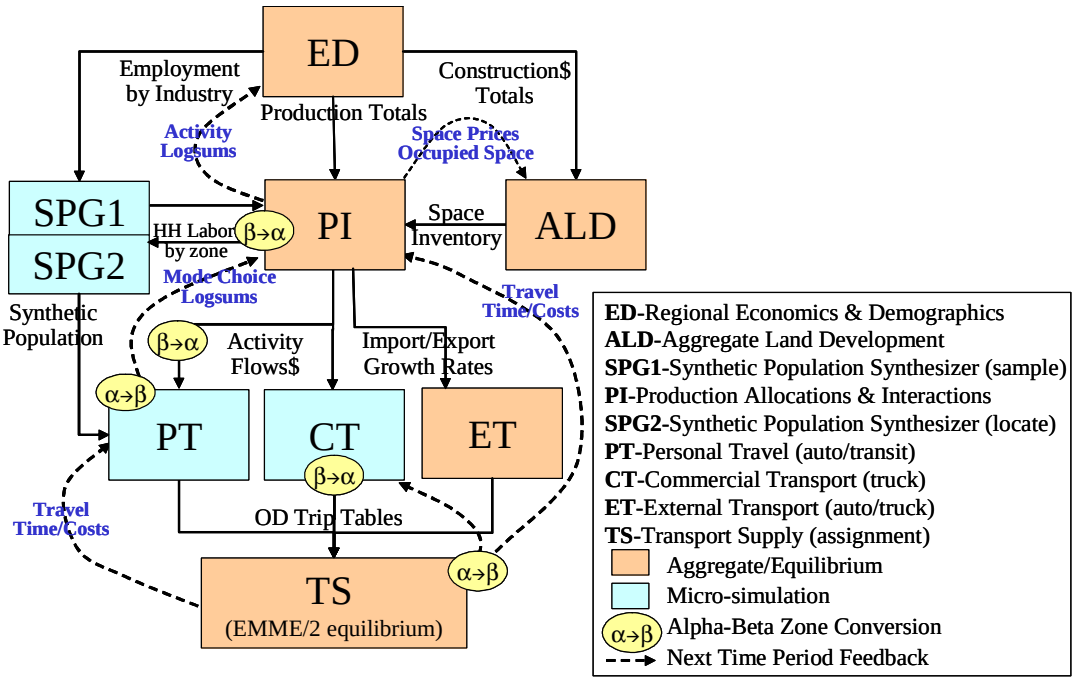
Figure 50. Eastern Oregon Percent Change in Output by Industry from 2006 to 2027, All Scenarios (including percent of statewide output by industry)

Conclusion

Oregon will realize significant increases in freight flows over the next thirty years. Even if the rate of growth is lower than current economic forecasts predict and the cost of transportation rises, the demands on the freight system will be great. While the precise mix of industry activity is challenging to predict, economic inertia causes the prevailing commodity mix and regional flow patterns to remain generally intact under different economic conditions. Oregon relies on a network of corridors to get goods to market. Many of Oregon goods are destined to locations within the state, while others are destined to markets beyond Oregon borders. These corridors also accommodate freight moving through the state

Oregon freight movement patterns result from the combined decisions and actions of thousands of "economic actors" – not only the buyers and sellers, but the links between them, such manufacturers, shippers, distribution centers, warehouses, distributers and consumers. Each industry follows a distinct logistics pattern, some requiring fast, reliable transportation of goods, while others look for the least expensive modes to take advantage of economies of scale. Some goods move via multiple freight modes, combinations of air and truck, or rail and truck, making adaptive changes to remain competitive as market conditions vary over time.

All this reveals the importance of creating a system that supports the activity of a variety of users, keeping in mind the facilities are shared with passenger transportation modes, as well as freight moving through the state. Not only does system use vary by industry and commodity, it also varies by region of the state.



Appendix A – Oregon Statewide Integrated Model 2 (SWIM2) Overview

The Oregon Statewide Integrated Model (SWIM2) is an integrated land use transport model covering the entire State of Oregon. It is a second generation model, drawing on previous work done on the First Generation Statewide Model (SWIM1) and the Eugene-Springfield UrbanSim Model. The SWIM1 model was a customized version of the TRANUS software. SWIM2 is a more disaggregate and complex customized framework that combines a PECAS spatial model (Production, Exchange, and Consumption Allocation System) with activity-based transport models. SWIM2 augments the First Generation SWIM1 Model in more complex applications of Oregon statewide policy and investment decisions. Future SWIM2 model upgrades will be driven by policy application needs.

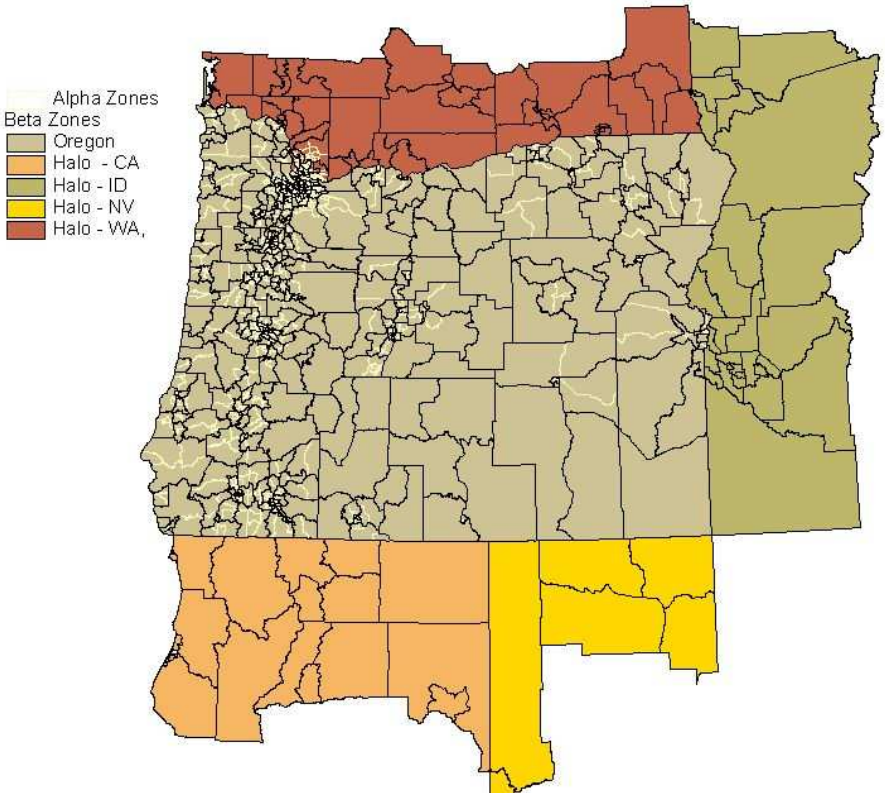
The development of both the first and second generation models was commissioned by the Oregon Department of Transportation as part of its Transportation and Land Use Model Improvement Program (TLUMIP) within the larger Oregon Model Improvement Program (OMIP). The model development has been undertaken by a series of teams led by Parsons Brinckerhoff, with Hunt Analytics, HBA Specto, EcoNorthwest and The University of Washington playing key roles as sub-contractors. The program has also been guided by an international Peer Panel.

SWIM2 contains nine modules as shown in Figure A.1. Each was developed and calibrated independently before proceeding with full system integration. The full model calibration of all modules in both a baseyear and trends over time was then completed and shared with the TLUMIP Peer Panel. The full model is run every 3 years, while the spatial-economic modules (ED-SPG1-ALD-PI) run every year.

Figure A.1. Modules and Flows in the Oregon Statewide Integrated Model (SWIM2)

SWIM2 operates at two geographic levels (Figure A.2). Both encompass 36 Oregon and 39 (Halo) adjacent state counties. The halo encompasses a roughly 50-mile buffer around Oregon. A system of alphazones (light and dark lines in Figure A.2) is the most disaggregate zone system. There are 2,950 alphazones within the model boundaries (2,575 zones in Oregon and 375 in the Halo) and 12 extermal stations (Table A.1 and Figure A.3). The External Stations serve as model area entry/exit points or gateways.

Figure A.2. SWIM2 alphazone and betazone Systems



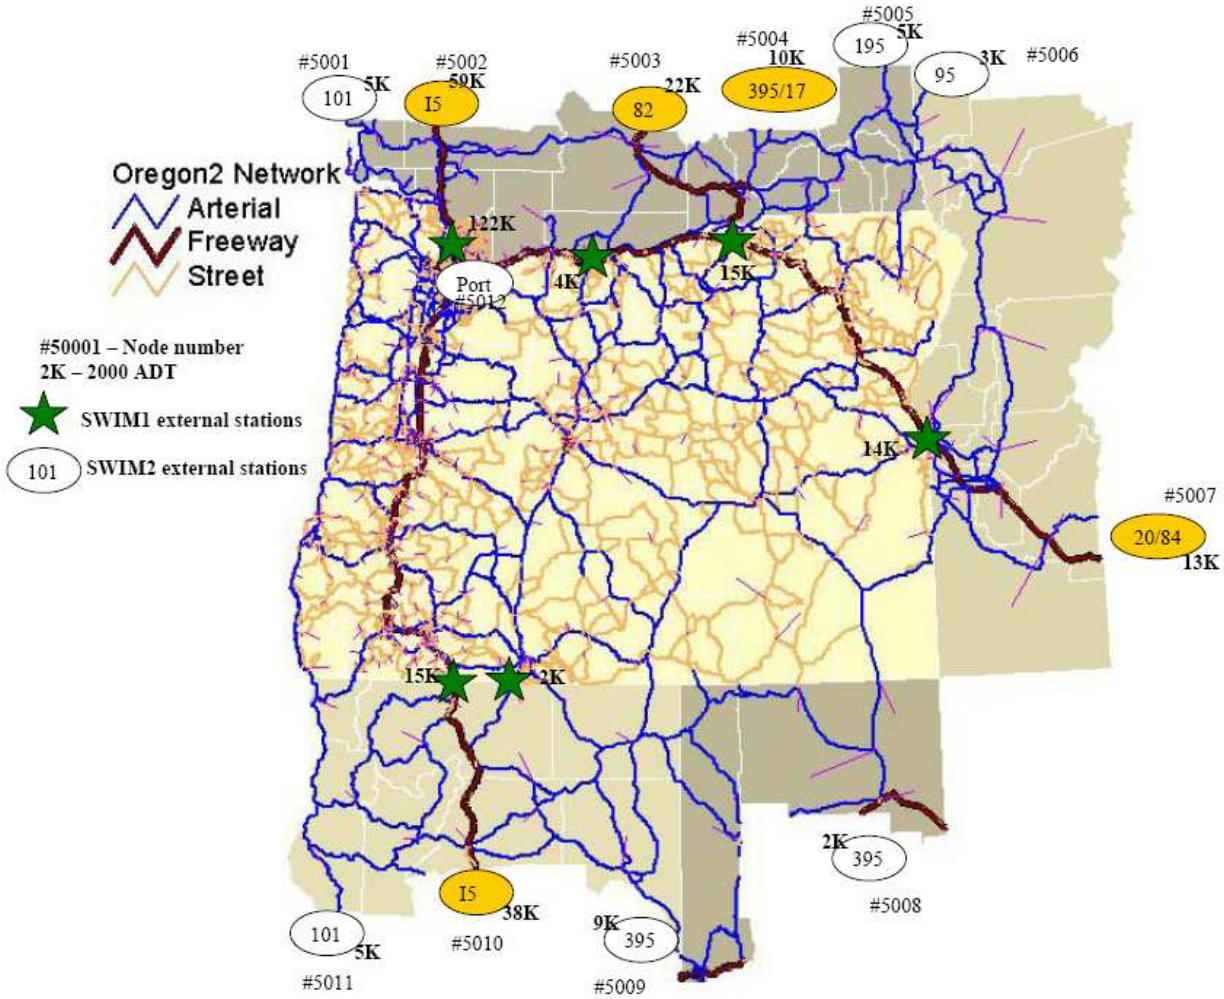


Table A.1. SWIM2 External Stations

SWIM2 Node#	External Station Description
5001	US101 (WA)
5002	I-5 (WA)
5003	I-82 (WA)
5004	US395/WA17 (WA)
5005	US195 (WA)
5006	US95 (ID near WA border)
5007	I-84/US20 (ID)
5008	US95 (NV, just north of I-80)
5009	US395 (CA, just north of I-80)
5010	I-5 (CA)
5011	US101 (CA)
5012	Port of Portland Terminal 6

Figure A.3. Map of SWIM2 External Stations

The Production Allocation and Interactions (PI) module operates on a more aggregated betazone system (dark lines in Figure A.2) and replace the 12 External Stations with six World Markets (Table 2.2). There are 518 betazones, collapsing zones only within Oregon, with a focus on the small urban zones. For example, the roughly 970 alphazones in Portland were collapsed to approximate a set of 66 employment regions used by the Metro MPO model. In other urban areas, zones were collapsed based on a sliding population scale (approximately 25,000 persons/zone), respecting similar employment clusters and transportation commute sheds. In rural areas, homogenous public lands (e.g., BLM, National Forests) were collapsed, while retaining most county and all ACT boundaries (Area Commissions on Transportation (ACTs), used in Oregon transportation planning, provide a convenient way to divide the State into 12 areas).

The six World Markets, used only in the PI module, are defined in Table A.2 and Figure A.4 and A.5 including the assumptions on distance to reach these markets beyond the model halo boundary. It is assumed that goods transported by truck and rail is limited to the US (except Hawaii), Canada and Mexico. Imports and Exports to other regions in the world are shipped by barge, either from the Portland port or from other US East or Southeast ports. The Air mode is not estimated, since it represents less than 1 percent of all goods movement in Oregon, and at most 2 percent of any single commodity's flows. Reporting for that mode is handled outside the SWIM.

The distance represents the weighted average distance from the halo boundary to the centroid of the World Market. In the case of the Oceanic market (zone 6005), an equivalent distance was identified that would result in the correct overall shipping costs. The 'local' World Market 6006 is assumed to support commodities that are traded within 75 miles of the model area.

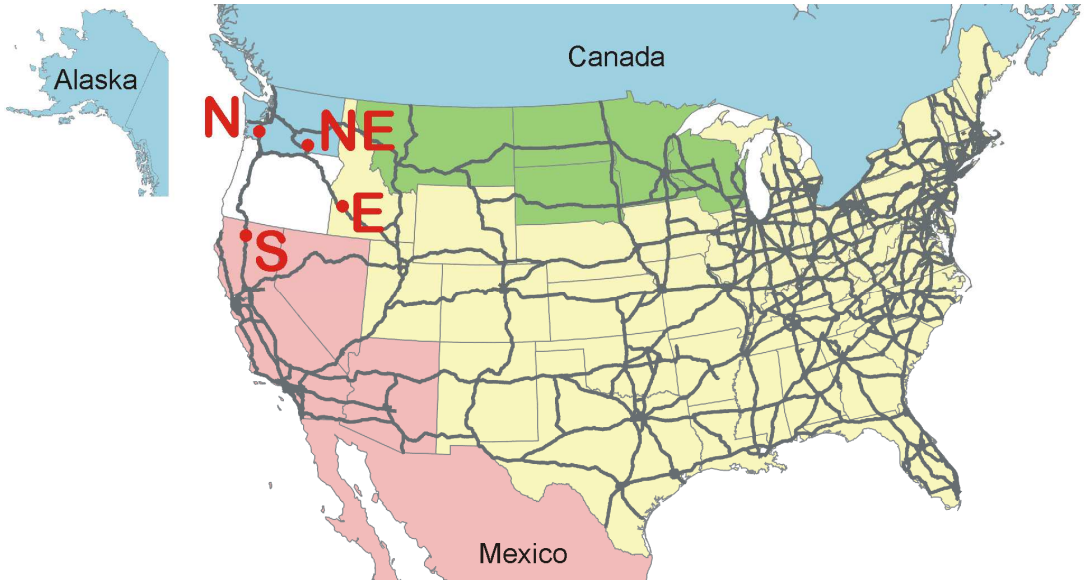
These six World Markets link to the model transport network at the 12 External Stations of Figure A.3, as shown in Table A.2. These External Stations roughly parallel the likely rail as well as truck freight routes. The local 6006 world market, trading within 75 miles of the model boundary, is linked to the minor External Stations, which is all but I-5 (5002, 5010), I-84 (5007) and the Port of Portland (5012).

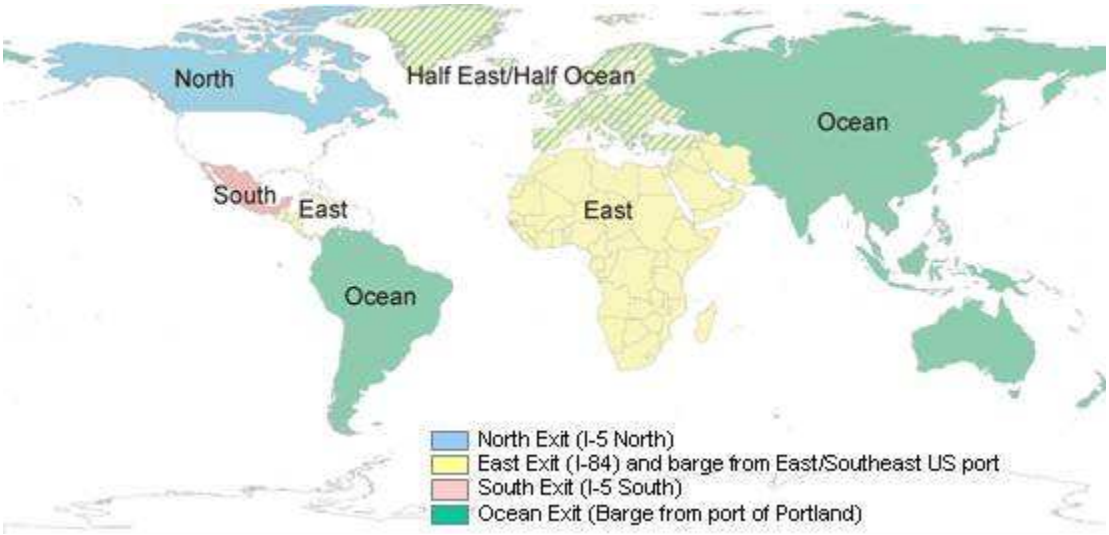
Table A.2. PI World Market Zones and Distance Assumptions

Zone Number	Code	Distance beyond halo (miles)*	External Station/ Relevant Roads	World Market Definition
6001	N	240	5002 I-5	Washington State and Canada
6002	NE	800	5003 I-82 5004 US 395	Northern states of the Midwest
6003	E	1,200	5007 I-84	Central and Eastern part of the US and barge traffic through East and South Coast US ports
6004	S	460	5010 I-5	Southwestern states and Mexico
6005	Ocean	1500 for imports, 600 for exports	Port of Portland (5012)	Rest of the world
6006	Local	75	5001, 5003, 5004, 5005, 5006, 5008, 5009, 5011	Local markets in neighboring states

* Assumes 50 mph beyond halo to calculate equivalent travel time. The assignment of external origin/destination regions to external stations is based on a fastest travel time analysis to the centroids of each external region. Oceanic shipping costs for zone 6005 were calibrated to truck transport costs so that all World Markets would compete on the same measure. This assumes $600-900 import and $700-2200 export costs to ship a Truck Equivalent Unit (TEU) between Portland and Japan (per may 2007 discussions with Port of Portland Staff).

Figure A.4. World Markets in North America





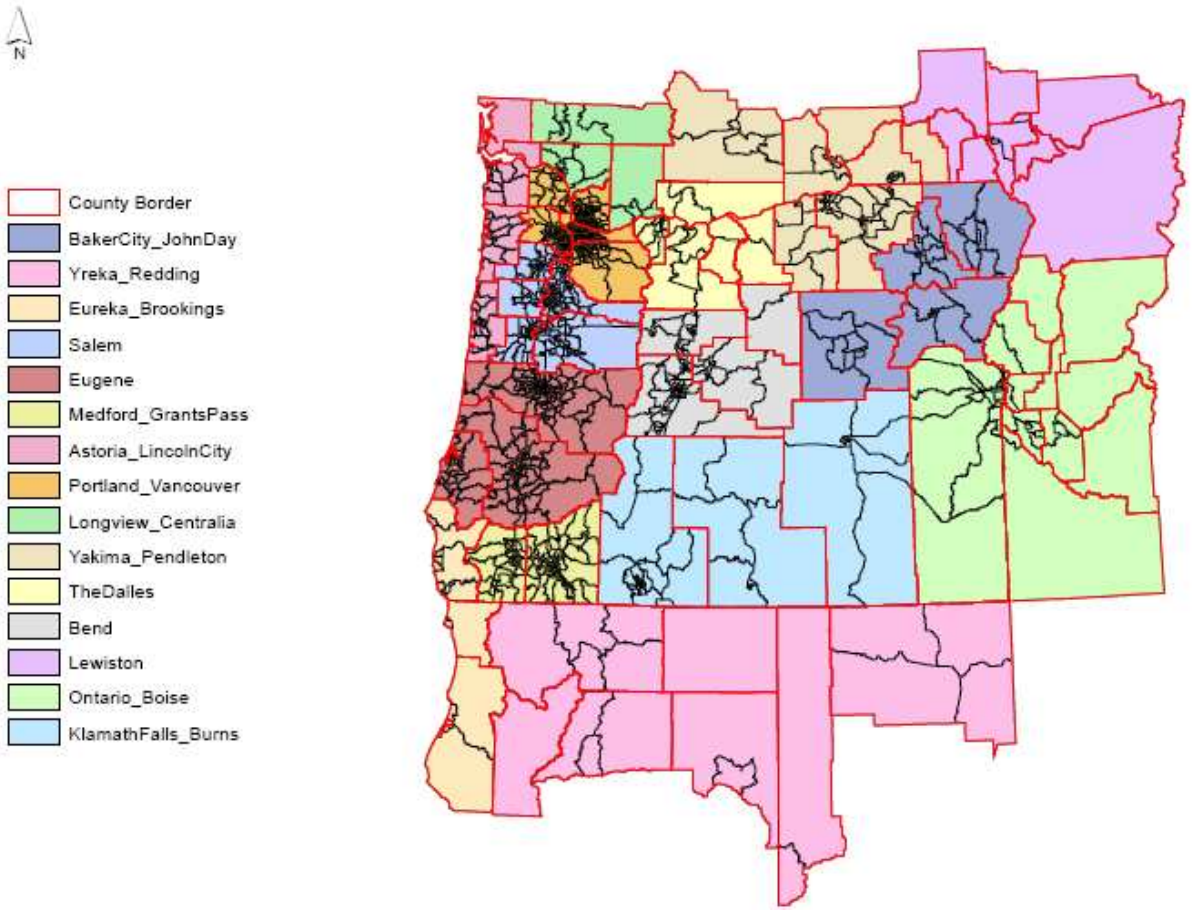


Figure A.5. World Markets outside US

The Aggregate Land Development (ALD) land use module uses a 15 region aggregation of the alphazones for making land development decisions. These regions, shown in Figure A.6, represent land development markets within the study area.

Figure A.6. ALD Land Market Regions

Tables A.3 lists the industry used in SWIM2. In general, a given industrial sector is split into blue-collar and white-collar (or 'management') components using associated 'production' and 'office' space, respectively. The industries are split this way so that the allocation processes in the module can consider the very different location behavior and space requirements of these two components separately. The few industries without separate management and production sites include FIRE (Finance, Insurance, Real-Estate), hotel, personal services, construction, and home-based services. Home-based services are self-employed workers who sell their services to households (e.g., housekeepers, nannies, handymen). The brokerage portion of real estate, which uses labor and floorspace, was folded into FIRE. The remaining rents of the 'real estate' category, and other non-spatial activities were folded into imports (if negative) or exports (if positive). These non-spatial activities don't consume floorspace or labor and include private and institutional money flows (rents, enterprises, capital, federal/state/local government funding and investment, accounting/financial transactions, change in inventories, salvage).

Internal management activities for the remaining industries require separate offices and employees that have different characteristics (income, location, trip generation) then the specific purpose of the industry.

Table A.3. Activities - Industries

Index*	Industry	Floorspace	Internal Service
2, 3	Agriculture And Mining	in Agriculture space	and Office space
7,8	Electronics And Instruments	in Light industry space	and Office space
10, 12	Food Products	in Heavy industry space	and Office space
11, 12	Food Products	in Light industry space	
23 , 24	Lumber And Wood Products	in Heavy industry space	and Office space
25, 27	Other Durables	in Heavy industry space	and Office space
26, 27	Other Durables	in Light industry space	
28, 30	Other Non-Durables	in Heavy industry space	and Office space
29, 30	Other Non-Durables	in Light industry space

14, 15	Government Administration	in Support space	and Office space
13	Forestry And Logging	in Logging space	
1	Accommodations	in Accommodation space	
9	FIRE, Business, and Professional Services	in Office space	
31	Personal & Other Services And Amusements	in Retail space	
20	Home-based Services		
6	Construction		

* Second index is for 'office' portion of split industry

Household categories (Table A.4) are base on the 1990 Census PUMS categories of household income (1990$) and persons per household. Household activities include the production of labor and consumption of various goods (primarily through retail) and services. Note that internal money flows commodity, 'Money and Unclassified Goods' does not produce commercial truck trips within CT and ET.

Table A.4. Activities - Household Income-Size Categories (1989$)

Code	Description	
HH0to5K1to2	Household Income $0 to 4,999	Household size 1 to 2 persons
HH5to10K1to2	Household Income $5,000 to 9,999	Household size 1 to 2 persons
HH10to15K1to2	Household Income $10,000 to 14,999	Household size 1 to 2 persons
HH15to20K1to2	Household Income $15,000 to 19,999	Household size 1 to 2 persons
HH20to30K1to2	Household Income $20,000 to 29,999	Household size 1 to 2 persons
HH330to40K1to2	Household Income $30,000 to 39,999	Household size 1 to 2 persons
HH40to50K1to2	Household Income $40,000 to 49,999	Household size 1 to 2 persons
HH50to70K1to2	Household Income $50,000 to 69,999	Household size 1 to 2 persons
HH70plusK1to2	Household Income over $70,000	Household size 1 to 2 persons
HH0to5K3plus	Household Income $0 to 4,999	Household size 3 or more persons
HH5to10K3plus	Household Income $5,000 to 9,999	Household size 3 or more persons
HH10to15K3plus	Household Income $10,000 to 14,999	Household size 3 or more persons
HH15to20K3plus	Household Income $15,000 to 19,999	Household size 3 or more persons
HH20to30K3plus	Household Income $20,000 to 29,999	Household size 3 or more persons
HH30to40K3plus	Household Income $30,000 to 39,999	Household size 3 or more persons
HH40to50K3plus	Household Income $40,000 to 49,999	Household size 3 or more persons
HH50to70K3plus	Household Income $50,000 to 69,999	Household size 3 or more persons
HH70plusK3plus	Household Income $70,000 and over	Household size 3 or more persons

Tables A.5 through A.8 identify various commodities produced and consumed in the model, including study area imports and exports. Table A.5 identifies the commodities tracked in the CT module, including 42 types of goods, based on standard commodity (SCTG) classifications.

Table A.5. Commodities – Goods Categories

Goods	
SCTG01: Live animals and live fish	SCTG25: Logs and other wood in the rough
SCTG02: Cereal grains	SCTG26: Wood products
SCTG03: Other agricultural products	
SCTG04: Animal feed and products of animal origin n.e.c.	
SCTG05: Meat fish seafood and their preparations	SCTG27: Pulp newsprint paper and paperboard
SCTG06: Milled grain and bakery products	SCTG28: Paper or paperboard articles
SCTG07: Other prepared foodstuffs and fats and oils	SCTG29: Printed products
SCTG08: Alcoholic beverages	
SCTG09: Tobacco products	
	SCTG31: Nonmetallic mineral products
	SCTG32: Base metal in primary or semi-finished forms and finished basic shapes
SCTG10: Monumental or building stone	
SCTG11: Natural sands	SCTG33: Articles of base metal
SCTG12: Gravel and crushed stone	SCTG34: Machinery
SCTG13: Nonmetallic minerals n.e.c.	SCTG35: Electronic/electrical equipment and components
SCTG14: Metallic ores and concentrates	SCTG36: Motorized and other vehicles (including parts)
	SCTG37: Transportation equipment n.e.c.
SCTG15: Coal	
SCTG16: Natural Gas & Crude Petroleum	
SCTG17: Gasoline and aviation turbine fuel	
SCTG18: Fuel oils	SCTG38: Precision instruments and apparatus
SCTG19: Coal and petroleum products n.e.c.	SCTG30: Textiles leather and articles of textiles or leather
	SCTG39: Furniture mattresses and mattress supports lamps lighting fittings and illuminated signs
SCTG20: Basic chemicals	
SCTG21: Pharmaceutical products	SCTG40: Miscellaneous manufactured products
SCTG22: Fertilizers	SCTG41: Waste and scrap
SCTG23: Chemical products and preparations n.e.c.	
SCTG24: Plastics and rubber	Money and unclassified goods (not used in CT/ET)

Table A.6 identifies the 16 services, including internal management services tracked in the Personal Travel (PT) Model. Internal Management Services, defined as 'value added office labor', spatially connect the production and office components of split industries. This commodity is the service provided by management and other office support workers to the production floor of the same industry. In many cases, this flow represents a relationship between two establishments of the same firm.

Table A.6. Commodities – Services Categories

Services	
Internal Management Services (B)	Transport (B)
Fire, Business, And Professional Services (B)	Communications And Utilities (B)
Personal And Other Services And Amusements (P)	Construction (B)
Health Services (P)	Government Administration (P)
Accommodations (B)	Higher Education (P)
Real Estate (P)	Lower Education (P)
Homebased Services (P)	
Retail Trade (P)	
Wholesale Trade (B)	

Note: Assumed to be primarily business (B) or personal (P) services

Labor, tracked in the PT module, is included as a commodity that is produced by households and consumed by economic production activities. Labor of different occupation categories is treated as different commodity categories, as shown in Table A.7.

Table A.7. Commodities - Labor Occupation Categories

Index	Labor Occupations	1990 US Census Occupation Codes
0	0_NoOccupation: Not employed	NA
1	1_ManPro: Managers/Professionals	0-82
2	1A_Health: Health Workers	83-112
3	2_PstSec: Post-Secondary Teachers	113-154
4	3_OthTchr: Other Teachers	155-162
5	4_OthP&T: Other Professional/Technical Office	163-262
6	5_RetSls: Retail Sales Workers	263-282
7	6_OthR&C: Other Retail/Clerical Office	283-402
8	7_NonOfc: Non-Office workers	all other

Floorspace categories are shown in Table A.8, while Table A.3 identifies which floorspace types are used by each industry category. The ALD Module adjusts the amount of space available in alphazones in any model period.

Table A.8. Commodities - Floorspace Categories

Residential Floorspace	NonResidential Floorspace	Other Floorspace
		FLR Agriculture (includes Mining)
FLR SFD (Single Family Home)	FLR Accommodation	
FLR MH (Manufactured Home)	FLR Office	FLR Logging
FLR AT (Attached Home)	FLR Government Support	
FLR MF (Multi-family, Institutional)	FLR Retail	
FLR RRSFD (Rural Residential SFD)	FLR Warehouse	
FLR RRMH (Rural Residential MH)	FLR Depot	
	FLR Light Industry	
	FLR Heavy Industry	
	FLR Hospital	
	FLR Institutional	
	FLR Grade-school	

Table A.9 identifies the various modes and vehicles used in the model to transport person and goods flows. Non-motorized passenger modes and non-truck freight modes are not assigned to the network.

Table A.9. Modes and Vehicle Types

Trip Code	SDT	LDT	CT	ET	Trip Mode	Trip Mode Definition
Passenger (PT SDT and PT LDT)						
DA	X	X			Drive-Alone	Single-occupant auto
SR2	X	X			Shared-Ride 2	2 person occupant auto
SR3P	X	X			Shared-Ride 3+	3+ person occupant auto
WALK*	X				Walk	Walk
BIKE*	X				Bicycle	Bicycle
TRANSIT_WALK		X			Walk-Transit	Walk-Access Transit
TRANSIT_DRIVE		X			Drive-Transit	Auto-Access Transit
SCHOOL_BUS*	X				School bus	School bus (not assigned to the network)
AIR		X			Drive-Air	Drive-Access Air travel within the modelarea
HSR_DRIVE		X			Walk-HSR	Drive-Access intercity Rail
HSR_WALK		X			Drive-HSR	Walk-Access intercity Rail
Freight						
STK			X		Truck	
TRK1			X		TRK1	<34,000 lbs. (likely single-unit)
TRK2			X	X	TRK2	34,000 -64,000 lbs.
TRK3			X		TRK3	64,000 -80,000 lbs. (articulated)
TRK4			X	X	TRK4	80,000 - 105,500 lbs. (articulated)
TRK5			X		TRK5	>105,500 lbs. (articulated)
SAA*			X		Air	
SRR*			X		Freight Rail	
SWA*			X		Waterborne Freight	
SPA*			X		Pipeline	

* Not assigned to the network.

Table A.10 provides a listing of all of the attributes of persons and households created in the Synthetic Population Generator (SPG) module and used in the PT module. The table also shows the Census-based coding categories for each attribute. The fields of the synthetic population used in the SWIM2 model are described below (asterisked values are synthesized by the model, others are drawn from PUMS records):

- Household-Person File Link (HH_ID, PER_ID). The household attributes were linked to each person in the household, by storing a household (HH_ID) and person (PER_ID) id in the person file. HH_ID are numbered sequentially across the whole sample (starting with 1). PER_ID are numbered sequentially across all persons in a household.
- Household Attributes (PERSONS, AUTOS*). The number of persons and the total number of autos in the household. The Census auto value is updated by the PT module.
- Home Location (ALPHAZONE). The alphazone location of the household, assigned by SPG2 (consistent with PI labor flows).
- Household Income (RHHINC). Total household income in units of 1989 dollars.
- Residential Floorspace Type (UNITS1, SINGLE_FAMILY*). The household's residential floorspace type is indicated by the number of units in the dwelling unit (UNITS1). In PT, a binary variable is created to indicate whether the dwelling unit is a single family unit.
- Demographics (AGE, SEX). Age and gender for each household member.
- Employment Information (RLABOR, OCCUP, INDUSTRY, ESR*, SW_OCC*, SW_SPLIT_IND*, WORKTAZ*). Employment status for each household member indicates whether each person is employed or not in labor force (RLABOR). If employed, PUMS occupation and industry from PUMS (OCCUP, INDUSTRY) are reassigned consistent with SWIM2 categories (SW_OCC and SW_SPLIT_IND). The PT module assigns a work location alphazone (WORKTAZ) and employment status code (ESR)
- School Status (SCHOOL). School status of each household member representing whether the person was currently enrolled in school.

Table A.10. Synthetic Population Household and Person Attributes

Household Attributes	
Code	Description
HH_ID	Household ID
AZONE	Home Location alphazone 0001-4141
PERSONS	Number of Person (person records) in household
RHHINC	Household income (1989$) 0000000 .N/A(GQ/vacant/no income) -999999..9999999 .Total household income
AUTOS (PUMS version, replaced by PT-version)	Vehicles (1 ton or less) available 0. N/A (GQ/vacant) 1 . No vehicles 2 . 1 vehicle 3 . 2 vehicles 4 . 3 vehicles 5 . 4 vehicles 6 . 5 vehicles 7 . 6 vehicles 8 . 7 or more vehicles
UNITS1	Units in structure 00 .N/A or Group Quarters (MF) 01 .Mobile home or trailer (MH or RRMH) 02 .One-family house detached (SFDor RRSFD) 03 .One-family house attached (AT) 04 .2 Apartments (AT) 05 .3-4 Apartments (MF) 06 .5-9 Apartments (MF) 07 .10-19 Apartments (MF) 08 .20-49 Apartments (MF) 09 .50 or more apartments (MF) 10 .Other (MF)
Household Attributes	

Person Attributes	
HH_ID	Household ID
PER_ID	Person ID
AGE	00 .Less than 1 year 01..89 .Age in years 90 .90 or more years old
SEX	0 .Male 1 .Female
SCHOOL	0 .N/A (less than 3 years old) 1 .Not attending school 2 .Yes, public school, public college 3 .Yes, private school, private college
RLABOR	Employment status 0 .N/A (less than 16 years old) 1 .Civilian employed, at work 2 .Civilian employed, with a job but not at work 3 .Unemployed 4 .Armed forces, at work 5 .Armed forces, with a job but not at work 6 .Not in labor force
OCCUP	Census Occupation ### (1990 Census Occupation codes)
INDUSTRY	Census Industry ### (1990 Census Industry codes)
SW_OCCUP	SWIM2 Occupation (based on PUMS OCCUP fields) See Table 2.7 Index
SW_SPLIT_IND	SWIM2 Split Industry ('office' split from 'production') (based on SW_OCCUP and INDUSTRY fields) See Table 2.3 Index
Person Attributes	

From SPG output files: SynPopP.csv and SynPopH.csv

Household Attributes	
Code	Description
SINGLE_FAMILY	Single Family 0. Multi-family household 1. Single-family household
AUTOS	Vehicles (1 ton or less) available 0. No vehicles 1 . 1 vehicle 2 . 2 vehicles 3 . 3 or more vehicles

Person Attributes	
WORKTAZ	Work Location alphazone 0001-4141 (assigned by PT work location choice model)
ESR	Simplified Employment Status 0. Not employed 1. Employed

From PT output files: personData.csv and householdData.csv

Appendix B. SCTG Commodity Groups Represented in SWIM2

Commodity Code	Category Description*	Commodity Group-7
SCTG01	Live animals and live fish	Food or Kindred Products
SCTG02	Cereal grains	Food or Kindred Products
SCTG03	Other agricultural products	Food or Kindred Products
SCTG04	Animal feed and products of animal origin, n.e.c.	Food or Kindred Products
SCTG05	Meat, fish, seafood, and their preparations	Food or Kindred Products
SCTG06	Milled grain products and preparations, and bakery products	Food or Kindred Products
SCTG07	Other prepared foodstuffs and fats and oils	Food or Kindred Products
SCTG08	Alcoholic beverages	Food or Kindred Products
SCTG09	Tobacco products	Food or Kindred Products
SCTG10	Monumental or building stone	Clay, minerals, stone
SCTG11	Natural sands	Clay, minerals, stone
SCTG12	Gravel and crushed stone	Clay, minerals, stone
SCTG13	Nonmetallic minerals, n.e.c.	Clay, minerals, stone
SCTG14	Metallic ores and concentrates	Clay, minerals, stone
SCTG15	Coal	Petroleum, Coal, Chemicals
SCTG16	Crude Petroleum	Petroleum, Coal, Chemicals
SCTG17	Gasoline and aviation turbine fuel	Petroleum, Coal, Chemicals
SCTG18	Fuel oils	Petroleum, Coal, Chemicals
SCTG19	Coal and petroleum products, n.e.c.	Petroleum, Coal, Chemicals
SCTG20	Basic chemicals	Petroleum, Coal, Chemicals
SCTG21	Pharmaceutical products	Petroleum, Coal, Chemicals
SCTG22	Fertilizers	Petroleum, Coal, Chemicals
SCTG23	Chemical products and preparations, n.e.c.	Petroleum, Coal, Chemicals
SCTG24	Plastics and rubber	Petroleum, Coal, Chemicals
SCTG25	Logs and other wood in the rough	Forest or Wood Products
SCTG26	Wood products	Forest or Wood Products
SCTG27	Pulp, newsprint, paper, and paperboard	Pulp or Paper products
SCTG28	Paper or paperboard articles	Pulp or Paper products
SCTG29	Printed products	Pulp or Paper products
SCTG30	Textiles, leather, and articles of textiles or leather	Other/Misc
SCTG31	Nonmetallic mineral products	Clay, minerals, stone
SCTG32	Base metal in primary or semi-finished forms and in finished basic shapes	Machinery, Instrum, Transp Equip, Metals
SCTG33	Articles of base metal	Machinery, Instrum, Transp Equip, Metals
SCTG34	Machinery	Machinery, Instrum, Transp Equip, Metals
SCTG35	Electronic and other electrical equipment and components, and office equipment	Machinery, Instrum, Transp Equip, Metals
SCTG36	Motorized and other vehicles (including parts)	Machinery, Instrum, Transp Equip, Metals
SCTG37	Transportation equipment, n.e.c.	Machinery, Instrum, Transp Equip, Metals
SCTG38	Precision instruments and apparatus	Machinery, Instrum, Transp Equip, Metals
SCTG39	Furniture, mattresses and mattress supports, lamps, lighting fittings, and illuminated signs	Other/Misc
SCTG40	Miscellaneous manufactured products	Other/Misc

* For detailed descriptions of commodities included in each group, see “SCTG Commodity Codes” booklet CFS-1200, October 2006, U.S. Department of Transportation and U.S. Department of Commerce.

Appendix C. Standard Industrial Codes (SIC)

	Industry	IndustryGroup-7
1	ACCOMMODATIONS	Gov't, Education, Biz Services, Accommodations
2	AGRICULTURE AND MINING-Agriculture	Ag, Mining, Food
3	AGRICULTURE AND MINING-Office	Ag, Mining, Food
4	COMMUNICATIONS AND UTILITIES-Light Industry	Retail, Personal Service, Communication
5	COMMUNICATIONS AND UTILITIES-Office	Retail, Personal Service, Communication
6	CONSTRUCTION	Electronics, Durables, Construction
7	ELECTRONICS AND INSTRUMENTS-Light Industry	Electronics, Durables, Construction
8	ELECTRONICS AND INSTRUMENTS-Office	Electronics, Durables, Construction
9	FIRE BUSINESS AND PROFESSIONAL SERVICES	Gov't, Education, Biz Services, Accommodations
10	FOOD PRODUCTS-Heavy Industry	Ag, Mining, Food
11	FOOD PRODUCTS-Light Industry	Ag, Mining, Food
12	FOOD PRODUCTS-Office	Ag, Mining, Food
13	FORESTRY AND LOGGING	Forestry, Wood
14	GOVERNMENT ADMINISTRATION-Government Support	Gov't, Education, Biz Services, Accommodations
15	GOVERNMENT ADMINISTRATION-Office	Gov't, Education, Biz Services, Accommodations
16	HEALTH SERVICES-Hospital	Health
17	HEALTH SERVICES-Institutional	Health
18	HEALTH SERVICES-Office	Health
19	HIGHER EDUCATION	Gov't, Education, Biz Services, Accommodations
20	HOMEBASED SERVICES	Retail, Personal Service, Communication
21	LOWER EDUCATION-Grade School	Gov't, Education, Biz Services, Accommodations
22	LOWER EDUCATION-Office	Gov't, Education, Biz Services, Accommodations
23	LUMBER AND WOOD PRODUCTS-Heavy Industry	Forestry, Wood
24	LUMBER AND WOOD PRODUCTS-Office	Forestry, Wood
25	OTHER DURABLES-Heavy Industry	Electronics, Durables, Construction
26	OTHER DURABLES-Light Industry	Electronics, Durables, Construction
27	OTHER DURABLES-Office	Electronics, Durables, Construction
28	OTHER NON-DURABLES-Heavy Industry	Paper, NonDurables
29	OTHER NON-DURABLES-Light Industry	Paper, NonDurables
30	OTHER NON-DURABLES-Office	Paper, NonDurables
31	PERSONAL AND OTHER SERVICES AND AMUSEMENTS	Retail, Personal Service, Communication
32	PULP AND PAPER-Heavy Industry	Paper, NonDurables
33	PULP AND PAPER-Office	Paper, NonDurables
34	RETAIL TRADE-Office	Retail, Personal Service, Communication
35	RETAIL TRADE-Retail	Retail, Personal Service, Communication
36	TRANSPORT-Depot	Retail, Personal Service, Communication
37	TRANSPORT-Office	Retail, Personal Service, Communication
38	WHOLESALE TRADE-Office	Retail, Personal Service, Communication
39	WHOLESALE TRADE-Warehouse	Retail, Personal Service, Communication

Executive Summary

INTRODUCTION

The City of Portland (City) is considering annexation and development of a long-range land use plan for West Hayden Island (WHI). This process requires not only annexing and zoning the property, but also an assessment of natural resources, potential conflicting land uses, and marine industrial and recreational uses. WHI is approximately 800 acres and is the undeveloped western portion of Hayden Island, located in the Columbia River near the confluence with the Willamette River. WHI is owned by the Port of Portland, and was added to the region's urban growth boundary in 1983 for marine industrial purposes. It is both a potentially important economic resource and an important natural resource, containing undeveloped open space in a location with habitat value. WHI is designated as Marine Industrial Land on METRO's 2040 Growth Concept Map, and as a Regionally Significant Industrial Area on the Title 4 map in the Urban Growth Functional Plan. WHI is also identified by METRO as a high value riparian area and a Habitat of Concern in the regional inventory, and as a Moderate Habitat Conservation Area in Title 13.

The WHI Economic Foundation Study will serve as a foundation study for the zoning and annexation of WHI and is intended to provide background information for the current planning process and future WHI studies. The objective of the study is to identify likely marine-related economic development opportunities and corresponding land needs over a planning period of the next 30 years. The land demand analysis will also inform the Economic Social, Environmental and Energy (ESEE) Analysis to be completed as part of the City land use plan for WHI.

This Economic Foundation Study provides information about marine-related industrial land needs relative to WHI and its surroundings over the next 30 years. A companion study, the Environmental Foundation Study, provides a detailed understanding of the condition, function, and value of WHI natural resources. A third recreation study describes recreation participation, development potential, and value on and around WHI. Together these studies provide information on the importance and potential contribution of WHI in three different land uses: habitat, marine-industrial use, and recreation. The studies also provide information on potential compatibility and conflicts with multiple land uses on WHI.

Broadly, the scope of this work is to 1) assess the opportunities for marine-related economic growth in Portland Harbor, 2) estimate the land acreage and site characteristics necessary to accommodate this growth, 3) compare the available land supply to the land demand to identify marine industrial land shortages, and 4) identify the potential role of WHI and other sites in meeting projected land shortages. The scope of the analysis is marine-related uses, which includes both marine cargo and marine industrial uses. Marine cargo refers to activity and facilities related to the movement of waterborne cargo while marine industrial refers to industrial activity and facilities requiring waterborne transportation. Marine industrial activities may include manufacturing, vessel repair and construction, and rail yards at marine terminal sites.

In terms of geographic scope, the analysis is focused on Portland Harbor, with a limited review of the availability and relative suitability of alternative marine industrial land sites in the Lower Columbia River. The planning timeframe for the analysis is a 30-year horizon through 2040. Due to time and resource constraints, the scope of the analysis is based on existing data and readily available information.

HISTORY AND ECONOMIC ROLES OF PORTLAND HARBOR

The purpose of this section is to provide planning and policy context for the WHI decision process by describing the economic history and regional role of marine-related activities and land needs in Portland Harbor and surrounding areas. Furthermore, the section describes the economic contribution of marine-related uses to the regional economy. This section is intended to portray the broader economic context of marine-related uses and their regional importance.

For over 140 years, Portland has been a successful port city and continues today in this role due to its location at the nexus of excellent rail infrastructure, including the Olympic oil pipeline, two interstate freeways, the Columbia River deepwater shipping channel, and the Upper Columbia/Snake Rivers barge system. Marine cargo terminals handle and transport freight that is vital to numerous other industries located throughout Oregon, Southwest Washington, and beyond. Cargo movement through the Portland Harbor has grown steadily over the past century, and recent trends indicate continued future growth. A wide web of industries rely on waterborne transportation, including wholesalers and retailers who import consumer products, manufacturers that import raw and intermediate goods, and manufacturers and natural resource industries that export products.

Portland Harbor serves as an economic engine for the metro regional economy. The Portland Harbor is home not only to transportation and distribution activities linked to marine terminals, but also manufacturing facilities that rely on marine transportation. These marine-related industries are linked to other industries located in Portland Harbor and elsewhere in the metro area, including wholesale trade, local and regional transportation firms, manufacturing firms, and retail firms. These businesses depend on the transportation hub at Portland Harbor either for transport of their products to international or regional markets, or for the provision of inputs of the wide variety of freight materials imported through Portland Harbor, whether petroleum, consumer apparel, automobiles, or raw materials.

These water-dependent industries are then linked to other industries in the harbor and elsewhere throughout the metro region. Past studies indicate that cargo and manufacturing activities dependent on waterborne transportation contribute significantly to the metro region's economy. These studies indicate that marine-related economic activity generates approximately 20,000 jobs and $1.4 billion in income, while economic activity in the overall harbor area may support approximately 100,000 jobs and $3.5 billion in regional income.

Although there are several other ports in the Lower Columbia River, including the ports of Kalama, Longview, St. Helens, and Vancouver, Portland is distinguished in the level of its transportation connections and its location in a large metropolitan area. The metro area provides a larger population of skilled labor and a larger local industrial base that can generate cluster benefits and additional opportunity for marine-related businesses. As part of the Portland metropolitan area, Vancouver also has this advantage over other Lower Columbia River ports. However, Portland is differentiated from Vancouver and all other Lower Columbia Ports because it is the only port that handles large volumes of all cargo types (specifically, it is the only port that generally handles containers). While some marine industrial uses could be suitable at any Lower Columbia River port, for certain land uses that rely on all types of transportation connections and a large population or industrial base, marine industrial land in the Portland metropolitan area (in Vancouver or Portland) may not be as easily substituted for lands elsewhere in the Lower Columbia. While locating in Portland may be more desirable for some marine-related uses, other ports appear to be less land constrained (and have larger contiguous, shovel-ready sites), and may have less contamination.

Key findings from this section are summarized below:

- **Long-Term Leading Port.** From the late 19th century, Portland has been a leading West Coast port due to its position on the confluence of the Willamette and Columbia Rivers, its multi-modal transportation

infrastructure, and its proximity to areas producing substantial natural resources (primarily timber and grain) and associated finished products.

- **Continued Land Absorption for Marine-Related Activities**. Marine-related activities have experienced continued growth in Portland, with particular growth occurring during the world wars and continuing today. From 1960 to 1997, an annual average of 21 acres has been developed for river-dependent industrial uses in the Portland and Vancouver harbor area.
- **Marine-Related Activities Contribute Significantly to City's Economy.** Past studies indicate that cargo and manufacturing activities dependent on waterborne transportation contribute significantly to the region's economy. These studies indicate that river-dependent economic activity generates approximately 20,000 jobs and $1.4 million in income, while economic activity in the overall harbor area may support approximately 100,000 jobs and $3.5 million in income.
- **Regional Reliance on Marine-Cargo Activities**. A wide web of industries rely on waterborne transportation, including wholesalers and retailers who import consumer products, manufacturers that import raw and intermediate goods, and manufacturers and natural resource industries that export products.
- **Substitutability of Marine-Related Lands in Portland vs. Other Ports.** Portland is differentiated from other Lower Columbia Ports because it accommodates all cargo types (it is the only port that handles container cargo) and is closer to the population centers that utilize consumer goods that are shipped by marine freight. Additionally, as a metropolitan area Portland has a larger population of skilled labor and a larger local industrial base that can generate cluster benefits and additional opportunity for marine-related businesses; this advantage is also shared by the Port of Vancouver. Other ports, however, appear to be less land constrained (and have larger contiguous, shovel-ready sites), and may have less contamination. In general, Lower Columbia ports are distinguished by having access to two competing rail lines, which ensures more competitive rail rates.

GENERAL ECONOMIC AND MARINE INDUSTRIAL TRENDS

The purpose of this section is to identify the level of marine industrial economic activity likely to occur within Portland Harbor. The analysis consists of a 30-year (to the year 2040) forecast of job and cargo growth associated with marine industrial development opportunities. A review of economic and demographic trends is first provided, followed by a discussion of employment and land use trends more specific to marine industrial opportunities in Portland Harbor. These subsections rely on data from interviews as well as published data to provide historical and current context to the marine cargo and employment growth forecasts. A final subsection provides the marine cargo and job-growth forecast. The forecasts are based on different assumptions about the types of marine industrial development that could occur over the planning horizon, resulting in a low, medium, and high estimate of job growth. The three scenarios reflect uncertainty regarding overall economic growth, business location decisions, magnitude of cargo movement, and the Portland Harbor cargo market share.

Prior to the current recession, economic and population growth in the Portland metro region outpaced growth elsewhere in the nation. Economic activity is expected to begin recovering in 2010, with employment and population growth expected to average 1.4 percent and 1.5 percent, respectively, through 2030. A primary source of past economic growth in Portland has been marine-related economic activity, including marine industrial and marine cargo uses. These uses are projected to continue to grow over the next 30-years, with particular growth forecasted in the marine cargo and related transportation, warehousing, utility, and wholesale trade sectors.

The forecasts for cargo and employment have low, most likely, and high estimates, and yet still exclude the significant uncertainty represented by future markets development. New markets are perhaps the most

uncertain area since a new market can develop rapidly as a result of global economic forces, new technologies, and policy developments. Interviews with planners, industry representatives, and commodity forecasters, indicates that new markets are the most difficult to predict factors for both cargo and marine industrial growth, and the most important.

Growth in marine cargo over the 30 year planning horizon to 2040 is expected to vary by cargo type, but is projected to grow on a most likely average annual rate of between 0.2 percent for breakbulk to 3.3 percent for automobiles. Together, the marine cargo types measured in tonnage (dry bulks, grain, liquid bulks, and breakbulk) are expected to grow at a most likely average annual rate of 0.6 percent (average annual growth rate weighted by current tonnage), while containers are expected to increase at an annual rate of 2.4 percent for containers, and automobiles at a rate of 3.3 percent annually.

Growth in marine-industrial employment is expected to roughly mirror economic growth trends in the region, as some elements are expected to grow less slowly (manufacturing), while others are expected to grow more rapidly (transportation and warehousing). Growth rates in marine industrial employment are projected to vary from between 0.7 percent to 1.7 percent, with total employment estimated to increase by 2,100 jobs to 6,000 jobs.

As identified in the 2006 trade capacity analysis, availability of marine industrial land and adequate freight handling and transportation system infrastructure are critical to the growth of marine-related employment. Development of additional lands and facilities will likely be necessary to meet the projected growth in these sectors. If so, land availability for marine industrial development on West Hayden Island may be able to play a critical role in providing the infrastructure and lands necessary to take advantage of growth in these industries. These issues will be addressed in subsequent sections of this study.

Key findings from the general trend assessment are summarized below:

- **General Global Economic Outlook**. The current recession has caused a short-term decline on local cargo and employment, but this trend is expected to be reversed in 2010, with annual growth forecasted to be positive through 2040.
- **Population Growth.** Population growth in the Portland metro area has outpaced state and national growth, averaging 2.5 percent annually from 1980 to 2007. Annual growth from 2000 to 2060 is forecasted to average 1.2 percent, with growth to 2030 forecasted at the higher annual rate of 1.5 percent.
- **General Employment Growth.** Since 1981, Oregon has experienced average employment growth of 2 percent annually (compared to 1.7 percent nationally). Portland metro area employment is expected to nearly mirror population growth rate. Employment is forecasted to grow at an annual average rate of 1.2 percent from 2000 to 2060, with a higher annual growth rate of 1.4 percent expected through 2030. METRO forecasts employment growth of approximately 23,600 jobs in the Columbia Harbor area from 2010 to 2035.

Key findings from the cargo and employment forecasts are summarized below:

- **Cargo Forecasts.** Three cargo forecasts completed for the region were assessed: one for the Puget Sound and Columbia River system completed in 2009 for the Washington Public Ports Association, and two for Portland Harbor completed in 2009 (one by the Oregon Department of Transportation and one for the Port of Portland). Of these, the forecast completed for Portland Harbor (done for the Port of Portland) was utilized as it is the most recent, the most conservative, and utilized sound methodology. This forecast estimates growth in each cargo type in Portland Harbor through 2040, with estimated growth rates from 2007 to 2040 varying from 0.2 percent for breakbulk to 3.7 percent for automobiles. A recent trade capacity analysis for the Portland/Vancouver area indicates that this forecasted growth is feasible given the infrastructure in the region, since it is less than the doubling of freight volumes that the study suggested was possible (though challenging) for the region.

- **Marine and Rail-Dependent Industrial Job Forecast.** Data collected by the City of Portland indicates that in Portland Harbor there are 212 firms employing approximately 8,400 workers. Based on general population and employment growth trends in the region, these jobs are forecast to grow at an average annual rate of 1.2 percent a year. Barring constraints to growth such as land availability, this suggests that total employment in the Harbor area dependent on the multi-model transport system may increase to 12,000 jobs by 2040.

MARINE-RELATED SITE SUITABILITY

The purpose of this section is to provide an understanding of site suitability and constraints for marine-related uses, including both marine cargo and marine industrial uses. Site suitability is assessed for six marine cargo types: automobiles, liquid bulk, grain dry bulk, other dry bulk, containers, and breakbulk. Site suitability is also assessed for two marine industrial types: vessel related services and marine-dependent manufacturing.[1] Requirements for a given marine-related use vary depending on site and use-specific needs. This section is intended to provide a general sense of the site size, water access, and intermodal infrastructure requirements for each of these marine-related uses. Where available, information on trends in these requirements is presented. A brief discussion is also provided on site constraints for marine-related use related to natural resources and environmental contamination. The information presented in this section is used in later sections to assess the suitability of vacant, waterfront lands in Portland to meet the requirements for marine-related uses, and to assess the suitability of West Hayden Island (WHI) and other lands in the Lower Columbia River.

Marine-related uses share similar site requirements, including 1) zoning (industrial), 2) flat and contiguous lands with shoreline access of 400 feet or more, and 3) proximity to multimodal infrastructure (water, truck, and rail). Differences arise in acreage and water depth requirements, with marine cargo uses typically requiring more acreage and deeper water. Specifically, marine cargo facilities are usually sized at 50 acres or more (with the exception of local/regional dry bulk and liquid facilities that can be as small as five acres) and require a minimum draft depth of 35 feet. Marine industrial uses vary considerably in their site size requirements, but are typically at least five acres in size and can be as large as several hundred acres. A draft depth of 20 to 30 feet is required for most marine industrial uses.

Regarding site limitations, marine cargo and marine industrial uses alike face constraints related to sensitive natural resources and brownfield contamination. The presence of either can limit site usage or increase site acreage requirements for mitigation, and increase site development costs.

Table ES-1 summarizes the site characteristics of each marine-related use described above. **ES-1** is not an exhaustive analysis of specific businesses that fall into marine cargo and marine industrial classifications. Rather, the intended purpose of **Table ES-1** is to summarize general characteristics and potential requirements of marine cargo and marine industrial sites, based upon representative businesses in Portland Harbor as well as in other west coast ports.

In general, the table indicates that cargo facilities require sites that are typically 50 acres or larger, with the exception of local/regional dry bulk and liquid bulk facilities that may be much smaller. It is important to note that while many existing grain facilities are relatively small, industry trends show that newer facilities are larger to accommodate larger vessels and longer unit trains (to ensure competitive railroad rates). Many of the acreage sizes indicated in **Table ES-1** indicate the core terminal operation footprint, which excludes the rail infrastructure and ancillary structures and operations. Furthermore, the site sizes in **Table ES-1** do not include any acreage required for onsite mitigation or environmental protection. Total acreage, including

[1] Marine or vessel related services include barging, cargo handling services, and naval/coast guard services. Marine dependent manufactures are those firms that require marine facilities for the transport of raw and finished product.

rail infrastructure and support operations, for new marine cargo facilities handling containers, automobiles, national/international dry bulks, and grain are typically 100 acres or more.

All cargo facilities require minimum draft depths of 35 feet, with a deeper draft more suitable for many cargo types. Berth lengths of most cargo facilities are at least 550 feet, with many larger than 1,000 feet. As noted above, these lengths do not include dolphins, which extend the shoreline length for mooring vessels. This emphasizes the need for sites with at least 400 feet of shoreline length.

Marine industrial sites vary significantly in their requirements, both in terms of acreage, berth length, and channel depth. However with the exception of some vessel-related services, most marine industrial sites require at least a 20-foot draft and a five acre site. Nearly all marine industrial uses require a site with at least 400 feet of riverfront to accommodate a berth, and nearly all require access to rail and truck routes.

Table ES-1 Summary of Site Characteristics for Marine-Related Land Uses

	Acreage Approximation		Water Frontage Approximation		Berth Depth Requirement within 150' of Shore[2]	Rail Infrastructure Requirements
Site Type	Portland Harbor	Other West Coast Harbors	Portland Harbor	West Coast Ports		
Cargo						
Automobile	75 - 120	95 - 168	414' - 1,000	1,040' – 1,300'	35' or greater	Rail Ramp & Nearsite Rail Yard (5+ acres)
Container	193	50 - 385	Total of 2,850' (3 berths)	1,100' – 6,380'	40' or greater	Intermodal Yard (Onsite or Nearby Rail Yard) & Mainline Access
Breakbulk	20 - 50	15 - 75	2005' (2 berths)	600' – 1,750	35' or greater	Nearby Rail Yard & Mainline Access
Grain	40 – 100	40 - 100	327' – 928'	715'	40' or greater	Spur/loop & Nearby Rail Yard & Mainline Access
Dry bulk National/International	25 – 120	34 – 136	740'- 900+'	550' – 1,900	40' or greater	Spur/loop & Nearby Rail Yard & Mainline Access
Dry Bulk Local/Regional	5 – 27	5 – 23	N/A	550' – 1900'	40' or greater	Spur
Liquid bulk	5 – 45	10 - 20	700'	700' – 1,980'	35' or greater	Spur
Industrial						
Vessel Related Services	5 - 60		175' – 3,900'	150- - 1,400'	20' or greater	Spur / None
Marine dependent manufacturing	10 - 170 acres		994' – 1,800'	500' – 875'	20' or greater	Spur

Key findings from the suit suitability assessment are summarized below:

- **General Site Requirements.** Sites for marine industrial use must be zoned for industrial use, and be located on the waterfront with access to adequate channel depth—at least 20 feet for marine industrial sites and at least 35 feet water depth for marine cargo sites. Most marine-related uses require this draft depth for a length of 400 feet within 150 feet of shore, with depth close to shore most desirable. Marine cargo and marine industrial sites also both require easy access to rail and truck transportation routes.

[2] This distance from shore is based upon PHILS study, City of Portland, Portland Harbor Industrial Lands Study, February 2003, Prepared by E.D. Hovee & Company.

LUBA No. 2020-009
Page 6823

- **General Acreage Requirements.** Acreage is required not only for the footprint of the marine terminal or marine industrial operations, but also for infrastructure such as access roads and rail lines. Acreage requirements differ by use, but in general, marine terminals require more acreage due to the large rail facilities required for many cargo facilities and associated warehousing and distribution facilities. Existing marine cargo terminals generally range in size from 20 acres to over 100 acres, while marine industrial sites typically range between 5 acres and 100 acres.
- **Variation in Specific Site Requirements.** Site size and configuration vary significantly based on specific use, operational requirements, site constraints, and local market conditions. An examination of just one use, such as container cargo terminals, will reveal very different site sizes and configurations at different ports and even at the same port.
- **Trends in Marine Cargo Facilities.** Ship size is increasing for most cargo types, resulting in larger desired berth lengths and deeper river depth. The trend towards unit trains for grain and international/national dry bulk cargoes means that larger sites (100+ acres) that can accommodate multiple unit trains are expected to be necessary for future competitiveness. Trends in Asia and other land-constrained areas are to minimize terminal footprint through a variety of methods; in general, these methods are costly, respond to specific local market conditions, and have not been implemented at Lower Columbia ports. The tradeoffs between cost and site efficiency, and the resulting impact on competitiveness and economic viability is not addressed in this analysis.
- **Natural Resources Site Constraints.** Waterfront areas often have sensitive natural resources. Local, state, and national regulations protect sensitive resources, and often require mitigation and avoidance of impact for development in areas with these resources. In addition to requiring lands to be set aside for environmental purposes, developing in areas with sensitive resources may increase site development cost and limit suitability.
- **Contamination Site Constraints.** By raising site development costs and raising long-term liability concerns, contamination in waterfront areas can reduce the market feasibility of a site for marine industrial use.

INVENTORY OF SUITABILITY MARINE-RELATED SITES

Following a brief overview of current land use in Portland Harbor, this section provides an inventory of vacant, waterfront lands in the industrial districts in Portland. The lands inventoried for this study are located along the Willamette River downstream of the Fremont Bridge and eastward along the Columbia River to Interstate 5. The purpose of the section is to provide an understanding of the available supply of industrial waterfront land in Portland Harbor, and the characteristics of the land supply relative to the site suitability requirements for marine-related uses outlined above. The section concludes with a comparison of site characteristics required for marine-related uses versus the characteristics of the available waterfront lands in Portland. The focus is an inventory of lands in Portland Harbor; the next section includes an overview assessment of the availability of industrial lands suitable for marine-related uses in other ports on the Lower Columbia River.

The site suitability analysis discussed above identified the desired or required site characteristics for each type of marine industrial use. As noted in that section, most marine cargo uses require channel depth of 35 feet or more and sites that are 60 to over 100 acres in size. There are no sites that meet these requirements currently vacant in Portland Harbor. Assuming that future dredging enables deep draft access to all sites, there are still no sites that are large enough to accommodate a new, modern marine cargo facility. The possible exceptions are liquid bulk and local/regional dry bulk facilities that may require a smaller site.

Marine industrial uses and their site size requirements are quite varied. However, it is expected that most marine industrial uses desire sites of at least five acres, draft of 20 feet within 150 feet of shore, and a

shoreline length of at least 400 feet. As indicated above, however, many marine industrial uses require large sites of over 100 acres. There are 11 sites in Portland Harbor that are five acres or more with shoreline length of 400 feet, of which nine have depth of 20 feet or more within 150 feet of shore. All but one of these sites are constrained as suspected brownfields. **Table ES-2** summarizes the number of available sites that may be potentially suitable for each type of marine-related use.

Waterfront vacant land suitable for marine cargo and marine industrial use is limited by site size and configuration, natural resource constraints, and contamination. There are 31 sites with 300 acres of vacant, waterfront industrial lands, of which 20 sites are smaller than five acres in size. No vacant sites are larger than 60 acres in size, which precludes development of many marine cargo uses and some marine industrial uses. There are, however, 11 sites larger than five acres that with channel deepening could become appropriate for local/regional market dry bulk or liquid bulk cargo or for marine industrial uses. All but one of these sites is a suspected brownfield, however, which constrains its suitability. Suitability of these sites for each use will depend on use-specific site requirements as well as the tolerance of the user for the potentially large liability associated with the Superfund site and upland brownfield contamination.

Table ES-2 Available, Potentially Suitable Sites by Marine-Related Use

Marine-Related Use	Number of Available, Potentially Suitable Sites	Notes
Cargo		
Automobile	0	No vacant sites large enough to accommodate new automobile terminal and associated infrastructure.
Container	0	No vacant sites large enough to accommodate new container terminal and associated infrastructure.
Breakbulk	0	No vacant sites large enough to accommodate new breakbulk terminal and associated infrastructure.
Dry Bulk (National/International)	0	No vacant sites are large enough to accommodate a new grain or international dry bulk commodity terminal and associated infrastructure.
Liquid Bulk	0-6	There are six sites that are larger than ten acres that are located in the Northwest industrial district proximate to the Olympic pipeline. All of these sites have suspected upland contamination. Only one of these sites (it is 13.5 acres in size and is owned by Northwest Natural Gas) currently has a draft of 35 feet.
Dry Bulk (Regional/Local)	1-11	There are 11 sites in Portland Harbor that are larger than five acres and have shoreline access of 400 feet. Only one of these sites does not have suspected upland contamination, and is owned by the Port of Portland. Only one other site (it is 13.5 acres in size and is owned by Northwest Natural Gas) currently has a draft of 35 feet.
Industrial		
Vessel Related Services	1-11	There are eleven vacant sites larger than five acres in size with adequate riverfront access, of which nine sites have draft depth of 20 feet or more. Only one site does not have potential upland contamination, and is owned by the Port of Portland.
Manufacturing	0 – 11	There are eleven vacant sites larger than five acres in size, and only two sites larger than 50 acres in size. Of these sites, nine sites have draft depth of 20 feet or more. There are no vacant riverfront sites larger than 60 acres in size. All sites larger than 15 acres are affected by upland contamination.

Key points from this site inventory include:

- **Marine cargo.** The industrial districts in Portland Harbor downstream of the Steel Bridge cover 5,932 acres of land in taxlots.[3] This land encompasses river-dependent marine industrial and marine cargo activities and facilities, as well as rail-dependent uses that are not directly dependent on water access but that utilize the intermodal transportation facilities available in the Harbor area.
- **Available, Vacant Lands.** In 2009, the Economic Opportunity Analysis (EOA) completed for the City of Portland inventoried the industrial lands available for development throughout the City. This study estimated the vacant industrial land supply at approximately 3,000 acres, of which approximately 1,900 acres are located in the Columbia Harbor area (which includes lands along the Willamette River downstream of the Fremont Bridge and eastward along the Columbia River to 82nd Street). Of all vacant industrial lands (as classified by the 2009 Economic Opportunities Analysis or EOA), only 33 sites in the Columbia Harbor geography are adjacent to the waterfront. Nearly all of these sites are located in Portland Harbor, but nine are located in the Rivergate industrial district with access to the Columbia River. Redevelopment of non-vacant lands was not examined in this analysis.
- **Size of Available Land.** There are a total of 300 acres on the 33 sites, with the average site size approximately 10 acres. Over 65 percent of sites are less than 5 acres in size, less than the minimum typically required for marine-related uses. Ten sites are larger than 10 acres, and three sites are larger than 30 acres. Adjacent parcels (including upland parcels) with the same landowner have been grouped into one 'site', as have been parcels with different land owners that may be feasible to aggregate. This aggregation results in 31 sites being analyzed (rather than 33 sites).
- **Waterfront Characteristics**. Twenty-five sites have the minimum waterfront access (400 feet) required by most marine-related uses, with 11 sites having minimum waterfront access that are larger than 5 acres. Only one site larger than 5 acres has access to deep draft channel depth of 35 feet, but access to deep draft waters will be increased once dredging resumes again on the Willamette River (currently dredging is suspended pending the outcome of the Portland Harbor Superfund cleanup).
- **Natural Resource Constraints.** All vacant waterfront sites are affected by at least one natural resource constraint. Of the 300 acres of vacant, waterfront lands, over half (170 acres) are affected by some level of natural resource constraint based on City of Portland overlay zoning. These constraints can affect the costs and required acreage for development, but do not prohibit development. It is expected that all waterfront lands suitable for marine industrial use will be affected by natural resource constraints, whether located in Portland Harbor or elsewhere.
- **Contamination.** The Willamette River in Portland Harbor has been identified by the Environmental Protection Agency as a Superfund site. This designation affects all waterfront acreage from Columbia Slough to the Fremont Bridge, and presents a challenge to the transfer and lease of property in the harbor. As assessed by Oregon Department of Environmental Quality (DEQ), nearly one-half of the 31 vacant, waterfront properties in Portland Harbor have potential upland contamination. This contamination can present costly clean up requirements and may limit the lease or sale of these properties.
- **Overall Summary**. There are no sites currently vacant on the waterfront that are suitable for marine cargo development, with the exception of liquid or small dry bulk facilities. There are 11 vacant sites larger than 5 acres with appropriate shoreline access, there are no sites available larger than 60 acres.

[3] Portland Bureau of Planning, 2003, Portland Harbor Industrial Lands Study Part One: Inventories, Trends and Geographic Context.

LAND ABSORPTION AND NEEDS FORECAST

This section concludes the economic foundation study, and provides a forecast of land absorption demand by marine-related uses in Portland Harbor together with a discussion of the potential role of WHI. The section draws from all preceding economic sections to evaluate the demand for additional lands for marine uses, and the potential role of WHI to meet this demand. The first two subsections forecast the land need for marine-related uses in Portland Harbor, including marine cargo and marine industrial uses. The forecast for marine cargo lands is based on an assessment of current capacity compared to forecast cargo volume. The forecast for marine industrial lands is based on past land absorption trends of marine industrial land combined with an existing forecast of land absorption in the Portland Harbor area. The final subsections focus on the availability of existing lands in Portland Harbor to meet demand compared to the suitability of WHI land and lands available at other Ports.

Provided there is adequate terminal infrastructure and land, marine cargo volume is projected to grow over the next 30 years in Portland, as is marine industrial land use. However, projected growth will not be realized if suitable lands are not available. In particular, lack of available, large developable sites suitable for marine industrial development constrains growth opportunities for marine cargo or large marine industrial manufacturers. As noted in METRO's 2009 urban growth report, the region must decide how it will accommodate forecasted population and employment growth and what investments we are willing and able make in transportation corridors and employment areas to support long-term employment growth.[4]

Forecasted demand for marine-related land uses (both marine cargo and marine industrial) ranges from 220 acres in the low forecast to 980 acres in the high forecast. Of this acreage, up to 130 acres may be accommodated on smaller parcels in the harbor area (potentially 55 acres of regional/local dry bulk terminal and liquid bulk terminal and up to 75 acres of marine industrial). This figure is based on the available lands in the harbor area and the proportion of brownfield sites that may be available for development.

WHI is the only parcel suitable in Portland Harbor for new uses that require 100 acres or more. Development of WHI for marine terminal use would likely allow Portland to capture the forecasted potential cargo opportunities, and associated jobs and income. Forecasted acreage demand that can not likely be satisfied in the harbor area ranges from 150 acres in the low scenario to 850 acres in the high scenario. Development on WHI for marine cargo purposes may also lead to more available lands in Portland Harbor for other industrial uses, if some existing cargo operations such as grain are consolidated at larger marine terminals. Growth in these marine-related industries is a major engine for the local economy, and has implications across a variety of sectors.

Key points in this section related to marine cargo land needs include:

- **Cargo Forecast**. Cargo is forecasted to increase in all cargo categories, but is concentrated in the automobile (growth of 280 percent by 2040) and container (growth of 212 percent by 2040) cargoes. Tonnage of all other cargoes is expected to grow by 22 percent by 2040 under the most likely scenario.
- **Cargo Forecast vs. Existing Capacity.** Capacity of existing Portland cargo facilities is shown in Table 1, as determined by the Port of Portland. As highlighted in grey in **Table ES-3**, in the most likely forecast scenario there is not adequate existing capacity for automobile, and there may not be adequate future capacity for grain cargo.

[4] METRO. 2009. 20 and 50 year Regional population and employment range forecasts. accessed online at: http://library.oregonmetro.gov/files/appendix_12_forecast.pdf.

Table ES-3 Forecast Cargo Volume versus Annual Cargo Capacity of Existing Terminals in Portland Harbor

			Cargo Forecast by 2040			
Cargo	Units	Current Practical Maximum Capacity	Low	Most Likely	High	Potential Capacity Shortfall
Automobiles	Units	675,000	925,000	1,145,000	1,364,000	350,000 – 700,000
Containers	TEU	700,000	379,000	585,000	744,000	0 - 50,000
Breakbulk	MT	2,100,000	1,010,000	1,181,000	1,295,000	0
Grain	MT	4,100,000 - 7,100,000	5,647,000	6,477,000	7,059,000	0 – 3,000,000
Dry Bulk National/international	MT	8,200,000	4,650,000	6,054,000	9,733,000	0 – 1,500,000
Dry Bulk Local / Regional	MT	2,500,000	2,089,000	2,471,000	2,852,000	0 – 500,000

- **Land Needs for Cargo Growth**. An important assumption is that future marine-related development in Portland will be similar in size and site requirements to new marine-related developments at other west coast and Lower Columbia ports. Also, to meet growing demand, ports throughout the United States have typically increased throughput capacity by building new terminals requiring new land for development. Ports around the world have also worked to increase efficiency and increase throughput at existing facilities by changing operating standards and implementing such practices as off-site storage and more efficient cargo management systems. While reducing acreage requirements in marine areas, these practices can substantially increase operating costs and reduce competitiveness of a port. There are thus tradeoffs associated with cost competitiveness and land use efficiency.
- **Marine Cargo Land Absorption Forecast**. Based on the size trends of new terminals being constructed on the west coast, the forecasted land need through 2040 for the Port of Portland to retain and attract potential cargo clients ranges from approximately 150 acres (low forecast for only automobiles) to approximately 680 acres (high forecast), with a most likely land need of approximately 425 acres. These forecasts indicate that this land would be required to build modern, operationally-efficient terminals to accommodate all projected cargo growth, but does not signify that these terminals would be operating at capacity.
- **Land Needs compared to Vacant Inventory**. Marine cargo land need is forecast to range from 150 acres to 680 acres, primarily in parcels larger than 100 acres. It is anticipated that up to 55 acres in the high forecast and 25 acres in the most likely forecast could be met by vacant lands available in the Portland Harbor. The remaining land need for marine cargo (150 acres in the low scenario, 400 acres in the most likely scenario, and 625 in the high scenario), is expected to be for parcels larger than 100 acres to accommodate rail access and ensure competitiveness. As discussed above, there are no vacant parcels of this size available in Portland Harbor. To accommodate these new marine terminals in Portland given the currently available land supply, it is expected that the Port of Portland would need to develop land on WHI.

Key points related to land need for marine industrial growth:

- **Existing River-Dependent Land Use and Employment**. River dependent uses were classified by the City, and were further divided for this study into marine cargo and marine industrial uses based ownership and existing use of the site. There are 47 parcels in Portland Harbor identified by the City as river-dependent, with a total of 1,790 acres. Of the 47 river-dependent parcels, there are 29 with available employment data. Data for these parcels indicate 2,780 employees in river-dependent uses, of whom approximately 77 percent (2,140 employees) are employed in marine industrial uses with the remaining 23 percent (640 employees) employed in marine cargo uses.

- **Marine Industrial Land Absorption.** Based on the City of Portland Economic Opportunities Analysis (EOA) job forecasts and proportion of land in marine industrial uses, a range of 70 to 300 acres is the forecasted land need for marine industrial uses.

Key points related to marine-related land need and vacant land supply:

- **Land Needs compared to Vacant Inventory**. Vacant parcels are available in Portland Harbor for marine industrial uses requiring less than 60 acres. There are 11 parcels (263 acres) of vacant lands in Portland Harbor that are larger than five acres and have adequate shoreline length. However, only one of the 11 potential sites (19 acres) does not have potential upland contamination, the presence of which carries significant costs and risks. Thus, while Portland Harbor has available brownfield sites for redevelopment that will accommodate smaller-sized marine industrial uses, it lacks sites for large river-dependent manufacturers and has limited opportunities for uses requiring uncontaminated sites on the river.
- **Suitability of WHI.** WHI has the land size, deepwater access, and proximity to rail and interstate infrastructure necessary for a marine terminal location. If marine terminal development were to take place on the island it is expected that a bridge for vehicular access would be constructed connecting WHI with Marine Drive in Portland. It is also expected that rail access would be developed by integrating with the existing BNSF rail bridge on the eastern limits of the WHI. The primary constraint to WHI development is expected to be impact to natural resources.
- **Concept Designs.** A recent study conducted for the Port of Portland provides some general design guidelines for potential marine terminal development of WHI.[5] This preliminary study analyzed terminals for automobiles (75 to 140 acres), dry bulk (110 to 175 acres), liquid bulk (125 to 155 acres), and container cargo (95 to 140 acres). Conceptual designs, include rail infrastructure, were generated for these terminals. Berths for each terminal type were described, and vary from floating platforms to split-level fixed berths to a traveling loader system. All berths would be located on the north side of the island.
- **Alternative Rail Layouts**. Two general design concepts were developed, one with a long track traversing east-west along the island parallel to the shoreline, and one with the tracks approximately extending only as far west as the power line corridor. Limiting the rail footprint to the east side the BPA power line corridor increases the amount of time for trains to enter or exit the mainline tracks by approximately 25 percent due to increased curvature in the track configuration. Other operational constraints would result from this configuration, including increased labor for train handling and maneuvering, and providing only one loop track of the desired 8,000 to 10,000 feet length which would require increased coordination between terminals.
- **Available Lands at Other Lower Columbia Ports.** At the Port of Vancouver there are 718 acres available, of which 218 acres are in the planned Terminal 5, and 350 to 400 acres are in the planned Columbia Gateway. At the Port of Longview, the only available parcels for additional marine terminal development are privately owned, but include approximately 730 acres.

CONCLUSIONS

Portland Harbor has been a leading west coast port for over 100 years, transporting and handling marine cargo products that sustain businesses and economic activity in the metro area and the greater region extending through Oregon, Southwest Washington, and into Idaho and beyond. Marine industrial activity in the Portland Harbor has also been an important component of the Portland economy, and includes businesses

[5] HDR Engineering, Inc. 2009. West Hayden Island Terminal Site and Operation Requirements and Addendum 1. Prepared for Port of Portland. Accessed at http://www.portlandonline.com/bps/index.cfm?a=279953&c=51508.

highly interdependent on each other and on the cargo handled at marine terminals in the area. As the Portland Harbor has continued to develop over the last century, land use needs have expanded with approximately 21 acres being developed every year from 1960 to 1997. Future growth is anticipated, particularly in the marine cargo sectors and the transportation, logistics, and distribution industries.

While there is uncertainty associated with the magnitude of marine cargo and marine industrial growth over the 30-year planning horizon, the current market position of Portland and historical and recent trends indicate significant growth opportunities. Based on the marine cargo and employment growth rates forecasted to 2040, marine-related land needs to accommodate growth are expected to exceed land supply in Portland Harbor. Land needs are forecasted to range from a low of 220 acres to a high of 980 acres, reflecting uncertainty in new market opportunities and rates of overall economic growth.

As in numerous past studies (Portland Harbor Industrial Lands Study, Trade Capacity Assessment, Economic Opportunities Analysis), this study finds that marine industrial land is limited in the region, particularly for large sites of 60 acres or more needed for marine terminals and large marine industrial operations. Furthermore, marine industrial redevelopment opportunities on the available land are constrained by both the Portland Harbor Superfund Site and the upland contamination present on many sites. Liability concerns and redevelopment costs affect the marketability of these sites to prospective buyers or new tenants.

In summary, to capture economic growth opportunities in marine-industrial land uses, Portland will need to provide large parcels for marine industrial growth. Barring considerable redevelopment and reconfiguration of existing sites in Portland Harbor, Portland will need to look to new sites such as WHI to ensure large site availability for significant growth opportunities. If WHI is not developed, it appears that the existing and planned terminals at ports located on the Washington side of the Lower Columbia River may be able to meet the forecasted cargo demand for the Lower Columbia. Under this scenario, however, it is expected that Portland would lose opportunities to expand marine-related economic activity and would forfeit the associated jobs and income. Additionally, if WHI is not developed, it is expected that fewer lands will be available for marine industrial uses in Portland Harbor, potentially resulting in less job growth in marine-related manufacturing and other sectors dependent on marine cargo activities.

Introduction

1.1 BACKGROUND

The City of Portland (City) is considering annexation and development of a long-term land use plan for West Hayden Island (WHI). This process requires not only annexing and zoning the property, but also an assessment of natural resources, potential conflicting land uses, and marine industrial and recreational uses. WHI is approximately 800 acres and is the undeveloped western portion of Hayden Island, located in the Columbia River near the confluence with the Willamette River. WHI is owned by the Port of Portland, and was added to the region's urban growth boundary in 1983 for marine industrial purposes. It is both a potentially important economic resource and an important natural resource, containing undeveloped open space in a location with habitat value. WHI is designated as Marine Industrial Land on METRO's 2040 Growth Concept Map, and as a Regionally Significant Industrial Area on the Title 4 map in the Urban Growth Functional Plan. WHI is also identified by METRO as a high value riparian area and a Habitat of Concern in the regional inventory, and as a Moderate Habitat Conservation Area in Title 13.

1.2 PURPOSE

The WHI Economic Foundation Study will serve as a foundation study for the zoning and annexation of WHI and is intended to provide background information for the current planning process and future WHI studies. The objective of the study is to identify likely marine-related economic development opportunities and corresponding land needs over a planning period of the next 30 years. The land demand analysis will also inform the Economic Social, Environmental and Energy (ESEE) Analysis to be completed as part of the City land use plan for WHI.

This Economic Foundation Study provides information about marine-related industrial land needs relative to WHI and its surroundings over the next 30 years. A companion study, the Environmental Foundation Study, provides a detailed understanding of the condition, function, and value of WHI natural resources. A third recreation study describes recreation participation, development potential, and value on and around WHI. Together these studies provide information on the importance and potential contribution of WHI in three different land uses: habitat, marine-industrial use, and recreation. Collectively, the studies also provide information on potential compatibility and conflicts with multiple land uses on WHI.

1.2.1 WHI Public Planning Process

The City of Portland's Bureau of Planning and Sustainability (BPS) is leading a collaborative public process to evaluate alternative long-term uses for West Hayden Island (WHI). To help the City in determining future plan designations on West Hayden Island, the City has created a Community Working Group (CWG). This study is intended to provide information for the Community Working Group (CWG), which is tasked with advising the Portland City Council on "how marine industrial, habitat, and recreational uses might be

reconciled on West Hayden Island (WHI); and if the CWG determines that a mix of uses is possible on WHI, to recommend a preferred concept plan."[6]

The CWG is made up of stakeholders with diverse backgrounds and interests in WHI land use. CWG members include representatives of local businesses and industries, non-profit organizations, surrounding neighborhoods, and staff with the City of Portland, Metro Region, and the Port of Portland. Reaching agreement on a planning framework for the site will allow planning, management and enhancement efforts to proceed. The City will coordinate this effort with planning work currently being done on the Columbia River Crossing (CRC) project and East Hayden Island.

1.3 SCOPE

Broadly, the scope of this work is to 1) assess the opportunities for marine-related economic growth in Portland Harbor, 2) estimate the land acreage and site characteristics necessary to accommodate this growth, 3) compare the available land supply to the land demand to identify marine industrial land shortages, and 4) identify the potential role of WHI and other sites in meeting projected land shortages. The scope of the analysis is marine-related uses, which includes both marine cargo and marine industrial uses. Marine cargo refers to activity and facilities related to the movement of waterborne cargo while marine industrial refers to industrial activity and facilities requiring waterborne transportation. Marine industrial activities may include manufacturing, vessel repair and construction, and rail yards at marine terminal sites.

In terms of geographic scope, the analysis is focused on Portland Harbor, with a limited review of the availability and relative suitability of alternative marine industrial land sites in the Lower Columbia River. The planning timeframe for the analysis is a 30-year horizon through 2040. Due to time and resource constraints, the scope of the analysis is based on existing data and readily available information.

1.4 LIMITATIONS

The study is intended to utilize the best available data to forecast the economic growth and associated land needs of marine industrial lands. To accomplish this scope of work within the allotted timeframe and resources, certain assumptions were necessary. Furthermore, the study is limited by the existing data and information collected from interviews, further data collection was not included in the scope of work. Summarized below are the key study assumptions used in the analysis as well as the data gaps that were identified.

1.4.1 Study Assumptions

This study is based on economic forecasts of marine cargo and marine industrial economic activity, including employment growth, land needs, and cargo tonnage. While based on the best available data, forecasts are derived using numerous assumptions which affect the certainty of the forecast. The certainty of marine industrial and marine cargo forecasts is also influenced by the fact that marine-related land uses require large sites of 60 to 100 acres. The development of one site can consequently dramatically alter the balance of available land supply and demand in the region, making projections of land need highly sensitive to assumptions regarding new market or growth opportunities.

The following assumptions were utilized to develop cargo and employment forecasts and associated land need forecasts:

[6] From the West Hayden Island Community Working Group Charter, March 17, 2009.

LUBA No. 2020-009
Page 6833

- Economic growth will resume in 2010, and employment and cargo growth will resume during that timeframe and will, on average, be positive through 2040.
- Portland will continue to invest in the road and rail infrastructure necessary for it to thrive and grow as a marine cargo port and marine industrial center.
- Current economic conditions and historical trends are a good indicator of future economic and trade growth and associated land needs.
- The proportion of land use and employment that is marine industrial will remain fairly constant into the future.
- Future marine-related development in Portland will be similar in size and site requirements to new marine-related developments at other west coast and Lower Columbia ports. In other words, current site requirements are a good indicator of future site requirements for marine-related uses, including acreage size requirement for a given cargo type and annual cargo throughput.

1.4.2 Data Gaps

The study is also limited to existing, readily available data. The following key data gaps were among those identified during the course of the study:

- Lack of comprehensive information on marine-related employment in Portland Harbor and an associated lack of comprehensive studies on the total economic contribution of marine-related uses in Portland Harbor.
- Lack of uniform, comprehensive data on the characteristics of marine-industrial sites at ports. This information is confidential or unpublished, with entities reluctant to share information publically.
- Limited detailed information on the operation and cost tradeoffs associated with infrastructure design and footprint size of marine terminal and marine industrial sites. Information of this nature is very limited as these tradeoffs are specific to a particular market, cargo, and tenant rather than widely applicable across uses.

To compensate for these data gaps, the study utilized interviews with the City of Portland, Portland Development Commission, Port of Portland, industry professionals, and other consultants to augment available, published information.

1.5 REPORT ORGANIZATION

Following this introduction, there are six additional sections to this report. **Section 2** addresses the economic history and contribution of Portland Harbor, including information regarding the economic impact of marine-related land uses. **Section 3** addresses economic trends that will affect the growth in marine cargo and marine industrial uses, and provides cargo and employment forecast through 2040. **Section 4** identifies the characteristics that make a site suitable for marine cargo and marine industrial land uses, while **Section 5** inventories the available lands in Portland Harbor to identify which sites may be suitable for marine related uses. **Section 6** concludes the study by drawing from all previous sections to identify the land need in Portland Harbor to meet forecasted growth in marine-related uses, and to identify the land availability and suitability in Portland Harbor, West Hayden Island, and other Lower Columbia River sites to meet this demand. References are provided in **Section 7**, while **Appendix A** provides data and analysis related to **Section 2.**

SECTION 2

Economic History and Contribution of Portland Harbor

The purpose of this section is to provide planning and policy context for the WHI decision process by describing the economic history and regional role of marine-related activities and land needs in Portland Harbor and surrounding areas. Furthermore, the section describes the economic contribution of marine-related uses to the regional economy. This section is intended to portray the broader economic context of marine-related uses and their regional importance.

2.1 OVERVIEW OF DATA SOURCES

Data sources for this section include general sources about the history of land uses in Portland Harbor prepared for and by the City of Portland, interviews with Portland Harbor businesses, geospatial data on lands uses in Portland Harbor provided by the City of Portland, as well as employment data. Additionally, the section on the economic contribution of Portland Harbor businesses and marine-related uses draws from a variety of existing economic impact studies that have been prepared for the City of Portland, the Port of Portland, and other regional entities. Finally, the section also utilizes information from other ports in the area to compare the characteristics of Portland Harbor to other Lower Columbia River ports.

2.2 ECONOMIC HISTORY AND REGIONAL ROLE OF PORTLAND HARBOR

From the late 19th century, Portland Harbor has been a leading west coast port due to its position on the confluence of the Willamette and Columbia Rivers, its multi-modal transportation infrastructure, and its proximity to areas producing substantial natural resources (primarily timber and grain) and associated finished products. From its earliest days, the majority of Portland's exports have been raw materials (agricultural products, lumber, metals, and potash while imports are more likely to be finished products (autos, consumer materials) for distribution throughout the northwest and Midwest. Today, Portland Harbor is a 40-foot deep-water port that includes the lower 12 miles of the Willamette River and two miles along the Columbia River. Located at the nexus of excellent rail infrastructure, the Olympic oil pipeline, two interstate freeways, the Columbia River deepwater shipping channel, and the Upper Columbia/Snake Rivers barge system, Portland Harbor has continued to serve as an important gateway for the movement of goods to and from businesses located in Oregon, southwest Washington, Idaho, and further afield. In addition to regional domestic trade, Portland serves as an international gateway, particularly with respect to Asian markets. At the turn of the 21st century, Portland has become a 'trans-shipment center', with more goods moving through Portland to national and international destinations than are consumed locally in the region.[7]

Discussed below are the key developments in the history of Portland over the past 140 years as a significant shipping location. These include steps to ensure regular dredging and the creation of public docks, as well as the continued development of additional lands for expanding maritime industries. Lands to the north of downtown were filled in during the 1920s to create the Guilds Lake and Swan Island industrial areas, while port lands continued to be expanded to the north through the 1970s with the development of the Rivergate

[7] City of Portland, Bureau of Transportation, 2006, Freight Master Plan.

area. Portland's continued expansion to the north was due in part to the larger size of ships but also was due to the large parcels of vacant land that were available in these areas. Portland's harbor continues to be a major economic engine in the region and has experienced substantial growth in the past 40 years.

2.2.1 Economic History

True to its name, Portland has become a major port for the west coast, eclipsing other ports along the Lower Columbia, and competing with Seattle and Tacoma in Washington and Oakland and Los Angeles/Long Beach for a portion of the global trade market. This summary provides a history of Portland Harbor, the reasons behind its growth, and the subsequent growth of the city.

The dependably deep shoreline along Portland's waterfront was preferred for ocean-going vessels over the harder-to-navigate shallow water area adjacent to Ross Island. In 1846, Captain John Couch moved his operations from Oregon City to Portland, helping to establish Portland as a port city, where the first harbor facilities were privately-owned docks in the area now known as Tom McCall Waterfront Park. When gold was discovered in California in 1848, the resultant building boom created a demand for lumber to be transported to San Francisco. Portland was ideally situated near the confluence of the Willamette and Columbia Rivers and had close access both to large stands of timber and nearby wheat farms. The dominant export from Portland, from the mid nineteenth century into the 1930s, was lumber and wood products, and the Columbia River, the fourth largest river in the United States, provided an east/west passage through the adjacent mountain ranges.

2.2.1.1 Further Development at the End of the 19th Century

In the 1880s OSN (now the Oregon Railway and Navigation Company OR&N) set up a freight terminal in Albina, connecting with the east coast in 1882 and to San Francisco in 1887. While the completion of these rail lines altered how goods were moved within the country, they also gave Portland strength as a transfer point between rail and shipping modes. Industry growth paralleled trade growth. With the availability of raw timber, saw mills sprouted on both sides of the Willamette, as did other industries using wood products. Companies making furniture, windows and doors, architectural features and crates grew from the area along the downtown waterfront south to the Brooklyn neighborhood and SW Fulton Street and north to Linnton and St. Johns.

2.2.1.2 Portland in the Early 20th Century

The Lewis and Clark Centennial Exposition in 1905 brought thousands of visitors to the area, many of whom decided to move to Portland. Portland's population more than doubled during the decade, reaching 207,214 by 1910. This influx of people, combined with the increased rail connections (ten lines served the Portland area), resulted in a surge of industrial growth in the trade and transportation sectors as well as manufacturing. This growth included creation of many woolen textile firms including Jantzen, Pendleton, and the Portland Woolen Mills in St. Johns. Other major new businesses included the Swift and Company meat packing plant near the Columbia River rail bridge, which employed 1,500 workers. Portland was considered the number one lumber shipping and manufacturing center in the world according to *Harper's Weekly* in 1913. The city also emerged as the nation's number one wheat port in the 1910s.

The end of the first decade also brought about changes that ultimately resulted in the establishment of the Portland Dock Commission, which was a part of City of Portland government. In 1909, Portland voters approved the sale of $500,000 in dock bonds to address neglect of private docks beginning to fall into disrepair. The mission of the Portland Dock Commission was to construct and maintain municipally-owned docks, leading to development of Terminal 1 along NW Front Street between 14th and 17th Avenues, featuring a 955-foot dock intended to receive overseas ships. Soon after, Terminal 2, a smaller terminal, opened at the

foot of Washington Street on the east side, with a frontage of 525 feet. Meanwhile, the Federal Rivers and Harbors Act of 1912 granted the Port of Portland the responsibility for maintaining a channel depth of 35 feet in the Portland Harbor.

2.2.1.3 Growth after World War I

World War I created a surge in shipbuilding, as German U-boats were destroying cargo ships faster than they could be built. From 1917 through 1919, Portland shipyards launched 227 vessels, 96 of them steel ships. Shipyard employment climbed to 28,000 by the end of 1918. Ship building facilities ranged from the Northwest Steel Company at SW Sheridan Street, to the Grant-Smith-Porter yard in St. Johns.

The Portland Dock Commission continued to expand, constructing Terminal 3 in St. Johns with 540 feet of harbor frontage (later removed to make way for the St. Johns Bridge in 1931) and Terminal 4, along the north edge of St. Johns, completed in 1920. This terminal was the largest and most important of the municipal terminals with 3,035 feet of harbor frontage with three slips and five piers which could accommodate large shipments and storage of grain. Terminal 1 included a grain elevator, warehouses, additional covered and open storage, and bulk oil tanks. The completion of this terminal encouraged the growth of neighboring St. Johns, supported by development of a trolley line.

As of 1920, Portland's population had increased to 258,288, the 20th largest city in the US. The City of Portland continued to be a major manufacturing and shipping center. Also in 1920 Portland was the largest lumber manufacturing city in the world, and second in the shipping of wheat (which it became the leading shipper of by 1921) and wool. In addition, Portland was the largest flour manufacturing city on the Pacific Coast, the largest furniture manufacturer west of the Mississippi, and the largest livestock and meat packing center on the Pacific Coast. These industries contributed to the primary exports of lumber, wheat, flour, agricultural products, wool, livestock, meats, canned fruits, vegetables, and salmon.

The 1920s also brought a new mode of transportation to the Portland Harbor. In 1922, the Portland Dock Commission bought Swan Island, using the island to receive dredge spoils from the river and connecting it to the mainland. With this newly created land, the Port of Portland built the city's first airport in 1928, which operated as the City's airport until completion of a new airport at the current Columbia River site in 1941. During this time, the Portland Dock Commission also sent channel spoils to Guilds Lake (site of the Lewis & Clark Exposition) which opened this area for later industrial development.

2.2.1.4 The End of the Boom and the Depression Years

The end of the 1920s and the 1930s brought a general slowdown in activity and construction, though the City removed the aging docks and constructed a seawall in 1929. Reductions in the price of lumber and wheat were experienced in the 1920s and, along with the market crash, reduced exports and imports at many municipal ports. The longshoremen strike of 1934 and its ripple effect threw over 50,000 workers out of work, demonstrating the multiplier effect of maritime industries on the City. The Depression also brought Works Progress Administration (WPA) projects to the region, including construction of several major dams, including Bonneville. The resultant cheap power generated by these facilities would help encourage industries reliant on consistently inexpensive energy, such as aluminum smelters.

2.2.1.5 The Influence of World War II on Portland

In 1940, the Portland Dock Commission leased 80 acres north of Terminal 1 to the Oregon Shipbuilding Corporation for a shipyard and Swan Island was converted to a shipbuilding facility, where 147 T-2 tankers were constructed, creating opportunities for other metal industries. At its peak in 1943 and 1944, 140,000 workers were part of the metropolitan defense industries, including 92,000 employed by Henry Kaiser. Once

war was declared, the War Department took over much of the operations of Terminal 4 and designated it as "The Portland Sub-Port of Embarkation." Civilian maritime shipping was shifted to Terminals 1 and 2. Eventually, Terminal 2 was taken out of the public maritime portfolio when it was leased to Columbia Industries to use in airplane parts manufacturing from 1942 to 1945.

The influx of jobs also attracted a large number of workers who came to settle in Portland, and also in the separate city of Vanport, on the north edge of Portland (current location of Portland International Raceway and Delta Park). Before being flooded in 1948, Vanport was Oregon's second largest city in population, with many of its residents involved in the shipbuilding industry. Portland's population reached 373,628 in the 1950 census. Portland's population would remain stagnant for the next three decades as the region's population growth shifted to the suburbs and unincorporated areas, with the 1980 census population of 366,383. But, similar to many urban areas in the country, the metropolitan Portland region did see a large increase in population growing from 501,000 in 1940 to 889,000 in 1989.

Much of the manufacturing base remained in Portland, and the influx of skilled workers helped many of the evolving manufacturers that specialized in construction materials, transportation equipment, machinery and tools. Many of these firms, such as Schnitzer Steel, Hyster, and Precision Castparts are familiar names today.

2.2.1.6 Post World War II and Shifts in Port Activity

After the war, Swan Island remained the only ship repair yard available on the west coast, establishing a marine construction and repair industry associated with the ship yard. The remainder of Swan Island was developed into an industrial park in 1957. The migration of docks and shipping activity continued to move downstream, as construction of many downtown bridges slowed boat traffic on the Willamette River. The removal of shipping facilities in the downtown area led to the Portland Dock Commission's decision to maintain the dredge channel only downstream from the Broadway Bridge. The Portland Dock Commission renovated Terminal 4 after its return from the War Department, funded through a $6.5 million bond measure in 1954. Between 1945 and 1955, imports increased from 40,594 tons to 227,139 tons, and exports increased from 141,219 tons to 854,281 tons. This compares to 1925 volumes of 577,211 tons of imports and 580,219 tons of exports. By 1957, Portland was the leading dry cargo port of the Pacific Coast.

2.2.1.7 Changes in Transportation Infrastructure

Just as Portland's position made it a logical crossroads for trade and for the growth of railroads in the 1800s it provided an ideal place for the intersection of major north/south and east/west roadways. This growth started with the development of the U.S. Highways, where Highway 99 became the major north/south highway between Vancouver, British Columbia and Los Angeles, California, and U.S. Highway 30 provided a convenient, low-elevation linkage between Astoria on the coast through Portland and into the heartland of Eastern Oregon and Washington, and many mountain states. The Interstate Highway system, begun in 1956 paralleled these routes with Interstate 5 following U.S. 99 and Interstate 80N (now Interstate 84) following U.S. 30 through the Columbia Gorge. These highways augmented existing railroads to help encourage the increase in container shipping that was to come.

Additionally, the dam building on the Columbia and Snake Rivers changed shipping patterns by facilitating development of the barge system that enabled river-borne transport of agricultural and wood products, metals, and other commodities from as far east as Lewistown, Idaho to Portland's marine terminal facilities. Growth in barge traffic has played a large role in riverfront development, marine transportation, and growth of agricultural production in the Columbia River watershed.

2.2.1.8 The 1960s and Port Expansion

This period brought the emergence of new goods that were shipped through Portland facilities as Portland began receiving imported cars. This development corresponded with the opening of a Portland Dock Commission office in Tokyo, Japan. By the mid 1960s, approximately 1,000 autos per month were handled through Portland Dock Commission terminals, including almost all Volkswagens destined for the Northwest. A 400-foot floating automobile dock was installed at Terminal 4, helping to make Portland the busiest auto import terminus in the Pacific Northwest. Portland's favorable rail connections, with good service throughout the Northwest and more transcontinental rail service than any other West Coast port, increased the attractiveness of Portland as an auto importer.

Seeking land for future public port facilities, as well as areas to place dredge material, 2,000 acres were purchased in 1965 near the confluence of the Willamette and Columbia Rivers (an area which would eventually increase to 3,000 acres with subsequent purchases). Mostly ranchland and other lowland floodplain, this area within unincorporated Multnomah County beyond the border of the St. Johns district and Terminal 4 would eventually become the Rivergate Industrial area.

2.2.1.9 Port of Portland

In addition to maintaining the Columbia and Willamette River navigation channels, the Port of Portland had assumed a greater role as a development agency since the acquisition of Swan Island as the City's first municipal airport. The Port of Portland was created in 1891, and had been unrelated to the Portland Dock Commission until in 1971 the Port of Portland acquired the assets and function of the Portland Dock Commission. The Oregon legislature amended the Port's charter to "promote the maritme, shipping, aviation, commercial and industrial interests of the Port." In 1973, the Oregon Legislature expanded the Port of Portland to serve Washington and Clackamas counties, in addition to Multnomah County.

2.2.1.10 Development of Rivergate Area

Development of the Rivergate area became the responsibility of the Port of Portland, which expanded terminal operations, taking advantage of the large amounts of vacant land and its ideal location on the lower Willamette and Columbia Rivers which provided better river access for the now-larger container ships. Portland continued to be a major exporter of wheat, and one of the first maritime developments approved, after land in the Rivergate area was filled, was a new grain terminal with a capacity of 40,000 tons held in eight 140-foot concrete silos, allowing the more efficient movement of larger volumes of wheat. At about the same time, the Port began working on Terminal 6 featuring three container cranes, direct rail service, a container distribution center, and two berths on 1,800 feet of berth space. The first port facility with Columbia River frontage, it was located along the Oregon Slough, next to the western tip of Hayden Island.

As much of this area was under Multnomah County's jurisdiction and not zoned for industrial use, the Port needed to work first with the County, and later the City to rezone and annex the land into the City of Portland. The properties were annexed in 1979 and re-zoned under a 1976 master plan. The land mass of the Rivergate area allowed inclusion of new maritime activities with designated sites for complementary industrial activities as well as environmental mitigation and wetlands preservation. The process of development at Rivergate differed significantly from the previous harbor development process where wetlands such as Guilds Lake and the area near Terminal 4 were indiscriminately filled. The Rivergate area was the first terminal area to be developed under recently passed environmental guidelines, preserving and—in-some cases—augmenting Kelly Point Park, Columbia Slough, and the Smith & Bybee Wetlands.

Terminals at Rivergate have been expanded several times in the past 30 years, including expansions to the elevator system at Terminal 5 and expansions in container facilities and auto handling capacity at Terminal 6. Rivergate also was laid out for other industrial uses, with many of the sites now being used by industries that

complement the terminal activities including materials manufacturing such as steel, and several warehouse, distribution, and trucking companies.

2.2.2 Local Maritime Trends of the Last 20 Years

Unlike many mature cities, Portland's industrial base has shown steady growth over the past 20 years. Some of this growth may be due to the strong land use policies instigated by Metro and the City to ensure the preservation of industrial lands, allowing job growth in many industries, particularly electronic manufacturing, the construction trades, air transportation and wholesale trade.

Portland Harbor has kept much of its land in service for river industrial uses with some exceptions, such as the absorption of Terminal 1, just north of the Fremont Bridge and the area between it and the Steel Bridge, into the Central City—now making up the waterfront area for the new residential towers of the River District. This area was rezoned for housing as part of the Central City Plan in 1988, in order to allow Central City expansion and accelerate the housing development in the Central City and throughout the City, which are both regional growth management goals. In the early 1990s Portland adopted the goal that it would capture at least 20 percent of the region's growth. The dividing line at the Steel Bridge between the mixed use/higher density Central City and Portland Harbor Industrial districts was refined in the 2001 Guild's Lake Plan and the most recent Northwest District Plan. Other factors related to the conversion of Terminal 1 for mixed uses include the fact that the area did not have sufficient rail access for modern operations and was also located adjacent to Front Avenue, which prohibited expansion. In general, the absorption of Terminal 1 and the development of the Rivergate area highlight the overall trend of port facilities moving farther downstream on the Willamette River.

South of Downtown, much of the "South Waterfront" area has been rezoned for mixed use, and is being developed with condominiums and an expansion of medical facilities. The area still has Zidell Marine (a ship builder) and some other smaller industrial uses, but is undergoing transition, as was anticipated in the Central City Plan. Outside of the Central City, the area along the east bank of the Willamette River, between the University of Portland and the St. Johns Bridge is largely vacant, and some of the property has been purchased by the University of Portland.

However, most of the other harbor lands on the Willamette River between downtown and the confluence with the Columbia River have been preserved for industrial use. In the 1980s the City of Portland created industrial sanctuaries to encourage industrial growth and protect industrial districts from incompatible uses such as housing, high density uses, and high traffic uses. The Willamette Greenway Plan (1987) created this zone, better known as the River Industrial Zone.

Many of the older harbor industrial areas north of downtown house river-related industry. In 2000, a survey of businesses within Guild's Lake and Lower Albina areas revealed that 65 and 70 percent respectively of the river frontage is in river-dependent industrial use. The areas upland from these riverfront properties include two of Portland's four rail yards as well as a concentration of industrial uses that can supplement the river-dependent uses. The city anticipates that the tank farms will also be looking to expand their operations as new biofuels are anticipated. Overall, there have been $450 million of completed or funded capital investments made on 30 harbor area sites from 2004 to 2007. Many of these sites have river, rail and road access and use all three for portions of their activities. River-dependent industrial land (as defined in the river plan) along the Portland and Vancouver harbors has had an average absorption rate of 21 acres between 1960 and 1997. More recently, of the 232 acres that were vacant in 1990 and occupied by 1997 (including Port properties), 105 acres were developed as marine cargo uses, 43 acres as marine industrial, and 20 acres as marine infrastructure.

Marine cargo tonnage handled at Portland Harbor increased by 253 percent between 1960 and 2000, driven largely by growth in exports. Between 1985 and 2000, Portland captured an increased share of West Coast

marine cargo in dry bulks, autos, and breakbulks. Portland, Seattle, and Tacoma had declining shares of West Coast container cargo between 1985 and 2000, as an increasing share concentrated at the Los Angeles and Long Beach harbors. However, since 2000, Los Angeles has been experiencing capacity problems causing movement in the harbor to suffer. Portland dominates cargo volume for the Columbia River deepwater seaports, handling 66 percent of the total marine cargo tonnage in 2000.

Although truck traffic has become the dominant mode for delivery of goods to and from Port facilities, proximity of rail has continued to influence modal choice. Rail is a major mode of transportation for ocean-bound cargo, handling 37 percent of all tonnage in the metro area, in 1997. Twenty-one percent is handled by barge, and 42 percent by truck. Rail tonnage increased by 1.8 percent annually in the decade from 1993 through 2003. Both truck and rail tonnage is expected to grow approximately 2.5 percent annually, while barge is expected to become a smaller percentage of overall tonnage with forecast annual growth of 0.29 percent.

If the trends continue into the future, it is anticipated the Portland will continue to increase its cargo volume. Since these marine terminals have a fairly large multiplier effect in job creation, expansion of the port would also expand opportunities for various other industries.

2.2.3 Portland Harbor and Other Lower Columbia River Ports

Other ports along the Lower Columbia also provide potential sites for marine cargo and marine industrial businesses. However, differences between these ports influence a business decision to locate at one port over another. This section contrasts the characteristics of the Port of Portland to the other Lower Columbia ports, including the Ports of Kalama, Longview, and Vancouver. The available land at these sites and the associated facilities and future plans for each port are also discussed to provide context for the relative availability and substitutability of land at different ports in the Lower Columbia River.

Interviews were conducted with several businesses within the Portland Harbor. The purpose of these interviews was to determine the importance of marine industrial developments to businesses now and in the future. In addition, these interviews were used to verify results from previous research. Businesses interviewed included an automotive import company, a rail service provider, liquid bulk company, dry bulk company, and a representative from a rail consulting firm.

Interview topics covered current operations, future plans, issues of future uncertainty, and site suitability requirements. Common themes from these interviews were the importance of intermodal connections, commercial trends, and possible constraints for future growth. For example, every person interviewed spoke to the importance of rail and the advantages of multiple rail service providers within Portland Harbor. Many noted that the presence of two rail service providers results in beneficial rates for harbor businesses.

2.2.3.1 Portland Harbor Distinguishing Features and Cargo Types Handled

The Lower Columbia River Ports at times work cooperatively to maintain the healthy transportation economy that serves the region, but at times also compete with one another to attract a new client or new service area. Through published research and personal interviews, the advantages and disadvantages of each of the ports in the Lower Columbia are described below in order to portray the degree to which available land at one port can substitute for available land at another port in the region. This analysis is intended to merely identify the potential for substituting land at one port for another, and should not be interpreted as an assessment of which ports would be most suitable for different kinds of marine industrial expansion. A wide variety of factors influence final decisions on where to locate industrial activities, including uncertain future national and international economic drivers, availability of funding, private negotiations, and public permitting processes. Still, an overview of the differences can provide foundational information for planning in the Portland Harbor.

In general, Portland is distinguished as being the most significant transportation hub on the Lower Columbia River. Portland is located at the nexus of two interstate freeways (Interstate-5 and Interstate-84), the confluence of the Willamette and Columbia Rivers, the intersection of the north-south and east-west Class I rail lines, and also has an international airport. Due to its proximity to Portland, the Port of Vancouver has easy access to this transportation system. While all of the Lower Columbia ports (with the exception of St. Helens) are located on or near Interstate-5 and are located near the north-south lines of both Class I rail lines, the Ports of Vancouver and Portland are thus differentiated in their level of access to truck, rail, and air transportation.

As summarized in **Table 2-1**, Portland is further differentiated in that it is the only port on the Lower Columbia River that handles large quantities of all types of cargo. In particularly, Portland is distinguished in that container traffic on the Columbia River is centered at the Port of Portland. This is due to the fact that many of the inbound and outbound containers either originate or are destined for locations in the Portland metropolitan area. The Ports of Vancouver and Portland are also the only ports on the Lower Columbia River that handle liquid bulk (primarily petroleum products) and automobile cargoes. Location in a metropolitan area is not only important for attracting these cargo types, but it is also important to attract marine industrial businesses. These businesses benefit from the access to a large, highly skilled labor force as well as proximity to local suppliers and buyers. Interviews with Portland Harbor businesses attest to the fact that the industry clusters in the Harbor are highly interrelated and contribute to the overall success of the area.

Portland is thus differentiated from other Lower Columbia Ports because it handles large volumes of all types of cargo. Additionally, Portland has a larger population of skilled labor and a larger local industrial base that can generate cluster benefits and additional opportunity for marine-related businesses, particularly marine industrial businesses. However, the benefits of being located in a major metropolitan area are also enjoyed by the Port of Vancouver. The benefits of a metropolitan location may not be as important for such cargoes as grain, dry bulks, and breakbulk, as evident in the fact that these cargoes are handled at nearly all Lower Columbia ports. Depending on the specific cargo, its handling requirements, and its local transportation modes, marine industrial land in Portland may be highly substitutable for marine industrial lands at other Lower Columbia ports. For other marine cargo and marine industrial uses, marine industrial land in the Portland metropolitan area (in Vancouver or Portland) may not be as easily substituted for lands elsewhere in the Lower Columbia.

While locational considerations make lands in Portland more desirable for certain marine-related uses, other ports appear to be less land constrained and have less contamination. The Port of Portland has three sites available: the Suttle Road Site at Terminal 6 has approximately 30 acres available which could be suitable for expansion of the automobile terminal, the T-4 Pier 1 site is approximately 35 acres and could be suitable for liquid bulks or local/regional dry bulk use, while the 6.5 acres located at the upstream end of Toyota at Terminal 4 could be used to expand the Toyota facility. As summarized in **Table 2-1**, Portland has no large, shovel-ready sites, while several other ports do have such lands available. Furthermore, known contamination of in-water and upland areas is limited at other ports, while Portland Harbor is listed as a superfund site due to in-water contamination and many upland areas surrounding the harbor have suspected contamination. This contamination carries significant costs in terms of potential future liability as well as development costs that may deter marine-related use.

LUBA No. 2020-009
Page 6843

Table 2-1 Land and Cargo Characteristics of Lower Columbia River Ports

Characteristic	Port of Kalama	Port of Longview	Port of Vancouver	Port of St. Helens	Port of Portland
Cargo Handled					
Containers	No	No	Yes (Very Limited)	No	Yes
Automobiles	No	No	Yes	No	Yes
Breakbulk	Yes	Yes	Yes	No	Yes
Grain	Yes	Yes	Yes	No	Yes
Dry bulk	No	Yes	Yes	Yes	Yes
Liquid bulk	No	No	Yes	No	Yes
Land Availability					
Total shovel ready acreage over 100 acres	Yes	No	Yes	Yes	No
Shovel ready contiguous sites over 50 acres	1	0	3	1	0
Access to adjacent additional/undeveloped land	Yes	No	Yes	Yes	Yes
Undeveloped sites greater than 100 acres	No	No	1	1	1
Contamination					
Contaminated sites	No	Limited (on private land not port property)	Limited (groundwater contamination on acquired site)	Limited (1 site has some contamination from previous owner)	Yes (Portland Harbor Superfund Site, Upland Contamination on Private lands)

2.3 ECONOMIC CONTRIBUTION AND VALUE OF MARINE-RELATED USES

As described above, economic development of the City of Portland and the region as a whole has always been closely linked with marine-related industry in Portland Harbor. The degree to which marine-related uses currently contribute to the regional economy (defined as the four-county area of Clackamas, Multnomah, Washington, and Clark County) can be analyzed using two related factors:

1. **Number and strength of the linkages between marine-related economic sectors and other economic sectors in the regional economy.** Linkages can be based on purchase of inputs for the marine-related sector (goods and services produced by other sectors) and purchase of outputs from the marine-related sectors (goods and services required by other sectors). The more numerous the industries connected to the marine-related uses, and the stronger the linkages and interdependencies, the greater the economic importance of the marine-related uses in the regional economy.
2. **Job and income impact of marine-related economic activity.** The relative size of employment and income in the marine-related economic sectors as well as the size of employment and income in closely related sectors dependent on marine-related uses indicates the overall economic importance of marine related uses.

This section discusses the existing studies and data that provide information on the degree of economic dependency and importance of marine-related uses in Portland. Although there are numerous existing studies to draw from, and several that estimate employment and income in marine-related industries, data gaps prevent full quantification of the total economic contribution in terms of jobs and income in sectors closely linked to marine-related uses. Given these data gaps, the intent of the section is to characterize the linkages

between marine-related uses and other economic sectors in Portland to give a sense of the potential total jobs and income contribution of marine-related activity in all sectors.

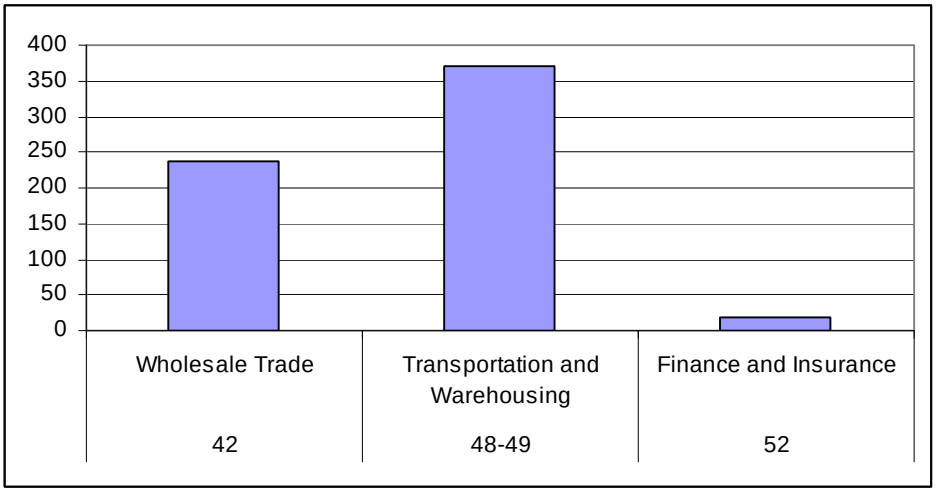
2.3.1 Overview of Economic Links

Marine-related industrial and marine cargo uses are linked to a great number of other industrial activities within Portland and the region. Marine industrial uses are situated on the river in order to utilize water transportation for import or export of their primary or finished goods. These marine industries are linked to other industries located in Portland Harbor and elsewhere in the region, including wholesale trade, local and regional transportation firms, manufacturing firms, and retail firms. Marine cargo terminals handle and transport freight that is vital to numerous other industries located throughout Oregon, Southwest Washington, and beyond. These businesses depend on the transportation hub at Portland Harbor either for transport of their products to international or regional markets (such as grain, steel, or minerals), or for the provision of inputs of the wide variety of freight materials imported through Portland Harbor, whether petroleum, consumer apparel, automobiles, or raw materials.

To identify these links, this section first discusses the primary marine-related sectors operating in Portland Harbor, including water transportation, warehousing and wholesale trade, metals manufacturing, and transportation equipment firms. The related, linked industries that are associated with these industries are then discussed. As a starting point, this analysis assesses the economic sectors that are linked with water transportation activities, as an indicator of which sectors depend on water-borne transportation provided by Portland Harbor. Following the linkages further, we find that all sectors in the Portland metro area and beyond are linked in some way to sectors that rely on water transportation. The challenge is to identify those industries that are most dependent on water transportation, and gain a sense of their economic importance in the region. This analysis is intended to verify and expand the body of economic impact research on the economic importance of marine-related uses in the Portland Harbor to help inform the question of how the annexation of West Hayden Island for marine industrial uses could help sustain a healthy future economy for the City.

There are some 1.3 million jobs across a range of industries in the Portland Metropolitan region, which are explored more fully in section 3 of this report. This section of the report reviews the activities of the Portland Harbor, and the Transport by Water industry within the harbor. This overview is intended to provide the context of the harbor-related activities within the region and the linkages of that activity to the rest of the region's economy.

2.3.1.1 Primary Sectors & Clusters Dependent on Marine Transportation

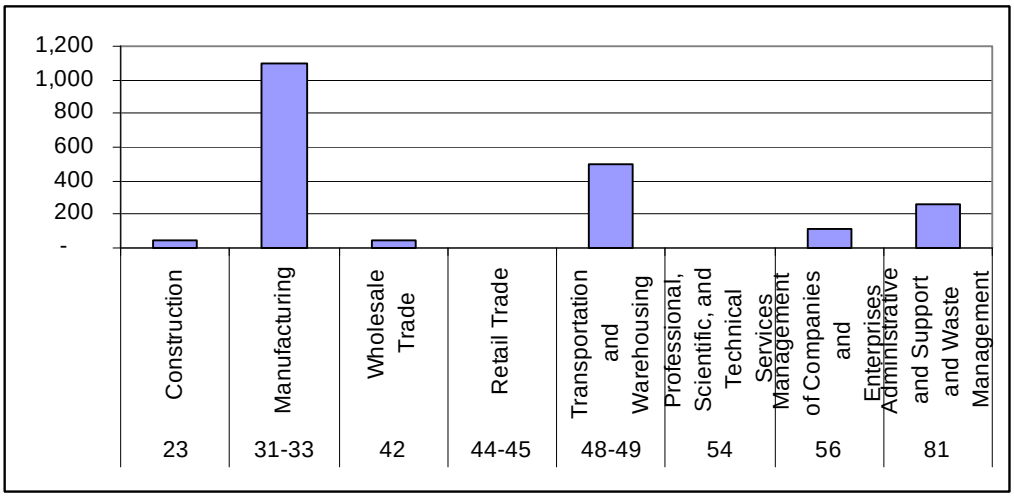


Employment by industry in Portland Harbor is analyzed using geospatial data provided by the City of Portland on 993 parcels totaling 5,979 acres. This data is from the City's Working Harbor analysis conducted in 2004; the working harbor geography is the same as the Portland Harbor geography. Employment data from the 2008 Quarterly Census of Employment and Wages is available for 481 parcels (4,334 acres), with an estimated 35,000 jobs. Excluding parcels designated as residential uses, there are 5,953 acres in 897 parcels in the Portland Harbor. Among these, 117 parcels are designated as river-dependent, rail-dependent, or both river- and rail-dependent. These lands comprise just over one-half of the total land area, and account for just under 24 percent of the area's estimated 35,000 employees. As employment data were not available for all parcels, the analysis is limited to those parcels for which complete data were available.

River dependent uses are defined in the *Portland Zoning Code* as "a use which can be carried out only on, in, or adjacent to a river because it requires access to the river for waterborne transportation or recreation." River dependent uses were classified by the City, and were further divided for this study into marine cargo and marine industrial uses based on ownership and existing use of the site. There are 46 parcels identified by the

LUBA No. 2020-009
Page 6845

City as river-dependent, which aggregate to a total of 1,787 acres. Of the 46 river-dependent parcels, there are 28 with available employment data. Data for these parcels indicate 2,707 employees in river-dependent uses, of whom approximately 76 percent (2,067 employees) are employed in marine industrial uses with the remaining 24 percent (640 employees) employed in marine cargo uses. **Figures 2-1** and **2-2** display the employment distribution and the job categories for parcels designated as marine cargo.



As would be expected, jobs on parcels classified as marine cargo are mostly in the wholesale trade and transportation and warehousing categories. Employment classification on marine industrial land uses is much more diverse. Of the 755 acres of marine industrial land, employment data are available for 542 acres that provide employment for 2,067 workers across a range of industries. Over half of these employees (1,098 jobs) are classified as working in Manufacturing, another 504 jobs in Transportation and Warehousing, and the remainder classified as a range of service, and construction jobs.

Note: Excludes parcels for which no employment data were available.

Source: Oregon Employment Division, 2008 Quarterly Census of Employment and Wages, City of Portland GIS, merged by ENTRIX, and tabulated by Bonnie Gee Yosick LLC.

Figure 2-1 Employment Distribution for Parcels Classified as Marine Cargo

Note: Excludes parcels for which no employment data were available.

Figure 2-2 Category of Jobs for Parcels Classified as Marine Industrial

For the 1,524 acres of land designated as river-dependent for which employment data area available, there are an estimated 2,700 employees across a range of industries. Over one-third are classified as transportation equipment manufacturing.

According to the employment data from the 2008 Quarterly Census of Employment and Wages, over one-third of the employment on the rail-dependent parcels is in the railroad rolling stock manufacturing industry, most likely Oregon Iron Works. The economic impact of these 1,009 jobs in the railroad rolling stock manufacturing sector is quantified later in this report, as is the economic impact of the Transport by Water industry.

Within the context of the Portland Metropolitan region, these harbor jobs represent a small fraction of total employment within the region, but they are intricately linked to the overall economic activity of the region. As has been noted in numerous other reports, the region's economy is heavily dependent on the traded sectors, and all forms of transportation are integral to sustaining these economic sectors. Some of the connections are explored below.

2.3.1.1.1 Cluster and Linkage Analysis of Water Transportation Industry

Industry clusters are generally defined as geographic concentrations of interconnected companies and institutions in a particular field. Cluster analysis—the identification of groups of firms or industry sectors that share similar suppliers, skills, markets, and workers—has been used as part of the City of Portland economic development efforts for years. The City has used the results of cluster analysis to better understand the regional economy, to focus its economic development agenda, and to identify industry partners.

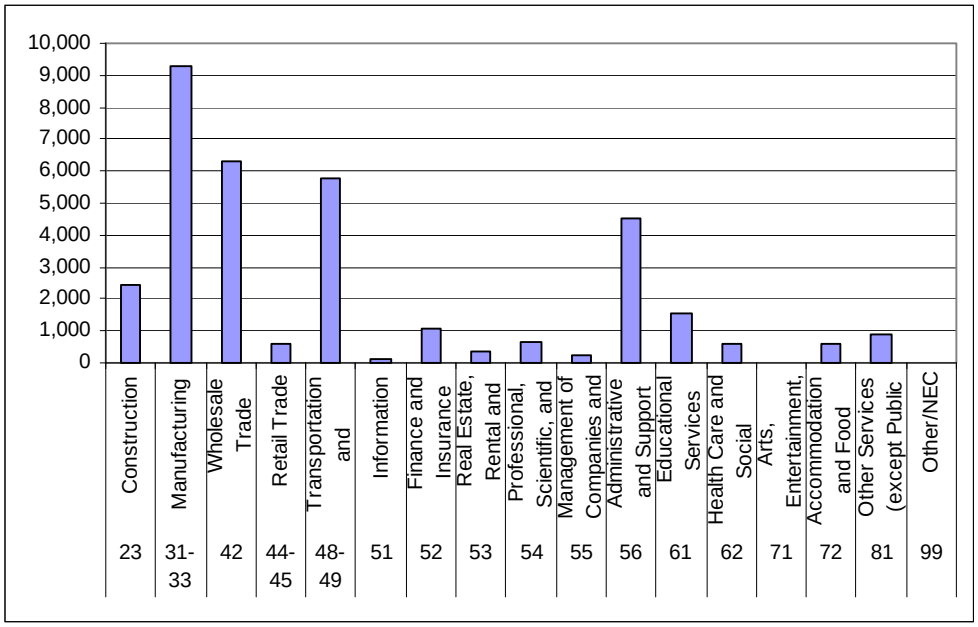
Cluster efforts typically analyze various traded sectors. According to a paper on how to include economic impact information into investment decisions for transportation projects by the Economic Development Research Group (2008),[8]

> *The traded industries serve as a primary generator of wealth by producing more than can be consumed locally. However, from a transportation perspective, traded industries are important because their products are traded and hence depend on long-distance transportation connections to customers in national or international markets. As a result, any major reduction in access to customers outside the region can have serious implications for many traded industries (and therefore the broader economy). Thus, transportation's support for traded industries not only enables those industries to generate wealth for the region, but transportation becomes an important determinant of their future economic prospects.*

There are several industry clusters that are most reliant on marine terminal and harbor activities. A cluster and linkage analysis of five primary industries dependent on water transportation was conducted for a four-county area, including Multnomah, Washington, and Clackamas counties in Oregon, and Clark County in Washington. These industries are handling of automobiles, transport manufacturing (including barge manufacturing companies), handling of steel slab, petroleum, and paper and cartons. The analysis uses the IMPLAN[9] 2007 dataset. In addition to being one of the most commonly used tools in economic impact

[8] Economic Development Research Group, Inc. 2008. Use of Freight and Business Impact Criteria for Evaluating Transportation Investments, Executive Summary. Prepared for the Portland Business Alliance and Port of Portland, Available at www.portofportland.com/.../Trade_Trans_Studies_EDR_ExecSmry.pdf.

[9] IMPLAN is a static equilibrium input-output model first developed in 1979 by the U.S. Forest Service in cooperation with the Federal Emergency Management Agency and the U.S. Bureau of Land Management to assist the Forest Service in land and resource planning and management. The program has been updated and improved over subsequent years and is now one of the most commonly-used economic modeling tools for measuring the economic impacts of development projects.



analysis; IMPLAN is also frequently used for cluster analysis, by examining the relationships of industries to their buyers and suppliers. The structure of the model mimics the monetary transactions for consumption within an economy, allowing a detailed examination of the effects of transactions between businesses and between businesses and final consumers.

Findings from the cluster analysis indicate that employees in these water transportation-dependent sectors have higher than average employee compensation. All of these sectors are also strongly linked with other manufacturers as well as wholesale trade, indicating the importance of trade and movement of goods to these industries. Detailed findings from the analysis are provided in **Appendix A**.

2.3.1.2 Other Sectors & Clusters Dependent on Multi-Modal Transportation

In addition to the industries analyzed above, there are other industries not strictly defined as marine dependent which benefit from the multi-modal transport available in the harbor. These industries, indirectly supported by the marine transport, might not locate in the harbor were it not for the combined multi-modal transport.

The industries with the greatest employment in the Portland Harbor include Manufacturing, Wholesale Trade, Transportation and Warehousing, Administrative and Support Services, and Construction. The distribution of employment provided by the Quarterly Census of Employment and Wages is shown in **Figure 2-3** below. Industries are shown by 2-digit NAICS code (for example, construction is NAICS sector 23).

Note: Excludes parcels for which no employment data were available.

Source: Oregon Employment Division, 2008 Quarterly Census of Employment and Wages, City of Portland GIS, merged by ENTRIX, and tabulated by Bonnie Gee Yosick LLC.

Figure 2-3 Employment Distribution by Sector in Portland Harbor

2.3.2 Regional Jobs and Income Impacts

Regional economic impact studies analyze how one or more sectors of an economic system ripple through a larger economy due to the interconnectedness of economic activity such as water transportation. Economic activity within the sector that is the focus of the study is called a direct effect. The economic 'ripple' that occurs when the economic activity within the study sector (i.e., water transportation) increases demand in

related economic sectors that either supply inputs to water transportation or utilize water transportation outputs is called the indirect effect. Another effect typically reported in impact studies is the induced effect that occurs when the change in economic activity affects incomes to workers and proprietors, which then increases their household spending, thus stimulating economic activity in retail, real estate, and other consumer-related sectors.

As described above, water transportation is an integral component to many industries located in the Portland Harbor. These water-dependent industries are then linked to other industries in the harbor and elsewhere throughout the metro region. This section describes existing economic impact studies as well as new analysis conducted for this study that quantifies elements of the economic activity supported by marine transportation. These studies were conducted for a range of purposes, and most limit their analysis to parts of single industries. None of the analyses attempt to quantify the overall economic impacts of the harbor activities. Similarly, the objective of this current assignment is to provide context for the many inter-related industries functioning in the harbor, rather than attempt to provide an overall analysis of economic impact from harbor-related activities.

2.3.2.1 Previous Studies

The impacts of Portland Harbor on the regional economy have been studied at different geographic scales focusing on different industry sectors. Previous studies have focused on the impact of Portland Harbor industry activity in the Portland economy for a number of different purposes including industrial land use planning. Other studies have focused on water transportation and marine terminal activity in an attempt to isolate the benefits of the harbor itself. Still other studies have addressed the idea that one of the most critical economic benefits of the harbor facilities is that it is part of a linked multimodal water/rail/truck transportation system that collectively attracts commerce. As such, it is difficult to isolate (or credit) any one element of that transportation system with economic results because it is the presence of all transportation modes that serves to attract economic activity. For this reason, some research has considered the impacts of industries that are dependent upon the transportation system. Previous efforts to quantify economic impact related to Portland Harbor include:

- A 2003 economic impact analysis of distribution industry by Martin Associates
- A 2003 economic impact analysis of Portland Harbor by E.D. Hovee & Company; and
- A 2003 economic impact analysis of Portland Harbor freight rail by Cambridge Systematics
- A 2007 economic impact analysis of Port of Portland Marine Terminals by Martin Associates

Approaches for this previous research have varied both in methodology and data. Data differences include differences in source, geographic scope, and the degree to which industries are aggregated. Methodological differences tend to follow from the purpose of the study, the way interdependence of harbor industries is handled, and the level of economic impact estimated (e.g. jobs, gross revenues, direct and indirect impacts, etc.). These studies are discussed below and then summarized in **Table 2-3**.

2003 Study of the Economic Impacts of Distribution Industry

One economic impact study was completed in 2003 by Martin Associates and estimates the economic impacts of the distribution industry on the Portland regional economy.[10] The research is based on 67 interviews with local business leaders within the Portland Harbor distribution industry including wholesale trade, warehousing, and transportation sectors. This information is then analyzed in an input-output model called

[10] Martin Associates, 2003, 'The Economic Impacts of the Value Added Regional Distribution Industry in the Portland area.'

LUBA No. 2020-009
Page 6849

IMPLAN. This study defines the Portland region as the counties of Clackamas, Clark, Multnomah, and Washington (p. 2). Impacts estimated include direct, indirect, and induced jobs and income, as well as state/local taxes (see **Table 2-2**).

Table 2-2 Economic Impacts of Value Added Distribution Industry on Portland Regional Economy

	Economic Impact
Jobs	17,242
Direct	7,864
Induced	4,283
Indirect	5,095
Personal Income	$809,811
Direct	$278,287
Induced	$363,723
Indirect	$167,801
State/Local Taxes	$88,600
State Taxes	$60,300
County/Local Taxes	$21,000
Tri-Met Tax	$7,300

Note: Dollars in Thousands

2003 Bureau of Planning Study of the Economic Impacts of Portland Harbor

In 2003, the Portland Bureau of Planning[11] and E.D. Hovee & Company[12] completed the Portland Harbor Industrial Lands Study. Based on the five-county region of Clackamas, Columbia, Multnomah, Washington, and Yamhill Counties (Portland Metropolitan Statistical Area, or Portland MSA), this study uses multipliers estimated by the Bureau of Economic Analysis through the Regional Input-Output Modeling System to find that the harbor is responsible for one in eight regional jobs in 2000 accounting for almost 100,000 jobs in the metro area with a payroll of $3.5 billion. At the water transportation level, employment grew 1.6 percent annually between 1980 and 2000. Over that same time period, the Portland MSA share of total national water transportation employment increased from 0.76 percent to 1.11 percent, a substantial shift. Additionally, the report indicates the water transportation industry employee earnings are 43 percent higher than the average employee earnings for all sectors in Multnomah County in 2000. At the transportation industry level, the report finds that every transportation employee in the harbor study area results in 2.4 jobs in the Portland MSA totaling 15,341 jobs (direct, indirect, and induced job impacts) with a payroll of $459.1 million.

2003 Study of the Economic Impacts of Portland Harbor Freight Rail

A study by Cambridge Systematics, titled *The Freight Rail and the Oregon Economy Study* reports that of the 10.5 million tons ($11.2 billion in value) that were shipped to or from the Port of Portland in 2002, fully 6.2 million or 59 percent arrived or departed by rail. The majority of these tons, 5.7 million, were loaded onto

[11] Portland Bureau of Planning. 2003. Portland Harbor Industrial Lands Study Part One: Inventories, Trends and Geographic Context.

[12] E.D. Hovee & Company. 2003. Portland Harbor Industrial Lands Study Part Two: Interviews and Analysis.

ocean going vessels and approximately 530,000 tons of rail shipments were loaded from marine vessels onto trains. If a similar percent of the of 1997 marine terminal tonnage (59 percent of 10.8 million tons in 1997) were assumed to have been moved by rail, this calculation would represent 6.35 million tons. When matched with the statewide volume of 55.2 million tons of rail moved in 1997, this volume suggests that roughly 11.5 percent of all rail movement in the state also moved by water through Portland Harbor. The study also found that Multnomah County, the location of the Port of Portland, ships 41 percent of all rail tonnage in the state and receives 69 percent of all rail tonnage, further strengthening the fact that transportation connectivity is a driver of economic activity.

With the connectivity between rail and water transportation in mind, the impacts from industries that are rail dependent are further examined. The study by Cambridge Systematics analyzes the Commodity Flow database to identify top commodities (ranked by weight) originating and terminating in the Portland Metropolitan region, focusing attention on the movement of specific commodities, including mineral bulks, grains, automobiles, containers, and breakbulk cargo. The study further analyzes USDOT data on estimated rail expenditures by industry group for the Portland Metro region and the state as a whole, noting that the lumber, wood, and paper product industry spent $159 million on rail service in 2002. With annual output of $2.9 billion, this industry supported 12,000 jobs. In addition, the second largest purchaser of rail service, the transportation equipment industry, spent $106 million on rail service. This industry produces $4.9 billion and supported a total of 11,200 jobs in 2002. The wholesale trade industry was found to spend $49 million on rail service and the industry's output was $15.2 billion which supported 55,600 jobs. The primary metals industry also spent a large amount of funds on rail, approximately $30 million in 2002. This industry's output was $1.4 billion and it supported 7,700 jobs. The chemical industry was the fifth largest purchaser of rail freight and spent approximately $13 million on rail, which supported an industry output of $777 million and 2,358 jobs.

2007 Study of the Economic Impacts of Port of Portland Marine Terminals

A later study also by Martin Associates focuses on the Port of Portland. Titled the *Local and Regional Economic Impacts of the Port of Portland*,[13] the study estimates the regional economic impacts generated by the cargo and vessel activity at marine terminals in Portland Harbor. The results suggest economic impacts of nearly $996 million and 6,568 jobs as a direct result of the Portland Harbor through public and private terminal activity in 2006. The analysis further estimates an average salary of $47,760 for the jobs directly attributable to marine terminal activity, nearly $996 million in business revenue, $1.4 billion in personal wage and salary income and local consumption expenditures, and nearly $146 million in state and local tax revenue. Including direct, indirect, and induced jobs, the study estimates total employment attributable to marine terminal activity at 19,036 jobs. This analysis was based on a survey of 295 employers with operations in Portland Harbor, and publicly-available data from the Census Bureau. The analysis also disaggregates employment impact by geography of residence and by type of commodity handled.

The analysis categorized the impact into five broad categories:

- Surface transportation;
- Maritime services;
- Port of Portland;
- Banking/Insurance/Law; and
- Shippers/Consignees.

[13] Martin Associates. 2007. The Local and Regional Economic Impacts of the Port of Portland, 2006.

Surface transportation is further divided into rail and truck, while the maritime services category is disaggregated into terminals, International Longshore and Warehouse Union (ILWU), towing, pilots, agents, surveyors/chandlers/maritime services, forwarders, warehouse & container repair, government, maritime equipment/construction, and barge. The information below summarizes findings from this report by cargo type handled by marine terminals. The Transport by Water industry analyzed corresponds roughly to the Terminals subcategory within Maritime Services in the Martin analysis. Other categories in the Martin analysis correspond to other industry sectors. As noted in the Martin report, some jobs cannot be accurately attributed to a particular commodity or industry.

- **Containers** -- In 2006, 1.5 million short tons of containerized cargo, or about 123,000 containers were moved on vessels calling the Port of Portland, creating 846 direct jobs. All containerized cargo was handled by Port of Portland facilities, the majority via Terminal 6. Three hundred one jobs were created in the local trucking industry. In addition to the truck impact, other key employment categories include members of the ILWU (173 full-time equivalent workers) and 180 jobs with warehouse and container repair firms. There are also 115 jobs with freight forwarders/customhouse brokers booking the freight and clearing imports through U.S. customs.
- **Breakbulk** -About 76,000 tons of breakbulk cargo moved via the Port of Portland terminals in 2006, creating 75 direct jobs, the majority of which are with members of the ILWU.
- **Soda Ash** -- 2.4 million tons of soda ash exports originate in Wyoming, arriving via unit train directly to the bulk loading facility. A total of 131 direct jobs were generated by this export move. The majority of these jobs are held by ILWU and rail employees.
- **Grain** -- The majority of the 6.4 million tons of grain exported via the Portland Harbor consists of wheat originating in Oregon, Washington and the Dakotas. Three elevators move this grain, two of which are private terminals, while the third elevator is located on Port of Portland property. About 60 percent of the grain is exported via the grain elevator leased from the Port of Portland. About 60 percent of the 840 direct jobs are with the railroads moving the grain.
- **Potash** -- The 1.9 million tons of potash exported from the Port of Portland facilities, creating 94 direct jobs, are primarily with ILWU and the railroads moving the potash from Canada.
- **Dry Bulk** -- Dry bulk commodities consist of cement, limestone, fertilizer, and sand and gravel. Nearly 4 million tons of dry bulk cargoes move via barge in the Portland Harbor and support 943 direct jobs with local truckers, terminal operations and barge operations.
- **Liquid Bulk** -- In 2006, 99,000 tons of other liquid bulk cargoes such as fertilizers and food oil moved via the Portland Harbor. These cargoes supported 47 direct jobs, primarily with local terminal operators and trucking firms
- **Autos** -- The Port of Portland is the leading automobile import port in the Pacific Northwest. In calendar year 2006, the Portland auto facilities handled 464,000 import and export automobiles. The handling of automobiles generated 796 direct jobs, of which 44 percent are with terminal operators and automobile processing facilities. About 30 percent of the direct jobs are in the surface transportation sector, and about 57 percent of the surface transportation sector jobs generated by the transport of automobiles are with the trucking firms, and the balance by rail. The movement of automobiles generates 161 full time jobs for the ILWU.
- **Iron and Steel** -- The 836,000 tons of steel slab imports and 148,000 tons of steel via the public marine terminals generated 727 direct jobs. These jobs are primarily associated with the receipt of slab, and the employees of the local steel mill importing the slab. The majority of this cargo is trucked to the local mill or to direct importers
- **Petroleum** -- About 5.8 million tons of petroleum products moved to and from the private terminals along the Columbia River System. The 5.8 million tons of petroleum generated 562 direct jobs, of which

60 percent is with local truck distribution from the river terminals handling the products. Other key job impacts are with barge operations distributing the petroleum products up-river, as well as bunkering activity.

- **Forest Products** -- The 214,000 tons of cartons and paper moved in the Portland Harbor by barge, creating 191 direct jobs, the majority with the local importer and distribution firms.

This analysis is the best estimate of the impact of economic activities occurring within Portland Harbor. However, the analysis is limited to cargo and marine-related activity, and does not include the marine-related industrial activity described in the previous section.

Summary of Previous Studies of Economic Impact

Even with their methodological differences, and differences in scope, findings from these previous analyses can inform this effort, including:

- The Portland Harbor is linked to a range of industries, particularly wholesale trade, transportation and warehousing, and other forms of transport.
- The multipliers result in higher numbers of jobs and output linked to the river than just direct jobs
- The movement of goods link the various transport-related industries (Transport by Rail, Transport by Water, Transport by Air, and Transport by Truck)

An overview of the different studies that have been completed including the different geographies, different approaches, and different purposes, is provided in **Table 2-3** below.

Table 2-3 Summary of Studies of Impacts of Portland Harbor Industry on Portland Metro Area

			Portland Metro Area Impacts				Portland Metro Area (Counties)					
Study	Industries	Study Area of Industries	Direct Jobs	Total Job	Total Earnings	Model	Clackamas	Clark	Multnomah	Skamania	Washington	Yamhill
Martin Associates, 2003	Wholesale Trade, Transportation, and Warehousing	Entire Portland metro region	7,864	17,242	$809,811	Implan	X	X	X		X

Note: Dollars in Thousands

2.3.2.2 Estimates of Impact of Marine-Related Uses in Portland Harbor

As noted above, the 2007 Martin Associates study presents the most comprehensive estimate of the impact of marine-related economic activities occurring within Portland Harbor. However, the analysis underestimates total economic impacts, as it is limited to cargo and marine-related activity and does not include the direct or total economic contribution of marine industrial activity. The 2003 Bureau of Planning study estimated the economic impact of all industry within the Portland Harbor, which likely results in an overestimate of the impact of marine-related uses, since not all harbor area industries depend on marine transportation. The total regional economic impacts of marine-related uses are thus estimated to range between the values from these two studies: total (direct, indirect and induced) employment is estimated to range from 19,000 to 100,000 jobs, while total income generated from these jobs is estimated to range from $1.4 billion to $3.5 billion annually.

Transport by Water

One critical component of marine-related activity is the Transport by Water industry, which enables and enhances the other terminal and marine-related industrial activities. This section of the analysis explores in more detail the economic impact of the Transport by Water industry. With only 834 direct employees, it accounts for less than 13 percent of the direct employees attributed to marine terminal activity in the Martin report. As such, it is important to note that the Transport by Water industry is but one small component of the employment and economic activity in the Portland Harbor.

Using a 2007 data set specific to the four-county Portland Metro region, an analysis using IMPLAN indicates that Transport by Water has 834 direct employees and approximately $540 million in output (see **Table 2-4**). This estimate is comparable—though slightly less than—the 976 employees estimated in terminal employment in maritime services from the Martin study.

Table 2-4 Economic Impact of Transport by Water Industry, 2007

	Direct	Indirect	Induced	Total
Output	$540,000,000	$247,709,000	$116,976,000	$904,685,000
Employment	830	2,020	1,010	3,860
Employee Compensation	$77,747,000	$89,809,000	$35,104,000	$202,660,000
Average Compensation per Employee	$93,200	$44,600	$34,700	$52,500

Source: IMPLAN 2007 dataset, analyzed by Bonnie Gee Yosick, LLC.

The estimated $540 million in direct economic output generates an additional nearly $248 million in indirect output and nearly $117 million in induced output for a total estimated economic output of nearly $905 million from transport by water.

The direct employment of 834 jobs and $540 million output in the Transport by Water industry supports over 2,010 indirect employees in a range of related industries, and another 1,010 employees from induced spending for a total impact of 3,860 jobs. Again, the Martin analysis estimated 976 in terminal employment in maritime services in 2006, but did not disaggregate the output and personal income impacts of those terminal employees from the total, so a direct comparison is not possible.

Finally, of the $540 million in Transport by Water output, nearly $78 million is direct employee compensation. Adding employee compensation to employees in direct and indirectly impacted industries results in total employment of nearly 3,900 jobs supported by the Transport by Water industry. As noted earlier, average compensation for the water transport industry sector is higher than the average for all industries. The resulting values generated by this analysis are different than those generated by the Martin

report due to definitional and methodological differences in the analyses. In particular, much of the terminal-related employment resulting from this analysis may not be as adequately captured as in the Martin study. This is because many of the pilots, towers, forwarders, and others are not categorized in the Transport by Water sector in the IMPLAN data. In these cases, the Martin study should have covered these types of firms, while the IMPLAN data would not. As such, the higher impact values from the Martin report are potentially consistent with the IMPLAN results presented here.

2.4 SUMMARY

This section has provided an overview of the economic history and regional economic contribution of Portland Harbor and marine industrial land uses. For over 140 years, Portland has been a successful port city and continues today in this role due to its location at the nexus of excellent rail infrastructure, including the Olympic oil pipeline, two interstate freeways, the Columbia River deepwater shipping channel, and the Upper Columbia/Snake Rivers barge system. Marine cargo terminals handle and transport freight that is vital to numerous other industries located throughout Oregon, Southwest Washington, and beyond. Cargo movement through the Portland Harbor has grown steadily over the past century, and recent trends indicate continued future growth. A wide web of industries rely on waterborne transportation, including wholesalers and retailers who import consumer products, manufacturers that import raw and intermediate goods, and manufacturers and natural resource industries that export products.

Portland Harbor serves as an economic engine for the metro regional economy. The Portland Harbor is home not only to transportation and distribution activities linked to marine terminals, but also manufacturing facilities that rely on marine transportation. These marine-related industries are linked to other industries located in Portland Harbor and elsewhere in the metro area, including wholesale trade, local and regional transportation firms, manufacturing firms, and retail firms. These businesses depend on the transportation hub at Portland Harbor either for transport of their products to international or regional markets, or for the provision of inputs of the wide variety of freight materials imported through Portland Harbor, whether petroleum, consumer apparel, automobiles, or raw materials.

These marine-related industries are then linked to other industries in the harbor and elsewhere throughout the metro region. Past studies indicate that cargo and manufacturing activities dependent on waterborne transportation contribute significantly to the metro region's economy. These studies indicate that marine-related economic activity generates from 20,000 to 100,000 jobs and from $1.4 to 3.5 billion to $1.4 billion annually in regional income.

Although there are several other ports in the Lower Columbia River, including the ports of Kalama, Longview, St. Helens, and Vancouver, Portland is distinguished in the level of its transportation connections and its location in a large metropolitan area. The metro area provides a larger population of skilled labor and a larger local industrial base that can generate cluster benefits and additional opportunity for marine-related businesses. As part of the Portland metropolitan area, Vancouver also has this advantage over other Lower Columbia River ports. However, Portland is differentiated from Vancouver and all other Lower Columbia Ports because it is the only port that handles large volumes of all cargo types (specifically, it is the only port that generally handles containers). While some marine industrial uses could be suitable at any Lower Columbia River port, for certain land uses that rely on all types of transportation connections and a large population or industrial base, marine industrial land in the Portland metropolitan area (in Vancouver or Portland) may not be as easily substituted for lands elsewhere in the Lower Columbia. While locating in Portland may be more desirable for some marine-related uses, other ports appear to be less land constrained (and have larger contiguous, shovel-ready sites), and may have less contamination.

SECTION 3

Trends and Forecasts for Marine Related Uses

The purpose of this section is to identify the level of marine industrial economic activity likely to occur within Portland Harbor. The analysis consists of a 30-year (to the year 2040) forecast of job and cargo growth associated with marine industrial development opportunities. A review of economic and demographic trends is first provided, followed by a discussion of employment and land use trends more specific to marine industrial opportunities in Portland Harbor. These subsections rely on data from interviews as well as published data to provide historical and current context to the marine cargo and employment growth forecasts. A subfinal section provides the marine cargo and job-growth forecast. The forecasts are based on different assumptions about the types of marine industrial development that could occur over the planning horizon, resulting in a low, medium, and high estimate of job growth. The three scenarios reflect uncertainty regarding overall economic growth, business location decisions, magnitude of cargo movement, and the Portland Harbor cargo market share.

3.1 OVERVIEW OF DATA SOURCES AND KEY ASSUMPTIONS

This section covers a review of relevant trends and data related to the economic environment, employment in general, population growth, and other factors that can support the marine industrial forecasts. The data and research presented in this section has been gathered from a variety of sources and is intended to provide a broad understanding and interpretation of the Portland economy. For this reason, data and information are not always comparable in terms of geography and classification. For example, much of the information pertains to the larger economic region known as the Portland Metropolitan Statistical Area (PMSA) which includes five Oregon counties plus Clark and Skamania counties in Washington State. Yet other information is presented at the county level, with a particular focus on Multnomah County, while other information is presented for the Oregon portion of the PMSA. Another example is that the classification of different types of industries varies from research organization to organization, and/or annual data may have been collected at different points in the year causing some discrepancy between sources. In all cases an attempt has been made to identify the geographic boundary of the information presented. Also, an effort has been made to calculate wherever possible average annual growth rates (AGRs). Annual growth rates allow for trend data to be compared in terms of the rate of growth or decline, and may be calculated for annual changes in any kind of time-series data.

Several elements of the approach to forecasting marine industrial cargo and employment are similar. These are:

- Both forecasts are developed under the assumption that public infrastructure is continually developed over the forecast horizon to accommodate increases within the sector.
- Both forecasts were developed by considering the larger regional growth within the sector, and then anticipating the share of the larger growth that would likely occur within the Portland Harbor.
- Both forecasts were developed by another organization, and reviewed and adjusted by the ENTRIX team for the purpose of this report.

- Both provide low, high, and most likely scenarios to accommodate uncertainty stemming from a variety of factors including overall economic growth, commodity flows, timing of the economic recovery, and competition from other regional and local marine industrial facilities.

3.2 GENERAL EMPLOYMENT AND POPULATION TRENDS

The recent economic downturn has had a substantial effect on employment in Portland and the region. Oregon's unemployment stands at 11.3 percent [14] as of October, 2009 compared with a rate of 7.2 in October of 2008, and 5.2 in 2007. For the Portland Metropolitan Statistical Area (PMSA), which covers seven counties including Clark and Skamania Counties in Washington State, seasonally adjusted unemployment was at a rate of 11.6 in October of this year, up from 6.8 at the same time last year, and 4.9 in 2007.

Businesses will expand more slowly than originally forecast and it will take some time for employment in the area to recover to 2007 levels. As yet it is unclear what effect this will have on population growth in the area. Fewer people are moving throughout the country because home prices have dropped and those who might have moved may be less likely to if there is a risk of losing money on their homes. On the other hand, with unemployment rates high throughout the country, some people may move in hopes of finding new opportunities, and the general redistribution of workers may mean that in migration continues to the area unabated.

In general, the current recession has caused a short-term decline on local cargo and employment, but this trend is expected to be reversed in 2010, with annual growth forecasted to be positive through 2040. The Portland metro region has grown faster in both employment and population than other areas of the country, and this trend is expected to continue in the immediate future, with growth slowing after 2030.

- **Population Growth.** Population growth in the Portland metro area has outpaced state and national growth, averaging 2.5 percent annually from 1980 to 2007. Annual growth from 2000 to 2060 is forecasted to average 1.2 percent, with growth to 2030 forecasted at the higher annual rate of 1.5 percent.
- **General Employment Growth**. Since 1981, Oregon has experienced average employment growth of 2 percent annually (compared to 1.7 percent nationally). Portland metro area employment is expected to nearly mirror population growth rate. Employment is forecasted to grow at an annual average rate of 1.2 percent from 2000 to 2060, with a higher annual growth rate of 1.4 percent expected through 2030. Metro forecasts employment growth of approximately 23,600 jobs in the Columbia Harbor area (which includes Portland Harbor but is a larger geographic area) from 2010 to 2035.

3.2.1 Employment

Non-farm employment in the PMSA includes significant industries such as health care and social assistance (10.2 percent), retail trade (10.2 percent), and manufacturing (9.9 percent). These employment levels are consistent with the state and national levels as detailed in **Table 3-1**. The PMSA has slightly greater employment concentrations in wholesale trade, and professional and technical services than the nation or the state. The region also has slightly lower concentrations of employment in accommodations and food services, government, and retail trade than the state or nation. Multnomah County, which is home to Portland Harbor and the majority of marine industrial employment, has a slightly higher concentration of employment in Transportation and Warehousing; Finance and Insurance; Professional, Scientific and Technical Services; and Management when compared to the state and nation.

* For some categories, data were not available to avoid disclosure of confidential information, but he estimates are included in the total number of employees. In the case of transportation, warehousing, and utilities, and as well for mining, data from the Oregon Employment Department, and the category included utilities as well as transportation and warehousing. For mining, the category includes both mining and logging.

Source: Bureau of Economic Analysis, Regional economic Accounts accessed at www.bea.gov/regional/reis

National employment experienced rapid growth over the 1980s followed by reduced growth in the 1990s.[15] This decade has seen significantly less employment than the previous decades with the September 11th induced recession and the current global recession. Employment growth in Oregon since 1981 has outpaced has outpaced National employment growth averaging 2.04 percent compared with 1.72 percent nationally. The employment growth trend echoes the business cycle with Oregon having greater variance during the peak and trough phases than the national levels. The changes in employment for Oregon and the nation on an annual basis are presented in **Figure 3-1**.

[15] Bureau of Economic Analysis. Regional Economic Accounts. Table CA25N.

Source: Bureau of Economic Analysis, Regional Economic Accounts accessed at www.bea.gov/regional/reis

Figure 3-1 Oregon and US Employment Growth, 1981 to 2007

The recent preliminary Urban Growth Report[16] for Portland reports that employment growth within the PMSA is expected to increase substantially by 2030. Forecasts of employment growth predict as much as 1.87 percent annual growth in Portland area employment through 2030. Employment growth is forecasted in a range to account for uncertainty in variety of factors that influence employment including population growth, regional macro-economic issues, and national economic growth. The lower bound employment growth is predicted at 0.84 percent over the same time period. The range of forecast values is based on a 90 percent probability that employment growth will lie within the range of forecasted values presented in **Table 3-2**, and shown graphically in **Figure 3-2**.

Table 3-2 Portland Forecasted Employment Growth (PMSA)

Year	Low	Medium	High
2000	973,000	973,000	973,000
2030 (*average annual increase from 2000*)	1,252,200 (0.8%)	1,476,100 (1.4%)	1,700,000 (1.9%)
2060 (*average annual increase from 2000*)	1,648,400 (0.9%)	2,024,200 (1.2%)	2,400,000 (1.5%)

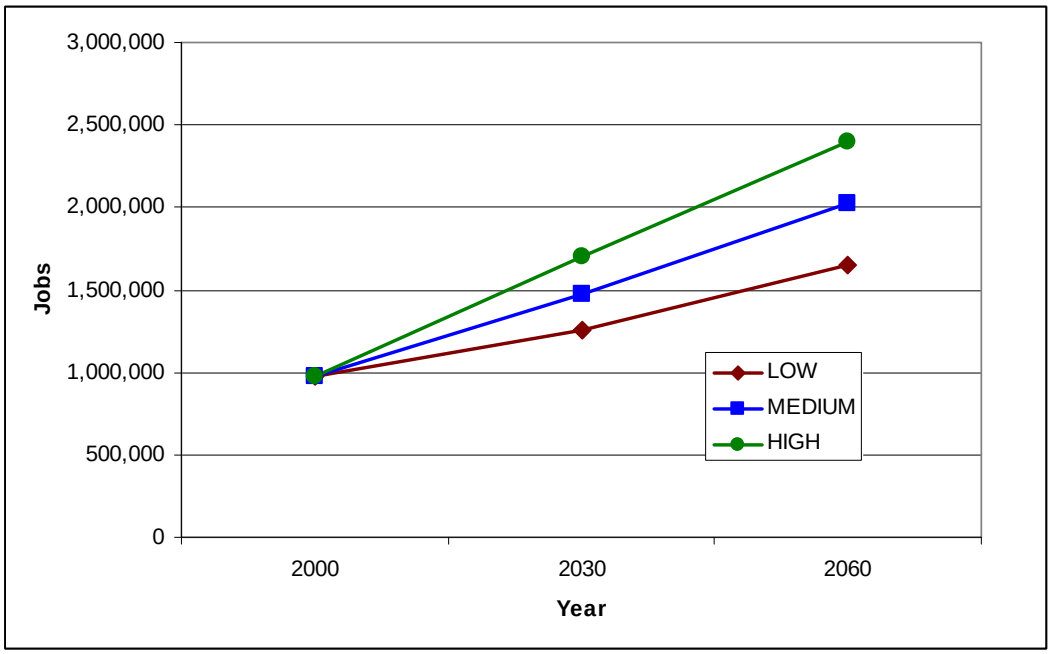

Figure 3-2 Portland Forecasted Employment Growth

The following table shows the range of employment growth rate by key industry for the Portland region. The annualized percentage growth rate range is within the 90 percent confidence interval for each sector. Total non-farm employment growth is forecasted to range from 0.7 percent to 1.8 percent annually for the next 40 years. As indicated in the table, most growth is expected to occur in the trade, transportation, and service industries.

Table 3-3 Annualized Wage and Salary Employment Growth Forecast in Portland Region 2008 - 2040

Industry Sector (NAICS)	High Growth Rate	Low Growth Rate
Nonfarm total employment	1.80%	0.70%
Manufacturing, total	0.60%	-1.10%
Durable Goods, total	0.60%	-1.20%
Wood Products	0.20%	-1.80%
Primary Metals	-0.80%	-3.70%
Fabricated Metals	-0.10%	-0.90%
Machinery	-0.50%	-1.00%
Electronics	1.00%	-0.90%
Transportation Equipment	0.70%	-1.50%
Nondurable Goods, total	0.40%	-0.80%
Nonmanufacturing, total	2.00%	-0.90%
Construction	2.00%	-2.50%
Wholesale Trade	1.50%	1.20%
Retail Trade	1.00%	0.20%
Transport., Warehousing, Utilities	1.70%	1.40%
Information Services	2.20%	0.50%

Industry Sector (NAICS)	High Growth Rate	Low Growth Rate
Financial Activities	1.80%	1.20%
Business Services	2.40%	0.60%
Education & Health Services	2.70%	2.20%
Leisure & Hospitality	1.60%	1.30%
Other & Personal Services	2.40%	1.10%
Government, civilian total	1.10%	0.80%
Federal	0.00%	-0.20%
State & Local	1.30%	1.00%

Source: METRO, 2009, Urban Growth Report, appendix 12: Population and Employment Forecast

3.2.2 Population

The PMSA has historically experienced greater population growth than the state or nation averaging an annual rate of 2.5 percent since 1980 compared with 1.5 percent for Oregon and 1.2 percent for the nation (see **Table 3-4**).

Table 3-4 Population Growth, 1980 to 2007

Geographic	Population (1,000s)								Average
Location	1980	1985	1990	1995	2000	2005	2006	2007	AGR
US	227,225	237,924	249,623	266,278	282,172	295,561	298,363	301,290	1.2%
Oregon	2,641	2,673	2,860	3,184	3,431	3,622	3,681	3,736	1.5%
Portland MSA	1,347	1,391	1,536	1,749	1,936	2,087	2,126	2,166	2.3%

Source: Bureau of Economic Analysis, Regional Economic Accounts, accessed online at www.bea.gov/regional/reis/.

Population growth in the PMSA is expected to outpace forecasted growth in Oregon and the US. Annual population growth is forecasted around 0.9 percent for the US, 1.16 percent for Oregon, and between 1.28 and 1.7 for the Portland metro region, depending on the source of the forecast. **Table 3-5** displays different annual population growth rates based on varying geographic areas and forecast sources.

Table 3-5 Population Growth Forecasts, 2000 to 2030

Geography	Growth Rate (APR)	Source
	2000 to 2030	
US	0.85%	Census
US	0.95%	Global Insight
Oregon	1.14%	Global Insight
Oregon	1.16%	US Census
Oregon	1.18%	OR OEA
Portland Metro, 3 Counties	1.28%	OR OEA

Portland Metro, 7 Counties	1.37%	Metro
Portland Metro, 7 Counties	1.70%	Metro

Source: Metro, March 2009 draft, '20 and 50 year Regional population and employment range forecasts.'

The recent Urban Growth Report for Portland reports that population growth within the seven county PMSA is expected to increase substantially by 2030. Population growth is forecasted in a range to account for uncertainty in variety of factors that influence population growth, including regional macroeconomics, availability of housing, and national economic growth. The lower bound population growth rate is predicted at 1.4 per year to 2030, with growth slowing to 1.1 percent per year to 2060. There is a 90 percent probability that population growth will lie within the range of forecasted values presented in **Table 3-6**. **Figure 3-3** shows the projected population estimates graphically.

Table 3-6 Portland Forecasted Population Growth (PMSA)

Year	Low	Medium	High
2000	1,927,881	1,927,881	1,927,881
2030 (*average annual increase from 2000*)	2,903,300 (1.4%)	3,051,400 (1.5%)	3,199,500 (1.7%)
2060 (*average annual increase from 2000*)	3,609,300 (1.1%)	3,992,700 (1.2%)	4,376,100 (1.4%)

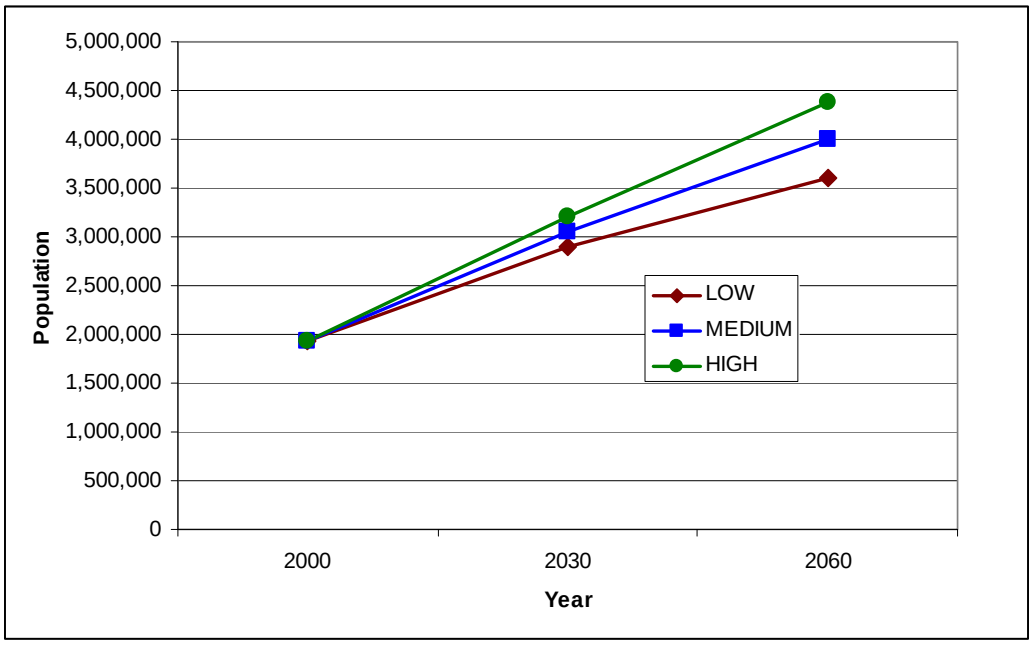

Figure 3-3 Portland Forecasted Employment Growth

Another source for population forecasts is the Oregon Office of Economic Analysis, which prepared forecasts in 2004. These forecasts to the year 2040 suggested an annual growth of 1.25 percent for the combined three counties of Washington, Multnomah, and Clackamas, with much faster growth rates expected toward the beginning of the forecast period. The period of analysis was between 2000 and 2040. For the three county area, the forecasts suggest that between 2000 and 2040, the population would grow by over 900,000 people in total, with nearly 57 percent expected to result from net in-migration versus natural population growth. This represents over 500,000 people expected to move to the three counties by 2040. The remainder of the growth results from natural growth –the number of expected births in a given year exceeds the number of expected deaths in that year.

3.3 MARINE-RELATED TRENDS

This section covers the relevant data and trends within the marine industrial sector that will influence the anticipated future marine-related activity within Portland Harbor. Factors influencing growth in marine-related uses include trends in domestic and international waterborne trade, capital intensiveness versus labor intensiveness of marine businesses, and overall growth rate of the regional, national, and international economies. Trends of marine-relate employment, regional trade capacity, and land use are discussed in preparation for the next section, which presents forecasts of employment and marine cargo trade.

Regarding marine industrial trends, many of the private marine-industrial firms in Portland Harbor have recently made site improvements that imply their continued investment in the area. These firms include Advanced American Diving, Ash Grove Cement, and Rinker (a concrete batch plant). US Barge has made improvements to their Portland Shipyard site and both Schnitzer Steel and Gunderson have made dock improvements. Overall, there have been $450 million of completed or funded capital investments made on 30 harbor area sites from 2004 to 2007. However, in the long-term, as identified in the 2003 Portland Harbor Industrial Lands Study, medium-larger firms anticipate minimal demand for more industrial land for expansion. Additionally, businesses note that Superfund uncertainty and competitive multi-modal transport are key determinants of business investment.

While marine cargo volumes have grown, across the United States maritime employment in marine cargo handling has declined over the past several decades due to increasing capital-intensiveness of marine terminal operations. Thus, the relationship between employment and land needs is changing due to technological advances.

3.3.1 Employment Trends

As discussed in **Section 2**, marine-related activity in Portland Harbor occurs in a variety of industrial sectors. The main sectors include distribution (transportation and warehousing), wholesale trade, and metals and equipment manufacturing. Past employment growth from 1976 to 2000 in these sectors is presented in **Table 3-7**. All of the predominant sectors in Portland Harbor grew more slowly during this period than the average rate of private employment growth of 3.2 percent. However, all grew at a healthy annual rate of between 1.2 to 2.3 percent, with the fastest growing sectors being wholesale trade (2.3 percent growth) and trucking and warehousing (2.0 percent growth). Water transportation also grew at a fast rate, with 1.7 percent growth.

Table 3-7 Selected Sector Employment Growth 1976 – 2000 in Portland MSA (Oregon Portion)

Sector	1976	1980	1985	1990	1995	2000	Annual Growth Rate 1976 to 2000
Private Sector Employment	353,416	440,145	440,581	555,117	643,902	747,378	3.2%
Water Transportation	1,492	1,696	1,194	1,224	1,513	2,223	1.7%
Wholesale Trade	54,846	67,269	65,926	78,927	89,850	94,051	2.3%
Trucking and Warehousing	9,536	10,560	11,529	14,463	17,242	15,389	2.0%
Manufacturing	88,700	108,320	95,584	107,006	115,870	128,275	1.5%
Transportation Equipment	9,104	9,209	6,974	9,980	10,260	12,126	1.2%
Primary Metal Industries	4,881	6,908	6,057	7,776	6,466	7,453	1.8%

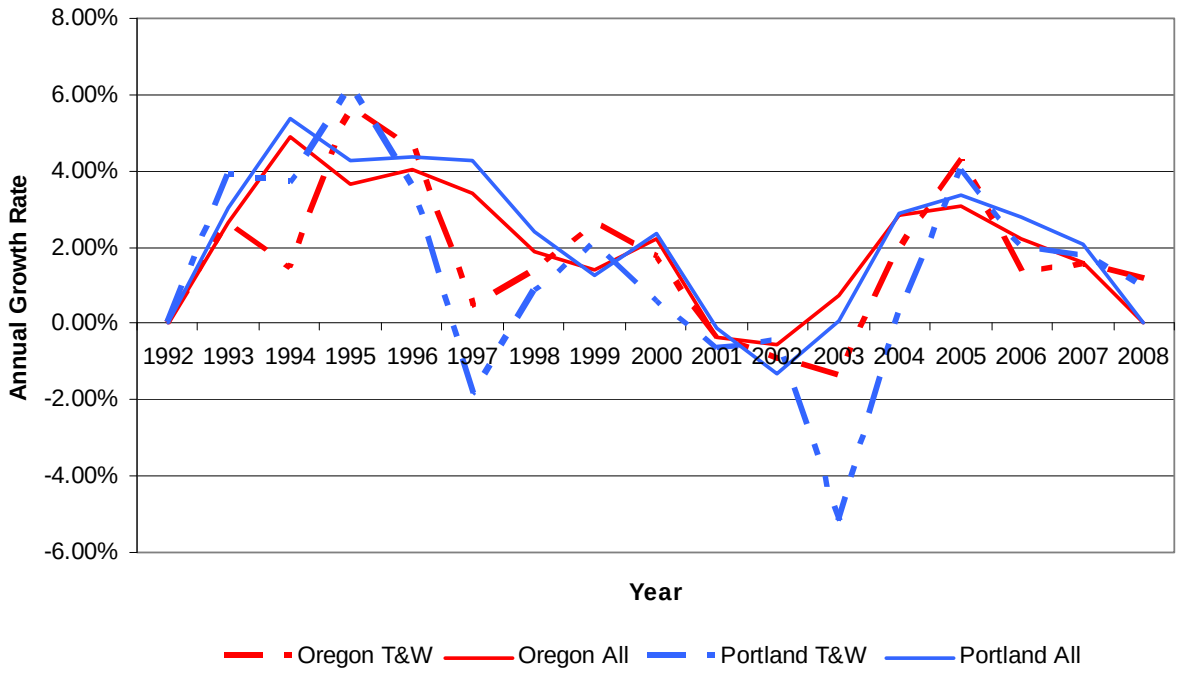
3.3.1.1 Transportation and Warehousing Employment

One of the main sectors dependent on marine transportation is the Transportation and Warehousing (T&W) sector. This sector employs 37,800 employees within the PSA and 55,800 within Oregon.[17] This figure corresponds to 4.1 percent of the workforce in the PMSA area and 3.9 percent of the total Oregon workforce. Employees within the PMSA transportation and warehousing industry earn $42,260 annually compared with $46,570 across all industries (see **Table 3-8**). Employment in the transportation and warehousing industry within Portland has grown from 30,600 employees in 1992 to 37,800 employees in 2008, a growth of 24 percent. Oregon employment in the same sector grew 32 percent from the 1992 level of 42,200 to 55,800 in 2008. Within this sector, the subsector of Water Transportation represents just one to two percent of the total sector jobs. In these sectors, as for most employment sectors, the PMSA represents the majority of jobs. For all industries, the PMSA accounts for 64 percent of statewide jobs. In transportation and warehousing, the PMSA represents 68 percent of all jobs, and for water transportation, the PMSA represents 85 percent.

Table 3-8 Employment in the Water Transportation Industry, 2008

	Water Transportation	Transportation and Warehousing	All Industries
Oregon			
Employment	692	55,783	1,445,462
Average Salary	$63,648	$39,531	$41,700
Portland MSA			
Employment	589	37,812	930,387
Average Salary	$64,380	$42,258	$46,570



Source: U.S. Census Bureau, Local Employment Dynamics, accessed online at http://lehd.did.census.gov/led/datatools/qwi-online.html.

Note: No water transportation employment information is reported for the WA portion of Portland MSA

Though total employment in the water transportation industry is limited, employee salaries are significantly higher than the average industry salary. In 2008, he average annual salary for water transportation employees in Portland is $64,380 and $63,648 in the state.

Historic employment growth in the transportation and warehousing industry sector is show in **Figure 3-4** below for the period between 1992 and 2008. The dotted red and blue lines both show transportation and warehousing sector employment change, while the solid lines represent all sector employment growth. It is noticeable that transportation and warehousing tends to follow a similar pattern of growth as all sectors, although transportation and warehousing saw more severe declines in employment in 1997 and in the period between 2001 and 2004, than did the all sectors combined. All sectors saw declines in employment in 2001 and 2002.

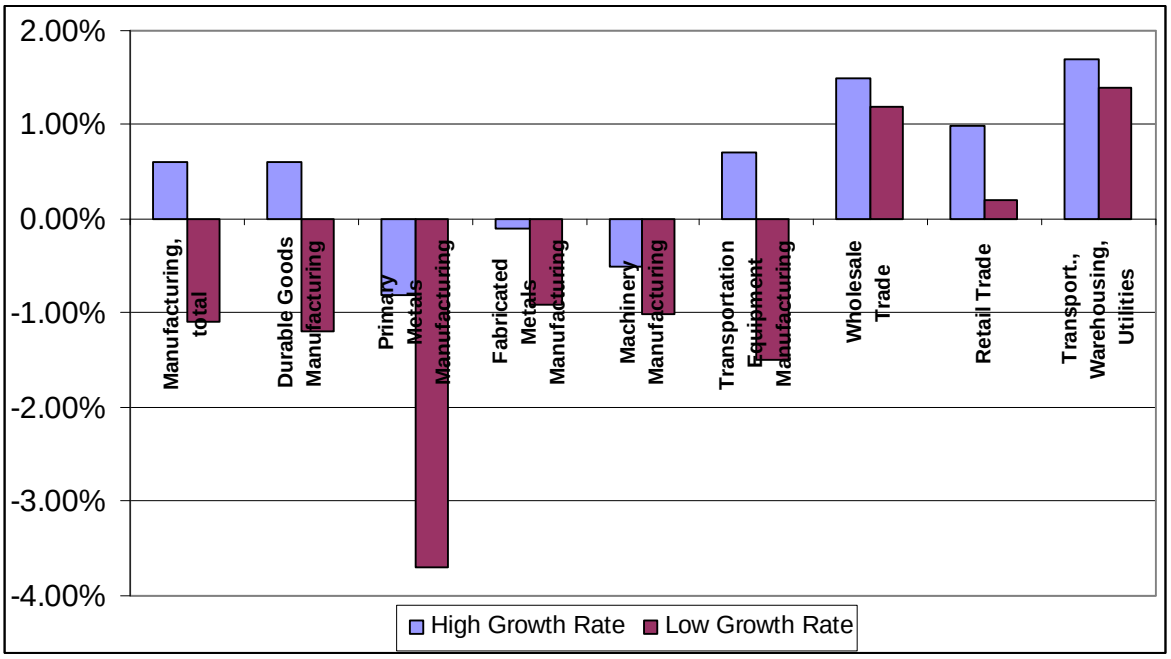
Figure 3-4 Employment Growth in the Transportation and Warehousing Industry, 1992 to 2008

The Transportation, Warehousing, and Utilities (TW&U) industries are expected to grow substantially over the next five years both nationally and statewide. Annualized TW&U growth is expected to average 2.9 percent between 2010 and 2015 in Oregon and 3.7 percent nationally. This forecasted growth comes after a period of average declining employment since 2000. **Table 3-9** presents these figures below.

Table 3-9 Employment in the Transportation, Warehousing, and Utilities Industries, in 1000s

	1990	1995	2000	2005	2010	2015
US						
Total Nonfarm	109,489.8	117,306.6	131,793.6	133,699.2	131,441.9	142,911.9
Annualized Nonfarm Growth		1.4%	2.5%	0.3%	-0.3%	1.7%
Transportation, Warehousing, and Utilities	4,216.3	4,505.1	5,013.1	4,917.7	4,810.8	5,709.1
Annualized TW&U Growth		1.4%	2.3%	-0.4%	-0.4%	3.7%
Oregon						
Total Nonfarm	1,255.6	1,428.1	1,617.9	1,654.4	1,624.8	1,805.4
Annualized Nonfarm Growth		2.7%	2.7%	0.5%	-0.4%	2.2%
Transportation, Warehousing, and Utilities	46.9	54.6	57.6	57.2	53.8	61.5
Annualized TW&U Growth		3.3%	1.1%	-0.1%	-1.2%	2.9%

Source: Office of Economic Analysis, Employment by Industry: 1990 to 2015, accessed at http://www.oea.das.state.or.us/DAS/OEA/economic.shtml.



The TW&U industry is expected to outpace general growth in nonfarm employment both statewide and nationally. Forecasted total nonfarm employment is expected to grow annually by only 1.7 percent nationally and 2.2 percent statewide.

Employment growth within the transportation and warehousing industry was consistent across the nation, state and Multnomah County between 2002 and 2007 (see **Table 3-10**). Data from before the 2001 is not comparable to the 2001 to 2007 data since transportation and utilities employment was not recorded.

Table 3-10 Transportation and Warehousing Employment Growth, 2001 to 2007

	2001-2002	2002-2003	2003-2004	2004-2005	2005-2006	2006-2007
Multnomah	-2.6%	-2.4%	1.3%	1.4%	3.6%	4.0%
Oregon	-0.4%	-1.0%	3.3%	3.4%	2.4%	1.2%
US	-2.4%	-0.9%	2.1%	3.6%	2.6%	2.4%

This short-term pattern is reinforced by the long-term growth rates forecasted by METRO and presented above in **Table 3-3**. **Figure 3-5** below presents high and low forecasted growth rates for selected sectors in Portland. As indicated in the table, employment growth is forecasted in trade, transportation, and warehousing industries, while employment is expected to decline in manufacturing industries across the metro area. In particular, the transportation, warehousing, and utilities sectors are forecasted to grow by 1.4 to 1.7 percent annually and wholesale trade is expected to grow by 1.2 to 1.5 percent annually over the next thirty years.

Figure 3-5 Selected Sectors: Annualized Wage and Salary Employment Growth Forecast in Portland Region 2008 - 2040

3.3.2 Marine Cargo Trends

Statistics from the U.S. Army Corps of Engineers indicate that waterborne cargo volume handled at ports in the Lower Columbia River has grown at a compound annual growth rate of 2.9 percent from 1962 to 2007.[18] Marine cargo movement on the Columbia River is dominated by the Port of Portland. In Portland Harbor, between 1960 and 2000 marine cargo tonnage shipped through Portland Harbor increased by 253 percent.[19] To accommodate this growth in marine cargo, from 1974 to 2010 there have been 1,297 acres of land developed for marine terminal uses in the Lower Columbia River, or 36 acres annually.[20] Of this acreage, 55 percent, or 719 acres, have been developed during this timeframe in Portland Harbor.

As discussed in **Section 1**, Portland has a competitive advantage in rail distribution of marine freight that has allowed the region to grow as a gateway for imports for the U.S. consumer market, such as automobiles, as well as exports, such as minerals and feed products. Growth in marine cargo thus depends not only on economic conditions in the local market, but also on broader regional, national, and international (particularly Pacific Rim) economic conditions.

International trade growth tends to be an amplified response to economic growth: when economic growth slows trade growth tends to decelerate even more, while when economic growth accelerates, trade growth accelerates even faster.[21] The current economic recession has substantially slowed international trade, but it is expected that trade will start to recover in 2010 with strong long-term growth. As a percent of world GDP, imports have been increasing to about 35 percent in 2008 and are expected to rise as high as 40 percent by 2040 (compared to 20 percent in the period 1980 to 1995).[22] This growth in trade will result in increased marine cargo transport.

3.3.2.1 Trade Capacity

The overall trade capacity for Portland/Vancouver area was recently analyzed in a collaborative fashion between METRO, Oregon Department of Transportation, Portland Development Commission, Port of Portland and Port of Vancouver.[23] This report comprises analyses by several different consultants and authors in order to determine the impact of increased international and domestic trade on the regional supply (and demand for) trade support infrastructure including industrial land. The report finds that Portland/Vancouver has a growth opportunity as rapidly growing Asian economies drive increased trade demand, but the area may face capacity strains in terms of industrial land supply, and the ability of highway and rail system to handle additional volumes. A component of the study, developed by Global Insight, Inc. identified regional population growth, workforce migration, trade with rapidly growing Asian states, as factors that will favorably impact the Portland/Vancouver trade future.

The study forecasts a doubling of freight volumes by 2035 for the region, though these opportunities depend on ensuring adequate infrastructure, including preserving the Columbia –Snake River barge system, creating short line rail to alleviate congestion and to carry local carload business, enhancing the roadway system, and preserving land for logistics operations. Improving the highway network capacity and preserving land for transportation/logistics industry were identified as actions that could be taken by the regional planners to avoid losing trade to new emerging port gateways such as Prince Rupert in British Columbia, and Punta

LUBA No. 2020-009
Page 6869

Colonet in Baja California were identified as challenges in the region. The study also notes that while marine industrial land is a scarce commodity in the region due to particular location and size requirements, additional land may need to be developed for marine terminals to capture trade growth opportunities.

3.3.2.2 Energy and Transportation Costs and Freight Transport Mode

As energy costs rise, shippers and supply-chain managers are increasingly trying to keep freight on the most energy efficient forms of transportation – rail and sea transport – longer. As a result, one strategy being considered is to move more freight to smaller regional distribution centers such as Portland, according to a recent study by Cushman and Wakefield completed for NAIOP, a national commercial real estate association.[24] This paper suggests that by using smaller, albeit more costly distribution centers such as Portland, the additional costs of smaller trucks (known as LTL – less than load) that deliver to individual facilities can be reduced. The article also states that a move to lower cost modes of transport would benefit the largest ports and the inland hubs with the best rail access. Southern California and Seattle/Tacoma could see an increase in loads that are headed for the traditional inland hubs of Chicago, Atlanta, and Dallas via rail. A more sea-oriented approach would bring more goods through the canals – Panama and Suez – straight to the major East Coast ports of New York/New Jersey, Hampton Roads, and Savannah. Recent investments in intermodal hubs and rail routes could give some advantage to Kansas City and Columbus, Ohio.

3.3.3 Portland Harbor Land Need Trends

Drawing on economic analysis coupled with 80 in-depth interviews with harbor area industry leaders and two focus groups, the Portland Harbor Industrial Lands Study identifies thirteen industries that possess a competitive advantage in Portland Harbor. The study determines that the harbor is in transition shifting towards wholesale-distribution and transportation activities and away from manufacturing. The expansion of foreign trade continues to be a primary driver of land development for marine cargo uses. The study identifies that limited land availability may constrain future growth opportunities, particularly for large industrial or marine cargo uses.

The study reports that 10,460 jobs are forecasted to be added to the Portland Harbor area between 2000 and 2020. Using a job density of eight jobs per acre, the current harbor area employment density, the study determines a need for 1,310 acres of new buildings to accommodate the additional 10,460 employees by 2020. Businesses interviewed suggested they would reconfigure layouts or add an additional shift to accommodate employee growth and very few indicated plans to expand. Historically, 20 acres per year have been developed in the Harbor area to accommodate maritime activities. Continuing this trend to 2020 (from 2000) results in a demand of 400 acres of riverfront industrial property.

Business interviews conducted by the Portland Development Commission (PDC) in 2006[25] of industry leaders in Portland Harbor suggest that industries are reinvesting in the harbor districts through building, equipment, rail, and dock improvements. These interviews imply industry leaders demand warehouse and truck distribution space, close-in industrial service space, and rail access. Limited land supply is seen as a limiting factor for growth. Available sites are viewed as requiring large investment related to environmental liability or other uncertainty which many businesses are not willing to accept. Interviews identified rail congestion and road congestion as areas requiring capital investment to reduce costs to businesses. Increased rail capacity is the most pressing need identified

[24] The New Age of Trade: The Americas (2009) Submitted by: Maria T. Sicola, Executive Managing Director, Research, Cushman & Wakefield, Inc. Research conducted for the NAIOP, available at: http://www.naiop.org/foundation/completedresearch.cfm.

[25] Portland Development Commission, 2006, Working Harbor Reinvestment strategy Business Interview Results.

The Portland Economic Opportunities Analysis (EOA) Summary Report,[26] completed in 2009 also analyzes employment and development trends. The study area for the report is Portland proper, but nine sub-areas within the Portland city boundary are created based on geographic location and industry or commercial focus for forecasting future trends. The study uses six focus groups with 58 participants were used to provide input on land demand topics including emerging trends and business location needs. This study identifies Columbia Harbor as a geographic sub-area, which includes Portland Harbor, the Columbia waterfront industrial zone to 82nd, and some of East Hayden Island. The Columbia Harbor sub-area is primarily geared towards manufacturing and distribution with sixteen percent of all jobs within Portland accounting for 64,000 jobs: the most of any sub-area.

The study identifies the vacant land supply for potential development. Much of the land in the Columbia Harbor region has constraints (such as environmental contamination) limiting potential growth decreasing the total land included in the vacant land supply. For example, only 476 acres of vacant, partially vacant, or re-developable land are available in Columbia Harbor with no natural resource zoning or other constraints of a total 1,910 acres of vacant land in the Harbor. Including non-employment related land demand of an estimated 640 acres for marine terminals (390 acres), rail infrastructure (200 acres), and airport expansion (50 acres), the study concludes there is a shortage of industrial land from 100 acres to 800 acres. If these regional transportation land needs are not included, the study estimates that there is sufficient available vacant acreage in the low and mid scenarios with a shortage of 170 acres in the high scenario. The data from the EOA on available lands needs is utilized in **Section 5** of this study to assess the availability and suitability of vacant waterfront lands in Portland Harbor specifically for marine-related uses.

3.4 MARINE-RELATED FORECASTS FOR PORTLAND HARBOR

This section presents 30-year forecasts for marine cargo and marine industrial employment in Portland Harbor.

3.4.1 Marine Cargo Forecasts

Three cargo forecasts completed for the region were assessed: one for the Puget Sound and Columbia River system completed in 2009 for the Washington Public Ports Association, and two for Portland Harbor completed in 2009 (by the Oregon Department of Transportation) and in 2010 (for the Port of Portland by BST Associates). Of these, the forecast completed by BST Associates for Portland Harbor was utilized as it is the most recent, the most conservative, and utilized sound methodology. This forecast estimates growth in each cargo type in Portland Harbor through 2040, with estimated growth rates from 2007 to 2035 varying from 0.2 percent for breakbulk to 3.7 percent for automobiles. A recent trade capacity analysis for the Portland/Vancouver area indicates that this forecasted growth is feasible given the infrastructure in the region, since it is less than the doubling of freight volumes that the study suggested was possible (though challenging) for the region.

The forecasts presented below represent the expected flow of cargo through Portland Harbor assuming that there is adequate marine industrial land available and adequate transportation infrastructure, including in marine terminals, rail and road infrastructure, and the barge system. The forecasts are for six primary cargo types: dry bulk, liquid bulk, grain, breakbulk, containers, and automobiles. Bulk cargoes are commodities that are transported unpackaged in large quantities, and can be in dry or liquid form. Grain is a dry bulk commodity that is large enough to merit its own forecast. Breakbulk are commodities that must be loaded individually, and are often palletized or in bales. Bulk and breakbulk cargoes are measured in metric tons (MT). Container cargoes are products that are transported in truck-size intermodal containers, known as

[26] E.D. Hovee & Company. March 2009 draft. City of Portland Economic Opportunities Analysis: Summary Report.

twenty foot equivalents (TEU). Automobiles are typically fully assembled vehicles that can roll on and roll off RO/RO of vessels; growth in auto cargoes is measured in units with each vehicle equal to one unit.

It is important to note that the cargo mix and mode of shipment of different cargo types is fairly dynamic and responds quickly to market factors. While past forecasts have predicted overall growth levels in cargo, the cargo commodities with the most growth have frequently been different than anticipated. An example of this is the largely unanticipated movement from breakbulk to containerized cargo that led to declines in breakbulk cargo but resulted in dramatic growth in the new cargo type of containers. In addition to technological change, as growth in cargo reflects overall economic activity, the cargo mix will change based on which economic sectors decline and grow and the subsequent change in the region's mix of imports and exports. Thus, there is more certainty regarding overall cargo volume than the specific future cargo mix that will be handled in Portland Harbor.

Also, as noted in the 2006 trade capacity analysis, growth in trade in Portland is likely to alternative between periods of slow to moderate growth and period of rapid expansion. This is due to Portland's relatively small market size, which makes it more strongly dependent on external forces in national and international markets.

3.4.1.1 Previous Cargo Forecasts

In 2009, a marine cargo was completed for the Washington Public Ports Association that projected cargo growth in Puget Sound and the Columbia River.[27] Although completed after the 2008 economic downturn, the results were developed prior to more recent assessments that suggest a global slowdown of trade. These results were developed for both the Puget Sound region, and for the Lower Columbia region broken into the Washington portion and the Oregon portion. **Table 3-11** shows the results for all areas. After each region, there is a column showing the average annual growth rate of that cargo from the year in the preceding row. For example, between 2002 and 2007, the Puget Sound region increased cargo volumes by an average of 3.8 percent per year; between 2007 and 2010, the forecast suggests that the same region will increase on average by 0.7 percent annually. The forecast for all regions shows a significant slowdown in annual growth between 2007 and 2010 due to do the global economic decline, but similarly all regions are forecast to see increases in the following years.

Table 3-11 Summary Forecasts for Puget Sound and Columbia River System in 1,000 metric tons

Year	Puget Sound	Annual Growth Rate	Columbia River - WA	Annual Growth Rate	Columbia River - OR	Annual Growth Rate
2002	66,639		12,481		18,051	
2007	80,396	*3.8%*	16,209	*5.4%*	20,765	*2.8%*
2010	82,208	*0.7%*	17,759	*3.1%*	20,837	*0.1%*
2015	90,720	*2.0%*	19,070	*1.4%*	22,460	*1.5%*
2020	99,859	*1.9%*	19,885	*0.8%*	24,099	*1.4%*
2025	110,958	*2.1%*	20,745	*0.9%*	25,895	*1.4%*
2030	120,202	*1.6%*	21,406	*0.6%*	27,665	*1.3%*
2007-2030		*1.8%*		*1.2%*		*1.3%*

[27] BST Associates and HIS Global Insight and Mainline Management Inc. (2009). 2009 Marine Cargo Forecast, Technical Report. Prepared for Washington Public Ports Association. March 23.

Another forecast is currently under development for the Oregon Department of Transportation for marine cargo to the year 2040. Preliminary results are shown below by type of cargo (see **Table 3-12**). Annual growth rates are shown for each commodity type in two ways. The first shows the 2010 – 2040 annual increases expected, and the second row shows the growth rate beginning with 2007, which was a recent high. The purpose of the second row of growth rates is to show that net increases are still anticipated, but are smaller when calculated to include the slowdown. Average annual growth rates provide a quick way to compare increases across both regions and commodities, and also provide a sense of what is expected into the future.

Table 3-12 Oregon Department of Transportation Forecast for Portland Harbor Cargo to 2035

Year	Breakbulk	Dry bulk	Liquid bulk	Grain	Total Bulk and Grain	Containers	Autos
2002	772,966	4,032,277	6,353,987	3,899,745	15,058,975	255,745	394,776
2007	1,125,955	5,402,217	6,448,519	5,992,325	18,969,016	260,128	449,307
2010	740,586	5,257,522	6,874,514	7,328,792	20,201,414	235,630	538,496
2020	935,919	6,239,386	7,104,274	7,696,568	21,976,147	306,539	755,427

3.4.1.2 Marine Cargo Forecast Utilized in this Study

The marine cargo forecast presented below was developed by BST Associates for this study. This cargo forecast is the potential cargo volume that could flow through Portland Harbor, assuming that there is adequate terminal capacity. The BST Associates forecast is the forecast utilized in this study for the following reasons:

1. **Most Recent Forecast**. The BST forecast was finalized in April, 2010 and is the most recent marine cargo forecast for Portland Harbor. This forecast considered the short and long-term economic effects of the economic recession that started in December, 2007.
2. **Geographic Area**. The BST forecast focuses on the Portland Harbor geography, which is the relevant area for this study.
3. **Conservative**. Compared to the ODOT forecast, the BST forecast is generally more conservative in estimating cargo growth in Portland Harbor. The BST forecast considers the short and long-term economic effects of the economic recession that started in December, 2007.
4. **Sound Methodology.** BST Associates has been conducting marine cargo forecasts since 1991 for a variety of public agencies in the Pacific Northwest. BST cargo forecasts have been accepted by regional agencies since at least 2002 when BST prepared the 2002 METRO Commodity Flow Forecast for METRO, Oregon Department of Transportation, Port of Vancouver, Regional Transportation Council, and Port of Portland.

The forecasts are based on a bilateral trade model developed by Global Insight. The forecast is by type of commodity, and the data provided by Global Insight has been adjusted by BST Associates according to the most up to date information available. The forecasts do not, however, cover new market opportunities which may well have the most profound influence on future trade. Instead, these estimates are based primarily on the historic growth trends in each cargo type in the Pacific Northwest, the Portland Harbor market share, as

well as regional, national, and domestic macroeconomic variables and trade patterns. For each type of commodity, a forecast has been developed for the Pacific Northwest region, and then market share estimates were developed for the Portland Harbor. For more information, the BST Associates report contains the complete forecast rationale for each commodity.

Growth in cargo is typically based on tonnage. For dry bulks, grain, liquid bulk, and breakbulk, trade growth is measured in metric tons (MT). Containers are measured by twenty-foot equivalent units (TEU), which is the standard container dimension. Finally, automobile cargo is measured by units, with each vehicle representing one unit.

Table 3-13 shows the most likely cargo forecasts, with a low and high forecast shown in **Table 3-14** and **Table 3-15** respectively. In addition to the forecasted growth of existing cargo types shown in **Tables 3-13** through **3-15**, BST Associates notes that new market opportunities of new cargo types may develop, particularly for dry bulks and containers. These opportunities may be in the magnitude of 3 million MT of dry bulk, and 150,000 TEU of containers.

Consistent with previous forecasts of marine cargo in Portland Harbor, the BST Associates forecast indicates that cargo tonnage will increase in nearly all cargo categories over the next 30 years. Over the forecast period, autos, containers and dry bulk cargos are expected to expand faster than the other types of cargoes. In particular, automobiles are expected to expand most rapidly, with compound annual growth from 2008 to 2040 expected to average from 2.6 to 3.8 percent, with a most likely average annual growth rate of 3.3 percent. Portland continues to be the number two in the west coast for imports of automobiles, and the forecast for continued imports is favorable in the wake of US automobile production declines.

Containers are expected to grow at the second fastest rate from 2008 to 2040, expected to range between 1.4 to 2.9 percent, with a most likely average annual growth rate of 2.4 percent annually. Containers are expected to continue to have an advantage for products that also experience competitive barge rates on the Columbia-Snake river system, container market share expansion is limited in the future because although the Columbia river channel has recently been deepened to 43-feet, more and more container ships will require 44-feet to 46-feet depths in the future. However, smaller container vessels, or vessels that are not fully loaded, can still navigate the 30-foot channel and there are opportunities for container growth. As evidence of this, since the BST forecast was finalized, the Port of Portland recently finalized a 25-year lease of container and breakbulk facilities at Terminal 6, to a new container terminal operator that specializes in small to mid-size terminals in niche markets. This new lease agreement is expected to increase container growth at Portland Harbor.

Dry bulk cargoes in the most likely forecast are also expected to continue to increase by 0.8 percent to 1.0 percent annually, in part due to stronger Asian currencies demanding exports of soda ash, potash, minerals ores, chemicals, and fertilizers. This growth is expected in the national/international dry bulk markets, which in Portland Harbor are currently dominated by mineral exports, as well as the local/regional dry bulk markets, which include construction materials as well as agricultural fertilizers.

Table 3-13 Most Likely Marine Cargo Forecast for Portland Harbor to 2040

Year	Breakbulk (1,000 MT)	Dry bulk National/International (1,000 MT)	Dry bulk Local/Regional (1,000 MT)	Liquid bulk (1,000 MT)	Grain (1,000 MT)	Containers (TEU)	Autos (Units)

Source: BST Associates. 2010. West Hayden Island Marine Cargo Forecasts and Capacity Assessment, Final Report. Prepared for Port of Portland.

As noted above, the 2010 most likely marine cargo forecast prepared by BST Associates and presented in **Table 3-13** above is conservative compared to the 2009 ODOT (presented in **Table 3-12**). **Table 3-16** below compares the two forecasts in terms of annual average growth between 2007 and 2035. As indicated in the table, the BST Associates forecast projects lower annual cargo growth rates for all cargo types in Portland Harbor except liquid bulk and containers.

Table 3-16 Comparison of Cargo Forecasts for Years 2007 – 2035, Average Annual Compound Growth Rate

Cargo Type	BST Associates for Port of Portland	ODOT
Breakbulk	0.03%	0.20%
Dry Bulk	0.51%	1.30%
Liquid Bulk	0.90%	0.40%
Grain	0.23%	1.30%
Containers	2.11%	0.90%
Autos	2.84%	3.70%

3.4.2 Marine Employment Forecast

This section draws from general employment forecasts conducted for the metro region, as well as for the sub area of the metro region (Columbia Harbor sub area) that includes the Portland Harbor. In particular, the analysis draws from the Economic Opportunities Analysis (EOA) that developed employment forecasts for the City by sub area to the year 2035 for the purpose of understanding employment land demand and supply. These sub area employment forecasts are, in turn, based on the total employment forecast by 2035 conducted by METRO for the seven county Portland Metropolitan Statistical Area. For the transportation, warehouse and utilities sector, total employment is expected to grow to 57,700, 61,350, and 65,010 jobs respectively for the low, medium, and high forecast scenarios. Citywide capture of the jobs in this category also varies in the estimation, assuming that 57, 63, and 68 percent respectively in this sector are located in the City. This represents a reduction in the current city capture of these jobs, which is closer to 74 percent.

Using these estimates, the EOA job forecast for the city ranges from a low of 32,889, to a high of 44,206, with the midpoint being 38,650 jobs forecast by 2035 for the City. The forecast was developed using an overall growth rate of 1.7 percent annually, identified as the medium scenario forecast from METRO at the time. These numbers are consistent with other current estimates of transportation and warehousing employment in Multnomah County, which was 25,524 in 2007.[28] At the 1.7 percent growth rate, the medium forecast of 38,650 is attained in 2035 if jobs in this sector were 25,359 in 2010. While all of the transportation and warehousing sector jobs are not marine industrial jobs, these jobs are linked to the intermodal transportation system which depends in part upon the marine transportation.

Another source of information about marine industrial jobs in the Portland Harbor is the Working Harbor data developed by the City. These data account for the types of economic activity in the based on whether the firm located in the harbor is dependent on marine transportation, dependent on rail facilities or dependent upon both. This provides yet another way to consider the employment related to marine transportation. Of the 212 firms located in the harbor, 47 firms with just under 2,000 employees are dependent on both the river and rail transportation while another 23 firms with 660 employees are dependent on the river but not necessarily the rail. This totals to 70 firms dependent on marine transportation, with approximately 2,625 employees. There are also 142 firms that employ over 5,800 people that are dependent on the rail transportation facilities. **Table 3-17** below shows this firm and employment information.

Table 3-17 River and Rail Dependent Firms and Employment in the Portland Harbor

Type of Industrial Facility	Number of Firms	Number of Employees
Both River and Rail Dependent	47	1,969
River Dependent Only	23	656
Rail Dependent Only	142	5,817
Both River and Rail Dependent	47	1,969
Total	212	8,442

Source: Data provided by the Bureau of Planning and Sustainability

It is expected that this employment information is incomplete as many firms have operations in the harbor area but may have main office locations elsewhere that results in undercounting of harbor area employment. For example, as discussed in Section 1, the Martin and Associates 2007 study of the economic impact of Portland Harbor marine terminals estimated that there are 6,570 jobs in Portland Harbor directly dependent on public and private marine terminals. This results in an estimate of river dependent jobs nearly three times higher than the Working Harbor data. This estimate even undercounts the total river-dependent employment as marine industrial facilities with docks are not classified as marine terminals in the Martin and Associates analysis.

As illustrated in **Table 3-17**, not all Portland Harbor businesses are directly dependent on the river and water transportation. However, as discussed in **Section 1**, businesses in the harbor area are highly interdependent and it is challenging to isolate the economic activity and jobs that are dependent upon the marine transportation network. Based on the interdependence of all Portland Harbor employment as well as the uncertainty associated with the number of marine industrial jobs that are in fact dependent on water transportation, this analysis bases the projection of marine industrial employment growth on the 8,440 river

[28] Office of Economic Analysis, Employment by Industry: 1990 to 2015, accessed at http://www.oea.das.state.or.us/DAS/OEA/economic.shtml.

and/or rail dependent jobs presented in **Table 3-17**. Growth rates in marine industrial employment will be based on the overall economic and population growth of the region and the nation, growth rate in international trade, and the local growth rate in marine-related industries such as heavy manufacturing and warehousing and distribution. As noted previously in this section, employment growth rates in manufacturing industries are expected to be slow or negative, while growth rates in transportation, warehousing, and distribution are expected to outpace growth in other industries. This analysis projects that marine industrial employment growth rates will be at a low rate of 0.7 percent per year, a medium growth rate of 1.2 percent per year, and a high growth rate of 1.7 percent per year. These growth rates are based on the following data points:

- Forecasted metro employment growth rate of 0.7 to 1.8 percent through 2040,
- Forecasted metro employment growth rate of 1.4 to 1.7 percent growth in transportation and warehousing through 2040,
- Projected population growth rate in the metro area of 1.4 to 1.7 percent through 2030, and
- Forecasted combined tonnage growth rate of 0.6 percent for dry bulks, liquid bulks, grain; and higher tonnage growth rates of 2.4 percent for containers and 3.3 percent for automobiles.

Assuming a low growth rate of 0.7 percent per year, a medium growth rate of 1.2 percent per year, and a high growth rate of 1.7 percent per year, the future marine industrial employment can be expected to increase to just over 12,370 jobs by 2040 under the most likely scenario, 10,550 under the slow growth scenario, and 14,480 jobs for the high growth scenario (see **Table 3-18**).

Table 3-18 Marine Industrial Employment Forecast for the Portland Harbor

Year	Low (0.7 % Growth Rate)	Most Likely (1.2 % Growth Rate)	High (1.7 % Growth Rate)
2008	8,440	8,440	8,440
2020	9,180	9,740	10,330
2030	9,840	10,980	12,230
2040	10,550	12,370	14,480

3.5 SUMMARY

Prior to the current recession, economic and population growth in the Portland metro region outpaced growth elsewhere in the nation. Economic activity is expected to begin recovering in 2010, with employment and population growth expected to average 1.4 percent and 1.5 percent, respectively, through 2030. A primary source of past economic growth in Portland has been marine-related economic activity, including marine industrial and marine cargo uses. These uses are projected to continue to grow over the next 30-years, with particular growth forecasted in the marine cargo and related transportation, warehousing, utility, and wholesale trade sectors.

The forecasts for cargo and employment have low, most likely, and high estimates, and yet still exclude the significant uncertainty represented by future markets development. New markets are perhaps the most uncertain area since a new market can develop rapidly as a result of global economic forces, new technologies, and policy developments. Interviews with planners, industry representatives, and commodity forecasters, indicates that new markets are the most difficult to predict factors for both cargo and marine industrial growth, and the most important.

Growth in marine cargo over the 30-year planning horizon to 2040 is expected to vary by cargo type, but is projected to grow on a most likely average annual rate of between 0.2 percent for breakbulk to 3.3 percent for automobiles. Together, the marine cargo types measured in tonnage (dry bulks, grain, liquid bulks, and breakbulk) are expected to grow at a most likely average annual rate of 0.6 percent (average annual growth rate weighted by current tonnage), while containers are expected to increase at an annual rate of 2.4 percent for containers, and automobiles at a rate of 3.3 percent annually.

Growth in marine-industrial employment is expected to roughly mirror economic growth trends in the region, as some elements are expected to grow less slowly (manufacturing), while others are expected to grow more rapidly (transportation and warehousing). Growth rates in marine industrial employment are projected to vary from between 0.7 percent to 1.7 percent, with total employment estimated to increase by 2,100 jobs to 6,000 jobs.

As identified in the 2006 trade capacity study, availability of marine industrial land and adequate freight handling and transportation system infrastructure are critical to the growth of marine-related employment. Development of additional lands and facilities will likely be necessary to meet the projected growth in these sectors. If so, land availability for marine industrial development on West Hayden Island may be able to play a critical role in providing the infrastructure and lands necessary to take advantage of growth in these industries. These issues will be addressed in subsequent sections of this study.

Marine-Related Site Suitability

The purpose of this section is to provide an understanding of site suitability and constraints for marine-related uses, including both marine cargo and marine industrial uses. Site suitability is assessed for six marine cargo types: automobiles, liquid bulk, grain dry bulk, other dry bulk, containers, and breakbulk. Site suitability is also assessed for two marine industrial types: vessel related services and marine-dependent manufacturing.[29] Requirements for a given marine-related use vary depending on site and use-specific needs. This section is intended to provide a general sense of the site size, water access, and intermodal infrastructure requirements for each of these marine-related uses. Where available, information on trends in these requirements is presented. A brief discussion is also provided on site constraints for marine-related use related to natural resources and environmental contamination.

The information presented in this section will be used to assess the suitability of vacant, waterfront lands in Portland to meet the requirements for marine-related uses (**Section 5**), and to assess the suitability of West Hayden Island (WHI) and other lands in the Lower Columbia River (**Section 6**).

4.1 OVERVIEW OF DATA SOURCES AND KEY ASSUMPTIONS

Sources drawn from include interviews with ports in the Lower Columbia River, master planning documents for the Port of Portland, interviews with river-dependent businesses, interviews with marine transportation planning consultants, and characteristics of marine-related sites in Portland and other ports.

For this analysis, information from a variety of ports regarding terminal characteristics was reviewed to provide generalized information on site requirements common to all marine related uses, as well as information on how site characteristics and requirements differ based on different cargo uses and local market conditions. Port-provided documents, including the rail analysis and conceptual site design for WHI conducted by HDR provide information on infrastructure requirements and a reference point for potential future development considerations for WHI. The recommendations from HDR were analyzed and found to be consistent with terminal size and infrastructure characteristics at other ports, and so were presented as one option for development on WHI.

Apart from review of the HDR conceptual plans, the current analysis does not include identification of WHI development options or an analysis of the tradeoffs associated with different facility sizes. Rather, the analysis presented in this section is a catalog of the range of sites suitable for marine-related uses likely to expand or locate in the study area. The purpose of the analysis is to provide an understanding of the types of sites needed to meet potential marine-related growth. Recognizing the desire for information regarding site design tradeoffs, available information on operational and cost tradeoffs associated with infrastructure design and footprint size is provided. Information of this nature, however, is very limited as these tradeoffs are specific to a particular cargo and tenant rather than widely applicable across uses.

Furthermore, the analysis assumes that characteristics of existing terminals and operating practices are a good predictor of future site requirements. It can be difficult to predict innovations and/or emerging markets in commodity forecasts. It is not part of the scope of this analysis to predict the viability of potential

[29] Marine or vessel related services include barging, cargo handling services, and naval/coast guard services. Marine dependent manufactures are those firms that require marine facilities for the transport of raw and finished product.

technological innovations, either here or abroad. The Port of Portland is in competition with other West Coast ports for market share. Innovations in Europe and Asia indicate what is operationally possible in those environments to increase efficiency, but it does not indicate what is economically or operationally feasible for Columbia River ports. The Port of Portland operates in a very different market, with different labor, land, and infrastructure constraints than those for European and Asian ports.

It is important, however, to recognize that port operating practices and technology are evolving and are improving land use efficiencies at ports worldwide. These practices include expansion of operating hours, smoothing of peak seasonal volumes, increasing capital and labor, and using off-site transfer and storage yards.[30] Such efforts can increase throughput, but also increase operating costs, which can lead shippers to find alternative locations.

4.2 GENERAL SITE SUITABILITY

In general, marine cargo site requirements differ from marine industrial site requirements due to the need for deeper vessel drafts and larger sites. However, the following general site characteristics are required for both marine cargo and marine industrial uses:

- **Sites must be zoned appropriately.** In Portland, appropriate zoning is heavy industrial (IH) or general industrial (IG).
- **Sites need to be relatively flat with contiguous acreage**, preferably in consolidated rectangular shape, with riverfront length of at least 400 feet and depth from the waterfront of at least 400 feet.[31]
- **Sites need to have sufficient draft depth within 150 feet of shore** For a site to be suitable for marine cargo, it typically needs to be able to accommodate vessels with draft depths of 40 feet or more, with minimum draft depth of 35 feet. [32, 33] The predominant trend is towards bigger vessels, with correspondingly deeper loaded vessel drafts and longer berth requirements. This compares to marine industrial uses that rely on barge transportation that require a 20 to 30-foot draft depth.
- **Marine cargo and marine industrial sites both require easy access to water as well as to rail and truck transportation routes.** Businesses interviewed for this analysis spoke repeatedly of the importance of intermodal transportation for their organization (see **Section 2**). Nearly all marine-related uses must be located on a truck route that provides easy access to an interstate highway network, such as Interstate 5 and Interstate 84. Additionally, many marine-related uses need access to an airport. All sites in Portland Harbor have this access with the nearby presence of Portland International Airport. Marine cargo facilities tend to have a greater need for intermodal transportation than that of marine industrial businesses because these facilities handle greater volumes of product. Therefore, marine cargo facilities tend to require land that can sustain a large quantity of rail, often configured as a rail yard or a loop to contain unit trains (in which all cars in the train carry the same cargo). A rail yard, or railroad yard, is a complex series of railroad tracks for storing, sorting, or loading/unloading, railroad cars and/or locomotives. Railroad yards have many tracks in parallel for keeping rolling stock stored off the mainline, so that they do not obstruct the flow of traffic. A site with multiple rail providers is preferred, since competition between rail companies helps to assure lower freight prices. [34]

LUBA No. 2020-009
Page 6881

- **Acreage requirements** for marine cargo sites also tend to be larger than for marine industrial due to the large rail facilities required for many cargo facilities and associated warehousing and distribution facilities.
- **Constraints to both marine cargo and marine industrial development include environmental contamination and requirements to protect natural resources**. For example, it is preferable to have less than 30 percent of a site be covered by wetlands and less than 10 percent of a site within the flood plain.[35] Upland and in-water environmental contamination is also a limitation in that it is costly and often carries high risk of future liability.
- **Security**. Many industrial sites, including marine cargo and marine industrial facilities, require separation with fences or other barriers from public areas for both security of materials and also for public safety. Furthermore, security measures required by the Security and Accountability for every Port Act of 2006 may slightly increase the footprint required for marine terminals sites. For example, random searches of containers by the Coast Guard may slow the movement of cargo through ports. In the future, the Container Security Initiative may also slow the movement of cargo from a foreign port.

Following a discussion of trends in railroad operations and vessel size, this section provides a brief overview of each type of marine related use, together with a discussion of the general characteristics of land use and infrastructure requirements, including draft depth, berth length, and rail access. Existing facilities in Portland and other Lower Columbia and west coast ports are described to provide a sense of existing facility parameters.

4.2.1 Trends

Several rail infrastructure and vessel trends are affecting marine industrial sectors. In general, changes in Class I railroad operations towards longer, unit trains and increasing sizes of marine vessels result in greater infrastructure and site size requirements for marine-related uses, but particularly for marine cargo uses.

4.2.1.1 Rail Requirements

The combined access to rail, marine, and road transportation is critical for many businesses located in Portland Harbor. Portland has a competitive advantage over many other west coast ports as it is served by two Class I railroads, Union Pacific and BNSF (Burlington Northern Sante Fe) Railways, that both have west coast and east-west continental rail lines. Portland is also served by several short line railroads, which serve local customers and also distribute freight to and from the Class I railroads. The east-west rail lines that serve Portland cross the Cascade Range through the Columbia Gorge at river elevation, compared to the more expensive railroad routes from the Puget Sound that cross the Cascade Range through Stevens Pass and Stampede Pass.

Four main line rail routes converge in Portland: 1) BNSF north to Seattle and Vancouver, British Columbia, 2) BNSF east to Chicago via Kansas City, 3) Union Pacific south to Oakland and Los Angeles, then across the Southwest to New Orleans, and 4) Union Pacific east to Chicago via Salt Lake City and Denver. Access to this rail infrastructure is a key requirement for many marine industrial and marine cargo uses, but the type of access and associated site requirements varies by use as will be described below. However, several trends affecting nearly all marine-related uses are noteworthy.

First, the railroads are using longer trains. BNSF has required that all of their intermodal trains will be 8,000 feet in length, which allows them to increase the amount of freight that can be handled on the mainlines

[35] E.D. Hovee & Company and City of Portland. February 2003. Portland Harbor Industrial Lands Study.

without having to increase the number of trains.[36] Use of these longer trains requires additional rail yard capacity to assemble and hold the longer trains and longer sidings to permit trains to meet and pass.

Second, due to increased demand on Class I railroads and resulting congestion, the railroads are changing their business model to become more wholesale carriers and focusing on long-haul trains with intermodal containers or unit trains with bulk commodities such as grain.[37] These types of cargoes are typically hauled long distances with few stops, putting the least pressure on the rail networks, thereby minimizing costs and congestion. Railroads have focused on mainline 'hook and haul' service; this requires short line railroads and truckers to consolidate shipments in larger terminals as the railroads have started declining requests to service smaller carload traffic (2, 5, or 10 cars).[38] For shippers that are located on a mainline that do not assemble unit trains, the railroads are requiring that the facility have siding tracks off of the mainline for loading and unloading and that all trains must enter and leave the sidings at relatively high speeds.

Unit trains are typically 8,000 to 10,000 feet long, and typically require storage track off of the main rail line near the terminal where trains can be 'chambered' until needed at the terminal. Also needed at the terminal are loop tracks or long working tracks for loading and unloading. As today's unit trains are typically 110-cars of 62 feet, working tracks plus track through the loading/unloading area requires approximately 3 acres of land without any at-grade crossings. Based on design specifications from BNSF and UPRR, the design of an industrial loop track for loading and unloading would require a footprint of approximately 1 mile long and over one-quarter of a mile wide.[39] Shorter tracks require doubling or tripling over into multiple tracks, which undesirably breaks the unit train.

These shifts towards longer trains and 'hook and haul' service of unit trains have consequences for the suitability of sites for both marine cargo and marine industrial uses. Marine cargo uses such as dry bulk, container, and auto should have access to on-site or adjacent rail facilities for loading unit trains; this requires more acreage than older facilities. Marine industrial uses will also require more services from short line railroads and also rail capacity to assemble their carloads.

4.2.1.2 Vessel Size

For nearly all cargo types, vessels are becoming larger, with deeper draft and longer berth requirements. **Table 4-1** summarizes forecasted vessel lengths and associated loaded drafts for existing and forecasted future vessels. This is particularly true for container vessels, as summarized in **Table 4-1**. Container vessels currently operating are classified as Panamax and Post-Panamax. The draft depth of 43 feet in the Lower Columbia River channel can accommodate Post-Panamax vessels up to 6,000 twenty foot equivalents (TEU), with a length of 1,001 feet. Vessels for automobiles, dry bulk, and liquid bulk cargoes are also expected to increase. Some of the largest vessels, if fully loaded, have deeper drafts than accommodated by the 43-foot Columbia River navigation channel. Thus, the largest vessels in the commercial fleets will either not carry cargoes through Portland, or will not be fully loaded.

Table 4-1 Existing and Forecasted 30-Year Future Vessel Lengths and Loaded Drafts (Feet)

	Vessel Overall Length (feet)		Vessel Loaded Draft (feet)	
Cargo Type	Existing	Future (30-year forecast)	Existing	Future
Container	965	1,200	39.5	50.0
Auto	640	760	32.2	37.1
Dry Bulk	738	805	42.0	44.9
Liquid Bulk	804	935	42.98	47.9

Table source: HDR Engineering, 2009, West Hayden ISloand Marine Terminal Site and Operation Requirements.

This increasing vessel size has implications for site suitability as larger vessels require longer berth lengths. For example, existing auto vessels require a berth length of approximately 400 feet (assuming local availability of barges for use as floating dock platforms), while the forecasted future auto fleet will require a berth of up to 480 to 500 feet in length.[40] Additionally, larger vessel sizes indicate a greater spike in cargo volumes handled with each incoming or outgoing vessel. This, in turn, increases terminal capacity requirements, as more infrastructure and space is required to handle larger volumes of cargo at a given time.

4.3 MARINE CARGO SITE SUITABILITY

Marine cargo uses are assessed for six cargo types (similar to **Section 3**): automobiles, liquid bulk, grain dry bulk, other dry bulk, containers, and breakbulk. The text below describes specific characteristics of each of these marine cargo facility types. Site requirements differ amongst cargo types due to the differences in vessel size used for each cargo type, which affects berth length and draft depth requirements. A vessel's overall length (LOA) largely determines the berth length requirement, which in turn determines the shoreline length of acreage required at a site. Additionally, rail infrastructure and associated acreage requirements differ by cargo type. Following the narrative discussion of each cargo type, a summary section provides a table of general site requirements by cargo type (see **Section 4.6**).

Ranges are provided for site suitability characteristics. Even for one cargo type, site suitability depends on a wide range of factors, based on the specific cargo being handled, the operational characteristics of the terminal, labor market conditions and agreements, and specific site and local market considerations. An examination of just one use, such as container cargo terminals, will reveal very different site sizes and configurations at different ports and even at the same port.

As noted above, trends in marine cargo transportation that may affect the suitability of sites include larger vessels that have deeper drafts and longer unit trains that require larger rail yards. A recent report completed for the Port of Portland recommends that future terminal sites have a rail capacity to hold a minimum of an 8,500- foot train, and have working track lengths in the 2,500 to 3,500 foot range.[41]

It is also important to note that marine terminals typically require acreage not only for specific marine terminal operations for each cargo type as described below, but also for access roads, rail lines, maintenance areas, administrative buildings, and terminal storage space. For example, the Port of Portland's Terminal 6 has 522 acres. Of this acreage, there is a container terminal of 200 acres, of which 17 acres is presently used for breakbulk operations and two automobile terminals totaling 227 acres. The remaining acreage is used for rail, road, and general terminal operations, or is presently used for non-marine cargo (Suttle Road site). The

[40] HDR Engineering and Port of Portland. October 2009. West Hayden Island Marine Terminal Site and Operation Requirements.
[41] HDR Engineering and Port of Portland. October 2009. West Hayden Island Marine Terminal Site and Operation Requirements.

data on total acreage for all terminal operations was not available for many marine terminals, therefore acreages listed in the sections below often represent the size of core terminal operations, as noted in the text.

Finally, the berth lengths listed below typically represent the dockface length only and do not include berthing and mooring dolphins that extend the length of the berth or provide a mooring point. These dolphins can extend the dockface by 300 feet (150 feet on both ends of the dock).

4.3.1 Automobile

Automobiles are classified as roll on-roll off (RO/RO) cargo since they are driven on and off of transport ships. West coast ports serve as gateways for Asian automakers importing vehicles into the United States. Portland is the largest volume auto import port along the west coast, with Toyota, Hyundai, and Honda using Port of Portland facilities (Terminals 4 and Terminal 6).[42]

The Port of Portland is a desirable location for automobile importers due to lower rail rates and the fresh water environment, which results in less salt damage to the automobiles than in seawater ports. In addition, Portland is the gateway to the west for rail, and most automobiles imported through the Port of Portland are transported overland via rail.[43] Newer automotive rail ramps are double ended and can accommodate two blocks of five to seven cars. A rail design for a potential automotive terminal for the Port of Portland recommended 12 load lines of approximately 180 feet in length, and requiring five acres. Regarding draft requirements, automotive transport vessels that make calls to the Port of Portland typically require at minimum a draft depth of 32 feet (e.g. Toyota) and future vessels may require 37 feet.[44]

Automobile facilities at Port of Portland range in size from 75 to 120 acres. The Toyota facility has two berths, one that is 410 feet and another that is 950 feet. Other west coast ports with automobile imports, such as Long Beach, Vancouver, and Tacoma, have similarly sized automobile facilities. The Port of Long Beach Toyota facility is 168 acres in size and includes 110 acres of open storage area, 18 acres of rail facilities, four acres of warehousing/processing, 15 acres of truck staging, and 20 acres of employee parking.[45] The depth of this facility's docking area is 38 feet and the berth length is 1,300 feet.[46] The Subaru facility at the Port of Vancouver covers 90 acres and has a 1,040-foot berth.[47] The Marshall Avenue Auto Facility at the Port of Tacoma is approximately 165 acres in size and can handle 25,000 vehicles at any given time.[48] The acreage includes buildings covering 148,000 square feet (3.4 acres), as well as 72 dedicated railcar spots.[49]

Automobile manufacturers differ in how they operate their port facilities, which affects vehicle movement, number and type of employees (and associated parking requirements), building location and type, and overall site size requirements. For example, in Portland Harbor some automobile manufacturers such as Toyota and Honda aim to transport their vehicles from the harbor shortly after arrival by vessel, while others such as Hyundai store their vehicles at Port facilities for longer periods.[50] Site requirements also differ as Toyota adds accessories after manufacturing at their site, while Honda does not. Most automobile manufacturers also

50 This is due to differences in supply chain management. Toyota operates on a pull strategy, in which shipments respond to consumer demand and 'pulls' the product through the supply chain. Honda operates on a 'push' strategy that is based on products being pushed through the supply chain based on manufacturing production levels set in accordance with historical demand from retailers.

desire space to have a facility to do repairs and touchups to the imported automobiles, and also require a fueling station to provide gasoline for newly arrived cars.[51]

Operational differences between manufacturers result in different land requirements for a given automobile throughput, but at a minimum, a large parcel of approximately 100 acres is required for an automobile cargo terminal. Automotive terminal design requirements completed recently for the Port of Portland recommend a terminal of 75 to 125 acres.[52] This design includes a marshalling area to manage cargo flow, 5 acres of loading and unloading area, a multimodal rail yard, and a processing center for offices, vehicle repairs and cleaning, employee parking, and a truck gate area. Total acreage requirement is 140 acres for the terminal area and 30 acres for the intermodal rail yard.

4.3.2 Container

The containerization of shipments began in 1960 and allows for greater ease in transferring goods between ships, docks, trucks and rail. Containers are standardized rectangular boxes used in the transport of cargo, with a width of eight feet, a height of either 8.5 feet or 9.5 feet, and a length of 10 feet to 40 feet. Goods transported by container are varied, including such products as tennis shoes and tires. The throughput capacity of a container terminal is measured in twenty foot equivalents (TEUs) and is equal to one 20 feet x 8.5 feet x 8 feet container. Containers are moved to and from ships with cranes, and are moved in the storage yard with a variety of stacking equipment.

Marine vessels for container cargo are currently in the 965 to 985 feet range and have a loaded draft requirement of 39.6 to 42.7 feet. Vessel size is expected to continue to grow, partly due to the planned construction of two sets of locks at the Panama Canal to accommodate larger container cargo ships. Future Panamax and Post-Panamax vessels will be in the 1,100 to 1,200 feet range with a draft requirement of approximately 46 to 50 feet.[53] Post-Panamax vessels are super-sized ships capable of carrying three times more cargo than ships now transiting the canal.

As the size of container vessels are increasing, many ports are taking the necessary steps to accommodate the larger vessels. For example, the Port of Oakland is dredging to achieve a draft of 50 feet and redeveloping the foundations of their wharf to sustain the weight of increased loads. The Port of Prince Rupert is anticipating expansion of their container facilities by 80 acres, and plans to add one berth that is 1,443 feet in length in water that is 59 feet deep. In total, this will bring the total acreage of this container facility to 139 acres.[54] This container terminal is relatively smaller than many other terminals as all containers at this facility go directly onto rail; there is no trucking or intermodal facility.

West coast container terminals range in size from approximately 50 to 400 acres. The Port of Portland has a container terminal at Terminal 6 that is 232 gross acres, including 20 acres of rail yard and 7 acres for road access. Approximately 193 of the Terminal 6 acres are for container terminal operations. The on-dock intermodal rail yard has annual capacity for 1,100 trains. The Port of Tacoma has six container terminals. Each has a draft depth of 51 feet and all but one has two berths, with each berth having a length of 1,100 to 1,300 feet.[55] The APM container terminal at the Port of Tacoma has 135 acres, but utilizes an intermodal rail yard that is an additional 32 acres.

55 Port of Tacoma, Container Terminals, Website (http://www.portoftacoma.com/Page.aspx?nid=102) accessed January 2, 2010.

The Port of Long Beach has seven container terminals ranging in size from 70 acres to 385 acres, with rail infrastructure occupying a large proportion of terminal acreage.[56] Of the container terminals in Long Beach, all but two have rail onsite or are located near rail yards, and these two terminals are currently expanding to have rail.[57] The terminal that is 70 acres in size does not have rail, so containers are moved to their destination via truck, which is the appropriate mode for the products handled at this terminal.[58] Each of the container terminals at Long Beach also has a truck queue area that requires additional space at the terminal. Additionally, customs officers inspect the containers two to three times each day, and require an inspection area of 100 square feet. Total berth lengths for these container terminals are between 1,800 and 6,379 feet and the design depths for the berths are between 36 and 55 feet.[59]

In the past, increases in container terminal throughput volumes were typically accomplished by expanding wharfs and increasing the amount of land within the container yard. As port land has become increasingly scarce, other methods of increasing throughput have been employed based on economic considerations related to local labor agreements/practices, scarcity of land, mix of intermodal rail versus local truck/barge transport, and capital costs.[60] These methods include the reduction of container dwell time, the use of 'off-dock' facilities, and by increasing container storage density.[61] As the ground space density increases, the labor costs of stacking operations also climbs, making these operations uncompetitive once density exceeds 200 to 300 TEU per acre.[62] The technology at the Port of Los Angeles and Long Beach container terminals require more labor and an increase in unproductive lifts. Therefore, higher ground space productivity is more suitable in ports where labor is relatively inexpensive and land costs are high.

Another method to reduce waterfront land requirements is to move containers to an offsite storage yard, although this creates an additional cost of transporting containers to the offsite yard. For example, the Port of Hong Kong and the Port of Long Beach are using a remote container yard to improve capacity.[63] At the Port of Hong Kong, imported containers are immediately loaded onto a train and moved to a sorting yard off of the terminal site. Export containers are directly delivered to the terminal by truck or rail. This reduces the amount of container storage space required within the container terminal, but does increase the handling time to transport the containers.[64] However, while such operations are competitive in the Long Beach and Hong Kong markets, ports in the Lower Columbia River face very different market factors including different levels of land constraints, labor conditions, and cargo products.

A recently completed Port of Portland report suggests a future container terminal with a 140-acre footprint.[65] This footprint includes the acreage required for a loop track to accommodate a unit train. Portland's competitive advantage for container traffic is its excellent rail service. Intermodal infrastructure that enables assemblage and storage of unit trains helps to compensate for the additional time required for traveling up the Columbia River from the ocean. The acreage required for a container cargo terminal and associated land uses varies based on configuration and throughput, but when evaluating acreage requirements for container

LUBA No. 2020-009
Page 6887

facilitates at west coast ports, at a minimum, 100 acres are required for a container cargo terminal and associated infrastructure.

4.3.3 Breakbulk

Breakbulk cargo is shipped in units such as bags, bales, barrels, boxes, cartons, drums, and pallets. In the past, breakbulk products shipped from the Pacific Northwest included forest and agricultural products. However, increasingly these products have been containerized. Many cargoes can be shipped as either breakbulk or container cargo, with the predominant mode being determined by pricing and shipping frequency. Now, the primary breakbulk cargo handled at the Port of Portland is inbound steel used by area manufacturers and the Class I railroads.

Port of Portland breakbulk facilities include Terminal 2 and portions of Terminal 6 used for breakbulk steel cargo.[66] Terminal 2 covers 49 acres, of which 28 acres are dedicated to breakbulk open storage. The remaining acreage is used for a covered warehouse, cranes, a truck lane, and other services.

There are nine breakbulk terminals at the Port of Long Beach that range in size from 15 to 22 acres. The Cooper/T. Smith (CTS) breakbulk Terminal (Pier F) has 21 acres, of which 4.1 acres are covered storage and the rest is open yard. At this facility, almost 100 percent of their product is shipped by truck as rail is less suitable for the goods they handle. In the past they utilized rail for timber/lumber, but they rarely handle this type of product now. The truck queue system for breakbulk is very different from container and requires much less space.[67] The berth lengths for these breakbulk terminals are between 600 and 1,985 feet and have a draft depth of between 32 feet and 43 feet (with the majority being 36 feet deep).[68]

The Port of Vancouver has two existing sites dedicated to breakbulk. There is a 40-acre site and a 70-acre site, with docks 1,250 feet and 1,750 feet in length, respectively, and a draft depth of 40 feet.[69] The Port of Vancouver also has a planned breakbulk facility at Terminal 5 that would be 218 acres.

As indicated above, site size for breakbulk varies substantially depending on the cargo and whether it will be transported by rail or by truck, as well as other operating considerations. Regarding rail infrastructure, to increase operational efficiency, a breakbulk terminal would have a loop track and on-dock track connectivity.[70] In general, sites for breakbulk cargo require a minimum of 20 acres if rail is not required, to up to 70 to 100 acres for cargoes requiring rail access. No designs for a breakbulk terminal have recently been completed for the Port of Portland.

4.3.4 Dry Bulk

Dry bulks include grain, potash, bentonite clay, copper, zinc, soda ash, and a variety of minerals. Typically dry bulks are separated into grain cargo and other dry bulk goods, a convention which is followed in this analysis. Other dry bulk goods can be further separated based on point of origin and destination into local/regional dry bulks and national/international dry bulks.

69 Ibid.

70 Ports and Marine, Inc. and Port of Portland. January 2003. Marine Terminal Master Plan.

4.3.4.1 Local/Regional Dry Bulk

The local/regional dry bulks are typically smaller volume dry bulks that are imported/exported in support of industry located in the immediate region of the terminal. Examples here include cement, salt, gypsum, aggregates, etc. These terminals are usually a mix of rail and truck and do not need to support train activity on-site. They therefore tend to have smaller footprints.

The Port of Long Beach has seven terminals that specialize in local/regional dry bulks. Five out of these seven terminals are less than ten acres in size and do not have rail facilities. The largest of the seven is a 23-acre terminal that handles petroleum coke, coal, potash, borax, soda ash, and a variety of other minerals. This facility has rail capacity for two 100-car unit trains. The majority of these terminals have berths in the 550 to 650 feet range; however, two of the terminals have total berth lengths of 1,100 feet and 1,900 feet.[71] Among other facilities, local/regional dry bulks are handled at the 27-acre Simplot facility in Portland Harbor. Construction materials are handled at other local/regional dry bulk terminals in Portland Harbor. The Port of Vancouver, USA has a five-acre dry bulk terminal that has a berth 800 feet in length and a depth of 40 feet.

As indicated by the size of these facilities, local/regional dry bulk marine terminals can be quite small relative to other marine terminals, with footprints that vary from less than 10 acres to 30 acres in size. Their smaller size is due in part to the fact that they do not depend as heavily on rail infrastructure as national/international dry bulk terminals.

4.3.4.2 National/International Dry Bulk

The national/international terminals serve cargos that are railed in from other parts of the US or Canada in unit trains. These terminals require larger footprints to support terminal rail infrastructure. National/international dry bulks exported through the Port of Portland include potash mined in Saskatchewan (Terminal 5) and soda ash mined in Wyoming (Terminal 4).[72] The potash terminal at Terminal 5 is 120 acres, and has rail capacity for 220 tank cars on loop tracks. The soda ash terminal is 25 acres, but this acreage footprint does not include much of the rail and road acreage used to support terminal operations. National/international dry bulks typically arrive by barge and train at the Port of Portland, and are then transferred to dry bulk vessel, or freighters. Freighters are currently 738 feet LOA and require drafts of 42 feet. By 2040, it is anticipated that dry bulk vessels will increase to 805 feet LOA and have a draft requirement of 45 feet.[73]

At the Port of Vancouver, dry bulks such as copper concentrate and bentonite clay are exported through Terminal 2. Approximately 34 acres of this terminal are dedicated to dry bulk operations, but this acreage does not include rail infrastructure. The terminal includes a loop track capable of handling 104-car unit trains, bulk sheds with approximately 160,000 square feet of space, and a recently added 72,000 square foot storage facility for copper concentrate.[74] The Port of Prince Rupert has a state-of-the-art 136-acre dry bulk facility that handles coal. This facility is considered a world leader as it has sufficient rail infrastructure to efficiently transfer coal between marine vessels and unit trains.[75]

A study recently conducted for the Port of Portland anticipates that a future national/international dry bulk facility in Portland would require between 125 and 155 acres, including rail infrastructure with an overall

track length of 7,000 to 10,000 feet. [76] The terminal rail loop would be multi-tracked to provide adequate track length depending on the operation.

4.3.5 Grain

The Columbia River is the third largest grain exporting region in the world and Portland Harbor is the number one exporter of wheat along the Columbia River.[77] The majority of grain exported from the Port of Portland is wheat with barley, with increasing amounts of feed grains (corn and soybeans) from the mid-western United States also being exported. Grain is exported by three grain terminals in the Portland Harbor including Columbia Grain at Terminal 5 and Cargill Louis Dreyfus (CLD) Pacific Grains at Irving, and the LDC Berth or "O" Dock.[78] The CLD grain terminal berth is 327 feet in length and the Columbia Grain terminal is 928 feet in length.[79]

Approximately 40 percent of grain delivered to Portland arrives by barge, with the remainder delivered by rail.[80] Grain is moved by rail on unit trains, which are trains that comprised of cars with the same cargo. Bulk grain rail loading and unloading ideally requires a loop train that can handle a 110-car train in six to eight hours.

A new 108-acre grain terminal is being constructed at the Port of Longview. A unique feature of the terminal is the ability of the facility to hold four 110-unit trains simultaneously.[81] Similar to the existing Kalama Export Company terminal in Kalama, the new Longview terminal will be able to handle both wheat/barley and feed grains (corn and soybeans). Feed grains are shipped in unit trains from the Midwest. The relatively new grain terminal at the Port of Prince Rupert is 100 acres and has a draft depth of 48 feet. The older grain terminal at the Port of Vancouver USA is 45 acres. This terminal has a berth length of 715 feet and a draft depth of 40 feet.[82]

As previously described, existing dry bulk vessels are typically 738 feet and have a draft of 42 feet. It is anticipated that dry bulk vessels will increase to 805 feet in length and have a draft of 45 feet.[83] In addition to the need to accommodate larger vessels, new grain terminals such as the terminal at the Port of Longview are being constructed to handle unit trains. This capacity is necessary to ensure that a facility can efficiently load and unload trains according to the Class I railroads 'hook and haul' procedures, and also ensure the most cost effective rail rates. A grain terminal with loop tracks sufficient to have capacity for unit trains is expected to require a footprint of 100 acres or more.

4.3.6 Liquid Bulk

Waterborne liquid cargo is transported via a tanker or a tank ship. Typically tankers carry hydrocarbons, chemicals, water, and agricultural products. A liquid bulk vessel or tanker is approximately 804 feet in length and draws 43 feet of draft when loaded. It is anticipated that over the next 30 years, liquid bulk vessels will

increase in size to 935 to 1,000 feet in length and will have a loaded draft of 48 feet.[84] In many respects, a liquid bulk terminal is configured and operated similarly to that of a dry bulk terminal.[85]

Liquid bulk facilities tend to be smaller than other cargo facilities. Port of Portland's Terminal 4 has a liquid bulk facility that is six acres in size and handles liquid fertilizer. Kinder Morgan's Linnton and Willbridge Cove liquid bulk operations are, respectively, located on 17 and 44-acre sites.[86] The vast majority of the liquid terminals in the Portland Harbor are petroleum terminals that are located along the western bank of the Willamette River in the Linton or Willbridge Cove area, because this area is adjacent to the Olympic Pipeline, which transports petroleum.

The Port of Long Beach has seven liquid bulk terminals with six of these being less than 11 acres in size and the largest being 18 acres. The range of berth length at these terminals ranges between 700 feet and 1,980 feet with depths between 36 feet and 52 feet.[87] The Port of Vancouver, USA liquid bulk terminal, operated by NuStar is 14 acres and has a berth of 400 feet in length and a berth depth of 40 feet.

Due to the potential environmental contamination associated with an oil spill, terminals that handle petroleum require a physical separation of their operations from the public. Ideally, operators of these facilities would desire their facilities to be remotely located and isolated from public spaces. However, liquid bulk facilities, including those handling petroleum product, are often located in areas that have only fences separating the facilities from public streets or recreation paths. As oil products are not typically explosive, the primary public safety risk is environmental contamination.[88]

A study recently conducted for the Port of Portland anticipates that a future, large liquid bulk facility in Portland could require between 125 and 155 acres, including rail infrastructure, truck loading, product blending, and tank storage areas. [89] This size of terminal could accommodate refining and pipeline operations within a rail storage loading loop. Terminal layout and size, however, would vary substantially based on the business operations and the type of product handled. Operations similar to existing facilities in Portland Harbor would utilize much less acreage, within the range of 10 to 50 acres.

4.4 MARINE INDUSTRIAL SITE SUITABILITY

A 2004 City of Portland study evaluated the businesses that are located along the Willamette River and rely on water access. In addition to marine cargo facilities, these river-dependent businesses include marine and vessel related services and marine-dependent manufactures.[90]

Marine or vessel-related services include barging, cargo handling services, and naval/coast guard services. Marine-dependent manufactures are those firms that require marine facilities for the transport of raw and finished product. The characteristics and general site requirements of these marine industrial businesses are discussed in greater detail below.

4.4.1 Marine and Vessel-Related Services and Operations

Barging is the process of pulling or pushing a flat bottom floating platform with the assistance of a tug boat. Much of the barge traffic along the Lower Columbia River is supplying grain from eastern Washington and Oregon to terminals in the Port of Portland, Port of Vancouver, Port of Kalama, and the Port of Longview. Approximately 40 percent of the grain that these terminals receive is transported via barge. Barge companies require access to water in order to provide this service to grain elevators and to other companies. For example, Tidewater operates facilities in the Port of Vancouver USA and Foss Maritime operates a 10-acre site in Portland. The berth length at both of these facilities is 700 feet.[91]

Commercial barge traffic on the Columbia River upstream of Portland includes tugs and barges for the movement of commodities.[92] Typical commodities moved downstream include agriculture products and the upstream movement of goods includes petroleum, fertilizer, and chemicals. There are three to four tons of cargo moved downstream for every ton moved upstream.

Barges on the Columbia-Snake River system typically use one tug for multiple barges. These barges are based upon the size of the locks on the Columbia-Snake River system, and are typically 42 feet wide (with doublewides 84 feet in width). Individual barge lengths vary between 150 feet and 300 feet. Fully loaded barges on the Columbia River typically draw 13.5 feet of water.[93] Additional tug activity for the Port of Portland involves ship assist. In Portland, the business that operates these tugs is Foss Maritime.[94]

Other vessel-related services include shipyards that repair and build ships. Typical site characteristics of shipyards include docking facilities, dry docks, floating dry docks and onsite storage for boats while they are cleaned and repaired. Portland Shipyard is operated by Cascade General and is one of the world's largest ship repair facilities. It is located on a 60-acre site in the Swan Island area of Portland Harbor. It has two dry docks, one 661 feet long by 112 feet wide and the other is 598 feet long by 88 feet wide.[95] The berth lengths available at the Cascade General yard are between 780 feet and 3,900 feet.[96] The Port of Seattle has the Todd Pacific Shipyard and it occupies a 46-acre site and has multiple berths ranging from 590 feet through 1,400 feet.[97]

Finally, marine industrially uses include facilities to preserve marine safety. In Portland, the Coast Guard marine safety site is located on an eight-acre site in the Swan Island area, and has two berths, one is 175 feet and the other is 330 feet.[98] Other federal government presence occupying river frontage is that of the Army Corp of Engineers dredging base, which is located at the Port of Portland Terminal 2.

4.4.2 Marine-Dependent Manufacturing

There are a number of manufacturing firms that require deep water access to perform business operations. Some examples of this are barge manufacturing, recyclers, and steel product manufacturing. For example, Oregon Steel Mills previously used its docking facilities to unload material, but recently began using

Terminal 6 for receiving. Schnitzer Steel disassembles machinery and other metal fabrication to send to Asia on barges for recycling into new metal components.[99] Schnitzer Steel is approximately 150 acres in size and has three berths with lengths between 600 and 700 feet, while Oregon Steel Mills is 170 acres in size and has 994 feet of berth space.[100] The Schnitzer Steel sites in the Port of Oakland and in the Port of Tacoma are 30 and 20 acres, respectively.[101] The Port of Oakland facilities have three berths sized at 500 feet, 700 feet, and 875 feet.[102]

Marine barges are typically larger than those that travel within the Columbia-Snake River system and are built to deal with rough seas. A typical marine barge can be 300 feet or larger.[103] Portland Harbor is the home of multiple marine barge manufactures including Gunderson and Zidell. These firms use deep water access to ship finished barges to clients. Zidell Marine Corporation builds marine barges up to 90 feet wide and up to 900 feet long.[104] The Zidell shipyard is located near the Ross Island Bridge, further upstream than the Steel Bridge. Gunderson is located on approximately 70 acres near Terminal 2.

4.5 SITE CONSTRAINTS

Two significant constraints to marine-related development in Portland Harbor frequently cited in recent studies are the sensitive natural resources and the environmental contamination that are frequently in riverfront areas. This section provides an overview of the constraints to marine-related development when these features are present.

4.5.1 Environmental Contamination Constraints

This section describes how upland contamination and Superfund contamination affects the suitability of sites for marine industrial development.

4.5.1.1 Brownfields

A brownfield is a site where environmental contamination or the possibility of contamination is preventing that property's redevelopment.[105] The Oregon Department of Environmental Quality tracks upland contamination, both from potentially leaking underground storage tanks and from other sources. Several studies on Portland Harbor have included interviews of local industrial land users about brownfield development.[106] These studies have found that industry representatives view the costs and the long term liability of these sites as a major constraint. Most of the industry representatives were interested in brownfield development, but were concerned about liability and financing of brownfield site purchase. Many people interviewed stated that brownfield development requires appropriate financial incentives and limited liability.

106 Working Harbors Reinvestment Strategy. April 18, 2008. Website (http://www.portlandonline.com/bps/index.cfm?c=42598) accessed January 6, 2010. Portland Bureau of Planning. 2003. Portland Harbor Industrial Lands Study Part One: Inventories, Trends and Geographic Context. Davis and Hibbitts. 1998. Report on Industrial Lands Focus Groups.

The primary constraint associated with purchase or lease of a brownfield site is the clean up cost and potential liability for past contamination. **Table 4-2** below illustrates a recent case study comparing the costs of developing a brownfield site to that of developing a greenfield site. The study compared high tech manufacturing, industrial parks, warehouse distribution and general manufacturing business development on both brownfields and greenfields within the Portland area. In every situation the costs of redeveloping a brownfield for a new business venture exceeded the costs of developing a new greenfield site.

Table 4-2 Case Study of Brownfield Development verses Greenfield Development

Characteristics and Costs	High Tech Manufacturer		Industrial Park		Warehouse Distribution		General Manufacturing	
	City of Portland		City of Tualatin		City of Portland		Clackamas County	
	Brownfield	Greenfield	Brownfield	Greenfield	Brownfield	Greenfield	Brownfield	Greenfield
Acreage	37.95	53.20	45.50	44.50	37.95	25.91	37.75	37.95
Building size			630000	630000	400,000	400,000	450,000	450,000

Source: Port of Portland, Portland Development Commission, City of Portland, METRO, December 2004, Brownfield/Greenfield Development Cost Comparison Study. Prepared by the Mackenzie Group.

4.5.1.2 Superfund

Vacant lands in Portland Harbor are not only potential brownfields with upland contamination, but they also lie adjacent to the Portland Harbor Superfund site. Starting in 2000, a six mile section of the Willamette River, the actual water body, was added to the Superfund site list. A Superfund site is an uncontrolled or abandoned place where hazardous waste is located, possibly affecting local ecosystems or people.[107] Currently, the lower 10 miles of the Willamette River from the Columbia Slough to the Fremont Bridge are within the Portland Harbor Superfund area.

4.5.2 Natural Resource Constraints

Lands bordering the Willamette and Columbia Rivers that may be appropriate for marine industrial uses often contain significant natural resources. Many of these natural resources are regulated by federal, state, regional and local agencies and those regulations can constrain development opportunities. In particular, site design to

[107] EPA. Superfund. Website (http://www.epa.gov/superfund/sites/) accessed January 6, 2010.

avoid impacts on natural resources can increase the cost of development or the amount of land required. Likewise, mitigation for impacts to natural resources may also increase the cost of development and land requirements. Development on sites located along the Columbia River will have to obtain multiple permits under various local, state, regional and federal regulations; however, some sites, due to the type and characteristics of the natural resources, may be more constrained than others.

Over the past 20 years, the City of Portland has identified specific significant natural resources within the city limits and applied overlay zones that require development to generally avoid and minimize impacts to natural resources and to mitigate unavoidable impacts. There are three types of environmental overlay zones in the Portland: protection (p-zone), conservation (c-zone), and river environmental (e-zone). These require protection of "some resources and function values that have been identified by the City as providing benefits to the public".[108] The p-zone provides the highest level of protection, and development will only be approved in this zone for a narrow set of circumstances (e.g., access). Within the c-zone, development is allowed but must avoid and minimize impacts to natural resources to the maximum extent practicable and mitigate unavoidable impacts. Regulations apply not only to development, but also to land divisions and property line adjustments, removal of native vegetation, planting of non-native vegetation, enhancement of resources, or changing of topography through grading, excavating or filling.

In the River Plan/North Reach, a new river environmental overlay (e-zone) is proposed. The e-zone applies in high and medium ranked riparian resource areas. The e-zone is similar to the c-zone, in that it requires avoiding, minimizing, and mitigating impacts, but the e-zone contains specific exemptions and standards for marine industrial development. Regulations that would apply to every proposal include a 50-foot setback for all non river-related/dependent development, enhancement requirements, balanced cut and fill, erosion control, and storm water management. [109]

Other regulations that apply to development along and within the rivers include: Federal Emergency Management Agency (FEMA), Endangered Species Act (ESA), Rivers and Harbors Act, and the Oregon Removal-Fill Law and Clean Water Act (CWA). Under FEMA, development must occur on elevations above the 100-year floodplain. For elevations below this level, fill is required, which must be offset by equivalent cut elsewhere. This cut and fill requirement thus increases costs of development within the 100-year floodplain. Under the federal ESA, federal agencies must ensure that their actions, including any actions they authorize, do not jeopardize listed species or adversely affect their critical habitat. If the project design and implementation plan are deemed adequate, applicants would need permits from state and federal agencies that may include conditions to avoid, minimize, or mitigate expected impacts of the proposed project.

Section 10 of the Rivers and Harbors Act of 1899 also regulates all activities in or over navigable waters of the United States, which extends to the 'ordinary high water mark' or the high tide line. All activities must be permitted that may affect the course, location, condition, or capacity of navigable waters. The Oregon Removal-Fill Law and Section 404 of the federal CWA protect waterways and wetlands in the State of Oregon by regulating the discharge of dredged and fill material into waters of the United States, including wetlands. Finally, the CWA sets standards for point sources of water pollution.

4.6 SUMMARY OF SITE SUITABILITY AND CONSTRAINTS

Marine-related uses share similar site requirements, including 1) zoning (industrial), 2) flat and contiguous lands with shoreline access of 400 feet or more, and 3) proximity to multimodal infrastructure (water, truck, and rail). Differences arise in acreage and water depth requirements, with marine cargo uses typically

[108] Portland Bureau of Development Services. 2007. Title 33, Planning and Zoning Chapter 33.430, Environmental Zones. Accessed online at: http://www.portlandonline.com/bds/index.cfm?c=43093.

[109] Industrial Development and Natural Resources Integration Task Group, March 20, 2008, Meeting #10.

requiring more acreage and deeper water. Specifically, marine cargo facilities are usually sized at 50 acres or more (with the exception of local/regional dry bulk and liquid facilities that can be as small as five acres) and require a minimum draft depth of 35 feet. Marine industrial uses vary considerably in their site size requirements, but are typically at least five acres in size and can be as large as several hundred acres. A draft depth of 20 to 30 feet is required for most marine industrial uses.

Regarding site limitations, marine cargo and marine industrial uses alike face constraints related to sensitive natural resources and brownfield contamination. The presence of either can limit site usage or increase site acreage requirements for mitigation, and increase site development costs.

Table 4-3 summarizes the site characteristics of each marine-related use described above. **Table 4-3** is not an exhaustive analysis of specific businesses that fall into marine cargo and marine industrial classifications. Rather, the intended purpose of **Table 4-3** is to summarize general characteristics and potential requirements of marine cargo and marine industrial sites, based upon representative businesses in Portland Harbor as well as in other west coast ports.

In general, the table indicates that cargo facilities require sites that are typically 50 acres or larger, with the exception of local/regional dry bulk and liquid bulk facilities that may be much smaller. It is important to note that while many existing grain facilities are relatively small, industry trends show that newer facilities are larger to accommodate larger vessels and longer unit trains (to ensure competitive railroad rates). Many of the acreage sizes indicated in **Table 4-3** indicate the core terminal operation footprint, which excludes the rail infrastructure and ancillary structures and operations. Furthermore, the site sizes in **Table 4-3** do not include any acreage required for onsite mitigation or environmental protection. Total acreage, including rail infrastructure and support operations, for new marine cargo facilities handling containers, automobiles, national/international dry bulks, and grain are typically 100 acres or more.

All cargo facilities require minimum draft depths of 35 feet, with a deeper draft more suitable for many cargo types. Berth lengths of most cargo facilities are at least 550 feet, with many larger than 1,000 feet. As noted above, these lengths do not include dolphins, which extend the shoreline length for mooring vessels. This emphasizes the need for sites with at least 400 feet of shoreline length.

Marine industrial sites vary significantly in their requirements, both in terms of acreage, berth length, and channel depth. However with the exception of some vessel-related services, most marine industrial sites require at least a 20-foot draft and a five acre site. Nearly all marine industrial uses require a site with at least 400 feet of riverfront to accommodate a berth, and nearly all require access to rail and truck routes.

Table 4-3 Summary of Site Characteristics for Marine-Related Land Uses

	Acreage Approximation		Water Frontage Approximation		Berth Depth Requirement within 150' of Shore[110]	Rail Infrastructure Requirements
Site Type	Portland Harbor	Other West Coast Harbors	Portland Harbor	West Coast Ports		
Cargo						
Automobile	75 - 120	95 - 168	414' - 1,000	1,040' – 1,300'	35' or greater	Rail Ramp & Nearsite Rail Yard (5+ acres)
Container	193	50 - 385	Total of 2,850' (3 berths)	1,100' – 6,380'	40' or greater	Intermodal Yard (Onsite or Nearby Rail Yard) & Mainline Access
Breakbulk	20 - 50	15 - 75	2005' (2 berths)	600' – 1,750	35' or greater	Nearby Rail Yard & Mainline Access

Inventory of Portland Harbor Sites for Marine-Related Uses

Following a brief overview of current land use in Portland Harbor, this section provides an inventory of vacant, waterfront lands in the industrial districts in Portland. The lands inventoried for this study are located along the Willamette River downstream of the Fremont Bridge and eastward along the Columbia River to Interstate 5. The purpose of the section is to provide an understanding of the available supply of industrial waterfront land in Portland Harbor, and the characteristics of the land supply relative to the site suitability requirements for marine-related uses outlined in **Section 4**. The section concludes with a comparison of site characteristics required for marine-related uses versus the characteristics of the available waterfront lands in Portland. The focus is an inventory of lands in Portland Harbor; **Section 6** includes an overview assessment of the availability of industrial lands suitable for marine-related uses in other ports on the Lower Columbia River.

5.1 OVERVIEW OF DATA SOURCES AND KEY ASSUMPTIONS

The primary data sources for this section are the GIS and site inventory data from the Economic Opportunities Analysis completed in 2009 for the City of Portland that identifies the vacant land inventory in the City and the level of availability of these lands based on site constraints. Additional data sources include GIS data on designated truck routes from the City of Portland Freight Master Plan and GIS data on Willamette River depths from the Lower Willamette Group. A key assumption in the analysis is that future site requirements will be similar to existing site requirements.

5.2 CURRENT PORTLAND HARBOR LAND USE

The industrial districts in Portland Harbor downstream of the Steel Bridge cover 5,932 acres of land in tax lots.[111] This land encompasses river-dependent marine industrial and marine cargo activities and facilities, as well as rail-dependent uses that are not directly dependent on water access but that utilize the intermodal transportation facilities available in the Harbor area. Land use in Portland Harbor was categorized as river-dependent and/or rail-dependent by the City of Portland for the Working Harbor Reinvestment Strategy. Data from the City indicates that approximately one-third of all employers (33 percent) and jobs (31 percent) in the Portland Harbor are river-dependent, with approximately 1,790 acres in river-dependent uses in 2004.[112]

5.3 INVENTORY OF AVAILABLE LANDS FOR MARINE-RELATED USES

In 2009, the Economic Opportunity Analysis (EOA) completed for the City of Portland inventoried the industrial and commercial lands available for development throughout the City.[113] This analysis classifies

[111] Portland Bureau of Planning. 2003, Portland Harbor Industrial Lands Study Part One: Inventories, Trends and Geographic Context.

[112] Oregon Employment Division, 2008 as provided by Metro.; WH_taxlots010610: Multnomah County Assessment & Taxation(2010), as provided by City of Portland, Bureau of Planning & Sustainability; wkhrbr_Rail_User_sites datasets: City of Portland, Bureau of Planning, 2006; WH_sites_2004Atlas.shp: Prepared by City of Portland Bureau of Planning & Portland Development Commission.

[113] E.D. Hovee and Company, 2009, City of Portland Economic Opportunities Analysis: Task 2/3 – Supply and Demand, Prepared for the City of Portland Bureau of Planning and Sustainability.

lands based on their level of vacancy as well as the constraints on these sites due to the City of Portland's environmental overlay zoning and/or potential contamination. Vacancy is defined based on the proportion of the site that is vacant. Sites over 90 percent vacant are classified as vacant, while sites that are less than 90 percent vacant are classified as partially vacant. All vacant or partially vacant parcels larger than 0.5 acres are included in the analysis.

The EOA study estimated the vacant industrial and commercial land supply in the City of Portland at approximately 3,000 acres, of which 1,910 acres are located in the Columbia Harbor area (which is a geography broader than the Portland Harbor area, and includes lands along the Willamette River downstream of the Fremont Bridge and eastward along the Columbia River to 82nd street). The EOA data classifies industrial, employment, and commercial lands into five tiers depending on the proportion vacant, environmental protection constraints based on City of Portland environmental zoning, and potential contamination. Of the 1,910 acres of available land in the Columbia Harbor area, nearly half (46 percent, or 877 acres) were classified as potential brownfields based on data from the Oregon Department of Environmental Quality (DEQ). As indicated in **Table 5-1**, 21 percent of available land (396 acres) is over 90 percent vacant and has no environmental zoning constraints, while another 4 percent (80 acres) is partially vacant land that has no environmental zoning constraints. The remaining 29 percent of vacant lands (391 acres that are over 90 percent vacant, plus 167 acres that are partially vacant) have some environmental zoning constraints.

Table 5-1 EOA Classification of Available, Vacant Lands in the Columbia Harbor Area

Parcel Classification	Acreage	Proportion of Available Acreage
Over 90% Vacant, No Environmental Zoning Constraints	396	21%
Over 90% Vacant, Environmental Zoning Constraints	391	21%
Partially Vacant, No Environmental Zoning Constraints	80	4%
Partially Vacant, Environmental Zoning Constraints	167	9%
Vacant, Potential Brownfield	877	46%
Total	1,910	100%

Source: E.D. Hovee and Company, LLC, 2009, Economic Opportunities Analysis Task 2/3 – Supply and Demand.

The EOA dataset includes all lands classified as vacant (including vacant and partially vacant) by the City of Portland as of January, 2009. As marine-related uses require waterfront access, a small subset of the Columbia Harbor lands analyzed in the EOA were identified and assessed for this study. In this analysis of lands available for marine-related uses, the focus is industrial lands bordering the Willamette or Columbia Rivers in the Portland Harbor. Of all vacant industrial lands identified in the EOA, only 35 sites in the Columbia Harbor geography are adjacent to the waterfront in the Portland Harbor.[114]

Of these 35 waterfront sites, 33 are evaluated in this analysis. Two larger parcels, the 41-acre McCormick and Baxter site and the 28-acre Triangle Park site, which are adjacent sites located to the northwest of the University of Portland (Sites 13 and 15 on **Map 5-1**, both indicated with hatch marks), are not anticipated to be available for industrial development due to zoning and expected use for expansion by University of Portland.[115] The Triangle Park site is owned by the University of Portland,

[114] The EOA data on vacancy is by tax lot. Often, adjacent tax lots with the same owner are included in one site (Based on spatial data from WH_sites_2004Atlas.shp: Prepared by City of Portland Bureau of Planning & Portland Development Commission by aggregating taxlots with coincident ownership). Each site, as defined by the Working Harbor Atlas data, may be larger than the sum of vacant tax lots as some of the tax lots on a site may be occupied. To assess vacant site size, this analysis only includes the acreage in vacant tax lots in each site.

[115] As identified in the City's 2001 Site Reuse Assessment Report for the McCormick and Baxter site, the redevelopment costs contamination liability, property encumbrances, and infrastructure requirements exceed market value for industrial uses. Additionally, site access to both sites is limited to streets used for residential access. Truck transportation from an industrial site would negatively impact local neighborhoods. Based on these considerations, the City in 2001 recommended that the McCormick and Baxter site be utilized for recreational purposes.

LUBA No. 2020-009
Page 6899

and is intended for use as athletic fields and a waterfront trail based on settlements between EPA, University of Portland, and the previous owner, Triangle Park LLC.[116] The McCormick and Baxter site is also intended for recreational uses based on the City of Portland's Site Use Assessment Report conducted in 2001, and the University of Portland has shown interest in acquiring this site as well.[117] These properties are removed from consideration (and highlighted in black in the **Table 5-2** below), leaving 33 vacant, waterfront sites. All of these 33 sites are zoned for industrial use.

Sites 13 and 15 highlighted in black are not available for industrial development based on expected recreational land use.Nearly all of the 33 vacant sites are located in Portland Harbor, but a few are located in the Rivergate industrial district with access to the Columbia River (for simplicity, hereafter all 33 sites will be referred to as Portland Harbor sites). To assess suitability for specific marine-related uses, these sites were further assessed based on the suitability characteristics identified in Section 4: size, access to infrastructure (rail, truck routes, and pipelines), waterfront characteristics (channel depth and shoreline length), natural resource constraints, and contamination.

The suitability of the 33 available sites for marine-related use is assessed below using the spatial dataset developed for the EOA as well as supplemental information on transportation infrastructure, channel depth, and waterfront access. Site characteristics related to size, ownership, waterfront access, proximity to infrastructure, environmental zoning constraints, and brownfield development constraints are summarized below.

5.3.1 Site Size

Based on the EOA data, there are 33 sites of vacant, waterfront land in Portland Harbor.[118] As indicated in **Map 5-1**, there are a few vacant waterfront sites that are located close to each other that could potentially be aggregated into larger sites.[119] Several were identified that could be aggregated to existing sites, these include two sites (Sites 18 and 19) that could be aggregated to the Port of Portland's Terminal 4. One of these sites (Site 19) is already owned by the Port, while the other site is currently owned by Langley St. Johns LLC (Site 18) and could potentially also be aggregated to Terminal 4.[120] Together, these two sites represent 14 acres of vacant property. Two other sites with aggregation potential for the Port of Portland include the Time Oil site (Site 29) and a property owned by Schnitzer Investment Corporation (Site 27), which together represent nearly 52 acres. Henceforth in this analysis, these sites remain aggregated into two sites of 14 and 52 acres (rather than 4 individual sites) such that the analysis considers 31 sites.

One other site with aggregation potential is the Linnton Plywood site (Site 20), which may potentially be acquired by Arco/BP and aggregated with its adjacent, existing terminal operation located to the south. As this site would be aggregated to a developed site, rather than aggregated with another vacant site, it was not aggregated for the purposes of this analysis.

On the 31 vacant waterfront sites in Portland Harbor, there are a total of 300 acres. The average site size is approximately 10 acres. However, 65 percent of all sites are less than 5 acres in size, less than the minimum typically required for marine-related uses. Ten sites (31 percent) are larger than 10 acres, and three sites (nine percent) are larger than 30 acres. No sites are larger than 60 acres, which is less than the size suitable for most marine cargo uses as described in **Section 4**.

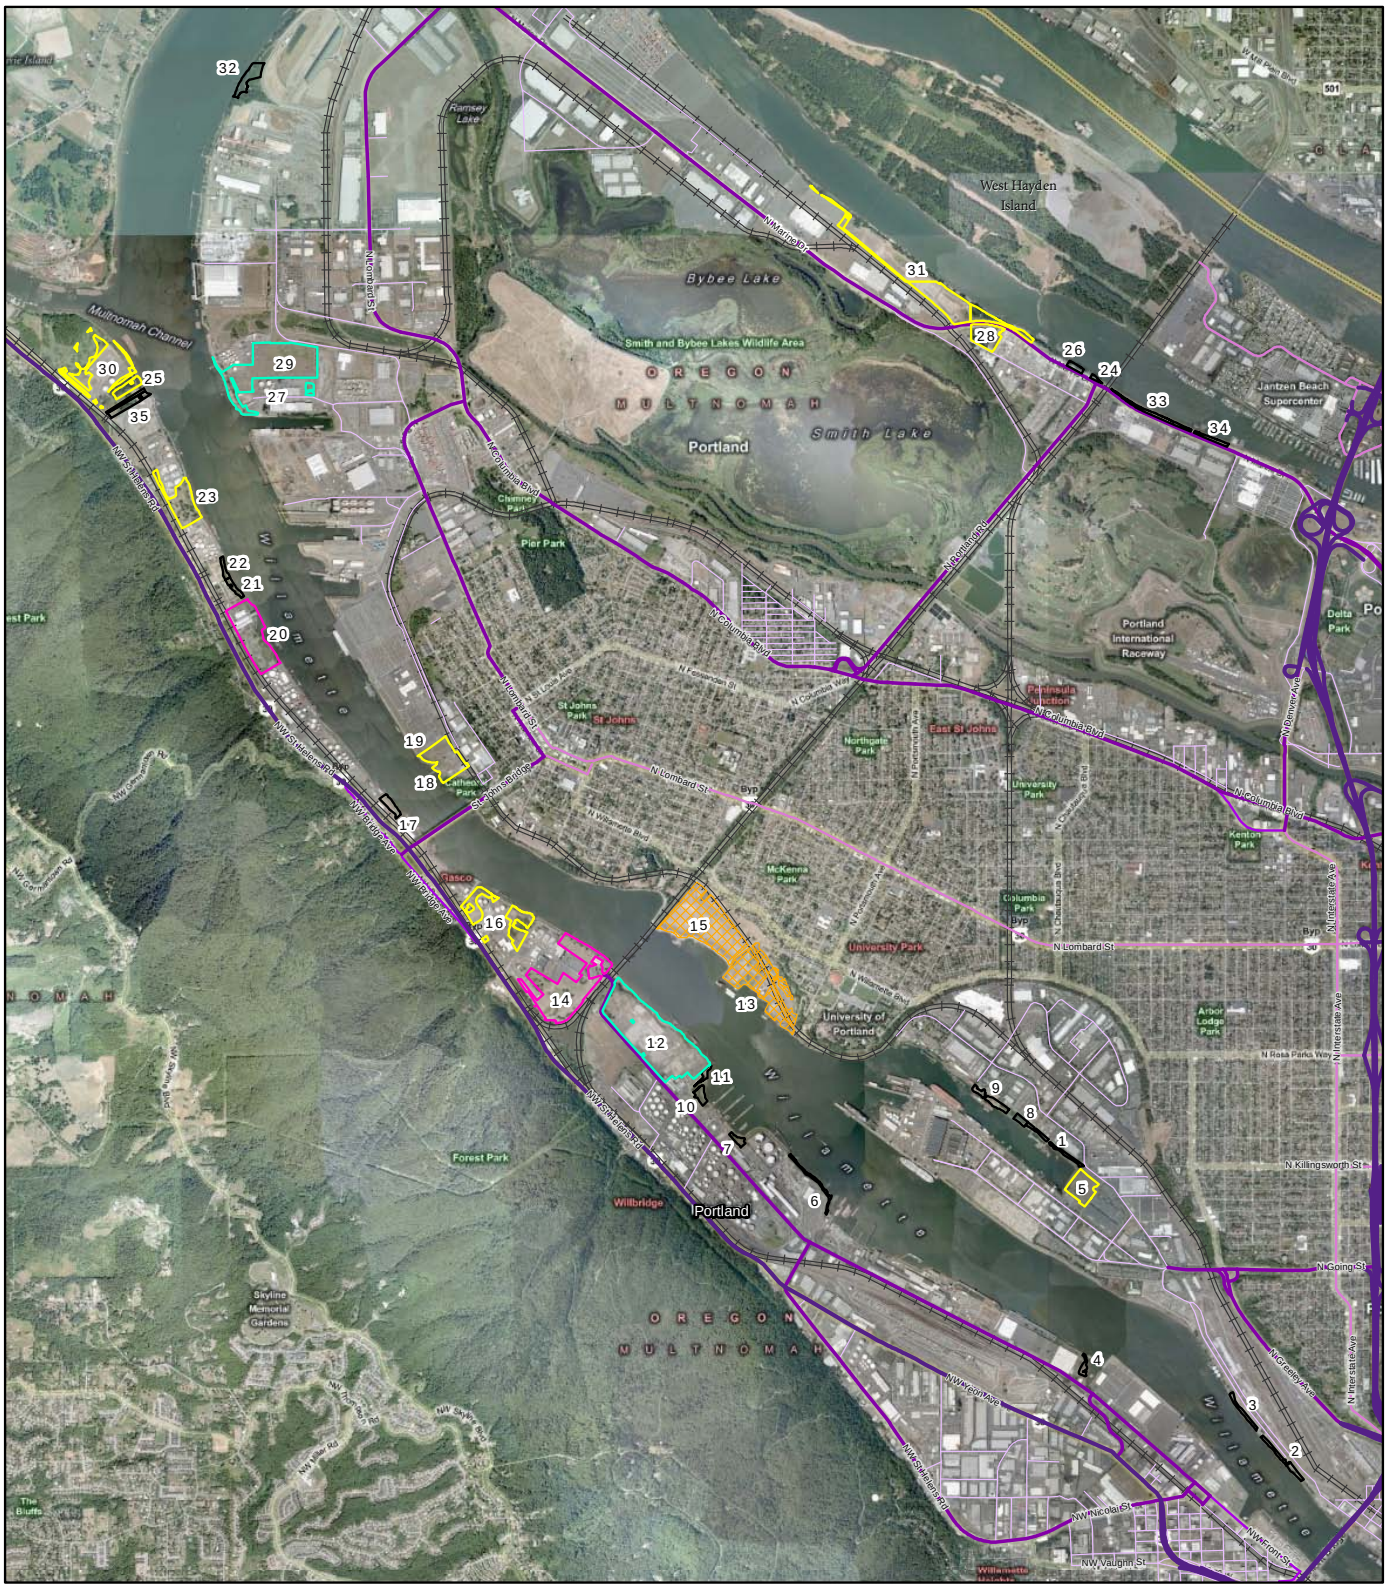

Figure 5-1 presents the size distribution of the 31 sites of vacant, waterfront industrial lands in Portland Harbor. **Table 5-3** presents summary statistics for each size category. **Map 5-1** provides an overview of the location and size of these sites.

[118] Note that the there are 39 tax lot parcels in the EOA data that are vacant and located on the waterfront. These tax parcels, and adjoining vacant tax parcels with common ownership as indicated by the site number from the working harbor GIS dataset, were joined together to form 33 sites.

Source: Economic Opportunities Analysis Data prepared by Real Urban Geographics, ENTRIX analysis. Ownership

Ownership is also a factor for some marine-related users, and indicates whether a site would be available for sale or lease. During interviews, several Portland Harbor businesses stated that it is often more desirable to own a site, rather than lease from the port or another entity. The inventory of lands in Portland Harbor indicates that most vacant areas are owned by the private sector. A few smaller parcels are owned by the Port, the City (Bureau of Environmental Services), Utilities (Portland General Electric), or Railroads.

5.3.2 Waterfront Characteristics

The length of the waterfront and the depth of the adjacent channel are important characteristics for marine-related development. As identified in **Section 4**, waterfront of 400 feet is required for most marine-related uses, while water draft depth of at least 35 feet is required for most marine cargo uses while a draft depth of at least 20 feet is required for most barge uses.

The federal navigation channel on the Columbia River extends 11.6 miles into the Willamette River to the Broadway Bridge in Portland. The Willamette River is routinely dredged, but the last channel deepening

was in 1997. Historically, the Army Corps of Engineers has dredged 500,000 to 700,000 cubic yards of sediment from the lower Willamette navigation channel every three to five years. Other than an interim dredging action to address one site (Post Office Bar), the Army Corps has suspended dredging operations pending the outcome of the Portland Harbor Superfund cleanup. The lack of maintenance dredging over the last 13 years has resulted in shoaling of the channel, with many areas of the channel less than 40 feet deep.[121] Based on the uncertainty associated with dredging of the lower Willamette River, this analysis presents the current draft depth near vacant, waterfront areas. It is important to note however, that the channel depth at these sites could be deepened in the future, thereby increasing site suitability from a channel depth perspective.

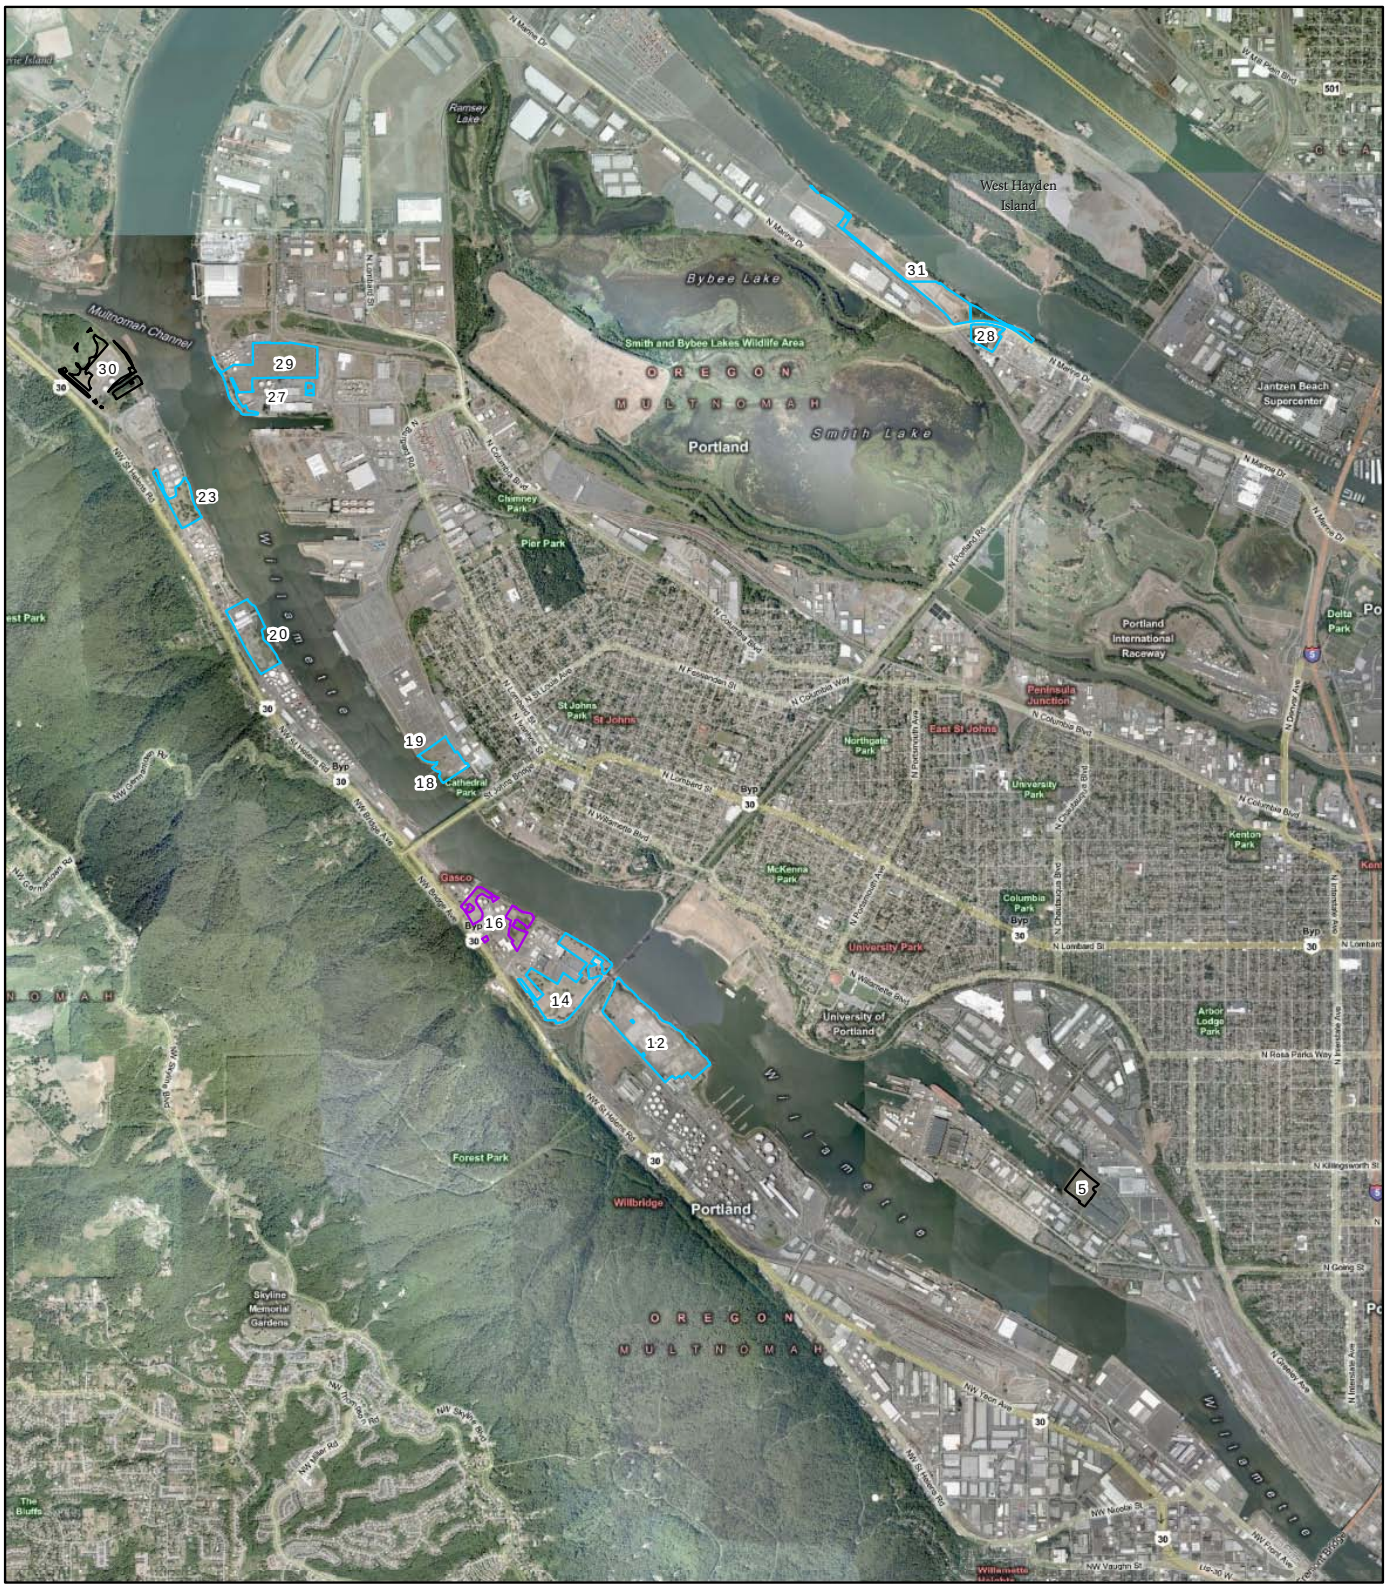

Table 5-4 summarizes channel depth and waterfront length for the 31 vacant waterfront sites. As indicated in the table, six sites have river frontage of less than 400 feet and are smaller than 5 acres in size, rendering them unsuitable for most marine industrial uses. An additional seven sites do not have access to channel depth of 20 feet within 150 feet of shore, but future dredging could remedy this shortfall. Currently, only two vacant sites have deep draft depth of 35 feet suitable for marine terminal use (one site is 2.3 acres in size while the other is 13.5 acres). **Map 5-2** presents the 11 sites indicated in the shaded area of the table that are larger than five acres and have water frontage greater than 400 feet. Of these 11 sites, nine sites currently have channel depth of 20 feet or more suitable for barge access.

Table 5-4 River Access at Vacant, Waterfront Areas (Channel Depth Measured at 150 feet from Shore)

Acreage Classification	Deep Draft Depth (Channel Depth > 35 feet River Length > 400 feet)	Barge Depth (Channel Depth > 20 feet River Length > 400 feet)	Depth Constraint (Channel Depth < 20 feet, Shoreline > 400 feet)	Shoreline Constraint (Shoreline < 400 feet))

5.3.3 Proximity to Infrastructure

As noted in **Section 4**, proximity to intermodal transportation infrastructure is important for nearly all marine-related uses. All 31 sites in the harbor area provide good access to multi-modal transportation facilities. As noted throughout this analysis, access to intermodal transportation is a primary reason that many businesses locate in the harbor area. All of the sites identified as waterfront, vacant lands are located near a truck route and a rail line access point. In general, sites on the east side of the Willamette River are better served by rail, as they are closer to the mainline Class I rail roads running south-north and east-west from Portland.

Nearby access to freight truck routes is important for both marine cargo and marine industrial facilities. High truck volumes and tractor-trailer activity characterize industrial-serving freight movement, so efficient access to regional/interstate freight movement corridors is required. The Freight Master Plan developed by the City of Portland Office of Transportation has classified a hierarchy of five types of truck routes in Portland. As defined in the Freight Master Plan, these are:

- **Regional Truckway.** Routes for interregional and interstate movement of freight. Serves both industrial and commercial land uses via access ramps.
- **Priority Truck Street**. Principal route for truck mobility in Freight Districts, and between Freight Districts, and Regional Truckways. Provides truck access and circulation to industrial and employment land uses.
- **Major Truck Street**. Principal route for truck mobility between commercial centers and corridors. Provides truck access and circulation to regional main streets.
- **Truck Access Street.** Route for distribution of truck trips in neighborhoods. Provides truck access and circulation for delivery of goods and services to commercial and residential uses.
- **Local Truck Street.** Routes for local truck access and circulation to residents and businesses outside of the freight districts.

As illustrated in **Map 5-1**, all 31 sites in Portland Harbor have access to a priority truck street that leads to Interstate-5, which is a regional truckway. This access as well as the proximity to Interstate-5 varies by site. Sites on the east side of the Willamette River have better access to Interstate-5, and thus are preferred for those uses that rely heavily on truck transportation. Furthermore, some sites are constrained by the local level of congestion and ease of site ingress and egress. For example the Siltronic site (Site 14) has access issues, both with limited road capacity as it is at the end of a dead end road and upon exiting the site all traffic must flow back to Kittridge through the tank farms to reach Highway 30. This site of employee access constraint currently affects all westside waterfront locations, although options have been considered to construct an overcrossing to increase access to these sites.

In addition to road and rail connections, liquid bulk facilities that handle petroleum typically require access to the Olympic Pipeline which crosses the Multnomah Channel and then runs southward along the western shore of the Willamette River in the Northwest industrial district. Fifteen of the 31 vacant areas are located here, and as such are expected to have access to this pipeline. As indicated in **Table 5-5**, size of these vacant areas located near the pipeline ranges from 59 acres to just over one acre, with most sites sized less than five acres. As indicated in the shaded area of the table, six sites proximate to the Olympic pipeline are larger than 10 acres and have shoreline of at least 400 feet. One of these sites, with site size of 13.5 acres, currently has a draft depth of 35 feet that may be able to accommodate liquid bulk cargo vessels.

Table 5-5 Vacant, Waterfront Areas with Pipeline and Appropriate Shoreline Access

Acreage Classification	Number of Sites	Number of Sites with Shoreline > 400 feet
< 5 acres	9	6
10 to 20 acres	3	3
20 to 30 acres	1	1
30 to 40 acres	1	1
50 to 60 acres	1	1
Total	15	12

Source: Economic Opportunities Analysis Data prepared by Real Urban Geographics, Lower Willamette Group GIS data, ENTRIX analysis.

5.3.4 Natural Resource Constraints

As noted in **Section 4**, there are numerous types of requirements for proposed development in areas with significant natural resources and/or are located in the floodplain, which can affect the costs and required acreage for development. Analogous with the EOA study, this analysis utilizes the environmental overlay zoning by the City of Portland combined with mapping of the 100-year floodplain as an indicator of the level of natural resource constraint on development (although it is recognized that these are not the only regulations that may constrain the use of these sites). It is important to note that the City of Portland's environmental overlay zones do not prohibit development on these lands, but rather can affect the cost of development. The level of natural resource constraint is one factor among many that may affect where industrial development may occur. Every site on the river has some form of constraint, and all sites have to undergo multiple permits under various local, state and federal regulations to place development on, or near the river. Therefore, no available sites are removed from consideration due to natural resource constraints.

All vacant, waterfront sites are affected by at least one natural resource constraint. In fact, of the 300 acres of vacant, waterfront lands, over half (170 acres) are affected by some level of natural resource constraint. Sixteen sites are constrained on 90 percent or more of the site, while another five sites are constrained on 75 percent or more of the site. **Table 5-6** indicates that there are only four sites that are constrained on less than 50 percent of their area.

Table 5-6 Site Area Affected by Natural Resource Constraints

Acreage Classification	90% Constrained	75% to 90% Constrained	50% to 75% Constrained	25% to 50% Constrained	Less than 25% Constrained

5.3.5 Portland Harbor Superfund

As noted in **Section 4** the Willamette River in Portland Harbor has been identified by the Environmental Protection Agency (EPA) as a Superfund site. According to the EPA, "more than a century of historical

LUBA No. 2020-009
Page 6909

industrial use has resulted in Willamette River sediments being contaminated with many hazardous substances, such as heavy metals, polychlorinated biphenyls (PCBs), polynuclear aromatic hydrocarbons (PAH), dioxin/furans, and pesticides".[122] This designation affects all waterfront acreage from Columbia Slough to the Fremont Bridge, and presents a difficult challenge to the transfer and lease of all waterfront property in the harbor until a final cleanup plan and allocation of liability is determined. As discussed in the Portland Harbor Industrial Lands Study, many firms are reluctant to invest in riverfront and related sites until Superfund liability is resolved.

The All Appropriate Inquiries (AAI) rule establishes standards for environmental due diligence that will encourage more urban redevelopment by protecting purchasers of sites from liability for past contamination. However, the major unresolved issue with this rule is that the EPA does not review the due diligence performed by the prospective buyer. The Harbor Redevelopment Initiative (Harbor ReDI) is working to ensure that businesses can purchase sites within Portland Harbor and reduce the purchaser's liability to the Superfund site. Harbor ReDI is a multi-agency project that is aimed at developing processes and tools for restoring at least one or more contaminated sites along the Willamette River to productive industrial use with at least one site under development by 2013.[123]

Currently, the Harbor ReDI team is working with a company in the acquisition of a vacant Portland Harbor site and educating this business in the due diligence process to meet the AAI rule. Given that this business meets this AAI rule, it should separate the business's liability from in-river contamination within the water body (EPA authority) from liability for upland contamination (State authority).[124] It is hoped that this purchase will occur in the next nine months and serve as an example that the risk can be mitigated for waterfront sites along Portland Harbor.[125] However, until Superfund liability is resolved, in-water contamination will remain a limitation to redevelopment in Portland Harbor.

5.3.6 Brownfield Contamination and Redevelopment Potential

In addition to the Superfund site, there is upland contamination in the harbor area that is assessed by the Oregon Department of Environmental Quality (DEQ). The DEQ classifies a site as a brownfield if expansion on the property is complicated by actual or perceived environmental contamination. This analysis classifies a site to be a potential brownfield site if it is listed on the Environmental Cleanup Site Information (ECSI) database, the Leaking Underground Storage Tank (LUST) database, or is listed as a Portland Potential Contaminated Unit (PCU).

A site is listed in the ECSI database if there is a known or suspected contamination from a hazardous material. All sites in the ESCI database have documented, suspected, or remediated hazardous substance contamination in the groundwater, surface water, soil, and/or sediment. The DEQ adds sites to the ECSI when DEQ becomes aware of contamination or potential contamination from hazardous substances such as solvents, metals, PCBs, or petroleum hydrocarbons.[126] LUST is a listing of sites with reported releases of petroleum products from regulated underground storage tanks, unregulated underground storage tanks, and home heating oil tanks.

126 Oregon Department of Environmental Quality, Land Quality: Environmental Cleanup site Information (ECSI). Accessed at www.deq.state.or.us/lq/esci/esci.htm.

The DEQ databases do not provide information on the degree of potential upland contamination, but rather the presence of a site in the database indicates that there is potential for contamination to exist at the site. As presented in **Figure 5-2** and **Map 5-3**, 15 of the 31 vacant properties, representing over 250 of the 300 available acres in Portland Harbor, are potential brownfields. For the 16 sites and 50 acres without suspected upland contamination, only one site is larger than 5 acres (Site 31), and it is owned by the Port of Portland.

Source: Economic Opportunities Analysis Data prepared by Real Urban Geographics, ENTRIX analysis.

Figure 5-2 Sites and Acreage of Contamination on Vacant Portland Harbor Sites

While there are very few vacant lands available in the Portland Harbor, particularly of any great size relative to need, liability issues surrounding the acquisition of brownfield sites limits redevelopment. Sites that are least constrained and are the easiest to develop, are typically developed first. However, as noted in the EOA, more constrained sites may be developed as they become the only options available. The EOA forecasts that in the entire Columbia Harbor geography (which includes many upland vacant sites that are not located on Portland Harbor), approximately 20 to 45 percent of sites with suspected brownfield contamination will be available for development by 2035. Assuming this same proportion of land is available for development in Portland Harbor, up to approximately 115 acres of the 270 acres in brownfield sites may be available for development.

5.3.7 Summary of Site Inventory

As has been described in many prior documents (Portland Harbor Industrial Lands Study, Trade Capacity Analysis, Economic Opportunity Analysis), marine industrial land is in short supply in the region. In particular, large sites of 50 acres or more are rare. **Table 5-7** summarizes the characteristics of vacant waterfront sites with waterfront length of 400 feet or more. As indicated in the table, there are only eleven sites that have this access, and only four such sites that are larger than 20 acres. All four of these larger sites are identified as having not only potential Superfund liability, but also upland contamination. All of the sites also have natural resource constraints. The only two sites of 50 acres or larger are the aggregated Schnitzer/Time Oil site (Site 27 and Site 29) and the Atofina Chemicals site (Site 12). The Schnitzer/Time Oil site is 51.7 acres, with natural resource constraints on 74 percent of the property. The Atofina Chemicals site is 59.3 acres, with 9.5 acres constrained by environmental overlay zoning and floodplain restrictions. Both sites are listed in the ECSI database and are also a Portland PCU.

There is only one vacant site larger than 5 acres that is not listed as a potential brownfield due to upland contamination (Site 31). This site is owned by the Port of Portland and is 19.1 acres, and has conservation overlays and floodplain constraints on 7.8 acres.

Table 5-7 Summary of Available Sites Potentially Suitable for Marine-Related Uses

Site Size	Number of Vacant Sites Shoreline > 400 feet	Number of Vacant Sites Shoreline > 400 feet Not a Suspected Brownfield
5 to 10 acres	1	
10 to 20 acres	6	1
20 to 30 acres	1	
30 to 40 acres	1	
50 to 60 acres	2	
Total	11	1

Of the 11 sites potentially suitable for marine-related uses, there are nine sites with access to channel depths of 20 feet or more. One of these sites has access to channel depth of 35 feet or more within 150 feet of shore. This site is 13.5 acres and is owned by Northwest Natural Gas (Site 16, **Map 5-1**). Over half of the site is affected by floodplain and environmental zoning overlay restrictions, and the site is also listed as a PCU.

5.4 POTENTIAL ABSORPTION OF LAND BY NON-INDUSTRIAL USES

The State of Oregon passed legislation in the early 1970s as part of the statewide land use planning program that created urban growth boundaries to try and reduce urban sprawl.[127] In the 1980s the City of Portland created industrial sanctuaries to encourage industrial growth and protect industrial districts from incompatible uses such as housing, high density uses, and high traffic uses. The Willamette Greenway Plan (1987) created this zone, better known as the River Industrial Zone.

This zone limits the use of riverfront lands to river-dependent and river-related industry within Portland Harbor. The Willamette Greenway Plan stipulates that no building, structure, parking lots, or fills are to be

[127] City of Portland, Portland Development Commission. August 16-17, 2007. Portland Industrial Land Sanctuary Area.

located within the setback unless it can be proven to be necessary to the functioning of a river-dependent or river-related use.[128] Uses that are not river dependent or related must obtain a Greenway Goal Exemption.

Industrial sanctuary zoning does not allow housing and limits standalone retail, service, and office uses to 3,000 square feet per site or up to 25,000 square feet per site with a conditional use permit for those businesses serving industrial needs.[129] Due to this zoning, it is expected that there will be limited absorption of land by non-industrial uses in the Portland Harbor. Exceptions may include cases where brownfield or Superfund liability may preclude industrial development, or where other significant site constraints for industrial development apply (such as transportation access for the Triangle Park and McCormick and Baxter sites as discussed above).

5.5 SUMMARY OF LAND AVAILABILITY FOR MARINE USES

Section 4 identified the desired or required site characteristics for each type of marine industrial use. As noted in that section, most marine cargo uses require channel depth of 35 feet or more and sites that are 60 to over 100 acres in size. There are no sites that meet these requirements currently vacant in Portland Harbor. Assuming that future dredging enables deep draft access to all sites, there are still no sites that are large enough to accommodate a new, modern marine cargo facility. The possible exceptions are liquid bulk and local/regional dry bulk facilities that may require a smaller site.

Marine industrial uses and their site size requirements are quite varied. However, it is expected that most marine industrial uses desire sites of at least five acres, draft of 20 feet within 150 feet of shore, and a shoreline length of at least 400 feet. As indicated in **Section 4**, however, many marine industrial uses require large sites of over 100 acres. There are 11 sites in Portland Harbor that are five acres or more with shoreline length of 400 feet, of which nine have depth of 20 feet or more within 150 feet of shore. All but one of these sites are constrained as suspected brownfields. **Table 5-8** summarizes the number of available sites that may be potentially suitable for each type of marine-related use.

Waterfront vacant land suitable for marine cargo and marine industrial use is limited by site size and configuration, natural resource constraints, and contamination. There are 31 sites with 300 acres of vacant, waterfront industrial lands, of which 20 sites are smaller than five acres in size. No vacant sites are larger than 60 acres in size, which precludes development of many marine cargo uses and some marine industrial uses. There are, however, 11 sites larger than five acres that with channel deepening could become appropriate for local/regional market dry bulk or liquid bulk cargo or for marine industrial uses. All but one of these sites is a suspected brownfield, however, which constrains its suitability. Suitability of these sites for each use will depend on use-specific site requirements as well as the tolerance of the user for the potentially large liability associated with the Superfund site and upland brownfield contamination.

[128] Bureau of Planning. November 1987. Willamette Greenway Plan.

Table 5-8 Available, Potentially Suitable Sites by Marine-Related Use

Marine-Related Use	Number of Available, Potentially Suitable Sites	Notes
Cargo		
Automobile	0	No vacant sites large enough to accommodate new automobile terminal and associated infrastructure.
Container	0	No vacant sites large enough to accommodate new container terminal and associated infrastructure.
Breakbulk	0	No vacant sites large enough to accommodate new breakbulk terminal and associated infrastructure.
Dry Bulk (National/International)	0	No vacant sites are large enough to accommodate a new grain or international dry bulk commodity terminal and associated infrastructure.
Liquid Bulk	0-6	There are six sites that are larger than ten acres that are located in the Northwest industrial district proximate to the Olympic pipeline. All of these sites have suspected upland contamination. Only one of these sites (it is 13.5 acres in size and is owned by Northwest Natural Gas) currently has a draft of 35 feet.
Dry Bulk (Regional/Local)	1-11	There are 11 sites in Portland Harbor that are larger than five acres and have shoreline access of 400 feet. Only one of these sites does not have suspected upland contamination, and is owned by the Port of Portland. Only one other site (it is 13.5 acres in size and is owned by Northwest Natural Gas) currently has a draft of 35 feet.
Industrial		
Vessel Related Services	1-11	There are eleven vacant sites larger than five acres in size with adequate riverfront access, of which nine sites have draft depth of 20 feet or more. Only one site does not have potential upland contamination, and is owned by the Port of Portland.
Manufacturing	0 – 11	There are eleven vacant sites larger than five acres in size, and only two sites larger than 50 acres in size. Of these sites, nine sites have draft depth of 20 feet or more. There are no vacant riverfront sites larger than 60 acres in size. All sites larger than 15 acres are affected by upland contamination.

Land Absorption and Needs Forecast

This section concludes the economic foundation study, and provides a forecast of land absorption demand by marine-related uses in Portland Harbor together with a discussion of the potential role of WHI. It draws from all preceding economic sections to evaluate the demand for additional lands for marine uses, and the potential role of WHI to meet this demand. **Section 2** described the history and economic role of the Portland Harbor area and provides the context and trends of land use and absorption by both marine cargo and marine industrial facilities. **Section 3** presented and discussed the specific cargo forecasts and associated employment that may be expected through the end of the planning period in 2040; these forecasts provide the basis for the land absorption forecast presented in this section. Furthermore, the information provided in **Sections 4 and 5** regarding the site requirements for marine-related land uses and the available land supply in Portland Harbor provide the information necessary to determine where and how growth may be accommodated.

The first two subsections forecast the land need for marine-related uses in Portland Harbor, including marine cargo and marine industrial uses. The forecast for marine cargo lands is based on an assessment of current capacity compared to forecast cargo volume. The forecast for marine industrial lands is based on past land absorption trends of marine industrial land combined with an existing forecast of land absorption in the Portland Harbor area. The final subsections focus on the availability of existing lands in Portland Harbor to meet demand compared to the suitability of WHI land and lands available at other ports.

This section focuses on the industrial lands expected to be required to meet the forecasted growth, and does not address the potential tradeoffs associated with these land uses. A discussion of these tradeoffs is provided in the Integrated Summary of the Environmental and Economic Foundation Studies.

6.1 OVERVIEW OF DATA SOURCES AND KEY ASSUMPTIONS

Key data sources for the marine cargo land absorption forecast include the 2010 BST Associates cargo forecasts and capacity assessments for Portland Harbor, as well as interviews with the Port of Portland regarding terminal capacity and future adjustments to terminal operations to meet cargo growth. Data sources for the marine industrial land absorption forecast include the 2009 Economic Opportunities Analysis (EOA) completed for the City of Portland, and the Portland Harbor Industrial Lands Study (PHILS) completed for the City of Portland in 2003.

An important assumption carried over from **Sections 4 and 5** is that future marine-related development in Portland will be similar in size and site requirements to new marine-related developments at other west coast and Lower Columbia ports. Another assumption is that the proportion of land use that is marine industrial will remain fairly constant into the future.

6.2 FORECAST OF LAND NEED FOR MARINE CARGO

Marine cargo land needs are directly related to future cargo volumes. **Table 6-1** summarizes the cargo volumes that could be expected to flow through Portland Harbor facilities by 2040, with the key assumption that there is adequate and efficient marine terminal capacity. These cargo forecasts are drawn from the forecast completed in December 2009 by BST Associates for the Port of Portland, as presented in **Section 3**. For existing cargo categories, three estimates provide (low, most likely, and high) a range of possible cargo

volume. These estimates have been supplemented by BST Associates to indicate the potential volume of cargo in containers and dry bulk if new market opportunities arise for new commodities.[130] For containers, these new markets are expected to be tied to increased intermodal traffic for regional markets, with containers handled in Portland transported to a broader market of the United States via rail. For dry bulk, these new markets would most likely be coal, iron ore, and like bulk materials that are not currently handled in Portland Harbor.

Table 6-1 Forecast Cargo Volumes for Portland Harbor

		Existing Cargo Products			New Cargo Products
Cargo	Units	Low	Most Likely	High	Potential Opportunity
Automobiles	Units	925,000	1,145,000	1,364,000	
Containers	TEU	379,000	520,000	614,000	130,000
Breakbulk	MT	1,010,000	1,181,000	1,295,000	
Grain	MT	5,647,000	6,477,000	7,059,000	
Dry Bulk	MT	6,739,000	8,525,000	9,585,000	3,000,000
National / International	*MT*	*4,650,000*	*6,054,000*	*6,733,000*	*3,000,000*
Local/Regional	*MT*	*2,089,000*	*2,471,000*	*2,852,000*	
Liquid Bulk	1,000 MT	6,912,000	7,571,000	8,011,000	

Source: BST Associates, 2010

6.2.1 Forecast Cargo Volume vs. Existing Capacity

Terminals and facilities handling marine cargo in Portland Harbor are located on both Port of Portland land and privately owned lands. The Port of Portland operates four marine cargo terminals (Terminals 2, 4, 5, and 6). These terminals handle all primary cargo categories. Terminals on private lands primarily handle liquid bulk, local/regional dry bulk, and grain cargoes. Data on capacity at these existing facilities is summarized in **Table 6-2**. The capacity estimated in **Table 2** takes into account that the annual sustainable practical capacity at terminal facilities is typically 75 to 85 percent of a terminal's maximum capacity. This is due to adjustments necessary to accommodate peak flows and seasonal variations in cargo flows, as well as recognizing that due to safety and economic considerations, terminals cannot operate at maximum capacity at all times. This practical capacity is utilized to estimate land needs based on projected cargo growth.

As liquid bulk facilities are often operated on private lands and data is difficult to obtain, the cargo volume versus capacity for this cargo type is not analyzed in the same manner for this cargo. Additionally, the annual growth forecast for liquid bulk, 0.5 percent, is lower than other cargoes, so additional capacity may not be needed for that cargo type.

Table 6-2 Acreage and Annual Cargo Capacity of Existing Terminals in Portland Harbor

Cargo	Capacity in Portland Harbor	Marine Terminal Acreage in Portland Harbor
Automobiles	675,000 Units	314
Containers	700,000 TEU	193
Breakbulk	2,100,000 MT	41
Grain	7,100,000 MT	42 (Public terminals only)
Dry Bulk	10,700,000 MT	188+
National / International	8,200,000 MT	161
Local/Regional	2,500,000 MT	27+[131]
Liquid Bulk	N/A	N/A

Source: BST Associates, 2009 and 2010, Port of Portland Marine Terminal Master Plan, Personal communication with the Port of Portland and BST Associates.
Abbreviations: TEU is twenty-foot equivalent units, MT is metric tons.

Comparing the cargo forecasts in **Table 6-1** with the estimated sustainable practical capacities in Portland Harbor does not represent the complete picture of the ability of existing facilities in Portland Harbor to meet increased demand. First, the capacity estimates in **Table 6-2** represent the likely maximum practical capacity of facilities and terminals in Portland Harbor, but do not reflect the operating constraints at these facilities that may render them uncompetitive in the future. As discussed in Section 4, trends in the marine cargo industry are for larger, more efficient facilities than those that exist in Portland Harbor. This is particularly the case for the grain and dry bulk facilities that may become outdated. Second, the capacities in **Table 6-2** represent the capacity of handling the same type of cargo being currently handled, when in reality future growth may occur in different commodities that may require different facilities and separate terminals.

The capacity for each type of cargo category (**Table 6-2**) compared to the cargo forecasted (**Table 6-1**) is discussed below.

6.2.1.1 Grain

The Port of Portland estimates the capacity of grain terminals in Portland Harbor at 7.1 million metric tons per year (MTPY). The two private grain cargo facilities in Portland Harbor are older facilities that are smaller and less efficient, and may not be able to continue competitively operating into the future.[132] These facilities have a maximum practical capacity of approximately 3.0 million MTPY. If these facilities cease operation, then the potential grain cargo through Portland Harbor may exceed capacity of grain facilities by 2020.

The new Longview grain terminal, which will have an estimated an annual practical capacity of 8 million MT when complete, is larger and more cost competitive than existing Portland Harbor terminals. The Longview terminal is located on over 100 acres and can accommodate four unit-trains, allowing for lower shipping rates from the railroads and more cost competitive overall operations. The new Longview grain terminal has a similar size, throughput capacity, and rail capability as the Kalama Export Company elevator in Kalama, previously the newest export elevator on the Columbia River.

[131] Note that this is the acreage of the JR Simplot marine cargo terminal, which receives both anhydrous ammonia from gas tank ships as well as urea from bulk transport ships and barges. There are other private dry bulk cargo terminals operating in Portland Harbor.

[132] Ports and Marine Inc, Van Sickle Allen & Associates, JWD Group, and HDR Engineering, 2003, Marine Terminal Master Plan 2020, Volume 3: Planning Inputs, Prepared for the Port of Portland. Personal communication with Paul Sorenson with Barbara Wyse on January 15, 2010.

6.2.1.2 Dry Bulk

Dry bulk cargo can be differentiated into two classes based on whether the cargo originates and terminates in a local/regional market or in a national/international market. Local/regional market dry bulks include cement, gypsum, aggregates, steel scrap, and fertilizers. The national/international market dry bulks include minerals, ores, and like products that originate or terminate in the Rocky Mountains, Midwest, or Canada. These national/international cargoes typically move by unit train to/from the Port while local/regional cargoes typically move by truck.

National/international dry bulk cargo is handled at Port of Portland Terminals 4 and 5. Soda ash is exported through Kinder-Morgan's facility at Terminal 4, while potash is exported through the Canpotex facility at Terminal 5. There are smaller, private terminals also operating in Portland Harbor handling the local/regional products such as aggregates and other materials used by the construction industry and agricultural fertilizers. One private terminal, owned and operated by Schnitzer Steel, exports shredded metal scrap in bulk form.

Total annual practical capacity is estimated at 10.7 million MTPY. There is an estimated capacity of 8.2 million MTPY at terminals handling the potash and soda ash national/international cargo, and an estimated 2.5 million MTPY practical maximum capacity at terminals handling local/regional cargo.[133] This compares to a forecasted volume of 4.7 to 9.7 million MTPY of national/international cargo by 2040 and a volume of 2.1 to 2.9 million MTPY of local/regional cargo. As noted above, these cargoes are handled by separate types of terminals and therefore should be evaluated separately.

For the national/international cargoes, volume is forecasted to exceed capacity only in the high forecast scenario in which Portland attracts a new cargo type. In this scenario, demand could exceed capacity as early as 2030. Potential new dry bulk markets include coal, iron ore, or like materials that may add another 3.0 million metric tons in dry bulk volume through Portland if terminal space is available. To attract these new markets, it is expected that additional land would be required for a new terminal. For the local/regional cargoes, volume is similarly forecasted to exceed capacity (by approximately 0.5 million MTPY) only in the high forecast scenario.

6.2.1.3 Automobile

There are three automobile terminals at the Port of Portland, with a combined annual throughput capacity of 675,000 units. There is a 100-acre Toyota facility at Terminal 4, which has a capacity of 250,000 units. Terminal 6 has two separate auto terminals for Honda and Hyundai. Honda has a 60-acre facility with a capacity of 190,000 units, while Hyundai has a 120-acre facility with annual capacity of 235,000 units. Capacity at these terminals is largely dependent on the storage capacity at the terminal as well as the length of time that vehicles stay at the terminal. Thus, suitable intermodal connections that allows efficient transfer of vehicles from the terminal is a key factor affecting capacity.

Actual throughput in 2008 at Port of Portland automobile terminals is estimated at approximately 408,000 units, down from a peak of 464,000 units in 2007.[134] Even under the low forecast scenario, potential total volume of auto imports to the Port of Portland is expected to exceed existing capacity by 2030. However, it is important to note that auto cargo volume may increase not just through increased imports by Toyota, Honda, and Hyundai, but also through other Asian automakers starting import operations in Portland. As multiple automakers do not typically operate at the same terminal, new facilities for other automakers may be required before cargo volumes reach 675,000 units.

[133] Cargo volume peaked in 2007. In that year, it is estimated that the private terminals in Portland handled 2.3 million MT local/regional cargo, and that this volume was near practical maximum capacity. Therefore, maximum practical capacity at these terminals is estimated at 2.5 million MTPY.

[134] BST Associates. 2010. West Hayden Island Marine Cargo Forecasts and Capacity Assessment, Prepared for the Port of Portland.

The date that auto cargo volumes may exceed terminal capacity largely depends on when and whether Portland attracts a new automaker. Attracting a new automaker to Portland would result in a large, sudden increase in auto imports rather than a gradual annual increase. To accommodate a new auto account in Portland Harbor, additional land would likely be required for a new terminal.

6.2.1.4 Container

The Terminal 6 container facility at the Port of Portland has an estimated annual capacity of 700,000 TEUs. Portland currently is not a large intermodal gateway for container imports railed to other parts of the country, but rather serves as a container port for the regional area. Even under the high forecast scenario, container volume for this market area is estimated to reach 614,000 TEUs by 2040. However, if Portland attracts intermodal container traffic destined for more distant markets, an additional 130,000 TEUs may be expected by 2040.[135] In this scenario, container volumes by 2040 could exceed the capacity of Terminal 6 due to constraints at the berth. If container cargo increases to the level forecast in the high scenario, then it is likely that container operations at Terminal 6 would expand into Berth 603, which is currently serving breakbulk. Breakbulk would then either be consolidated at Terminal 2, or would be handled in areas currently serving auto cargo at Terminal 6. This would either reduce the capacity of breakbulk to the 1.1 million MTPY handled at Terminal 2, or reduce the capacity of auto terminals. With the use of Berth 603, the maximum capacity for containers at Terminal 6 would increase to at least 1 million TEUs.

6.2.1.5 Breakbulk

Breakbulk cargoes are primarily handled at Port of Portland's Terminal 2 (capacity 1.1 million MTPY) and Terminal 6 Terminal 6 (capacity 1.0 million). Maximum practical capacity at these terminals is estimated at 2.1 million MTPY. The 2040 forecast for breakbulk volumes in Portland Harbor ranges from 1.0 to 1.3 million MTPY; thus potential cargo volume is not expected to exceed sustainable practical throughput capacity by 2040. However, as noted above, in the high container cargo growth forecast, demand for new container capacity could be met by converting Berth 603 from breakbulk to container use and relocating breakbulk operations either to Terminal 2 or to an area in Terminal 6 presently used by auto cargo.[136] In this case, space for breakbulk would need to be identified, likely at Terminal 6, potentially reducing acreage currently used in auto terminals. If this option were not available, then a new breakbulk facility could potentially be necessary.

6.2.1.6 Liquid Bulk

Liquid bulk facilities in Portland Harbor handle liquid chemicals such as fertilizer, but primarily consist of the petroleum bulk terminals concentrated on the west side of the Willamette River in the Linnton and Willbridge areas. This area has access to the Olympic Pipeline as well as marine, rail, and truck transportation, which are all important modes of transporting petroleum products to Oregon. The throughput capacity of these facilities to handle petroleum products is not known. However, industry interviews indicate that most facilities are fairly built out, with relatively small amounts of land available for expansion. Several operations have invested in infrastructure to increase site efficiency, including constructing pipelines between different companies operating in close proximity. Some operations are looking to expand on their existing properties. In the past, BP/ARCO has sought to purchase and expand their operations on the adjacent Linnton Plywood site, but due to the cost of remediation and potential Superfund liability, has not purchased the site. Though limited, the potential for facilities to expand on their existing acreage combined with the relatively low forecasted liquid cargo volume growth of 0.5 percent annually through 2040 indicates that there is limited

[135] BST Associates. 2010. West Hayden Island Lower Columbia Port Capacity Assessment.

[136] Daly, Jim, Port of Portland. January 20, 2010. personal communication with Barbara Wyse, ENTRIX, Inc..

additional land needed to meet projected liquid bulk cargo growth. Based on the interest shown by BP Arco to purchase the 23-acre Linnton Plywood site, the land demand for petroleum liquid bulk facilities in the energy cluster area of Linnton is estimated at approximately 25 acres.

6.2.1.7 Summary of Capacity vs. Forecasted Cargo Volume

Comparison of forecasted cargo volumes for Portland Harbor by 2040 compared to capacity at existing Portland marine terminal facilities indicates that additional lands will be required for Portland to retain and attract its full potential cargo market share. While there is still capacity for growth in most cargo areas, by 2040 cargo volumes of each type may reach the limits of existing facilities' practical capacity. Automobile cargo terminals are the most constrained, with maximum practical capacity potentially being reached as early as 2020 under the high forecast scenario. Other cargo types particularly limited are grain and dry bulk facilities. Grain is limited by the age and small size (and potential lack of competitiveness) of existing facilities, while growth in new dry bulk markets would be limited by lack of terminal capacity to accommodate a new operator. Finally, growth in container cargo for a broader regional market using intermodal transport may be limited by existing terminal capacity.

Table 6-3 summarizes existing capacity versus forecasted cargo volume. New market opportunities provided in **Table 6-1** are incorporated into the high cargo volume forecast, and one-half of the forecast new market opportunities are incorporated into the "most likely" forecast. The highlighted areas of the table indicate cargo volumes that exceed practical capacity of existing Portland cargo terminals.

Table 6-3 Forecast Cargo Volume versus Annual Cargo Capacity of Existing Terminals in Portland Harbor

			Cargo Forecast by 2040			
Cargo	Units	Practical Maximum Capacity	Low	Most Likely	High	Potential Capacity Shortfall
Automobiles	Units	675,000	925,000	1,145,000	1,364,000	250,000 – 700,000
Containers	TEU	700,000	379,000	585,000	744,000	0 - 50,000
Breakbulk	MT	2,100,000	1,010,000	1,181,000	1,295,000	0
Grain	MT	4,100,000 - 7,100,000	5,647,000	6,477,000	7,059,000	0 – 3,000,000
Dry Bulk National/international	MT	8,200,000	4,650,000	6,054,000	9,733,000	0 – 1,500,000
Dry Bulk Local / Regional	MT	2,500,000	2,089,000	2,471,000	2,852,000	0 – 500,000

The acreage of land potentially needed to accommodate and attract the cargo growth opportunities shaded in grey in **Table 6-3** is explored in the next section.

6.2.2 Marine Cargo Forecasted Land Need

Facility development for marine cargo uses requires long-range planning and flexibility to meet changing market conditions, including development of new markets and change in cargo volumes. To meet growing demand, ports throughout the United States have typically increased throughput capacity by building new terminals requiring new land for development. Ports around the world have also worked to increase efficiency and increase throughput at existing facilities by changing operating standards and implementing such practices as off-site storage and more efficient cargo management systems. While reducing acreage

requirements in marine areas, these practices can substantially increase operating costs and reduce competitiveness of a Port.

To retain and attract marine cargo tenants and customers, the Port of Portland must not only offer facilities that meet long-term operational requirements, but it must offer competitive and economically-efficient facilities. Additionally, to attract new tenants, the Port must be able to demonstrate that it has available facilities and land. Recently, several potential clients (such as the operator of the new grain terminal in Longview) have turned to competing ports due to the lack of large, available sites in Portland Harbor. To attract these clients, the Port likely needs to have land available for development – potentially before the specific client is known. Due to permitting processes, land designated for marine industrial uses has a long lead time to bring it into productive use. This makes it difficult to respond to markets and potential clients in a timely and flexible manner if lands are not available.

Thus, in addition to the marine cargo forecast, there are several important factors to consider when forecasting land needs for marine cargo uses. First, as suggested above, there is a feedback loop in developing new lands for marine cargo uses, as building a terminal can itself generate additional demand from new markets and new clients. Second, land need for marine terminal uses is not a gradual absorption as with most industrial land uses, but rather a sudden large absorption. A new marine terminal and associated facilities (including rail) should be constructed according to projected long-term needs and not just to satisfy short-term needs. Third, new cargo handling facilities are sometimes constructed as strategic, long-term investments by private businesses before demand exceeds capacity. Based on these factors, potential land absorption by marine cargo uses was not forecast for each year or decade, but rather forecast for the duration of the entire planning period to 2040.

A low, most likely, and high acreage need for marine cargo uses by 2040 is forecasted. This forecast is based on the marine terminal and associated infrastructure acreage that would be needed for Portland to capture its potential cargo market share as presented in **Table 6-1**. (**Section 6.4** below evaluates the availability of lands in Portland Harbor and other ports in the Lower Columbia to meet this potential need.)

As indicated in Table 3, under the low cargo forecast, automobiles are the only cargo for which cargo volume exceeds capacity. In this low forecast, potential auto cargo by 2040 exceeds capacity by 250,000 units. Existing auto import facilities at the Port of Portland and other ports have an average capacity of approximately 2,000 vehicles per year per gross acre.[137] These figures indicate that, at a minimum, approximately 150 acres (including rail yard) would be required to provide adequate terminal capacity to meet the forecast shortage of 250,000 units by 2040. This would be the total potential shortage of terminal acreage under the low cargo forecast.

Using the same methodology for the most likely and high cargo forecast scenarios, respectively, land requirements for automobile terminals by 2040 would be 260 and 370 acres. However, it is unlikely that automobile imports will grow at the same rate for each auto manufacturer. There is a need to allow for some automakers to grow faster than others, and therefore allow for the fact that some automakers may need to expand prior to others reaching capacity. Therefore, the total acreage to accommodate forecasted auto cargo growth is slightly increased for the most likely and high scenarios to 300 and 400 acres, respectively.

Under the most likely cargo forecast scenario, additional land would likely be required for automobiles (300 acres as described above) and grain. In the most likely scenario for grain cargo, it is expected that the grain terminals on private lands in Portland Harbor would cease operations during the planning period due to their age and the fact that they are very rail constrained. The grain facility at Terminal 5 will most likely remain

[137] This is slightly more annual throughput capacity per acre than recommended by recent work completed for the Port of Portland by HDR Engineering. This work assumed an annual throughput capacity of 2,000 vehicles per storage acre per year, plus additional space to accommodate terminal operations. This analysis indicated that approximately 125 acres would be required for an annual throughput of 200,000 cars.

competitive as it is a relatively modern elevator served by a major off-terminal railyard at South Rivergate, enabling it to be competitive despite a relatively small terminal footprint. Retirement of the two private grain facilities would result in a shortage of 2 to 3 million MTPY of grain cargo capacity compared to forecasted demand.

The most likely scenario would be that a new, larger grain terminal would replace the two older, private terminals that are rail constrained. These elevators handle wheat and barley but do not handle feed grains (corn and soybeans). New grain facilities are typically 100 or more acres in size and provide sufficient land for four unit trains, similar to the new facility in Longview. A new facility of this size, though necessary to provide the sufficient efficiency, would likely provide more capacity than initially required. However, other private grain terminals elsewhere in the Northwest may face similar age constraints (not accounted for in the grain cargo forecast for Portland Harbor), resulting in additional grain being handled through Portland if a new facility were constructed. Grain terminals can still be profitable when not operating at full capacity.

Under the most likely scenario, it is also anticipated that additional land would be demanded for liquid bulk facilities. As noted above, the interest shown by BP Arco to purchase the 23-acre Linnton Plywood site indicates a land demand for petroleum liquid bulk facilities in the energy cluster area of Linnton. Therefore, liquid bulk land demand is estimated at approximately 25 acres in the most likely and high scenarios.

Finally, under the high demand forecast, cargo volume is forecast to exceed capacity for cars, containers, grain, and dry bulk. As estimated above, approximately 400 acres is required to provide capacity for forecast automobile cargo. If Portland attracts new container traffic for a broader geographic area, then additional capacity could be required at Terminal 6 to handle this additional volume. As noted above, this additional capacity would likely be handled by converting Berth 603 to container use and re-locating the breakbulk cargo to another area at Terminal 6. One possible option would be to reduce acreage at one of the Terminal 6 auto terminals. Furthermore, the new lease of Terminal 6 prevents the Port of Portland from developing a new container terminal for the next 15 years.

Grain is forecast to rise to 7 million MTPY in the high forecast. A new grain facility of approximately 100 acres, as described in the most likely forecast, would provide sufficient capacity for this volume of grain.

While the volume of dry bulk cargo in the most likely forecast could be handled by existing terminals, under the high forecast a new, large terminal would be required to accommodate a new market opportunity in the national/international market. New dry bulk terminals with capacity of 5 to 8 million MTPY would likely require between 110 and 175 acres (125 acres used in **Table 6-4** below), including the associated rail infrastructure.[138] Additionally, in the high forecast scenario, growth is forecasted to exceed capacity. Depending on the product composition of the cargo increase, one or two additional small dry bulk facilities would likely need to be developed to meet this growth. Acreage requirements would likely be one or two parcels totaling approximately 30 acres of land.

Total forecasted land needs for marine cargo uses are summarized in **Table 6-4**. The forecasted land need through 2040 for the Port of Portland to retain and attract potential clients ranges from approximately 150 acres (low forecast) to approximately 665 acres (high forecast), with a most likely land need of approximately 400 acres. Though forecast by cargo type, this analysis indicates a general shortage of marine terminal land in Portland Harbor to meet cargo growth opportunities across the spectrum of waterborne products. The forecast should be interpreted as a general indication of land need across marine cargo types.

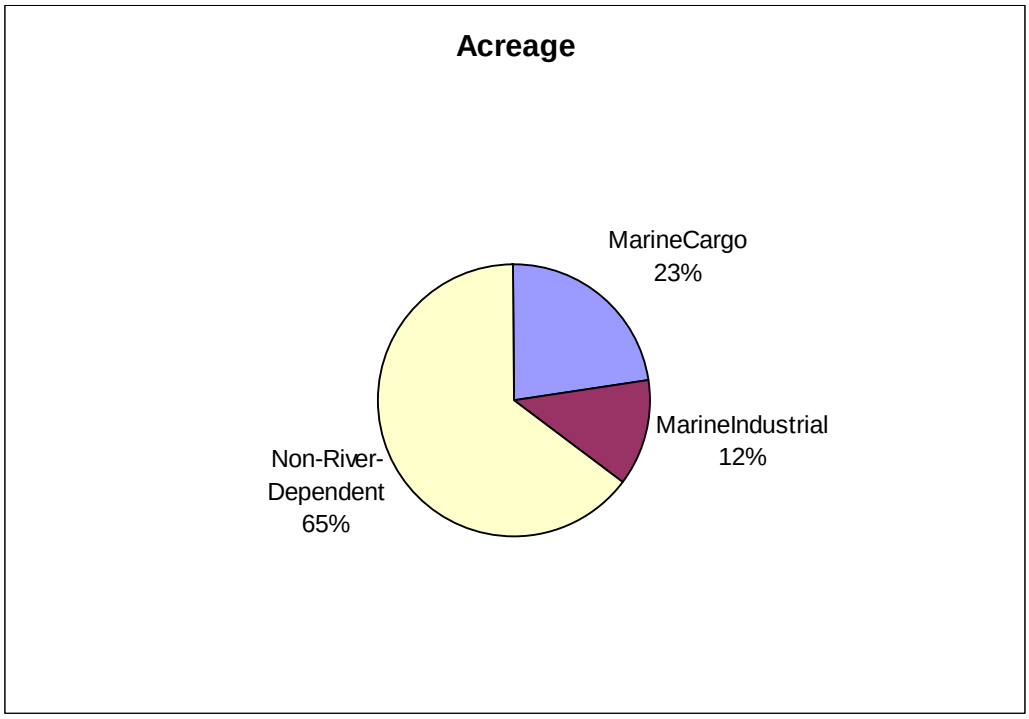
[138] HDR Engineering, Inc. 2009. West Hayden Island Terminal Site and Operation Requirements, Prepared for Port of Portland.

Table 6-4 Forecast Cargo Volume versus Annual Cargo Capacity of Existing Terminals in Portland Harbor

	Terminal Land Need Forecast by 2040 (Acres)		
Cargo	Low	Most Likely	High
Automobiles	150	300	400
Containers			
Breakbulk			
Grain		100	100
Dry Bulk National/International			125
Dry Bulk Local/Regional			30
Liquid Bulk		25	25
Total	150	425	680

This forecasted land need is relatively conservative when compared with historical marine cargo land absorption in Portland Harbor. As noted in Section 3, there have been 719 acres of land absorbed in Portland Harbor from 1974 to 2010 for marine terminals, or 20 acres annually. Assuming this same rate of land absorption over the next 30 years, there would be 600 acres of land absorbed for marine cargo uses by 2040.

6.3 FORECAST OF LAND NEED FOR MARINE INDUSTRIAL



Land demand is forecast for marine industrial uses in this section. This forecast is based on the proportion of industrial lands in the Portland Harbor that are river-dependent (marine-related) as well as the employment land needs forecast in the 2009 Economic Opportunities Analysis (EOA) for the Columbia Harbor geography.

Four factors that influence which marine industrial uses will locate in the harbor area are: multimodal distribution infrastructure, industry clusters, heavy industrial character, and central urban location.[139] Between 1960 and 1997, an average of 5.6 acres annually of marine industrial development occurred, or 1 percent annual growth.[140] As identified in the Portland Harbor Industrial Lands Study, Portland is strongly competitive for 13 industrial sectors, of which four are already located in Portland Harbor. The future rate of growth in marine industrial lands will depend on the growth of specific industries as well as the availability of suitable waterfront land. The rate of absorption of lands will also depend on which industries are attracted to Portland Harbor, as site size varies radically amongst industry groups.

6.3.1 Marine Industrial Lands and Employment in Portland Harbor

As noted in section 2, the consultant team received geospatial data and employment data within the Portland Harbor. **Figures 6-1** and **6-2** summarize the employment and acreage in river-dependent uses and/or rail-dependent uses and other uses. **Table 6-5** displays the proportion of river-dependent acreage (henceforth, river dependent uses includes uses dependent only on river and uses dependent on both river and rail) and employment that is in marine industrial and marine cargo uses.

Figure 6-2 Employment for Portland Harbor Lands by River and Rail Dependency

As noted earlier, jobs on parcels classified as Marine Terminal are mostly classified as freight, with a small proportion classified as heavy manufacturing. The job density of these jobs is very low, averaging less than one job per acre, as shown in **Table 6-5**.

Table 6-5 Job Density Marine Terminal Uses

	Acres	Jobs	Job Density
Freight	978	598	0.61
Heavy Mfg	6	42	7.00
Total	984	640	0.65

Note: Excludes parcels for which no employment data were available.

Source: Oregon Employment Division, 2008 Quarterly Census of Employment and Wages, City of Portland GIS, merged by Entrix, and tabulated by Bonnie Gee Yosick LLC.

Classification of employment on land classified as marine industrial is much more diverse. Of the 751 acres of marine industrial land, employment data are available for 538 acres that provide employment for 2,067 workers across a range of industries. Over half of these employees (1,105 jobs) are classified as working in heavy manufacturing, another 644 jobs as freight, and the remainder classified as heavy transportation, services, and construction jobs. In general, parcels designated as marine-industrial are less employment-dense (average of 3.84 jobs per acre) as parcels not designated as river-dependent (average of 11.50 jobs per acre). Though not responsible for large numbers of employees, the most job-intensive of the marine-industrial categories included Services (at an average job density of 21.50 jobs per acre) and Heavy Transportation (at an average job density of 20.60 jobs per acre).

Table 6-6 Job Density Marine Industrial Uses

	Acres	Jobs	Job Density

6.3.2 Forecasted Land Need

The City of Portland Economic Opportunities Analysis (EOA) forecasts an additional 16,360 jobs in the Columbia Harbor area by year 2035, with an associated requirement of 880 acres. This estimate is based on standards of square feet of space per employee (ranging from 350 square feet for office uses to 926 square feet for general industrial and 1,263 square feet for warehousing uses) and a 0.30 Floor-Area Radio (FAR).

According to the inventory, the Columbia Harbor currently contains 1,910 acres of vacant land. Using GIS data from the EOA and the City's Working Harbor analysis, it is estimated that the Portland Harbor contains 856 acres of vacant land, or approximately 45 percent of all vacant land within the Columbia Harbor area.

This analysis applied two methods to estimate land forecast for marine industrial use:

1. Apportioning EOA forecasted land need in Columbia Harbor by assuming that development occurs evenly throughout the Columbia Harbor with 45 percent occurring in Portland Harbor, and
2. Apportioning EOA forecasted land need in Columbia Harbor by assuming that 75 percent of development occurs in Portland Harbor, and

3. Apportioning EOA job forecast in Columbia Harbor to marine industrial employment based on current proportion of employment in river-dependent use, and then converting to land absorption based on job density currently observed in Portland Harbor marine industrial uses.

For both methods, intensification of development is likely as jobs and land uses become more water-dependent in the Portland Harbor.

The first way of estimating land development assumes vacant land across the Columbia Harbor geography is evenly developed. Based on this assumption, approximately 400 acres (45 percent of 880 acres) in Portland Harbor are expected to be developed by 2035 for both marine industrial and other non-river dependent uses (acreage for marine terminals is not included in the 880 acres EOA forecasted land need). As marine industrial accounts for 16 percent of the all land uses, it is estimated that approximately 60 acres (16 percent of the 400 acres forecast to be developed in the Portland Harbor) may be absorbed by marine industrial uses by 2035; this represents a low estimate of marine industrial land absorption in Portland Harbor by 2035.

With the urbanization and intensification of land uses in the Portland Harbor, as well as the greater land use per employee in Portland Harbor industries, the Portland Harbor may likely absorb a greater proportion of the forecast land development in the larger Columbia Harbor area. A high estimate of land absorption by marine industrial uses assumes that 75 percent of all land absorption in the Columbia Harbor geography occurs in Portland Harbor, or 660 acres. Assuming again that 16 percent of this is for marine industrial uses, provides a higher forecasted land absorption of approximately 100 acres for marine industrial uses by 2035. This estimate represents a 0.3 percent to 0.5 percent annual increase in industrial land use through 2035. This is still likely a conservative estimate, as attracting just one large manufacturing firm to the area could absorb this amount of land. For example, the Portland Development Commission is currently working to attract manufacturing businesses associated with the wind turbine industry that would likely require waterfront access.

A third method relies not on the land forecast from the Economic Opportunities Analysis, but on the jobs forecast of 16,350 new jobs by 2035 in the Columbia Harbor. Holding the proportion of marine industrial jobs constant in the Portland Harbor (about 6 percent of jobs estimated as marine industrial) yields about 980 marine industrial jobs by year 2035.[141] The currently observed average job density of 3.84 marine industrial jobs per acre suggests 250 acres of land in Columbia Harbor needed to accommodate these jobs. Given that the bulk of land in Columbia Harbor appropriate for marine industrial development is located within Portland Harbor, no apportionment of Columbia Harbor development to the Portland Harbor is necessary.

These methodologies suggest a range of land needs ranging from 60 to 250 acres for marine industrial activities by 2035. This corresponds to an average annual land demand of 2.4 to 10 acres. Assuming the same annual growth rate through 2040, then land needs are expected to range from 70 to 300 acres. The Portland Harbor Industrial Lands Study notes that average annual land absorption from 1960 to 1997 was 5.6 acres. If this rate were projected forward, it would suggest land need of approximately 170 acres by 2040, which falls within the range of projected land needs based on EOA forecasts.

[141] Note that this marine industrial employment growth is slightly lower than the combined marine industrial and marine terminal employment growth forecasted in Section 3.

Table 6-8 Forecast Land Need for Portland Harbor Development (Acres)

Timeframe	Low (land based)	Medium (land based)	High (jobs based)
Annual Demand	2.4	4	10
Total Demand by 2035	60	100	250
Total Demand by 2040	70	120	300

Source: Oregon Employment Division, 2008, Quarterly Census of Employment and Wages, E. D. Hovee & Company, ENTRIX, and Bonnie Gee Yosick LLC.
Note: Land projection is through 2035 as this is the time period analyzed in the Economic Opportunities Analysis.

6.4 LAND NEEDS COMPARED TO AVAILABLE LANDS INVENTORY

The discussion below compares land needs for marine cargo and marine industrial development in the Portland Harbor forecasted above to the inventory of suitable sites completed in **Section 5**.

6.4.1 Marine Cargo

Marine cargo land need is forecast to range from 150 acres to 680 acres, primarily in parcels larger than 100 acres. In the high forecast scenario, up to 30 acres of land may be required to accommodate growth in local/regional dry bulk cargo, such as aggregates or agricultural chemicals. Depending on the type of cargo product, this level growth may be accommodated in one larger or two smaller parcels. It is likely that the land requirement for this cargo type could be met by vacant lands available in the Portland Harbor, as long as business opportunities are willing to develop suspected brownfield sites with potential Superfund liabilities. As described in Section 5, the vacant lands in the harbor area include parcels of 30 acres in size, though many of them are potential brownfield sites and may be subject to liability associated with the Superfund site. Additionally, the most likely and high forecast scenarios indicate demand of approximately 25 acres for liquid bulk expansion in the Linnton area of the Portland Harbor. This demand is also subject to constraints related to contamination.

The remaining land need for marine cargo (150 acres in the low scenario, 400 acres in the most likely scenario, and 625 in the high scenario), is for parcels larger than 100 acres to accommodate rail access and ensure competitiveness. As discussed in Section 5, there are no parcels of this size available in Portland Harbor. To accommodate these new marine terminals given the currently available land supply, it is expected that the Port of Portland would need to develop land on WHI.

6.4.2 Marine Industrial

Marine industrial land need through 2035 is forecast to range from 70 to 300 acres. As discussed in Section 4, parcels for marine industrial development vary in size from 5 acres to more than 100 acres and require barge access. There are 11 parcels (263 acres) of vacant lands in Portland Harbor that are larger than five acres and adequate shoreline length. However, only one of the 11 potential sites (19 acres) does not have potential upland contamination, the presence of which carries significant costs and risks as discussed in Section 4. As noted in **Section 4,** the EOA forecasts that up to 45 percent of brownfield sites will be available for development by 2035. This indicates that in addition to the 19-acre site that is not contaminated, there may be up to 110 acres of brownfield sites that may be available, for a total of 130 acres. Thus, while Portland Harbor has available brownfield sites for redevelopment that will accommodate smaller-sized marine industrial uses, it lacks sites for large river-dependent manufacturers or other opportunities requiring uncontaminated sites on the river. This may make it difficult to attract new businesses to the region unless additional lands are available on WHI.

6.4.3 Summary of Unmet Land Needs

Forecasted demand for marine-related land uses (both marine cargo and marine industrial) ranges from 220 acres in the low forecast to 980 acres in the high forecast. Of this acreage, up to 130 acres may be accommodated on smaller parcels in the harbor area (potentially 55 acres of regional/local dry bulk terminal and liquid bulk terminal and up to 75 acres of marine industrial). Forecasted acreage demand that can not likely be satisfied in the harbor area ranges from 150 acres in the low scenario to 850 acres in the high scenario.

6.5 AVAILABILITY AND SUITABILITY OF LOWER COLUMBIA SITES

Marine cargo and marine industrial uses that desire to locate in the Portland metro area may also consider sites at other locations along the Columbia River (see **Section 2.2.3**). While the forecast of land needs is specific to Portland Harbor and does not include all Lower Columbia River forecasted land need, this section describes the suitability of WHI compared to other potential Lower Columbia marine industrial sites.

6.5.1 WHI

WHI consists of more than 800 acres of relatively undeveloped land on the western portion of Hayden Island. Hayden Island is located in the Columbia River just east of the confluence with the Willamette River. The main, deepwater channel of the Columbia River is on the north side of Hayden Island, while the North Portland Harbor is located on the south side. The Port of Portland acquired the land in 1993 for the purpose of marine industrial development. The land was designated in 1995 as Regionally Significant Industrial Area as well as a Regionally Significant Natural Area.

WHI has the land size, deepwater access, and proximity to rail and interstate infrastructure necessary for a marine terminal location. Interstate 5 bisects Hayden Island, as does the Burlington Northern Sante Fe (BNSF) mainline. As direct access to I-5 is difficult from WHI, if marine terminal development were to take place on the island it is expected that a bridge for vehicular access would be constructed connecting WHI with Marine Drive in Portland. It is also expected that rail access would be developed by integrating with the existing BNSF rail bridge on the eastern limits of the WHI. WHI is identified as regionally significant natural area and provides a large expanse of relatively undeveloped natural area within the Columbia River riparian corridor. Consequently, the primary constraint to WHI development is expected to be impact to natural resources, which is evaluated in the companion study to this economic foundation study.

A recent study conducted for the Port of Portland provides some general design guidelines for potential marine terminal development of WHI.[142] This preliminary study analyzed terminals for automobiles (75 to 140 acres), dry bulk (110 to 175 acres), liquid bulk (125 to 155 acres), and container cargo (95 to 140 acres). Conceptual designs, include rail infrastructure, were generated for these terminals. Berths for each terminal type were described, and vary from floating platforms to split-level fixed berths to a traveling loader system. All berths would be located on the north side of the island.

If the area is developed, rail infrastructure required for efficient and competitive terminals would vary by terminal type, but would include working track lengths (2,500 to 3,500 feet), storage tracks, and a railcar storage area. Regional market advantage can be achieved with rail infrastructure including 8,500 to 10,000-foot tracks. An intermodal railyard of 30 acres is included in the design concepts . Loop tracks of 8,500 feet for dry bulk facilities are also included in the design concepts for the dry bulk, liquid bulk, and grain

[142] HDR Engineering. Inc. 2009. West Hayden Island Terminal Site and Operation Requirements and Addendum 1. Prepared for Port of Portland. Accessed at http://www.portlandonline.com/bps/index.cfm?a=279953&c=51508.

terminals. Additional landside facilities that would be required on WHI include a gate complex (control point for cargo entering or leaving the terminal by road).

Two general design concepts were developed, one with a long track traversing east-west along the island parallel to the shoreline, and one with the tracks approximately extending only as far west as the power line corridor (see Addendum 1 to the Technical report). Limiting the rail footprint to the east side the BPA power line corridor increases the amount of time for trains to enter or exit the mainline tracks by approximately 25 percent due to increased curvature in the track configuration. Other operational constraints would result from this configuration, including increased labor for train handling and maneuvering, enable only one loop track of the desired 10,000 feet length, and require increased coordination between terminals.

6.5.2 Available Land at Other Lower Columbia Ports

There are four other ports located on the Lower Columbia River: St. Helens in Oregon, and Vancouver, Longview, and Kalama in Washington. Each of these ports has land available for marine terminal expansion as summarized in **Table 6-9**. The suitability of these sites for marine terminal purposes depends on the associated infrastructure, the size of the sites, natural resource constraints, and the intended land use for the sites.

Table 6-9 Lands Available for Marine Terminal Development at Other Columbia River Ports

	Available Lands		Available for Marine Terminals
Port	Port Lands	Private Lands	
Vancouver	568 - 618		718
Longview		600	600
Kalama	80 – 100		
St. Helens	200 – 450		

This analysis focuses on lands in the Ports of Longview and Vancouver as lands available at Kalama and St. Helens are unlikely to be used for marine terminal development. In Kalama, there are 80 to 100 acres vacant, but the Port is seeking users generally associated with manufacturing or processing. The St. Helens port has 200 acres available for development, but this acreage is in an energy park at Port Westward that is controlled by Portland General Electric. As such, it is not considered suitable for marine terminal development.

At the Port of Vancouver there are 718 acres available, of which 218 are in the planned Terminal 5, and 350 to 400 are in the planned Columbia Gateway. The planned Terminal 5 is located just to the west of the Port of Vancouver facilities and is expected to serve bulk and breakbulk cargoes on 140 acres. The Port is expecting that much of this facility will be used to handle increased volumes of wind turbine cargo. To serve this terminal with rail access, a unit train track is expected to be complete in 2010, which is a portion of the West Vancouver Rail Access Plan that is intended to be completed in 2017.

Another property owned by the Port of Vancouver, the Columbia Gateway property, is a 1,106-acre property, of which 350 to 400 acres may include marine terminals. A 2005 concept design for this property includes two auto facilities of 116 and 85 acres, respectively, as well as a dry bulk or grain facility on 110 acres.[143] The Port is expecting to use the Columbia Gateway site by 2018.

[143] Port of Vancouver. 2005. Developing Our Future. Vancouver Lake Watershed Partnership Power Point Presentation. Accessed at http://www.cityofvancouver.us/PublicWorks/vancouverlake/MapsMaterials/VLWP_PortPresentation_61505.pdf.

The Port of Longview is developing a new grain facility on more than 100 acres that is expected to have a capacity of 8 million MTPY. The only available parcels for additional marine terminal development are privately owned. The Chinook Ventures property has 416 acres and a dock, and may be used for cement production or other uses. It is not known if this site would potentially be available for marine terminal development. Another available, private property, Barlow Point is a private, greenfield property in Longview that is 318 acres and has rail connections to BNSF. This property has been available for sale for the last several years, and it is not known what constraints may apply to the site.

6.5.3 Summary and Comparison of Site Availability and Suitability

There are available lands and several planned facilities to accommodate forecasted growth in Columbia River cargo, including those at WHI. Land on WHI would be able to accommodate two marine cargo terminals, and would likely enable the Port of Portland to capture its potential cargo growth opportunities presented in **Section 3**. WHI provides the deepwater access, parcel size, proximity to rail and truck infrastructure, and configuration required for modern, efficient marine terminal facilities. WHI is also very suitable for marine industrial uses as it separates industrial use from residential areas and reduces the likelihood of incompatibilities or encroachment by non-industrial uses such as residential areas.

If WHI is not developed, it appears that the existing and planned terminals at ports located on the Washington side of the Lower Columbia River may be able to meet the forecasted cargo demand for the Lower Columbia (see **Table 6-10**). Under this scenario, however, it is expected that Portland would lose market share in marine cargo and associated jobs and income. Additionally, if WHI is not developed, it is expected that fewer lands will be available for marine industrial uses in Portland Harbor, resulting in less job growth in river-dependent manufacturing and other sectors dependent on marine cargo activities.

Table 6-10 2040 Cargo Forecast for the Lower Columbia River

		Portland Harbor Forecast 2040			Lower Columbia River, WA		Total Lower Columbia River
	Units	Low	Most Likely	High	2030[b]	2040[c]	Most Likely 2040
Automobiles	Units	925,000	1,145,000	1,364,000	118,000	123,000	1,268,000
Containers	TEU	379,000	520,000	614,000			520,000
Breakbulk	MT	1,010,000	1,181,000	1,295,000	294,000	295,000	1,476,000
Grain	MT	5,647,000	6,477,000	7,059,000	5,928,000	5,946,000	12,423,000
Dry Bulk	MT	6,547,000	8,524,000	1,018,000	4,355,000	4,377,000	12,901,000
Liquid Bulk	1,000 MT	6,912,000	7,571,000	8,011,000	1,282,000	1,297,000	8,868,000

a/ BST and Global Insight 2009 WHI Marine Cargo Trends and Forecasts

b/ BST and Global Insight 2009 Marine Cargo Forecast for Washington Public Ports Association

c/ Assuming growth rate from 2030 to 2040 is the same as from 2025 to 2030

6.6 SUMMARY AND IMPLICATIONS OF MARINE-RELATED DEVELOPMENT AT WHI

Provided there is adequate terminal infrastructure and land, marine cargo volume is projected to grow over the next 30 years in Portland, as is marine industrial land use. However, projected growth will not be realized if suitable lands are not available. In particular, lack of available, large developable sites suitable for marine industrial development constrains growth opportunities for marine cargo or large marine industrial manufacturers. As noted in METRO's 2009 urban growth report, the region must decide how it will

accommodate forecasted population and employment growth and what investments we are willing and able make in transportation corridors and employment areas to support long-term employment growth.[144]

Forecasted demand for marine-related land uses (both marine cargo and marine industrial) ranges from 220 acres in the low forecast to 980 acres in the high forecast. Of this acreage, up to 130 acres may be accommodated on smaller parcels in the harbor area (potentially 55 acres of regional/local dry bulk terminal and liquid bulk terminal and up to 75 acres of marine industrial). This figure is based on the available lands in the harbor area and the proportion of brownfield sites that may be available for development, as discussed in **Section 6.4.2**.

WHI is the only parcel suitable in Portland Harbor for new uses that require 100 acres or more. Development of WHI for marine terminal use would likely allow Portland to capture potential cargo opportunities forecast in **Section 3**, and associated jobs and income. Forecasted acreage demand that can not likely be satisfied in the harbor area ranges from 150 acres in the low scenario to 850 acres in the high scenario. Development on WHI for marine cargo purposes may also lead to more available lands in Portland Harbor for other industrial uses, if some existing cargo operations such as grain are consolidated at larger marine terminals. As discussed in **Section 2**, growth in these marine-related industries is a major engine for the local economy, and has implications across a variety of sectors.

In summary, to meet all projected cargo growth, particularly automobile, and provide large parcels for marine industrial growth, Portland is expected to need to develop WHI. (This assumes that there is not significant redevelopment and/or consolidation of land uses in Portland Harbor and also assumes similar future site requirements for marine cargo). If WHI is not developed, it appears that the existing and planned terminals at ports located on the Washington side of the Lower Columbia River may be able to meet the forecasted cargo demand for the Lower Columbia. Under this scenario, however, it is expected that Portland would opportunities to expand marine-related economic activity and would forfeit the associated jobs and income. Additionally, if WHI is not developed, it is expected that fewer lands will be available for marine industrial uses in Portland Harbor, potentially resulting in less job growth in marine-related manufacturing and other sectors dependent on marine cargo activities.

APPENDIX A

Marine Industrial Cluster and Linkage Analysis for Selected Industries

Cluster analysis—the identification of groups of firms or industry sectors that share similar suppliers, skills, markets, and workers—has been used as part of the City of Portland economic development efforts for years. The City has used the results of cluster analysis to better understand the regional economy, to focus its economic development agenda, and to identify industry partners.

Industry clusters are generally defined as geographic concentrations of interconnected companies and institutions in a particular field. They may include:

- Suppliers of specialized inputs, machinery, and services;
- Distribution channels and customers;
- Manufacturers of complementary products;
- Companies related by skills, technologies or common inputs; and
- Related institutions such as research organizations, universities, training entities, others.

Cluster efforts typically analyze various traded sectors. According to a paper on how to include economic impact information into investment decisions for transportation projects by the Economic Development Research Group (2008),[145]

> *The traded industries serve as a primary generator of wealth by producing more than can be consumed locally. However, from a transportation perspective, traded industries are important because their products are traded and hence depend on long-distance transportation connections to customers in national or international markets. As a result, any major reduction in access to customers outside the region can have serious implications for many traded industries (and therefore the broader economy). Thus, transportation's support for traded industries not only enables those industries to generate wealth for the region, but transportation becomes an important determinant of their future economic prospects.*

[145] Economic Development Research Group, Inc. 2008. Use of Freight and Business Impact Criteria for Evaluating Transportation Investments, Executive Summary. Prepared for the Portland Business Alliance and Port of Portland, Available at www.portofportland.com/.../Trade_Trans_Studies_EDR_ExecSmry.pdf.

As maritime services are not an export in and of themselves, the intent of this exercise is to explore and quantify those industries most reliant on marine terminal and harbor activities. The analysis uses the IMPLAN[146] 2007 dataset and defines the region as the four-county area, including Multnomah, Washington, and Clackamas counties in Oregon, and Clark County in Washington. In addition to being one of the most commonly used tools in economic impact analysis; IMPLAN is also frequently used for cluster analysis, by examining the relationships of industries to their buyers and suppliers. The structure of the model mimics the monetary transactions for consumption within an economy, allowing a detailed examination of the effects of transactions between businesses and between businesses and final consumers.

The top 30 industrial purchasers of water transportation services are shown in tabular form in **Appendix A** with the IMPLAN industry code and the percent represented of all industry-based intermediate commodity demand (see **Table A-1**). These results show that the two largest industrial "customers" of water transportation services are the scientific research and development services industry and flour mill and malt manufacturing industry, together accounting for over half of the intermediate industrial-based water transportation services demand. This reflects the fact that grain produced in the region relies heavily on water transportation to reach their global customers. Again, a primary challenge of this data is the fact that it is limited to the intermediate demand generated by other industrial users within the four-county region. In as much as the majority of demand is final demand from consumers and foreign and domestic trade, the conclusions derived from this data are limited.

A reverse type of analysis demonstrates the sectors upon which water transportation depends. These suppliers of intermediate inputs to the water transportation sector are linked in that some portion of their business depends upon the water transportation sector. For example, water transportation depends on fuel, and other supplies that are purchased when ships dock on the harbor. The top 30 suppliers (by gross value of goods and/or services provided) to the water transportation industry are also shown in tabular form in Appendix B along with the IMPLAN industry code and the percent the industry represents of all intermediate inputs to the water transportation industry (see **Table A-2**). Many of the industries represented in the list of suppliers are not well represented regionally. Consequently, much of the economic benefit of those purchases 'leaks' outside the region. To correct for this phenomenon, another review covers regional inputs estimated from Regional Purchase Coefficients, yielding a list more relevant to the region (**Table A-3**). The largest supplier to industries providing water transportation is Scenic and Sightseeing Transportation and Support Activities for Transportation, followed by Real Estate Services, the US Postal Service, and Couriers and Messengers.

Cluster analysis concepts were applied to the following industries in Portland Harbor that are dependent on water transportation:

- Handling of Automobiles;
- Transport Manufacturing, including barge manufacturing companies in the harbor, such as Gunderson and US Barge;
- Handling of Steel Slab;
- Petroleum; and

[146] IMPLAN is a static equilibrium input-output model first developed in 1979 by the U.S. Forest Service in cooperation with the Federal Emergency Management Agency and the U.S. Bureau of Land Management to assist the Forest Service in land and resource planning and management. The program has been updated and improved over subsequent years and is now one of the most commonly-used economic modeling tools for measuring the economic impacts of development projects.

- Paper and Cartons.

An analysis of the buyers and suppliers to these sectors shows how they are linked to the rest of the Portland economy.

Handling of Automobiles: According to the Martin report, the handling of autos accounted for 796 employees in 2006. In IMPLAN, these activities might be captured as motor vehicle parts manufacturing which accounted for nearly 2,000 employees and nearly $623 million in economic output. At nearly $61,000, its average employee compensation is about eight percent higher than the all-industry average of about $56,500. The top 30 industrial purchasers of motor parts manufacturing services are shown in **Appendix A** along with the IMPLAN industry code and the percent represented of all industry-based intermediate commodity demand (see **Table A-4**). The largest industrial "customers" of motor vehicle parts manufacturing services are the related industries of truck manufacturing and automotive repair and maintenance. The largest supplier to motor vehicle parts manufacturing industries is wholesale trade, reflecting the importance of trade and the movement of goods to this industry (see **Table A-5**).

Transport Manufacturing: Barge manufacturers in the harbor include Gunderson and US Barge. Classified as NAICS code 332312, this industry is included in IMPLAN industry group 186, described as "Plate Work and Fabricated Structural Product Manufacturing" which has 1,926 employees and nearly $572 in economic output. Earnings per worker average nearly $61,000, about the same as observed in handling of autos. The top purchasers of Plate Work and Fabricated Structural Product Manufacturing are two different sectors of Nonresidential Construction (commercial / health care structures and other nonresidential structures), followed by Transport by Water. Like Handling of Autos, a top supplier is Wholesale Trade, followed by Iron and Steel Mills.

Handling of Steel: One key element of the marine terminal activities is the handling of steel such as Schnitzer and Oregon Steel. According to the Martin report, the handling of steel slabs accounted for 676 employees in 2006, and the handling of steel breakbulk another 51. In IMPLAN, these activities might be captured as metal foundries which accounted for over 3,300 employees and over $860 million in economic output. At nearly $85,000, its average employee compensation is higher than the all-industry average of about $56,500, as was observed in transport by water and handling of autos. The largest industrial "customers" of metal foundries manufacturing services are generally durable good manufacturers, including motor vehicle parts manufacturing, pump equipment manufacturing, and equipment handling manufacturing (**Table A-6**). They might include employers in the harbor area such as Tube Forgings of America, Sulzer Pumps, NW Copper Works, Harmer Steel, and Gunderson. The largest supplier to metal foundries manufacturing industries is wholesale trade (**Table A-7**).

Handling of Petroleum: Chevron, Conoco Phillips, KinderMorgan, NuStar Energy, Northern Resources, and Western States Petroleum all operate facilities in Portland Harbor. According to the Martin report, the handling of petroleum accounted for 562 employees in 2006. In IMPLAN, these activities might be captured as petroleum distribution (which includes retail gas stations) which accounted for nearly 4,500 employees and over $540 million in economic output. At less than $20,000, its average employee compensation is just about 65 percent lower than the all-industry average of about $56,500. However, the inclusion of retail gasoline stations in the category is likely to pull down the average, despite a strong probability that compensation for employees at the private terminals handling the receipt of petroleum product is higher. The largest industrial "customers" of petroleum distribution services are the construction sectors (**Table A-8**). This phenomenon is due, in large part, to the inclusion of retail gas stations in this sector. The largest supplier to petroleum distribution manufacturing industries is real estate establishments, though these are probably lease/rent agreements for the retail gasoline stations included in this sector (**Table A-9**).

Paper and Cartons: Georgia Pacific in Rivergate and Smurfit on North Burgard Way have large operations in the harbor. According to the Martin report, the handling of paper accounted for 70 employees in 2006, and the handling of cartons another 99. In IMPLAN, these activities might be captured as the paperboard container industry which accounted for over 1,180 employees and over $405 million in economic output. At nearly $71,500, its average employee compensation is 26 percent higher than the all-industry average of about $56,500, as was observed in transport by water, handling of autos, and the handling of steel. The largest industrial "customers" of paperboard manufacturing services are other manufacturers, including a range of food and food product manufacturing, such as fruit and vegetable processing manufacturing, breweries, cookie/cracker/pasta and snack manufacturing, and some durables, such as cutlery/utensils/pot/pan manufacturing (Table A-10). The largest supplier to paperboard manufacturing industries is the wholesale trade sector, again highlighting the importance of trade and movement of goods to this industry (Table A-11). Other suppliers might include companies like Western Machine Works on North Burgard Way, which manufactures products for the pulp and paper industry

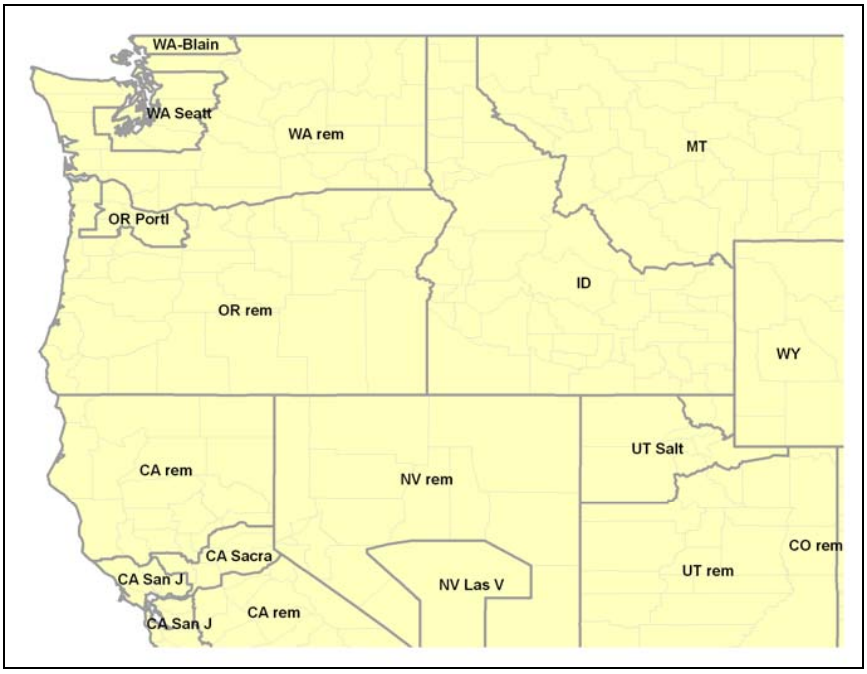
Introduction

As part of the planning effort leading up to the development of a statewide Freight Plan as a component of the Oregon Transportation Plan, the Oregon Department of Transportation (ODOT) has invested in an update to the statewide commodity flow forecast. This forecast will meet the needs of ODOT's first multi-modal Statewide Freight Plan with guidance from the Economic and Freight Working Group, and it will support modeling and analysis done by the ODOT Transportation Planning Analysis Unit (TPAU) and other future ODOT freight planning activities.

This report provides an overview of the methodology used to create this Oregon Commodity Flow Forecast (Oregon CFF), which aims to address the limitations of existing forecasts – inconsistent and separate databases for different modes, lack of transparency in data and assumptions, and data gaps – in a consistent methodology based on national and local data sources.

The Oregon CFF is a county level commodity flow forecast in tons and vehicles (where applicable) for truck, rail, marine, air, and pipeline modes from 2002 to 2035. Factors to convert the results to dollar value are also provided. The approach builds on the Federal Highway Administration (FHWA) Freight Analysis Framework (FAF2) national commodity flow forecast, which disaggregates the data to the sub-state level using local data and expertise on historical and forecast economic and modal trends. Local data is included to either verify that the national forecast provides accurate data for Oregon, or to modify or supplement the national data, as well as to disaggregate the data to the county level.



The report compares the results to other forecasts, including the prior commodity flow forecast used in the 2006 Oregon Transportation Plan (OTP), and summarizes general findings. The report first discusses the general methodology and assumptions used in the development of the Oregon CFF. That is followed by a summary of results by mode and across all modes. The report closes with a discussion about how the forecast can be modified to reflect alternative scenarios. A detailed methodology and descriptive items are contained in the appendices.

Methodology

A detailed methodology describing the data sources and processing used in the Oregon CFF is contained in Appendix A, and summarized here. The key data source for the Oregon CFF is the 2002 Freight Analysis Framework (FAF2), a national commodity flow forecast dataset published by the Federal Highway Administration (FHWA). The FHWA FAF2 commodity flow forecast was chosen because FAF2 is national in scope, highly regarded in terms of capturing interstate and international flows, uses a relatively recent base year (2002), and provides a quick way to complete a forecast in time for the Oregon Freight Plan work anticipated for Fall 2009.

FAF2 provides freight flows in tons or dollar values between 130 FAF2 regions encompassing the US for the year 2002 as well as forecasts from 2010 to 2035 in five year increments. The data is split by mode as well as by 43 commodities classified by Standard Classification Transported Goods (SCTG) codes. FAF2 regional zones are relatively coarse, as shown in Exhibit 1. Oregon is covered by two zones: Oregon Portland and Oregon Remainder. The Oregon Portland zone includes the Oregon portion of the Portland-Vancouver region covering Multnomah, Washington, Clackamas, and Yamhill Counties. The remaining 32 Oregon counties are included in the Oregon Remainder zone.

Exhibit 1. FAF2 Zones and Counties

For the Oregon CFF, the commodities were converted from SCTG classification into the Standard Transportation Commodity Code (STCC) classification to enable the use of local data sources, such as the Surface Transportation Board's Rail Waybill data.

In order to transform the coarse FAF2 zone flows into smaller geographic regions within Oregon, the data had to be disaggregated. Since the FAF2 dataset contains the whole

United States, flows with at least one trip ends within Oregon were disaggregated from FAF2 zones to Oregon counties. In the case of truck flows, this was done based on county employment and IMPLAN inter-industry coefficients. For rail flows, the FAF2 flows were compared to the Surface Transportation Board's Rail Carload Waybill data set which contains county level detail of origin and destinations. The overall numbers were found to be comparable, so the Waybill data for 2002 was used as the base, and the FAF2 growth rates were applied to obtain the forecast. The other modes relied on local data to allocate FAF2 flows to specific Oregon facilities (rail stations, airports, marine ports, or pipeline terminals), including US Corps of Engineers Waterborne Commerce data and the Oregon Energy Report. Zones outside of Oregon were aggregated from FAF2 zones to "Other Domestic" and "Other International" categories. Special consideration was made for air mail and fish commodities. The Oregon CFF methods and data are described further in Appendices A through D.

Statewide Commodity Flow Findings

The data for all the modes and years was compiled into a master database and then summarized by mode and across modes in order to study overall trends in freight. Since the base year for FAF2 is 2002, current economic trends are not reflected. The Oregon Office of Economic Analysis (OEA) Global Insight subscription forecasts (April and June 2009) show the current downturn having little to no impact on the 2035 forecasts, after a slight disruption to 2010. This should be kept in mind while reviewing the forecast values.

As shown in Exhibit 2, truck flows dominate throughout the Oregon CFF, with a share of roughly 72 to 78%. All modes retain a stable share over the forecast period. Air remains less than 0.1% in terms of overall tonnage, but represents six to 11% of flows in terms of value of all state freight movements. The Oregon CFF numbers obscure the importance of air in the state freight system as the ability to ship products by air is critical to seamless delivery of high-value products for business, industry, and personal uses. Such key commodities moved by air range from pharmaceuticals (e.g., blood and organs) to other time-sensitive deliveries (e.g., legal documents, auto parts).

The compound average growth rate (CAGR) of all Oregon freight averages 1.9% annually in tonnage, but goods are becoming more valuable, showing a 3.0% growth in value over the 2002-2035 period. Air and water grow faster than average, while pipeline and rail grow slower. For comparison, OEA forecasts of annual employment (June 2009) and population (2004) growth from 2003 to 2035 are 3.2% and 1.3%, respectively.

Exhibit 2: 2002-2035 Oregon Commodity Flow by Mode

Mode	2002	2010	2035	Growth Rate 2002-2035	Mode split 2002-2035	
Tonnage (1000s)						
Truck	259,213	294,458	508,331	2.1%	75%	78%
Rail	39,008	47,314	64,289	1.5%	11%	10%
Water	34,835	47,926	60,296	1.7%	10%	9%
Pipeline	13,599	13,436	17,401	0.7%	4%	3%
Air	236	288	767	3.6%	0.1%	0.1%
TOTAL	346,892	403,423	651,083	1.9%	100%	100%
Value (Millions of $ in 2002$)						
Truck	$159,878	$185,862	$411,465	2.9%	73%	72%
Rail	$15,631	$16,906	$27,434	1.7%	7%	5%
Water	$22,467	$31,660	$60,798	3.1%	10%	11%
Pipeline	$7,307	$6,828	$9,530	0.8%	3%	2%
Air	$13,253	$17,575	$61,408	4.8%	6%	11%
TOTAL	$218,536	$258,830	$570,635	3.0%	100%	100%

Notes: Growth Rate = Compound annual growth rate 2002-2035.
Excludes tonnage traveling through Oregon without an Oregon origin or destination.

Exhibit 3 summarizes commodity flows by direction of flow (inbound, outbound or internal). The outbound flows are growing the fastest, nearly twice the inbound flows,

reflecting the high FAF2 growth rates in domestic outbound truck flows for selected commodities.

Exhibit 3: 2002-2035 Oregon Commodity Flow Tonnage by Direction (1000 tons)

Direction	Year			Growth Rate 2002-2035
	2002	2010	2035	
Inbound	86,365	101,157	131,957	1.3%
Internal	197,993	223,356	364,482	1.9%
Outbound	62,533	78,909	154,644	2.8%

Notes: Growth Rate = Compound annual growth rate 2002-2035.

The Oregon CFF tonnage is summarized by Oregon region in Exhibit 4 and excludes pipeline flows. Overall the growth rates are relatively consistent, with Portland growing at the highest rate due to the fact that it provides a gateway, and thus an origin or destination for many state flows, resulting in compounding of flows that cause it to grow at a faster rate. Non-Portland regions are growing slightly faster than OEA population growth rate of 1.3%).

Exhibit 4: 2002-2035 Oregon Commodity Flow Tonnage by Region (1000 tons)

Oregon Region	Year			Growth Rate 2002-2035
	2002	2010	2035	
Portland	252,002	284,571	519,770	2.2%
Eastern Oregon	40,353	48,113	69,365	1.7%
Central Oregon	57,419	68,353	100,035	1.7%
Willamette Valley	100,928	119,292	174,615	1.7%
Southern Oregon	45,415	52,972	78,040	1.7%
Coastal Oregon	34,535	39,409	55,536	1.4%

Notes: Growth Rate = Compound annual growth rate 2002-2035.
Does not include pipeline flows. Internal flows counted in multiple regions
Regions defined by county groupings consistent with OEA forecasts.

Exhibit 5 shows that the top commodities shipped in terms of tonnage are: farm and associated food products (STCC 1 and 20), forest and associated wood/paper products (STCC 8, 24, 26, and 27), coal/fuels (STCC 11, 13, and 29), clay/stone/glass (STCC 32), and waste/scrap/misc shipments (STCC 40, 41, 46, 48, 49, and 50). Other sizeable commodities are transportation equipment and machinery (STCC 35 and 36), metal/metal products (STCC 33 and 34), and rubber/plastics (STCC 30). Of the larger commodities, forest and related wood/paper products as well as construction materials show lower than average growth, while equipment and rubber/plastics show higher than average growth.

Exhibit 5: 2002-2035 Oregon Tonnage by Commodity (1000 tons, all modes)

		Tonnage (1000 tons)			Growth Rate	Value ($M in 2002$)		
	STCC	2002	2010	2035	2002-2035	2002	2010	2035
1	Farm products	48,301	58,375	88,932	1.9%	$11,310	$13,941	$21,132
8	Forest products	18,033	16,470	16,888	-0.2%	$780	$713	$733
9	Fresh fish	347	414	745	2.3%	$1,617	$1,931	$3,476
10	Metallic ores	492	619	579	0.5%	$484	$648	$563

14	Nonmetallic minerals	3,745	4,823	7,468	2.1%	$279	$362	$564
19	Ordnance or accessories	281	335	1,365	4.9%	$146	$174	$711
20	Food and kindred products	17,810	20,522	38,411	2.4%	$15,731	$18,345	$34,769
21	Tobacco products	486	553	1,202	2.8%	$882	$1,004	$2,182
22	Textile mill products	299	257	235	-0.7%	$5,617	$4,913	$4,544
23	Apparel & related prod	173	151	149	-0.5%	$9,985	$8,563	$7,954
24	Logs, lumber, wood prod	30,816	31,014	40,145	0.8%	$12,399	$12,445	$15,972
25	Furniture or fixtures	595	677	1,375	2.6%	$1,444	$1,635	$3,223
26	Pulp, paper, allied prod	6,603	7,150	10,325	1.4%	$5,737	$6,182	$8,822
27	Printed matter	1,236	1,310	1,657	0.9%	$2,849	$3,022	$3,821
28	Chemicals, allied products	17,354	21,721	38,210	2.4%	$13,918	$17,291	$34,775
29	Petroleum or coal prod	32,361	34,500	54,487	1.6%	$9,298	$10,013	$16,616
30	Rubber or misc plastics	1,857	2,465	5,579	3.4%	$4,928	$6,530	$14,765
31	Leather or leather prod	114	97	88	-0.8%	$702	$596	$536
32	Clay, concrete, glass, stone	100,463	128,072	168,924	1.6%	$3,458	$4,342	$5,929
33	Primary metal products	4,602	5,502	7,792	1.6%	$4,330	$5,099	$7,457
34	Fabricated metal products	3,603	4,664	9,646	3.0%	$10,019	$12,986	$27,165
35	Machinery	2,772	4,241	11,444	4.4%	$21,681	$33,017	$89,096
36	Electrical equipment	678	841	2,277	3.7%	$24,215	$30,855	$90,827
37	Transportation equipment	3,310	3,858	9,904	3.4%	$14,470	$17,596	$45,228
38	Instrum, photo/optical equip	104	111	623	5.6%	$2,154	$2,530	$13,905
39	Misc products of manuf.	1,060	1,281	4,713	4.6%	$4,084	$4,933	$17,868
	Waste/scrap(STCC40,48,49)	13,731	16,139	45,218	3.7%	$1,747	$2,083	$5,638
	Misc freight (STCC 41,46,50)	14,582	16,651	42,832	3.3%	$25,216	$28,460	$77,967
45	Shipping Containers (rail)	403	508	647	1.4%	$315	$397	$506
	Mail (STCC 43,45,47)	207	257	328	1.4%	$162	$201	$257
	TOTAL	346,892	403,423	651,083	1.9%	$218,536	$258,829	$570,635

Notes: Some rail waybill-only commodities combined with related categories, as noted.
Excludes tonnage traveling through Oregon without an Oregon origin or destination.
Growth Rate = Compound annual growth rate 2002-2035.

Truck

Of the 226 Mtons that originate as truck trips in Oregon in 2002, 85% stayed within Oregon, with the remainder shipped to the rest of the world, mainly to Washington (15.9 million short tons) and California (11.0 million short tons). The Washington flows include local trips within the Portland-Vancouver region that travel between states. This outbound truck flow is forecast to grow significantly (3.6%) while inbound and internal flows grow more slowly (1.3% and 1.8%, respectively). The outbound growth is dominated by a few commodities exhibiting significantly large domestic outbound growth.

The FAF2 truck growth forecasts imply that the currently balanced inbound (head-haul) and outbound (back-haul) flows for the state will become more outbound focused by 2035. This is primarily the result of a large growth in domestic outbound flows for the following selected commodities: farm products, food products, rubber/plastics, clay/concrete/glass/stone, fabricated metals, transportation equipment, waste/scrap, and miscellaneous freight shipments.

Even though the FAF2 Oregon Remainder zone is more than 20 times larger in area than the FAF2 Oregon Portland zone, Oregon Remainder receives only 46% more goods, receiving 133.5 million short tons in 2002 compared with Oregon Portland's 91.2 million short tons.

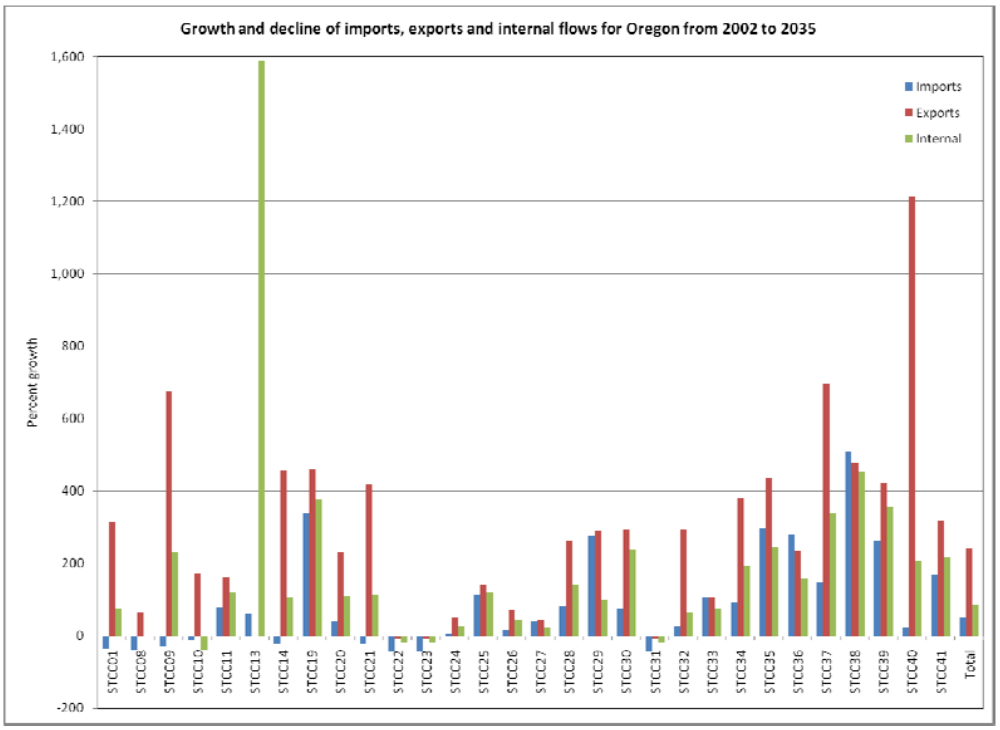
Clay, concrete, glass, or stone products (STCC 32) are the dominant commodity in terms of tons carried by truck, making up 41.6% of internal and 6.8% of outbound tonnage flows in 2002. FAF2 forecasts that this commodity will remain the highest tonnage level commodity transported by trucks, although its share of internal truck tons are forecast to decrease to 38.2 %. The largest outbound commodity in 2002 is machinery, excluding electrical (STCC 35), with 28.2% of all outbound flows.

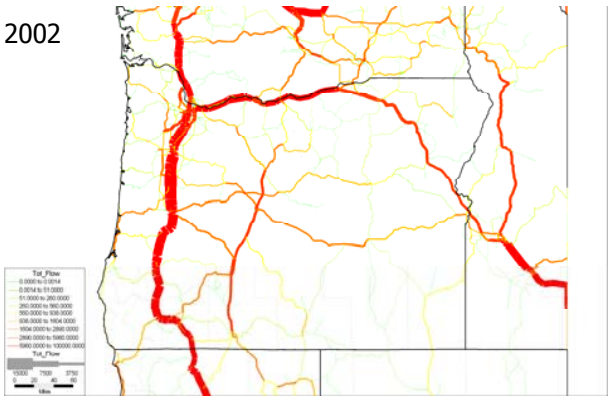
Exhibit 6 shows the major shifts in commodity tonnage flows by trucks. The high growth rate of STCC13 (crude oil, natural gas or gasoline) is due to the small absolute numbers in the base year. According to FAF2, the largest growth in internal as well as inbound flows is in instruments, photo/optical goods (STCC 38), and waste/Scrap (STCC 40) is expected to grow more than 13-fold.

The FAF2 truck growth forecasts imply that the currently balanced inbound (head-haul) and outbound (back-haul) flows for the state (33.3 Mtons IB and 31.4 Mtons OB Truck), will change into a more outbound-focused balance by 2035 (50.6 Mtons IB and 101.7 Mtons OB Truck). This is primarily the result of large growth in outbound domestic flows for the following selected commodities: farm products, food products, rubber/plastics, clay/concrete/glass/stone, fabricated metals, transportation equipment, waste/scrap, and misc. freight shipments. While this growth may be optimistic, the commodities experiencing the domestic outbound growth seem reasonable. Indeed, the list includes Oregon's fastest-growing export commodities: Primary metal manufactures, Miscellaneous manufactures, and Transportation equipment all grew more than 94% between 2002 and 2006 per the Bureau of Census, Foreign Trade Division data. And

domestic demand for Oregon farm and food products and plastics is certainly strong. [1] As a result, no adjustment was made to alter these high FAF2 growth rates, keeping the integrity of the FAF2 forecast intact. It should be noted that these trends are being verified by discussions with weigh station staff and FAF2 forecasters

Exhibit 6: 2002-2035 Growth of Oregon Truck Tonnage Flows by Commodity





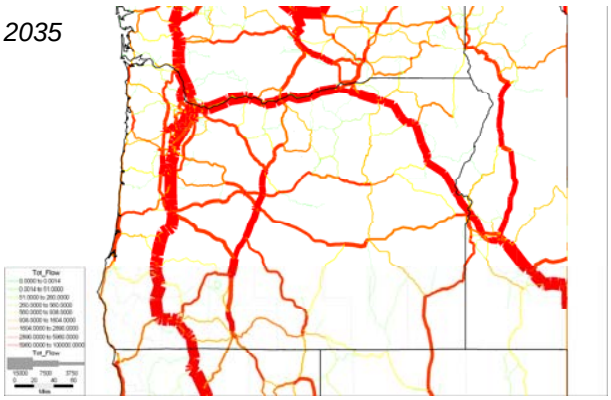


Exhibit 7 identifies the truck trips (vehicles) assigned to the Oregon network in base year 2002 and forecast year 2035. Some adjustment of FAF2 flows was required to replicate the higher flows on the north-south I-5 corridor versus the east-west I-84 corridor.

Exhibit 7: Oregon CFF Truck Assignment Results (vehicles)

2002

2035

http://www.sedcor.org/pdfs/Express5_07.pdf

Rail

Approximately 25% of all rail tonnage is lumber or wood products; other top commodities include chemicals, pulp, farm products, and food products. Together, these commodities make up about 65% of all rail tonnage. By direction in 2002, 14 to 16% travel inbound-outbound to non-Portland Oregon locations, roughly in balance. The inbound flows to Portland exceed the outbound flows (29% versus 12%), while 26% of the tonnage travels through the state. The through flows include trains from Washington that travel east up the Oregon side of the Columbia River corridor without stopping in Oregon

All commodities are expected to grow over time, except for forest products, which is expected to decline by approximately 50% from 2002 to 2035.

Exhibit 8 summarizes rail tonnage in, out, within, and through Oregon, based on waybill data flow pattern and FAF2 growth rates. The largest rail tonnage for the year 2002 moved from the rest of the world (ROW) to Oregon Portland followed by through trips (origin and destination outside Oregon). The next tier of tonnage is from Oregon Remainder to the rest of the world, followed by the reverse direction, and then flows from Oregon Portland to the rest of the world. Over time, the pattern of flows does not change.

Exhibit 8: Summary of Oregon Rail Flows (1000 tons)

Origin	Destination	2002 Waybill	% of Total	2010 Forecast	% of Total	2035 Forecast	% of Total
ROW	Oregon Portland	15,269	29.10%	19,065	30.00%	24,060	28.10%
ROW	ROW	13,448	25.60%	16,271	25.60%	21,486	25.00%
Oregon Remainder	ROW	8,294	15.80%	9,642	15.20%	12,670	14.80%
ROW	Oregon Remainder	7,113	13.60%	8,270	13.00%	13,391	15.60%
Oregon Portland	ROW	6,206	11.80%	7,326	11.50%	10,059	11.70%
Oregon Remainder	Oregon Portland	625	1.20%	1,142	1.80%	1,215	1.40%
ROW	Oregon Portl_SeaPort	536	1.00%	565	0.90%	963	1.10%
Oregon Portland	Oregon Remainder	289	0.60%	555	0.90%	542	0.60%

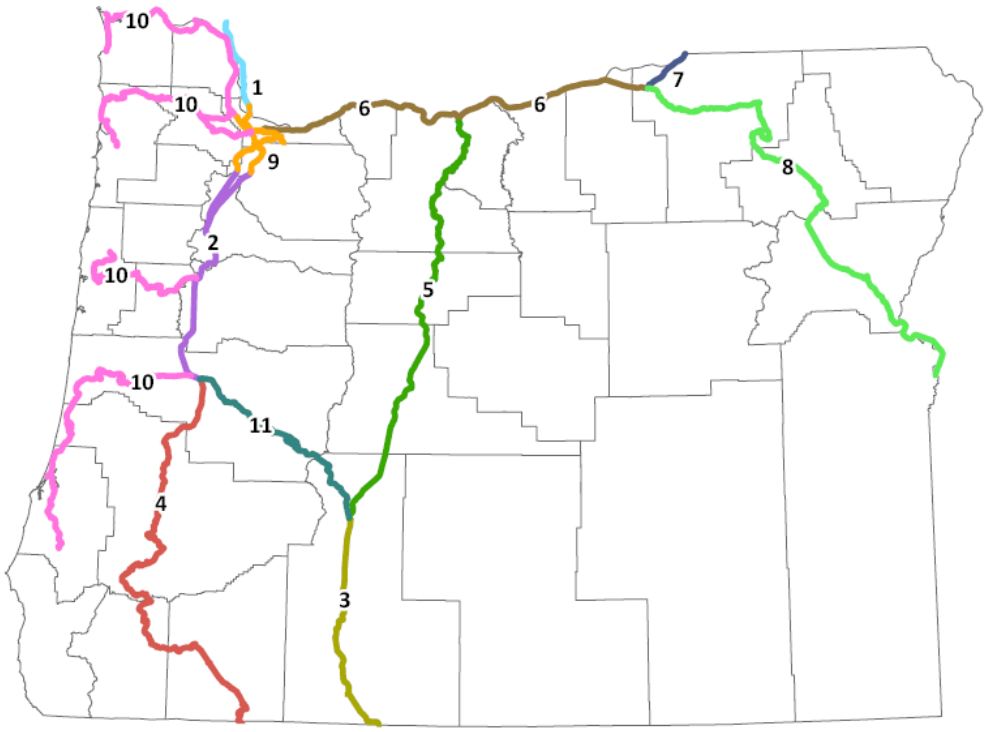
Oregon Portland	Oregon Portland	228	0.40%	320	0.50%	565	0.70%
Oregon Remainder	Oregon Remainder	196	0.40%	201	0.30%	277	0.30%

Oregon Portland – Multnomah, Washington, Clackamas, and Columbia Counties
Oregon Remainder – All other Oregon Counties
Oregon Portl_SeaPort - Port of Portland Sea Port
ROW – locations outside of Oregon

The rail tonnage origin-destination flows were assigned to the corridors as shown in Exhibit 9, using the corridors shown in Exhibit 10. Any rail flow using the corridor for any distance is counted in the Exhibit 9 tonnage for that corridor. Corridor 10 is actually a grouping of the four coastal rail corridors, including the currently inoperable Port of Tillamook Bay and Port of Coos Bay rail lines[2]. The largest corridor flows are in Corridor 9 (system of freeways in the Portland metropolitan area) and Corridor 6 (I-84



[2] The Port of Coos Bay intends to restore service on their rail line before 2012 (interview with Port of Coos Bay staff as part of the Oregon Strategic Port Plan, July 2009).

east of Portland metropolitan area). The lowest rail flows are on the coast (Corridor 10) and in southwest region of the state (Corridors 4 and 11).

Exhibit 9: Oregon Rail Tonnage Assignment by Corridor (1000 tons)

Corridor	Description	2002 Waybill	% of Total	2010 Forecast	% of Total	2035 Forecast	% of Total
9	Portland area	41,713	26.0%	56,489	26.1%	87,197	26.1%
6	Columbia River Corridor	37,022	23.1%	49,594	22.9%	77,379	23.2%

Note: Coastal lines grouped into Corridor #10

Water

The Portland Harbor, at the confluence of the Willamette and Columbia Rivers, is the connection for 85% of all water flows in Oregon. It is dominated by the Port of Portland, with roughly half of the Portland Harbor commodity movements served by other nearby private facilities in 2002. The primary commodities moved in the harbor include grains, fuels, metals, mineral, machinery, motorized vehicles, and clay/concrete/glass/stone. The Portland Harbor's inbound and outbound flows are both forecast to grow annually by roughly 1.3 and 2.0%, respectively.

Commodity movements by water at coastal ports (Coos Bay and Astoria) are dominated by the exchange of wood chips and logs, with minor flows of fuel, lumber, fish, machinery and transport equipment. Port of Coos Bay is significantly larger than the Port of Astoria (1.4Mtons compared with 0.09Mtons in 2002), but its log flows are subject to dynamic changes in the value of the US and Canadian dollars, and these flows are forecast to decline over time (-1.8 % annually).[3] Other commodity flows at both ports are forecast to grow at a roughly 2-3 % annual rate between 2002 and 2035.

Columbia River ports (Morrow and Umatilla) downriver flows are dominated by the outbound flow of grains, animal feed (hay), and other agriculture products. Upriver flows are primarily waste, fuel, and some fertilizers. Port of Morrow is slightly larger than Port of Umatilla (662ktons compared with 548ktons in 2002), with significant container traffic and agriculture products, while the Port of Umatilla is dominated by the large grain and fuel facilities. The upriver growth is projected to grow by 1%, while the outbound downriver commodities are forecast to grow at a faster 5% growth.

Marine flows by port and direction are summarized in Exhibit 11.

[3] Port of Coos Bay indicated some additional forest product outbound flows not included in the US Army Corp of Engineers Waterborne Commerce Data. These data were not provided at the time of publication of this memorandum, so are not included here.

Air

PDX accommodates 99% of all international air cargo flows into and out of the state and 95% of all domestic flows in 2002. Shipments greater than 100 pounds from parcel carriers were included in freight; smaller shipments are included as air mail. International air freight, representing 18ktons of textiles, machinery, base metals, electronics, agriculture products, and precision instruments in 2002, grows annually by 5% for inbound and 3% outbound between 2002 and 2035.

A variety of commodities move by air in small quantities. Top domestic commodities moved by air to and from PDX include: electronics, prepared foodstuffs, base metals, transportation equipment, meat/fish/seafood, machinery, chemicals/chemical preparations, and miscellaneous manufactured products. PDX transports pharmaceuticals and mixed freight to other Oregon airports. Top air freight domestic commodities for the other Oregon airports include: prepared foodstuffs, base metals, meat/fish/seafood, and electronic equipment. Overall domestic freight grows annually by 3.5% for both inbound and outbound flows between 2002 and 2035 (less for non-PDX airports). Higher growth is forecast in agricultural products, pharmaceuticals, machinery, and precision instruments, with lower than average growth in chemicals, wood/paper products, metals, electrical equipment and mixed freight. Despite the high growth rates the tonnage moved remains a small but critical freight movement for the state.

All air mail (STCC50), representing 6.5ktons in 2002 was assumed to pass through PDX, before/after other Oregon airports. Since FAF2 does not provide forecasts of air mail, it was assumed to grow at the rate of population (1.3% per year per OEA population forecast) from 2002 to 2035.

FAF2 data was scaled to have inbound and outbound flows roughly in balance in 2002, growth rates of various commodities, led to non-PDX airports having 2:1 outbound flows in 2035.

Pipeline

Natural gas is 100% delivered via pipeline. Natural gas imports used by Oregon (4.7Mtons in 2002) are forecast to grow by 1.7% annually from 2002 to 2035. Natural gas passing through Oregon to California (13.7Mtons in 2002) grows by a slow 0.7% annually during this period, showing almost no growth at all until after 2010). Natural gas imports shift, less is imported via the Williams Eastern Oregon Branch from Salt Lake City via Ontario, balanced by an increase from the PGE Alberta line through Idaho and Umatilla.

Pipeline-delivered petroleum is imported to Oregon via the Olympic Pipeline from Washington via Portland (92%) and the Chevron Pipeline (8%) from Washington via Umatilla. The Kinder Morgan pipeline distributes petroleum from Portland to the Willamette Valley via Eugene. Oregon has no through petroleum pipeline flows. Petroleum delivered by pipeline to Oregon is expected to grow by less than 0.1% from 2002 to 2035.

Comparison to Other Forecasts

This section compares the Oregon Commodity Flow forecast to the following studies:

- Prior Oregon Commodity Flow Forecast (Global Insight base year 1997)
- Panama Canal Expansion Impact
- Port of Portland Portland/Vancouver Trade Capacity Analysis (Global Insight base year 1997)
- Oregon Agriculture statistics

Prior Commodity Flow Forecast

The most recent detailed study of Oregon's statewide commodity flow patterns was prepared by Global Insight in 2004. This prior forecast was used in the 2006 Oregon Transportation Plan (OTP). This section compares that prior commodity flow forecast with the results of this work.

In the base year, which was 1997 for the prior Global Insight commodity flow forecast and 2002 for the current FAF2 work, the Global Insight forecast is quite a bit higher in both tonnage and value terms (value numbers may reflect dollars in different year constant dollars). Global Insight had overall growth of 1.7% for 1997 to 2030 as compared with the FAF2 forecast of 2.2% for 2002 to 2035, with some variance by mode (see Exhibit 12). Global Insight has lower water growth rates and holds the pipeline flows fixed (0% growth).

The following tables use 2030 as the forecast year since it was included in the current ("Oregon CFF") and previous ("Global Insight") commodity flow forecasts and will be used as the point of comparison.

Exhibit 12: Global Insight and FAF2 Forecast (Mtons)

Mode	Oregon CFF			Global Insight			
	2002	2030	Growth Rate 2002-2030	1997	2000	2030	Growth Rate 1997-2030
Tonnage (MTons)							
Truck	259,213	466,782	2.1%	330,027	341,778	631,172	2.0%
Rail	39,008	61,395	1.6%	55,225	56,971	100,606	1.8%
Water	34,835	59,216	1.9%	38,266	35,238	45,092	0.5%
Pipeline	13,599	16,601	0.7%	10,713	10,713	10,713	0.0%
Air	236	624	3.5%	318	329	747	2.6%
Total	346,892	604,618	2.0%	434,549	445,029	788,330	1.8%
Value ($M)							
Truck	159,878	353,660	2.9%	399,272	419,364	1,114,936	3.2%
Rail	15,631	25,126	1.7%	70,583	72,889	138,403	2.1%
Water	22,467	52,989	3.1%	30,233	31,091	40,023	0.9%
Pipeline	7,307	8,939	0.7%	3.816	3,816	3,816	0.0%
Air	13,253	47,077	4.6%	3.232	3,316	10,536	3.7%
Total	218,536	487,790	2.9%	507.136	530,477	1,307,715	2.9%

Growth Rate = Compound annual growth rate 2002-2035.

Global Insight and the Oregon CFF forecast a similar growing truck share, and the rail and air shares are also consistent between the two forecasts. Global Insight shows smaller and declining water and lower pipeline forecast than the Oregon CFF.

As shown in Exhibit 13, the variation in growth rates can be attributed in large part to the FAF2's much higher forecast for tonnage heading out of the state of Oregon.

Exhibit 13: Global Insight and FAF2 Forecast, by Flow Direction

Flow	Oregon CFF (Mtons)			Global Insight (Mtons)			
	2002	2030	Growth Rate 2002-2030	1997	2000	2030	Growth Rate 1997-2030
Inbound	86	131	1.3%	215	222	386	1.8%
Internal	198	367	1.9%	77	76	132	1.6%
Outbound	63	152	2.8%	85	87	148	1.7%

Growth Rate = Compound annual growth rate 2002-2035.

In both forecast sets, base year major commodities are stones/minerals/ores, food products, and fuels, as shown in Exhibit 14. GI shows a higher share of forest/wood products, while the Oregon CFF shows higher shares for miscellaneous commodities and waste. Overall growth rates are very similar between the two forecasts, although there are some differences by commodity; specifically Oregon CFF exhibits higher growth for manufacturing products, chemicals, miscellaneous products and waste, and a much lower forest/wood products growth rate. The Global Insight forecast did not separately forecast Commercial Fish (Live Fish) commodity flow.

Exhibit 14: Global Insight and FAF2 Commodity Share

STCCs	Description	Commodity Mix (% of total)		Growth Rate	
		Oregon CFF 2002	Global Insight 1997	Oregon CFF 2002-2035	Global Insight 1997-2030

40	Waste	7%	2%	3.7%	2.4%
	TOTAL	100%	100%	1.9%	1.8%

Growth Rate = Compound annual growth rate 2002-2035.

Panama Canal Impacts/Forecasts

The Oregon CFF was compared with forecasts developed for the Panama Canal expansion study, by Parsons Brinckerhoff staff experienced with international freight movements. It is difficult to speak specifically about Oregon commodity movements within this larger international context given that there are other U.S. and West Coast ports (Tacoma, Seattle, Oakland, Los Angeles/Long Beach) that have a much larger share of the international export/import market compared to Portland Harbor. Additionally, forecasts from the Panama Canal work are proprietary; however, a few general comparisons can be drawn.

In general, the Panama Canal study found that international export commodity annual growth rates of 2 to 4% are within a reasonable range for nearly all commodities over the next 30 years. Oregon CFF has a 2002 to 2035 average annual growth rate for outbound (domestic and international flow) of 2.8%, 1.8% if considering only international non-truck mode[4] Forest, lumber and wood products (STCC8 and 24), fuels (STCC13), and primary metals (STCC33) outbound flows are forecast to grow less than 2% annually in the Oregon CFF. In the case of forest and wood products, this reflects Oregon's declines in this industry. In the case of fuels, the lower growth is consistent with the Oregon CFF assumption that fuel usage growth is population-based Commodities with a higher growth rate of 4 to 7% include rubber/plastics (STCC30), transportation equipment (STCC37), waste/scrap (STCC40), miscellaneous shipments

[4] International truck flows are not broken out, but include a small 100ktons in 2002, consisting primarily of motorized vehicles and plastics/rubber exported to Mexico.

(STCC39 and STCC41). Only the growth rates of the low growth commodities listed above fall outside of the 2 to 4% range when considering non-truck outbound international flows.

The expansion of the Panama Canal is expected to shift some container liner calls from West Coast to East Coast ports, as it becomes less expensive to reach East Coast markets via the Panama Canal rather than shipping across the U.S. mainland through West Coast ports. The impact to Oregon, however, is expected to be limited, if any. The Oregon CFF identifies only selected international commodities shipped through Oregon ports to the East Coast. Of such flows (roughly 65,000 tons in 2002), over 75% are machinery and base metals (STCC 35 and 34) shipped from Asia to the Port of Portland and then via air, land or rail to the East Coast. Automobiles handled through the Port of Portland are not expected to be impacted, as they are typically destined for the Midwest rather than East Coast.

Portland/Vancouver Trade Capacity Study

The Port of Portland commissioned Global Insight to prepare a Portland/Vancouver Trade Capacity Analysis (Trade Study) for the bi-state metro region in 2006, covering air, water, truck, and pipeline. The comparison with the Oregon CFF is complicated by the fact that the Trade Study includes both Oregon and Washington sides of the Portland-Vancouver region, while FAF2 includes an four-county Oregon-only Portland zone (Multnomah, Washington, Clackamas, and Yamhill Counties), and Vancouver is grouped with the rest of Washington State (outside Seattle and Blaine, Washington). Additionally, the Trade Study uses SCTG commodity classification, rather than the STCC codes used in the Oregon CFF. An effort to add the Vancouver share of flows to the Oregon CFF would require some in-depth analysis of the Trade Study and other relevant data sets such as Washington traffic counts, origin-destination truck surveys, rail waybill data, and employment by industry data.

As expected the Trade Study, which covers both Vancouver and Portland, includes quite a bit more tonnage - 261Mtons in 1997 as compared with 188Mtons in 2002 for the Oregon CFF within the Portland Harbor - with the difference representing the Washington side of the Metro area, and the inclusion of some local trips (express shipments) absent or under-reported in the Oregon CFF. After accounting for the different commodity classifications, the mix of commodities in the Portland region compares favorably between the two studies as shown in Exhibit 15. Oregon CFF shows more stones/minerals/ores and waste, while having slightly less food/forest products in the base year. Growth rates are largely consistent. Oregon CFF has lower growth for stone/minerals/ores, forest/wood growth, metals, and machinery rate, and higher growth for fuels and manufacturing products.

Exhibit 15: Commodity Mix of Port Trade Study and Oregon CFF

STCCs	Description	1997 Portland/Vancouver Trade Study Share	1997 Portland/Vancouver Trade Study Growth Rate	2002 (Portland Only) Oregon CFF Share	2002 (Portland Only) Oregon CFF Growth Rate

Growth Rate = Compound annual growth rate 2002-2035.

Agriculture

National agricultural statistics, the Oregon Department of Agriculture, and the Oregon State University Extension Service provide Oregon agriculture facts and figures. Given the differences in commodity categories (crops, livestock, fish, and nursery products), units (ranging from bushels to hundredweights rather than tons), and years it is difficult to directly compare these data. Additionally, agriculture statistics are typically reported as production amounts that are consumed both within the state and exported both domestically and internationally. As an order of magnitude estimate, the Oregon agriculture facts and figures report 2008 agricultural production valued at $4.9 billion, a record high. The comparable figure for Oregon CFF is an outbound flow of $3.9 billion forecast for 2008 (given 2002 base year), excluding commodities in-state. Overall, the Oregon CFF agriculture estimates seem to be with a reasonable range of the reported statistics.

Potential Future Efforts

The Oregon CFF 2002 to 2035 forecast provides a basis for understanding the primary freight movements today and in the future under existing conditions. In several instances circumstances are likely to change, and the detail and transparency provided in Oregon CFF can provide a starting point for evaluating such changes. Alternative scenarios, as identified by groups such as the Freight and Economy Working Group or Freight Steering Committee, might include changes to transportation networks (e.g., reflecting the cessation of operations across the Coast Range of the Port of Tillamook Bay and Port of Coos Bay Railroads, one or more potential new liquid natural gas

terminal(s)), freight mode shifts (e.g., truck-rail diversion), changes in infrastructure capacity and/or operational philosophy (e.g., Union Pacific restrictions through the Siskiyou Mountains, bi-directional running between Class I railroads), or potential new cargo market opportunities (e.g., Port of Portland attracting new dry bulk cargos, closure of aluminum smelters, shipment of new wind turbines, truck driver shortage). In such cases, specific flows (by commodity or origin-destination pair) can be isolated and modified, such as changing the mode (truck-rail mode share changes), or the change in forecast growth rate.

One caution in the modification of the Oregon CFF is in keeping the intact nature of the overall flows. These are based on an underlying economic forecast (Global Insight forecast for FHWA FAF2 work). As such, changes in the economy (e.g., alternative economic conditions or linkage to WOC2 Economic Forecast) affect many sectors and thus multiple commodities, and for that reason it is hard to consistently capture all the likely effects without a careful analysis and accounting of the underlying economics.

Three other potential future enhancements to the Oregon CFF database are:

- Further classification of the marine flows to the handling group level, such as containers, bulk, break-bulk, autos, etc.
- Inclusion of shortline railroad commodity movements, using ODOT collected and processed data, combined with FAF rail commodity-specific growth rates.
- Inclusion of inter-modal commodity flows. These are flows that travel by more than one mode, such as truck transferring to rail. Because it is not possible to identify which leg of the trip was made by which mode within the FAF data, these flows were not evaluated for this effort. However, it would be possible to establish a methodology to split these trips, particularly the truck and rail trips which use established corridors.
- Update of the Oregon CFF based on more recent economic forecasts.
- Review of the Oregon CFF by industry and/or key commodities across all modes.

Conclusions

The Oregon CFF examines all commodity flow modes using a methodology derived from the FHWA FAF2 national commodity flow forecast. The Oregon CFF forecasts have undergone scrutiny from:

- The consultant teams' modal experts and quality assurance and control process,
- Port of Portland economic and planning staff,
- The Freight and Economy Working Group, and
- Comparisons with other efforts, including the Port of Portland's Trade Study.

The Oregon CFF method is transparent in its assumptions and data sources; the inability to alter the underlying FAF2 economic forecasts is a potential shortcoming, but the FAF2 commodity growth assumptions have shown a strong resilience in the face of close scrutiny. The Oregon CFF should provide a solid basis for ODOT freight planning work, including a strong basis for the upcoming multi-modal Oregon Freight Plan and a sound foundation for the evaluation of alternative scenarios.

Appendix A: Detailed Methodology

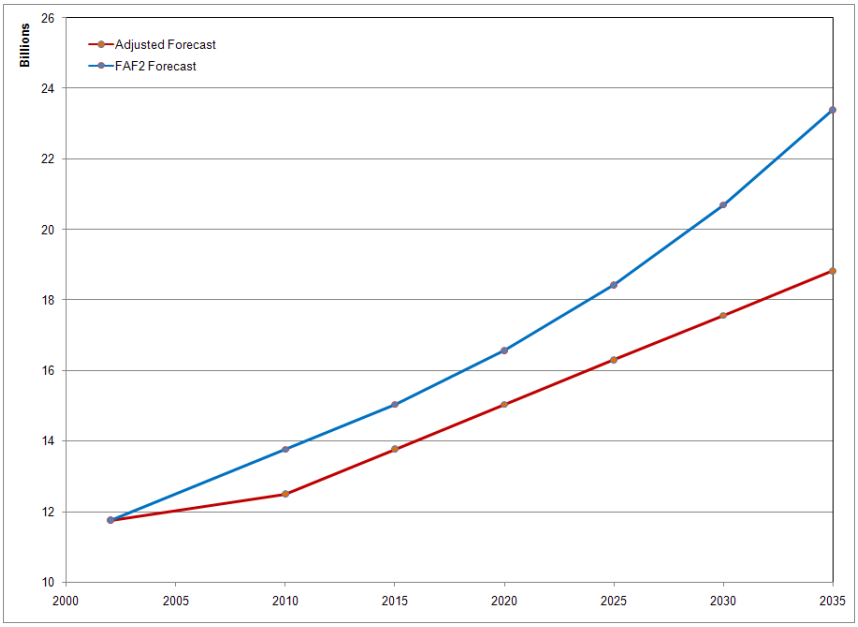
The Oregon CFF approach of building on the FHWA FAF2 national commodity flow forecast was chosen because FAF2 is national in scope, highly regarded in terms of capturing interstate and international flows, uses a relatively recent base year (2002), and provides a quick way to complete a forecast in time for the Oregon Freight Plan work anticipated for Fall 2009. However, the inability to adjust or quantify the FAF2 underlying economic forecasts, particularly the optimistic economic conditions and low fuel price assumptions, poses some limitations that must be taken into account, which are partially addressed through adjustments noted herein. This section discusses the methodology and data sources used to develop the Oregon CFF, including the FHWA FAF2 dataset and disaggregation of each model to sub-state level within Oregon.

FHWA FAF2 Forecast Dataset

The key source for the Oregon CFF is the FAF2, published by FHWA in 2002. FAF2 provides freight flows in tons or dollar value between 130 FAF2 regions encompassing the US for the year 2002 plus forecasts from 2010 to 2035 in five year increments. The mode is distinguished as well as 43 commodities classified by Standard Classification Transported Goods (SCTG) codes. FAF2 is based on the national Commodity Flow Survey, which only captures freight flows of 50 miles or more; therefore short-distance flows, which are less important in analyzing freight flows at the statewide level, are underrepresented in the FAF2 dataset.

FAF2 does not make explicit assumptions about future mode split. The mode split for every commodity derived in the base year is kept constant in forecast years, and the mode split only changes if the share of a commodity grows or declines. For instance, if the amount of coal shipped in the US declines in a given year, the, that share of the rail mode also declines because most coal is currently shipped by rail.

FAF2 flows are provided in 43 SCTG commodity classes. For this study, the commodities were converted into the Standard Transportation Commodity Code (STCC) classification for two reasons. First, flows by truck were transformed into actual truck trips, using payload factors provided by Battelle (2002) given in STCC commodity classifications. Further, the Rail Waybill Data from the Surface Transportation Board, which is used to disaggregate rail flow forecasts, is provided in STCC categories.



The SCTG-to-STCC conversion used by truck and rail modes is based on 1999 IMPLAN[5] freight data compiled under ODOT TPAU work done in support of the 2002 ODOT Bridge Limitation Study. The conversion process allocates each SCTG flow into multiple STCC flows in a many-to-many mapping, where each of the 43 SCTG categories is split into multiple STCC categories.

[5] IMPLAN, (Impact analysis for Planning), is a static model based on input-output modeling structures, adapted for geographic areas down to the county level.

For the air, water, and pipeline modes a more simplistic one-to-many mapping process is used.6 This approach is better suited to the select commodities moved by these modes, where the many-to-many proportional allocation would result in some commodity tonnage that is not transported by air, water or pipeline. Both the SCTG and STCC commodity codes were retained in the Oregon dataset for air, water, and pipeline modes because the SCTG categories are a more accurate description of the commodity as initially classified by FAF2, while the STCC code allows consistency with the other modes in the Oregon CFF. Appendix B provides a listing of both the FAF2 SCTG and the Oregon CFF STCC commodity codes.

The FAF2 forecasts for the years 2010 through 2035 are based on an economic forecast provided by Global Insight in 2002, specifically for FAF2. This underlying economic forecast is proprietary and unavailable for further analysis or adjustment. A paper by Battelle (2007) summarizes the forecasts' key assumptions on macro-economic growth. This economic forecast leads to fairly optimistic FAF2 growth rates for freight in the US, as shown by the blue line in Exhibit A1 which shows the growth of truck flows (in tons) as an example.

Exhibit A1. Original and Adjusted FAF2 Total Truck Commodity Growth Rates (Btons)

After 2015, FAF2 proposes an exponential growth of trucks flows, almost doubling the tons shipped by truck from 2002 to 2035, which appears too optimistic for two primary reasons. First, the current economic downturn could not have been foreseen when the

[6] For instance, for Oregon trucks STCG 13 "Nonmetallic minerals n.e.c." corresponds to 67% STCC 32 "Clay, concrete, glass, or stone product" and 33% STCC 14 "Nonmetallic ores, minerals, excluding fuel." However for air, SCTG 13 is likely only to correspond to STCC 14, as the heavier STCC 14 commodity is unlikely to travel by air.

FAF2 flows were released in 2006; the first forecast year 2010 is likely to generate significantly fewer truck trips then proposed by the FAF2 forecast. Second, Battelle (2007) assumes constant fuel prices until 2035, but the expected depletion of the oil reserves will most likely result in significant fuel cost increases that will affect truck flows more severely than rail or water flows. Though there is little consensus on the actual mode split after the oil price shock seen in recent years, it is likely to limit growth in freight traffic overall.

The red line in Exhibit A1 represents a more conservative growth rate for truck flows used in the Oregon CFF work, as compared with the FAF2 growth rate. The years 2005 and 2010 have been scaled down to account for the current economic downturn, consistent with the Oregon Office of Economic Analysis (OEA) recent forecast (Global Insight, April 2009), which assumes a 1.8% growth rate, relative to the 5% growth rate in FAF2. For future years after 2010, a linear growth rate was assumed, consistent with the nearly linear FAF2 growth rate from 2002 to 2015. The same 2% rate has been applied to FAF2 forecast freight flows from 2015 onward, as compared with the more optimistic 3% growth rate in the out-years of the OEA Global Insight forecast. This down-scaling only affects the total tonnage volume, as the flow patterns given by FAF2 remain unaffected. The resulting ratio of adjustment for FAF2 data for all modes was applied and is shown in Exhibit A2.[7]

Exhibit A2. Adjustment to FAF2 Growth Rates for All Modes

Year	Adjustment to FAF2 Growth Rate
2010	0.907703
2015	0.915536
2020	0.907576
2025	0.88464
2030	0.848849
2035	0.804833

While the effects of the economic downturn and fuel price changes on the air, rail, water, and pipeline modes are less certain than the effects on the truck mode, it was determined that all modes are impacted by the overly generous forecasts and thus are all impacted using the factors noted above. The impacts of fuel prices on rail, water and air are disputed and even more uncertain than for trucks. Therefore, while the FAF2 flows were down-scaled for all flows, it is important to recognize the uncertainties in these adjustments.

The FHWA FAF2 database provides both tonnage and value in its results. Exhibit A3 summarizes the 2002 average value density function ($/ton) for each commodity by mode, based on a sample of FAF2 domestic flows for Oregon, which can be applied to the tonnage in this report. Value density values are highly variable, depending upon the mix of commodities in each category and vary by state and mode, and over time.

[7] Fishing and air mail forecast tonnages, generated outside of the FAF2 forecast, were not adjusted.

For example, the values shipped by air are typically quite a bit higher than those shipped by rail.

50	Bulk in boxcar	NA	NA	781.5	NA	NA

NA = No Oregon CFF of this commodity by this mode.
Values are based on 2002 FAF2 Oregon dataset domestic sample, in units of $M and 1000tons.
High precision is retained, since this will be applied to large annual tonnages.
STCCs 42+ are not included in FAF2; their rates assumed to match STCC40 or STCC41.

Modal Disaggregation

FAF2 regional zones are relatively coarse, as shown in Exhibit A4. Oregon is covered by two zones: Oregon Portland and Oregon Remainder. The Oregon Portland zone includes the Oregon portion of the Portland-Vancouver region covering Multnomah, Washington, Clackamas, and Yamhill Counties. The remaining 32 Oregon counties are included in the Oregon Remainder zone.

Exhibit A4. FAF2 zones and counties

For those trip ends within Oregon, the FAF2 commodity flows for each mode were disaggregated from FAF2 zones to Oregon counties. In the case of truck flows, this was done based on county employment and IMPLAN inter-industry coefficients, while other modes relied on local data to allocate FAF2 flows to specific Oregon facilities (rail stations, airports, marine ports, or pipeline terminals). Zones outside of Oregon were aggregated from FAF2 zones to "Other Domestic" and "Other International" (including Canada and Mexico) categories.8 These methods and data are described in more detail below.

County Employment/IMPLAN Disaggregation Method (used by truck)

To increase spatial resolution, truck flows between 130 US FAF2 zones were disaggregated to flows between 3,241 US counties. Even though the disaggregation of flows in the eastern part of the US does not improve precision of Oregon flows, disaggregating all flows the same way enables a coherent method to be applied throughout the country and allows capture of through truck traffic.

[8] For example, a container of goods originating in Asia bound for Salem Oregon, would be represented as an International "SEA" flow with origin Asia FAF region and destination 'Oregon Remainder' and an gateway of Tacoma port. For the Oregon CFF, this is further broken down into an 'Other International' trip by water that we ignore, and a 'domestic' truck trip from "Other Domestic" (Tacoma) to Marion County (Salem, OR). Further, each different commodity within the container would be treated as a separate annualized flow between these trip ends.

Employment was used as a weight for the truck flow disaggregation to counties as counties with more employment are assumed to produce and attract more trucks. Within Oregon, nonfarm employment forecasts from the OEA Global Insight forecast (June 2009) were used for the following sectors: construction, natural resources, and mining; manufacturing; transportation, trade, and utilities; information; financial activities; professional and business services; educational and health services; leisure and hospitality; other services; and government. Oregon agriculture employment by county was added based on 2007 U.S. Department of Agriculture data.

The use of employment by industry type combined with inter-industry coefficients allows the allocation of the origins and destinations of flows to counties with the corresponding employment type. For instance, SCTG25 (logs and other wood in the rough) is produced in those counties that have agricultural employment; similarly, this commodity is shipped to those counties that have employment in industries consuming these types of products. The approach makes use of inter-industry coefficients, referred to as "make" and "use" coefficients, developed from 2007 Oregon IMPLAN input/output tables. These coefficients indicate the commodities each industry makes and uses in its production process.

For instance, if there is a flow of SCTG07 (other foodstuff) being shipped from FAF2 zone A to FAF2 zone B, and the IMPLAN data indicates that this commodity is produced by two industries: 3% by agriculture and 97% by manufacturing, then the employment of all counties in FAF2 zone A is used to distribute the origin of that flow over all counties, weighted by the make coefficients derived from IMPLAN data. In this example, the share of the origin of this flow for county C in FAF2 zone A is described by the following equation:

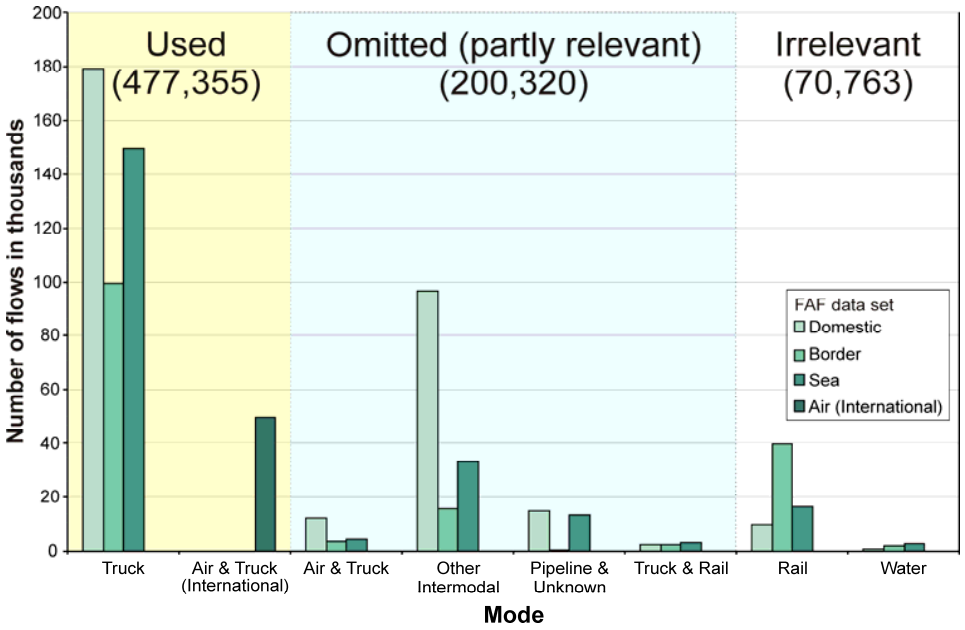
$$sf_{c \in A} = FAF_{A,B} \cdot \frac{0.03 \cdot agEmp_c + 0.97 \cdot manEmp_c}{\sum_{z \in A} 0.03 \cdot agEmp_z + 0.97 \cdot manEmp_z}$$

$sf_{c \in A}$	Share of flows originating in county c which is located in FAF2 zone A
$FAF_{A,B}$	FAF2 flows from FAF2 zone A to FAF2 zone B
$agEmp_c$	Employment in agriculture in county c
$manEmp_c$	Employment in manufacturing in county c

To disaggregate the destination of this flow, the use coefficients derived from the IMPLAN data are applied with the same procedure.

This disaggregation is applied to commodity flows where the origin or destination is within Oregon. No detailed employment forecast at the county level are available outside of Oregon so 2002 total employment is used to disaggregate flows with an origin and/or destination outside of Oregon, and the Global Insight employment forecast is used for future years. No forecast for agricultural employment is available for Oregon or outside of Oregon, so this employment type is kept constant over time.

The mode split forecasted in FAF2 should be used with care. In FAF2, the modal split is a function of the commodity composition. For each commodity, the modal split remains unchanged throughout the years. If, for instance, a commodity that is dominated by rail



declines over time, the share of rail drops accordingly. No true mode choice is simulated within FAF2. The mode shift reported in FAF2 indicates the demand for modes but is not constrained by capacity, costs, or existence of modal alternatives.

Intra-county trips are not included in the data, and FAF2 data sources tend to under-represent short trips. Additionally, water flows on the Columbia River that do not utilize Oregon's Ports are not included. These limitations are of minimal consequence in the statewide view of freight movement within Oregon that is the goal of this effort.

Trucks

The FAF2 data distinguishes modes and mode combinations. For truck representation, only the mode 'Truck' and the domestic part of the international flow 'Air & Truck' were used, as shown in Exhibit A5. Combinations such as 'Truck & Rail' or domestic 'Air & Truck' were omitted assuming that the longer part of that trip is made by rail or air, and only a small portion of the trip relies on truck transportation; further the data set is not specific enough to distinguish which part of the trip is made by which mode. Of the 200,320 flows omitted, likely only a small portion of these trips are made by truck, and this shortcoming is assumed to be acceptably small. Data for land-border crossings included the portion of the trip from the border crossing to the domestic destination or from the domestic origin to the border crossing. Likewise, sea and air freight was included as a trip to or from the domestic port or airport. Truck trips to distribute air mail to each Oregon county, not included in FAF2, were added based on the OEA 2002 population distribution and forecast.

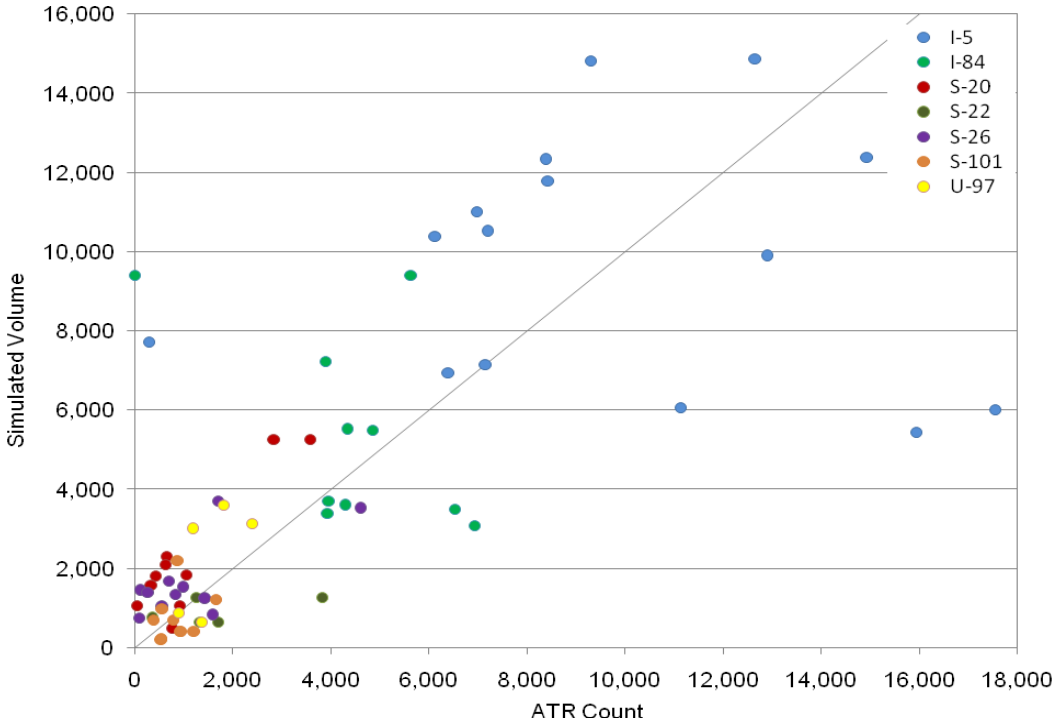
Exhibit A5: FAF2 Truck Data Used in the Oregon CFF

For the dominant modes, truck and rail, the Oregon CFF provides not only tonnage by origin-destination flows, but also vehicle flows on network links. After disaggregating the flows, commodity-specific payload factors (Battelle 2002: 29) were used to convert FAF2 goods flows in tons into number of truck trips. An average empty-truck rate of 19.4% was assumed for all flows based on US Census Bureau truck data (2008). The annual FAF2 flows were converted to flows of an average weekday. Flows were divided by 365.25 days and then a factor of 1.048 was applied to transform Annual Average Daily Traffic (AADT) into Annual Average Weekday Traffic (AAWDT), based on national truck data. Finally, trucks were split into the two truck types: medium-heavy duty trucks weighing below 26,000 pounds and heavy-heavy duty trucks weighing 26,000 pounds and above. The share of each truck type depends on the distance of the truck flow – a longer distance implies a larger share of heavy-heavy duty trucks. The share of each truck type for five distance classes is based on the 2002 Vehicle Inventory and Use Survey (VIUS), published by the US Census Bureau (2004).

The resulting truck vehicle flows were assigned to the US highway network using the TransCAD software and US network. It should be noted that these truck trips no longer retain the tonnage and commodity information of the origin-destination flows. Assigning flows from one county to another requires designating one point within each county as the origin or destination of the flow, with geographic centroids commonly used for these points. In many cases, however, the geographic centroid of the county does not match the activity center in that zone, so the centroid of the largest city within each county was used instead to ensure that the representation of flows within every county is more realistic. During assignment, Medium-Heavy Duty (MHD) trucks are assumed to have a passenger car equivalent (PCE) of 1.5, Heavy-Heavy Duty (HHD) trucks are assumed to have a PCE of 2.5. This accounts for the additional space trucks use on the road in comparison to autos. Additionally, to make trucks sensitive to congestion in the assignment step, a volume delay function is used with adjusted coefficients ($\alpha = 1$ and $\beta = 6$, in the Bureau of Public Roads volume-delay function). Air mail (STCC 43) is not captured in the FAF2 data, so air and truck separate forecasts were developed for traffic generate by air mail and were added to the FAF2 data. These estimates assumed airport mail tonnage from airport statistics was further distributed to each county, based on the OEA forecasted state employment share (see further discussion under the air mode discussion below).

A detailed analysis of the shipping of fish (STCC 09) revealed that FAF2 and the truck disaggregation method to Oregon origins and destinations using agricultural employment by county did not capture fish flows with the desired detail. Further information was collected, and a fish commodity flow dataset was created synthetically to replace the FAF STCC9 flows (see discussion of 'specialty area' at the end of this chapter with further detail in Appendix D). An average payload factor of five tons per truck was assumed for both air mail and fish flows.

Traffic counts from 133 of Oregon's Automatic Traffic Recorder (ATR) stations were geo-referenced to the network to validate the truck assignment results (ODOT 2009).



The ATR data provide total vehicle counts as well as counts by vehicle classification for year 2003. A first comparison of simulated truck volumes with ATR counts revealed a strong overestimation of traffic flows on I-84 and a comparable underestimation of truck flows on I-5, and a thorough network testing did not show any network problems. As the two highways I-5 (north-south) and I-84 (east-west) serve very different markets, this mismatch appears to result from underlying issues in the FAF2 data. A separate analysis of Internal-Internal (II), Internal-External/External-Internal (IE/EI) and External-External (EE) revealed that a significant contribution to this error was contributed by EE flows, which shows that long-distance trips are responsible for a large part of this mis-estimate.

Avoiding a reverse-engineering of the FAF2 data, an adjustment process was implemented that increases flows on I-5 and decreases flows on I-84. All origin-destination county pairs that generate trips using I-5 were isolated from those that contribute to traffic on I-84. Subsequently, tonnage flows for county pairs that use I-5 were scaled up, and flows using I-84 were scaled down. County pairs that use both I-5 and I-84 were not adjusted.

To develop the appropriate scaling factor for both I-5 and I-84, a weighted average deviation was calculated, giving more emphasis on count locations with higher volumes. Using the original flows, I-5 was underestimated by 53% and I-84 was overestimated by 78% – implying scaling factors of 2.169 and 0.357, respectively, to adjust the tonnage flows.

Exhibit A6 provides a validation of how the truck counts match assigned Oregon CFF truck trips. The averages of both I-5 and I-84 match the diagonal line (where the x-axis ATR traffic count would match the simulated Oregon CFF flow exactly), neglecting one unexplainable outlier on each highway with a truck count volume of 311 on I-5 and 8 on I-84. Overall, the match between estimated truck volumes and ATR counts is not unreasonable for truck simulation, but it should be noted that the commodities have been converted into truck loads based on national averages; through trips going through Oregon were disaggregated based on total employment numbers only; the highway network is a simplified national network that does not capture local capacity expansions; all intra-county trips are missing, reducing the simulated volumes and lacking congestion which may trigger detours in reality; and the count volumes represent an annual average, including all uncertainties when applied to comparisons with daily weekday volumes.

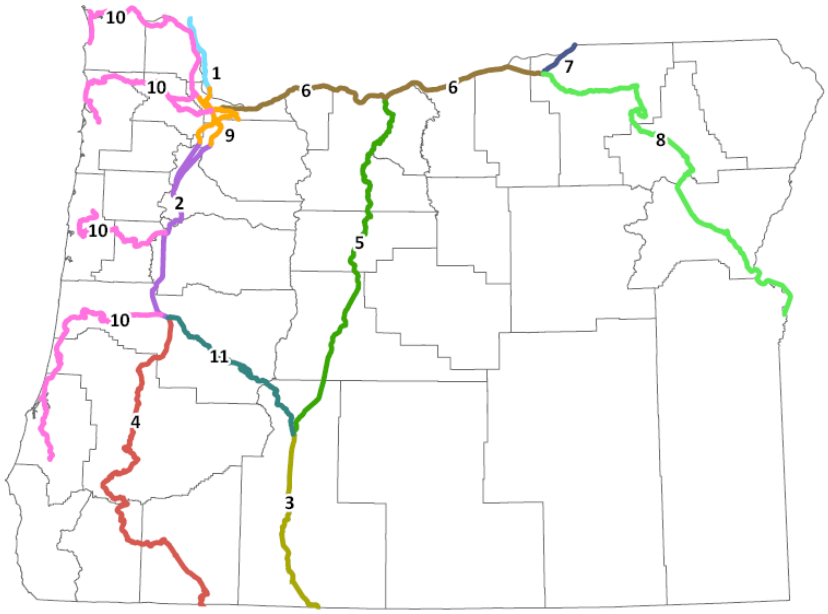
Exhibit A6: Validation of Truck Volumes

Rail

The rail mode data obtained from the FAF2 dataset was compared to Oregon's confidential historical 2002 Rail Waybill dataset obtained by ODOT from the Surface Transportation Board. The Rail Waybill data was used to identify the pattern of flows in the 2002 base year, while the correlation provided a way to apply the FAF2 growth rates to the base year waybill data.

The Rail Waybill data trip ends (origin or destination) inside of Oregon were grouped by Freight Station Accounting Code (FSAC), specific to a station and a rail line, and the county code; trip ends outside of Oregon were identified by state name (including Canadian provinces). The data was further classified as the FAF2 Oregon Portland zone (Clackamas, Multnomah, Washington, or Yamhill Counties), FAF2 Oregon Remainder zone (all other counties), Portland Sea Port, Other Oregon Sea Port, or Rest of World to correspond with the categories in the FAF2 dataset.

The Rail Waybill dataset is specific to Oregon and contains trips with an Oregon trip origin or destination, as well as trips that travel through Oregon without stopping for re-classification (i.e., trips from Washington to California). The FAF2 data covers the entire nation, and although it was possible to isolate the Oregon trip ends, it was difficult to identify rail through trips that do not stop for re-classification. It was therefore assumed that the origin-destination pairs (by county code, which is common between the two data sets) that appeared in the Rail Waybill data should be used instead of the same origin-destination trips from the FAF2 data. The total amount of through tonnage



extracted from the Rail Waybill data was slightly larger (13,448 Ktons) than the tonnage in the same origin-destination pairs of the FAF2 data (12,083 Ktons). It should be noted that the Rail waybill dataset only includes traffic volumes that are reported by the Class I railroads (BNSF and UP). Traffic that moves locally on a shortline railroad or between multiple shortline railroads is not included in the dataset. For the base of year 2002, this volume is very small but is expected to grow in future years.

Because theses total amounts of tonnage are very close, the more geographically accurate and spatially disaggregated Rail Waybill data was used for the Oregon CFF baseline 2002 data.

The FAF2 dataset was used to calculate growth rates specific to each commodity from 2002 to 2035, which were applied to the base year rail waybill data. The total value of the future forecast was again very close to the FAF2 total tonnage forecast. The tonnage forecast maintains the city name for the Oregon rail stations and a US Census Bureau Federal Information Processing Standard (FIPS) code which identifies the county, for each trip end.

As with trucks, rail mode tonnage flows were assigned to the rail network, and the origin-destination tonnage data was aggregated by city or county. In addition to tonnage, rail cars were retained from the base year waybill dataset. Since the rail mode utilizes a pre-existing network of track infrastructure, it is logical to evaluate the tonnage flow by corridor; the dominant pre-existing corridors in Oregon are shown in A7. A uniform method was employed to assign the flows to the network, such that any flow starting and ending on the corridor was included in the full corridor flow. The detailed method of assigning certain origin-destination flows to each corridor is included in Appendix C.

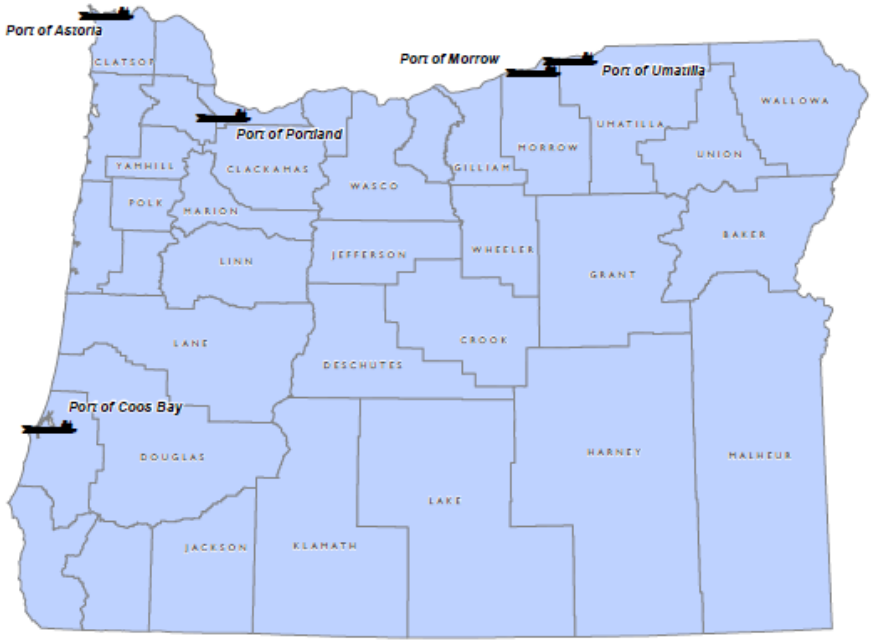


Exhibit A7. Oregon Rail Corridor Network (coastal lines grouped in #10)

Water

The Oregon CFF includes the Marine Ports shown in Exhibit A8 – including two coastal ports, a collective set of facilities in the Portland Harbor, and two ports upstream on the Columbia River. The Port of Newport was not included as it currently accommodates only limited commercial freight movement.

Exhibit A8. Oregon Ports

*Note: The Port of Newport was not included as it currently accomodates only limited commercial freight movement.

The water flows in the Oregon CFF rely on the FHWA FAF2 dataset for base year flows and growth rates. This dataset includes domestic and international marine flows that connect to land modes covered elsewhere in the Oregon CFF, to reach the true origin or destination points often outside of Oregon. The FHWA FAF2 dataset commodities (SCTG) were converted to STCC categories using a simplified one-to-many relationship.

The FAF2 data was disaggregated to ports within Oregon, using the US Corps of Engineers Waterborne Commerce reports, and data from the Port of Portland website. Through flows on the Columbia River, which is largely served by Washington and Idaho ports, and along the coast are not included in the Oregon CFF.

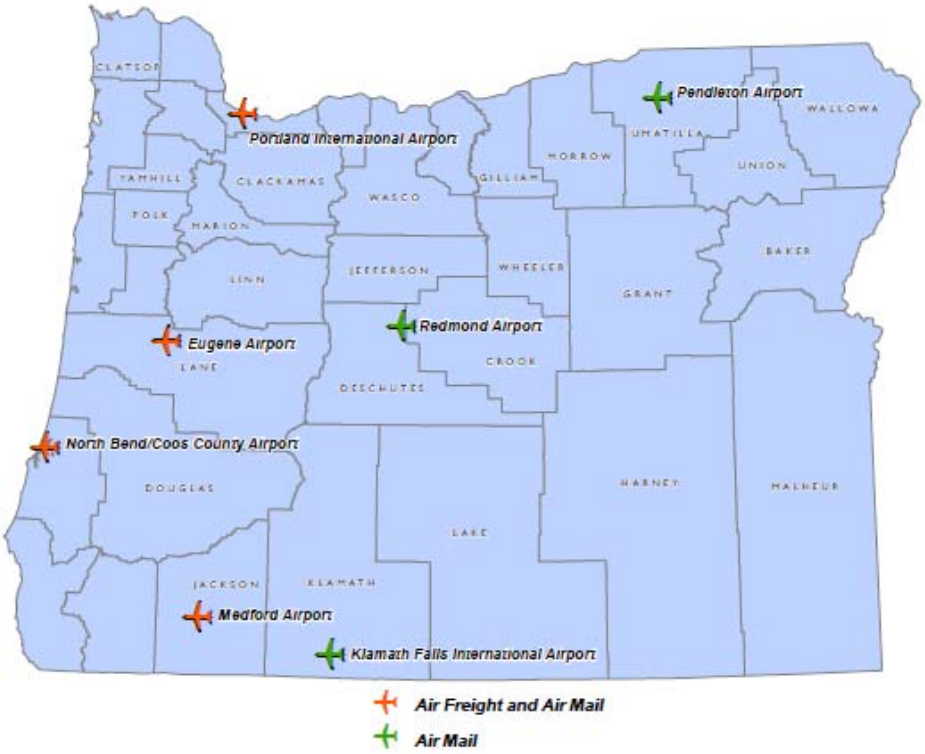
The FAF2 dataset water flows were aggregated to four regions: Other Domestic, Other International, Oregon Portland, and Oregon Remainder. In doing so, the true origin,

destination, intermodal flow is lost.9 All Oregon Portland FAF2 flows were assigned to "Portland Harbor" with flows to and from multiple ports within the three-county region on the Columbia and Willamette Rivers. Auto commodity flows, missing from the FAF2 dataset, were added to Portland Harbor flows as imports from Asia, which is consistent with Port of Portland statistics (613 Ktons forecast for 2010), and assumes the 1993-2008 3.5% annual growth rate in auto imports. Fuel flows were also missing, and were added to internal and outbound domestic flows (577Ktons and 3082ktons, respectively in 2002), assuming a growth rate consistent with OEA population forecasts.

FAF2 water flows were allocated among the Oregon coastal ports in Coos Bay and Astoria to roughly match the commodity mix from the 2002 Waterborne Commerce data. Newport was not included, as no data was provided in this dataset.

Remaining FAF2 flows were then allocated to the Columbia River ports in Umatilla and Morrow as follows:

- **Grain**: 65% allocated to Port of Umatilla, reflecting the Pendleton Grain Growers and CLD Pacific Grain facilities there for international and domestic grain imports. The remaining Columbia River grain exports were assumed to be shipped from the Port of Morrow via the Port of Portland.
- **Fuel**: 90% allocated to Umatilla tank farms, with the remainder to Morrow (linking to rail line).
- **Animal Feed**: Assumed to be hay from Morrow (100%).
- **Fertilizers**: Assumed to be allocated to the Umatilla Tidewater facility (100%)
- **Waste**: The significant quantity of waste/scrap (STCC 40) shipped from Washington to in containers, missing from FAF2 dataset, was added and grouped with Port of Morrow. Scrap/waste was assumed to represent the bulk of Arlington containers (200 Ktons in 2010, based on 22000 TEUs in 2008) and to grow consistent with the OEA's Oregon population forecast to 2035.
- **Gravel**: A large flow of gravel from Washington to Oregon non-Portland ports (2 Mtons in 2002) was not consistent with the Waterborne Commerce data or with expert understanding of the river commerce, so it was dropped. This flow may consist of dredging materials that are not expected to be sustained in the forecast periods. A large internal movement of gravel within the Portland Harbor remains.
- **Other**: The remaining mix of commodities (24 Ktons in 2002 of chemical products, agriculture products, mixed freight, etc.), mostly international exports, were split between Port of Morrow (75% and Port of Umatilla (25%)



Air

Portland (PDX), Medford (MFR), Eugene (EUG), and North Bend/Coos County (OTH) airports serve air freight, while Redmond (RDM), Klamath Falls (LMT), Pendleton (PDT)

[9] For instance, an international import by sea to the Port of Portland that is shipped inland by rail or truck would be translated into two trips, an "Other Intl" trip to the "Portland Harbor", and a second trip from "Portland Harbor" to "Other Dom". The international origin is lost in the second leg of the trip.

airports primarily carry air mail services. The locations of these airports are shown in Exhibit A9.

Exhibit A9. Oregon Airports

The air mode commodity flows in the Oregon CFF rely on FHWA FAF2 dataset for base year flows and growth rates. This dataset includes both domestic and international air flows. The FHWA FAF2 dataset commodities (SCTG) were converted to STCC categories using a simplified one-to-many relationship.

FAF2 data include shipments that typically weigh more than 100 pounds that are shipped by air by commercial or private aircraft, not including express shipments.[10] The 2006 Portland/Vancouver Trade Capacity Analysis (Trade Study) shows air and express mail flows (STCC44) as 0.2% of Portland/Vancouver tonnage in 1997 (467 Ktons).

These small package flows are felt to be less important in a statewide freight view, and it should be noted that the limited data on mail and express shipping is also not very precise. The Port of Portland noted a significant shift in the reported air mail tonnage statistics when FedEx won the US Postal Service (USPS) contract and the actual mail volume for USPS was co-mingled with FedEx's freight volumes. Despite an increasing

[10] This would exclude FedEx's <100 lb package volume which comprises approximately 99% of its total airfreight volume to or from Oregon (average package weight is approximately 35 lbs.) and UPS' <100 lb package volume which comprises approximately 97% of its total airfreight volume to or from Oregon (average package weight is approximately 8 lbs). FedEx packages going in and out of Oregon generally pass through the main sort facility in Portland. Similarly, UPS sort facilities are in Portland, Tualatin, Roseburg and Hermiston.

shift of consumer spending to on-line retail, small package carriers (integrators – FedEx and UPS) have experienced express volume declines since 2002.

The FAF2 data was disaggregated to airports within Oregon, using airport air cargo and mail on/off tonnage statistics for 2007 and 2008 from websites and airport master plans. FAF2 flows were aggregated to flows between four regions: Other Domestic, Other International, Oregon Portland, and Oregon Remainder. In doing so, the true origin, destination, and intermodal flow are lost (see note under water flows above). Since total FAF2 2002 tonnage for the state was a reasonable match to 2008 airport statistics, after adjusting for different years' data, no overall adjustment was needed. Factors, shown in Exhibit A10, were applied to each aggregated flow among the state's airports to roughly balance 2002 inbound and outbound flows at each airport. Internal flows between PDX and other Oregon airports also had to be significantly reduced. The resulting 2035 flows are not very well balanced, for Oregon Remainder airports in particular, due to varying growth rates on FAF2 flows by commodity.

Exhibit A10: Air Adjustment Factors by Aggregated Flows Factors

	Factors	
Airport Flow	Inbound flow	Outbound flows
PDX International	0.34	0.62
Oregon Remainder International	1.00	0.05
PDX Domestic	2.25	0.90
Oregon Remainder Internal	1.00	0.15

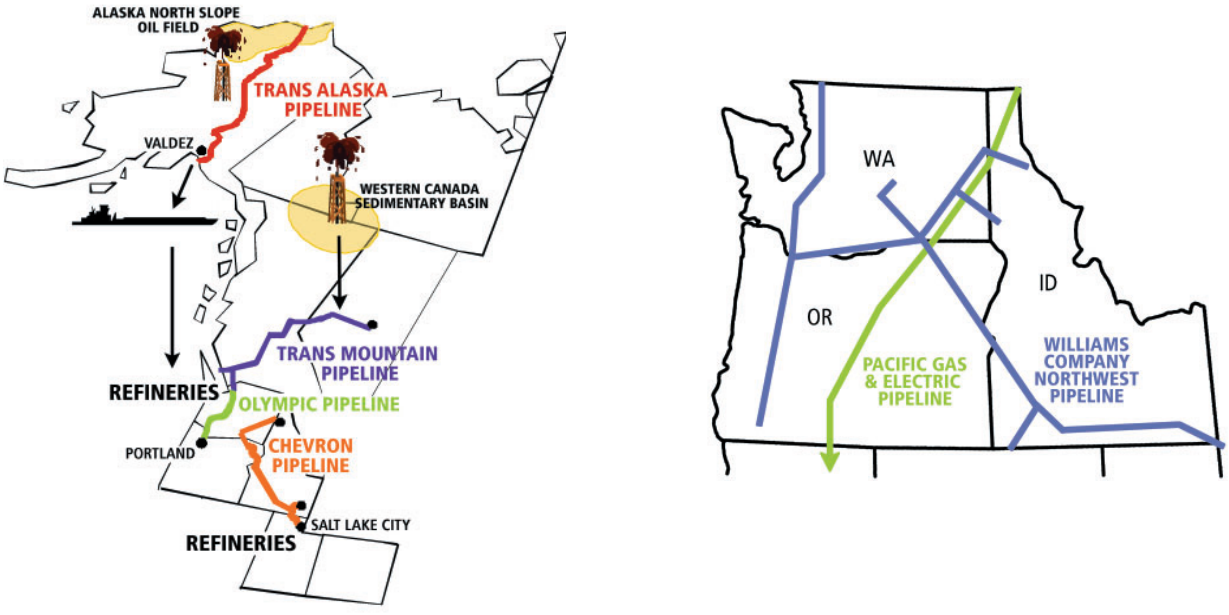
The Oregon Remainder FAF2 zone was split into the three non-Portland airports, using the factors in Exhibit A11. A significant portion of FAF2 region Remainder flows were shifted to PDX, because although total tonnage for the state was reasonable, there were not enough PDX flows. All Oregon Remainder international flows were assigned to Medford (MFR).

Exhibit A11: Factors for Allocating Flows among Oregon Airports

Airport	Oregon Remainder Share1	Oregon Remainder Share2
Portland (PDX)	0.9435	NA
Medford (MFR)	0.0065	0.1147
Eugene (EUG)	0.0239	0.4236
North Bend/Coos Bay (OTH)	0.0260	0.4616

Note: Constant share for all years assumes airport relative size remains the same.

FAF2 does not include air mail flows, so air mail was added (assigned to STCC 50), based on tonnage statistics by airport in 2008. The growth in air mail was assumed to match statewide population annual growth of 1.3% from 2002 to 2035 and was assumed to travel to PDX before/after reaching other state airports.



Pipeline

The pipeline flows in the Oregon CFF rely on FHWA FAF2 dataset for base year flows and growth rates. The FAF2 data was disaggregated to pipelines within Oregon using the 2007-2009 State of Oregon Energy Plan, and the websites of Oregon Department of Energy, Kinder Morgan Company, and various energy providers, as well as contact with representatives of these organizations. Natural gas was distributed among Oregon counties based on OEA population forecasts.

Pipeline flows cover two basic commodities: petroleum (SCTG17, SCTG18, and STCC29, which includes gasoline, jet fuel and diesel fuel) and natural gas (SCTG19, STCC13), which were treated separately. All other commodities in the FAF2 "Pipeline & unknown" mode were dropped, as non-pipeline flows. Petroleum is further distributed locally by trucks and barges, but these local trips are not included in the Oregon CFF. Natural gas was assumed to be distributed via local pipeline to each county from the nearest branch line.

Petroleum and natural gas pipeline networks for the Pacific Northwest are shown in Exhibit A12. FAF2 Petroleum flows (SCTG17 and SCTG18) were mapped to these pipeline routes, and volumes were scaled (0.79 factor applied to Olympic pipeline flows) to match Oregon Department of Energy data. Within Oregon petroleum flows consisted of the Kinder Morgan pipeline from Portland to Eugene, and it was assumed that a constant 34.6% share of the Olympic pipeline flow to Portland tank farms continues to be piped on to Eugene based on information from Kinder Morgan staff.

Exhibit A12. Pipeline Networks: Petroleum (left) and Natural Gas (right)

FAF2 natural gas flows were limited to pipeline flows from Idaho, Washington, and the Port of Portland (from British Columbia), and the proportions matched Oregon energy data. Significant through flows to California beyond Klamath Falls were teased out of the existing FAF2 flows, given known Oregon usage (FAF2 and Oregon statistics), and total flows through Oregon (FAF2). FAF2 forecasts capture the change in inbound sources starting in 2010, at which point, a price equalization plan will be in place that will mean Oregon receives more of its gas from the Rocky Mountains than it does today. FAF2 assumes 3M3M tons from the Williams Washington pipeline will shift to the PGE Idaho (Alberta) source. FAF2 further assumes a limited growth in through flows to California between 2002 and 2010. Oregon counties served by the Williams, WA I-5 pipeline exceeded FAF2 flows, so flows were shifted from the Williams Columbia River branch as needed. Flows were further distributed to each county based on OEA county population patterns and growth forecasts.

Specialty or targeted areas: Commercial Fishing

Initially, STCC9 fresh fish was assumed to be produced within Oregon in a spatial pattern of other agriculture products, following the pattern of Oregon agriculture employment. However, because of the high importance and special circumstances of this particular commodity, these initial assumptions were refined. The resulting approach combines fish landing data from the Dungeness Crab Association and Oregon Department of Fish and Wildlife plus port interview data. These fish flows, a total of 219Ktons in 2002 (0.07% of total state freight tonnage), were assumed to be produced on the Oregon coast or nearby fish farms or imported from Alaska or international origins. Half of this tonnage then was then assumed to move to points for internal consumption within the state, with the remainder sent outbound primarily by truck, water, and some air movements (70 Ktons for all modes in 2002). The modified fish commodity is thus housed separately from the modal datasets. A full description of the assumed fish commodity flows data and assumptions are included in Appendix D.

Structure and Design of the Commodity Flow Forecast Database

All five of the mode-specific processed data files plus special air mail and fish commodity datasets comprise a master commodity flow dataset containing two types of files:

- Origin-destination tonnage flow by commodity and mode
- Assigned flows by link/corridor and vehicle type (truck and rail only)

The origin-destination tonnage flow file contains the geographic identifier (county within Oregon) of the origin and destination, commodity code(s), mode, and tonnage for each origin-destination pair. This data covers the 2002 base year and the forecast years in 5-year increments out to 2035. The assigned flows cover the truck and rail modes, with the flows assigned to the associated network for each (see discussion in methodology section).

Appendix B: Commodity Codes (STCC and SCTG)

Exhibit B1: Standard Transportation Commodity Code (STCC)

STCC	Description
1	Farm products
8	Forest products
9	Fresh fish
10	Metallic ores
11	Coal
13	Crude petroleum, natural gas or gasoline
14	Nonmetallic ores, minerals, excluding fuels
19	Ordnance or accessories
20	Food and kindred products
21	Tobacco products, excluding insecticides
22	Textile mill products
23	Apparel or other finished textile products or knit apparel
24	Lumber or wood products, excluding furniture
25	Furniture or fixtures
26	Pulp, paper, or allied products
27	Printed matter
28	Chemicals or allied products
29	Petroleum or coal products
30	Rubber or miscellaneous plastics products
31	Leather or leather products
32	Clay, concrete, glass, or stone products
33	Primary metal products
34	Fabricated metal products
35	Machinery, excluding electrical
36	Electrical machinery, equipment, or supplies
37	Transportation equipment
38	Instruments, photographic goods, optical goods, watches, or clocks
39	Miscellaneous products of manufacturing
40	Waste or scrap materials not identified by producing industry
41	Miscellaneous freight shipments
42	Containers, carriers or devices, shipping, returned empty
43	Mail
45	Shipper association or other associated traffic
46	Miscellaneous mixed shipments
47	Small packaged freight movements
48	Waste hazardous materials or waste hazardous substances
49	Other Waste
50	Bulk in boxcar

Exhibit B2: Standard Classification of Transported Goods (SCTG) commodity codes

Code	Commodity Class
01	Live animals and live fish
02	Cereal grains
03	Other agricultural products
04	Animal feed and products of animal origin, not elsewhere classified (n.e.c.)
05	Meat, fish, seafood, and their preparations
06	Milled grain products and preparations, and bakery products
07	Other prepared foodstuffs and fats and oils
08	Alcoholic beverages
09	Tobacco products
10	Monumental or building stone
11	Natural sands
12	Gravel and crushed stone
13	Nonmetallic minerals n.e.c.
14	Metallic ores and concentrates
15	Coal
16	Crude Petroleum
17	Gasoline and aviation turbine fuel
18	Fuel oils
19	Coal and petroleum products, n.e.c.
20	Basic chemicals
21	Pharmaceutical products
22	Fertilizers
23	Chemical products and preparations, n.e.c.
24	Plastics and rubber
25	Logs and other wood in the rough
26	Wood products
27	Pulp, newsprint, paper, and paperboard
28	Paper or paperboard articles
29	Printed products
30	Textiles, leather, and articles of textiles or leather
31	Nonmetallic mineral products
32	Base metal in primary or semi-finished forms and in finished basic shapes
33	Articles of base metal
34	Machinery
35	Electronic and other electrical equipment and components and office equipment
36	Motorized and other vehicles (including parts)
37	Transportation equipment, n.e.c.
38	Precision instruments and apparatus
39	Furniture, mattresses and mattress supports, lamps, lighting fittings
40	Miscellaneous manufactured products
41	Waste and scrap
43	Mixed freight

Appendix C: Rail Corridors Assignment Method

This appendix describes the process used to aggregate rail flows to corridors. The rail origin-destination tonnages were assigned to the Oregon rail network. A rail corridor tonnage flow was counted in the origin corridor, destination corridor, and the corridors it had to traverse.

Exhibit C1 summarizes the corridors (Exhibit 10) assigned to each origin-destination flow. For the BNSF line, the regions outside of Oregon were defined as follows:

- BNSFNW: British Columbia, Saskatchewan, Alberta, and Washington State
- BNSFSW: California, Arizona, Nevada, New Mexico, Utah
- BNSFEAST: All other states and provinces

For the UP line, the regions out of Oregon were defined as follows:

- UPNW: Washington
- UPSW: California, Arizona, Nevada, New Mexico
- UPCAN: All Canadian Provinces
- UPEAST: All other US States

Inside of Oregon, each FSAC code tied a station to the corridor it falls into.

It was not possible to tie the 'through' flows between California and Canada to a specific corridor because there are two different corridors for entering the state from the north. Modal experts determined that a 25-75% split between flows traveling on Corridor 1 versus Corridor 7 from or to Canada should be assumed. The tonnage flowing through the state from the NW to the SW was summarized. The through tonnage was then multiplied by .25 and added to Corridors 1 and 5, and multiplied by .75 and added to Corridors 7 and 6. Corridors 9, 2, 11, and 3 received all of tonnage because they are the common corridors through the state for both entry corridors.

Exhibit C1: Assignment Logic for Rail Corridor Flows

OD1	OD2	Corridors Traveled					
BNSFNW	2	1	2	9			
BNSFNW	9	1	9				
BNSFNW	5	1	9	5	6		
BNSFNW	3	1	9	5	6

Appendix D: STCC9 Fish Commodity Base Year and Forecast Assumptions

Commercial Fishing Methodology Memo

Objective

Oregon's commercial fishing industry is a substantial contribution to Oregon's coastal economy and is the livelihood for many Oregon residents. It also is a growing industry both domestically and internationally. Although the tonnage is less than 1% of the total commodity flow on a statewide basis, the impact on Oregon's economy and the value of the product cannot be understated.

This methodology memo is intended to list the process and assumptions used to develop a baseline commodity flow forecast for commercial fish in Oregon. This work is intended to provide a higher level of detail for Oregon than that which is included in national and international datasets such as the Freight Analysis Framework, but continues to utilize those datasets as one basis for estimating the distribution of commercial fish within and outside of Oregon.

For the purposes of this memo, commercial fishing includes salt-water seafood, fresh-water catch, as well as fish farm product.

Data Sources

This methodology is based on pulling together a variety of data sources. These sources, and how they are proposed to be used for the Commercial Fish commodity flow forecast, are listed below. For the commodity flow forecast, which is in terms of short or "English" tons, data sources reporting in Metric tons have been converted to short tons here. A Metric ton equals approximately 1.1 short tons.

- Pacific Coast Fisheries Information Network (PacFIN) database via a report by BST Associates.
- Oregon Aquaculture Association for information on small, commercial fish producers (fish farms; http://www.oregonaquaculture.org).
- Oregon Department of Fish and Wildlife, Commercial Fish Landings (by Port for ocean fishing, by county for fresh fish, above or below Bonneville Dam for Columbia River).
- "Oregon's Commercial Fishing Industry: Year 2005 and 2006 Review and Year 2007 Outlook", Oregon Department of Fish and Wildlife and Oregon Coastal Zone Management Association Inc., June 2007.
- Discussions with Pacific Seafood (Monica Isbell, July 2009) for mode split, direction and distribution of flow.

Definition of "Fresh Fish" In Commodity Flow Database

Detailed definition of the "Fresh Fish" commodity is by Standard Classification of Transported Goods Code (SCTG) and Standard Transportation Commodity Code (STCC) codes. The FAF2 provides SCTG that is converted to STCC for the Oregon Commodity Flow forecast. Thus, the components of the Commercial Fish commodity relevant to Oregon are, using the STCC coding:

- STCC09 FRESH FISH OR OTHER MARINE PRODUCTS
  - 091 FRESH FISH OR OTHER MARINE PRODUCTS EXC. PROCESSED
  - 0912 FRESH FISH PRODUCTS, OR FRESH UNPACKAGED (UNPROCESSED) FISH EXC. FRESH OR FRESH FROZEN PROCESSED FISH 2035
  - 09121 FINFISH
  - 09122 SHELLFISH
  - 0913 OTHER MARINE PRODUCTS
  - 09131 SHELLS, OYSTER, CRAB, CLAM, ETC.
  - 09139 MISC. MARINE PRODUCTS, NEC
  - 098 FISH HATCHERIES, FARMS, PRESERVES

Assumptions

A variety of assumptions are also necessary to develop a baseline forecast. These include:

- The commodity category of "Fresh Fish" includes commercial fish landed in Oregon (mostly the Oregon coast), plus fish transported to Oregon from Alaska, Hawaii, California and overseas.
- Ocean fish include fish, crab, oysters, and other shellfish.
- Oregon's commercial fishing industry accounts for approximately half (106,000 short tons out of 219,000 short tons) of the total fish/seafood commodity flow, based on the Pacific Coast Fisheries Information Network (PacFIN), ODFW and Freight Analysis Framework databases for the calibration base year of 2002.
- Oregon's fish farms (small, commercial fish producers of trout, steelhead, bass, etc.) account for approximately 0.5% of the fresh fish commodity flow in Oregon (based on information from the Oregon Aquaculture Association).
- Fresh fish tracked by ODFW includes trout, crayfish, and shrimp.

Based on the "Commercial Fishing Industry" report and outlook, and recent trends including establishment of marine preserves off the Oregon coast, the following assumptions are made regarding growth in the industry:

- The South Coast commercial fishing industry will experience continued declining of the fleet, reduction of fisheries and species depletion, and continued consolidation of the commercial fish processing industry. The ports have been making funding requests for cold storage and processing facilities, and it is assumed that these eventually will get built. Additionally, there is a small but growing industry of transporting live commercial fish commodity. Thus the forecast is for an offset between the fleet decline, new storage and processing centers, and the new live market, and commercial fishing growth in the South Coast will be flat.
- The North Coast will continue to experience constrained growth due to depletion of certain fish species, limits due to tribal fishing treaties, and competition from the Alaska and Washington fleets off the Oregon Coast. It will continue to see some growth in demand. Thus, growth rates for North Coast counties will be approximately 2-3% per year.
- To keep pace with increased demand in Oregon, domestically in the US, and internationally, Oregon's fish farming industry as well as the Columbia River fisheries will continue to see moderate growth, on the order of 2% per year.

Based on the BST report, using the Pacific Ocean commercial fish landings (tons) and value from 2002, adjusted to 2008 dollars, commercial fish is valued at $795,000 per kilo-Ton ($70,000,000 total value divided by 88 Ktons).

Commodity Flow Parameters

The commercial fishing supply chain is assumed to consist of the following:

- Ocean fish: fish are caught at sea and brought back to Oregon either for processing or for transporting live (a small, but growing industry). Processing consists of gutting and filleting the fish. Two products are created from this process- fresh fish for sale to the public via stores and restaurants and canned fish (including fish products) for domestic and export sales. Fresh Fish is distributed within a limited number of hours of processing either by refrigerated container/truck for local and regional delivery or by air cargo for national and international markets. Canned fish and fish products are packaged in containers and shipped both domestically (rail and truck) and internationally by ocean vessels.
- The parameters should then reflect the two product types.

Using the assumptions and data above, Exhibit C-1 below summarizes the 2002 commercial fish tonnage produced, by county, as well as 2035 projections. Exhibit C-2 summarizes value.

Other parameters are as follows:

- Domestic/International Split:
  - 34% international
  - 66% domestic.
- Mode Split
  - Ocean – 34%
  - Truck – 55%
  - Air – 10%
  - Rail – 1%.
- Direction of Domestic Flows Outside Oregon:
  - 35% north into Washington
  - 10% east (Idaho, Montana, others)
  - 55% south into California.
- Use FAF2-based method to split out within-Oregon vs. outbound flows
- County disaggregation of flow destinations within Oregon should roughly match population.

Additionally, the commodity flow forecast is being calibrated to the 2002 base year of the Freight Analysis Framework (FAF2). The studies and data referenced in this memo attempt to utilize 2002 data where possible. However, there have been some recent trends regarding fleet condition, depletion of fisheries for certain species while opening of new fisheries for other species, tribal fishing treaties and catch limits, and other events that are ever-changing the nature of commercial fishing. As a reasonableness check, the 2010 year for the commodity flow forecast will be checked against 2008 and 2009 catch data.

Exhibit D1: Calculation of Commodity Flow Tonnage, Production End

Commercial Fishing Baseline	Landed		Adjusted to Include Imported From Elsewhere		Annual Growth Rate	2035 Estimate
County	**Pounds (2002)**	**kTons (2002)**	**kTons(2002)**	**Share**		
Benton	100000	0.1	0.1	0.05%	2%	0.17

ENDANGERED SPECIES ACT SECTION 7 STREAMLINING AGREEMENT BETWEEN THE CITY OF PORTLAND, NOAA FISHERIES, U.S. ARMY CORPS OF ENGINEERS AND U.S. FISH AND WILDIFE SERVICE

February 14, 2003

PURPOSE

This agreement establishes a cooperative process for streamlining Endangered Species Act Section 7 consultations between the City of Portland (City), NOAA Fisheries, Army Corps of Engineers (Corps), and the U.S. Fish and Wildlife Service (USFWS). The streamlined consultation will provide a number of benefits including increased coordination for reviewing and providing analysis and documentation of City projects, programs and activities in order that they proceed in a timely manner while meeting Federal agency and City goals for ensuring ESA compliance and assisting in the conservation and recovery of listed and proposed species.

GOALS

The purpose of this agreement is to create a process to meet the following goals:

(1) To ensure that City project and program timeframes are met in a timely manner;

(2) To improve coordination, communication, and agreement on formal and informal consultation/conferencing on listed and proposed species prior to and during project/program proposal development; and

(3) To ensure that ongoing activities do not jeopardize listed and proposed species, result in the destruction/adverse modification of designated critical habitat, or result in unauthorized take during consultations on an existing project or activity;

(4) To support conservation and recovery of listed and proposed species.

PROCESS

Coordination between the City and Federal agencies early in the planning process for projects, programs and activities that require or would benefit from federal agency review is expected to result in the early identification of potential impacts to listed and proposed species and critical habitat and means to address such impacts. Early cooperation is also expected to conserve listed and proposed species while at the same time minimizing delay of proposed City projects, programs and activities.

The City and Federal agencies will convene a team to meet on a quarterly basis or when mutually deemed necessary by the parties to work towards the following:

(1) Ongoing and future Section 7 consultations with the City will be discussed and streamlined (e.g., batching similar projects or with similar timing needs, combining multiple agency consultations, etc.);

(2) Information, documentation, format, and timeframes will be developed for Biological Evaluations/Assessments (BE/BA) and Biological Opinions;
(3) Agreement on the use of the Programmatic Biological Opinion for Standard Local Operating Procedures for Endangered Species (SLOPES) for Certain Activities Requiring Department of Army Permits in Oregon;
(4) Development of additional compliance strategies in addition to Section 7 (e.g., 4(d) rule limit, sub-basin planning and programmatic opportunities) as needed for City projects, programs and activities; and
(5) Achieve better coordination between strategies to comply with the ESA and additional regulatory requirements with other state and Federal regulatory programs.

A regular assessment of the progress made towards achieving the goals of this agreement will be made on an annual basis. A process for resolution shall be developed in a timely and expeditious manner where issues, barriers, or disagreements that would preclude meeting the intent of the agreement are identified.

Successful implementation of the intent of the agreement will require full cooperation and coordination. The agreement will be carried out based on trust, mutual respect and accountability.

Vera Katz, Mayor
City of Portland

Michael Tehan
USDC, NOAA Fisheries

Colonel Richard Hobernicht, District Engineer
U.S. Army Corps of Engineers, Portland District

Kemper M. McMaster, State Supervisor
USDI Fish and Wildlife Service

ORDINANCE NO.

*Readopt remanded Ordinance No. 188142 to restrict bulk fossil fuel terminals. (Ordinance; Amend Title 33, Planning and Zoning)

The City of Portland ordains:

Section 1. The Council finds:

General Findings

1. The rapid development of fossil fuel resources in the western U.S. and Canada has resulted in numerous facility and infrastructure projects proposed to transport coal, diluted bitumen, natural gas, propane or other fossil fuels through the West Coast.

2. Fossil fuels pose risks to safety, health, and livability, including mobility of people, other freight, and other commercial vehicles.

3. The State of Oregon and the greater Pacific Northwest are vulnerable to powerful subduction zone earthquakes that occur with periodic frequency along the Juan de Fuqua and North American plates.

4. In the past, both the Huu-ay-aht First Nation peoples and the Makah tribe shared similar stories of lost land and peoples as a result of these earthquakes and tsunamis, which scientific research has matched with Japanese tsunami records and on-the-ground geologic field research to reconstruct the Cascadia earthquake of 1700. This research shows that subduction zone earthquakes have occurred along the Pacific Northwest with relative regularity over the last 10,000 years, and if averages from past events are predictive, the region could be overdue for another powerful subduction zone earthquake.

5. Many of the city's buildings and critical infrastructure were built before the city's seismic exposure was widely understood. This infrastructure includes Oregon's primary liquid fuel storage facilities, the Critical Energy Infrastructure (CEI) hub, which is located in northwest Portland and receives 90 percent of the state's liquid fuel supply either via pipeline or marine vessel. Most of the storage tanks within the CEI hub have been built prior to any design and performance lessons learned from the damaging Great Alaskan earthquake of 1964 and the many other documented earthquakes that followed.

6. The CEI hub is vulnerable to failure in the event of subduction zone earthquake. A 2012 Oregon Department of Geology and Mineral Industries (DOGAMI) Earthquake Risk Study for Oregon's Critical Energy Infrastructure Hub report states that a magnitude 8 or 9 Cascadia Subduction Zone earthquake would impact the CEI Hub with: ground shaking; liquefaction (soil behavior phenomenon in which a saturated sand softens and loses strength during strong earthquake ground shaking); lateral spreading (where surficial soil permanently moves laterally due to earthquake shaking); landslides; co-seismic settlement (where the ground surface is permanently lowered due to seismic

shaking); and bearing capacity failures (when the foundation soil cannot support the structure it is intended to support). The study also notes that, at the time, only three existing storage tanks were known to have addressed liquefaction vulnerabilities.

7. The 2013 Oregon Resilience Plan raised concerns about the sturdiness of CEI facilities constructed on soils susceptible to liquefaction, and infrastructure not built to current standards given the hub's age-range of structures.

8. The Portland Bureau of Emergency Management's Mitigation Action Plan (MAP) identifies how natural hazard events like floods, landslides, and earthquakes might affect the City of Portland. The Portland area has experienced numerous earthquakes in the past, ranging from Magnitude 4.5 to 9.0. Portland is certain to experience seismic events in the future. Many of Portland's fossil fuel storage tanks were built before seismic design requirements in building codes were adopted.

9. Most of Portland's employment and industrial zones are in areas with high to very high levels of liquefaction susceptibility, as documented by the 2018 DOGAMI Earthquake Regional Impact Analysis. Fossil fuel infrastructure poses considerable risks in the event of a major earthquake.

10. The extraction and combustion of fossil fuels are significant sources of greenhouse gas emissions and major contributors to climate change and pollution.

11. Coal contains toxic heavy metals, including mercury, arsenic and lead, and exposure to these toxic heavy metals is linked to cancer, birth defects and other health problems.

12. A Union Pacific train carrying oil from North Dakota to Tacoma derailed in Mosier, Oregon on June 3, 2016, spilling 42,000 gallons of crude oil, igniting a fire, and leading to the evacuation of one-quarter of the town's residents.

13. Tribal communities in Oregon and Washington have expressed concerns about the safety risks of fossil fuel infrastructure and the related threats to human health, cultural heritage, and environmental quality.

14. The City's 2015 Climate Action Plan (adopted by Resolution 37135) identifies the need to establish a "fossil fuel export policy that considers lifecycle emissions, safety, economics, neighborhood livability and environmental impacts" (Climate Action Plan, action 3G, page 69).

15. The City committed in its 2015 Climate Action Plan to advancing policy and programs to reduce local fossil fuel use both in the City's own operations and through community-wide initiatives.

16. In Resolutions 36959 and 36962 adopted in 2012, the Council expressed opposition to coal trains traveling through Portland until a programmatic, comprehensive and area-

wide Environmental Impact Statement and comprehensive Health Impact Assessment are completed.

17. Resolution 37168, adopted November 12, 2015, expressed the City Council's opposition to the "expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." It also expressed the Council's intent not to restrict improvements in safety, efficiency, or seismic resilience; the provision of service directly to end users; or infrastructure that will accelerate the transition to non-fossil fuel energy sources.

18. The 2035 Comprehensive Plan sets policy direction (Policies 4.75 and 4.76) to encourage disaster-resilient development and specifically to reduce natural hazard risks to critical energy and transportation infrastructure in Portland Harbor.

19. The first step in making the current situation better is to ensure that the situation does not get worse. Continuing to allow the unlimited increase in fossil fuel terminal storage tank capacity in a moderate to high risk area increases the risk to the surrounding industrial district and the Willamette River. The FFTZ amendments are a regulatory approach that will limit the size of new fossil fuel terminals and prohibit the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions, which will be an improvement compared to the current regulations that allow for unlimited growth in fossil fuel terminals.

20. These Zoning Code amendments create a new land use category with development standards that limit the size of new terminals and prohibit the expansion of existing terminals.

21. The amendments promote major benefits to human health and safety, environmental health and resilience, with minor impacts to economic prosperity and equity.

22. The amendments will prohibit expansion at existing fuel terminals and limit new terminal development, potentially impacting associated job growth and tax revenue. At the same time, the code restrictions on fossil fuel terminal development will also limit potential financial risks from a major accident involving fossil fuel infrastructure.

23. The amendments will limit the risk of low, but potentially catastrophic, safety risks associated with fossil fuel infrastructure.

24. The amendments will allow for the continued operation, but prohibit expansion of storage capacity, with some exceptions, at existing fuel terminals and limit new terminal development.

25. The amendments will restrict development of fossil fuel terminals consistent with City and State objectives on climate change and public safety. While fossil fuels like natural gas and propane have the potential to replace higher-carbon fuels, substituting these fuels for higher-carbon fuels does not begin to approach the goal of an 80% reduction in

carbon emissions by 2050 established in Portland's Climate Action Plan or the State of Oregon's 75% reduction goal.

26. In Resolution 37168, the City Council expressed support for accelerating the transition to non-fossil fuel energy sources. As part of that transition, the Oregon Department of Environmental Quality (ODEQ) is implementing the Oregon Clean Fuels Program, which requires a 10 percent reduction in average carbon intensity by 2025. Fuels that could be used to achieve the standards include ethanol, biodiesel, electricity, hydrogen, natural gas, propane, and biogas, which may require additional storage capacity. In order to facilitate implementation of the Clean Fuels Program, non-fossil fuel storage tanks are not subject to the capacity limits.

27. Ordinance No. 188142 was appealed to the Oregon Land Use Board of Appeals (LUBA). LUBA issued a decision upholding two assignments of error in *Columbia Pacific Building Trades Council et al v. City of Portland*, LUBA Case No. 2017-001, July 19 2017).

28. LUBA's decision was appealed to the Oregon Court of Appeals, which overturned LUBA's decision which was affirmed in part and reversed in part in *Columbia Pacific Building Trades Council v. City of Portland*, 289 Or App 739 (2018).

29. The Oregon Court of Appeals decision was appealed to the Oregon Supreme Court, which denied review in *Columbia Pacific Building Trades Council v. City of Portland*, 363 Or 390 (2018).

30. On October 5, 2018, LUBA remanded *Columbia Pacific Building Trades Council et al v. City of Portland*, LUBA Case No. 2017-001 to assignments of error that LUBA sustained and were either affirmed or not challenged on appeal to the Court of Appeals.

31. A general notification of the November 20, 2019, City Council public hearing on the remand of Ordinance No. 188142 was sent to the City's legislative notice list, the fossil fuel terminal property owners, and the parties to the appeal.

32. On November 20, 2019, the Portland City Council held a public hearing and received testimony on the re-adoption of the fossil fuel terminal zoning restrictions.

Conclusion

33. The City Council has considered applicable policies, as described in Exhibit A, to determine that this ordinance on the whole complies with the 2035 Comprehensive Plan and on balance is equally or more supportive of the goals and policies of the 2035 Comprehensive Plan than the current regulations. In reaching this conclusion, City Council has weighed and balanced competing policy directions. In particular, the Council finds that:
    a. Statewide Planning Goal 7 (Natural Hazards) and 2035 Comprehensive Plan Goal 4.D with Policies 4.79 and 4.80, requires reducing risk to people and property from natural hazards. The FFTZ amendments further these goals and policies by

limiting the risks of storing large volumes of hazardous materials in an area with high susceptibility to an earthquake. Large fossil fuel terminals represent a risk to people, property and the natural environments that the City Council finds as a compelling reason to limit future risk by limiting the size of new facilities and prohibit the expansion of existing facilities. Continuing to allow an unlimited increase in storage capacity at FFTs in a high risk area would be less supportive of the 2035 Comprehensive Plan than adopting the FFTZ amendments

b. Policy 6.48 provides direction to limit fossil fuel terminals to what is necessary to serve the region. The City Council recognizes that Portland's fossil fuel terminals handle 90 percent of the fossil fuel for the State of Oregon and Southwest Washington. These changes support the retention of existing fossil fuel terminals by designating them as a limited use that allows the terminals to continue to operate and invest in upgrades and supports opportunities for growth through exceptions, such as aviation or renewable fuels. Further, the use limitations provide flexibility to FFTs to replace and reconfigure existing storage tank capacity to increase safety and meet future needs. In addition, limiting storage capacity to the existing facilities reduces risk from a major earthquake, which outweighs the policy direction to provide capacity to accommodate any potential future increase in fossil fuel consumption, in part, because continuing to consolidate fossil fuel storage capacity in Portland is counter to resiliency principles that emphasize redundancy and distributed facilities.
c. Statewide Planning Goal 9 (Economic Development) and 2035 Comprehensive Plan Goal 6.C with Policies 6.20 and 6.36, among others, provide for the retention and growth of businesses, especially those in the traded sector. The City Council interprets these policies apply to the economy in general, rather than specific types of business. These changes and restrictions only apply to a narrowly defined new land use category, Bulk Fossil Fuel Terminals, and do not have a significant effect on the other allowed uses in industrial and employment zones. There are no changes proposed to the Comprehensive Plan or Zoning Map that will impact the overall size or intensity of development in the industrial and employment areas of Portland. These amendments are narrowly constructed to apply to one class of businesses that make up a small portion of the city, regional and state economy. Further, these regulations only limit future expansion of these fossil fuel terminals, with some key exceptions, and designate these businesses as a limited use that allows their continued operation.
d. Guilds Lake Industrial Sanctuary (GLIS) Plan policies provide direction to maintain, protect and enhance businesses in the sanctuary. This plan was adopted in 2001 and does not address the need for resiliency in a high and medium liquefaction susceptibility area. The City Council interprets these policies to apply to the GLIS as a whole and not individual businesses. The City Council interprets the legislative intent of the GLISP is to maintain the area as an industrial sanctuary and to prohibit incompatible land uses. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses that could undermine the viability of the industrial sanctuary. These regulations apply to only one type of business that makes up a minority part of the businesses found in GLIS. The remaining industrial uses to continue to operate under current

regulations. The impact of the limits on fossil fuel terminals is mitigated by designating existing fossil fuel terminals as a limited use that allows the terminals to continue to operate and make upgrades and supports limited enhancement through exceptions to the storage capacity restrictions.

NOW THEREFORE, The Council directs:

a. Adopt Exhibit A as additional findings.
b. Amend Title 33, Planning and Zoning, as shown in Exhibit B, Fossil Fuel Terminal Zoning Amendments, Remand Report, dated October 30, 2019.
c. Adopt the commentary in Exhibit B, Fossil Fuel Terminal Zoning Amendments, Remand Report, dated October 30, 2019, as legislative intent and further findings.
d. Adopt Exhibit C. LUBA Record for *Columbia Pacific Building Trades Council et al v. City of Portland*, LUBA Case No. 2017-001, as additional evidence.
e. The Bureau of Planning and Sustainability shall report to City Council no later than December 31, 2021 on the implementation of this ordinance, including:
    - the number and description of any requests by existing terminal operators to upgrade and replace storage capacity at their facilities;
    - the number and description of building permits issued for fossil fuel tanks between 125,000 and 2 million gallons;
    - the trends in fossil fuel energy use and non-fossil energy use in Oregon;
    - the status of local and state regulatory proceedings that may improve seismic resilience of fossil fuel storage infrastructure; and
    - information on compliance with the Oregon Clean Fuels Program.

f. City Bureaus, including BDS, PBEM and Fire, shall work with the State of Oregon to develop policy options to require seismic upgrades of storage tanks within a firm deadline for replacement of older, unsafe tanks.

Section 2.
The Council declares that an emergency exists due to the fact that Portland is currently at risk of a major earthquake; therefore, this ordinance shall be in full force and effect from and after its passage by the Council.

Section 3.
If any section, subsection, sentence, clause, phrase, diagram, designation, or drawing contained in this Ordinance, or the plan, map or code it adopts or amends, is held to be deficient, invalid or unconstitutional, that shall not affect the validity of the remaining portions. The Council declares that it would have adopted the plan, map, or code and each section, subsection, sentence, clause, phrase, diagram, designation, and drawing thereof, regardless of the fact that any one or more sections, subsections, sentences, clauses, phrases, diagrams, designations, or drawings contained in this Ordinance, may be found to be deficient, invalid or unconstitutional.

Exhibit A:
Findings of Fact Report
October 2019

Text amendments to the zoning code must be found to be consistent with the Comprehensive Plan, Urban Growth Management Functional Plan, and the Statewide Planning Goals. In addition, the amendments must be consistent with the intent or purpose statement for the base zone, overlay zone, and plan district where the amendment is proposed, and any plan associated with the regulations. (33.835.040)

1. Finding: The City Council has identified and addressed all relevant and applicable goals and policies in this document.
2. Finding: The City Council has considered the public testimony on this matter and has weighed all applicable goals and policies and on balance has found the need to adopt the Fossil Fuel Terminal Zoning amendments (the FFTZ amendments).

Part I. Statewide Planning Goals

State planning statutes require cities to adopt and amend comprehensive plans and land use regulations in compliance with the Statewide Planning Goals.

The Statewide Planning Goals that apply to Portland are:

Goal 1 Citizen Involvement
Goal 2 Land Use Planning
Goal 5 Natural Resources, Scenic and Historic Areas, and Open Spaces
Goal 6 Air, Water and Land Resource Quality
Goal 7 Areas Subject to Natural Hazards
Goal 8 Recreational Needs
Goal 9 Economic Development
Goal 10 Housing
Goal 11 Public Facilities and Services
Goal 12 Transportation
Goal 13 Energy Conservation
Goal 14 Urbanization
Goal 15 Willamette River Greenway

There are approximately 560 acres of land both within Portland's municipal boundaries and beyond the regional urban service boundary that can be classified as rural land. In 1991, as part of Ordinance 164517, the City Council took an exception to Goal 3 and 4. the agriculture and forestry goals. Because of the acknowledged exception, the following goals do not apply:

Goal 3 Agricultural Lands
Goal 4 Forest Lands

Other Statewide Planning Goals apply only within Oregon's coastal zone. Since Portland is not within Oregon's coastal zone, the following goals do not apply to this decision:

Goal 16 Estuarine Resources

Goal 17 Coastal Shorelands
Goal 18 Beaches and Dunes
Goal 19 Ocean Resources

Goal 1. Citizen Involvement. To develop a citizen involvement program that insures the opportunity for citizens to be involved in all phases of the planning process.

3. Finding: The preparation of these amendments has provided numerous opportunities for public involvement, including:

Concept Phase. In 2016, prior to the initiation of the legislative project, BPS conducted four stakeholder focus groups meetings. These meetings included participants with a range of perspectives and experience, including community group representatives, fuel terminal representatives, environmental organizations, and business organizations. These meetings served as a forum for discussing issues and potential approaches, and to help inform project staff develop concepts. In addition to the stakeholder focus groups, BPS staff met with several fuel terminals to explain the proposal, answer questions, and discuss their individual concerns. These meetings were needed because antitrust regulations constrained discussion about certain topics, for example supply chains, in the presence of representatives from other fuel terminals.

Discussion Draft. On June 29, 2016, the Fossil Fuel Terminal Zoning Amendments Discussion Draft was published and posted on the Bureau website.

Proposed Draft. On August 12, 2016, the Fossil Fuel Terminal Zoning *Proposed Draft* was published in preparation for the Planning and Sustainability Commission (PSC) review and recommendation. In support of this process, the BPS website had a project page dedicated to this project, an email address for submitting testimony. As part of the Proposed Draft publication and legislative process requirements, the following legal notices were also sent:

- Form 1 35-day Notice
  Sent to the Department of Land Conservation and Development (DLCD)
- Legislative Notice
  Sent to interested parties, recognized organizations, affected bureaus, TriMet, Metro and ODOT and published in the Daily Journal of Commerce
- Measure 56 Notice
  Required by Ballot Measure 56, this mailed notice was sent to property owners with industrial or employment base zoning.

The PSC held a public hearing on September 13, 2016. On October 11, 2016, the Planning and Sustainability Commission voted to recommend the Fossil Fuel Terminal Zoning Amendments to City Council, including PSC-recommended modifications to the Proposed Draft. All PSC meetings were streamed live and available for viewing on the Bureau website.

Recommended Draft. On October 24, 2016. the Fossil Fuel Terminal Zoning Amendments *Recommended Draft* was published to present the PSC recommendations to City Council. On October 25, 2016, notice of the City Council hearing on the Fossil Fuel Terminal Zoning Amendments was mailed. The City Council held public hearings on November 10 and 16, 2016, to receive testimony on the *Recommended Draft*. On December 8, 2016, the City Council voted to adopt the Fossil Fuel Terminal Zoning Amendments.

As noted below in these findings, the FFTZ amendments are consistent with the goals and policies

of Chapter 2 (Community Involvement) of the 2035 Comprehensive Plan and the findings in response to those goals and policies are incorporated by reference. The events and outreach strategies summarized here demonstrate consistency with the requirements of Statewide Planning Goal 1.

Goal 2. Land Use Planning. To establish a land use planning process and policy framework as a basis for all decisions and actions related to use of land and to assure an adequate factual base for such decisions and actions.

4. Finding: Goal 2, as it applies to the FFTZ amendments, requires the City to follow established procedures for legislative amendments to the Zoning Code, which are found in 33.740 (Legislative Procedure). The amendments support this goal because, as demonstrated by these findings, the FFTZ amendments were developed consistent with the Statewide Planning Goals, the Metro Urban Growth Management Functional Plan, and 2035 Comprehensive Plan, as detailed in this ordinance.
5. Finding: Other government agencies received notice from the 35-day DLCD notice and the City's legislative notice. In the initial adoption of the ordinance, the City received testimony from the Port of Portland. The City responded to the issues raised by the Port by amending the code to include an exception for the storage of fossil fuels for exclusive use at an airport, surface passenger terminal, marine, truck or air freight terminal, drydock, ship or barge servicing facility, rail yard, or as part of a fleet vehicle servicing facility. The City did not receive any requests from other government agencies to modify the FFTZ amendments.
6. Finding: The City Council's decision is based on the findings in this document, which are based on the factual evidence presented to the Planning and Sustainability Commission and City Council as part of the initial adoption in 2016 as well as the evidence presented as part of the reconsideration of this ordinance that is incorporated in the record that provides the adequate factual base for this decision.

Goal 5. Open Space, Scenic and Historic Areas, and Natural Resources. To protect natural resources and conserve scenic and historic areas and open spaces.

7. Finding:

Open Spaces. The FFTZ amendments do not include Comprehensive Plan map or Zoning Map changes. There are no designated open spaces (OS map designations) on any of the existing FFTs.

Scenic Resources. In 1991, the City adopted the Scenic Resources Protection Plan and applied a scenic (s) overlay zone to protect significant scenic resources. Two of the FFTs (BP West Coast and NuStar/Shore Terminals) are in a (s) overlay zone. The scenic resource protections (Chapter 33.480) are not amended by this ordinance and the height limits associated with the (s) overlay zone will continue to apply to the two FFT sites.

Historic Resources. Historic resources are located throughout the City, but very few are in the industrial zones. There are no designated Historic Landmarks or Districts in or immediately adjacent to any of the existing FFTs. Existing historic resource protections are not being amended (Chapter 33.445).

Natural Resources. There are significant natural resources in industrial zones, especially along on the Willamette and Columbia Rivers. Six of the existing FFTs have frontage on the Willamette River with designated natural resources that are protected by the Greenway Overlay Zone (Chapters 33.440), which is not amended by this ordinance.

Generally. As noted below in the findings for the 2035 Comprehensive Plan, the FFTZ amendments are consistent with the goals and policies of Chapter 4 (Design and Development,

including Historic and Cultural Resources) and Chapter 7 (Environment and Watershed Health) of the 2035 Comprehensive Plan and the findings in response to those goals and policies are incorporated by reference. Therefore, FFTZ amendments are consistent with the requirements of Statewide Planning Goal 5.

Goal 6. Air, Water, and Land Resource Quality. To maintain and improve the quality of the air, water and land resources of the state.

8. Finding: Goal 6 requires the maintenance and improvement of the quality of air, water, and land resources. The State has not adopted administrative rules for complying with Statewide Planning Goal 6. The City complies with federal and state environmental standards and statutes, including the federal Clean Water Act and Clean Air Act. Existing City regulations including Title 10 (Erosion Control) and the Stormwater Management Manual will remain in effect and are applicable to future development. As noted below in the findings for the 2035 Comprehensive Plan, the FFTZ amendments are consistent with the goals and policies of Chapter 7 (Environment and Watershed Health) of the 2035 Comprehensive Plan and the findings in response to those goals and policies are incorporated by reference. Therefore, FFTZ amendments are consistent with the requirements of Statewide Planning Goal 6.

Goal 7, **Areas Subject to Natural Disasters and Hazards.** To protect people and property from natural hazards.

9. Finding: The State has not adopted administrative rules for complying with Statewide Planning Goal 7. Most of Portland's employment and industrial zones are in areas with high to very high levels of liquefaction susceptibility, as documented by the 2018 DOGAMI Earthquake Regional Impact Analysis. Fossil fuel infrastructure poses considerable risks in the event of a major earthquake. According to the 2012 DOGAMI Earthquake Risk Study for Oregon's Critical Energy Infrastructure Hub report, a magnitude 8 or 9 Cascadia Subduction Zone earthquake would impact the CEI Hub with: ground shaking; liquefaction (soil behavior phenomenon in which a saturated sand softens and loses strength during strong earthquake ground shaking); lateral spreading (where surficial soil permanently moves laterally due to earthquake shaking); landslides; co-seismic settlement (where the ground surface is permanently lowered due to seismic shaking); and bearing capacity failures (when the foundation soil cannot support the structure it is intended to support).

According to the 2012 DOGAMI report, liquefaction and lateral spreading hazards are of primary concern to the fossil fuel terminals. As described in the 2012 Oregon State Energy Assurance Plan, this Critical Energy Infrastructure Hub (CEI Hub) sits on top of very poor soils that are highly susceptible to earthquake-induced permanent ground deformation. The CEI Hub is adjacent to the Willamette River and has extensive deposits of highly liquefiable soils. These soils (made of sands, silts, gravels and clays) have been naturally deposited by river activity as well as been created from man-made activities, such as hydraulically placed material from river dredging or debris placed as landfill.

The FFTs have significant seismic risks because most of the tanks have been constructed without any or only limited seismic design criteria on soils with moderate to high levels of liquefaction susceptibility, as documented by the Portland Bureau of Emergency Management's 2016 Critical Energy Infrastructure Hub Study and the 2012 DOGAMI Earthquake Risk Study for Oregon's Critical Energy Infrastructure Hub report. Continuing to allow the increase in FFTs in a high risk area increases the risk to the surrounding industrial district and the Willamette River. The FFTZ amendments limit future risk by limiting the size of new fossil fuel terminals and prohibiting the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions. Further, by

designating existing FFTs as a limited use, as opposed to a prohibited nonconforming use, allows the terminals to continue to operate and invest in facilities that reduce the risks and improve their ability to withstand a major earthquake, which ultimately can make Portland more resilient.

As noted below in the findings for the 2035 Comprehensive Plan, the FFTZ amendments are consistent with the goals and policies of Chapter 7 (Environment and Watershed Health) of the 2035 Comprehensive Plan and the findings in response to those goals and policies are incorporated by reference. Therefore, FFTZ amendments are consistent with the requirements of Statewide Planning Goal 7.

Goal 8. Recreational Needs. To satisfy the recreational needs of the citizens of the state and visitors and, where appropriate, to provide for the siting of necessary recreational facilities including destination resorts.

10. Finding: Goal 8 focuses on the provision of destination resorts. However, it does impose a general obligation on the City to plan for meeting its residents' recreational needs: "(1) in coordination with private enterprise; (2) in appropriate proportions; and (3) in such quantity, quality and locations as is consistent with the availability of the resources to meet such requirements."

Goal 8 provides that "Recreation Needs -- refers to existing and future demand by citizens and visitors for recreations areas, facilities and opportunities." Goal 8 also provides that "Recreation Areas, Facilities and Opportunities -- provide for human development and enrichment, and include but are not limited to: open space and scenic landscapes; recreational lands; history, archaeology and natural science resources; scenic roads and travelers; sports and cultural events; camping, picnicking and recreational lodging; tourist facilities and accommodations; trails; waterway use facilities; hunting; angling; winter sports; mineral resources; active and passive games and activities."

The City of Portland has robust and diverse system of parks, recreation areas and open spaces. However, there are no parks adjacent to the existing FFTs. Further, the ordinance limits development for a single type of use, which will reduce negative impacts to parks that are near industrial areas, especially Forest Park, which is located across Highway 30 from the Northwest Industrial District where the existing FFTs are located.

As noted below in the findings for the 2035 Comprehensive Plan, the FFTZ amendments are consistent with the goals and policies of Chapter 8 (Public Facilities and Services) of the 2035 Comprehensive Plan and the findings in response to those goals and policies are incorporated by reference. Therefore, FFTZ amendments are consistent with the requirements of Statewide Planning Goal 8.

Goal 9. Economic Development. To provide adequate opportunities throughout the state for a variety of economic activities vital to health, welfare, and prosperity of Oregon's citizens.

11. Finding: Goal 9 requires cities to consider economic activities vital to the health, welfare, and prosperity of Oregon's citizens. Comprehensive plans for urban areas are required to include, among other things: an analysis of economic patterns, potentialities, strengths, and deficiencies; policies concerning economic development; and land use maps that provide for at least an adequate supply of sites for a variety of industrial and commercial uses.

The 2035 Comprehensive Plan demonstrates compliance with Goal 9. Land needs for a variety of industrial and commercial uses are identified in the Economic Opportunities Analysis (EOA), which was adopted (Ordinance 187831) and acknowledged by LCDC on April 25, 2017.

The City's acknowledged EOA analyzed and demonstrated adequate growth capacity for a diverse range of employment uses, which are organized into different geographies that represent a distinct mix of business sectors and building types. In each of the geographies, the City analyzed the future employment growth and the developable land supply to accommodate that growth.

The FFTZ amendments do not include comprehensive plan map amendments, and, therefore, do not affect the employment development capacity of Portland.

As noted below in the findings for the 2035 Comprehensive Plan, the FFTZ amendments are consistent with the goals and policies of Chapter 6 (Economic Development) of the 2035 Comprehensive Plan and the findings in response to those goals and policies are incorporated by reference. Therefore, FFTZ amendments are consistent with the requirements of Statewide Planning Goal 9.

Goal 10. Housing. To provide for the housing needs of citizens of the state.

12. Finding: Goal 10 specifies that each city must plan for and accommodate needed housing types. As used in ORS 197.307 "needed housing" means all housing on land zoned for residential use or mixed residential and commercial use that is determined to meet the need shown for housing within an urban growth boundary at price ranges and rent levels that are affordable to households within the county with a variety of incomes, including but not limited to households with low incomes, very low incomes and extremely low incomes, and includes attached and detached single-family housing and multiple family housing for both owner and renter occupancy;

Goal 10 requires each city to inventory its buildable residential lands, forecast future needs, and zone enough buildable land to meet those needs. The FFTZ amendments do not include comprehensive plan map amendments, and, therefore, do not affect the residential development capacity of Portland.

As noted below in the findings for the 2035 Comprehensive Plan, the FFTZ amendments are consistent with the goals and policies of Chapter 5 (Housing) of the 2035 Comprehensive Plan and the findings in response to those goals and policies are incorporated by reference. Therefore, FFTZ amendments are consistent with the requirements of Statewide Planning Goal 10.

Goal 11. Public Facilities and Services. To plan and develop a timely, orderly and efficient arrangement of public facilities and services to serve as a framework for urban and rural development.

13. Finding: Statewide Planning Goal 11, Public Facilities, requires cities to adopt and update public facilities plans. Public facilities plans ensure that urban development is guided and supported by types and levels of water, sewer and transportation facilities appropriate for the needs and requirements of the urban areas to be serviced, and that those facilities and services are provided in a timely, orderly and efficient arrangement.

The adopted 2035 Comprehensive Plan includes the Citywide Systems Plan (CSP), which was adopted (Ordinance 185657) and acknowledged by LCDC on April 25, 2017. The CSP includes the Public Facilities Plan with information on current and future transportation, water, sanitary sewer, and stormwater infrastructure needs and projects, consistent with the requirements of Statewide Planning Goal 11.

The FFTZ amendments do not include comprehensive plan map amendments. These regulations apply to only one type of use that makes up a minority part of the uses found in Portland's industrial districts. The remaining industrial uses continue to be regulated under the current

development regulations and do not intensify the development capacity. Therefore, these changes will not adversely impact the City's public facilities.

As noted below in the findings for the 2035 Comprehensive Plan, the FFTZ amendments are consistent with the goals and policies of Chapter 8 (Public Facilities and Services) of the 2035 Comprehensive Plan and the findings in response to those goals and policies are incorporated by reference. Therefore, FFTZ amendments are consistent with the requirements of Statewide Planning Goal 11.

Goal 12. Transportation. To provide and encourage a safe, convenient and economic transportation system.

14. **Finding:** OAR 660-012-0060 (1) If an amendment to a functional plan, an acknowledged comprehensive plan, or a land use regulation (including a zoning map) would significantly affect an existing or planned transportation facility, then the local government must put in place measures as provided in section (2) of this rule, unless the amendment is allowed under section (3), (9) or (10) of this rule. A plan or land use regulation amendment significantly affects a transportation facility if it would:
    (a) Change the functional classification of an existing or planned transportation facility (exclusive of correction of map errors in an adopted plan);
    (b) Change standards implementing a functional classification system; or
    (c) Result in any of the effects listed in paragraphs (A) through (C) of this subsection based on projected conditions measured at the end of the planning period identified in the adopted TSP. As part of evaluating projected conditions, the amount of traffic projected to be generated within the area of the amendment may be reduced if the amendment includes an enforceable, ongoing requirement that would demonstrably limit traffic generation, including, but not limited to, transportation demand management. This reduction may diminish or completely eliminate the significant effect of the amendment.
        (A) Types or levels of travel or access that are inconsistent with the functional classification of an existing or planned transportation facility;
        (B) Degrade the performance of an existing or planned transportation facility such that it would not meet the performance standards identified in the TSP or comprehensive plan; or
        (C) Degrade the performance of an existing or planned transportation facility that is otherwise projected to not meet the performance standards identified in the TSP or comprehensive plan.

The adopted 2035 Comprehensive Plan includes the Transportation Systems Plan (TSP), which was adopted in three phases (Ordinance 187832, 188177, and 188957). Phase 1 and 2 was submitted as part Task Four of Periodic Review; and both were approved by LCDC Order 18 – WKTSK – 001897 on August 8, 2018. Phase 3 of the Transportation System Plan was adopted as a post-acknowledgement plan amendment by Ordinance No. 188957, became effective on June 23, 2018. The TSP includes a congestion performance analysis of the 2035 Comprehensive Plan Map.

The FFTZ amendments do not change the functional classification of any existing or proposed transportation facility, nor do they change the standards implementing a functional classification system. Therefore, the amendments do not have a significant effect under (a) or (b).

The FFTZ amendments limit one type of use allowed in industrial areas. The remaining industrial uses continue to be regulated under the current development regulations and do not intensify the development capacity. Therefore, the amendments do not have a significant effect under (c).

Portland's Air, Rail, Water Pipeline Plan (ARWP) is adopted into the acknowledged TSP in compliance with OAR 660-012-0020(2)(e). The ARWP includes information on the location and extent of existing or planned facilities, as specified by the rule. The ARWP does not have functional classification or performance standards, and the rule does not require them.

Furthermore, as noted below in the findings for the 2035 Comprehensive Plan, the FFTZ amendments are consistent with the goals and policies of Chapter 9 (Transportation) of the 2035 Comprehensive Plan and the findings in response to those goals and policies are incorporated by reference. Therefore, the FFTZ amendments are consistent with the requirements of Statewide Planning Goal 12.

Goal 13. Energy Conservation. To conserve energy.

15. Finding: The State has not adopted specific rules for complying with Statewide Planning Goal 13. Goal 13 generally requires that land use plans contribute to energy conservation.

The FFTZ amendments do not adopt or amend a local energy policy or implementing provisions.

Goal 14. Urbanization. To provide for an orderly and efficient transition from rural to urban land use, to accommodate urban population and urban employment inside urban growth boundaries, to ensure efficient use of land, and to provide for livable communities.

16. Finding: Metro is responsible for Goal 14 compliance on behalf of Portland and other cities within the metropolitan region. Metro has adopted an Urban Growth Management Functional Plan and compliance with this plan by constituent cities assures compliance with Goal 14, which is discussed in Part II of this document and those findings are incorporated by reference.

As discussed above under Goal 9, the FFTZ amendments will not change the employment development capacity inside the urban growth boundary and the City will continue to have adequate capacity to accommodate its allocated forecasted growth. Therefore, FFTZ amendments are consistent with the requirements of Statewide Land Use Goal 14.

Goal 15. Willamette River Greenway. To protect, conserve, enhance and maintain the natural, scenic, historical, agricultural, economic and recreational qualities of lands along the Willamette River as the Willamette River Greenway.

17. Finding: Six of the 11 existing FFTs have frontage on the Willamette River. However, these parcels will continue to be subject to development regulations for flood plains or natural resources. Furthermore, no changes to existing protections afforded through the greenway overlay zones are proposed.

Therefore, FFTZ amendments are consistent with the requirements of Statewide Land Use Goal 15 because they do not change the protections to affected lands within the Willamette River Greenway Overlay Zone.

Part II. Metro Urban Growth Management Functional Plan

Under ORS 268.380 and its Charter, Metro has the authority to adopt regional plans and require city and county comprehensive plans to comply with regional plan. Metro adopted its Urban Growth Management Functional Plan under this authority.

In its June 2011 update to its 2010 compliance report Metro found, "The City of Portland is in compliance with all Urban Growth Management Functional Plan requirements in effect on December

15, 2010, except for Title 13, Nature in Neighborhoods." On January 16, 2013 the City received a letter from Metro stating that Portland had achieved compliance with Title 13.

Title 1. Housing Capacity. The Regional Framework Plan calls for a compact urban form and a "fair-share" approach to meeting regional housing needs. Title 1 requires each city and county to maintain or increase its housing capacity, especially in centers, corridors, main streets, and station communities, except as provided in section 3.07.120.

18. Finding: The FFTZ amendments do not reduce housing potential in any part of the City because the amendments affect a use of industrial land and does not change the designation of residential lands.

    Therefore, the FFTZ amendments are consistent with the requirements of Title 1.

Title 2. Regional Parking Policy. (repealed in 1997)

Title 3. Water Quality and Flood Management. To protect the beneficial water uses and functions and values of resources within the Water Quality and Flood Management Areas by limiting or mitigating the impact on these areas from development activities and protecting life and property from dangers associated with flooding.

19. Finding: Title 3 calls for the protection of the beneficial uses and functional values of resources within Metro-defined Water Quality and Flood Management Areas by limiting or mitigating the impact of development in these areas. Title 3 establishes performance standards for 1) flood management; 2) erosion and sediment control; and 3) water quality. The City has adopted overlay zones and land use regulations, including Title 10 Erosion Control and the balanced cut-and-fill standards in Title 24 Building Regulations, that, in the June 2011 update to its 2010 compliance report, Metro found sufficient to comply with Title 3. This ordinance does not change any of these overlays or regulations.

    FFTs are located in the 100-year floodplain. In the Zoning Code, the City of Portland's Title 3 program is implemented primarily through the greenway overlay zones, which are unchanged by these amendments and will ensure any new development will be done in a way to protect people and property and the functions and values of the floodplain.

Title 4. Industrial and Other Employment Areas. The Regional Framework Plan calls for a strong regional economy. To improve the economy, Title 4 seeks to provide and protect a supply of sites for employment by limiting the types and scale of non-industrial uses in Regionally Significant Industrial Areas (RSIAs), Industrial and Employment Areas. Title 4 also seeks to provide the benefits of "clustering" to those industries that operate more productively and efficiently in proximity to one another than in dispersed locations. Title 4 further seeks to protect the capacity and efficiency of the region's transportation system for the movement of goods and services and to encourage the location of other types of employment in Centers, Corridors, Main Streets and Station Communities. The Metro Council will evaluate the effectiveness of Title 4 in achieving these purposes as part of its periodic analysis of the capacity of the urban growth boundary.

20. Finding: The purpose of Title 4 is to maintain a regional supply of existing industrial and employment land by limiting competing uses for this land. Metro has not adopted a Statewide Planning Goal 9 economic opportunities analysis for the region, so Title 4 is not based on an assessment of the land needed for various employment types, nor do the Title 4 maps necessarily depict lands most suitable to accommodate future job growth. Rather, Title 4 seeks to protect the manufacturing, warehousing, and distribution of goods within three types of mapped areas by

limiting competing uses. These three areas are Regionally Significant Industrial Areas (RSIAs), Industrial Areas, and Employment Areas.

The FFTs are located in the northwest industrial district, which is a designated RSIA. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, the FFTZ amendments are consistent with the requirements of Metro Title 4.

Title 5. Neighboring Cities (repealed 1997)

Title 6. Centers, Corridors, Station Communities and Main Streets. The Regional Framework Plan identifies Centers, Corridors, Main Streets and Station Communities throughout the region and recognizes them as the principal centers of urban life in the region. Title 6 calls for actions and investments by cities and counties, complemented by regional investments, to enhance this role. A regional investment is an investment in a new high-capacity transit line or designated a regional investment in a grant or funding program administered by Metro or subject to Metro's approval.

21. Finding: Title 6 establishes eligibility criteria for certain regional investments, and the use of more flexible trip generation assumptions when evaluating transportation impacts. Title 6 also contains aspirational activity level targets for different Metro 2040 place types. This title is incentive-based, so these findings simply serve to document intent. There are no specific mandatory compliance standards in Title 6 that apply to this ordinance.

The existing FFTs are not located in designated Title 6 areas, therefore this title does not apply.

Title 7. Housing Choice. The Regional Framework Plan calls for establishment of voluntary affordable housing production goals to be adopted by local governments and assistance from local governments on reports on progress towards increasing the supply of affordable housing. It is the intent of Title 7 to implement these policies of the Regional Framework Plan.

22. Finding: Title 7 addresses housing choice. Metro adopted voluntary affordable housing goals for each city and county in the region for the years 2001 to 2006, but never updated them. Title 7 does not apply. The FFTZ amendments change the City's industrial zones and does not impact the City of Portland's residential development capacity or affordable housing programs.

Title 8. Compliance Procedures. Title 8 addresses compliance procedures and establishes a process for ensuring city or county compliance with requirements of the Urban Growth Management Functional Plan. A city or county proposing an amendment to a comprehensive plan or land use regulation shall submit the proposed amendment to METRO at least 35 days prior to the first evidentiary hearing on the amendment.

23. Finding: Metro was provided with the 35-day DLCD notice and the City's standard legislative notice. Title 8 also requires the City to provide findings of compliance with the *Urban Growth Management Functional Plan*, as described here. All applicable requirements of Title 8 have been met.

Title 9. Performance Measures. (repealed in 2010)

Title 10. Functional Plan Definitions. Title 10 contains definitions. When 2035 Comprehensive Plan uses a term found in Title 10 either the term has the same meaning found in Title 10, or the difference is explained.

24. Finding: The FFTZ amendments do not change any definitions in the 2035 Comprehensive Plan that are also found in Title 10. All applicable requirements of Title 10 have been met.

Title 11. Planning for New Urban Areas. (not directly applicable)

Title 12. Protection of Residential Neighborhoods. Existing neighborhoods are essential to the success of the 2040 Growth Concept. The intent of Title 12 of the Urban Growth Management Functional Plan is to protect the region's residential neighborhoods. The purpose of Title 12 is to help implement the policy of the Regional Framework Plan to protect existing residential neighborhoods from air and water pollution, noise, and crime and to provide adequate levels of public services.

25. Finding: Title 12 addresses protection of residential neighborhoods. This title largely restricts Metro's authority to plan and regulate density in single-family neighborhoods. Further, the 2035 Comprehensive Plan does not employ any of the optional provisions of Title 12. The FFTZ amendments were originated by the City's legislative process and do not affect residential neighborhoods. Therefore, this title does not apply to this ordinance.

Title 13. Nature in Neighborhoods. The purposes of this program are to (1) conserve, protect, and restore a continuous ecologically viable streamside corridor system, from the streams' headwaters to their confluence with other streams and rivers, and with their floodplains in a manner that is integrated with upland wildlife habitat and with the surrounding urban landscape; and (2) to control and prevent water pollution for the protection of the public health and safety, and to maintain and improve water quality throughout the region.

26. Finding: Title 13 is expressly intended to provide a minimum baseline level of protection for identified Habitat Conservation Areas. Local jurisdictions may achieve substantial compliance with Title 13 using regulatory and/or non-regulatory tools. The City of Portland implements Title 13 through its adopted Natural Resources Inventory (NRI) and subsequent protection measures through the environmental overlay zones, which Metro has found to be in substantial compliance with Title 13.

No changes to the environmental or greenway overlay zones are proposed as part of this project. Therefore, FFTZ amendments are consistent with the requirements of Title 13.

Title 14. Urban Growth Management Plan. Title 14 addresses the regional urban growth boundary. Since this ordinance does not require, nor initiate, a boundary change, Title 14 does not apply.

Summary, Urban Growth Management Functional Plan Findings

27. Finding: The Metro Title 10 definition of comply or compliance means "substantial" rather than absolute compliance. "Substantial compliance" means city comprehensive plans and implementing ordinances, on the whole, conform with the purposes of the performance standards in the functional plan and any failure to meet individual performance standard requirements is technical or minor in nature.

For the facts and reasons stated above this ordinance substantially complies with all Urban Growth Management Functional Plan requirements applicable to the FFTZ amendments.

Part III. Portland's Comprehensive Plan

Portland's 2035 Comprehensive Plan was adopted as part of Task Four of Periodic Review. Task Four was adopted by Ordinance No. 187832 on June 15, 2016. The 2035 Comprehensive Plan was amended as part of Task Five of Periodic Review, which was adopted by Ordinance No. 188177 on December 21, 2016. Both ordinances were made effective on May 24, 2018 by Ordinance No. 188695, and both Tasks Four and Five were approved by LCDC Order 18 – WKTSK – 001897 on August 8, 2018.

28. Finding: The City Council has identified the following guiding principles, goals and policies to be applicable to the FFTZ amendments.

Guiding Principles

The 2035 Comprehensive Plan adopted five "guiding principles" in additional to the goals and policies typically included in a comprehensive plan. These principles were adopted to reinforce that implementation of the plan needs to be balanced, integrated and multi-disciplinary, and the influence of each principle helps to shape the overall all policy framework of the plan. The FFTZ amendments further these guiding principles as described below.

Economic Prosperity. Support a low-carbon economy and foster employment growth, competitiveness and equitably distributed household prosperity.

29. Finding: This guiding principle is to support a robust and resilient regional economy, thriving local businesses and growth in living-wage jobs and household prosperity. The FFTZ amendments support a low-carbon economy by providing an exception for additional storage capacity for non-fossil, renewable fuels. If fosters employment growth, competitiveness, and contributes to more equitably distributed household prosperity because the regulations are narrowly crafted to apply to one type of use and maintains the development capacity of Portland's industrial areas. Further, the FFTZ amendments support economic prosperity as noted below in the findings for Chapter 6 (Economic Development) of the 2035 Comprehensive Plan and the findings in response to those goals and policies are incorporated by reference.

Human Health. Avoid or minimize negative health impacts and improve opportunities for Portlanders to lead healthy, active lives.

30. Finding: The FFTZ amendments further the objectives to avoid or minimize negative health impacts associated with FFTs by reducing the risks associated with a major earthquake. Continuing to allow the increase in FFTs in a high risk area increases the risk to the surrounding industrial district, the Willamette River and Portland as a whole. The first step in making the current situation better is to ensure that the situation does not get worse by continuing to allow the unlimited increase in fossil fuel terminal storage tank capacity in a moderate to high risk. The FFTZ amendments are a regulatory approach that will limit the size of new fossil fuel terminals and prohibit the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions, which will be an improvement compared to the current regulations that allow for unlimited growth in fossil fuel terminals. Further, by designating existing FFTs as a limited use allows the terminals to continue to operate and invest in facilities that reduce the risks and improve their ability to withstand a major earthquake, which can minimize health impacts in the event of a major earthquake.

Environmental Health. Weave nature into the city and foster a healthy environment that sustains people, neighborhoods, and fish and wildlife. Recognize the intrinsic value of nature and sustain the ecosystem services of Portland's air, water and land.

31. **Finding:** The FFTZ amendments foster a healthy environment and sustain the ecosystem services of Portland's air, water and land by reducing the risk associated with a major earthquake. The first step in making the current situation better is to ensure that the situation does not get worse by continuing to allow the unlimited increase in fossil fuel terminal storage tank capacity in a high risk area. The FFTZ amendments are a regulatory approach that will limit the size of new fossil fuel terminals and prohibit the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions, which will be an improvement compared to the current regulations that allow for unlimited growth in fossil fuel terminals. Further, by designating existing FFTs as a limited use allows the terminals to continue to operate and invest in facilities that reduce the risks and improve their ability to withstand a major earthquake, which can minimize environmental impacts in the event of a major earthquake. No changes to the environmental or greenway overlay zones are proposed as part of this project, therefore the natural resource values and functions will be sustained.

Equity. Promote equity and environmental justice by reducing disparities, minimizing burdens, extending community benefits, increasing the amount of affordable housing, affirmatively furthering fair housing, proactively fighting displacement, and improving socio-economic opportunities for under-served and under-represented populations. Intentionally engage under-served and under-represented populations in decisions that affect them. Specifically recognize, address and prevent repetition of the injustices suffered by communities of color throughout Portland's history.

32. **Finding:** This guiding principle provides a framework to ensure Portlanders more equitably share in the benefits and burdens of growth and development. A fundamental purpose of the FFTZ amendments is to reduce the risks associated with a major earthquake. Continuing to allow the increase in FFTs in a high risk area increases the risk to Portland's environment, especially the Willamette River. The first step in making the current situation better is to ensure that the situation does not get worse by continuing to allow the unlimited increase in fossil fuel terminal storage tank capacity in a moderate to high risk. The FFTZ amendments are a regulatory approach that will limit the size of new fossil fuel terminals and prohibit the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions, which will be an improvement compared to the current regulations that allow for unlimited growth in fossil fuel terminals. Further, by designating existing FFTs as a limited use allows the terminals to continue to operate and invest in facilities that reduce the risks and improve their ability to withstand a major earthquake, which can minimize environmental impacts in the event of a major earthquake.

    The amendments also maintain socio-economic opportunities for under-served and under-represented populations because the regulations are narrowly crafted to apply to one type of use and maintains the development capacity of Portland's industrial areas, which is a good source of middle-wage jobs for people without college degrees.

Resilience. Reduce risk and improve the ability of individuals, communities, economic systems, and the natural and built environments to withstand, recover from, and adapt to changes from natural hazards, human-made disasters, climate change, and economic shifts.

33. **Finding:** The 2035 Comprehensive Plan describes resilience as "reducing the vulnerability of our neighborhoods, businesses, and built and natural infrastructure to withstand challenges – environmental, economic and social – that may result from major hazardous events." Most of Portland's employment and industrial zones are in areas with high to very high levels of liquefaction susceptibility, as documented by the 2018 DOGAMI Earthquake Regional Impact Analysis. Fossil fuel infrastructure poses considerable risks in the event of a major earthquake. The FFTZ amendments support this principle by taking the first step in making Portland more resilient is to stop increasing

the risk. The FFTs have significant seismic risks because most of the tanks have been constructed without any or only limited seismic design criteria on soils with moderate to high levels of liquefaction susceptibility, as documented by the Portland Bureau of Emergency Management's 2016 Critical Energy Infrastructure Hub Study and the 2012 DOGAMI Earthquake Risk Study for Oregon's Critical Energy Infrastructure Hub report. Continuing to allow the increase in FFTs in a high risk area increases the risk to the surrounding industrial district, the Willamette River and Portland as a whole. The FFTZ amendments limit future risk by limiting the size of new fossil fuel terminals and prohibiting the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions. Further, by designating existing FFTs as a limited use, as opposed to a prohibited nonconforming use, allows the terminals to continue to operate and invest in facilities that reduce the risks and improve their ability to withstand a major earthquake, which ultimately can make Portland more resilient.

Chapter 1: The Plan

Goal 1.A: Multiple goals
Portland's Comprehensive Plan provides a framework to guide land use, development, and public facility investments. It is based on a set of Guiding Principles that call for integrated approaches, actions, and outcomes that meet multiple goals to ensure Portland is prosperous, healthy, equitable, and resilient.

34. Finding: The FFTZ amendments are an amendment to the Zoning Code and do not amend the 2035 Comprehensive Plan. As noted above, FFTZ amendments are consistent with the guiding principles of the 2035 Comprehensive Plan. As part of an integrated approach to meet multiple goals, the City Council has considered, weighed and balanced applicable policies, as described on page HTU-5 of the 2035 Comprehensive Plan, to determine that this ordinance on the whole complies with the 2035 Comprehensive Plan. As described below, the City Council's decision to adopt the FFTZ amendments have considered the multiple goals of the comprehensive plan, including the guiding principles, to determine that the adoption of this ordinance will ensure that Portland is prosperous, healthy, equitable, and resilient by minimizing the risk posed by fossil fuel terminals.

Goal 1.B: Regional partnership. Portland's Comprehensive Plan acknowledges Portland's role within the region, and it is coordinated with the policies of governmental partners.

35. Finding: The findings show how the amendments are consistent with Metro's Urban Growth Management Functional Plan and the Statewide Planning Goals, including Goal 2 which requires coordination. In 2016, as part of the original adoption process, Metro, TriMet, and other state agencies received notice of the proposed FFTZ amendments from the 35-day DLCD notice and the City's legislative notice. In 2019, as part of the re-adoption of the remanded ordinance, the City posted a new 35-day DLCD notice and sent a legislative notice for the November 20, 2019 City Council hearing.

Goal 1.C: A well-functioning plan. Portland's Comprehensive Plan is effective, its elements are aligned, and it is updated periodically to be current and to address mandates, community needs, and identified problems.

36. Finding: The City Council defines "effective" as being successful in producing a desired or intended result. The desired or intended result is embodied in the Guiding Principles and goals and policies of the 2035 Comprehensive Plan. These findings demonstrate how the FFTZ amendments are consistent with the 2035 Comprehensive Plan, including advancing multiple goals. These changes represent updating regulatory implementation tools that respond to community needs and identified problems, especially in addressing the considerable risks fossil fuel terminals pose in the

event of a major earthquake, as documented by the Portland Bureau of Emergency Management's Critical Energy Infrastructure Hub Study (2016).

Goal 1.D: Implementation tools. Portland's Comprehensive Plan is executed through a variety of implementation tools, both regulatory and non-regulatory. Implementation tools comply with the Comprehensive Plan and are carried out in a coordinated and efficient manner. They protect the public's current and future interests and balance the need for providing certainty for future development with the need for flexibility and the opportunity to promote innovation.

37. Finding: The City Council interprets this goal to mean that the first step in making the current situation better is to ensure that the situation does not get worse. Continuing to allow the increase in storage tank capacity in FFTs in a high risk area increases the risk to the surrounding industrial district and the Willamette River. The FFTZ amendments are changes to the Zoning Code, which is a primary implementation tool. The City Council finds that the public's current and future interests are embodied in the Vision and Guiding Principles that address prosperity, human and environmental health, equity and resilience. In the event of a major earthquake, fossil fuel terminals pose considerable risks to all of those interests, as documented by the Portland Bureau of Emergency Management's Critical Energy Infrastructure Hub Study (2016). Continuing to allow the unlimited increase in storage capacity at FFTs in a high risk area does not protect the public's current or future interests. The FFTZ amendments are a regulatory approach that will limit the size of new fossil fuel terminals and prohibit the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions, which will be an improvement compared to the current regulations that allow for unlimited growth in FFTs.

The Zoning Code amendments change development standards and limit future expansion of storage capacity at FFTs, which may create uncertainty for the existing terminals. However, the uncertainty is mitigated by designating the existing FFTs as a limited use, as opposed to a prohibited or non-conforming use, that allows the terminals to continue to operate and invest in upgrades, as well as supporting opportunities for enhancement through exceptions, such as aviation or renewable fuels, to the storage capacity restrictions. If the existing FFTs had been designated as a prohibited use, as in the Proposed Draft of the amendments, then the existing FFTs would be nonconforming uses, which in some cases has been a barrier to obtaining financing for improvements and upgrades.

The City Council defines "flexibility" as a capability to adapt to new, different, or changing requirements and "innovation" as the introduction of something new. The amendments incorporate flexibility and innovation by designating the existing FFTs as a limited use that allows the terminals to continue to operate and invest in upgrades, as well as supporting opportunities for enhancement for aviation or renewable fuels among other exceptions.

Goal 1.E: Administration. Portland's Comprehensive Plan is administered efficiently and effectively and in ways that forward the intent of the Plan. It is administered in accordance with regional plans and state and federal law.

38. Finding: The 2035 Comprehensive Plan complies with state and federal law and is not amended by this ordinance. The FFTZ amendments add clear and objective regulations to the Zoning Code that can be administered by the City in an efficient and effective way that minimizes future risk and allows FFTs to invest in safety upgrades to decrease risk over time. These findings demonstrate how the FFTZ amendments are consistent with the intent of the 2035 Comprehensive Plan. As noted above, the findings show how the amendments are consistent with Metro's Urban Growth Management Functional Plan and the Statewide Planning Goals. The regulations are focused on

what the City has jurisdiction over – land use regulation for public health and safety – and does not exceed its authority into areas covered by state and federal law, such railroads and interstate commerce.

The Comprehensive Plan

Policy 1.1. Comprehensive Plan elements. Maintain a Comprehensive Plan that includes these elements:

- **Vision and Guiding Principles.** The Vision is a statement of where the City aspires to be in 2035. The Guiding Principles call for decisions that meet multiple goals to ensure Portland is prosperous, healthy, equitable, and resilient.
- **Goals and policies.** The goals and policies of the Comprehensive Plan, including the Urban Design Framework, provide the long-range planning direction for the development and redevelopment of the city.
- **Comprehensive Plan Map.** The Comprehensive Plan Map is the official long-range planning guide for spatially defining the desired land uses and development in Portland. The Comprehensive Plan Map is a series of maps, which together show the boundaries of municipal incorporation, the Urban Service Boundary, land use designations, and the recognized boundaries of the Central City, Gateway regional center, town centers, and neighborhood centers.
- **List of Significant Projects.** The List of Significant Projects identifies the public facility projects needed to serve designated land uses through 2035. including expected new housing and jobs. It is based on the framework provided by a supporting Public Facilities Plan (PFP). The Citywide Systems Plan (CSP) is the City's public facilities plan. The Transportation System Plan (TSP) includes the transportation-related list of significant projects. The list element of the TSP is also an element of the Comprehensive Plan.
- **Transportation policies, street classifications, and street plans.** The policies, street classifications, and street plan maps contained in the Transportation System Plan (TSP) are an element of the Comprehensive Plan. Other parts of the TSP function as a supporting document, as described in Policy 1.2.

39. Finding: The FFTZ amendments do not include changes to any of the Comprehensive Plan elements The FFTZ amendments do not change the List of Significant Projects, nor do they change policies, street classifications, or street plan maps contained in the Transportation System Plan (TSP).

Supporting Documents

Policy 1.2. Comprehensive Plan supporting documents. Maintain and periodically update the following Comprehensive Plan supporting documents.

1. **Inventories and analyses**. The following inventories and analyses are supporting documents to the Comprehensive Plan:
   - Economic Opportunities Analysis (EOA)
   - Buildable Lands Inventory (BLI)
   - Natural Resource Inventory (NRI)
   - Housing Needs Analysis (HNA)

40. Finding: The FFTZ amendments were developed consistent with the supporting documents of the adopted 2035 Comprehensive Plan. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes do not impact the industrial land designated in Portland and do not impact the employment development capacity identified in the EOA and the BLI.

    The FFTZ amendments do not change the NRI or the implementing environmental or greenway overlay zones.

    The FFTZ amendments do not impact residential land and do not change the Housing Needs Analysis.

2. Public Facilities Plan. The Public Facilities Plan (PFP) is a coordinated plan for the provision of urban public facilities and services within Portland's Urban Services Boundary. The Citywide Systems Plan (CSP) is the City's public facilities plan.

41. Finding: As demonstrated in the findings for Statewide Planning Goal 11, the FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes do not impact the provision of public services and are consistent with the adopted Citywide Systems Plan (CSP). The CSP, which was adopted (Ordinance 185657) and acknowledged by LCDC on April 25, 2017, includes the Public Facilities Plan with information on current and future transportation, water, sanitary sewer, and stormwater infrastructure needs and projects, consistent with the requirements of Statewide Planning Goal 11.

    The FFTZ amendments do not amend the Citywide System Plan, therefore the City continues to plan for public infrastructure investments to maintain and strengthen the infrastructure in the northwest industrial area where the FFTs are located. As noted below in the findings for goals and policies of Chapter 8 (Public Facilities and Services), which are incorporated by reference, the FFTZ amendments are consistent with the CSP.

3. Transportation System Plan (TSP). The TSP is the detailed long-range plan to guide transportation system functions and investments. The TSP ensures that new development and allowed land uses are consistent with the identified function and capacity of, and adopted performance measures for, affected transportation facilities. The TSP includes a financial plan to identify revenue sources for planned transportation facilities included on the List of Significant Projects. The TSP is the transportation element of the Public Facilities Plan. Certain components of the TSP are elements of the Comprehensive Plan. S*ee Policy 1.1*.

42. Finding: As demonstrated in the findings for Statewide Planning Goal 12 (Transportation) and the goals and policies of Chapter 9 (Transportation), the FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes do not impact the transportation system. The FFTZ amendments do not amend the Transportation System Plan, therefore the City continues to plan for public infrastructure investments to maintain and strengthen the multimodal transportation infrastructure in the northwest industrial area where the FFTs are located.

4. School Facility Plans. School facility plans that were developed in consultation with the City, adopted by school districts serving the City, and that meet the requirements of ORS 195 are considered supporting documents to the Comprehensive Plan.

43. Finding: The FFTZ amendments apply to only one type of industrial use that makes up a small part of the businesses found in Portland's industrial districts, therefore, these changes will not impact school facility plans.

Implementation tools

Policy 1.3. Implementation tools subject to the Comprehensive Plan. Maintain Comprehensive Plan implementation tools that are derived from, and comply with, the Comprehensive Plan. *Implementation tools include those identified in policies 1.4 through 1.9.*

Policy 1.4. Zoning Code. Maintain a Zoning Code that establishes the regulations that apply to various zones, districts, uses, and development types.

44. Finding: The FFTZ amendments include Zoning Code amendments create a new use category (bulk fossil fuel terminals) and applies it to the base zones. The development standards limit the size of new fossil fuel terminals and prohibit the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions. The FFTZ regulations designate existing FFTs as a limited use, which allows the terminals to continue to operate and invest in facilities that reduce the risks and improve their ability to withstand a major earthquake. Further, the use limitations (33.140.100.B.17.a) provide flexibility to FFTs to replace and reconfigure existing storage tank capacity to increase safety and meet future needs.

Policy 1.5 Zoning Map. Maintain a Zoning Map that identifies the boundaries of various zones, districts, and other special features.

45. Finding: The FFTZ amendments do not include Zoning Map amendments.

Policy 1.6 Service coordination agreements. Maintain coordination agreements with local governments of adjoining jurisdictions concerning mutual recognition of urban service boundaries; special service districts concerning public facilities and services within Portland's Urban Services Boundary; and public school districts concerning educational facilities within Portland's Urban Services Boundary.

Policy 1.7 Annexations. Provide a process incorporating urban and urbanizable land within the City's Urban Services Boundary through annexation. See policies 8.11-8.19 for service extension requirements for annexations.

Policy 1.8 Urban renewal plans. Coordinate Comprehensive Plan implementation with urban renewal plans and implementation activities. A decision to adopt a new urban renewal district, adopt or amend goals and objectives that will guide investment priorities within a district, or amend the boundaries of an existing district, must comply with the Comprehensive Plan.

Policy 1.9 Development agreements. Consider development agreements entered into by the City of Portland and pursuant to Oregon Revised Statute 94 a Comprehensive Plan implementation tool.

46. Finding: The FFTZ amendments do not include changes or amendments to service coordination agreements, annexation processes, urban renewal plans, or development agreements. Therefore, these policies are not applicable to the FFTZ amendments.

Administration

Policy 1.10. Compliance with the Comprehensive Plan. Ensure that amendments to the Comprehensive Plan's elements, supporting documents, and implementation tools comply with the Comprehensive Plan. "Comply" means that amendments must be evaluated against the Comprehensive Plan's applicable goals and policies and on balance be equally or more supportive of the Comprehensive Plan as a whole than the existing language or designation.

1.10.a Legislative amendments to the Comprehensive Plan's elements and implementation tools must also comply with the Guiding Principles.

1.10.b Legislative amendments to the Comprehensive Plan's elements should be based on the factual basis established in the supporting documents as updated and amended over time.

1.10.c Amendments to the Zoning Map are in compliance with the Comprehensive Plan if they are consistent with the Comprehensive Plan Map.

47. Finding: The City Council finds that this is a fundamental policy of the Comprehensive Plan that guides the manner in which the City Council considers amendments to the Plan itself or any implementing regulations, such as the Zoning Code. The City Council interprets the policy to require the Council to consider whether, after considering all relevant facts, an amendment is equally or more supportive of the Comprehensive Plan. The City Council finds that an amendment is equally supportive when it is on its face directly supported by goals and policies in the Plan. The City Council finds that an amendment is more supportive of the Comprehensive Plan when the amendment will further advance goals and policies, particularly those that are aspirational in nature. The City Council finds that the policy requires consideration as to whether amendments are equally or more supportive of the Plan *as a whole*. The City Council finds that amendments do not need to be equally or more supportive with individual goals and policies, but rather amendments must be equally or more supportive of the entire Comprehensive Plan. Therefore, the City Council finds that there may be instances where specific goals and policies are not supported by the amendments but still the amendment is equally or more supportive of the entire Comprehensive Plan when considered cumulatively. The City Council finds that there is no precise mathematical equation for determining when the Plan as a whole is supported but rather such consideration requires City Council discretion in evaluating the competing interests and objectives of the plan.

The FFTZ amendments are a legislative amendment to the Zoning Code, an implementation tool of the 2035 Comprehensive Plan. These findings identify how the FFTZ amendments comply with the 2035 Comprehensive Plan. That is, the amendments are evaluated against the 2035 Comprehensive Plan's Guiding Principles, goals, and policies, as detailed throughout this set of findings. As described in the finding for Policy 1.2, the factual basis of the supporting documents is not changed by this ordinance. Specifically, the employment capacity, as defined in the EOA, is not impacted by these changes – there are no map amendments, all industrial land use designations remain the same. The other supporting documents have been considered but are not impacted by these changes. The City Council finds that these amendments are equally or more supportive of the Comprehensive Plan than the existing Zoning Code regulations because they limit the considerable risks fossil fuel terminals pose in the event of a major earthquake, while allowing the existing terminals to continue to operate with limited opportunities for expansion, such as aviation fuel or renewable fuels.

The City Council finds that the evaluation to determine if the FFTZ amendments are on balance equally or more supportive than the existing language or designation must consider all of the goals and policies, as demonstrated by these findings. However, these amendments embody a situation where there are competing directions embodied by different policies. There are some policies where the amendments are equally supportive—not more or less so—but there are other policies where the amendments a more supportive and the code changes better embody the direction in the Comprehensive Plan as a whole.

For the reasons stated in these findings, the City Council concludes that the FFTZ amendments are on balance more supportive of the goals and policies of the 2035 Comprehensive Plan than the current regulations. The City Council has considered all applicable goals and policies to achieve an optimum outcome. Goals and policies are considered as factors which must be weighed, balanced and met on the whole, not as criteria that must be individually met. The purposes of the FFTZ amendments are to enhance public safety and protect the environment. The City council has weighed and balanced the applicable goals and policies and concludes that, on the whole, continuing to allow an unlimited increase in storage capacity at FFTs in a high risk area would be less supportive of the 2035 Comprehensive Plan than adopting the FFTZ amendments.

Policy 1.11. Consistency with Metro Urban Growth Management Functional Plan and Urban Growth Boundary. Ensure that the Comprehensive Plan remains consistent with the Metro Urban Growth Management Functional Plan and supports a tight urban growth boundary for the Portland metropolitan area.

Policy 1.12. Consistency with Statewide Planning Goals. Ensure that the Comprehensive Plan, supporting documents, and implementation tools remain consistent with the Oregon Statewide Planning Goals.

48. Finding: As noted earlier in these findings, the FFTZ amendments are consistent with and designed to further the applicable elements of the Metro Urban Growth Management Functional Plan and Statewide Planning Goals, consistent with the directives of policies 1.11 and 1.12.

Policy 1.13. Consistency with state and federal regulations. Ensure that the Comprehensive Plan remains consistent with all applicable state and federal regulations, and that implementation measures for the Comprehensive Plan are well coordinated with other City activities that respond to state and federal regulations.

49. Finding: The FFTZ amendments were developed to be consistent with applicable state and federal regulations and do not amend any Zoning Code sections that are required by state or federal regulations, including FEMA flood regulations and state building code requirements.

Policy 1.14. Public facility adequacy. Consider impacts on the existing and future availability and capacity of urban public facilities and services when amending Comprehensive Plan elements and implementation tools. Urban public facilities and services include those provided by the City, neighboring jurisdictions, and partners within Portland's urban services boundaries, as established by Policies 8.2 and 8.6.

50. Finding: As demonstrated in the findings for Statewide Planning Goal 11 and Chapter 8 (Public Facilities and Services) of the 2035 Comprehensive Plan, the FFTZ amendments do not significantly impact the provision of public services.

Policy 1.15. Intergovernmental coordination. Strive to administer the Comprehensive Plan elements and implementation tools in a manner that supports the efforts and fiscal health of the City, county and regional governments, and partner agencies such as school districts and transit agencies.

51. Finding: As demonstrated in the findings for Statewide Planning Goal 2, the City filed the required 35-day notice with Oregon Department of Land Conservation and Development to notify other government agencies of the proposed FFTZ amendments. In addition, the City sent a separate legislative notice to Multnomah County, adjacent cities, Metro and TriMet. The Port of Portland was the only government agency that raised issues or concerns with the original ordinance. The Port of Portland appreciated that the ordinance was amended to address their concerns about the supply of aviation fuel to Portland International Airport (PDX) and marine fuel suppliers.

Policy 1.16. Planning and Sustainability Commission review. Ensure the Planning and Sustainability Commission (PSC) reviews and makes recommendations to the City Council on all proposed legislative amendments to Comprehensive Plan elements, supporting documents, and implementation tools. The PSC advises City Council on the City's long-range goals, policies, and programs for land use, planning, and sustainability. The membership and powers and duties of the PSC are described in the Zoning Code.

52. Finding: The PSC reviewed and recommended the original FFTZ amendments in 2016. The PSC did not review the remand ordinance, as the City Council did not refer it back to the PSC or BPS for additional changes, but rather opted to re-adopt the original ordinance with minor technical changes to conform to the current zoning code.

Policy 1.17. Community Involvement Committee. Establish a Community Involvement Committee to oversee the Community Involvement Program as recognized by Oregon Statewide Planning Goal 1 – Community Involvement and policies 2.15-2.18 of this Comprehensive Plan.

53. Finding: The Citizen Involvement Committee was appointed in June 2018 and reviews and advises the way City staff engage with the public in land use and transportation planning. The Fossil Fuel Terminal Zoning were initially adopted in 2016, prior to the creation of the CIC, so was unable to consult on the community involvement program that informed the initial ordinance. The CIC did not review the remand ordinance, as the City Council did not refer it back to the PSC or BPS for additional changes, but rather opted to re-adopt the original ordinance with minor technical changes to conform to the current zoning code.

Policy 1.19. Area-specific plans. Use area-specific plans to provide additional detail or refinements applicable at a smaller geographic scale, such as for centers and corridors, within the policy framework provided by the overall Comprehensive Plan.

1.19.a Area-specific plans that are adopted after May 24, 2018, should clearly identify which components amend Comprehensive Plan elements, supporting documents, or implementation tools. Such amendments should be appropriate to the scope of the Comprehensive Plan; be intended to guide land use decisions; and provide geographically-specific detail. Such amendments could include policies specific to the plan area, land use designation changes, zoning map changes, zoning code changes, and public facility projects necessary to serve designated land uses.

1.19.b Area-specific plan components intended as context, general guidance, or directives for future community-driven efforts should not amend the Comprehensive Plan elements or implementation tools but be adopted by resolution as intent. These components include vision statements, historical context, existing conditions, action plans, design preferences, and other background information.

1.19.c Community, area, neighborhood, and other area-specific plans that were adopted by ordinance prior to January 1, 2018 are still in effect. However, the elements of this Comprehensive Plan supersede any goals or policies of a community, area, or neighborhood plan that are inconsistent with this Plan.

54. Finding: The only area-specific plan that applies to the FFTZ amendments is the Guilds Lake Industrial Sanctuary Plan (GLISP). The additional detail provided in that plan are addressed below. Council finds that the GLISP policies and objectives for preserving and enhancing industrial businesses and employment opportunities are consistent with the goals and policies in Chapter 6 (Economic Development) of the 2035 Comprehensive Plan. However, the GLISP does not address

other relevant policies identified in the 2035 Comprehensive Plan, especially Goal 4.D with Policies 4.79 and 4.80, which require reducing risk to people and property from natural hazards. Therefore, the City Council reads GLISP and the Comprehensive Plan together and finds that on balance, the FFTZ amendments are equally or more supportive of the comprehensive plan and GLISP.

Chapter 2: Community Involvement

Goal 2.A: Community involvement as a partnership. The City of Portland works together as a genuine partner with all Portland communities and interests. The City promotes, builds, and maintains relationships, and communicates with individuals, communities, neighborhoods, businesses, organizations, institutions, and other governments to ensure meaningful community involvement in planning and investment decisions.

Goal 2.B: Social justice and equity. The City of Portland seeks social justice by expanding choice and opportunity for all community members, recognizing a special responsibility to identify and engage, as genuine partners, under-served and under-represented communities in planning, investment, implementation, and enforcement processes, particularly those with potential to be adversely affected by the results of decisions. The City actively works to improve its planning and investment-related decisions to achieve equitable distribution of burdens and benefits and address past injustices.

Goal 2.C: Value community wisdom and participation. Portland values and encourages community and civic participation. The City seeks and considers community wisdom and diverse cultural perspectives, and integrates them with technical analysis, to strengthen land use decisions.

Goal 2.D: Transparency and accountability. City planning and investment decision-making processes are clear, open, and documented. Through these processes a diverse range of community interests are heard and balanced. The City makes it clear to the community who is responsible for making decisions and how community input is considered. Accountability includes monitoring and reporting outcomes.

Goal 2.E: Meaningful participation. Community members have meaningful opportunities to participate in and influence all stages of planning and decision making. Public processes engage the full diversity of affected community members, including under-served and under-represented individuals and communities. The City will seek and facilitate the involvement of those potentially affected by planning and decision making.

Goal 2.F: Accessible and effective participation. City planning and investment decision-making processes are designed to be culturally accessible and effective. The City draws from acknowledged best practices and uses a wide variety of tools, including those developed and recommended by under-served and under-represented communities, to promote inclusive, collaborative, culturally-specific, and robust community involvement.

Goal 2.G: Strong civic infrastructure. Civic institutions, organizations, and processes encourage active and meaningful community involvement and strengthen the capacity of individuals and communities to participate in planning processes and civic life.

55. Finding: The 2016 adoption of the ordinance provided opportunities for all interested parties to comment on and influence the Fossil Fuel Terminal Zoning proposal. The preparation of these amendments provided numerous opportunities for public involvement, including:

Concept Phase. In 2016, prior to the initiation of the legislative project, BPS conducted four stakeholder focus groups meetings. These meetings included participants with a range of perspectives and experience, including community group representatives, fuel terminal

representatives, environmental organizations, and business organizations. These meetings served as a forum for discussing issues and potential approaches, and to help inform project staff develop concepts. In addition to the stakeholder focus groups, BPS staff met with several fuel terminals to explain the proposal, answer questions, and discuss their individual concerns. These meetings were needed because antitrust regulations constrained discussion about certain topics, for example supply chains, in the presence of representatives from other fuel terminals.

Discussion Draft. On June 29, 2016, the Fossil Fuel Terminal Zoning Amendments Discussion Draft was published and posted on the Bureau website.

Proposed Draft. On August 12, 2016, the Fossil Fuel Terminal Zoning Proposed Draft was published in preparation for the Planning and Sustainability Commission (PSC) review and recommendation. In support of this process, the BPS website had a project page dedicated to this project, an email address for submitting testimony. As part of the Proposed Draft publication and legislative process requirements, the following legal notices were also sent:

Form 1 35-day Notice. Sent to the Department of Land Conservation and Development (DLCD)

Legislative Notice. Sent to interested parties, recognized organizations, affected bureaus, TriMet, Metro and ODOT and published in the Daily Journal of Commerce

Measure 56 Notice. Required by Ballot Measure 56, this mailed notice was sent to property owners with industrial or employment base zoning.

The PSC held a public hearing on September 13, 2016. On October 11, 2016, the Planning and Sustainability Commission voted to recommend the Fossil Fuel Terminal Zoning Amendments to City Council, including PSC-recommended modifications to the Proposed Draft. All PSC meetings were streamed live and available for viewing on the Bureau website.

Recommended Draft. On October 24, 2016. the Fossil Fuel Terminal Zoning Amendments Recommended Draft was published to present the PSC recommendations to City Council. On October 25, 2016, notice of the City Council hearing on the Fossil Fuel Terminal Zoning Amendments was mailed. The City Council held public hearings on November 10 and 16, 2016, to receive testimony on the Recommended Draft. On December 8, 2016, the City Council voted to adopt the Fossil Fuel Terminal Zoning Amendments.

Partners in decision making

Policy 2.1. Partnerships and coordination. Maintain partnerships and coordinate land use engagement with:

2.1.a Individual community members.

2.1.b Communities of color, low-income populations, Limited English Proficient (LEP) communities, Native American communities, and other under-served and under-represented communities.

2.1.c District coalitions, neighborhood associations, and business district associations as local experts and communication channels for place-based projects.

2.1.d Businesses, unions, employees, and related organizations that reflect Portland's diversity as the center of regional economic and cultural activity.

2.1.e Community-based, faith-based, artistic and cultural, and interest-based non-profits,

organizations, and groups.

2.1.f Institutions, governments, and Sovereign tribes.

Policy 2.2. Broaden partnerships. Work with district coalitions, neighborhood associations, and business district associations to increase participation and to help them reflect the diversity of the people and institutions they serve. Facilitate greater communication and collaboration among district coalitions, neighborhood associations, business district associations, culturally-specific organizations, and community-based organizations.

56. Finding: The FFTZ amendments were informed by a broad range of individuals and groups. A series of Stakeholder Working Group meetings were held that involved participants with a broad range of perspectives and experience, including community group representatives, business organizations and fossil fuel terminal owners.

Environmental justice

Policy 2.3. Extend benefits. Ensure plans and investments promote environmental justice by extending the community benefits associated with environmental assets, land use, and public investments to communities of color, low-income populations, and other under-served or under-represented groups impacted by the decision. Maximize economic, cultural, political, and environmental benefits through ongoing partnerships.

Policy 2.4. Eliminate burdens. Ensure plans and investments eliminate associated disproportionate burdens (e.g. adverse environmental, economic, or community impacts) for communities of color, low-income populations, and other under-served or under-represented groups impacted by the decision.

2.4.a, Minimize or mitigate disproportionate burdens in cases where they cannot be eliminated.

2.4.b, Use plans and investments to address disproportionate burdens of previous decisions.

57. Finding: The FFTZ amendments address issues that had been identified as particular burdens for low-income populations and communities of color, including public health and safety.

Invest in education and training

Policy 2.5. Community capacity building. Enhance the ability of community members, particularly those in under-served and/or under-represented groups, to develop the relationships, knowledge, and skills to effectively participate in plan and investment processes.

Policy 2.6. **Land use literacy.** Provide training and educational opportunities to build the public's understanding of land use, transportation, housing, and related topics, and increase capacity for meaningful participation in planning and investment processes.

Policy 2.7. Agency capacity building. Increase City staff's capacity, tools, and skills to design and implement processes that engage a broad diversity of affected and interested communities, including under-served and under-represented communities, in meaningful and appropriate ways.

58. Finding: Policies 2.5 through 2.7 concern broad approaches to educating community members and City staff about planning processes, and are not applicable to these Zoning Code amendments.

Community assessment

Policy 2.8. Channels of communication. Maintain channels of communication among City Council, the Planning and Sustainability Commission (PSC), project advisory committees, City staff, and community members.

59. Finding: The City Council interprets this policy to create the opportunity for the community and advisory committees to have opportunities to communicate their issues and concerns to the PSC and City Council outside of the formal legislative process. These changes are a legislative process with formal opportunities to testify to communicate directly with City Council. Therefore, this policy does not apply.

Policy 2.9. Community analysis. Collect and evaluate data, including community-validated population data and information, to understand the needs, priorities, and trends and historical context affecting different communities in Portland.

Policy 2.10. Community participation in data collection. Provide meaningful opportunities for individuals and communities to be involved in inventories, mapping, data analysis, and the development of alternatives.

Policy 2.11. Open Data. Ensure planning and investment decisions are a collaboration among stakeholders, including those listed in Policy 2.1. Where appropriate, encourage publication, accessibility, and wide-spread sharing of data collected and generated by the City.

60. Finding: Policies 2.9 through 2.11 concern how the City collects and makes available data that supports land use decisions. In this case, the City published data concerning the storage capacity of existing FFTs as part of the discussion draft, proposed draft, and recommendation draft with an opportunity for the community and terminal owners to validate that data.

Transparency and accountability

Policy 2.12. Roles and responsibilities. Establish clear roles, rights, and responsibilities for participants and decision makers in planning and investment processes. Address roles of City bureaus, elected officials, and participants, including community and neighborhood leadership, business, organizations, and individuals.

Policy 2.13. Project scope. Establish clear expectations about land use project sponsorship, purpose, design, and how decision makers will use the process results.

Policy 2.14. Community influence. At each stage of the process, identify which elements of a planning and investment process can be influenced or changed through community involvement. Clarify the extent to which those elements can be influenced or changed.

Policy 2.15. Documentation and feedback. Provide clear documentation for the rationale supporting decisions in planning and investment processes. Communicate to participants about the issues raised in the community involvement process, how public input affected outcomes, and the rationale used to make decisions.

61. Finding: As described in the findings for Statewide Planning Goal 1 (Citizen Involvement), the original legislative process was clearly outlined in notices, documents and on the project website as to how to testify to influence the Proposed Draft at the PSC, which amended the proposal. Then the Recommended Draft was published with the opportunity to testify to the City Council at the 2016 public hearings.

    For the re-adoption of the FFTZ amendments, the City Council received public testimony at the November 20, 2019 hearing on the substance of the regulations.

    The findings in this document respond to the public testimony and explain the rationale used to make this decision.

Community involvement program

Policies 2.16 through 2.23.

62. Finding: These policies concern the City's Community Involvement Program and are not applicable because the FFTZ amendments do not change this program.

Process design and evaluation

Policy 2.24. Representation. Facilitate participation of a cross-section of the full diversity of affected Portlanders during planning and investment processes. This diversity includes individuals, stakeholders, and communities represented by race, color, national origin, English proficiency, gender, age, disability, religion, sexual orientation, gender identity, and source of income.

Policy 2.25. Early involvement. Improve opportunities for interested and affected community members to participate early in planning and investment processes, including identifying and prioritizing issues, needs, and opportunities; participating in process design; and recommending and prioritizing projects and/or other types of implementation.

Policy 2.26. Verifying data. Use data, including community-validated population data, to guide planning and investment processes and priority setting and to shape community involvement and decision-making efforts.

Policy 2.27. Demographics. Identify the demographics of potentially affected communities when initiating a planning or investment project.

Policy 2.28. Historical understanding. To better understand concerns and conditions when initiating a project, research the history, culture, past plans, and other needs of the affected community, particularly under-represented and under-served groups, and persons with limited English proficiency (LEP). Review preliminary findings with members of the community who have institutional and historical knowledge.

Policy 2.29. Project-specific needs. Customize community involvement processes to meet the needs of those potentially affected by the planning or investment project. Use community involvement techniques that fit the scope, character, and potential impact of the planning or investment decision under consideration.

Policy 2.30. Culturally-appropriate processes. Consult with communities to design culturally-appropriate processes to meet the needs of those affected by a planning or investment project. Evaluate, use, and document creative and culturally-appropriate methods, tools, technologies, and spaces to inform and engage people from under-served and under-represented groups about planning or investment projects.

Policy 2.31. Innovative engagement methods. Develop and document innovative methods, tools, and technologies for community involvement processes for plan and investment projects.

Policy 2.32. Inclusive participation beyond Portland residents. Design public processes for planning and investment projects to engage affected and interested people who may not live in Portland such as property owners, employees, employers, and students, among others, as practicable.

Policy 2.33. Inclusive participation in Central City planning. Design public processes for the Central City that recognize its unique role as the region's center. Engage a wide range of stakeholders from the Central City and throughout the region including employees, employers, social service providers, students, and visitors, as well as regional tourism, institutional, recreation, transportation, and local/regional government representatives, as appropriate.

Policy 2.34. Accessibility. Ensure that community involvement processes for planning and investment projects are broadly accessible in terms of location, time, and language, and that they support the engagement of individuals with a variety of abilities and limitations on participation.

Policy 2.35. Participation monitoring. Evaluate and document participant demographics throughout planning and investment processes to assess whether participation reflects the demographics of affected communities. Adapt involvement practices and activities accordingly to increase effectiveness at reaching targeted audiences.

Policy 2.36. Adaptability. Adapt community involvement processes for planning and investment projects as appropriate to flexibly respond to changes in the scope and priority of the issues, needs, and other factors that may affect the process.

Policy 2.37. Process evaluation. Evaluate each community involvement process for planning or investment projects from both the City staff and participants' perspectives, and consider feedback and lessons learned to enhance future involvement efforts.

63. Finding: Policies 2.24 through 2.37 concern how the community involvement program is designed and developed to support planning and investment projects. The community involvement process conducted in support of initial adoption of the FFTZ amendments engaged a broad range of stakeholders. As part of the concept development of the zoning code changes, BPS held stakeholder focus group meetings with representatives from energy providers (the FFTs, the Western States Petroleum Association, Northwest Natural, and business organizations) and environmental organizations. The Discussion Draft was crafted in response to these discussions. In turn, comments on the Discussion Draft informed changes that were incorporated in the Proposed Draft. A large number of people testified at both the PSC and City Council public hearings, which resulted in amendments to the regulations.

    For this reconsideration of the remanded notice, a legislative notice was sent to the City's legislative notice list as well as the FFT owners and the attorneys that participated in the appeal. People testifies at the November 20, 2019, public hearing.

Information design and development

Policy 2.38. Accommodation. Ensure accommodations to let individuals with disabilities participate in administrative, quasi-judicial, and legislative land use decisions, consistent with federal regulations.

64. Finding: The City Council hearing on November 20, 2019 was held at City Hall, an accessible location.

Policy 2.39. Notification. Notify affected and interested community members and recognized organizations about administrative, quasi-judicial, and legislative land use decisions with enough lead time to enable effective participation. Consider notification to both property owners and renters.

65. Finding: For the original adoption of the FFTZ amendments, the City sent the required Measure 56 notice to all owners of industrial zoned properties when it published the Proposed Draft prior to the PSC hearing. The City also sent a legislative notice to interested parties, including neighborhood associations, business associations, and other affected jurisdictions, that have requested notice of proposed land use changes.

    The City sent a legislative notice to interested parties, FFT owners and the attorneys that participated in the appeal to inform them of the opportunity to testify at the November 20, 2019, City Council public hearing.

Policy 2.40. Tools for effective participation. Provide clear and easy access to information about administrative, quasi-judicial, and legislative land use decisions in multiple formats and through technological advancements and other ways.

Policy 2.41. Limited English Proficiency (LEP). Ensure that limited English proficient (LEP) individuals are provided meaningful access to information about administrative, quasi-judicial, and legislative land use decisions, consistent with federal regulations.

66. Finding: Regular communications about the original adoption of the FFTZ project and opportunities to participate and provide input were made available through the project website.

Chapter 3: Urban Form

GOAL 3.A: A city designed for people. Portland's built environment is designed to serve the needs and aspirations of all Portlanders, promoting prosperity, health, equity, and resiliency. New development, redevelopment, and public investments reduce disparities and encourage social interaction to create a healthy connected city.

67. Finding: The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes are consistent with the intent to maintain Portland's industrial districts over time. The FFTZ regulations apply to only one type of business that makes up a minority part of the businesses found in Portland's industrial districts, therefore it is not expected to have an impact on the goal of creating a healthy connected city.

GOAL 3.B: A climate and hazard resilient urban form. Portland's compact urban form, sustainable building development practices, green infrastructure, and active transportation system reduce carbon emissions, reduce natural hazard risks and impacts, and improve resilience to the effects of climate change.

68. Finding: Most of Portland's employment and industrial zones are in areas with high to very high levels of liquefaction susceptibility, as documented by the 2018 DOGAMI Earthquake Regional Impact Analysis. Fossil fuel infrastructure poses considerable risks in the event of a major earthquake. Continuing to allow the unlimited increase in storage capacity at FFTs in a high risk area does not reduce the risk or impact from a major earthquake. The FFTZ amendments are a regulatory approach that improves Portland's ability to withstand and recover from an earthquake by limiting the size of new fossil fuel terminals and prohibiting the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions, which is an improvement over the current regulations that allow for unlimited growth in FFTs. The FFTZ regulations focus on limiting risk by limiting new development (storage capacity), but designate existing FFTs as a limited use, which allows the terminals to continue to operate and invest in facilities that reduce the risks and improve their ability to withstand a major earthquake. Further, the use limitations provide flexibility to FFTs to replace and reconfigure existing storage tank capacity to increase safety and meet future needs.

The FFTZ amendments are consistent with this goal because they do not include map changes, nor do they allow for new incompatible land uses, and these regulations apply to only one type of business that makes up a minority part of the businesses found in Portland's industrial districts. Therefore, these changes support business retention and expansion in Portland's industrial districts, which will contribute to maintaining a compact urban form. The FFTZ amendments do not amend the Citywide System Plan or the Transportation System Plan, therefore the City continues to plan for public infrastructure investments that support green infrastructure and active transportation.

GOAL 3.C: Focused growth. Household and employment growth is focused in the Central City and other centers, corridors, and transit station areas, creating compact urban development in areas with a high level of service and amenities, while allowing the relative stability of lower-density single-family residential areas.

69. Finding: The FFTZ amendments are focused on changes to allowed uses in the City's industrial areas and do not affect the City's goal in creating compact urban development.

GOAL 3.D: A system of centers and corridors. Portland's interconnected system of centers and corridors provides diverse housing options and employment opportunities, robust multimodal transportation connections, access to local services and amenities, and supports low-carbon complete, healthy, and equitable communities.

70. Finding: The FFTZ amendments are focused on changes to allowed uses in the City's industrial areas and do not affect the City's goal in creating a system of centers and corridors.

GOAL 3.E: Connected public realm and open spaces. A network of parks, streets, City Greenways, and other public spaces supports community interaction; connects neighborhoods, districts, and destinations; and improves air, water, land quality, and environmental health.

71. Finding: The FFTZ amendments are focused on changes to the City's industrial areas, which play a limited role in the City's connected network of parks and open spaces. Six of the existing FFTs have frontage on the Willamette River with designated natural resources that are protected by the Greenway Overlay Zone (Chapters 33.440), which is not amended by this ordinance.

GOAL 3.F: Employment districts. Portland supports job growth in a variety of employment districts to maintain a diverse economy.

72. Finding: The 2035 Comprehensive Plan defines the verb "maintain" to mean keep what you have; conserve; preserve; continue. As described in the Economic Opportunities Analysis (EOA), Portland has a diverse economy with a wide range of businesses and employment opportunities that are distributed across the Central City, neighborhood commercial areas, campus institutions and industrial areas. The FFTZ amendments maintain Portland's diverse economy because the changes do not include map changes, nor do they allow for new incompatible land uses in industrial areas. Therefore, these changes will continue to provide the same opportunities for employment in Portland's employment districts. The FFTZ regulations apply to only one type of business that makes up a minority part of the businesses found in Portland's employment districts. The limits on expansion of storage capacity at fossil fuel terminals are mitigated by designating existing fossil fuel terminals as a limited use that allows the terminals to maintain, preserve and continue to operate and improve their intermodal facilities and supports opportunities for growth through a number of exceptions, such as aviation or renewable fuels, to the storage capacity restrictions.

GOAL 3.G: Nature in the city. A system of habitat corridors weaves nature into the city, enhances habitat connectivity, and preserves natural resources and the ecosystem services they provide.

73. Finding: The Willamette and Columbia rivers play a major role in the habitat corridors that weave nature into Portland. Six of the existing FFTs have frontage on the Willamette River with designated natural resources that are protected by the Greenway Overlay Zone (Chapters 33.440), which is not amended by this ordinance. In considering the natural hazard risks that the FFTs pose to the ecosystem functions on the river, as identified by the Portland Bureau of Emergency Management's Critical Energy Infrastructure Hub Study (2016), the City Council finds that continuing to allow the unlimited increase in storage capacity at FFTs in a high risk area does not enhance the current or

future natural resource functions of the rivers. Therefore, the FFTZ regulations focus on limiting risk by limiting new development (storage capacity), but designate existing FFTs as a limited use, which allows the terminals to continue to operate and invest in facilities that reduce the risks and improve their ability to withstand a major earthquake. Further, the use limitations provide flexibility to FFTs to replace and reconfigure existing storage tank capacity to increase safety. These regulations will limit the risks to the natural resource habitat functions and ecosystem services provided by the rivers.

Citywide design and development

Policy 3.1. Urban Design Framework. Use the Urban Design Framework (UDF) as a guide to create inclusive and enduring places, while providing flexibility for implementation at the local scale to meet the needs of local communities.

74. Finding: The UDF is a guide at the citywide scale. The UDF identifies the Rivers pattern area, which encompasses most of Portland's industrial and employment areas, including all of the existing FFTs. The FFTZ amendments are focused on changes to allowed uses in the City's industrial areas. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses. Therefore, these changes are consistent with this policy because they do not change the location or character of the Rivers pattern area.

Policy 3.2. Growth and stability. Direct most growth and change to centers, corridors, and transit station areas, allowing the continuation of the scale and characteristics of Portland's residential neighborhoods.

75. Finding: The FFTZ amendments are focused on changes to allowed uses in the City's industrial areas. These regulations apply to only one type of business that makes up a minority part of the businesses found in Portland's industrial districts. The other industrial uses continue to operate under current regulations. These changes will not affect the City's policies to direct most growth to centers and corridors or affect the scale and characteristics of Portland's residential neighborhoods.

Policy 3.3. Equitable development. Guide development, growth, and public facility investment to reduce disparities, ensure equitable access to opportunities, and produce positive outcomes for all Portlanders.

3.3.a. Anticipate, avoid, reduce, and mitigate negative public facility and development impacts, especially where those impacts inequitably burden communities of color, under-served and under-represented communities, and other vulnerable populations.

3.3.b. Make needed investments in areas that are deficient in public facilities to reduce disparities and increase equity. Accompany these investments with proactive measures to avoid displacement and increase affordable housing.

3.3.c. Encourage use of community benefit agreements to ensure equitable outcomes from development projects that benefit from public facility investments, increased development allowances, or public financial assistance. Consider community benefit agreements as a tool to mitigate displacement and housing affordability impacts.

3.3.d. Consider use of exactions imposed on development and other tools to capture value created by plans and investments, to reduce or mitigate displacement and housing affordability impacts.

3.3.e. Coordinate housing, economic development, and public facility plans and investments to create an integrated community development approach to restore communities impacted by past decisions.

76. Finding: One of the ways to reduce disparities and produce positive outcomes for all Portlanders is to create more opportunities for middle wage jobs, especially for people without college degrees. Those opportunities can be found in Portland's industrial areas. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes do not conflict with the intent to encourage growth in Portland's industrial districts. These regulations apply to only one type of business that makes up a minority part of the businesses found in Portland's industrial districts. The remaining industrial uses continue to operate under current regulations. These changes support the retention of existing fossil fuel terminals by designating them as a limited use, as opposed to a non-conforming use, that allows the terminals to continue to operate and invest in upgrades and supports opportunities for growth through exceptions, such as aviation or renewable fuels, to the storage capacity restrictions.

The City Council finds that the other types of anti-displacement mitigation measures identified in this policy are not applicable to Zoning Code changes that affect allowed uses in industrial zones.

Policy 3.4. All ages and abilities. Strive for a built environment that provides a safe, healthful, and attractive environment for people of all ages and abilities.

77. Finding: The City Council interprets this policy to be focused on creating a supportive built environment for children, the elderly and people with disabilities. Specifically, the policy is focused on the built environment of centers, corridors and residential areas where children, the elderly and people with disabilities inhabit the city. The FFTZ amendments are focused on changes to allowed uses in the City's industrial areas, where very few children, the elderly and people with disabilities are found. Therefore, this policy does not apply.

Policy 3.5. Energy and resource efficiency. Support energy-efficient, resource-efficient, and sustainable development and transportation patterns through land use and transportation planning.

78. Findings: The City Council interprets this goal to apply to the city as whole. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, will not significantly change the development pattern in Portland's industrial districts. The FFTZ amendments do not amend the Citywide System Plan or the Transportation System Plan. Therefore, these changes will continue to support the sustainable development and transportation patterns across the city as a whole.

Policy 3.6. Land efficiency. Provide strategic investments and incentives to leverage infill, redevelopment, and promote intensification of scarce urban land while protecting environmental quality.

79. Findings: The FFTZ amendments do not amend the Citywide System Plan or the Transportation System Plan. The City's Enterprise Zone program, which provides a property tax exemption to industrial firms, is one of the programs in which the City of Portland provides strategic assistance to businesses. These changes do not affect that program, and FFTs that make new capital investments remain eligible for that program. The FFTZ amendments do not amend the Greenway Overlay Zone standards or review process. Therefore, the City continues to plan for strategic investments and incentives in the industrial districts, while protecting environmental quality.

Policy 3.7. Integrate nature. Integrate nature and use green infrastructure throughout Portland.

80. Findings: No changes to greenway or environmental overlay zones, stormwater requirements, or tree code are a part of this ordinance. This policy does not apply.

Policy 3.8. Leadership and innovation in design. Encourage high-performance design and development that demonstrates Portland's leadership in the design of the built environment, commitment to a more equitable city, and ability to experiment and generate innovative design solutions.

81. Finding: The FFTZ amendments are use limitations for one type of use found in Portland's industrial areas. These changes support the retention of existing fossil fuel terminals by designating them as a limited use that allows the terminals to continue to operate and invest in upgrades and supports opportunities for growth through exceptions, such as aviation or renewable fuels. Further, the use limitations encourage innovation to FFTs to replace and reconfigure existing storage tank capacity to increase safety and meet future needs.

Policy 3.9. Growth and development. Evaluate the potential impacts of planning and investment decisions, significant new infrastructure, and significant new development on the physical characteristics of neighborhoods and their residents, particularly under-served and under-represented communities, with attention to displacement and affordability impacts. Identify and implement strategies to mitigate the anticipated impacts.

82. Finding: The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes do not conflict with the intent to encourage growth in Portland's industrial districts. These regulations apply to only one type of business that makes up a minority part of the businesses found in Portland's industrial districts. The remaining industrial uses continue to operate under current regulations. These changes apply to one type of use in the industrial zones, therefore, these changes will not have a significant impact on industrial areas, including the employment opportunities. These changes will not impact the physical characteristics of neighborhoods or result in increased displacement or affordability impacts, therefore no mitigations strategies have been identified.

Policy 3.10. Rural, urbanizable, and urban land. Preserve the rural character of rural land outside the Regional Urban Growth Boundary. Limit urban development of urbanizable land beyond the City Limits until it is annexed and full urban services are extended.

83. Finding: The FFTZ amendments apply to one type of use in the industrial zones, therefore, these changes will not have a significant impact on rural land outside the UGB. This policy does not apply.

Policy 3.11. Significant places. Enhance and celebrate significant places throughout Portland with symbolic features or iconic structures that reinforce local identity, histories, and cultures and contribute to way-finding throughout the city. Consider these especially at:

- High-visibility intersections
- Attractions
- Schools, libraries, parks, and other civic places
- Bridges
- Rivers
- Viewpoints and view corridor locations

- Historically or culturally significant places
- Connections to volcanic buttes and other geologic and natural landscape features
- Neighborhood boundaries and transitions

84. Finding: The existing FFTs are near significant places, but not considered significant places that should be enhanced or celebrated. This policy does not apply.

Centers

Policy 3.12. Role of centers. Enhance centers as anchors of complete neighborhoods that include concentrations of commercial and public services, housing, employment, gathering places, and green spaces.

Policy 3.13. Variety of centers. Plan for a range of centers across the city to enhance local, equitable access to services, and expand housing opportunities.

Policy 3.14. Housing in centers. Provide housing capacity for enough population to support a broad range of commercial services, focusing higher-density housing within a half-mile of the center core.

Policy 3.15. Investments in centers. Encourage public and private investment in infrastructure, economic development, and community services in centers to ensure that all centers will support the populations they serve.

Policy 3.16. Government services. Encourage the placement of services in centers, including schools and colleges, health services, community centers, daycare, parks and plazas, library services, and justice services.

Policy 3.17. Arts and culture. Ensure that land use plans and infrastructure investments allow for and incorporate arts, culture, and performance arts as central components of centers.

Policy 3.18. Accessibility. Design centers to be compact, safe, attractive, and accessible places, where the street environment makes access by transit, walking, biking, and mobility devices such as wheelchairs, safe and attractive for people of all ages and abilities.

Policy 3.19. Center connections. Connect centers to each other and to other key local and regional destinations, such as schools, parks, and employment areas, by frequent and convenient transit, bicycle sharing, bicycle routes, pedestrian trails and sidewalks, and electric vehicle charging stations.

Policy 3.20. Green infrastructure in centers. Integrate nature and green infrastructure into centers and enhance public views and connections to the surrounding natural features.

85. Finding: The FFTZ amendments change allowed uses in the City's industrial areas. There are no FFTs located in centers. These policies do not apply.

Central City

Policy 3.21. Role of the Central City. Encourage continued growth and investment in the Central City, and recognize its unique role as the region's premier center for jobs, services, and civic and cultural institutions that support the entire city and region.

Policy 3.22. Model Urban Center. Promote the Central City as a living laboratory that demonstrates how the design and function of a dense urban center can concurrently provide equitable benefits to human health, the natural environment, and the local economy.

Policy 3.23. Central City employment. Encourage the growth of the Central City's regional share of employment and continue its growth as the region's unique center for innovation and exchange through commerce, employment, arts, culture, entertainment, tourism, education, and government.

Policy 3.24. Central City housing. Encourage the growth of the Central City as Portland's and the region's largest center with the highest concentrations of housing and with a diversity of housing options and services.

Policy 3.25. Transportation hub. Enhance the Central City as the region's multimodal transportation hub and optimize regional access as well as the movement of people and goods among key destinations.

Policy 3.26. Public places. Promote public places and the Willamette River waterfront in the Central City as places of business and social activity and gathering for the people of its districts and the broader region.

86. Finding: The FFTZ amendments change allowed uses in the City's industrial areas. There are no FFTs located in the Central City. These policies do not apply.

Gateway Regional Center

Policy 3.27 Role of Gateway. Encourage growth and investment in Gateway to enhance its role as East Portland's center of employment, commercial, and public services.

Policy 3.28 Housing. Encourage housing in Gateway, to create East Portland's largest concentration of high-density housing**.**

Policy 3.29 Transportation. Enhance Gateway's role as a regional high-capacity transit hub that serves as an anchor for East Portland's multimodal transportation system.

Policy 3.30 Public places. Enhance the public realm and public places in Gateway to provide a vibrant and attractive setting for business and social activity that serves East Portland residents and the region.

87. Finding: The FFTZ amendments change allowed uses in the City's industrial areas. There are no FFTs located in the Gateway Regional Center. These policies do not apply.

Town Centers

Policy 3.31 Role of Town Centers. Enhance Town Centers as successful places that serve the needs of surrounding neighborhoods as well as a wider area, and contain higher concentrations of employment, institutions, commercial and community services, and a wide range of housing options.

Policy 3.32 Housing. Provide for a wide range of housing types in Town Centers, which are intended to generally be larger in scale than the surrounding residential areas. There should be sufficient zoning capacity within a half-mile walking distance of a Town Center to accommodate 7,000 households.

Policy 3.33 Transportation. Improve Town Centers as multimodal transportation hubs that optimize access from the broad area of the city they serve and are linked to the region's high-capacity transit system.

Policy 3.34 Public places. Provide parks or public squares within or near Town Centers to support their roles as places of focused business and social activity.

88. Finding: The FFTZ amendments change allowed uses in the City's industrial areas. There are no FFTs located in town centers. These policies do not apply.

Neighborhood Centers

Policy 3.35 Role of Neighborhood Centers. Enhance Neighborhood Centers as successful places that serve the needs of surrounding neighborhoods. In Neighborhood Centers, provide for higher concentrations of development, employment, commercial and community services, and a wider range of housing options than the surrounding neighborhoods.

Policy 3.36 Housing. Provide for a wide range of housing types in Neighborhood Centers, which are intended to generally be larger in scale than the surrounding residential areas, but smaller than Town Centers. There should be sufficient zoning capacity within a half-mile walking distance of a Neighborhood Center to accommodate 3,500 households.

Policy 3.37 Transportation. Design Neighborhood Centers as multimodal transportation hubs that are served by frequent-service transit and optimize pedestrian and bicycle access from adjacent neighborhoods.

Policy 3.38 Public places. Provide small parks or plazas within or near Neighborhood Centers to support their roles as places of local activity and gathering.

89. Finding: The FFTZ amendments change allowed uses in the City's industrial areas. There are no FFTs located in neighborhood centers. These policies do not apply.

Inner Ring Districts

Policy 3.39 Growth. Expand the range of housing and employment opportunities in the Inner Ring Districts. Emphasize growth that replaces gaps in the historic urban fabric, such as redevelopment of surface parking lots and 20th century auto-oriented development.

Policy 3.40 Corridors. Guide growth in corridors to transition to mid-rise scale close to the Central City, especially along Civic Corridors.

Policy 3.41 Distinct identities. Maintain and enhance the distinct identities of the Inner Ring Districts and their corridors. Use and expand existing historic preservation and design review tools to accommodate growth in ways that identify and preserve historic resources and enhance the distinctive characteristics of the Inner Ring Districts, especially in areas experiencing significant development.

Policy 3.42 Diverse residential areas. Provide a diversity of housing opportunities in the Inner Ring Districts' residential areas. Encourage approaches that preserve or are compatible with existing historic properties in these areas. Acknowledge that these areas are historic assets and should retain their established characteristics and development patterns, even as Inner Ring centers and corridors grow. Apply base zones in a manner that takes historic character and adopted design guidelines into account.

Policy 3.43 Active transportation. Enhance the role of the Inner Ring Districts' extensive transit, bicycle, and pedestrian networks in conjunction with land uses that optimize the ability for more people to utilize this network. Improve the safety of pedestrian and bike connections to the Central City. Strengthen transit connections between the Inner Ring Districts and to the Central City.

90. Finding: The FFTZ amendments change allowed uses in the City's industrial areas. There are no FFTs located in the Inner Ring. These policies do not apply.

Corridors

Policy 3.44. Growth and mobility. Coordinate transportation and land use strategies along corridors

to accommodate growth and mobility needs for people of all ages and abilities.

Policy 3.45. Connections. Improve corridors as multimodal connections providing transit, pedestrian, bicycle, and motor vehicle access and that serve the freight needs of centers and neighborhood business districts.

Policy 3.46. Design. Encourage street design that balances the important transportation functions of corridors with their roles as the setting for commercial activity and residential living.

Policy 3.47. Green infrastructure in corridors. Enhance corridors with distinctive green infrastructure, including landscaped stormwater facilities, extensive tree plantings, and other landscaping that both provide environmental function and contribute to a quality pedestrian environment.

91. Finding: The FFTZ amendments change allowed uses in the City's industrial areas. There are no FFTs located in corridors. These policies do not apply.

Civic Corridors

Policy 3.48. Integrated land use and mobility. Enhance Civic Corridors as distinctive places that are models of ecological urban design, with transit-supportive densities of housing and employment, prominent street trees and other green features, and high-quality transit service and pedestrian and bicycle facilities.

Policy 3.49. Design great places. Improve public streets and sidewalks along Civic Corridors to support the vitality of business districts, create distinctive places, provide a safe, healthy, and attractive pedestrian environment, and contribute to quality living environments for residents.

Policy 3.50. Mobility corridors. Improve Civic Corridors as key mobility corridors of citywide importance that accommodate all modes of transportation within their right-of-way or on nearby parallel routes.

Policy 3.51. Freight. Maintain freight mobility and access on Civic Corridors that are also Major or Priority Truck Streets.

92. Finding: The FFTZ amendments change allowed uses in the City's industrial areas. There are no FFTs located in civic corridors. These policies do not apply.

Neighborhood Corridors

Policy 3.52. Neighborhood Corridors. Enhance Neighborhood Corridors as important places that support vibrant neighborhood business districts with quality multi-family housing, while providing transportation connections that link neighborhoods.

93. Finding: The FFTZ amendments change allowed uses in the City's industrial areas. There are no FFTs located in neighborhood corridors. These policies do not apply.

Transit Station Areas

Policy 3.53. Transit-oriented development. Encourage transit-oriented development and transit-supportive concentrations of housing and jobs, and multimodal connections at and adjacent to high-capacity transit stations.

Policy 3.54. Community connections. Integrate transit stations into surrounding communities and enhance pedestrian and bicycle facilities (including bike sharing) to provide safe and accessible connections to key destinations beyond the station area.

Policy 3.55. Transit station area safety. Design transit areas to improve pedestrian, bicycle, and personal safety.

Policy 3.56. Center stations. Encourage transit stations in centers to provide high density concentrations of housing and commercial uses that maximize the ability of residents to live close to both high-quality transit and commercial services.

Policy 3.57. Employment stations. Encourage concentrations of jobs and employment-focused land uses in and around stations in employment-zoned areas.

Policy 3.58. Transit neighborhood stations. Encourage concentrations of mixed-income residential development and supportive commercial services close to transit neighborhood stations. Transit neighborhood stations serve mixed-use areas that are not in major centers.

Policy 3.59. Destination stations. Enhance connections between major destinations and transit facilities and strengthen the role of these station areas as places of focused activity.

94. Finding: The FFTZ amendments change allowed uses in the City's industrial areas. There are no FFTs located in transit station areas. These policies do not apply.

City Greenways

Policy 3.60. Connections. Create a network of distinctive and attractive City Greenways that link centers, parks, schools, rivers, natural areas, and other key community destinations.

Policy 3.61. Integrated system. Create an integrated City Greenways system that includes regional trails through natural areas and along Portland's rivers, connected to neighborhood greenways, and heritage parkways.

Policy 3.62. Multiple benefits. Design City Greenways that provide multiple benefits that contribute to Portland's pedestrian, bicycle, green infrastructure, and parks and open space systems.

Policy 3.63. Design. Use design options such as distinctive street design, motor vehicle diversion, landscaping, tree plantings, scenic views, and other appropriate design options, to create City Greenways that extend the experience of open spaces and nature into neighborhoods, while improving stormwater management and calming traffic.

95. Finding: The FFTZ amendments change allowed uses in the City's industrial areas. There are no FFTs located along city greenways. These policies do not apply.

Urban habitat corridors

Policy 3.64. Urban habitat corridors. Establish a system of connected, well-functioning, and diverse habitat corridors that link habitats in Portland and the region, facilitate safe fish and wildlife access and movement through and between habitat areas, enhance the quality and connectivity of existing habitat corridors, and establish new habitat corridors in developed areas.

Policy 3.65. Habitat connection tools. Improve habitat corridors using a mix of tools including natural resource protection, property acquisition, natural resource restoration, tree planting and landscaping with native plants, and ecological design integrated with new development.

Policy 3.66. Connect habitat corridors. Ensure that planned connections between habitat corridors, greenways, and trails are located and designed to support the functions of each element, and create positive interrelationships between the elements, while also protecting habitat functions, fish, and wildlife.

96. Finding: The Willamette and Columbia Rivers are considered urban habitat corridors. The FFTZ amendments support the urban habitat corridor policies by reducing the risk associated with a major earthquake. The first step in making the current situation better is to ensure that the situation does not get worse by continuing to allow the unlimited increase in fossil fuel terminal storage tank capacity in a high risk area. The FFTZ amendments are a regulatory approach that will limit the size of new fossil fuel terminals and prohibit the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions, which will be an improvement compared to the current regulations that allow for unlimited growth in fossil fuel terminals. Further, by designating existing FFTs as a limited use allows the terminals to continue to operate and invest in facilities that reduce the risks and improve their ability to withstand a major earthquake, which can minimize environmental impacts in the event of a major earthquake. No changes to the environmental or greenway overlay zones are proposed as part of this project, therefore the natural resource values and functions that contribute the habitat functions will be maintained.

Employment areas

Policy 3.67. Employment area geographies. Consider the land development and transportation needs of Portland's employment geographies when creating and amending land use plans and making infrastructure investments.

97. As described in the Economic Opportunities Analysis (EOA), Portland has a diverse economy with a wide range of businesses and employment opportunities that are distributed across the Central City, neighborhood commercial areas, campus institutions and industrial areas. The FFTZ amendments maintain Portland's diverse economy because the changes do not include map changes, nor do they allow for new incompatible land uses in industrial areas. Therefore, these changes will continue to provide the same opportunities for employment in Portland's employment area geographies. The FFTZ regulations apply to only one type of business that makes up a minority part of the businesses found in Portland's employment districts. The limits on expansion of storage capacity at fossil fuel terminals are mitigated by designating existing fossil fuel terminals as a limited use that allows the terminals to maintain, preserve and continue to operate and improve their intermodal facilities and supports opportunities for growth through a number of exceptions, such as aviation or renewable fuels, to the storage capacity restrictions.

Policy 3.68. Regional Truck Corridors. Enhance designated streets to accommodate forecast freight growth and support intensified industrial use in nearby freight districts. *See Figure 3-7 — Employment Areas.* Designated regional truckways and priority truck streets (Transportation System Plan classifications are shown to illustrate this network).

98. Finding: The City Council interprets the verb "enhance", which is not defined in the 2035 Comprehensive Plan, to mean to intensify or improve. The City Council interprets this policy to acknowledge the role that regional truck corridors play in our transportation system and to take steps to improve those functions. Portland's approach to regional truck corridors is unchanged because the FFTZ amendments do not amend the Citywide System Plan or the Transportation System Plan. Therefore, the City continues to plan for public infrastructure investments to maintain and strengthen the regional truck corridors in the northwest industrial area where the FFTs are located.

Rivers Pattern Area

Policy 3.69. Historic and multi-cultural significance. Recognize, restore, and protect the historic and multi-cultural significance of the Willamette and Columbia Rivers, including current activities such as

subsistence fishing of legally-permitted fish species.

99. Finding: The verb "recognize" is defined in the 2035 Comprehensive Plan as to acknowledge and treat as valid. The City Council interprets this policy to acknowledge the multi-cultural significance that the rivers play in our community and to take steps to improve those functions. Most of Portland's employment and industrial zones, including the Portland Harbor, are in areas with high to very high levels of liquefaction susceptibility, as documented by the 2018 DOGAMI Earthquake Regional Impact Analysis. Fossil fuel infrastructure poses considerable risks in the event of a major earthquake. Continuing to allow the unlimited increase in storage capacity at FFTs in a high risk area increases the risk to the Willamette and Columbia Rivers. The FFTZ amendments are a regulatory approach to help protect the rivers by limiting the size of new fossil fuel terminals and prohibiting the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions, which is an improvement over the current regulations that allow for unlimited growth in FFTs.

Policy 3.70. River transportation. Recognize and enhance the roles of the Willamette and Columbia rivers as part of Portland's historic, current, and future transportation infrastructure, including for freight, commerce, commuting, and other public and private transportation functions.

100. Finding: The verb "recognize" is defined in the 2035 Comprehensive Plan as to acknowledge and treat as valid. The City Council interprets the verb "enhance", which is not defined in the 2035 Comprehensive Plan, to mean to intensify or improve. The City Council interprets this policy to acknowledge the role that the rivers play in our transportation system and to take steps to improve those functions. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes will continue to provide the same opportunities for public and private transportation functions on the Willamette and Columbia rivers. The FFTZ regulations apply to only one type of business that makes up a minority part of the businesses found along the Willamette and Columbia rivers. The limits on expansion of storage capacity at fossil fuel terminals are mitigated by designating existing fossil fuel terminals as a limited use that allows the terminals to maintain, preserve and continue to operate and improve their intermodal facilities and transportation functions. In considering the natural hazard risks that the FFTs pose to the transportation functions on the river, as identified by the Portland Bureau of Emergency Management's Critical Energy Infrastructure Hub Study (2016), the City Council finds that continuing to allow the unlimited increase in storage capacity at FFTs in a high risk area does not enhance the current or future transportation functions of the rivers.

Policy 3.71. Recreation. Improve conditions along and within the Willamette and Columbia rivers to accommodate a diverse mix of recreational users and activities. Designate and invest in strategically-located sites along the length of Portland's riverfronts for passive or active recreation activities that are compatible with nearby land uses, historically and culturally important sites, significant habitat areas, restoration sites, and native fish and wildlife usage.

101. Finding: Six of the 11 existing FFTs have frontage on the Willamette River. However, there are no recreation access points near these terminals. These amendments do not change any plans for recreation sites on the Willamette and Columbia rivers, therefore this policy does not apply.

Policy 3.72 Industry and port facilities. Enhance the regionally significant economic infrastructure that includes Oregon's largest seaport and largest airport, unique multimodal freight, rail, and harbor access; the region's critical energy hub; and proximity to anchor manufacturing and distribution facilities.

102. **Finding:** The City Council interprets the verb "enhance", which is not defined in the 2035 Comprehensive Plan, to mean to intensify or improve. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, that adversely affect the land supply and economic opportunities in Portland's industrial areas.

The FFTs make up a significant portion of the region's critical energy infrastructure hub in the Portland Harbor. The FFTZ regulations include limits on the expansion of storage capacity at existing fossil fuel terminals, but those limits are mitigated by designating existing FFTs as a limited use that allows the terminals to maintain, preserve and continue to operate and improve their intermodal facilities. The changes support opportunities for enhancement and growth through exceptions to the storage capacity restrictions for aviation or renewable fuels. Further, the use limitations (33.140.100.B.17.a) provide flexibility to FFTs to replace and reconfigure existing storage tank capacity, such as consolidating smaller tanks into larger tanks, to meet future needs.

Policy 3.73. Habitat. Enhance the roles of the Willamette and Columbia rivers and their confluence as an ecological hub that provides locally and regionally significant habitat for fish and wildlife and habitat restoration opportunities.

103. **Finding:** Six of the 11 existing FFTs have frontage on the Willamette River. These parcels will continue to be subject to development regulations for flood plains and natural resources to protect significant habitat. Furthermore, no changes to existing protections in the greenway overlay zones are proposed.

Policy 3.74. Commercial activities. Enhance the roles of the Willamette and Columbia rivers in supporting local and regional business and commerce, including commercial fishing, tourism, recreation, and leisure.

104. **Finding:** The City Council interprets the verb "enhance", which is not defined in the 2035 Comprehensive Plan, to mean to intensify or improve. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, that adversely affect the land supply and economic opportunities along the Willamette and Columbia rivers.

The City Council interprets this policy to mean that the first step in making the current situation better is to ensure that the situation does not get worse. Continuing to allow the increase in FFTs in a high risk area increases the risk to other businesses that rely on the rivers. The FFTZ amendments are a regulatory approach that will limit the size of new fossil fuel terminals and prohibit the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions, which will be an improvement compared to the current regulations that allow for unlimited growth in FFTs. The FFTZ regulations support other commercial uses of the rivers by designating existing FFTs as a limited use, which allows the terminals to continue to operate and invest in facilities that reduce the risks and improve their ability to withstand a major earthquake. Allowing the FFTs to continue to operate and invest in upgrades will help support a strong local economy by providing for a continuing supply of fossil fuels to support a strong local economy. Further, the use limitations (33.140.100.B.17.a) provide flexibility to FFTs to replace and reconfigure existing storage tank capacity to increase safety and meet future needs.

Policy 3.75. River neighborhoods. Enhance the strong river orientation of residential areas that are located along the Willamette and Columbia Rivers.

105. **Finding:** The FFTZ amendments regulate the allowed uses in Portland's industrial areas. None of the FFTs are in residential areas. This policy does not apply.

Policy 3.76. River access. Enhance and complete Portland's system of river access points and riverside

trails, including the Willamette Greenway Trail, and strengthen active transportation connections between neighborhoods and the rivers.

106. Finding: Six of the 11 existing FFTs have frontage on the Willamette River. However, there are no access points near these terminals. These amendments do not change any plans for recreation sites on the Willamette and Columbia rivers, therefore this policy does not apply.

Policy 3.77. River management and coordination. Coordinate with federal, state, regional, special districts, and other agencies to address issues of mutual interest and concern, including economic development, recreation, water transportation, flood and floodplain management and protection, regulatory compliance, permitting, emergency management, endangered species recovery, climate change preparation, Portland Harbor Superfund, brownfield cleanup, and habitat restoration.

107. Finding: The City Council interprets this policy to guide intergovernmental coordination on the management of the rivers. Other government agencies received notice from the 35-day DLCD notice and the City's legislative notice. In the initial adoption of the ordinance, the City received testimony from the Port of Portland. The City responded to the issues raised by the Port by amending the code to include an exception for the storage of fossil fuels for exclusive use at an airport, surface passenger terminal, marine, truck or air freight terminal, drydock, ship or barge servicing facility, rail yard, or as part of a fleet vehicle servicing facility. The City did not receive any requests from other government agencies to modify the FFTZ amendments.

The City has an established procedure for coordinated review of river-related development, including docks, in areas where city, state and federal agencies all have jurisdiction. The Streamlining Team was established pursuant to a 2003 Intergovernmental Agreement between the City of Portland (City), NOAA Fisheries, Army Corps of Engineers (Corps), and the U.S. Fish and Wildlife Service (USFWS). The FFTZ amendments do not change these procedures and there is no impact to this coordinated process.

Policy 3.78 Columbia River. Enhance the role of the Columbia River for river dependent industry, fish and wildlife habitat, subsistence and commercial fisheries, floating- and land-based neighborhoods, recreational uses, and water transportation.

108. Finding: The City Council interprets the verb "enhance", which is not defined in the 2035 Comprehensive Plan, to mean to intensify or improve. The City Council interprets this policy to acknowledge the role that the Columbia River plays in our city and to take steps to improve those functions. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes will continue to provide the same opportunities on the Columbia River. The City Council interprets this goal to apply to districts as whole and not to individual businesses or sectors of business. These regulations apply to only one type of business that is not found on the Columbia River. The remaining industrial uses continue to operate under current regulations.

Policy 3.79 Willamette River North Reach. Enhance the role of the Willamette River North Reach for river dependent industry, fish and wildlife habitat, and as an amenity for riverfront neighborhoods and recreational users.

109. Finding: The City Council interprets the verb "enhance", which is not defined in the 2035 Comprehensive Plan, to mean to intensify or improve. The City Council interprets this policy to acknowledge the role that the Willamette River plays in our city and to take steps to improve those functions. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses. The City Council interprets this goal to apply to districts as whole and not to

individual businesses or sectors of business. These regulations apply to only one type of river dependent industry. The remaining industrial uses continue to operate under current regulations.

Policy 3.80. Willamette River Central Reach. Enhance the role of the Willamette River Central Reach as the Central City and region's primary riverfront destination for recreation, history and culture, emergency response, water transportation, and as habitat for fish and wildlife.

Policy 3.81 Willamette River South Reach. Enhance the role of the Willamette River South Reach as fish and wildlife habitat, a place to recreate, and as an amenity for riverfront neighborhoods and others.

110. Finding: For policies 3.80 and 3.81, the City Council interprets the verb "enhance", which is not defined in the 2035 Comprehensive Plan, to mean to intensify or improve. The City Council interprets this policy to acknowledge the role that the Willamette River plays in our city and to take steps to improve those functions. These regulations apply to only one type of business that is not found on Central and South reaches of the Willamette River. The remaining industrial uses continue to operate under current regulations. These policies do not apply.

Policy 3.82. Willamette River Greenway. Maintain multi-objective plans and regulations to guide development, infrastructure investments, and natural resource protection and enhancement within and along the Willamette Greenway.

111. Finding: The multi-dwelling zones are largely located outside areas along the Willamette and Columbia Rivers, with a few exceptions. These include areas of multi-dwelling zoning along the Willamette River near the east end of the Sellwood Bridge and areas around the Macadam Neighborhood Center. Portions of Hayden Island on the Columbia River also have multi-dwelling zoning. Existing rules for Willamette River Greenway and Macadam Plan District are not affected by these amendments. Similarly, the Hayden Island Plan District is not significantly affected.

Central City Pattern Area

Policy 3.83. Central City districts. Enhance the distinct identities of the Central City's districts.

Policy 3.84. Central City river orientation. Enhance and strengthen access and orientation to the Willamette River in the Central City and increase river-focused activities.

Policy 3.85. Central City pedestrian system. Maintain and expand the Central City's highly interconnected pedestrian system.

Policy 3.86. Central City bicycle system. Expand and improve the Central City's bicycle system.

112. Finding: The FFTZ amendments affect allowed uses in industrial zones outside the Central City. These policies do not apply.

Inner Neighborhoods Pattern Area

Policy 3.87 Inner Neighborhoods main streets. Maintain and enhance the Streetcar Era pattern of street-oriented buildings along Civic and Neighborhood corridors.

Policy 3.88 Inner Neighborhoods street patterns. Preserve the area's urban fabric of compact blocks and its highly interconnected grid of streets.

Policy 3.89 Inner Neighborhoods infill. Fill gaps in the urban fabric through infill development on vacant and underutilized sites and in the reuse of historic buildings on adopted inventories.

Policy 3.90 Inner Neighborhoods active transportation. Use the extensive street, sidewalk, and

bikeway system and multiple connections to the Central City as a key part of Portland's active transportation system

Policy 3.91 Inner Neighborhoods residential areas. Continue the patterns of small, connected blocks, regular lot patterns, and streets lined by planting strips and street trees in Inner Neighborhood residential areas.

113. Finding: The FFTZ amendments affect allowed uses in industrial zones. There are not existing FFTs in the Inner Neighborhoods Pattern Area. These policies do not apply.

Eastern Neighborhoods Pattern Area

Policy 3.92 Eastern Neighborhoods street, block, and lot pattern. Guide the evolving street and block system in the Eastern Neighborhoods in ways that build on positive aspects of the area's large blocks, such as opportunities to continue mid-block open space patterns and create new connections through blocks that make it easier to access community destinations.

Policy 3.93 Eastern Neighborhoods site development. Require that land be aggregated into larger sites before land divisions and other redevelopment occurs. Require site plans which advance design and street connectivity goals.

Policy 3.94 Eastern Neighborhoods trees and natural features. Encourage development and right-of-way design that preserves and incorporates Douglas fir trees and groves, and that protects the area's streams, forests, wetlands, steep slopes, and buttes.

Policy 3.95 Eastern Neighborhoods buttes. Enhance public views of the area's skyline of buttes and stands of tall Douglas fir trees.

Policy 3.96 Eastern Neighborhoods corridor landscaping. Encourage landscaped building setbacks along residential corridors on major streets.

Policy 3.97 Eastern Neighborhoods active transportation. Enhance access to centers, employment areas, and other community destinations in Eastern Neighborhoods by ensuring that corridors have safe and accessible pedestrian and bicycle facilities and creating additional secondary connections that provide low-stress pedestrian and bicycle access.

114. Finding: The FFTZ amendments affect allowed uses in industrial zones. There are not existing FFTs in the Eastern Neighborhoods Pattern Area. These policies do not apply.

Western Neighborhoods Pattern Area

Policy 3.98 Western Neighborhoods village character. Enhance the village character of the Western Neighborhoods' small commercial districts and increase opportunities for more people to live within walking distance of these neighborhood anchors.

Policy 3.99 Western Neighborhoods active transportation. Provide safe and accessible pedestrian and bicycle connections, as well as off-street trail connections, to and from residential neighborhoods.

Policy 3.100 Western Neighborhoods development. Encourage new development and infrastructure to be designed to minimize impacts on the area's streams, ravines, and forested slopes.

Policy 3.101 Western Neighborhoods habitat corridors. Preserve, enhance, and connect the area's network of habitat areas and corridors, streams, parks, and tree canopy.

Policy 3.102 Western Neighborhoods trails. Develop pedestrian-oriented connections and enhance the Western Neighborhoods' distinctive system of trails to increase safety, expand mobility, access to

nature, and active living opportunities in the area.

115. **Finding:** The FFTZ amendments affect allowed uses in industrial zones. There are not existing FFTs in the Western Neighborhoods Pattern Area. These policies do not apply.

Chapter 4: Design and Development

Goal 4.A: Context-sensitive design and development. New development is designed to respond to and enhance the distinctive physical, historic, and cultural qualities of its location, while accommodating growth and change.

116. **Finding:** The City Council interprets this goal to not apply to the City's industrial areas, where the physical, historic and cultural qualities are less sensitive to changes from new development.

The FFTs make up a significant portion of the region's critical energy infrastructure hub in the Portland Harbor. The FFTZ regulations include limits on the expansion of storage capacity at existing fossil fuel terminals, but those limits are mitigated by designating existing FFTs as a limited use that allows the terminals to maintain, preserve and continue to operate and improve their facilities. The changes support opportunities for growth and change through exceptions to the storage capacity restrictions for aviation or renewable fuels. Further, the use limitations provide flexibility to FFTs to replace and reconfigure existing storage tank capacity, such as consolidating smaller tanks into larger tanks, to meet future needs.

Goal 4.B: Historic and cultural resources. Historic and cultural resources are integral parts of an urban environment that continue to evolve and are preserved.

117. **Finding:** Historic and cultural resources are located throughout the City, but very few are located in the industrial zones where the FFTZ amendments change the allowed uses. There are no designated Historic Landmarks or Districts in or immediately adjacent to any of the existing FFTs. Existing historic resource protections are not being amended (Chapter 33.445).

Goal 4.C: Human and environmental health. Neighborhoods and development are efficiently designed and built to enhance human and environmental health: they protect safety and livability; support local access to healthy food; limit negative impacts on water, hydrology, and air quality; reduce carbon emissions; encourage active and sustainable design; protect wildlife; address urban heat islands; and integrate nature and the built environment.

118. **Finding:** Portland's FFTs are within a disaster-prone area that is at risk for a catastrophic Cascadia earthquake disaster. Most of Portland's employment and industrial zones are in areas with high to very high levels of liquefaction susceptibility, as documented by the 2018 DOGAMI Earthquake Regional Impact Analysis. Fossil fuel infrastructure poses considerable risks to human and environmental health in the event of a major earthquake.

The City Council interprets this goal to mean that the first step in enhancing human and environmental health is to stop increasing the risk. Continuing to allow the increase in FFTs in a high risk area increases the risk to the surrounding industrial district and Portland as a whole. The FFTZ amendments limit future risk by limiting the size of new fossil fuel terminals and prohibiting the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions. Further, by designating existing FFTs as a limited use, as opposed to a prohibited nonconforming use, allows the terminals to continue to operate and invest in facilities that reduce the risks and improve their ability to withstand a major earthquake, which ultimately can protect human and environmental health.

Goal 4.D: Urban resilience. Buildings, streets, and open spaces are designed to ensure long-term resilience and to adjust to changing demographics, climate, and economy, and withstand and recover from natural disasters.

119. Finding: Portland's FFTs are within a disaster-prone area that is at risk for a catastrophic Cascadia earthquake disaster. Most of Portland's employment and industrial zones are in areas with high to very high levels of liquefaction susceptibility, as documented by the 2018 DOGAMI Earthquake Regional Impact Analysis. Fossil fuel infrastructure poses considerable risks to human and environmental health in the event of a major earthquake.

The City Council interprets this goal to mean that the first step in making Portland more resilient is to stop increasing the risk. Continuing to allow the increase in FFTs in a high risk area increases the risk to the surrounding industrial district and the Willamette River. The FFTZ amendments limit future risk by limiting the size of new fossil fuel terminals and prohibiting the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions. Further, by designating existing FFTs as a limited use, as opposed to a prohibited nonconforming use, allows the terminals to continue to operate and invest in facilities that reduce the risks and improve their ability to withstand a major earthquake, which ultimately can make Portland more resilient.

Context

Policy 4.1. Pattern areas. Encourage building and site designs that respect the unique built, natural, historic, and cultural characteristics of Portland's five pattern areas described in Chapter 3: Urban Form.

Policy 4.2. Community identity. Encourage the development of character-giving design features that are responsive to place and the cultures of communities.

Policy 4.3. Site and context. Encourage development that responds to and enhances the positive qualities of site and context — the neighborhood, the block, the public realm, and natural features.

120. Finding: The City Council interprets policies 4.1 through 4.3 as to provide general policy direction on how to consider context for design and development standards. The City Council finds that in the City's industrial areas, the physical design features are less important and are less sensitive to changes from new development. The FFTZ amendments affect one type of allowed use in employment and industrial zones and do not change development standards that apply to development in those zones.

Policy 4.4. Natural features and green infrastructure. Integrate natural and green infrastructure such as trees, green spaces, ecoroofs, gardens, green walls, and vegetated stormwater management systems, into the urban environment. Encourage stormwater facilities that are designed to be a functional and attractive element of public spaces, especially in centers and corridors.

121. Finding: The FFTZ amendments affect one type of allowed use in employment and industrial zones and do not change development standards that apply to development in those zones, including those that apply to natural features and green infrastructure.

Policy 4.5. Pedestrian-oriented design. Enhance the pedestrian experience throughout Portland through public and private development that creates accessible, safe, and attractive places for all those who walk and/or use wheelchairs or other mobility devices.

122. Finding: The FFTZ amendments affect one type of allowed use in employment and industrial zones and do not change development standards that apply to development in those zones, including those that apply to pedestrian-oriented design features.

Policy 4.6. Street orientation. Promote building and site designs that enhance the pedestrian experience with windows, entrances, pathways, and other features that provide connections to the street environment.

123. Finding: The FFTZ amendments affect one type of allowed use in employment and industrial zones and do not change development standards that apply to development in those zones, including those that apply to street orientation.

Policy 4.7. Development and public spaces. Guide development to help create high-quality public places and street environments while considering the role of adjacent development in framing, shaping, and activating the public space of streets and urban parks.

124. Finding: The FFTZ amendments affect one type of allowed use in employment and industrial zones and do not change development standards that apply to development in those zones.

Policy 4.8. Alleys. Encourage the continued use of alleys for parking access, while preserving pedestrian access. Expand the number of alley-facing accessory dwelling units.

125. Finding: The FFTZ amendments affect one type of allowed use in employment and industrial zones and do not change development standards that apply to development in those zones, including those that apply to alleys.

Policy 4.9. Transitional urbanism. Encourage temporary activities and structures in places that are transitioning to urban areas to promote job creation, entrepreneurship, active streets, and human interaction.

126. Finding: The City Council interprets this policy to relate to temporary commercial activities and public gathering places outside of industrial areas. This policy does not apply.

Health and safety

Policy 4.10. Design for active living. Encourage development and building and site design that promotes a healthy level of physical activity in daily life.

Policy 4.11. Access to light and air. Provide for public access to light and air by managing and shaping the height and mass of buildings while accommodating urban-scale development.

Policy 4.12. Privacy and solar access. Encourage building and site designs that consider privacy and solar access for residents and neighbors while accommodating urban-scale development.

Policy 4.13. Crime-preventive design. Encourage building, site, and public infrastructure design approaches that help prevent crime.

Policy 4.14. Fire prevention and safety. Encourage building and site design that improves fire prevention, safety, and reduces seismic risks.

127. Finding: The City Council interprets this policy to relate to development outside of industrial areas. The FFTZ amendments affect one type of allowed use in employment and industrial zones and do not change development standards that apply to development in those zones. This policy does not apply.

Residential areas

Policy 4.15. Residential area continuity and adaptability. Encourage more housing choices to accommodate a wider diversity of family sizes, incomes, and ages, and the changing needs of households over time. Allow adaptive reuse of existing buildings, the creation of accessory dwelling units, and other arrangements that bring housing diversity that is compatible with the general scale and patterns of residential areas.

Policy 4.16. Scale and patterns. Encourage design and development that complements the general scale, character, and natural landscape features of neighborhoods. Consider building forms, scale, street frontage relationships, setbacks, open space patterns, and landscaping. Allow for a range of architectural styles and expression.

Policy 4.17. **Demolitions.** Encourage alternatives to the demolition of sound housing, such as rehabilitation and adaptive reuse, especially affordable housing, and when new development would provide no additional housing opportunities beyond replacement.

Policy 4.18. **Compact single-family options**. Encourage development and preservation of small resource-efficient and affordable single-family homes in all areas of the city.

Policy 4.19. Resource efficient and healthy residential design and development. Support resource efficient and healthy residential design and development.

128. Finding: The FFTZ amendments affect one type of allowed use in employment and industrial zones and do not change development standards that apply to development in those zones. This policy does not apply.

Design and development of centers and corridors

Policy 4.20. Walkable scale. Focus services and higher-density housing in the core of centers to support a critical mass of demand for commercial services and more walkable access for customers.

Policy 4.21. Street environment. Encourage development in centers and corridors to include amenities that create a pedestrian-oriented environment and provide places for people to sit, spend time, and gather.

Policy 4.22. Relationship between building height and street size. Encourage development in centers and corridors that is responsive to street space width, thus allowing taller buildings on wider streets.

Policy 4.23. Design for pedestrian and bicycle access. Provide accessible sidewalks, high-quality bicycle access, and frequent street connections and crossings in centers and corridors.

Policy 4.24. Drive-through facilities. Prohibit drive through facilities in the Central City, and limit new development of new ones in the Inner Ring Districts and centers to support a pedestrian-oriented environment.

Policy 4.25. Residential uses on busy streets. Improve the livability of places and streets with high motor vehicle volumes. Encourage landscaped front setbacks, street trees, and other design approaches to buffer residents from street traffic.

Policy 4.26. Active gathering places. Locate public squares, plazas, and other gathering places in centers and corridors to provide places for community activity and social connections. Encourage location of businesses, services, and arts adjacent to these spaces that relate to and promote the use of the space.

Policy 4.27. Protect defining features. Protect and enhance defining places and features of centers

and corridors, including landmarks, natural features, and historic and cultural resources.

Policy 4.28. Historic buildings in centers and corridors. Protect and encourage the restoration and improvement of historic resources in centers and corridors.

Policy 4.29. Public art. Encourage new development and public places to include design elements and public art that contribute to the distinct identities of centers and corridors, and that highlight the history and diverse cultures of neighborhoods.

129. Finding: The FFTZ amendments affect one type of allowed use in employment and industrial zones and do not change development standards that apply to development in those zones. There are no existing FFTs in centers and corridors. This policy does not apply.

Transitions

Policy 4.30. Scale transitions. Create transitions in building scale in locations where higher-density and higher-intensity development is adjacent to smaller-scale single-dwelling zoning. Ensure that new high-density and large-scale infill development adjacent to single dwelling zones incorporates design elements that soften transitions in scale and limit light and privacy impacts on adjacent residents.

Policy 4.31. Land use transitions. Improve the interface between non-residential uses and residential uses in areas where commercial or employment uses are adjacent to residentially-zoned land.

Policy 4.32. Industrial edge. Protect non-industrially zoned parcels from the adverse impacts of facilities and uses on industrially zoned parcels using a variety of tools, including but not limited to vegetation, physical separation, land acquisition, and insulation to establish buffers between industrial sanctuaries and adjacent residential or mixed-use areas to protect both the viability of long-term industrial operations and the livability of adjacent areas.

130. Finding: The FFTZ amendments affect one type of allowed use in employment and industrial zones and do not change development standards that apply to development in those zones. These policies do not apply.

Off-site impacts

Policy 4.33. Off-site impacts. Limit and mitigate public health impacts, such as odor, noise, glare, light pollution, air pollutants, and vibration that public facilities, land uses, or development may have on adjacent residential or institutional uses, and on significant fish and wildlife habitat areas. Pay attention to limiting and mitigating impacts to under-served and under-represented communities.

131. Finding: Portland's FFTs are within a disaster-prone area that is at risk for a catastrophic Cascadia earthquake disaster. Most of Portland's employment and industrial zones are in areas with high to very high levels of liquefaction susceptibility, as documented by the 2018 DOGAMI Earthquake Regional Impact Analysis. Fossil fuel infrastructure poses considerable risks to human and environmental health in the event of a major earthquake.

The City Council interprets this policy to mean that the first step in limiting public and environmental health impacts is to stop increasing the risk. Continuing to allow the increase in FFTs in a high risk area increases the risk to the surrounding industrial district and Portland as a whole. The FFTZ amendments limit future risk by limiting the size of new fossil fuel terminals and prohibiting the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions. Further, by designating existing FFTs as a limited use, as opposed to a prohibited nonconforming use, allows the terminals to continue to operate and invest in facilities that reduce

the risks and improve their ability to withstand a major earthquake, which ultimately can protect human and environmental health.

Policy 4.34. Auto-oriented facilities, uses, and exterior displays. Minimize the adverse impacts of highways, auto-oriented uses, vehicle areas, drive-through areas, signage, and exterior display and storage areas on adjacent residential uses.

Policy 4.35. Noise impacts. Encourage building and landscape design and land use patterns that limit and/or mitigate negative noise impacts to building users and residents, particularly in areas near freeways, regional truckways, major city traffic streets, and other sources of noise.

Policy 4.36. Air quality impacts. Encourage building and landscape design and land use patterns that limit and/or mitigate negative air quality impacts to building users and residents, particularly in areas near freeways, regional truckways, high traffic streets, and other sources of air pollution.

Policy 4.37. Diesel emissions. Encourage best practices to reduce diesel emissions and related impacts when considering land use and public facilities that will increase truck or train traffic.

Policy 4.38. Light pollution. Encourage lighting design and practices that reduce the negative impacts of light pollution, including sky glow, glare, energy waste, impacts to public health and safety, disruption of ecosystems, and hazards to wildlife.

132. Finding: The FFTZ amendments affect one type of allowed use in employment and industrial zones and do not change development standards that apply to development in those zones. These policies do not apply.

Scenic resources

Policy 4.41. Scenic resources. Enhance and celebrate Portland's scenic resources to reinforce local identity, histories, and cultures and contribute toward way-finding throughout the city. Consider views of mountains, hills, buttes, rivers, streams, wetlands, parks, bridges, the Central City skyline, buildings, roads, art, landmarks, or other elements valued for their aesthetic appearance or symbolism.

Policy 4.42. Scenic resource protection. Protect and manage designated significant scenic resources by maintaining scenic resource inventories, protection plans, regulations, and other tools.

Policy 4.43. Vegetation management. Maintain regulations and other tools for managing vegetation in a manner that preserves or enhances designated significant scenic resources.

Policy 4.44. Building placement, height, and massing. Maintain regulations and other tools related to building placement, height, and massing to preserve designated significant scenic resources.

Policy 4.45. Future development. Encourage new public and private development to create new public viewpoints providing views of Portland's rivers, bridges, surrounding mountains, hills and buttes, the Central City skyline, and other landmark features.

133. Finding: In 1991, the City adopted the Scenic Resources Protection Plan and applied a scenic (s) overlay zone to protect significant scenic resources. Two of the FFTs (BP West Coast and NuStar/Shore Terminals) are in a (s) overlay zone. The scenic resource protections (Chapter 33.480) are not amended by this ordinance and the height limits associated with the (s) overlay zone will continue to apply to the two FFT sites.

Historic and cultural resources

Policy 4.46. Historic and cultural resource protection. Protect and encourage the restoration of historic buildings, places, and districts that contribute to the distinctive character and history of

Portland's evolving urban environment.

Policy 4.47. State and federal historic resource support. Advocate for state and federal policies, programs, and legislation that would enable stronger historic resource designations, protections, and rehabilitation programs.

Policy 4.48. Continuity with established patterns. Encourage development that fills in vacant and underutilized gaps within the established urban fabric, while preserving and complementing historic resources.

Policy 4.49. Resolution of conflicts. Adopt and periodically update design guidelines for unique historic districts. Refine base zoning in historic districts to consider the character of the historic resources in the district.

Policy 4.50. Demolition. Protect historic resources from demolition. Provide opportunities for public comment, and encourage pursuit of alternatives to demolition or other actions that mitigate for the loss.

Policy 4.51. City-owned historic resources. Maintain City-owned historic resources with necessary upkeep and repair.

Policy 4.52. Historic Resources Inventory. Maintain and periodically update Portland's Historic Resources Inventory to inform historic and cultural resource preservation strategies.

Policy 4.53. Preservation equity. Expand historic preservation inventories, regulations, and programs to encourage historic preservation in areas and in communities that have not benefited from past historic preservation efforts, especially in areas with high concentrations of under-served and/or under-represented people.

Policy 4.54. Cultural diversity. Work with Portland's diverse communities to identify and preserve places of historic and cultural significance.

Policy 4.55. Cultural and social significance. Encourage awareness and appreciation of cultural diversity and the social significance of historic places and their roles in enhancing community identity and sense of place.

Policy 4.56. Community structures. Encourage the adaptive reuse of historic community structures, such as former schools, meeting halls, and places of worship, for arts, cultural, and community uses that continue their role as anchors for community and culture.

Policy 4.57. Economic viability. Provide options for financial and regulatory incentives to allow for the productive, reasonable, and adaptive reuse of historic resources.

Policy 4.58. Archaeological resources. Protect and preserve archaeological resources, especially those sites and objects associated with Native American cultures. Work in partnership with Sovereign tribes, Native American communities, and the state to protect against disturbance to Native American archaeological resources.

134. Finding: The City Council interprets that these policies relate to implementation approaches directly related to the preservation of historic and cultural resources, which is not the focus of the FFTZ amendments. Historic and cultural resources are located throughout Portland, but very few are in the industrial zones where the FFTZ amendments change the allowed uses. There are no designated Historic Landmarks or Districts in or immediately adjacent to any of the existing FFTs. Existing historic resource protections are not being amended (Chapter 33.445). Therefore, the policies do not apply.

Public art

Policy 4.59. Public art and development. Create incentives for public art as part of public and private development projects.

135. Finding: The FFTZ amendments affect one type of allowed use in employment and industrial zones and do not create incentives for public art. This policy does not apply.

Resource-efficient design and development

Policy 4.60. Rehabilitation and adaptive reuse. Encourage rehabilitation and adaptive reuse of buildings, especially those of historic or cultural significance, to conserve natural resources, reduce waste, and demonstrate stewardship of the built environment.

136. Finding: The FFTZ regulations encourage the rehabilitation of existing FFTs by designating them as a limited use, which allows the terminals to continue to operate and invest in facilities that improve their ability to withstand a major earthquake. Further, the use limitations provide flexibility to FFTs to replace and reconfigure existing storage tank capacity to increase safety and meet future needs.

Policy 4.61. Compact housing. Promote the development of compact, space- and energy-efficient housing types that minimize use of resources such as smaller detached homes or accessory dwellings and attached homes.

137. Finding: The FFTZ amendments affect one type of allowed use in employment and industrial zones and do not change development standards that apply to housing. This policy does not apply.

Policy 4.62. Seismic and energy retrofits. Promote seismic and energy-efficiency retrofits of historic buildings and other existing structures to reduce carbon emissions, save money, and improve public safety.

138. Finding: The FFTZ regulations encourage seismic retrofits of existing FFTs by designating them as a limited use, which allows the terminals to continue to operate and invest in facilities that improve their ability to withstand a major earthquake. Further, the use limitations provide flexibility to FFTs to replace and reconfigure existing storage tank capacity to increase safety and meet future needs.

Policy 4.63. Life cycle efficiency. Encourage use of technologies, techniques, and materials in building design, construction, and removal that result in the least environmental impact over the life cycle of the structure.

Policy 4.64. Deconstruction. Encourage salvage and reuse of building elements when demolition is necessary or appropriate.

Policy 4.65. Materials and practices. Encourage use of natural, resource-efficient, recycled, recycled content, and non-toxic building materials and energy-efficient building practices.

Policy 4.66. Water use efficiency. Encourage site and building designs that use water efficiently and manage stormwater as a resource.

Policy 4.67. Optimizing benefits. Provide mechanisms to evaluate and optimize the range of benefits from solar and renewable resources, tree canopy, ecoroofs, and building design.

Policy 4.68. Energy efficiency. Encourage and promote energy efficiency significantly beyond the Statewide Building Code and the use of solar and other renewable resources in individual buildings and at a district scale.

Policy 4.69. Reduce carbon emissions. Encourage a development pattern that minimizes carbon emissions from building and transportation energy use.

Policy 4.70. District energy systems. Encourage and remove barriers to the development and expansion of low-carbon heating and cooling systems that serve multiple buildings or a broader district.

Policy 4.71. Ecodistricts. Encourage ecodistricts, where multiple partners work together to achieve sustainability and resource efficiency goals at a district scale.

Policy 4.72. Energy-producing development. Encourage and promote development that uses renewable resources, such as solar, wind, and water to generate power on-site and to contribute to the energy grid.

139. Finding: The FFTZ amendments affect one type of allowed use in employment and industrial zones and do not change development standards that apply to development in those zones. These policies do not apply.

Designing with nature

Policy 4.73. Design with nature. Encourage design and site development practices that enhance, and avoid the degradation of, watershed health and ecosystem services and that incorporate trees and vegetation.

Policy 4.74. Flexible development options. Encouraging flexibility in the division of land, the siting and design of buildings, and other improvements to reduce the impact of development on environmentally-sensitive areas and to retain healthy native and beneficial vegetation and trees.

Policy 4.75. Low-impact development and best practices. Encourage use of low-impact development, habitat-friendly development, bird-friendly design, and green infrastructure.

Policy 4.76. Impervious surfaces. Limit use of and strive to reduce impervious surfaces and associated impacts on hydrologic function, air and water quality, habitat connectivity, tree canopy, and urban heat island effects.

Policy 4.77. Hazards to wildlife. Encourage building, lighting, site, and infrastructure design and practices that provide safe fish and wildlife passage, and reduce or mitigate hazards to birds, bats, and other wildlife.

Policy 4.78. Access to nature. Promote equitable, safe, and well-designed physical and visual access to nature for all Portlanders, while also maintaining the functions and values of significant natural resources, fish, and wildlife. Provide access to major natural features, including:

- Water bodies such as the Willamette and Columbia rivers, Smith and Bybee Lakes, creeks, streams, and sloughs.
- Major topographic features such as the West Hills, Mt. Tabor, and the East Buttes.
- Natural areas such as Forest Park and Oaks Bottom.

140. Finding: The FFTZ amendments affect one type of allowed use in employment and industrial zones and do not change development standards that apply to development in those zones. These policies do not apply.

Hazard-resilient design

Policy 4.79. Natural hazards and climate change risks and impacts. Limit development in or near areas prone to natural hazards, using the most current hazard and climate change-related information and maps.

141. **Finding:** The 2035 Comprehensive Plan defines "limit" as to minimize or reduce something or the effects of something relative to the current situation or to a potential future situation. Most of Portland's industrial zoning are in areas with high levels of liquefaction susceptibility, as documented by the 2018 DOGAMI Earthquake Regional Impact Analysis. Fossil fuel infrastructure poses considerable risks in the event of a major earthquake. The FFTZ amendments will limit the size of new fossil fuel terminals and prohibit the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions, which will minimize the risk from a future major earthquake compared to the current regulations that allow for unlimited growth in FFTs.

Policy 4.80. Geological hazards. Evaluate slope and soil characteristics, including liquefaction potential, landslide hazards, and other geologic hazards.

142. Most of Portland's employment and industrial zones are in areas with high to very high levels of liquefaction susceptibility, as documented by the 2018 DOGAMI Earthquake Regional Impact Analysis. Fossil fuel infrastructure poses considerable risks in the event of a major earthquake. According to the 2012 DOGAMI Earthquake Risk Study for Oregon's Critical Energy Infrastructure Hub report, a magnitude 8 or 9 Cascadia Subduction Zone earthquake would impact the CEI Hub with: ground shaking; liquefaction (soil behavior phenomenon in which a saturated sand softens and loses strength during strong earthquake ground shaking); lateral spreading (where surficial soil permanently moves laterally due to earthquake shaking); landslides; co-seismic settlement (where the ground surface is permanently lowered due to seismic shaking); and bearing capacity failures (when the foundation soil cannot support the structure it is intended to support).

According to the 2012 DOGAMI report, liquefaction and lateral spreading hazards are of primary concern to the fossil fuel terminals. As described in the 2012 Oregon State Energy Assurance Plan, this Critical Energy Infrastructure Hub (CEI Hub) sits on top of very poor soils that are highly susceptible to earthquake-induced permanent ground deformation. The CEI Hub is adjacent to the Willamette River and has extensive deposits of highly liquefiable soils. These soils (made of sands, silts, gravels and clays) have been naturally deposited by river activity as well as been created from man-made activities, such as hydraulically placed material from river dredging or debris placed as landfill.

The FFTs have significant seismic risks because most of the tanks have been constructed without any or only limited seismic design criteria on soils with moderate to high levels of liquefaction susceptibility, as documented by the Portland Bureau of Emergency Management's 2016 Critical Energy Infrastructure Hub Study and the 2012 DOGAMI Earthquake Risk Study for Oregon's Critical Energy Infrastructure Hub report. Continuing to allow the increase in FFTs in a high risk area increases the risk to the surrounding industrial district and the Willamette River. The FFTZ amendments limit future risk by limiting the size of new fossil fuel terminals and prohibiting the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions. Further, by designating existing FFTs as a limited use, as opposed to a prohibited nonconforming use, allows the terminals to continue to operate and invest in facilities that reduce the risks and improve their ability to withstand a major earthquake, which ultimately can make Portland more resilient.

Policy 4.81. Disaster-resilient development. Encourage development and site-management approaches that reduce the risks and impacts of natural disasters or other major disturbances and that improve the ability of people, wildlife, natural systems, and property to withstand and recover from such events.

143. **Finding:** The verb "encourage", which is defined in the 2035 Comprehensive Plan, means to promote or foster using some combination of voluntary approaches, regulations, or incentives.

Most of Portland's employment and industrial zones are in areas with high to very high levels of liquefaction susceptibility, as documented by the 2018 DOGAMI Earthquake Regional Impact Analysis. Continuing to allow the unlimited increase in storage capacity at FFTs in a high risk area increases the risk to the surrounding industrial district and the Willamette River. The FFTZ amendments are a regulatory approach that improves Portland's ability to withstand and recover from an earthquake by limiting the size of new fossil fuel terminals and prohibiting the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions, which is an improvement over the current regulations that allow for unlimited growth in FFTs. The FFTZ regulations focus on limiting risk by limiting new development (storage capacity), but designate existing FFTs as a limited use, which allows the terminals to continue to operate and invest in facilities that reduce the risks and improve their ability to withstand a major earthquake. Further, the use limitations provide flexibility to FFTs to replace and reconfigure existing storage tank capacity to increase safety and meet future needs.

Policy 4.83. Urban heat islands. Encourage development, building, landscaping, and infrastructure design that reduce urban heat island effects.

144. Finding: The FFTZ amendments affect one type of allowed use in employment and industrial zones and do not change development standards that apply to development in those zones. These policies do not apply.

Policy 4.84. Planning and disaster recovery. Facilitate effective disaster recovery by providing recommended updates to land use designations and development codes, in preparation for natural disasters.

145. Finding: The FFTZ amendments are an update to the allowed uses in employment and industrial zones to prepare for a natural disaster. The FFTZ amendments are a regulatory approach that improves Portland's ability to withstand and recover from an earthquake by limiting the size of new fossil fuel terminals and prohibiting the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions, which is an improvement over the current regulations that allow for unlimited growth in FFTs. The FFTZ regulations focus on limiting risk by limiting new development (storage capacity), but designate existing FFTs as a limited use, which allows the terminals to continue to operate and invest in facilities that reduce the risks and improve their ability to withstand a major earthquake.

Healthy food

Policy 4.85. Grocery stores and markets in centers. Facilitate the retention and development of grocery stores, neighborhood-based markets, and farmer's markets offering fresh produce in centers.

Policy 4.86. Neighborhood food access. Encourage small, neighborhood-based retail food opportunities, such as corner markets, food co-ops, food buying clubs, and community-supported agriculture pickup/drop-off sites, to fill in service gaps in food access across the city.

Policy 4.87. Growing food. Increase opportunities to grow food for personal consumption, donation, sales, and educational purposes.

Policy 4.88. Access to community gardens. Ensure that community gardens are allowed in areas close to or accessible via transit to people living in areas zoned for mixed-use or multi-dwelling development, where residents have few opportunities to grow food in yards.

146. Finding: The City Council interprets this policy to relate to development outside of industrial areas. The FFTZ amendments affect one type of allowed use in employment and industrial zones and do

not change development standards that apply to development in those zones. These policies do not apply.

Chapter 5: Housing

Goal 5.A: Housing diversity. Portlanders have access to high-quality affordable housing that accommodates their needs, preferences, and financial capabilities in terms of different types, tenures, density, sizes, costs, and locations.

Goal 5.B: Equitable access to housing. Portland ensures equitable access to housing, making a special effort to remove disparities in housing access for people with disabilities, people of color, low-income households, diverse household types, and older adults.

Goal 5.C: Healthy connected city. Portlanders live in safe, healthy housing that provides convenient access to jobs and to goods and services that meet daily needs. This housing is connected to the rest of the city and region by safe, convenient, and affordable multimodal transportation.

Goal 5.D: Affordable housing. Portland has an adequate supply of affordable housing units to meet the needs of residents vulnerable to increasing housing costs.

Goal 5.E: High-performance housing. Portland residents have access to resource-efficient and high-performance housing for people of all abilities and income levels.

147. Finding: The FFTZ amendments affect one type of allowed use in employment and industrial zones and do not affect housing development. Except for Policies 5.11 to 5.16, which City Council interprets as requiring evaluation and analysis as to who will benefit and who will be burdened by a planning decision, the City Council finds that these goals and policies do not apply.

Diverse and expanding housing supply

Policy 5.1. Housing supply. Maintain sufficient residential development capacity to accommodate Portland's projected share of regional household growth.

Policy 5.2. Housing growth. Strive to capture at least 25 percent of the seven-county region's residential growth (Multnomah, Washington, Clackamas, Yamhill, Columbia, Clark, and Skamania counties).

Policy 5.3. Housing potential. Evaluate plans and investments for their impact on housing capacity, particularly the impact on the supply of housing units that can serve low- and moderate-income households, and identify opportunities to meet future demand.

Policy 5.4. **Housing types.** Encourage new and innovative housing types that meet the evolving needs of Portland households, and expand housing choices in all neighborhoods. These housing types include but are not limited to single-dwelling units; multi-dwelling units; accessory dwelling units; small units; pre-fabricated homes such as manufactured, modular, and mobile homes; co-housing; and clustered housing/clustered services.

Policy 5.5. Housing in centers. Apply zoning in and around centers that allows for and supports a diversity of housing that can accommodate a broad range of households, including multi-dwelling and family-friendly housing options.

Policy 5.6. Middle housing. Enable and encourage development of middle housing. This includes multi-unit or clustered residential buildings that provide relatively smaller, less expensive units; more units; and a scale transition between the core of the mixed use center and surrounding single family

areas. Where appropriate, apply zoning that would allow this within a quarter mile of designated centers, corridors with frequent service transit, high capacity transit stations, and within the Inner Ring around the Central City.

Policy 5.7. Adaptable housing. Encourage adaption of existing housing and the development of new housing that can be adapted in the future to accommodate the changing variety of household types.

Policy 5.8. Physically-accessible housing. Allow and support a robust and diverse supply of affordable, accessible housing to meet the needs of older adults and people with disabilities, especially in centers, station areas, and other places that are proximate to services and transit.

Policy 5.9. Accessible design for all. Encourage new construction and retrofitting to create physically-accessible housing, extending from the individual unit to the community, using Universal Design Principles.

Policy 5.10. Coordinate with fair housing programs. Foster inclusive communities, overcome disparities in access to community assets, and enhance housing choice for people in protected classes throughout the city by coordinating plans and investments to affirmatively further fair housing.

Housing access

Policy 5.11. Remove barriers. Remove potential regulatory barriers to housing choice for people in protected classes to ensure freedom of choice in housing type, tenure, and location.

Policy 5.12. Impact analysis. Evaluate plans and investments, significant new infrastructure, and significant new development to identify potential disparate impacts on housing choice, access, and affordability for protected classes and low-income households. Identify and implement strategies to mitigate the anticipated impacts.

Policy 5.13. Housing stability. Coordinate plans and investments with programs that prevent avoidable, involuntary evictions and foreclosures.

Policy 5.14. Preserve communities. Encourage plans and investments to protect and/or restore the socioeconomic diversity and cultural stability of established communities.

Policy 5.15. Gentrification/displacement risk. Evaluate plans and investments, significant new infrastructure, and significant new development for the potential to increase housing costs for, or cause displacement of communities of color, low- and moderate-income households, and renters. Identify and implement strategies to mitigate the anticipated impacts.

Policy 5.16. Involuntary displacement. When plans and investments are expected to create neighborhood change, limit the involuntary displacement of those who are under-served and under-represented. Use public investments and programs, and coordinate with nonprofit housing organizations (such as land trusts and housing providers) to create permanently-affordable housing and to mitigate the impacts of market pressures that cause involuntary displacement.

148. Finding: The City Council interprets Policies 5.11 to 5.16 as requiring evaluation and analysis as to who will benefit and who will be burdened by a planning decision, including amendments to the Zoning Code. The City Council finds that one factor in housing stability and displacement is access to job opportunities across a wide range of wage scales, especially middle wage jobs such as those found in Portland's industrial districts. The FFTZ amendments apply to only one type of business that makes up a minority part of the businesses found in Portland's industrial districts. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses,

therefore, these changes do not change the land capacity in Portland's industrial districts and continue to support continued growth in those districts.

The regulations are narrowly crafted to support the retention of existing fossil fuel terminals by designating them as a limited use that allows the terminals to continue to operate and invest in upgrades and supports opportunities for growth through exceptions, such as aviation or renewable fuels.

Policy 5.17. Land banking. Support and coordinate with community organizations to hold land in reserve for affordable housing, as an anti-displacement tool, and for other community development purposes.

Policy 5.18. **Rebuild communities**. Coordinate plans and investments with programs that enable communities impacted by involuntary displacement to maintain social and cultural connections, and re-establish a stable presence and participation in the impacted neighborhoods.

Policy 5.19. **Aging in place.** Encourage a range of housing options and supportive environments to enable older adults to remain in their communities as their needs change.

Housing location

Policy 5.20. Coordinate housing needs in high-poverty areas. Meet the housing needs of under-served and under-represented populations living in high-poverty areas by coordinating plans and investments with housing programs.

Policy 5.21. Access to opportunities. Improve equitable access to active transportation, jobs, open spaces, high-quality schools, and supportive services and amenities in areas with high concentrations of under-served and under-represented populations and an existing supply of affordable housing.

Policy 5.22. New development in opportunity areas. Locate new affordable housing in areas that have high/medium levels of opportunity in terms of access to active transportation, jobs, open spaces, high-quality schools, and supportive services and amenities.

Policy 5.23. Higher-density housing. Locate higher-density housing, including units that are affordable and accessible, in and around centers to take advantage of the access to active transportation, jobs, open spaces, schools, and various services and amenities.

Policy 5.24. Impact of housing on schools. Evaluate plans and investments for the effect of housing development on school enrollment, financial stability, and student mobility. Coordinate with school districts to ensure plans are aligned with school facility plans.

Housing affordability

Policy 5.25. Housing preservation. Preserve and produce affordable housing to meet needs that are not met by the private market by coordinating plans and investments with housing providers and organizations.

Policy 5.26. Regulated affordable housing target. Strive to produce at least 10,000 new regulated affordable housing units citywide by 2035 that will be affordable to households in the 0-80 percent MFI bracket.

Policy 5.27. Funding plan. Encourage development or financial or regulatory mechanisms to achieve the regulated affordable housing target set forth for 2035.

Policy 5.28. Inventory of regulated affordable housing. Coordinate periodic inventories of the supply of regulated affordable housing in the four-county (Clackamas, Clark, Multnomah and Washington) region with Metro.

Policy 5.29. Permanently-affordable housing. Increase the supply of permanently-affordable housing, including both rental and homeownership opportunities.

Policy 5.30. Housing cost burden. Evaluate plans and investments for their impact on household cost, and consider ways to reduce the combined cost of housing, utilities, and/or transportation. Encourage energy-efficiency investments to reduce overall housing costs.

Policy 5.31. Household prosperity. Facilitate expanding the variety of types and sizes of affordable housing units, and do so in locations that provide low-income households with greater access to convenient transit and transportation, education and training opportunities, the Central City, industrial districts, and other employment areas.

Policy 5.33. Central City affordable housing. Encourage the preservation and production of affordable housing in the Central City to take advantage of the area's unique concentration of active transportation access, jobs, open spaces, and supportive services and amenities.

Policy 5.34. Affordable housing resources. Pursue a variety of funding sources and mechanisms including new financial and regulatory tools to preserve and develop housing units and various assistance programs for households whose needs are not met by the private market.

Policy 5.35. Inclusionary housing. Use inclusionary zoning and other regulatory tools to effectively link the production of affordable housing to the production of market-rate housing.

Policy 5.36. Impact of regulations on affordability. Evaluate how existing and new regulations affect private development of affordable housing, and minimize negative impacts where possible. Avoid regulations that facilitate economically-exclusive neighborhoods.

Policy 5.37. Mobile home parks. Encourage preservation of mobile home parks as a low/moderate-income housing option. Evaluate plans and investments for potential redevelopment pressures on existing mobile home parks and impacts on park residents and protect this low/moderate-income housing option. Facilitate replacement and alteration of manufactured homes within an existing mobile home park.

Policy 5.38. Workforce housing. Encourage private development of a robust supply of housing that is affordable to moderate-income households located near convenient multimodal transportation that provides access to education and training opportunities, the Central City, industrial districts, and other employment areas.

Policy 5.39. Compact single-family options. Encourage development and preservation of small resource-efficient and affordable single-family homes in all areas of the city.

Policy 5.40 Employer-assisted housing. Encourage employer-assisted affordable housing in conjunction with major employment development.

Policy 5.41 Affordable homeownership. Align plans and investments to support improving homeownership rates and locational choice for people of color and other groups who have been historically under-served and under-represented.

Policy 5.42 Homeownership retention. Support opportunities for homeownership retention for

people of color and other groups who have been historically under-served and under-represented.

Policy 5.43 Variety in homeownership opportunities. Encourage a variety of ownership opportunities and choices by allowing and supporting including but not limited to condominiums, cooperatives, mutual housing associations, limited equity cooperatives, land trusts, and sweat equity.

Policy 5.44 Regional cooperation. Facilitate opportunities for greater regional cooperation in addressing housing needs in the Portland metropolitan area, especially for the homeless, low- and moderate-income households, and historically under-served and under-represented communities.

Policy 5.45 Regional balance. Encourage development of a "regional balance" strategy to secure greater regional participation to address the housing needs of homeless people and communities of color, low- and moderate-income households, and historically under-served and under-represented communities throughout the region.

Homelessness

Policy 5.46. Housing continuum. Prevent homelessness and reduce the time spent being homeless by ensuring that a continuum of safe and affordable housing opportunities and related supportive services are allowed, including but not limited to Permanent Supportive Housing, transitional housing, self-built micro housing communities, emergency shelters, temporary shelters such as warming centers, and transitional campgrounds.

Health, safety, and well-being

Policy 5.47 Healthy housing. Encourage development and maintenance of all housing, especially multi-dwelling housing, that protects the health and safety of residents and encourages healthy lifestyles and active living.

Policy 5.48 Housing safety. Require safe and healthy housing free of hazardous materials such as lead, asbestos, and radon.

Policy 5.49. Housing quality. Encourage housing that provides high indoor air quality, access to sunlight and outdoor spaces, and is protected from excessive noise, pests, and hazardous environmental conditions.

Policy 5.50. High-performance housing. Encourage energy efficiency, green building practices, materials, and design to produce healthy, efficient, durable, and adaptable homes that are affordable or reasonably priced.

Policy 5.51. Healthy and active living. Encourage housing that provides features supportive of healthy eating and active living such as useable open areas, recreation areas, community gardens, crime-preventive design, and community kitchens in multifamily housing.

Policy 5.52. Walkable surroundings. Encourage active transportation in residential areas through the development of pathways, sidewalks, and high-quality onsite amenities such as secure bicycle parking.

Policy 5.53. Responding to social isolation. Encourage site designs and relationship to adjacent developments that reduce social isolation for groups that often experience it, such as older adults, people with disabilities, communities of color, and immigrant communities.

Policy 5.54 Renter protections. Enhance renter health, safety, and stability through education, expansion of enhanced inspections, and support of regulations and incentives that protect tenants

and prevent involuntary displacement.

Chapter 6: Economic Development

Goal 6.A: Prosperity. Portland has vigorous economic growth and a healthy, diverse economy that supports prosperity and equitable access to employment opportunities for an increasingly diverse population. A strong economy that is keeping up with population growth and attracting resources and talent can:

- Create opportunity for people to achieve their full potential.
- Improve public health.
- Support a healthy environment.
- Support the fiscal well-being of the city.

149. Finding: The City Council interprets this goal to apply to the city as whole and not to individual businesses or sectors of business. The City Council interprets this goal to mean that Portland has a strong economy with employment opportunities for a diverse population. The City Council finds that an important factor in a diverse economy is to provide access to job opportunities across a wide range of wage scales, especially middle wage jobs such as those found in Portland's industrial districts.

The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes maintain Portland's employment land supply to create opportunities for a growing economy.

These regulations apply to only one type of business that makes up a minority part of the businesses found in Portland's industrial districts. The remaining industrial uses continue to operate under the current development review system. The FFTZ amendments establish clear definitions for fossil fuels and the Bulk Fossil Fuel Terminal use category. These changes are fair to existing FFTs by designating them as a limited use that allows the terminals to continue to operate and. The limited use designation also allows the FFTs to invest in upgrades and supports opportunities for growth through exceptions, such as aviation or renewable fuels. Further, the use limitations provide flexibility to FFTs to replace and reconfigure existing storage tank capacity, such as consolidating smaller tanks into larger tanks, to meet future needs.

Goal 6.B: Development. Portland supports an attractive environment for industrial, commercial, and institutional job growth and development by: 1) maintaining an adequate land supply; 2) a local development review system that is nimble, predictable, and fair; and 3) high-quality public facilities and services.

150. Finding: The verb "support", which is defined in the 2035 Comprehensive Plan, means to aid the cause of. The City Council interprets this goal to apply to the city as whole and not to individual businesses or sectors of business. The City Council interprets this goal to mean that an attractive environment for economic development has three elements: 1) adequate land supply; 2) a predictable development review system; and 3) high-quality public services. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes maintain Portland's employment land supply.

These regulations apply to only one type of business that makes up a minority part of the businesses found in Portland's industrial districts. The remaining industrial uses continue to operate under the current development review system. The FFTZ amendments establish clear definitions for fossil fuels and the Bulk Fossil Fuel Terminal use category. These changes are fair to existing FFTs by designating them as a limited use that allows the terminals to continue to operate and. The

limited use designation also allows the FFTs to invest in upgrades and supports opportunities for growth through exceptions, such as aviation or renewable fuels. Further, the use limitations provide flexibility to FFTs to replace and reconfigure existing storage tank capacity, such as consolidating smaller tanks into larger tanks, to meet future needs.

The FFTZ amendments do not amend the Citywide System Plan or the Transportation System Plan, therefore the City continues to plan for public infrastructure investments in the industrial districts where the FFTs are located.

Goal 6.C: Business district vitality. Portland implements land use policy and investments to:

- Ensure that commercial, institutional, and industrial districts support business retention and expansion.

151. Finding: The verb "ensure", which is defined in the 2035 Comprehensive Plan, means to make sure that something will happen or be available. The City Council interprets this goal to apply to the city as whole and not to individual businesses or sectors of business. Further, the City Council interprets this goal to mean that the City will provide an adequate land base that is supported by public infrastructure investments that are needed to support businesses. The FFTZ amendments are consistent with this goal because they do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes do not conflict with the intent to support business retention and expansion in Portland's industrial districts. These regulations apply to only one type of business that makes up a minority part of the businesses found in Portland's industrial districts. The other industrial uses continue to operate under current regulations. These changes support the retention of existing fossil fuel terminals by designating them as a limited use that allows the terminals to continue to operate and invest in upgrades and supports opportunities for expansion through exceptions, such as aviation or renewable fuels. Further, the use limitations provide flexibility to FFTs to replace and reconfigure existing storage tank capacity to meet future needs. The FFTZ amendments do not amend the Citywide System Plan or the Transportation System Plan, therefore the City continues to plan for public infrastructure investments in the industrial districts where the FFTs are located.

- Encourage the growth of districts that support productive and creative synergies among local businesses.

152. Finding: The verb "encourage", which is defined in the 2035 Comprehensive Plan, means to promote or foster using some combination of voluntary approaches, regulations, or incentives. The City Council interprets this goal to apply to districts as whole and not to individual businesses or sectors of business. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes do not conflict with the intent to encourage growth in Portland's industrial districts. These regulations apply to only one type of business that makes up a minority part of the businesses found in Portland's industrial districts. The remaining industrial uses continue to operate under current regulations. These changes support the retention of existing fossil fuel terminals by designating them as a limited use, as opposed to a non-conforming use, that allows the terminals to continue to operate and invest in upgrades and supports opportunities for growth through exceptions, such as aviation or renewable fuels, to the storage capacity restrictions.

- Provide convenient access to goods, services, and markets.

153. Finding: The verb "provide", which is defined in the 2035 Comprehensive Plan, means to supply, offer, or make available. The adjective "convenient", which is not defined in the 2035 Comprehensive Plan, means to be situated to allow easy access. The City Council interprets this

goal to apply to the city as whole and not to individual businesses or sectors of business. The FFTZ amendments do not amend the Citywide System Plan or the Transportation System Plan, therefore the City continues to plan for public infrastructure investments in the industrial districts where the FFTs are located. These regulations apply to only one type of business that makes up a minority part of the businesses found in Portland's industrial districts. The remaining industrial uses continue to operate under current regulations. These changes support the retention of existing fossil fuel terminals by designating them as a limited use, as opposed to a non-conforming use, that allows the terminals to continue to operate and invest in upgrades and supports opportunities for growth through exceptions, such as aviation or renewable fuels, to the storage capacity restrictions. The limits and exceptions will enable the FFTs to maintain their ability to provide goods and services to their markets.

These regulations continue to allow access to current volumes of fossil fuels that support the economy of the State of Oregon and SW Washington. The existing FFTs can continue to operate as a limited use. The regulations also provide exceptions to the storage capacity limits for aviation and renewable fuels. Further, the City finds that reducing risk from a major earthquake outweighs the marginal impact to accommodating future demand for fossil fuels. In addition, continuing to locate all of the fossil fuel storage capacity in a high risk area in Portland is counter to 2013 Oregon Resilience Plan that recommends the diversification of locations for the storage of liquid fuels and identification of new liquid fuel energy corridors.

- Take advantage of our location and quality of life advantages as a gateway to world-class natural landscapes in Northwest Oregon, Southwest Washington, and the Columbia River Basin, and a robust interconnected system of natural landscapes within the region's Urban Growth Boundary.

154. Finding: The City Council interprets this goal to apply to the city as whole and not to individual businesses or sectors of business. Further, the City Council interprets the intent of this goal is to leverage location, access and quality of life as an advantage to attracting and retaining businesses and employees to Portland. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, that could undermine business retention and expansion in Portland's industrial districts. Therefore, these changes do not conflict with the intent of this goal to encourage business district vitality in Portland.

Diverse, expanding city economy

Policy 6.1. Diverse and growing community. Expand economic opportunity and improve economic equity for Portland's diverse, growing population through sustained business growth.

155. Finding: The City Council interprets this policy to apply to the city as whole and not to individual businesses or sectors of business. The City Council finds that an important factor in improving economic equity is to provide access to job opportunities across a wide range of wage scales, especially middle wage jobs such as those found in Portland's industrial districts.

The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes maintain Portland's employment land supply to create opportunities for a growing economy.

These regulations apply to only one type of business that makes up a minority part of the businesses found in Portland's industrial districts. The remaining industrial uses continue to operate under the current development review system. The FFTZ amendments establish clear definitions for fossil fuels and the Bulk Fossil Fuel Terminal use category. These changes are fair to existing

FFTs by designating them as a limited use that allows the terminals to continue to operate and. The limited use designation also allows the FFTs to invest in upgrades and supports opportunities for growth through exceptions, such as aviation or renewable fuels. Further, the use limitations provide flexibility to FFTs to replace and reconfigure existing storage tank capacity, such as consolidating smaller tanks into larger tanks, to meet future needs.

Policy 6.2. Diverse and expanding economy. Align plans and investments to maintain the diversity of Portland's economy and status as Oregon's largest job center with growth across all sectors (commercial, industrial, creative, and institutional) and across all parts of the city.

Policy 6.3. Employment growth. Strive to capture at least 25 percent of the seven-county region's employment growth (Multnomah, Washington, Clackamas, Yamhill, Columbia, Clark, and Skamania counties).

Policy 6.4. Fiscally-stable city. Promote a high citywide jobs-to-households ratio that supports tax revenue growth at pace with residential demand for municipal services.

156. Finding: The City Council interprets Policies 6.2 through 6.3 to apply to the city as whole and not to individual businesses or sectors of business. The City Council interprets these policies to support a growing economy as described in the EOA. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes maintain Portland's employment land supply to create opportunities for a growing economy consistent with the EOA.

Policy 6.5. Economic resilience. Improve Portland's economic resilience to impacts from climate change and natural disasters through a strong local economy and equitable opportunities for prosperity.

157. Finding: The verb "improve", which is defined in the 2035 Comprehensive Plan, means to make the current situation better; increase; enhance. The City Council interprets this policy to mean that the first step in making the current situation better is to ensure that the situation does not get worse. Continuing to allow the increase in FFTs in a high risk area increases the risk to the surrounding industrial district and the Willamette River. The FFTZ amendments are a regulatory approach that will limit the size of new fossil fuel terminals and prohibit the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions, which will be an improvement compared to the current regulations that allow for unlimited growth in FFTs. Continuing to allow the unlimited increase in storage capacity at FFTs in a high risk area increases the risk to the surrounding industrial district and the Willamette River in the event of a major earthquake. The FFTZ regulations improve resilience by designating existing FFTs as a limited use, which allows the terminals to continue to operate and invest in facilities that reduce the risks and improve their ability to withstand a major earthquake. Allowing the FFTs to continue to operate and invest in upgrades will help support a strong local economy by providing for a continuing supply of fossil fuels to support a strong local economy. Further, the use limitations (33.140.100.B.17.a) provide flexibility to FFTs to replace and reconfigure existing storage tank capacity to increase safety and meet future needs.

Policy 6.6. Low-carbon and renewable energy economy. Align plans and investments with efforts to improve energy efficiency and reduce lifecycle carbon emissions from business operations. Promote employment opportunities associated with the production of renewable energy, energy efficiency projects, waste reduction, production of more durable goods, and recycling.

158. Finding: The City Council interprets this policy to support changes to business operations to become more energy efficient and reduce carbon emissions. Further, this policy encourages

renewable energy, including renewable fuels as an alternative to fossil fuels. The FFTZ amendments are consistent with this policy by providing an exception that allows for new storage capacity for renewable, non-fossil fuels.

Policy 6.7. Competitive advantages. Maintain and strengthen the city's comparative economic advantages including access to a high-quality workforce, business diversity, competitive business climate, and multimodal transportation infrastructure.

159. Finding: The verb "maintain", which is defined in the 2035 Comprehensive Plan, means to keep what you have; conserve; preserve; continue. The verb "strengthen", which is not defined in the 2035 Comprehensive Plan, means to make stronger, improve. The City Council interprets this policy to apply to the city as whole and not to individual businesses or sectors of business. These regulations apply to only one type of business that makes up a minority part of the businesses found in Portland, therefore will not have a significant impact on the workforce. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, that could undermine the business retention and expansion in Portland's industrial districts, which in turn supports Portland's business diversity across the city as a whole.

The regulations maintain a competitive business climate by being narrowly crafted to support the retention of existing fossil fuel terminals by designating them as a limited use that allows the terminals to continue to operate and invest in upgrades and supports opportunities for growth through exceptions, such as aviation or renewable fuels, to the storage capacity restrictions. The FFTZ amendments do not amend the Citywide System Plan or the Transportation System Plan, therefore the City continues to plan for public infrastructure investments to maintain and strengthen the multimodal transportation infrastructure in the northwest industrial area where the FFTs are located.

Policy 6.8. Business environment. Use plans and investments to help create a positive business environment in the city and provide strategic assistance to retain, expand, and attract businesses.

160. Finding: The City Council interprets this policy to apply to districts as whole and not to individual businesses or sectors of business. The City Council also determines that creating a positive business environment does not mean allowing for the unlimited expansion of all business types. These regulations are narrowly crafted to apply to only one type of business that makes up a minority part of the businesses found in Portland.

As outlined in Goal 6.B, the City Council defines a "positive business environment" as providing an adequate land capacity that is supported by high-quality infrastructure, with predictable and fair development review regulations. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes do not change the land capacity in Portland's industrial districts. The FFTZ amendments do not amend the Citywide System Plan or the Transportation System Plan, therefore the City continues to plan for public infrastructure investments to maintain and strengthen the multimodal transportation infrastructure in Portland's industrial districts.

The regulations only limit one type of business (FFTs), due to the moderate to high levels of liquefaction susceptibility, as documented by the Portland Bureau of Emergency Management's 2016 Critical Energy Infrastructure Hub Study and the 2012 DOGAMI Earthquake Risk Study for Oregon's Critical Energy Infrastructure Hub report. However, the regulations maintain a competitive business climate by being narrowly crafted to support the retention of existing fossil fuel terminals by designating them as a limited use that allows the terminals to continue to operate

and invest in upgrades and supports opportunities for growth through exceptions, such as aviation or renewable fuels, to the storage capacity restrictions.

The City's Enterprise Zone program, which provides a property tax exemption to industrial firms, is one of the main ways in which the City of Portland provides strategic assistance to businesses. These changes do not affect that program, and FFTs that make new capital investments remain eligible for that program.

Policy 6.9. Small business development. Facilitate the success and growth of small businesses and coordinate plans and investments with programs that provide technical and financial assistance to promote sustainable operating practices.

161. Finding: These regulations apply to only one type of business that makes up a minority part of the businesses found in Portland. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, that could undermine the success and growth of small businesses in Portland's industrial districts, which in turn supports Portland's business diversity across the city as a whole. The ordinance does not change programs that provide technical and financial assistance to small businesses.

Policy 6.10. Business innovation. Encourage innovation, research, development, and commercialization of new technologies, products, and services through responsive regulations and public sector approaches.

162. Finding: The verb "encourage", which is defined in the 2035 Comprehensive Plan, means to promote or foster using some combination of voluntary approaches, regulations, or incentives. The City Council interprets this policy to apply to districts as whole and not to individual businesses or sectors of business. These regulations apply to only one type of business that makes up a minority part of the businesses found in Portland's industrial districts. These changes support innovation at existing fossil fuel terminals by designating them as a limited use, as opposed to a non-conforming use, that allows the terminals to continue to operate and invest in upgrades and supports opportunities for growth through exceptions, such as aviation or renewable fuels, to the storage capacity restrictions. Further, the use limitations provide flexibility to FFTs to replace and reconfigure existing storage tank capacity to increase safety and meet future needs.

Policy 6.11. Sharing economy. Encourage mechanisms that enable individuals, corporations, non-profits, and government to market, distribute, share, and reuse excess capacity in goods and services. This includes peer-to-peer transactions, crowd funding platforms, and a variety of business models to facilitate borrowing and renting unused resources.

163. Finding: The verb "encourage", which is defined in the 2035 Comprehensive Plan, means to promote or foster using some combination of voluntary approaches, regulations, or incentives. The City Council interprets this policy to apply to districts as whole and not to individual businesses or sectors of business. These regulations apply to only one type of business that makes up a minority part of the businesses found in Portland's industrial districts. This policy does not apply.

Policy 6.12. Economic role of livability and ecosystem services. Conserve and enhance Portland's cultural, historic, recreational, educational, food-related, and ecosystem assets and services for their contribution to the local economy and their importance for retention and attraction of skilled workers and businesses.

164. Finding: The FFTZ map amendments do not affect Portland's cultural, historic, recreational, educational, food-related, and ecosystem assets and services for their contribution to the local economy. These regulations apply to only one type of business that makes up a minority part of the

businesses found in Portland's industrial districts. In considering the natural hazard risks that the FFTs pose to the ecosystem services on the river, as identified by the Portland Bureau of Emergency Management's Critical Energy Infrastructure Hub Study (2016), the City Council finds that continuing to allow the unlimited increase in storage capacity at FFTs in a high risk area does not enhance the current or future ecosystem services of the rivers. Therefore, the FFTZ regulations focus on limiting risk by limiting new development (storage capacity), but designate existing FFTs as a limited use, which allows the terminals to continue to operate and invest in facilities that reduce the risks and improve their ability to withstand a major earthquake. These regulations will limit the risks to the natural resource habitat functions and ecosystem services provided by the rivers.

Land development

Policy 6.13. Land supply. Provide supplies of employment land that are sufficient to meet the long-term and short-term employment growth forecasts, adequate in terms of amounts and types of sites, available and practical for development and intended uses. Types of sites are distinguished primarily by employment geographies identified in the Economic Opportunities Analysis, although capacity needs for building types with similar site characteristics can be met in other employment geographies.

165. Finding: The verb "provide", which is defined in the 2035 Comprehensive Plan, means to supply, offer, or make available. The City Council interprets this policy to mean that the City will provide an adequate land base that is supported by public infrastructure investments that are needed to support businesses. The FFTZ amendments are consistent with this policy because they do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes do not conflict with the intent to provide an adequate land supply in Portland's industrial districts, as defined in the EOA. These regulations apply to only one type of business that makes up a minority part of the businesses found in Portland's industrial districts. The other industrial uses continue to operate under current regulations. The FFTZ amendments do not amend the Citywide System Plan or the Transportation System Plan, therefore the City continues to plan for public infrastructure investments in the industrial districts where the FFTs are located.

Policy 6.14. Brownfield redevelopment. Overcome financial-feasibility gaps to cleanup and redevelop 60 percent of brownfield acreage by 2035.

166. Finding: The City Council interprets this policy to mean that the City will create programs to support the brownfield cleanup target. The FFTZ amendments are Zoning Code changes that are not directly related to the cleanup of brownfields. However, the changes designate existing FFTs as a limited use, which allows the terminals to continue to operate and invest in facilities, including brownfield remediation.

Policy 6.15. Regionally-competitive development sites. Improve the competitiveness of vacant and underutilized sites located in Portland's employment areas using incentives, and regional and state assistance for needed infrastructure and site readiness improvements.

167. Finding: The verb "improve", which is defined in the 2035 Comprehensive Plan, means to make the current situation better; increase; enhance. The City Council interprets this policy to apply to the city as whole and not to individual businesses or sectors of business. The FFTZ amendments are consistent with this policy because they do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes maintain an adequate land supply in Portland's industrial districts. Further, these regulations apply to only one type of business that makes up a minority part of the businesses found in Portland's industrial districts. The other industrial uses continue to operate under current regulations. The FFTZ amendments do not amend the Citywide System Plan or the Transportation System Plan, therefore the City continues to plan for public

infrastructure investments in the industrial districts where the FFTs are located. Finally, the City's Enterprise Zone program, which provides a property tax exemption to industrial firms, is one of the key incentives that the City of Portland offers to encourage businesses to invest in sites. These changes do not affect that program.

Policy 6.16. Regulatory climate. Improve development review processes and regulations to encourage predictability and support local and equitable employment growth and encourage business retention, including:

168. Finding: The verb "improve", which is defined in the 2035 Comprehensive Plan, means to make the current situation better; increase; enhance. The City Council interprets this policy to mean that changes to development regulations should consider how those changes affect predictability, equitable employment growth, and business retention. The City Council interprets this policy to apply to the city as whole and not to individual businesses or sectors of business.

In terms of predictability, these development regulations apply to only one type of business that makes up a minority part of the businesses found in Portland. The development regulations are clear and objective, with clearly defined terms, such as what is a fossil fuel, to provide predictability in regulating FFTs.

The City Council defines equitable employment growth as providing for job opportunities across a wide range of wage scales, especially middle wage jobs such as those found in Portland's industrial districts. These regulations apply to only one type of business that makes up a minority part of the businesses found in Portland's industrial districts. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes do not change the land capacity in Portland's industrial districts and continue to support continued growth in those districts.

The regulations are narrowly crafted to support the retention of existing fossil fuel terminals by designating them as a limited use that allows the terminals to continue to operate and invest in upgrades and supports opportunities for growth through exceptions, such as aviation or renewable fuels.

6.16.a. Assess and understand cumulative regulatory costs to promote Portland's financial competitiveness with other comparable cities.

169. Finding: The City Council interprets this policy to apply to a consideration of the cost, in terms of the time it takes to go through the development review process, the permit fees, and the system development charges, associated with the development review process. This policy applies to the city as whole and not to individual businesses or sectors of business. These regulations apply to only one type of business that makes up a small part of the businesses found in Portland's industrial districts, therefore the regulatory cost impact is limited. The FFTZ amendments do not change any of the associated permit fees or system development charges, therefore it does not impact Portland's financial competitiveness.

6.16.b. Promote certainty for new development through appropriate allowed uses and "clear and objective" standards to permit typical development types without a discretionary review.

6.16.c. Allow discretionary-review to facilitate flexible and innovative approaches to meet requirements.

170. Finding: The City Council interprets policy 6.16.b and 6.16.c to work in tandem. Under policy 6.16.b, the direction is to promote certainty through appropriate allowed uses and "clear and

objective" standards. apply to the city as whole and not to individual businesses or sectors of business. The regulations promote certainty by being narrowly crafted to apply only to fossil fuel terminals. Designating FFTs as a limited use, as opposed to a non-conforming use, allows the terminals to continue to operate and invest in upgrades and supports opportunities for growth through exceptions, through clear and objective standards and definitions.

The City Council did not establish a discretionary conditional use review for the FFT use, due to the moderate to high levels of liquefaction susceptibility, as documented by the Portland Bureau of Emergency Management's 2016 Critical Energy Infrastructure Hub Study and the 2012 DOGAMI Earthquake Risk Study for Oregon's Critical Energy Infrastructure Hub report. The City Council finds that reducing risk from a major earthquake outweighs the policy direction to provide flexible and innovative approaches to accommodating additional storage capacity through a discretionary review process, in part, because continuing to locate all of the fossil fuel storage capacity in a high risk area in Portland is counter to the 2013 Oregon Resilience Plan that recommends the diversification of locations for the storage of liquid fuels and identification of new liquid fuel energy corridors.. The FFTs with access to the river are within the Greenway Overlay Zone (33.440), which establishes a discretionary review process to allow for industrial development, while preserving and enhancing the riparian habitat along the river. The FFTZ amendments do not amend the Greenway Overlay Zone standards or review process.

6.16.d. Design and monitor development review processes to avoid unnecessary delays.

171. Finding: The FFTZ amendments do not modify the development review process for FFTs. Designating the FFTs as a limited use does not subject those uses to new or additional development reviews. The ordinance includes a directive for BPS to monitor the effectiveness of this regulation and report back to City Council in two years.

6.16.e. Promote cost effective compliance with federal and state mandates, productive intergovernmental coordination, and efficient, well-coordinated development review and permitting procedures.

172. Finding: The City Council interprets this policy to apply to districts as whole and not to individual businesses or sectors of business. The City has an established procedure for coordinated review of river-related development, including docks, in areas where city, state and federal agencies all have jurisdiction. The Streamlining Team was established pursuant to a 2003 Intergovernmental Agreement between the City of Portland (City), NOAA Fisheries, Army Corps of Engineers (Corps), and the U.S. Fish and Wildlife Service (USFWS). The FFTZ amendments do not change these procedures and there is no impact to this coordinated process.

6.16.f. Consider short-term market conditions and how area development patterns will transition over time when creating new development regulations.

173. Finding: The City Council interprets this policy to apply to the city as whole and not to individual businesses or sectors of business. As described in the adopted EOA, Portland has a tight supply of industrial land. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes will not affect Portland's short-term industrial land supply. These regulations are consistent with Policy 6.37 (Industrial Sanctuaries) in that the City does not expect the industrial character and development pattern in these districts to transition over time. These changes support the retention of existing fossil fuel terminals by designating them as a limited use that allows the terminals to continue to operate and invest in

upgrades and supports opportunities for growth through exceptions, such as aviation or renewable fuels.

Policy 6.17. Short-term land supply. Provide for a competitive supply of development-ready sites with different site sizes and types, to meet five-year demand for employment growth in the Central City, industrial areas, campus institutions, and neighborhood business districts.

174. Finding: The verb "provide", which is defined in the 2035 Comprehensive Plan, means to supply, offer, or make available. The City Council interprets this policy to mean that the City will provide an adequate land base that is supported by public infrastructure investments that are needed to support businesses. The FFTZ amendments are consistent with this policy because they do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes do not conflict with the intent to provide an adequate land supply in Portland's industrial districts. These regulations apply to only one type of business that makes up a minority part of the businesses found in Portland's industrial districts. The other industrial uses continue to operate under current regulations. The FFTZ amendments do not amend the Citywide System Plan or the Transportation System Plan, therefore the City continues to plan for public infrastructure investments in the industrial districts where the FFTs are located.

Policy 6.18. Evaluate land needs. Update the Economic Opportunities Analysis and short-term land supply strategies every five to seven years.

175. Finding: The City Council interprets this policy to provide direction to the city to update the EOA. The EOA was adopted in 2016 and is still within the time range. The FFTZ amendments do not amend the EOA. Therefore, this policy does not apply.

Policy 6.19. Corporate headquarters. Provide land opportunities for development of corporate headquarters campuses in locations with suitable transportation facilities.

176. Finding: The verb "provide", which is defined in the 2035 Comprehensive Plan, means to supply, offer, or make available. The City Council interprets this policy to mean that the City will provide an adequate land base that is supported by public infrastructure investments that are needed for corporate headquarters. The FFTZ amendments are consistent with this policy because they do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes do not conflict with the intent to provide an adequate land supply in Portland's industrial districts. These regulations apply to only one type of business that makes up a minority part of the businesses found in Portland's industrial districts. The other industrial uses continue to operate under current regulations. The FFTZ amendments do not amend the Citywide System Plan or the Transportation System Plan, therefore the City continues to plan for public infrastructure investments in the industrial districts where the FFTs are located.

Traded sector competitiveness

Policy 6.20. Traded sector competitiveness. Align plans and investments with efforts to improve the city and regional business environment for traded sector and export growth. Participate in regional and statewide initiatives.

Policy 6.21. Traded sector diversity. Encourage partnerships to foster the growth, small business vitality, and diversity of traded sectors.

Policy 6.22. Clusters. Align plans and investments with efforts that direct strategic business development resources to enhance the competitiveness of businesses in traded sector clusters.

177. **Finding:** The 2035 Comprehensive Plan defines "traded sector" as a business sector consisting of companies that compete in markets extending beyond the metropolitan region. The City Council interprets policies 6.20 through 6.23 to apply to the city as whole and does not require the City to allow for the unlimited expansion of individual businesses or sectors of business. The City Council finds that fossil fuel energy is not identified as a key traded sector in city, regional or statewide initiatives. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes do not conflict with the intent to maintain Portland's industrial districts as part of the efforts to support trade sector and export growth over time. These changes support the retention of existing fossil fuel terminals by designating them as a limited use, as opposed to a non-conforming use, that allows the terminals to continue to operate and invest in upgrades and supports opportunities for growth through exceptions, such as aviation or renewable fuels, to the storage capacity restrictions. The FFTZ amendments do not amend the Citywide System Plan or the Transportation System Plan, therefore the City continues to plan for public infrastructure investments to maintain and strengthen the multimodal transportation infrastructure in the northwest industrial area as part of the City's traded sector economic development strategy.

Policy 6.23. Trade and freight hub. Encourage investment in transportation systems and services that will retain and expand Portland's competitive position as a West Coast trade gateway and freight distribution hub.

178. **Finding:** The verb "encourage", which is defined in the 2035 Comprehensive Plan, means to promote or foster using some combination of voluntary approaches, regulations, or incentives. The City Council interprets this policy to apply to the city as whole and not to individual businesses or sectors of business. The City Council interprets the policy in two ways. First, the City will promote and encourage public sector investments in the freight transportation system, including those by the City, the Port of Portland, Metro, and the State of Oregon. The FFTZ amendments do not amend the Citywide System Plan or the Transportation System Plan, therefore the City continues to plan for public infrastructure investments to maintain and strengthen the multimodal transportation infrastructure in the northwest industrial area where the FFTs are located.

Second, these changes support the continuing investment in existing fossil fuel terminals by designating them as a limited use, as opposed to a non-conforming use, that allows the terminals to continue to operate and invest in upgrades and supports opportunities for growth through exceptions, such as aviation or renewable fuels.

Finally, the City's Enterprise Zone program, which provides a property tax exemption to industrial firms, is one of the key incentives that the City of Portland offers to encourage businesses to invest in their facilities, including private multi-modal transportation systems such as docks, pipelines and transloading facilities. These changes do not affect that program, and FFTs that make new capital investments remain eligible for that program.

Policy 6.24. Traded sector land supply. Foster traded sector retention, growth, and competitive advantages in industrial districts and the Central City. Recognize the concentration of traded-sector businesses in these districts.

179. **Finding:** The verb "foster", which is defined in the 2035 Comprehensive Plan, means to encourage or guide the incremental development of something over a long period of time. The City Council interprets this policy to apply to districts as whole and not to individual businesses or sectors of business. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes do not conflict with the intent to maintain

Portland's industrial districts over time. These regulations are consistent with Policy 6.37 (Industrial Sanctuaries) in that the City does not expect the industrial character and development pattern in these districts to transition over time. These changes support the retention of existing fossil fuel terminals by designating them as a limited use that allows the terminals to continue to operate and invest in upgrades and supports opportunities for growth through exceptions, such as aviation or renewable fuels. The FFTZ amendments do not amend the Citywide System Plan or the Transportation System Plan, therefore the City continues to plan for public infrastructure investments to maintain and strengthen the multimodal transportation infrastructure in the northwest industrial area where the FFTs are located.

Policy 6.25. Import substitution. Encourage local goods production and service delivery that substitute for imports and help keep the money Portlanders earn in the local economy.

180. **Finding:** The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes do not conflict with the intent to maintain Portland's industrial districts over time, which provides a land supply for import substitution businesses. Specifically, these changes exceptions for renewable fuels that can be substitutes for fossil fuels. The FFTZ amendments do not amend the Citywide System Plan or the Transportation System Plan, therefore the City continues to plan for public infrastructure investments to maintain and strengthen the multimodal transportation infrastructure in the northwest industrial area that can support service delivery.

Policy 6.26. Business opportunities in urban innovation. Strive to have Portland's built environment, businesses, and infrastructure systems showcase examples of best practices of innovation and sustainability.

181. **Finding:** These regulations apply to only one type of business that makes up a minority part of the businesses found in Portland's industrial districts. The other industrial uses continue to operate under current regulations. This policy does not apply.

Equitable household prosperity

Policy 6.27. Income self-sufficiency. Expand access to self-sufficient wage levels and career ladders for low-income people by maintaining an adequate and viable supply of employment land and public facilities to support and expand opportunities in Portland for middle- and high-wage jobs that do not require a 4-year college degree.

6.27.a. Support the role of industrial districts as a leading source of middle-wage jobs that do not require a 4-year college degree and as a major source of wage-disparity reduction for under-served and under-represented communities.

6.27.b. Evaluate and limit negative impacts of plans and investments on middle and high wage job creation and retention.

182. **Finding:** The City Council finds income self-sufficiency is dependent on access to job opportunities across a wide range of wage scales, especially middle wage jobs such as those found in Portland's industrial districts. The FFTZ amendments apply to only one type of business that makes up a minority part of the businesses found in Portland's industrial districts. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes do not change the land capacity in Portland's industrial districts and continue to support continued employment growth in those districts.

The regulations are narrowly crafted to support the retention of existing fossil fuel terminals by designating them as a limited use that allows the terminals to continue to operate and invest in upgrades and supports opportunities for growth through exceptions, such as aviation or renewable fuels.

Policy 6.28. East Portland job growth. Encourage investment in, and alignment of, poverty-reduction efforts that address economic development, land use, transportation, housing, social services, public health, community development, and workforce development.

183. Finding: There are no FFTs in East Portland. The FFTZ amendments apply to only one type of business that makes up a minority part of the businesses found in Portland's industrial districts. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes do not change the land capacity in Portland's industrial districts and continue to support continued employment growth in those districts.

Policy 6.29. Poverty reduction. Encourage investment in, and alignment of, poverty-reduction efforts that address economic development, land use, transportation, housing, social services, public health, community development, and workforce development.

Policy 6.30. Disparity reduction. Encourage investment in, and alignment of, public efforts to reduce racial, ethnic, and disability-related disparities in income and employment opportunity.

184. Finding: For policies 6.29 and 6.30, the City Council finds that access to job opportunities across a wide range of wage scales, especially middle wage jobs such as those found in Portland's industrial districts is a key element of poverty and disparity reduction efforts. The FFTZ amendments apply to only one type of business that makes up a minority part of the businesses found in Portland's industrial districts. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes do not change the land capacity in Portland's industrial districts and continue to support continued employment growth in those districts.

Policy 6.31. Minority-owned, woman-owned and emerging small business (MWESB) assistance. Ensure that plans and investments improve access to contracting opportunities for minority-owned, woman-owned, and emerging small businesses.

185. Finding: The City Council interprets this policy to focused on supporting minority-owned, woman-owned, and emerging small businesses through City programs and contracting procedures, and not the Zoning Code. This policy does not apply.

Policy 6.32. Urban renewal plans. Encourage urban renewal plans to primarily benefit existing residents and businesses within the urban renewal area through:

1. Revitalization of neighborhoods.
2. Expansion of housing choices.
3. Creation of business and job opportunities.
4. Provision of transportation linkages.
5. Protection of residents and businesses from the threats posed by gentrification and displacement.
6. The creation and enhancement of those features which improve the quality of life within the urban renewal area.

186. Finding: The City Council interprets this policy to focused on urban renewal plans and not the Zoning Code. There are three urban renewal areas (Central Eastside, Willamette Industrial and Airport Way) that have industrial zoning that is amended by this ordinance. None of the existing

FFTs are in the URAs. The FFTZ amendments do not include changes to any urban renewal plans. This policy does not apply.

Central City

Policy 6.33. Central City. Improve the Central City's regional share of employment and continue its growth as the unique center of both the city and the region for innovation and exchange through commerce, employment, arts, culture, entertainment, tourism, education, and government.

Policy 6.34. Central City industrial districts. Protect and facilitate the long-term success of Central City industrial districts, while supporting their evolution into places with a broad mix of businesses with high employment densities.

Policy 6.35. Innovation districts. Provide for expanding campus institutions in the Central City and Marquam Hill, and encourage business development that builds on their research and development strengths.

187. Finding: The FFTZ amendments change allowed uses in the City's industrial areas. There are no FFTs located in the Central City. These policies do not apply.

Industrial and employment districts

Policy 6.36. Industrial land. Provide industrial land that encourages industrial business retention, growth, and traded sector competitiveness as a West Coast trade and freight hub, a regional center of diverse manufacturing, and a widely-accessible base of family-wage jobs, particularly for under-served and under-represented people.

188. Finding: The verb "provide", which is defined in the 2035 Comprehensive Plan, means to supply, offer, or make available. The City Council interprets this policy to apply to districts as whole and not to individual businesses or sectors of business. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes do not reduce the industrial land designated in Portland. These changes support the retention of existing fossil fuel terminals by designating them as a limited use that allows the terminals to continue to operate and invest in upgrades and supports opportunities for growth through exceptions, such as aviation or renewable fuels, to the storage capacity restrictions.

Policy 6.37. Industrial sanctuaries. Protect industrial land as industrial sanctuaries identified on the Comprehensive Plan Map primarily for manufacturing and distribution uses and to encourage the growth of industrial activities in the city.

189. Finding: The verb "protect", which is defined in the 2035 Comprehensive Plan, means to defend or guard against loss, injury, or destruction. The City Council interprets this policy to apply to the city as whole and does not require the City to allow for the unlimited expansion of individual businesses or sectors of business. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes will maintain Portland's industrial sanctuaries. These regulations are consistent with this policy in that the City does not expect the industrial character and development pattern in these districts to transition over time. These changes support the retention of existing fossil fuel terminals by designating them as a limited use that allows the terminals to continue to operate and invest in upgrades and supports opportunities for growth through exceptions, such as aviation or renewable fuels, to the storage capacity restrictions. The FFTZ amendments do not amend the Citywide System Plan or the Transportation System Plan, therefore the City continues to plan for public infrastructure investments to maintain

and strengthen the multimodal transportation infrastructure in the northwest industrial area where the FFTs are located.

Policy 6.38. Prime industrial land retention. Protect the multimodal freight-hub industrial districts at the Portland Harbor, Columbia Corridor, and Brooklyn Yard as prime industrial land that is prioritized for long-term retention.

6.38.a. Protect prime industrial lands from quasi-judicial Comprehensive Plan Map amendments that convert prime industrial land to non-industrial uses, and consider the potential for other map amendments to otherwise diminish the economic competitiveness or viability of prime industrial land.

6.38.b. Limit conversion of prime industrial land through land use plans, regulations, or public land acquisition for non-industrial uses, especially land that can be used by river-dependent and river-related industrial uses.

6.38.c. Limit regulatory impacts on the capacity, affordability, and viability of industrial uses in the prime industrial area while ensuring environmental resources are also protected.

6.38.d. Strive to offset the reduction of development capacity as needed, with additional prime industrial capacity that includes consideration of comparable site characteristics. Offsets may include but are not limited to additional brownfield remediation, industrial use intensification, strategic investments, and other innovative tools and partnerships that increase industrial utilization of industrial land.

6.38.e. Protect prime industrial land for siting of parks, schools, large-format places of assembly, and large-format retail sales.

6.38.f. Promote efficient use of freight hub infrastructure and prime industrial land by limiting non-industrial uses that do not need to be in the prime industrial area.

190. Finding: The City Council finds that this policy is implemented through the Prime Industrial Overlay Zone. The FFTZ amendments do not include changes to the overlay zone or to the Zoning Map where it is applied.

Policy 6.39. **Harbor access lands**. Limit use of harbor access lands to river- or rail-dependent or related industrial land uses due to the unique and necessary infrastructure and site characteristics of harbor access lands for river-dependent industrial uses.

191. Finding: The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes will maintain Portland's harbor access lands for river- or rail-dependent or related industrial uses.

Policy 6.40. **Portland Harbor Superfund Site**. Take a leadership role to facilitate a cleanup of the Portland Harbor that moves forward as quickly as possible and that allocates cleanup costs fairly and equitably. Encourage a science-based and cost-effective cleanup solution that facilitates re-use of land for river- or rail-dependent or related industrial uses.

192. Finding: The City Council interprets this policy to mean that the City will take a lead role to facilitate cleanup of the Portland Harbor. The FFTZ amendments are Zoning Code changes that are not directly related to the cleanup of Portland Harbor. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes will maintain Portland's industrial sanctuaries for river- or rail-dependent or related industrial uses. However, the

changes designate existing FFTs as a limited use, which allows the terminals to continue to operate and invest in facilities, including brownfield remediation related to the Portland Harbor cleanup efforts.

Policy 6.41. Multimodal freight corridors. Encourage freight-oriented industrial development to locate where it can maximize the use of and support reinvestment in multimodal freight corridors.

193. Finding: The verb "encourage", which is defined in the 2035 Comprehensive Plan, means to promote or foster using some combination of voluntary approaches, regulations, or incentives. The City Council interprets this policy to apply to districts as whole and not to individual businesses or sectors of business. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes continue to support freight-oriented industrial development. These regulations apply to only one type of business that makes up a small part of the businesses found in Portland's industrial districts. These changes support the retention of existing fossil fuel terminals by designating them as a limited use that allows the terminals to continue to operate and invest in upgrades and supports opportunities for growth through exceptions, such as aviation or renewable fuels. The FFTZ amendments do not amend the Citywide System Plan or the Transportation System Plan, therefore the City continues to plan for public infrastructure investments to maintain and strengthen the multimodal transportation infrastructure in the northwest industrial area where the FFTs are located.

Policy 6.42. Columbia East. Provide a mix of industrial and limited business park development in Columbia East (east of 82nd Avenue) that expand employment opportunities supported by proximity to Portland International Airport and multimodal freight access.

194. Finding: The FFTZ amendments affect one type of allowed use in employment and industrial zones and do not change development standards that apply to development in those zones. None of the existing FFTs are located in these dispersed employment areas.

Policy 6.43. Dispersed employment areas. Provide small, dispersed employment areas for a flexible and affordable mix of office, creative services, small-scale manufacturing, traded sector and distribution, and other small-format light industrial and commercial uses with access to nearby freeways or truck streets.

195. Finding: The FFTZ amendments affect one type of allowed use in employment and industrial zones and do not change development standards that apply to development in those zones. None of the existing FFTs are located in these dispersed employment areas.

Policy 6.44. Industrial land use intensification. Encourage reinvestment in, and intensification of, industrial land use, as measured by output and throughput per acre.

196. Finding: The verb "encourage", which is defined in the 2035 Comprehensive Plan, means to promote or foster using some combination of voluntary approaches, regulations, or incentives. The City Council interprets this policy to apply to industrial districts as whole and not to individual businesses or sectors of business. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes are consistent with the intent to maintain Portland's industrial districts over time. These changes support the retention of existing fossil fuel terminals by designating them as a limited use that allows the terminals to continue to operate and invest in upgrades and supports opportunities for growth through exceptions, such as aviation or renewable fuels. Further, the use limitations (33.140.100.B.17.a) provide flexibility to

FFTs to replace and reconfigure existing storage tank capacity to increase safety and meet future needs.

The City's Enterprise Zone program, which provides a property tax exemption to industrial firms, is one of the key incentives that the City of Portland offers to encourage businesses to invest in their facilities, including private multi-modal transportation systems such as docks, pipelines and transloading facilities. These changes do not affect that program, and FFTs that make new capital investments remain eligible for that program.

Policy 6.45. **Industrial brownfield redevelopment**. Provide incentives, investments, technical assistance and other direct support to overcome financial-feasibility gaps to enable remediation and redevelopment of brownfields for industrial growth.

197. **Finding:** The City Council interprets this policy to mean that the City will create programs to support brownfield cleanup in industrial areas. The FFTZ amendments are Zoning Code changes that are not directly related to the cleanup of brownfields. However, the changes designate existing FFTs as a limited use, which allows the terminals to continue to operate and invest in facilities, including brownfield remediation.

Policy 6.46. Impact analysis. Evaluate and monitor the impacts on industrial land capacity that may result from land use plans, regulations, public land acquisition, public facility development, and other public actions to protect and preserve existing industrial lands.

198. **Finding:** The City Council interprets this policy to provide direction to the city to evaluate and monitor industrial land capacity and development trends that result from plan and zoning changes. The ordinance includes a directive for BPS to monitor the effectiveness of this regulation and report back to City Council in two years.

Policy 6.47. Clean, safe, and green. Encourage improvements to the cleanliness, safety, and ecological performance of industrial development and freight corridors by facilitating adoption of market feasible new technology and design.

199. **Finding**: The FFTZ amendments affect one type of allowed use in employment and industrial zones and do not change development standards that apply to development in those zones. These changes designate existing FFTs as a limited use that allows the terminals to continue to operate and invest in upgrades that can improve the cleanliness, safety, and ecological performance of FFTs.

Policy 6.48. Fossil fuel distribution. Limit fossil fuels distribution and storage facilities to those necessary to serve the regional market.

200. **Finding:** The 2035 Comprehensive Plan defines "limit" as to minimize or reduce relative to the current situation or to a potential future situation. The City Council interprets the phrase "regional market" to mean the state of Oregon and Southwest Washington in recognition that Portland's fossil fuel terminals currently handle 90% of the fossil fuels consumed in Oregon and Southwest Washington. These changes support the retention of existing fossil fuel terminals by designating them as a limited use that allows the terminals to continue to operate and invest in upgrades and supports opportunities for growth through exceptions, such as aviation or renewable fuels. Further, the use limitations (33.140.100.B.17.a) provide flexibility to FFTs to replace and reconfigure existing storage tank capacity to increase safety and meet future needs. In addition, limiting storage capacity to the existing facilities, with some exceptions, reduces risk from a major earthquake, which outweighs the policy direction to provide capacity to accommodate any potential future

increase in fossil fuel consumption, in part, because continuing to locate all of the fossil fuel storage capacity in a high risk area in Portland is counter to the 2013 Oregon Resilience Plan that recommends the diversification of locations for the storage of liquid fuels and identification of new liquid fuel energy corridors.

Policy 6.49. Industrial growth and watershed health. Facilitate concurrent strategies to protect and improve industrial capacity and watershed health in the Portland Harbor and Columbia Corridor areas.

201. Finding: The verb "improve", which is defined in the 2035 Comprehensive Plan, means to make the current situation better; increase; enhance. The City Council interprets this policy to mean that the first step in making the current situation better is to ensure that the situation does not get worse. Continuing to allow the increase in FFTs in a high risk area increases the risk to watershed health. The FFTZ amendments are a regulatory approach that will limit the size of new fossil fuel terminals and prohibit the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions, which will be an improvement compared to the current regulations that allow for unlimited growth in FFTs. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes maintain Portland's industrial capacity. These regulations apply to only one type of business that makes up a minority part of the businesses found in Portland's industrial districts. The remaining industrial uses continue to operate under current regulations. The FFTZ regulations designate existing FFTs as a limited use, which allows the terminals to continue to operate and invest in facilities that reduce the risks and improve their ability to withstand a major earthquake. Allowing the FFTs to continue to operate and invest in upgrades will help support a strong local economy by providing for a continuing supply of fossil fuels to support a strong local economy.

Policy 6.50. **District expansion**. Provide opportunities for expansion of industrial areas based on evaluation of forecasted need and the ability to meet environmental, social, economic, and other goals.

202. Finding: The City Council interprets this policy to apply to Comprehensive Plan Map and Zoning Map amendments. The FFTZ amendments are a regulatory approach that will limit the size of new fossil fuel terminals and prohibit the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes maintain Portland's industrial capacity. This policy does not apply.

Policy 6.51. Golf course reuse and redevelopment. Facilitate a mix of industrial, natural resource, and public open space uses on privately-owned golf course sites in the Columbia Corridor that property owners make available for reuse.

203. Finding: The City Council interprets this policy to apply to Comprehensive Plan Map and Zoning Map amendments. The FFTZ amendments are a regulatory approach that will limit the size of new fossil fuel terminals and prohibit the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes maintain Portland's industrial capacity. This policy does not apply.

Policy 6.52. Residential and commercial reuse. Facilitate compatible industrial or employment redevelopment on residential or commercial sites that become available for reuse if the site is in or near prime industrial areas, and near a freeway or on a freight street.

204. Finding: The FFTZ amendments affect one type of allowed use in employment and industrial zones and do not change development standards that apply to development in those zones. This policy does not apply.

Policy 6.53. Mitigation banks. Facilitate industrial site development by promoting and allowing environmental mitigation banks that serve industrial land uses on prime industrial land.

205. Finding: The FFTZ amendments affect one type of allowed use in employment and industrial zones and do not change development standards that apply to development in those zones. This policy does not apply.

Policy 6.54. **Neighborhood buffers**. Maintain and enhance major natural areas, open spaces, and constructed features as boundaries and buffers for the Portland Harbor and Columbia Corridor industrial areas.

206. Finding: The FFTZ amendments affect one type of allowed use in employment and industrial zones and do not change development standards that apply to development in those zones. This policy does not apply.

Policy 6.55. Neighborhood park use. Allow neighborhood park development within industrial zones where needed to provide adequate park service within one-half mile of every resident.

207. Finding: This policy addresses park development in industrial zones. The FFTZ amendments affect one type of allowed use in employment and industrial zones and do not change development standards that apply to development in those zones. This policy does not apply.

Campus institutions

Policy 6.56. Campus institutions. Provide for the stability and growth of Portland's major campus institutions as essential service providers, centers of innovation, workforce development resources, and major employers.

Policy 6.57. Campus land use. Provide for major campus institutions as a type of employment land, allowing uses typically associated with health care and higher education institutions. Coordinate with institutions in changing campus zoning to provide land supply that is practical for development and intended uses.

Policy 6.58. Development impacts. Protect the livability of surrounding neighborhoods through adequate infrastructure and campus development standards that foster suitable density and attractive campus design. Minimize off-site impacts in collaboration with institutions and neighbors, especially to reduce automobile traffic and parking impacts.

Policy 6.59. Community amenities and services. Encourage campus development that provides amenities and services to surrounding neighborhoods, emphasizing the role of campuses as centers of community activity.

Policy 6.60. **Campus edges**. Provide for context-sensitive, transitional uses, and development at the edges of campus institutions to enhance their integration into surrounding neighborhoods, including mixed-use and neighborhood-serving commercial uses where appropriate.

Policy 6.61. Satellite facilities. Encourage opportunities for expansion of uses, not integral to campus functions, to locate in centers and corridors to support their economic vitality.

208. Finding: The FFTZ amendments change allowed uses in the City's industrial areas. There are no FFTs located on campus institutions. These policies do not apply.

Neighborhood business districts

Policy 6.62. Neighborhood business districts. Provide for the growth, economic equity, and vitality of neighborhood business districts.

Policy 6.63. District function. Enhance the function of neighborhood business districts as a foundation of neighborhood livability.

Policy 6.64. Small, independent businesses. Facilitate the retention and growth of small and locally-owned businesses.

Policy 6.65. Home-based businesses. Encourage and expand allowances for small, low-impact home based businesses in residential areas, including office or personal service uses with infrequent or by-appointment customer or client visits to the site. Allow a limited number of employees, within the scale of activity typical in residential areas. Allow home-based businesses on sites with accessory dwelling units.

Policy 6.66. Neighborhood-serving business. Provide for neighborhood business districts and small commercial nodes in areas between centers to expand local access to goods and services. Allow nodes of small-scale neighborhood-serving commercial uses in large planned developments and as a ground floor use in high density residential areas.

Policy 6.67. Retail development. Provide for a competitive supply of retail sites that support the wide range of consumer needs for convenience, affordability, accessibility, and diversity of goods and services, especially in under-served areas of Portland.

Policy 6.68. Investment priority. Prioritize commercial revitalization investments in neighborhoods that serve communities with limited access to goods
and services.

Policy 6.69. Non-conforming neighborhood business uses. Limit non-conforming uses to reduce adverse impacts on nearby residential uses while avoiding displacement of existing neighborhood businesses.

Policy 6.70. Involuntary commercial displacement. Evaluate plans and investments for their impact on existing businesses.

6.70.a. Limit involuntary commercial displacement in areas at risk of gentrification, and incorporate tools to reduce the cost burden of rapid neighborhood change on small business owners vulnerable to displacement.

6.70.b. Encourage the preservation and creation of affordable neighborhood commercial space to support a broad range of small business owners.

Policy 6.71. Temporary and informal markets and structures. Acknowledge and support the role that temporary markets (farmer's markets, craft markets, flea markets, etc.) and other temporary or mobile-vending structures play in enabling startup business activity. Also, acknowledge that temporary uses may ultimately be replaced by more permanent development and uses.

Policy 6.72 Community economic development. Encourage collaborative approaches to align land use and neighborhood economic development for residents and business owners to better connect and compete in the regional economy.

Policy 6.73. Centers. Encourage concentrations of commercial services and employment opportunities in centers.

6.73.a. Encourage a broad range of neighborhood commercial services in centers to help residents and others in the area meet daily needs and/or serve as neighborhood gathering places.

6.73.b. Encourage the retention and further development of grocery stores and local markets as essential elements of centers.

6.73.c. Enhance opportunities for services and activities in centers that are responsive to the needs of the populations and cultural groups of the surrounding area.

6.73.d. Require ground-level building spaces in core areas of centers accommodate commercial or other street-activating uses and services.

6.73.e. Encourage employment opportunities as a key function of centers, including connections between centers, institutions, and other major employers to reinforce their roles as vibrant centers of activity.

209. Finding: The FFTZ amendments change allowed uses in the City's industrial areas. There are no FFTs located in neighborhood business districts. These policies do not apply.

Chapter 7: Environmental and Watershed Health

Goal 7.A: Climate. Carbon emissions are reduced to 50 percent below 1990 levels by 2035.

210. Finding: The FFTZ amendments will limit the size of new fossil fuel terminals and prohibit the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions. The FFTZ amendments help provide a transition to a reliable, low-carbon energy infrastructure by designating existing FFTs as a limited use, which allows the terminals to continue to operate and invest in facilities to increase safety and reliability. In addition, the definition of fossil fuels explicitly does not include ethanol, biodiesel/renewable diesel other fuel additives that will allows FTTs to add storage capacity to provide reliable low-carbon fuels to help meet the carbon emissions reduction goals.

Goal 7.B: Healthy watersheds and environment. Ecosystem services and ecosystem functions are maintained and watershed conditions have improved over time, supporting public health and safety, environmental quality, fish and wildlife, cultural values, economic prosperity, and the intrinsic value of nature.

211. Finding: The FFTZ amendments foster a healthy environment and sustain the ecosystem services of Portland's air, water and land by reducing the risk associated with a major earthquake. The first step in making the current situation better is to ensure that the situation does not get worse by continuing to allow the unlimited increase in fossil fuel terminal storage tank capacity in a high risk area. The FFTZ amendments are a regulatory approach that will limit the size of new fossil fuel terminals and prohibit the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions, which will be an improvement compared to the current regulations that allow for unlimited growth in fossil fuel terminals. Further, by designating existing FFTs as a limited use allows the terminals to continue to operate and invest in facilities that reduce the risks and improve their ability to withstand a major earthquake, which can minimize environmental impacts in the event of a major earthquake. No changes to the environmental or greenway overlay zones are proposed as part of this project, therefore the natural resource values and functions will be sustained.

Goal 7.C: Resilience. Portland's built and natural environments function in complementary ways and are resilient in the face of climate change and natural hazards.

212. **Finding:** The 2035 Comprehensive Plan defines "resilience" as the capability to anticipate, prepare for, respond to, and recover from significant multi-hazard threats with minimum damage to social well-being, the economy, and the environment. Portland's FFTs are within a disaster-prone area that is at risk for a catastrophic Cascadia earthquake disaster. Most of Portland's employment and industrial zones are in areas with high to very high levels of liquefaction susceptibility, as documented by the 2018 DOGAMI Earthquake Regional Impact Analysis. Fossil fuel infrastructure poses considerable risks in the event of a major earthquake.

According to the 2012 DOGAMI Earthquake Risk Study for Oregon's Critical Energy Infrastructure Hub report, a magnitude 8 or 9 Cascadia Subduction Zone earthquake would impact the CEI Hub with: ground shaking; liquefaction (soil behavior phenomenon in which a saturated sand softens and loses strength during strong earthquake ground shaking); lateral spreading (where surficial soil permanently moves laterally due to earthquake shaking); landslides; co-seismic settlement (where the ground surface is permanently lowered due to seismic shaking); and bearing capacity failures (when the foundation soil cannot support the structure it is intended to support).

According to the 2012 DOGAMI report, liquefaction and lateral spreading hazards are of primary concern to the fossil fuel terminals. The CEI Hub is adjacent to the Willamette River and has extensive deposits of highly liquefiable soils. These soils (made of sands, silts, gravels and clays) have been naturally deposited by river activity as well as been created from man-made activities, such as hydraulically placed material from river dredging or debris placed as landfill.

The FFTs have significant seismic risks because most of the tanks have been constructed without any or only limited seismic design criteria on soils with high levels of liquefaction susceptibility, as documented by the Portland Bureau of Emergency Management's 2016 Critical Energy Infrastructure Hub Study and the 2012 DOGAMI Earthquake Risk Study for Oregon's Critical Energy Infrastructure Hub report. The City Council interprets this goal to mean that the first step in making Portland more resilient is to stop increasing the risk. Continuing to allow the increase in FFTs in a high risk area increases the risk to the surrounding industrial district and the Willamette River. The FFTZ amendments limit future risk by limiting the size of new fossil fuel terminals and prohibiting the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions. Further, by designating existing FFTs as a limited use, as opposed to a prohibited nonconforming use, allows the terminals to continue to operate and invest in facilities that reduce the risks and improve their ability to withstand a major earthquake, which ultimately can make Portland more resilient.

Goal 7.D: Environmental equity. All Portlanders have access to clean air and water, can experience nature in their daily lives, and benefit from development designed to lessen the impacts of natural hazards and environmental contamination.

213. **Finding:** The City Council interprets this goal to mean that the first step in lessening the impacts of natural hazards and environmental contamination is to stop increasing the risk. Continuing to allow the increase in FFTs in a high risk area increases the risk to the surrounding neighborhoods and the Willamette River. The FFTZ amendments limit future risk by limiting the size of new fossil fuel terminals and prohibiting the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions. Further, by designating existing FFTs as a limited use, as opposed to a prohibited nonconforming use, allows the terminals to continue to operate and invest in facilities that reduce the risks and improve their ability to withstand a major earthquake.

Goal 7.E: Community stewardship. Portlanders actively participate in efforts to maintain and improve the environment, including watershed health.

214. Finding: The City Council interprets this goal to mean that the City should have programs focused on community involvement in improving the environment. The FFTZ amendments change the Zoning Code and do not include other changes to stewardship programs. This goal does not apply.

Improving environmental quality and resilience

Policy 7.1. Environmental quality. Protect or support efforts to protect air, water, and soil quality, and associated benefits to public and ecological health and safety, through plans and investments.

Policy 7.2. Environmental equity. Prevent or reduce adverse environment-related disparities affecting under-served and under-represented communities through plans and investments. This includes addressing disparities relating to air and water quality, natural hazards, contamination, climate change, and access to nature.

215. Finding: The City Council interprets this goal to mean that the first step in lessening the impacts of natural hazards and environmental contamination is to stop increasing the risk. Continuing to allow the increase in FFTs in a high risk area increases the risk to the surrounding neighborhoods and the Willamette River. The FFTZ amendments limit future risk by limiting the size of new fossil fuel terminals and prohibiting the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions. Further, by designating existing FFTs as a limited use, as opposed to a prohibited nonconforming use, allows the terminals to continue to operate and invest in facilities that reduce the risks and improve their ability to withstand a major earthquake.

Policy 7.3. Ecosystem services. Consider the benefits provided by healthy ecosystems that contribute to the livability and economic health of the city.

216. Finding: The FFTZ amendments foster a healthy environment and sustain the ecosystem services of Portland's air, water and land by reducing the risk associated with a major earthquake. The first step in making the current situation better is to ensure that the situation does not get worse by continuing to allow the unlimited increase in fossil fuel terminal storage tank capacity in a high risk area. The FFTZ amendments are a regulatory approach that will limit the size of new fossil fuel terminals and prohibit the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions, which will be an improvement compared to the current regulations that allow for unlimited growth in fossil fuel terminals. Further, by designating existing FFTs as a limited use allows the terminals to continue to operate and invest in facilities that reduce the risks and improve their ability to withstand a major earthquake, which can minimize environmental impacts in the event of a major earthquake. No changes to the environmental or greenway overlay zones are proposed as part of this project, therefore the natural resource values and functions will be sustained.

Policy 7.4. Climate change. Update and implement strategies to reduce carbon emissions and impacts and increase resilience through plans and investments and public education.

7.4.a. Carbon sequestration. Enhance the capacity of Portland's urban forest, soils, wetlands, and other water bodies to serve as carbon reserves.

7.4.b. Climate adaptation and resilience. Enhance the ability of rivers, streams, wetlands, floodplains, urban forest, habitats, and wildlife to limit and adapt to climate-exacerbated flooding, landslides, wildfire, and urban heat island effects.

217. **Finding:** The FFTZ amendments help reduce carbon emissions by providing for a transition to a reliable, low-carbon energy infrastructure by designating existing FFTs as a limited use, which allows the terminals to continue to operate and invest in facilities to increase safety and reliability. In addition, the definition of fossil fuels explicitly does not include ethanol, biodiesel/renewable diesel other fuel additives that will allows FTTs to add storage capacity to provide reliable low-carbon fuels to help meet the carbon emissions reduction goals.

The 2035 Comprehensive Plan defines "resilience" as the capability to anticipate, prepare for, respond to, and recover from significant multi-hazard threats with minimum damage to social well-being, the economy, and the environment. Portland's FFTs are within a disaster-prone area that is at risk for a catastrophic Cascadia earthquake disaster. The FFTs have significant seismic risks because most of the tanks have been constructed without any or only limited seismic design criteria on soils with high levels of liquefaction susceptibility. The City Council interprets this policy to mean that the first step in making Portland more resilient is to stop increasing the risk. Continuing to allow the increase in FFTs in a high risk area increases the risk to the surrounding to the Willamette River and associated floodplains. The FFTZ amendments limit future risk by limiting the size of new fossil fuel terminals and prohibiting the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions. Further, by designating existing FFTs as a limited use, as opposed to a prohibited nonconforming use, allows the terminals to continue to operate and invest in facilities that reduce the risks and improve their ability to withstand a major earthquake, which ultimately can make Portland more resilient.

Policy 7.5. Air quality. Improve, or support efforts to improve, air quality through plans and investments, including reducing exposure to air toxics, criteria pollutants, and urban heat island effects. Consider the impacts of air quality on the health of all Portlanders.

Policy 7.6. Hydrology. Through plans and investments, improve or support efforts to improve watershed hydrology to achieve more natural flow and enhance conveyance and storage capacity in rivers, streams, floodplains, wetlands, and aquifers. Minimize impacts from development and associated impervious surfaces, especially in areas with poorly-infiltrating soils and limited public stormwater discharge points, and encourage restoration of degraded hydrologic functions.

Policy 7.7. Water quality. Improve, or support efforts to improve, water quality in rivers, streams, floodplains, groundwater, and wetlands through land use plans and investments, to address water quality issues including toxics, bacteria, temperature, metals, and sediment pollution. Consider the impacts of water quality on the health of all Portlanders.

Policy 7.8. Biodiversity. Strive to achieve and maintain self-sustaining populations of native species, including native plants, native resident and migratory fish and wildlife species, at-risk species, and beneficial insects (such as pollinators) through plans and investments.

Policy 7.9. Habitat and biological communities. Ensure that plans and investments are consistent with and advance efforts to improve, or support efforts to improve fish and wildlife habitat and biological communities. Use plans and investments to enhance the diversity, quantity, and quality of habitats habitat corridors, and especially habitats that:

- Are rare or declining.
- Support at-risk plant and animal species and communities.
- Support recovery of species under the Endangered Species Act, and prevent new listings.
- Provide culturally important food sources, including those associated with Native American fishing rights.

Policy 7.10. Habitat connectivity. Improve or support efforts to improve terrestrial and aquatic habitat connectivity for fish and wildlife by using plans and investments, to:

- Prevent and repair habitat fragmentation.
- Improve habitat quality.
- Weave habitat into sites as new development occurs.
- Enhance or create habitat corridors that allow fish and wildlife to safely access and move through and between habitat areas.
- Promote restoration and protection of floodplains.

Policy 7.11. Urban forest. Improve, or support efforts to improve the quantity, quality, and equitable distribution of Portland's urban forest through plans and investments.

7.11.a. Tree preservation. Require or encourage preservation of large healthy trees, native trees and vegetation, tree groves, and forested areas.

7.11.b. Urban forest diversity. Coordinate plans and investments with efforts to improve tree species diversity and age diversity.

7.11.c. Tree canopy. Support progress toward meeting City tree canopy targets.

7.11.d. Tree planting. Invest in tree planting and maintenance, especially in low-canopy areas, neighborhoods with under-served or under-represented communities, and within and near urban habitat corridors.

7.11.e. Vegetation in natural resource areas. Require native trees and vegetation in significant natural resource areas.

7.11.f. Resilient urban forest. Encourage planting of Pacific Northwest hardy and climate change resilient native trees and vegetation generally, and especially in urban habitat corridors.

7.11.g. Trees in land use planning. Identify priority areas for tree preservation and planting in land use plans.

7.11.h. Managing wildfire risk. Address wildfire hazard risks and management priorities through plans and investments.

Policy 7.12. Invasive species. Prevent the spread of invasive plants, and support efforts to reduce the impacts of invasive plants, animals, and insects, through plans, investments, and education.

Policy 7.13. Soils. Coordinate plans and investments with programs that address human-induced soil loss, erosion, contamination, or other impairments to soil quality and function.

218. Finding: The City Council interprets policies 7.5 through 7.13 as providing guidance to foster a healthy environment and sustain the ecosystem services of Portland's air, water and land resources. The FFTZ amendments support these policies by reducing the risk associated with a major earthquake. The first step in making the current situation better is to ensure that the situation does not get worse by continuing to allow the unlimited increase in fossil fuel terminal storage tank capacity in a high risk area. The FFTZ amendments are a regulatory approach that will limit the size of new fossil fuel terminals and prohibit the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions, which will be an improvement compared to the current regulations that allow for unlimited growth in fossil fuel terminals. Further, by designating existing FFTs as a limited use allows the terminals to continue to operate and invest in facilities that

reduce the risks and improve their ability to withstand a major earthquake, which can minimize environmental impacts in the event of a major earthquake. No changes to the environmental or greenway overlay zones are proposed as part of this project, therefore the natural resource values and functions will be sustained.

Policy 7.14. Natural hazards. Prevent development-related degradation of natural systems and associated increases in landslide, wildfire, flooding, and earthquake risks.

219. Finding: The 2035 Comprehensive Plan defines "prevent" as proactively avoid or hinder adverse impacts or outcomes. Development-related degradation means development that has adverse impacts on natural systems. For example, development in a floodplain that increases impervious surface can result in increased run-off that increases flooding. Most of Portland's employment and industrial zones are in areas with high to very high levels of liquefaction susceptibility, as documented by the 2018 DOGAMI Earthquake Regional Impact Analysis. Fossil fuel infrastructure poses considerable risks in the event of a major earthquake. The first step in making the current situation better is to ensure that the situation does not get worse. Continuing to allow the unlimited increase in fossil fuel terminal storage tank capacity in a high risk area increases the risk to the Willamette River. The City Council interprets this policy to mean development regulations should not increase the risk from natural hazards. The current regulations that allow unlimited expansion of storage tank capacity increase the risk from natural hazards. The FFTZ amendments proactively limit future earthquake risk by limiting the size of new fossil fuel terminals and prohibiting the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions. Further, by designating existing FFTs as a limited use allows the terminals to continue to operate and invest in facilities that reduce the risks and improve their ability to withstand a major earthquake. Further, the use limitations provide flexibility to FFTs to replace and reconfigure existing storage tank capacity to increase safety and meet future needs.

Policy 7.15. Brownfield remediation. Improve environmental quality and watershed health by promoting and facilitating brownfield remediation and redevelopment that incorporates ecological site design and resource enhancement.

220. Finding: The City Council interprets this policy to mean that the City will create programs to support brownfield cleanup. The FFTZ amendments are Zoning Code changes that are not directly related to the cleanup of brownfields. However, the changes designate existing FFTs as a limited use, which allows the terminals to continue to operate and invest in facilities, including brownfield remediation.

Policy 7.16. Adaptive management. Evaluate trends in watershed and environmental health using current monitoring data and information to guide and support improvements in the effectiveness of City plans and investments.

Policy 7.17. Restoration partnerships. Coordinate plans and investments with other jurisdictions, air and water quality regulators, watershed councils, soil and water conservation districts, Sovereign nations, and community organizations and groups including under-served and under-represented communities, to optimize the benefits, distribution, and cost-effectiveness of watershed restoration and enhancement efforts.

Policy 7.18. Community stewardship. Encourage voluntary cooperation between property owners, community organizations, and public agencies to restore or re-create habitat on their property, including removing invasive plants and planting native species.

221. **Finding:** The City Council interprets policies 7.16. through 7.18 to mean that the City will create programs to support restoration and community stewardship. The FFTZ amendments are Zoning Code changes that are not directly related to watershed restoration. These policies do not apply.

Planning for natural resource protection

Policy 7.19. Natural resource protection. Protect the quantity, quality, and function of significant natural resources identified in the City's natural resource inventory, including:

- Rivers, streams, sloughs, and drainageways.
- Floodplains.
- Riparian corridors.
- Wetlands.
- Groundwater.
- Native and other beneficial vegetation species and communities.
- Aquatic and terrestrial habitats, including special habitats or habitats of concern, large anchor habitats, habitat complexes and corridors, rare and declining habitats such as wetlands, native oak, bottomland hardwood forest, grassland habitat, shallow water habitat, and habitats that support special-status or at-risk plant and wildlife species.
- Other resources identified in natural resource inventories.

Policy 7.20. Natural resource inventory. Maintain an up-to-date inventory by identifying the location and evaluating the relative quantity and quality of natural resources.

Policy 7.21. Environmental plans and regulations. Maintain up-to-date environmental protection plans and regulations that specify the significant natural resources to be protected and the types of protections to be applied, based on the best data and science available and on an evaluation of cumulative environmental, social, and economic impacts and tradeoffs. *See Figure 7-2 — Adopted Environmental Plans.*

7.21.a. Improve the effectiveness of environmental protection plans and regulations to protect and encourage enhancement of ecological functions and ecosystem services.

Policy 7.22. Land acquisition priorities and coordination. Maintain a land acquisition program as a tool to protect and support natural resources and their functions. Coordinate land acquisition with the programs of City bureaus and other agencies and organizations.

222. **Finding:** The City Council interprets policies 7.19 through 7.22 as providing guidance to the City as to how to protect significant natural resources. The *2035 Comprehensive Plan* background documents included an updated Natural Resources Inventory (NRI), which was adopted (Ordinance 185657) and acknowledged by LCDC on June 13, 2014. The NRI identified the location, quantity, and quality of all significant natural resources as required by the inventory provisions of Statewide Planning Goal 5. From the set of all significant resources, high and medium quality resources, ranked primarily from riparian corridor and wildlife habitat considerations, were identified to comply with the inventory requirements of Title 13 of Metro's Urban Growth Management Functional Plan.

Environmental zones protect resources and functional values that have been identified by the City as providing benefits to the public. The FFTZ amendments are a regulatory approach that will limit the size of new fossil fuel terminals and prohibit the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions, which will be an improvement compared to the current

regulations that allow for unlimited growth in fossil fuel terminals. Further, by designating existing FFTs as a limited use allows the terminals to continue to operate and invest in facilities that reduce the risks and improve their ability to withstand a major earthquake, which can minimize environmental impacts in the event of a major earthquake. No changes to the environmental or greenway overlay zones are proposed as part of this project, therefore the natural resource values and functions will continue to be protected.

Protecting natural resources in development situations

Policy 7.23. Impact evaluation. Evaluate the potential adverse impacts of proposed development on significant natural resources, their functions, and the ecosystem services they provide to inform and guide development design and mitigation consistent with policies 7.24-7.26. and other relevant Comprehensive Plan policies.

Policy 7.24. Regulatory hierarchy: avoid, minimize, mitigate. Maintain regulations requiring that the potential adverse impacts of new development on significant natural resources and their functions first be avoided where practicable, then minimized, then lastly, mitigated.

Policy 7.25. Mitigation effectiveness. Require that mitigation approaches compensate fully for adverse impacts on locally and regionally significant natural resources and functions. Require mitigation to be located as close to the impact as possible. Mitigation must also take place within the same watershed or portion of the watershed that is within the Portland Urban Services Boundary, unless mitigating outside of these areas will provide a greater local ecological benefit. Mitigation will be subject to the following preference hierarchy:

- On the site of the resource subject to impact with the same kind of resource; if that is not possible, then
- Off-site with the same kind of resource; if that is not possible, then
- On-site with a different kind of resource; if that is not possible, then
- Off-site with a different kind of resource.

Policy 7.26. Improving environmental conditions through development. Encourage ecological site design, site enhancement, or other tools to improve ecological functions and ecosystem services in conjunction with new development and alterations to existing development.

223. The City Council interprets policies 7.23 through 7.26 as providing guidance to the City as to how to protect significant natural resources. The City's environmental and greenway overlay zones are the regulations that control development in order to protect the resources and functional values while allowing environmentally sensitive urban development. No changes to the environmental or greenway overlay zones are proposed as part of this project, therefore the natural resource values and functions will continue to be protected.

Aggregate resources

Policy 7.27. **Aggregate resource protection.** Protect aggregate resource sites for current and future use where there are no major conflicts with urban needs, or where these conflicts may be resolved**.**

Policy 7.28. **Aggregate resource development**. When aggregate resources are developed, ensure that development minimizes adverse environmental impacts and impacts on adjacent land uses.

Policy 7.29. Mining site reclamation. Ensure that the reclamation of mining sites protects public health and safety, protects fish and wildlife (including at-risk species), enhances or restores habitat

(including rare and declining habitat types), restores adequate watershed conditions and functions on the site, and is compatible with the surrounding land uses and conditions of nearby land.

224. Finding: Policies 7.27 through 7.29 provide guidance on aggregate resources. The FFTZ amendments are Zoning Code changes that affect one allowed use in the employment and industrial zones and are not directly related to aggregate. These policies do not apply.

Watershed-specific policies

The policies above guide planning, actions, and investments citywide. The following policies are intended to augment the citywide Watershed Health and Environment policies by providing additional guidance relating and responding to the characteristics within each of Portland's distinctive watersheds. They address watershed-specific habitat types, hydrology, water quality issues, and stormwater management challenges. Together, the citywide and watershed-specific policies support the close coordination of watershed health and land use programs, guiding land use planning-related activities and future infrastructure investments. While these watersheds are not entirely within Portland's urban services boundary, Portland's actions can have significant benefits for the watershed as a whole.

Columbia River Watershed

Policy 7.30. In-water habitat. Enhance in-water habitat for native fish and wildlife, particularly in the Oregon Slough and near-shore environments along the Columbia River.

Policy 7.31. Sensitive habitats. Enhance grassland, beach, riverbanks, wetlands, bottomland forests, shallow water habitats, and other key habitats for wildlife traveling along the Columbia River migratory corridor, while continuing to manage the levees and floodplain for flood control.

Policy 7.32. **River-dependent and river-related uses.** Maintain plans and regulations that recognize the needs of river-dependent and river-related uses while also supporting ecologically-sensitive site design and practices.

225. Finding: None of the existing FFTs have frontage on the Columbia River. The Columbia River plays a major role in the habitat corridors that weave nature into Portland, with designated natural resources that are protected by the Environmental Overlay Zone, which is not amended by this ordinance. In considering the natural hazard risks that the FFTs pose to the ecosystem functions on the river, as identified by the Portland Bureau of Emergency Management's Critical Energy Infrastructure Hub Study (2016), the City Council finds that continuing to allow FFTs in a high risk area does not enhance the current or future natural resource functions of the Columbia River. These regulations apply to only one type of allowed that makes up a minority part of the uses found in Portland's industrial districts. The other industrial uses continue to operate under current regulations, including other river-dependent and river-related uses.

Willamette River Watershed

Policy 7.33. Fish habitat. Provide adequate intervals of ecologically-functional shallow-water habitat for native fish along the entire length of the Willamette River within the city, and at the confluences of its tributaries.

Policy 7.34. Stream connectivity. Improve stream connectivity between the Willamette River and its tributaries.

Policy 7.35. River bank conditions. Preserve existing river bank habitat and encourage the rehabilitation of river bank sections that have been significantly altered due to development with more fish and wildlife friendly riverbank conditions.

Policy 7.37. Contaminated sites. Promote and support programs that facilitate the cleanup, reuse, and restoration of the Portland Harbor Superfund site and other contaminated upland sites.

Policy 7.38. Sensitive habitats. Protect and enhance grasslands, beaches, floodplains, wetlands, remnant native oak, bottomland hardwood forest, and other key habitats for native wildlife including shorebirds, waterfowl, and species that migrate along the Pacific Flyway and the Willamette River corridor.

Policy 7.39. Riparian corridors. Increase the width and quality of vegetated Riparian buffers along the Willamette River.

Policy 7.40. Connected upland and river habitats. Enhance habitat quality and connectivity between the Willamette riverfront, the Willamette's floodplain, and upland natural resource areas.

Policy 7.41. River-dependent and river-related uses. Develop and maintain plans and regulations that recognize the needs of river-dependent and river-related uses, while also supporting ecologically-sensitive site design and practices.

226. Finding: The eleven existing FFTs have frontage on the Willamette River. The Willamette River plays a major role in the habitat corridors that weave nature into Portland, with designated natural resources that are protected by the Greenway Overlay Zone, which is not amended by this ordinance. In considering the natural hazard risks that the FFTs pose to the ecosystem functions on the river, as identified by the Portland Bureau of Emergency Management's Critical Energy Infrastructure Hub Study (2016), the City Council finds that continuing to allow FFTs in a high risk area does not enhance the current or future natural resource functions of the Willamette River. These regulations apply to only one type of allowed that makes up a minority part of the uses found in Portland's industrial districts. The other industrial uses continue to operate under current regulations, including other river-dependent and river-related uses.

Columbia Slough Watershed

Policy 7.43 **Fish passage.** Restore in-stream habitat and improve fish passage within the Columbia Slough, including for salmonids in the lower slough.

Policy 7.44 **Flow constriction removal.** Reduce constriction, such as culverts, in the slough channels, to improve the flow of water and water quality.

Policy 7.45 **Riparian corridors.** Increase the width, quality, and native plant diversity of vegetated riparian buffers along Columbia Slough channels and other drainageways within the watershed, while also managing the slough for flood control.

Policy 7.46 **Sensitive habitats.** Enhance grasslands and wetland habitats in the Columbia Slough, such as those found in the Smith and Bybee Lakes and at the St. Johns Landfill site, to provide habitat for sensitive species, and for wildlife traveling along the Columbia and Willamette river migratory corridors.

Policy 7.47 **Connected rivers habitats.** Enhance upland habitat connections to the Willamette and Columbia rivers.

Policy 7.48 **Contaminated sites.** Ensure that plans and investments are consistent with and advance programs that facilitate the cleanup, reuse, and restoration of contaminated sites that are adjacent, or that discharge stormwater, to the Columbia Slough.

Policy 7.49 **Portland International Airport.** Protect, restore, and enhance natural resources and functions in the Portland International Airport plan district, as identified in Portland International Airport/Middle Columbia Slough Natural Resources Inventory. Accomplish this through regulations, voluntary strategies, and the implementation of special development standards.

227. Finding: There are no existing FFTs in the Columbia Slough watershed. The Columbia River plays a major role in the habitat corridors that weave nature into Portland, with designated natural resources that are protected by the Environmental Overlay Zone, which is not amended by this ordinance. These regulations apply to only one type of allowed that makes up a minority part of the uses found in Portland's industrial districts. The other industrial uses continue to operate under current regulations, including other river-dependent and river-related uses.

Fanno and Tryon Creek Watersheds

Policy 7.50 **Stream connectivity.** Encourage the daylighting of piped portions of Tryon and Fanno creeks and their tributaries.

Policy 7.51 **Riparian and habitat corridors.** Protect and enhance riparian habitat quality and connectivity along Tryon and Fanno creeks and their tributaries. Enhance connections between riparian areas, parks, anchor habitats, and areas with significant tree canopy. Enhance in-stream and upland habitat connections between Tryon Creek State Natural Area and the Willamette River.

Policy 7.52 **Reduced hazard risks.** Reduce the risks of landslides and streambank erosion by protecting trees and vegetation that absorb stormwater, especially in areas with steep slopes or limited access to stormwater infrastructure.

228. Finding: There are no existing FFTs in the Fanno and Tryon Creek watersheds, which play a major role in the habitat corridors that weave nature into Portland, with designated natural resources that are protected by the Environmental Overlay Zone, which is not amended by this ordinance. These regulations apply to only one type of allowed that makes up a minority part of the uses found in Portland's industrial districts. The other industrial uses continue to operate under current regulations, including other river-dependent and river-related uses.

Johnson Creek Watershed

Policy 7.53 **In-stream and riparian habitat.** Enhance in-stream and riparian habitat and improve fish passage for salmonids along Johnson Creek and its tributaries.

Policy 7.54 **Floodplain restoration.** Enhance Johnson Creek floodplain functions to increase flood-storage capacity, improve water quality, and enhance fish and wildlife habitat.

Policy 7.55 **Connected floodplains, springs, and wetlands.** Enhance hydrologic and habitat connectivity between the Johnson Creek floodplain and its springs and wetlands.

Policy 7.56 **Reduced natural hazards.** Reduce the risks of landslides, streambank erosion and

downstream flooding by protecting seeps, springs, trees, vegetation, and soils that absorb stormwater in the East Buttes.

Policy 7.57 **Greenspace network.** Enhance the network of parks, trails, and natural areas near the Springwater Corridor Trail and the East Buttes to enhance habitat connectivity and nature-based recreation in East Portland.

229. Finding: There are no existing FFTs in the Fanno and Tryon Creek watersheds, which play a major role in the habitat corridors that weave nature into Portland, with designated natural resources that are protected by the Environmental Overlay Zone, which is not amended by this ordinance. These regulations apply to only one type of allowed that makes up a minority part of the uses found in Portland's industrial districts. The other industrial uses continue to operate under current regulations, including other river-dependent and river-related uses.

Chapter 8: Public Facilities and Services

Goal 8.A: Quality public facilities and services. High-quality public facilities and services provide Portlanders with optimal levels of service throughout the city, based on system needs and community goals, and in compliance with regulatory mandates.

Goal 8.B: Multiple benefits. Public facility and service investments improve equitable service provision, support economic prosperity, and enhance human and environmental health.

Goal 8.C: Reliability and resiliency. Public facilities and services are reliable, able to withstand or recover from catastrophic natural and manmade events, and are adaptable and resilient in the face of long-term changes in the climate, economy, and technology.

Goal 8.D: Public rights-of-way. Public rights-of-way enhance the public realm and provide a multi-purpose, connected, safe, and healthy physical space for movement and travel, public and private utilities, and other appropriate public functions and uses.

Goal 8.E: Sanitary and stormwater systems. Wastewater and stormwater are managed, conveyed, and/or treated to protect public health, safety, and the environment, and to meet the needs of the community on an equitable, efficient, and sustainable basis.

Goal 8.F: Flood management. Flood management systems and facilities support watershed health and manage flooding to reduce adverse impacts on Portlanders' health, safety, and property.

Goal 8.G: Water. Reliable and adequate water supply and delivery systems provide sufficient quantities of high-quality water at adequate pressures to meet the needs of the community on an equitable, efficient, and sustainable basis.

Goal 8.H: Parks, natural areas, and recreation. All Portlanders have safe, convenient, and equitable access to high-quality parks, natural areas, trails, and recreational opportunities in their daily lives, which contribute to their health and well-being. The City manages its natural areas and urban forest to protect unique urban habitats and offer Portlanders an opportunity to connect with nature.

Goal 8.I: Public safety and emergency response. Portland is a safe, resilient, and peaceful community where public safety, emergency response, and emergency management facilities and services are coordinated and able to effectively and efficiently meet community needs.

Goal 8.J: Solid waste management. Residents and businesses have access to waste management services and are encouraged to be thoughtful consumers to minimize upstream impacts and avoid

generating waste destined for the landfill. Solid waste — including food, yard debris, recyclables, electronics, and construction and demolition debris — is managed, recycled, and composted to ensure the highest and best use of materials.

Goal 8.K: School facilities. Public schools are honored places of learning as well as multifunctional neighborhood anchors serving Portlanders of all ages, abilities, and cultures.

Goal 8.L: Technology and communications. All Portland residences, businesses, and institutions have access to universal, affordable, and reliable state-of-the-art communication and technology services.

Goal 8.M: Energy infrastructure and services. Residents, businesses, and institutions are served by reliable energy infrastructure that provides efficient, low-carbon, affordable energy through decision-making based on integrated resource planning.

230. Finding: The City Council interprets the Chapter 8 goals to provide general guidance to public agencies in how to provide basic to Portlanders. The FFTZ amendments do not amend the Citywide System Plan or the Transportation System Plan, therefore the City continues to plan for public infrastructure investments in the industrial districts where the FFTs are located.

Goal 8.M (energy infrastructure) is the one goal that is applicable to this ordinance. Oregon Administrative Rules (OAR 860-027-0400) define integrated resource plans (IRP) as investor-owned energy utility's written plan detailing its future long-term resource needs, its analysis of the expected costs and associated risks of the alternatives to meet those needs, and its action plan to select the best portfolio of resources to meet those needs. The NW Natural LNG Storage facility is the only FFT in Portland that is part of an investor-owned utility. NW Natural's 2018 IRP identifies the replacement of mechanical process equipment used for the liquefaction, vaporization, or storage of LNG, but not expansion of storage capacity. The FFTZ amendments only regulate fossil fuel storage tank capacity, therefore these changes are consistent with the NW Natural IRP.

As documented in the 2012 DOGAMI report, the current CEI hub infrastructure is not reliable in the event of a magnitude 8 or 9 Cascadia Subduction Zone earthquake. The FFTZ amendments will limit the size of new fossil fuel terminals and prohibit the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions, which will minimize the risk from a future major earthquake compared to the current regulations that allow for unlimited growth in FFTs. The FFTZ amendments help provide a reliable, low-carbon energy infrastructure by designating existing FFTs as a limited use, which allows the terminals to continue to operate and invest in facilities to increase safety and reliability. In addition, the definition of fossil fuels (33.910.030) explicitly does not include ethanol, biodiesel/renewable diesel other fuel additives that will allows FTTs to add storage capacity to provide reliable low-carbon fuels.

Public benefits

Policy 8.31. Application of Guiding Principles. Plan and invest in public facilities in ways that promote and balance the Guiding Principles established in The Vision and Guiding Principles of this Comprehensive Plan.

Policy 8.32. Community benefit agreements. Encourage the use of negotiated community benefit agreements for large public facility projects as appropriate to address environmental justice policies in Chapter 2: Community Involvement.

Policy 8.33. Community knowledge and experience. Encourage public engagement processes and strategies for larger public facility projects to include community members in identifying potential impacts, mitigation measures and community benefits.

Policy 8.34. Resource efficiency. Reduce the energy and resource use, waste, and carbon emissions from facilities necessary to serve designated land uses to meet adopted City goals and targets.

Policy 8.35. Natural systems. Protect, enhance, and restore natural systems and features for their infrastructure service and other values.

Policy 8.36. Context-sensitive infrastructure. Design, improve, and maintain public rights-of-way and facilities in ways that are compatible with, and that minimize negative impacts on, their physical, environmental, and community context.

Policy 8.38. Age-friendly public facilities. Promote public facility designs that make Portland more age-friendly.

231. Finding: The FFTZ amendments do not include new public facility or infrastructure projects. These policies do not apply.

Public rights-of-way

Policy 8.39. Interconnected network. Establish a safe and connected rights-of-way system that equitably provides infrastructure services throughout the city.

Policy 8.40. Transportation function. Improve and maintain the right-of-way to support multimodal transportation mobility and access to goods and services as is consistent with the designated street classification.

Policy 8.42. Stormwater management function. Improve rights-of-way to integrate green infrastructure and other stormwater management facilities to meet desired levels-of-service and economic, social, and environmental objectives.

Policy 8.43. Trees in rights-of-way. Integrate trees into public rights-of-way to support City canopy goals, transportation functions, and economic, social, and environmental objectives.

Policy 8.44. Community uses. Allow community use of rights-of-way for purposes such as public gathering space, events, or temporary festivals, if the community uses are integrated in ways that balance and minimize conflict with the designated through movement and access roles of rights-of-ways.

Policy 8.45. Pedestrian amenities. Encourage facilities that enhance pedestrian enjoyment, such as transit shelters, garbage containers, benches, etc. in the right-of-way.

Policy 8.46. Commercial uses. Accommodate allowable commercial uses of the rights-of-way for enhancing commercial vitality, if the commercial uses can be integrated in ways that balance and minimize conflict with the other functions of the right-of-way.

Policy 8.47. Flexible design. Allow flexibility in right-of-way design and development standards to appropriately reflect the pattern area and other relevant physical, community, and environmental contexts and local needs.

> **8.47.a.** Use a variety of transportation resources in developing and designing projects for all City streets, such as the City of Portland's Pedestrian Design Guide, Bicycle Master Plan-Appendix A, NACTO Urban Bikeway Design Guide, NACTO Urban Street Design Guide, Portland Parks and Recreation Trail Design Guidelines, Designing for Truck Movements and Other Large Vehicles, and City of Portland Green Street Policy, Stormwater Management Manual, Design Guide for Public Street Improvements, and Neighborhood Greenways. (TSP objective 8.1.e.).

Policy 8.48. Corridors and City Greenways. Ensure public facilities located along Civic Corridors,

Neighborhood Corridors, and City Greenways support the multiple objectives established for these corridors.

232. Finding: The City Council interprets these policies apply to new public facilities or infrastructure projects in the right-of-way. The FFTZ amendments do not include new public facility or infrastructure projects in the right-of-way. These policies do not apply.

Trails

Policy 8.53. Public trails. Establish, improve, and maintain a citywide system of public trails that provide transportation and/or recreation options and are a component of larger network of facilities for bicyclists, pedestrians, and recreational users.

Policy 8.54. Trail system connectivity. Plan, improve, and maintain the citywide trail system so that it connects and improves access to Portland's neighborhoods, commercial areas, employment centers, schools, parks, natural areas, recreational facilities, regional destinations, the regional trail system, and other key places that Portlanders access in their daily lives.

Policy 8.55. Trail coordination. Coordinate planning, design, improvement, and maintenance of the trail system among City agencies, other public agencies, non-governmental partners, and adjacent landowners.

Policy 8.56. Trail diversity. Allow a variety of trail types to reflect a trail's transportation and recreation roles, requirements, and physical context.

Policy 8.57. Public access requirements. Require public access and improvement of public trails along the future public trail alignments shown in Figure 8-2 — Future Public Trail Alignments**.**

Policy 8.58. Trail and City Greenway coordination. Coordinate the planning and improvement of trails as part of the City Greenways system.

Policy 8.59. Trail and Habitat Corridor coordination. Coordinate the planning and improvement of trails with the establishment, enhancement, preservation, and access to habitat corridors.

Policy 8.60. Intertwine coordination. Coordinate with the Intertwine Alliance and its partners, including local and regional parks providers, to integrate Portland's trail and active transportation network with the bi-state regional trail system.

233. Finding: The City Council interprets these policies to apply to designated trails. While designated trail alignments are included in public rights of way adjacent industrial zones, the FFTZ amendments do not amend the designated trail alignments. These policies do not apply.

Stormwater Systems

Policy 8.68. Stormwater facilities. Provide adequate stormwater facilities for conveyance, flow control, and pollution reduction.

Policy 8.69. Stormwater as a resource. Manage stormwater as a resource for watershed health and public use in ways that protect and restore the natural hydrology, water quality, and habitat of Portland's watersheds.

Policy 8.71. Green infrastructure. Promote the use of green infrastructure, such as natural areas, the urban forest, and landscaped stormwater facilities, to manage stormwater.

234. Finding: Stormwater is conveyed through the combined sewer system, pipes, ditches, or drainageways to streams and rivers. In some cases, stormwater is managed in detention facilities, other vegetated facilities, or allowed to infiltrate in natural areas. Safe conveyance of stormwater is

an issue in some areas, particularly in the hilly areas of west Portland and some parts of outer southeast which lack comprehensive conveyance systems and where infiltration is limited by geology or high groundwater. The FFTZ amendments affect one type of allowed use in employment and industrial zones and do not change development standards that apply to development in those zones, including those that apply to stormwater systems.

Flood management

Policy 8.76. Flood management. Improve and maintain the functions of natural and managed drainageways, wetlands, and floodplains to protect health, safety, and property, provide water conveyance and storage, improve water quality, and maintain and enhance fish and wildlife habitat.

Policy 8.77. Floodplain management. Manage floodplains to protect and restore associated natural resources and functions and to minimize the risks to life and property from flooding.

Policy 8.78. Flood management facilities. Establish, improve, and maintain flood management facilities to serve designated land uses through planning, investment and regulatory requirements.

235. Six of the existing FFTs have frontage on the Willamette River, with portions of the sites in the FEMA designated 100-year floodplain. For sites in flood prone areas, the FFTZ amendments do not amend the environmental overlay maps, nor do they change City programs that regulate development in the floodplain (i.e., Title 33.631 Sites in Flood Hazard Areas; Title 10 Erosion Control, and the balanced cut and fill requirements of Title 24).

Parks and recreation

Policy 8.92. Acquisition, development, and maintenance. Provide and maintain an adequate supply and variety of parkland and recreational facilities to serve the city's current and future population based on identified level-of-service standards and community needs.

Policy 8.93. Service equity. Invest in acquisition and development of parks and recreation facilities in areas where service-level deficiencies exist.

Policy 8.95. Park planning. Improve parks, recreational facilities, natural areas, and the urban forest in accordance with current master plans, management plans, or adopted strategies that reflect user group needs, development priorities, development and maintenance costs, program opportunities, financing strategies, and community input.

Policy 8.96. Recreational trails. Establish, improve, and maintain a complete and connected system of public recreational trails, consistent with Portland Parks & Recreation's trail strategy.

Policy 8.97. Natural resources. Preserve, enhance, and manage City-owned natural areas and resources to protect and improve their ecological health, in accordance with both the natural area acquisition and restoration strategies, and to provide compatible public access.

Policy 8.98. Urban forest management. Manage urban trees as green infrastructure with associated ecological, community, and economic functions, through planning, planting, and maintenance activities, education, and regulation.

Policy 8.99. Recreational facilities. Provide a variety of recreational facilities and services that contribute to the health and well-being of Portlanders of all ages and abilities.

236. Finding: The City Council interprets these policies to address City-owned parks and natural areas and not development on private land. These policies do not apply.

School facilities

Policy 8.113. School district capacity. Consider the overall enrollment capacity of a school district – as defined in an adopted school facility plan that meets the requirements of Oregon Revised Statute 195 – as a factor in land use decisions that increase capacity for residential development.

Policy 8.114. Facilities Planning. Facilitate coordinated planning among school districts and City bureaus, including Portland Parks and Recreation, to accommodate school site/facility needs in response to most up-to-date growth forecasts.

Policy 8.115. Co-location. Encourage public school districts, Multnomah County, the City of Portland, and other providers to co-locate facilities and programs in ways that optimize service provision and intergenerational and intercultural use.

Policy 8.116. Community use. Encourage public use of public school grounds for community purposes while meeting educational and student safety needs and balancing impacts on surrounding neighborhoods.

Policy 8.117. Recreational use. Encourage publicly-available recreational amenities (e.g. athletic fields, green spaces, community gardens, and playgrounds) on public school grounds for public recreational use, particularly in neighborhoods with limited access to parks.

Policy 8.118. Schools as emergency aid centers. Encourage the use of seismically-safe school facilities as gathering and aid-distribution locations during natural disasters and other emergencies.

Policy 8.119. Facility adaptability. Ensure that public schools may be upgraded to flexibly accommodate multiple community-serving uses and adapt to changes in educational approaches, technology, and student needs over time.

Policy 8.120. Leverage public investment. Encourage City public facility investments that complement and leverage local public school districts' major capital investments.

Policy 8.122. Private institutions. Encourage collaboration with private schools and educational institutions to support community and recreational use of their facilities.

237. Finding: The City Council interprets these policies to address school facilities and not development on private land. These policies do not apply.

Energy infrastructure

Policy 8.125. Energy efficiency. Promote efficient and sustainable production and use of energy resources by residents and businesses, including low-carbon renewable energy sources, district energy systems, and distributed generation, through land use plans, zoning, and other legislative land use decisions.

Policy 8.126. Coordination. Coordinate with energy providers to encourage investments that ensure reliable, equitable, efficient, and affordable energy for Portland residents and businesses.

238. Finding: The 2035 Comprehensive Plan defines "coordinate" as work together with others toward a common goal; collaborate. The verb "encourage", which is defined in the 2035 Comprehensive Plan, means to promote or foster using some combination of voluntary approaches, regulations, or incentives. As part of the concept development of the zoning code changes, in June 2016 BPS held stakeholder focus group meetings with representatives from energy providers - the FFTs, the Western States Petroleum Association and Northwest Natural. The Proposed Draft was crafted in response to these discussions and additional comments on the Discussion Draft. Further, in

response to testimony at the Planning and Sustainability Commission, changes were made to the use regulations to designate FFTs as a limited use (rather than a prohibited use) and allow for a ten percent expansion of storage capacity in conjunction with seismic safety upgrades. The City Council received testimony from energy providers that a ten percent capacity increase limit would be a severe limitation and would not justify the private investment needed to replace existing tanks. However, the City Council found that the energy providers' proposed Energy Corridor Overlay zone and definition of "region" as a seven state area (PADD-5) was not consistent with other City goals and policies to reduce seismic risk. Further, the City does not have the administrative authority and capacity to monitor and enforce regulations to control the destination of fossil fuels flowing through Portland to a seven-state region. Also, allowing for unlimited expansion of Portland's FFTs is not consistent with the DOGAMI recommendation to mitigate seismic vulnerability by increasing redundancy and reserve capacity in Oregon's liquid fuel supply by replacing, relocating, or adding redundant systems elsewhere. The FFTZ amendments designate existing FFTs as a limited use, as opposed to a prohibited or nonconforming use, allows the terminals to continue to operate and invest in facilities that reduce the risks and improve their ability to withstand a major earthquake. Further, the use limitations (33.140.100.B.17.a) provide flexibility to FFTs to replace and reconfigure existing storage tank capacity to increase safety and meet future needs.

Chapter 9 Transportation

GOAL 9.A: Safety. Transportation safety impacts the livability of a city and the comfort and security of those using City streets. Comprehensive efforts to improve transportation safety through engineering, education, enforcement and evaluation will be used to eliminate traffic-related fatalities and serious injuries from Portland's transportation system.

Goal 9.B: Multiple goals. Portland's transportation system is funded and maintained to achieve multiple goals and measurable outcomes for people and the environment. The transportation system is safe, complete, interconnected, multimodal, and fulfills daily needs for people and businesses.

GOAL 9.C: Great places. Portland's transportation system enhances quality of life for all Portlanders, reinforces existing neighborhoods and great places, and helps make new great places in town centers, neighborhood centers and corridors, and civic corridors.

GOAL 9.D: Environmentally sustainable. The transportation system increasingly uses active transportation, renewable energy, or electricity from renewable sources, achieves adopted carbon reduction targets, and reduces air pollution, water pollution, noise, and Portlanders' reliance on private vehicles.

GOAL 9.E: Equitable transportation. The transportation system provides all Portlanders options to move about the city and meet their daily needs by using a variety of safe, efficient, convenient, and affordable modes of transportation. Transportation investments are responsive to the distinct needs of each community.

GOAL 9.F: Positive health outcomes. The transportation system promotes positive health outcomes and minimizes negative impacts for all Portlanders by supporting active transportation, physical activity, and community and individual health.

GOAL 9.G: Opportunities for prosperity. The transportation system supports a strong and diverse economy, enhances the competitiveness of the city and region, and maintains Portland's role as a West Coast trade gateway and freight hub by providing efficient and reliable goods movement, multimodal access to employment areas and educational institutions, as well as enhanced freight

access to industrial areas and intermodal freight facilities. The transportation system helps people and businesses reduce spending and keep money in the local economy by providing affordable alternatives to driving.

239. Finding: The City Council interprets these goals to address transportation improvements, programming, funding priorities and maintenance and not development on private land.

The City Council interprets these goals to apply to districts as whole and not to individual businesses or sectors of business. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes do not reduce the employment land base and continue to support a strong and diverse economy.

The FFTZ amendments maintains Portland's role as a multimodal freight hub with enhanced freight access because they do not amend the Citywide System Plan or the Transportation System Plan, therefore the City continues to plan for public infrastructure investments to maintain and strengthen the multimodal transportation infrastructure in the industrial areas where the FFTs are located. Finally, the ordinance does not regulate transloading facilities, docks or pipelines – facilities that are key components of the multimodal freight transportation system.

Designing and planning

Policy 9.1. Street design classifications. Maintain and implement street design classifications consistent with land use plans, environmental context, urban design pattern areas, and the Neighborhood Corridor and Civic Corridor Urban Design Framework designations.

Policy 9.2. Street policy classifications. Maintain and implement street policy classifications for pedestrian, bicycle, transit, freight, emergency vehicle, and automotive movement, while considering access for all modes, connectivity, adjacent planned land uses, and state and regional requirements.

9.2.a. Designate district classifications that emphasize freight mobility and access in industrial and employment areas serving high levels of truck traffic and to accommodate the needs of intermodal freight movement.

9.2.b. Designate district classifications that give priority to pedestrian access in areas where high levels of pedestrian activity exist or are planned, including the Central City, Gateway regional center, town centers, neighborhood centers, and transit station areas.

9.2.c. Designate district classifications that give priority to bicycle access and mobility in areas where high levels of bicycle activity exist or are planned, including Downtown, the River District, Lloyd District, Gateway Regional Center, town centers, neighborhood centers, and transit station areas.

Policy 9.3. Transportation System Plan. Maintain and implement the Transportation System Plan (TSP) as the decision-making tool for transportation-related projects, policies, programs, and street design.

Policy 9.4. Use of classifications. Plan, develop, implement, and manage the transportation system in accordance with street design and policy classifications outlined in the Transportation System Plan.

9.4.a. Classification descriptions are used to describe how streets should function for each mode of travel, not necessarily how they are functioning at present.

240. Finding: The FFTZ amendments do not change the functional classification of any existing or proposed transportation facility, nor do they change the standards implementing a functional classification system.

Policy 9.5. Mode share goals and Vehicle Miles Travelled (VMT) reduction. Increase the share of trips made using active and low-carbon transportation modes. Reduce VMT to achieve targets set in the most current Climate Action Plan and Transportation System Plan, and meet or exceed Metro's mode share and VMT targets.

241. Finding: The FFTZ amendments remove regulatory barriers to encourage higher-density housing by providing for a wider range of housing types in the RM1 and RM2 zones throughout the city, which encompass 92 percent of the multi-dwelling zoning in Portland. The FFTZ amendments generally support reducing VMT and increasing non-automobile mode splits by creating more housing capacity in accessible locations because 86 percent of the acres with multi-dwelling zoning is located within ¼ mile of transit. The FFTZ amendments include mitigating strategies that serve to improve mode split performance and limit traffic impacts. which include eliminating or reducing minimum parking requirements; promoting a walkable urban form through regulations on the amount of building façade that can occupied with garages and prohibiting off-street parking between the building and the street. The FFTZ amendments also expand the TDM financial incentive requirements to multi-dwelling zones in locations close to frequent transit, projects with buildings with 10 or more units.

Policy 9.6. Transportation strategy for people movement. Design the system to accommodate the most vulnerable users, including those that need special accommodation under the Americans with Disabilities Act (ADA). Implement a prioritization of modes for people movement by making transportation system decisions per the following ordered list:

- Walking
- Bicycling
- Transit
- Fleets of electric, fully automated, multiple passenger vehicles
- Other shared vehicles
- Low or no occupancy vehicles, fossil-fueled non-transit vehicles

When implementing this prioritization ensure that:

- The needs and safety of each group of users are considered, and changes do not make existing conditions worse for the most vulnerable users.
- All users' needs are balanced with the intent of optimizing the right of way for multiple modes on the same street.
- When necessary to ensure safety, accommodate some users on parallel streets as part of multi-street corridors.
- Land use and system plans, network functionality for all modes, other street functions, and complete street policies, are maintained.
- Policy-based rationale is provided if modes lower in the ordered list are prioritized.

Policy 9.7. Moving goods and delivering services. In tandem with people movement, maintain efficient and reliable movement of goods and services as a critical transportation system function. Prioritize freight system reliability improvements over single-occupancy vehicle mobility where there are solutions that distinctly address those different needs.

242. Finding: The City Council interprets policies 9.6 and 9.7 to mean that people movement and freight movement are critical functions of the transportation system that should be prioritized over single-occupancy vehicles. Further, the City Council interprets this policy to apply to transportation system design and investment decisions, and not land use decisions. Portland's role as a multimodal freight

hub is maintained because the FFTZ amendments do not amend the Citywide System Plan or the Transportation System Plan. Therefore, the City continues to plan for public infrastructure investments to maintain and strengthen the multimodal transportation infrastructure in the northwest industrial area where the FFTs are located. The ordinance regulates storage capacity, it does not regulate transloading facilities, docks or pipelines – facilities that are key components of the multimodal freight transportation system.

Policy 9.8. Affordability. Improve and maintain the transportation system to increase access to convenient and affordable transportation options for all Portlanders, especially those who have traditionally been under-served or under-represented or have historically borne unequal burdens.

Policy 9.9. Accessible and age-friendly transportation system. Ensure that transportation facilities are accessible to people of all ages and abilities, and that all improvements to the transportation system (traffic, transit, bicycle, and pedestrian) in the public right-of-way comply with the Americans with Disabilities Act of 1990. Improve and adapt the transportation system to better meet the needs of the most vulnerable users, including the young, older adults, and people with different abilities.

Policy 9.10. Geographic policies. Adopt geographically-specific policies in the Transportation System Plan to ensure that transportation infrastructure reflects the unique topography, historic character, natural features, system gaps, economic needs, demographics, and land uses of each area. Use the Pattern Areas identified in Chapter 3: Urban Form as the basis for area policies.

9.10.a. Refer to adopted area plans for additional applicable geographic objectives related to transportation. Land use, development, and placemaking

243. Finding: Policies 9.8 through 9.10 address the design and planning of transportation facilities and not development on private land. These policies do not apply.

Land use, development, and placemaking

Policy 9.11. Land use and transportation coordination. Implement the Comprehensive Plan Map and the Urban Design Framework though coordinated long-range transportation and land use planning. Ensure that street policy and design classifications and land uses complement one another.

Policy 9.12. Growth strategy. Use street design and policy classifications to support Goals 3A-3G in Chapter 3: Urban Form. Consider the different design contexts and transportation functions in Town Centers, Neighborhood Centers, Neighborhood Corridors, Employment Areas, Freight Corridors, Civic Corridors, Transit Station Areas, and Greenways.

Policy 9.13. Development and street design. Evaluate adjacent land uses to help inform street classifications in framing, shaping, and activating the public space of streets. Guide development and land use to create the kinds of places and street environments intended for different types of streets.

244. Finding: For policies 9.11 through 9.13, the FFTZ amendments do not change the functional classification of any existing or proposed transportation facility, nor do they change the standards implementing a functional classification system. The FFTZ amendments limit one type of use allowed in industrial areas. The remaining industrial uses continue to be regulated under the current development regulations and do not intensify the development capacity. Therefore, the long-range transportation and land use plan continue to be coordinated.

Streets as public spaces

Policy 9.14. Streets for transportation and public spaces. Integrate both placemaking and transportation functions when designing and managing streets by encouraging design, development,

and operation of streets to enhance opportunities for them to serve as places for community interaction, environmental function, open space, tree canopy, recreation, and other community purposes.

Policy 9.15. Repurposing street space. Encourage repurposing street segments that are not critical for transportation connectivity to other community purposes.

Policy 9.16. Design with nature. Promote street alignments and designs that respond to topography and natural features, when feasible, and protect streams, wildlife habitat, and native trees.

245. Finding: These policies address the design and use of public streets and not development on private land. These policies do not apply.

Modal policies

Policy 9.17. Pedestrian transportation. Encourage walking as the most attractive mode of transportation for most short trips, within and to centers, corridors, and major destinations, and as a means for accessing transit.

Policy 9.18. Pedestrian networks. Create more complete networks of pedestrian facilities, and improve the quality of the pedestrian environment.

Policy 9.19. Pedestrian safety and accessibility. Improve pedestrian safety, accessibility, and convenience for people of all ages and abilities.

Policy 9.20. Bicycle transportation. Create conditions that make bicycling more attractive than driving for most trips of approximately three miles or less.

Policy 9.21. Accessible bicycle system. Create a bicycle transportation system that is safe, comfortable, and accessible to people of all ages and abilities.

Policy 9.22. Public transportation. Coordinate with public transit agencies to create conditions that make transit the preferred mode of travel for trips that are not made by walking or bicycling.

Policy 9.23. Transportation to job centers. Promote and enhance transit to be more convenient and economical than the automobile for people travelling more than three miles to and from the Central City and Gateway. Enhance regional access to the Central City and access from Portland to other regional job centers.

Policy 9.24. Transit service. In partnership with TriMet, develop a public transportation system that conveniently, safely, comfortably, and equitably serves residents and workers 24 hours a day, 7 days a week.

Policy 9.25. Transit equity. In partnership with TriMet, maintain and expand high-quality frequent transit service to all Town Centers, Civic Corridors, Neighborhood Centers, Neighborhood Corridors, and other major concentrations of employment, and improve service to areas with high concentrations of poverty and historically under-served and under-represented communities.

> **9.25.a.** Support a public transit system and regional transportation that address the transportation needs of historically marginalized communities and provide increased mobility options and access.

Policy 9.26. Transit funding. Consider funding strategies and partnership opportunities that improve access to and equity in transit service, such as raising metro-wide funding to improve service and decrease user fees/fares.

Policy 9.27. Transit service to centers and corridors. Use transit investments to shape the city's

growth and increase transit use. In partnership with TriMet and Metro**,** maintain, expand, and enhance Portland Streetcar, frequent service bus, and high-capacity transit, to better serve centers and corridors with the highest intensity of potential employment and household growth.

9.27.a. Locate major park-and-ride lots only where transit ridership is increased significantly, vehicle miles traveled are reduced, transit-supportive development is not hampered, bus service is not available or is inadequate, and the surrounding area is not negatively impacted.

Policy 9.28. Intercity passenger service. Coordinate planning and project development to expand intercity passenger transportation services in the Willamette Valley, and from Portland to Seattle and Vancouver, BC.

Policy 9.29. Regional trafficways and transitways. Maintain capacity of regional transitways and existing regional trafficways to accommodate through-traffic.

246. Finding: Policies 9.17 through 9.29 address the design and planning of transportation facilities and not development on private land. These policies do not apply.

Policy 9.30. Multimodal goods movement. Develop, maintain, and enhance a multimodal freight transportation system for the safe, reliable, sustainable, and efficient movement of goods within and through the city.

Policy 9.31. Economic development and industrial lands. Ensure that the transportation system supports traded sector economic development plans and full utilization of prime industrial land, including brownfield redevelopment.

Policy 9.32. Multimodal system and hub. Maintain Portland's role as a multimodal hub for global and regional movement of goods. Enhance Portland's network of multimodal freight corridors.

Policy 9.33. Freight network. Develop, manage, and maintain a safe, efficient, and reliable freight street network to provide freight access to and from intermodal freight facilities, industrial and commercial districts, and the regional transportation system. Invest to accommodate forecasted growth of interregional freight volumes and provide access to truck, marine, rail, and air transportation systems. Ensure designated routes and facilities are adequate for over-dimensional trucks and emergency equipment.

Policy 9.34. Sustainable freight system. Support the efficient delivery of goods and services to businesses and neighborhoods, while also reducing environmental and neighborhood impacts. Encourage the use of energy efficient and clean delivery vehicles, and manage on- and off-street loading spaces to ensure adequate access for deliveries to businesses, while maintaining access to homes and businesses.

Policy 9.35. Freight rail network. Coordinate with stakeholders and regional partners to support continued reinvestment in, and modernization of, the freight rail network.

Policy 9.36. Portland Harbor. Coordinate with the Port of Portland, private stakeholders, and regional partners to improve and maintain access to marine terminals and related river-dependent uses in Portland Harbor.

9.36.a. Support continued reinvestment in, and modernization of, marine terminals in Portland Harbor.

9.36.b. Facilitate continued maintenance of the shipping channels in Portland Harbor and the Columbia River.

9.36.c. Support shifting more long-distance, high-volume movement of goods to river and oceangoing ships and rail.

247. Finding: Policies 9.30 through 9.36 direct the City to develop, maintain, and enhance a multimodal freight transportation system. the City Council interprets this policy to apply to transportation system design and city investment decisions, and not decisions considering the appropriate land use. The FFTZ amendments support the retention of existing fossil fuel terminals by designating them as a limited use that allows the terminals to continue to operate and invest in upgrades and supports opportunities for growth through exceptions, such as aviation or renewable fuels. Further, the changes maintain Portland's multimodal freight hub because they do not amend the Citywide System Plan or the Transportation System Plan, therefore the City continues to plan for public infrastructure investments to maintain and strengthen the multimodal transportation infrastructure in the northwest industrial area where the FFTs are located. Finally, the ordinance does not regulate transloading facilities, docks or pipelines – facilities that are key components of the multimodal freight transportation system.

Policy 9.37. Portland Heliport. Maintain Portland's Heliport functionality in the Central City.

248. Finding: This policy applies to the Central City. There are no FFTs in the Central City. This policy does not apply.

Policy 9.38. Automobile transportation. Maintain acceptable levels of mobility and access for private automobiles while reducing overall vehicle miles traveled (VMT) and negative impacts of private automobiles on the environment and human health.

Policy 9.39. Automobile efficiency. Coordinate land use and transportation plans and programs with other public and private stakeholders to encourage vehicle technology innovation, shifts toward electric and other cleaner, more energy-efficient vehicles and fuels, integration of smart vehicle technology with intelligent transportation systems, and greater use of options such as car-share, carpool, and taxi.

Policy 9.40. Emergency response. Maintain a network of accessible emergency response streets to facilitate safe and expedient emergency response and evacuation. Ensure that police, fire, ambulance, and other emergency providers can reach their destinations in a timely fashion, without negatively impacting traffic calming and other measures intended to reduce crashes and improve safety.

249. Finding: Policies 9.38 through 9.40 address the design and use of public streets and not development on private land. These policies do not apply.

System management

Policy 9.45. System management. Give preference to transportation improvements that use existing roadway capacity efficiently and that improve the safety of the system for all users.

9.45.a. Support regional equity measures for transportation system evaluation.

Policy 9.46. Traffic management. Evaluate and encourage traffic speed and volume to be consistent with street classifications and desired land uses to improve safety, preserve and enhance neighborhood livability, and meet system goals of calming vehicle traffic through a combination of enforcement, engineering, and education efforts.

9.46.a. Use traffic calming tools, traffic diversion and other available tools and methods to create and maintain sufficiently low automotive volumes and speeds on neighborhood

greenways to ensure comfortable cycling environment on the street.

Policy 9.47. Connectivity. Establish an interconnected, multimodal transportation system to serve centers and other significant locations. Promote a logical, direct, and connected street system through street spacing guidelines and district-specific street plans found in the Transportation System Plan, and prioritize access to specific places by certain modes in accordance with policies 9.6 and 9.7.

9.47.a. Develop conceptual master street plans for areas of the City that have significant amounts of vacant or underdeveloped land and where the street network does not meet City and Metro connectivity guidelines.

9.47.b. As areas with adopted Street Plans develop, provide connectivity for all modes by developing the streets and accessways as shown on the Master Street Plan Maps in the Comp Plan.

9.47.c. Continue to provide connectivity in areas with adopted Street Plans for all modes of travel by developing public and private streets as shown on the Master Street Plan Maps in the Comp Plan.

9.47.d. Provide street connections with spacing of no more than 530 feet between connections except where prevented by barriers such as topography, railroads, freeways, or environmental constraints. Where streets must cross over protected water features, provide crossings at an average spacing of 800 to 1000 feet, unless exceptional habitat quality of length of crossing prevents a full street connection.

9.47.e Provide bike and pedestrian connections at approximately 330 feet intervals on public easements or rights-of-way when full street connections are not possible, except where prevented by barriers s such as topography, railroads, freeways, or environmental constraints. Bike and pedestrian connections that cross protected water features should have an average spacing of no more than 530 feet, unless exceptional habitat quality or length of connection prevents a connection.

Policy 9.48 Technology. Encourage the use of emerging vehicle and parking technology to improve real-time management of the transportation network and to manage and allocate parking supply and demand.

Policy 9.49 Performance measures. Establish multimodal performance measures and measures of system completeness to evaluate and monitor the adequacy of transportation services based on performance measures in goals 9.A. through 9.I. Use these measures to evaluate overall system performance, inform corridor and area-specific plans and investments, identify project and program needs, evaluate and prioritize investments, and regulate development, institutional campus growth, zone changes, Comprehensive Plan Map amendments, and conditional uses.

9.49.a. Eliminate deaths and serious injuries for all who share Portland streets by 2025.

9.49.b. Maintain or decrease the number of peak period non-freight motor vehicle trips, system-wide and within each mobility corridor to reduce or manage congestion.

9.49.c. By 2035, reduce the number of miles Portlanders travel by car to 11 miles per day or less, on average.

9.49.d. Establish mode split targets in 2040 Growth Concept areas within the City, consistent with Metro's targets for these areas.

9.49.e. By 2035, increase the mode share of daily non-drive alone trips to 70 percent citywide,

and to the following in the five pattern areas:

Pattern Area	2035 daily target mode share
Central City	85%
Inner Neighborhoods	70%
Western Neighborhoods	65%
Eastern Neighborhoods	65%
Industrial and River	55%

9.49.f. By 2035, 70 percent of commuters walk, bike, take transit, carpool, or work from home at approximately the following rates:

Mode	Mode Share
Walk	7.5%
Bicycle	25%
Transit	25%
Carpool	10%
Single Occupant Vehicle (SOV)	30% or less
Work at home	10% below the line (calculated outside of the modal targets above)

9.49.g. By 2035, reduce Portland's transportation-related carbon emissions to 50% below 1990 levels, at approximately 934,000 metric tons.

9.49.h. By 2025, increase the percentage of new mixed use zone building households not owning an automobile from approximately 13% (2014) to 25%, and reduce the percentage of households owning two automobiles from approximately 24% to 10%.

9.49.i. Develop and use alternatives to the level-of-service measure to improve safety, encourage multimodal transportation, and to evaluate and mitigate maintenance and new trip impacts from new development.

9.49.j. Use level-of-service, consistent with Table 9.1*, as one measure to evaluate the adequacy of transportation facilities in the vicinity of sites subject to land use review.

9.49.k. Maintain acceptable levels of performance on state facilities and the regional arterial and throughway network, consistent with the interim standard in Table 9.2*, in the development and adoption of, and amendments to, the Transportation System Plan and in

legislative amendments to the Comprehensive Plan Map.

9.49.l. In areas identified by Metro that exceed the level-of-service in Table 9.2* and are planned to, but do not currently meet the alternative performance criteria, establish an action plan that does the following:

- Anticipates growth and future impacts of motor vehicle traffic on multimodal travel in the area
- Establishes strategies for mitigating the future impacts of motor vehicles
- Establishes performance standards for monitoring and implementing the action plan.

*Note: Referenced Tables 9.1 and 9.2 are contained within the Transportation System Plan and should not be confused with tables or figures within the 2035 Comprehensive Plan.

9.49.m. Develop performance measures to track progress in creating and maintaining the transportation system.

Policy 9.50 Regional congestion management. Coordinate with Metro to establish new regional multimodal mobility standards that prioritize transit, freight, and system completeness.

9.50.a. Create a regional congestion management approach, including a market-based system, to price or charge for auto trips and parking, better account for the cost of auto trips, and to more efficiently manage the regional system.

Policy 9.51. Multimodal Mixed-Use Area. Manage Central City Plan amendments in accordance with the designated Central City Multimodal Mixed-Use Area (MMA) in the geography indicated in Figure 9-2. The MMA renders congestion / mobility standards inapplicable to any proposed plan amendments under OAR 660-0012-0060(10).

250. Finding: Policies 9.45through 9.51 address the management of the City's transportation system and not development on private land. These policies do not apply.

Transportation Demand Management

Policy 9.52. Outreach. Create and maintain TDM outreach programs that work with Transportation Management Associations (TMA), residents, employers, and employees that increase the modal share of walking, bicycling, and shared vehicle trips while reducing private vehicle ownership, parking demand, and drive-alone trips, especially during peak periods.

Policy 9.53. New development. Create and maintain TDM regulations and services that prevent and reduce traffic and parking impacts from new development and redevelopment. Encourage coordinated area-wide delivery of TDM programs. Monitor and improve the performance of private-sector TDM programs.

Policy 9.54. Projects and programs. Integrate TDM information into transportation project and program development and implementation to increase use of new multimodal transportation projects and services.

251. Finding: The FFTZ amendments affect one type of allowed use in employment and industrial zones. The City Council has not applied the TDM program to industrial development and those changes are not part of this ordinance.

Parking management

Policy 9.55. Parking management. Reduce parking demand and manage supply to improve

pedestrian, bicycle and transit mode share, neighborhood livability, safety, business district vitality, vehicle miles traveled (VMT) reduction, and air quality. Implement strategies that reduce demand for new parking and private vehicle ownership, and that help maintain optimal parking occupancy and availability.

Policy 9.56. Curb Zone. Recognize that the Curb Zone is a public space, a physical and spatial asset that has value and cost. Evaluate whether, when, and where parking is the highest and best use of this public space in support of broad City policy goals and local land use context. Establish thresholds to utilize parking management and pricing tools in areas with high parking demand to ensure adequate on-street parking supply during peak periods.

Policy 9.57. On-street parking. Manage parking and loading demand, supply, and operations in the public right of way to achieve mode share objectives, and to encourage safety, economic vitality, and livability. Use transportation demand management and pricing of parking in areas with high parking demand.

Policy 9.58. Off-street parking. Limit the development of new parking spaces to achieve land use, transportation, and environmental goals, especially in locations with frequent transit service. Regulate off-street parking to achieve mode share objectives, promote compact and walkable urban form, encourage lower rates of car ownership, and promote the vitality of commercial and employment areas. Use transportation demand management and pricing of parking in areas with high parking demand.

Policy 9.59. Share space and resources. Encourage the shared use of parking and vehicles to maximize the efficient use of limited urban space.

Policy 9.60. Cost and price. Recognize the high public and private cost of parking by encouraging prices that reflect the cost of providing parking and balance demand and supply. Discourage employee and resident parking subsidies.

Policy 9.61. Bicycle parking. Promote the development of new bicycle parking facilities including dedicated bike parking in the public right-of-way. Provide sufficient bicycle parking at high-capacity transit stations to enhance bicycle connection opportunities. Require provision of adequate off-street bicycle parking for new development and redevelopment. Encourage the provision of parking for different types of bicycles. In establishing the standards for long-term bicycle parking, consider the needs of persons with different levels of ability.

252. Finding: The FFTZ amendments do not change parking requirements or development standards affecting parking or the use of the right-of-way for parking. These policies do not apply.

Finance, programs, and coordination

Policy 9.62. Coordination. Coordinate with state and federal agencies, local and regional governments, special districts, other City bureaus, and providers of transportation services when planning for, developing, and funding transportation facilities and services.

Policy 9.63. New development impacts. Prevent, reduce, and mitigate the impacts of new development and redevelopment on the transportation system. Utilize strategies including transportation and parking demand management, transportation system analysis, and system and local impact mitigation improvements and fees.

Policy 9.64. Education and encouragement. Create, maintain, and coordinate educational and encouragement programs that support multimodal transportation and that emphasize safety for all modes of transportation. Ensure that these programs are accessible to historically under-served and

under-represented populations.

Policy 9.65. Telecommuting. Promote telecommuting and the use of communications technology to reduce travel demand.

Policy 9.66. Project and program selection criteria. Establish transportation project and program selection criteria consistent with goals 9A through 9I, to cost-effectively achieve access, placemaking, sustainability, equity, health, prosperity, and safety goals.

Policy 9.67. Funding. Encourage the development of a range of stable transportation funding sources that provide adequate resources to build and maintain an equitable and sustainable transportation system.

253. Finding: These policies address the funding and management of the City's transportation system and not development on private land. These policies do not apply.

Connected and Automated Vehicles

Policy 9.68 Connected and Automated Vehicles Priorities and Outcomes. Prioritize connected and automated vehicles that are fleet/shared ownership, fully automated, electric and, for passenger vehicles, shared by multiple passengers (known by the acronym FAVES). Develop and implement strategies for each following topic.

9.68.a. Ensure that all levels of automated vehicles advance Vision Zero by operating safely for all users, especially for vulnerable road users. Require adequate insurance coverage for operators, customers, and the public-at-large by providers of commercial connected and autonomous vehicle services.

9.68.b. Ensure that connected and automated vehicles improve travel time reliability and system efficiency by:

1. maintaining or reducing the number of vehicle trips during peak congestion periods;
2. reducing low occupancy vehicle trips during peak congestion periods;
3. paying for use of, and impact on, Portland's transportation system including factors such as congestion level, vehicle miles traveled, vehicle occupancy, and vehicle energy efficiency; and
4. supporting and encouraging use of public transportation.

9.68.c. Cut vehicle carbon pollution by reducing low occupancy "empty miles" traveled by passenger vehicles with zero or one passengers. Prioritize electric and other zero direct emission vehicles operated by fleets and carrying multiple passengers.

9.68.d. Make the benefits of automated mobility available on an equitable basis to all segments of the community while ensuring traditionally disadvantaged communities are not disproportionately hurt by connected and autonomous vehicle use. This includes people with disabilities, as well as communities of color, women, and geographically underserved communities.

9.68.e Identify, prevent, and mitigate potential adverse impacts from connected and automated vehicles.

Policy 9.69 Connected and Automated Vehicles Tools. Use a full range of tools to ensure that connected and automated vehicles and private data communications devices installed in the City right of way contribute to achieving Comprehensive Plan and Transportation System Plan goals and policies.

9.69.a. Maintain City authority to identify and develop appropriate data sharing requirements to inform and support safe, efficient, and effective management of the transportation system. Ensure that when connected and automated vehicles use City rights-of-way or when vehicles connect with smart infrastructure within the City they share information including, but not limited to, vehicle type, occupancy, speed, travel routes, and travel times, with appropriate privacy controls. Ensure that private data communications devices installed in the City right of way are required to share anonymized transportation data.

9.69.b. Design and manage the mobility zone, curb zone, and traffic control devices, e.g. to limit speeds to increase safety, to minimize cut-through traffic, evaluate future demand for pick-up and drop-off zones, and to prioritize automated electric vehicles carrying more passengers in congested times and locations;

9.69.c. Evaluate the public cost and benefit of investments in wayside communication systems serving connected and automated vehicles. Develop a criteria-driven automated vehicle wayside infrastructure investment plan.

9.69.d. Develop sustainable user-pays funding mechanisms to support connected and automated vehicle infrastructure and service investments, transportation system maintenance, and efficient system management.

9.69.e. Ensure that automated vehicles and vehicles that connect to smart City infrastructure, and private data communications devices installed in the City right of way, help pay for infrastructure and service investments, and support system reliability and efficiency. Develop a tiered pricing structure that reflects vehicle impacts on the transportation system, including factors such as congestion level, vehicle miles traveled, vehicle occupancy, and vehicle energy efficiency.

254. Finding: These policies address the management of automated vehicles and not development on private land. These policies do not apply.

Chapter 10: Land Use Designations and Zoning

Goal 10.A: Land use designations and zoning. Effectively and efficiently carry out the goals and policies of the Comprehensive Plan through the land use designations, Zoning Map, and the Zoning Code.

255. The FFTZ amendments do not change the land use designations, nor do they amend the Comprehensive Plan Map or the Zoning Map. These findings show how the changes carry out the goals and policies of the Comprehensive Plan through the Zoning Code.

Land use designations

Policy 10.1. Land use designations. Apply a land use designation to all land and water within the City's Urban Services Boundary. Apply the designation that best advances the Comprehensive Plan goals and

policies. The land use designations are shown on the adopted Land Use Map and on official Zoning Maps.

The Zoning Map and the Zoning Code

Policy 10.2. Relationship of land use designations to base zones. Apply a base zone to all land and water within the City's urban services boundary. The base zone applied must either be a zone that corresponds to the land use designation or be a zone that does not correspond but is allowed per Figure 10-1 — Corresponding and Less-Intense Zones for Each Plan Map Designation. In some situations, there are long-term or short-term obstacles to achieving the level of development intended by the land use designation (e.g., an infrastructure improvement to serve the higher level of development is planned but not yet funded). In these situations, a less intense zone (listed in Figure 10-1) may be applied. When a land use designation is amended, the zone may also have to be changed to a corresponding zone or a zone that does not correspond but is allowed.

Policy 10.3. Amending the Zoning Map.

10.3.a. Amending a base zone may be done legislatively or quasi-judicially.

10.3.b. When amending a base zone quasi-judicially, the amendment must be to a corresponding zone (*see Figure 10-1 — Corresponding and Allowed Zones for Each Land Use Designation*). When a designation has more than one corresponding zone, the most appropriate zone, based on the purpose of the zone and the zoning and general land uses of surrounding lands, will be applied.

10.3.c. When amending a base zone legislatively, the amendment may be to a corresponding zone or to a zone that is does not correspond but is allowed (*see Figure 10-1 — Corresponding and Allowed Zones for each Land Use Designation for zones that are allowed*). A legislative Zoning Map amendment may not be to a zone that is not allowed.

10.3.d. An amendment to a base zone consistent with the land use designation must be approved when it is found that current public services can support the uses allowed by the zone, or that public services can be made capable by the time the development is complete. The adequacy of services is based on the proposed use and development. If a specific use and development proposal is not submitted, services must be able to support the range of uses and development allowed by the zone. For the purposes of this requirement, services include water supply, sanitary sewage disposal, stormwater management, transportation, school district capacity (where a school facility plan exists), and police and fire protection.

10.3.e. An amendment to apply or remove an overlay zone or plan district may be done legislatively or quasi-judicially, and must be based on a study or plan document that identifies a specific characteristic, situation, or problem that is not adequately addressed by the base zone or other regulations.

Policy 10.4. Amending the Zoning Code. Amendments to the zoning regulations must be done legislatively and should be clear, concise, and applicable to a broad range of development situations faced by a growing city. Amendments should:

256. Finding: The FFTZ amendments were initially adopted by a legislative process and the reconsideration on remand is following a legislative procedure at City Council. The regulations are clear and concise in creating one use category with clear definition of terms and is applicable to all employment and industrial zones.

10.4.a. Promote good planning:

- Effectively and efficiently implement the Comprehensive Plan.

257. **Finding:** As demonstrated by these findings, the FFTZ amendments effectively and efficiently implement the Comprehensive Plan. Specifically:

The City Council has considered applicable policies to determine that this ordinance on the whole complies with the 2035 Comprehensive Plan and on balance is equally or more supportive of the goals and policies of the 2035 Comprehensive Plan than the current regulations. In reaching this conclusion, City Council has weighed and balanced competing policy directions.

In particular, the Council finds that Goal 4.D with Policies 4.79 and 4.80, requires reducing risk to people and property from natural hazards. The FFTZ amendments further these goals and policies because by limiting the risks of storing large volumes of hazardous materials in an area with high susceptibility to an earthquake. Large fossil fuel terminals represent a risk to people, property and the natural environments that the City Council finds as a compelling reason to limit future risk by limiting the size of new facilities and prohibit the expansion of existing facilities. Continuing to allow an unlimited increase in storage capacity at FFTs in a high risk area would be less supportive of the 2035 Comprehensive Plan than adopting the FFTZ amendments

Policy 6.48 provides direction to limit fossil fuel terminals to what is necessary to serve the region. The City Council recognizes that Portland's fossil fuel terminals handle 90 percent of the fossil fuel for the State of Oregon and Southwest Washington. These changes support the retention of existing fossil fuel terminals by designating them as a limited use that allows the terminals to continue to operate and invest in upgrades and supports opportunities for growth through exceptions, such as aviation or renewable fuels. Further, the use limitations provide flexibility to FFTs to replace and reconfigure existing storage tank capacity to increase safety and meet future needs. In addition, limiting storage capacity to the existing facilities reduces risk from a major earthquake, which outweighs the policy direction to provide capacity to accommodate any potential future increase in fossil fuel consumption, in part, because continuing to consolidate fossil fuel storage capacity in Portland is counter to resiliency principles that emphasize redundancy and distributed facilities.

Goal 6.C with Policies 6.20 and 6.36, among others, provide for the retention and growth of businesses, especially those in the traded sector. The City Council interprets these policies apply to the economy in general, rather than specific types of business. These changes and restrictions only apply to a narrowly defined new land use category, Bulk Fossil Fuel Terminals, and do not have a significant effect on the other allowed uses in industrial and employment zones. There are no changes proposed to the Comprehensive Plan or Zoning Map that will impact the overall size or intensity of development in the industrial and employment areas of Portland. These amendments are narrowly constructed to apply to one class of businesses that make up a small portion of the city, regional and state economy. Further, these regulations only limit future expansion of these fossil fuel terminals, with some key exceptions, and designate these businesses as a limited use that allows their continued operation.

Guilds Lake Industrial Sanctuary (GLIS) Plan policies provide direction to maintain, protect and enhance businesses in the sanctuary. This plan was adopted in 2001 and does not address the need for resiliency in a high and medium liquefaction susceptibility area. The City Council interprets these policies to apply to the GLIS as a whole and not individual businesses. The City Council interprets the legislative intent of the GLISP is to maintain the area as an industrial sanctuary and to prohibit incompatible land uses. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses that could undermine the viability of the industrial sanctuary. These

regulations apply to only one type of business that makes up a minority part of the businesses found in GLIS. The remaining industrial uses to continue to operate under current regulations. The impact of the limits on fossil fuel terminals is mitigated by designating existing fossil fuel terminals as a limited use that allows the terminals to continue to operate and make upgrades and supports limited enhancement through exceptions to the storage capacity restrictions.

- Address existing and potential land use problems.

258. Finding: Most of Portland's employment and industrial zones are in areas with high to very high levels of liquefaction susceptibility, as documented by the 2018 DOGAMI Earthquake Regional Impact Analysis. Fossil fuel infrastructure poses considerable risks in the event of a major earthquake. The FFTs have significant seismic risks because most of the tanks have been constructed without any or only limited seismic design criteria on soils with moderate to high levels of liquefaction susceptibility, as documented by the Portland Bureau of Emergency Management's 2016 Critical Energy Infrastructure Hub Study and the 2012 DOGAMI Earthquake Risk Study for Oregon's Critical Energy Infrastructure Hub report. Continuing to allow the increase in FFTs in a high risk area increases the risk to the surrounding industrial district and the Willamette River. The FFTZ amendments limit future risk by limiting the size of new fossil fuel terminals and prohibiting the expansion of storage capacity at existing fossil fuel terminals, with limited exceptions.

- Balance the benefits of regulations against the costs of implementation and compliance.

259. The FFTZ amendments balance the benefits and costs by designating existing FFTs as a limited use, as opposed to a prohibited nonconforming use, which allows the terminals to continue to operate and invest in facilities that reduce the risks and improve their ability to withstand a major earthquake, which ultimately can make Portland more resilient.

- Maintain Portland's competitiveness with other jurisdictions as a location in which to live, invest, and do business.

260. Finding: The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes maintain Portland's employment land supply to create opportunities for a growing economy. These regulations apply to only one type of business that makes up a minority part of the businesses found in Portland's industrial districts. The remaining industrial uses continue to operate under the current development review system.

10.4.b. Ensure good administration of land use regulations:

- Keep regulations as simple as possible.

261. Finding: The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes maintain Portland's employment land supply to create opportunities for a growing economy. These regulations apply to only one type of business that makes up a minority part of the businesses found in Portland's industrial districts. The remaining industrial uses continue to operate under the current development review system.

- Use clear and objective standards wherever possible.

262. Finding: The FFTZ amendments establish clear definitions for fossil fuels and the Bulk Fossil Fuel Terminal use category.

- Maintain consistent procedures and limit their number.
- Establish specific approval criteria for land use reviews.
- Establish application requirements that are as reasonable as possible, and ensure they are directly tied to approval criteria.
- Emphasize administrative procedures for land use reviews.

- Avoid overlapping reviews.

263. **Finding:** The FFTZ amendments do not establish new procedures or land use reviews. The FFTZ amendments establish clear definitions for fossil fuels and the Bulk Fossil Fuel Terminal use category. These regulations apply to only one type of use that makes up a minority part of the uses found in Portland's industrial districts. The other industrial uses continue to operate under current regulations. Designating the existing FFTs as a limited use, as opposed to a prohibited nonconforming or conditional use, allows the terminals to continue to operate and invest in upgrades without additional discretionary land use reviews. tank capacity, such as consolidating smaller tanks into larger tanks, to meet future needs.

10.4.c. Strive to improve the code document:

- Use clear language.
- Maintain a clear and logical organization.
- Use a format and layout that enables use of the document by lay people as well as professionals.
- Use tables and drawings to clarify and shorten the document.
- Identify and act on regulatory improvement suggestions.

264. **Finding:** The FFTZ amendments create a new use category consistent with the format used described and regulate other types of uses. The Zoning Code amendments are presented in as clear and objective of a way possible to ensure the intended users will be able understand and utilize the Zoning Code as it applies to their development proposals, land use, and properties, consistent with Comprehensive Plan Policy 10.4.

Part IV. Adopted Area Plans

The following adopted areas plans include policies related to the FFTZ amendments:

Guilds Lake Industrial Sanctuary Plan (2001)
The Guild's Lake Industrial Sanctuary (GLIS) Plan provides a policy framework to protect and promote the area's long-term economic viability as an industrial district for a broad variety of industrial land uses and businesses. The GLIS is an area that runs northwest of NW Vaughn Street along the Willamette River to the St. Johns Bridge. The plan recognizes the unique role of industrial land in Portland's economy and the importance of industrial businesses in providing living-wage jobs. The plan's vision statement, policies and objectives have been adopted as part of Portland's Comprehensive Plan and are implemented through the Zoning Code through the GLIS Plan District (33.531), which adds land use prohibitions and limits that were (at the time) above and beyond the limits in the industrial base zones.

Policy 1: Jobs and Economic Development
Maintain and expand industrial business and employment opportunities in the Guild's Lake Industrial Sanctuary. Stimulate investment in the area's public and private infrastructure and industrial facilities.

265. **Finding:** The City Council interprets this policy and objectives to apply to the GLISP area as whole and not to individual businesses or sectors of business. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes do not conflict with the policy intent to maintain the area as an industrial sanctuary. These regulations apply to only one type of business that makes up a minority part of the businesses found in GLIS. The remaining industrial uses continue to operate under current regulations. The impact of the limits on fossil fuel terminals is mitigated by protecting existing fossil fuel terminals as a limited use,

as opposed to a prohibited or non-conforming use, that allows the terminals to continue to operate and invest in upgrades and supports opportunities for enhancement through exceptions, such as aviation or renewable fuels.

The City Council interprets the verb "stimulate" to mean "encourage", which is defined in the 2035 Comprehensive Plan as to promote or foster using some combination of voluntary approaches, regulations, or incentives. The FFTZ amendments apply to only one type of business that makes up a minority part of the businesses found in GLIS. The remaining industrial uses continue to operate under current regulations. The limits on expansion of storage capacity at fossil fuel terminals is mitigated by designating existing fossil fuel terminals as a limited use that allows the terminals to continue to operate and invest in upgrades. The FFTZ amendments do not amend the Citywide System Plan or the Transportation System Plan, therefore the City continues to plan for public infrastructure investments in the area.

As noted in the findings above, the FFTZ amendments are consistent with the goals and policies of Chapter 6 (Economic Development) of the 2035 Comprehensive Plan and Statewide Planning Goal 9. The findings in response to those goals and policies are incorporated by reference.

Objective 1. Provide new employment opportunities by reusing or redeveloping reclaimed, underutilized and vacant land and buildings in the GLIS.

266. Finding: The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes will continue to provide opportunities for industrial redevelopment in the GLIS. These regulations apply to only one type of business that makes up a minority part of the businesses found in GLIS. These changes support the retention of existing fossil fuel terminals by designating them as a limited use that allows the terminals to continue to operate and invest in upgrades, which maintains the current employment opportunities at these businesses. The regulations also provide opportunities for growth through exceptions, such as aviation or renewable fuels, which can provide additional employment opportunities.

Objective 2. Foster a business and public policy environment that promotes continued private and public sector investments in infrastructure, facilities, equipment and jobs.

267. Finding: The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes will continue to provide opportunities for investment in the GLIS. These regulations apply to only one type of business that makes up a minority part of the businesses found in GLIS. The limits on expansion of storage capacity at fossil fuel terminals is mitigated by designating existing fossil fuel terminals as a limited use that allows the terminals to continue to operate and invest in other types of upgrades. The FFTZ amendments do not amend the Citywide System Plan or the Transportation System Plan, therefore the City continues to plan for public infrastructure investments in the area.

Objective 3. Enhance the GLIS as a competitive and forward-thinking industrial area by fostering innovative and environmentally-sensitive industrial projects and practices that improve the operational efficiency of GLIS firms while conserving natural resources and reducing pollution.

268. Finding: The City Council interprets the verb "enhance", which is not defined in the 2035 Comprehensive Plan, to mean to intensify or improve. The verb "foster", which is defined in the 2035 Comprehensive Plan, means to encourage or guide the incremental development of something over a long period of time. The City Council interprets this policy to mean that industrial development should incorporate green building practices, such as on-site stormwater management, and natural resource conservation, such as riverbank restoration. The City has achieved this objective through other regulatory programs, such as the Stormwater Management Manual and the Greenway Overlay Zone, that are not amended by this ordinance. The limits on

expansion of storage capacity at fossil fuel terminals is mitigated by designating existing fossil fuel terminals as a limited use that allows the terminals to continue to operate and invest in other types of upgrades that conserve natural resources and reduce pollution.

Policy 2: Transportation
Maintain, preserve and improve the intermodal and multimodal transportation system to provide for the smooth movement of goods and employees into and through the Guild's Lake Industrial Sanctuary.

269. **Finding:** The City Council interprets this policy and the objectives to apply to the GLISP area as whole and not to individual businesses or sectors of business. The transportation policy discussion and action plan in the GLISP is focused on a street system that accommodates all modes of traffic while preserving operational characteristics that support truck movement. The FFTZ amendments do not amend the Citywide System Plan or the Transportation System Plan, therefore the City continues to plan for public infrastructure investments in the area that seeks to accommodate all modes of traffic consist with the freight classifications for the district's roadways.

The fossil fuel terminals are privately-owned, specialized intermodal facilities that exclusively transport liquid bulk products into and out of the GLISP area via pipeline, barge, rail and truck. There is no evidence that these terminals are used by other businesses to move other types of goods. The limits on expansion of storage capacity at fossil fuel terminals is mitigated by designating existing fossil fuel terminals as a limited use that allows the terminals to maintain, preserve and continue to operate and improve their intermodal facilities to provide for the continued movement of goods through the GLIS. Finally, the ordinance does not regulate transloading facilities, docks or pipelines – facilities that are key components of the multimodal freight transportation system. As noted in the findings above, the FFTZ amendments are consistent with the goals and policies of Chapter 9 (Transportation) of the 2035 Comprehensive Plan and Statewide Planning Goal 12. The findings in response to those goals and policies are incorporated by reference.

Objective 1. Maintain, protect, and enhance the public and private multimodal transportation investments in the GLIS, including rail and marine terminal facilities, to ensure its continued viability as a major center for the import and export of industrial products in the state of Oregon.

270. **Finding:** The 2035 Comprehensive Plan defines the verb "maintain" to mean keep what you have; conserve; preserve; continue. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes will continue to provide the same opportunities for investment to provide for the continued movement of goods through the GLIS. The FFTZ amendments do not amend the Citywide System Plan or the Transportation System Plan, therefore the City continues to plan for public infrastructure investments in the area to provide for the continued viability as a major industrial center in Oregon.

The City Council interprets the verb "enhance", which is not defined in the 2035 Comprehensive Plan, to mean to intensify or improve. The FFTZ regulations apply to only one type of business that makes up a minority part of the businesses found in GLIS. The limits on expansion of storage capacity at fossil fuel terminals are mitigated by designating existing fossil fuel terminals as a limited use that allows the terminals to maintain, preserve and continue to operate and improve their intermodal facilities to provide for the continued movement of fossil fuels through the GLIS and supports opportunities for enhancement through exceptions, such as aviation or renewable fuels.

Objective 2. Maintain operational characteristics on roads and at intersections that support truck movements and industrial economic growth, while accommodating traffic, transit, and emergency access needs.

271. **Finding:** The FFTZ amendments do not change the functional classification of any roads in the GLIS. These regulations apply to only one type of business that makes up a minority part of the businesses found in GLIS. The FFTZ amendments do not amend the Citywide System Plan or the Transportation System Plan, therefore the City continues to plan for public infrastructure investments in the area.

Objective 3. Minimize traffic conflicts between industrial and nonindustrial uses.

272. **Finding:** The City Council interprets the verb "minimize" to mean to reduce something to the smallest possible amount. Minimizing traffic conflicts is a function of transportation policy. The FFTZ amendments do not change any transportation policies, including the functional classification of any roads in the GLIS. The FFTZ amendments do not include map changes, nor do they allow for new incompatible nonindustrial land uses that could be expected increase traffic conflicts.

Objective 4. Manage congestion on highways and roads within the GLIS through regional and area-wide systems planning and maximize the efficiency of transportation facilities for all modes of travel, with the participation of private industry.

273. **Finding:** The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, these changes will continue to provide the same opportunities for investment in the GLIS. The FFTZ amendments do not amend the Citywide System Plan or the Transportation System Plan, therefore the City continues to plan for public infrastructure investments in the area to manage congestion on highways and roads within the GLIS.

The City Council interprets the verb "maximize", which is not defined in the 2035 Comprehensive Plan, to mean to make the best use of. These regulations apply to only one type of business that makes up a minority part of the businesses found in GLIS. The limits on expansion of storage capacity at fossil fuel terminals is mitigated by designating existing fossil fuel terminals as a limited use that allows the terminals to continue to operate and invest in other types of upgrades to all modes of travel. The FFTZ regulations allow terminals to maximize the efficiency of their private transportation facilities (docks and pipelines) by providing expanded opportunities through exceptions, such as for aviation or renewable fuels, to the storage capacity restrictions.

Objective 5. Develop alternative transportation options for employees of the GLIS, including transit, carpools, bicycling, and walking to reduce parking needs, vehicle emissions, and congestion levels.

274. **Finding:** The City Council interprets this policy to focus on the commute modes of employees of the GLIS. Developing alternative transportation options is a function of transportation policy. The FFTZ amendments do not change any transportation policies, therefore, this policy does not apply. Further, employment at FFTs is a small share of the overall employment of the GLIS. The limits on expansion of storage capacity at fossil fuel terminals is mitigated by designating existing fossil fuel terminals as a limited use that allows the terminals to continue to operate, which can maintain these employment levels, which can maintain ridership for the existing transit service. The FFTZ amendments do not amend the Citywide System Plan or the Transportation System Plan, therefore the City continues to plan for public infrastructure investments in the area to support this objective.

Objective 6. Locate safe pedestrian and bicycle routes within the GLIS that minimize conflicts with industrial traffic. Improve pedestrian and bicycle connections to nearby residential areas to reduce congestion levels and auto emissions, preserve capacity of the street system, and reduce parking needs.

275. **Finding:** The City Council interprets this policy to focus on the investment in pedestrian and bicycle routes in the GLIS, which is a function of transportation policy. The FFTZ amendments do not amend the Citywide System Plan or the Transportation System Plan, therefore this policy does not apply.

Objective 7. Recognize the role of NW Vaughn Street as an important multimodal access route to the Guild's Lake Industrial Sanctuary and Northwest Portland.

276. **Finding:** The City Council interprets this policy to focus on the functional classification of NW Vaughn Street, which is a function of transportation policy. The FFTZ amendments do not amend the Citywide System Plan or the Transportation System Plan, therefore this policy does not apply.

Policy 3: Land Use

Preserve and protect land primarily for industrial uses, and minimize land use conflicts in the Guild's Lake Industrial Sanctuary. Allow compatible nonindustrial uses within the GLIS that provide retail and business services primarily to support industrial employees and businesses.

277. **Finding:** The City Council interprets this policy and the objectives to apply to the GLISP area as whole and not to individual businesses or sectors of business. The City Council interprets this policy to mean that the most effective way to preserve and protect industrial uses is to minimize land use conflicts by limiting nonindustrial uses, which is the reason why the City Council applied the Prime Industrial Overlay Zone to the GLIS as part of the 2035 Comprehensive Plan adoption. The Prime Industrial Overlay Zone restricts additional uses, such as self-service storage and major event entertainment, that are allowed in the industrial base zones. The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, with these changes, the GLIS will continue to be used primarily for industrial uses and land use conflicts will be minimized.

Objective 1. Preserve the overall industrial character of the Guild's Lake Industrial Sanctuary.

278. **Finding:** The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, the overall industrial character of the GLIS will be preserved.

Objective 2. Preserve the physical continuity of the area designated as Industrial Sanctuary within the Guild's Lake Industrial Sanctuary.

279. Finding: The FFTZ amendments do not include map changes, including to the plan district boundaries, therefore, with the physical continuity of the GLIS is preserved.

Objective 3. Minimize conflicts between industrial and nonindustrial land uses.

280. **Finding:** The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, the GLIS will continue to be used primarily for industrial uses and land use conflicts will be minimized.

Objective 4. Prohibit new residential uses within the GLIS.

281. **Finding:** The FFTZ amendments do not include map changes, nor do they allow for new incompatible land uses, therefore, residential uses within the GLIS will continue to be prohibited.

Objective 5. Allow the provision of support services to employees and businesses in the GLIS to reduce trips outside of the GLIS.

282. **Finding:** The FFTZ amendments do not include map changes, nor do they allow for new nonindustrial land uses, therefore, this objective does not apply.

Objective 6. Encourage industrial businesses to locate their accessory offices and showrooms along NW Vaughn Street.

283. **Finding:** The FFTZ amendments do not include map changes, nor do they allow for new nonindustrial land uses. Additionally, there are no FFTs located on NW Vaughn, therefore, this objective does not apply.

Objective 7. Preserve the GLIS's Willamette River waterfront as a location for river-dependent and river-related industrial uses.

284. **Finding:** The existing fossil fuel terminals are designated as a limited use that allows the terminals to continue to operate and invest in upgrades, including their waterfront facilities. The FFTZ amendments do not include map changes, nor do they allow for new nonindustrial land uses, therefore, the Willamette River waterfront is preserved as a location for river-dependent and river-related industrial uses.

Objective 8. Recognize the Willamette River as a valuable economic, transportation, natural and recreational resource for the entire city. Coordinate GLIS Plan policies and implementation measures with ongoing and future citywide planning efforts that address the significance of the river and the city's industrial land supply.

285. **Finding:** The verb "recognize" is defined in the 2035 Comprehensive Plan as to acknowledge and treat as valid. The 2035 Comprehensive Plan defines "coordinate" as work together with others toward a common goal; collaborate. The FFTZ amendments do not include map changes, nor do they allow for new nonindustrial land uses, therefore, the city's industrial land supply is maintained. The FFTZ amendments do not include changes that impact the economic, transportation, natural, and recreational resource function of the Willamette River. The waterfront is preserved as a location for river-dependent and river-related industrial uses. Finally, the ordinance does not regulate transloading facilities, docks or pipelines – facilities that are key components of utilizing the Willamette River as part of the multimodal freight transportation system. As noted in the findings above, the FFTZ amendments are consistent with the policies 3.70, 3.72, 4.82, and 9.36 of the 2035 Comprehensive Plan, and the findings in response to those policies are incorporated by reference.

Objective 9. The industrial character and economic viability of the Guild's Lake Industrial Sanctuary must continue to be the priority when considering the public need for expanded access to the Willamette River. Design and implement any greenway enhancements along the river so as to avoid or minimize negative impacts on industrial operations.

286. Finding: The FFTZ amendments do not include changes to the greenway enhancement requirements in Chapter 33.440, therefore this objective does not apply.

Objective 10. Contribute to the maintenance and enhancement of all of Northwest Portland as a diverse urban environment that includes opportunities for housing, commercial services, and industrial employment in relatively close proximity.

287. **Finding:** The FFTZ amendments do not include map changes, nor do they allow for new nonindustrial land uses, therefore, the diverse urban environment of Northwest Portland is maintained.

The City Council interprets the verb "enhance", which is not defined in the 2035 Comprehensive Plan, to mean to intensify or improve. The FFTZ regulations apply to only one type of business that makes up a minority part of the industrial businesses found in GLIS. The limits on expansion of storage capacity at fossil fuel terminals is mitigated by designating existing fossil fuel terminals as a limited use that allows the terminals to maintain, preserve and continue to operate and improve their intermodal facilities to provide for the continued movement of fossil fuels through the GLIS and supports opportunities for enhancement through a number of exceptions, such as aviation or

renewable fuels, to the storage capacity restrictions; therefore the FFTZ changes contribute maintain and enhancing the industrial employment in this part of Northwest Portland.

Part V. Zoning Code Amendment Criteria

33.835.040 Approval Criteria

A. Amendments to the zoning code. Text amendments to the zoning code must be found to be consistent with the Comprehensive Plan, Urban Growth Management Functional Plan, and the Statewide Planning Goals. In addition, the amendments must be consistent with the intent or purpose statement for the base zone, overlay zone, plan district, use and development, or land division regulation where the amendment is proposed, and any plan associated with the regulations. The creation of a new plan district is subject to the approval criteria stated in 33.500.050.

288. Finding: The findings in this exhibit demonstrate how the FFTZ amendments are consistent with the 2035 Comprehensive Plan, the Urban Growth Management Functional Plan, and the Statewide Planning Goals.

The City Council interprets this criterion to require the FFTZ amendments show consistency on balance. The City Council has applied all applicable policies and the findings in this exhibit demonstrate how the FFTZ amendments to the zoning code are, on balance, consistent with the 2035 Comprehensive Plan, the Urban Growth Management Functional Plan, and with the Statewide Planning Goals.

No new plan district has been proposed, therefore the criteria in 33.500.050 do not apply.

Part VI. Zoning Code Purpose Statements

33.140 Employment and Industrial Zones
33.140.010 General Purpose of the Zones
The employment and industrial zones are for areas of the City that are reserved for industrial uses and for areas that have a mix of uses with a strong industrial orientation. The zones reflect the diversity of industrial and business areas in the City. The zones differ in the mix of allowed uses, the allowed intensity of development, and the development standards. The regulations promote areas which consist of uses and developments which will support the economic viability of the specific zoning district and of the City. The regulations protect the health, safety and welfare of the public, address area character, and address environmental concerns. In addition, the regulations provide certainty to property owners, developers, and neighbors about the limits of what is allowed.

289. Finding: The FFTZ amendments do not allow for new incompatible land uses, therefore, these changes are consistent with the intent to allow a mix of uses with a strong industrial orientation in Portland's industrial districts. These regulations apply to only one type of use that makes up a minority part of the uses found in Portland's industrial districts. The remaining industrial uses continue to operate under current regulations. The FFTZ amendments protect the health, safety and welfare of the public and address environmental concerns by reducing the risk associated with a major earthquake by ensuring that the situation does not get worse by continuing to allow the unlimited increase in fossil fuel terminal storage tank capacity in a high risk area. The regulations provide certainty by designating existing FFTs as a limited use, which allows the terminals to

continue to operate and invest in facilities that reduce the risks and improve their ability to withstand a major earthquake.

33.920 Description of Use Categories

33.920.010 Purpose

This Chapter classifies land uses and activities into use categories on the basis of common functional, product, or physical characteristics. Characteristics include the type and amount of activity, the type of customers or residents, how goods or services are sold or delivered, and certain site factors. The use categories provide a systematic basis for assignment of present and future uses to zones. The decision to allow or prohibit the use categories in the various zones is based on the goals and policies of the Comprehensive Plan.

290. **Finding:** The FFTZ amendments create a new use category – Bulk Fossil Fuel Terminals – based on the function, the type of product handled or produced, the type and amount of activity, and how the goods are sold or delivered. The use category has been assigned to the base zones. The designation of a prohibited or limited use is based on the findings in this exhibit that demonstrate how, on balance, the designation is consistent with the goals and policies of 2035 Comprehensive Plan.

Fossil Fuel Terminal Zoning Amendments

Exhibit B
Remand Report

City of Portland, Oregon

City Council Public Hearing
November 20, 2019 at 2:00 p.m.
City Council Chambers

Bureau of Planning and Sustainability
Innovation. Collaboration. Practical Solutions.
City of Portland, Oregon

Proposed Action

The City of Portland intends to reconsider and readopt the Fossil Fuel Terminal Zoning Amendments. On December 14, 2016, the Portland City Council adopted Ordinance No. 188142 which amended the Zoning Code to create a new land use category (Bulk Fossil Fuel Terminals) with development standards to regulate the storage tank capacity. The amendments prohibited expansion of storage tank capacity at existing fuel terminals and limited new terminal development to 2 million gallons of storage tank capacity. The storage of coal at Bulk Fossil Fuel Terminals was prohibited.

The amendments allowed for the continued operation of existing terminals as a limited use in the industrial and employment zones. Terminals can continue to operate and invest in seismic and safety upgrades. The prohibition on the expansion of storage capacity included exceptions to the storage capacity limits to address issues identified in previous City Council resolutions, particularly for aviation fuels and renewable fuels.

Ordinance No. 188142 was appealed to the Oregon Land Use Board of Appeals (LUBA). In *Columbia Pacific Building Trades Council v. City of Portland*, LUBA Case No. 2017-001, LUBA reversed the Ordinance holding that the City's decision was unconstitutional; failed to demonstrate compliance with the Guild's Lake Industrial Sanctuary Plan (GLISP) and Statewide Planning Goal 12; and was not supported by an adequate factual base.

LUBA's decision was appealed to the Oregon Court of Appeals. In *Columbia Pacific Building Trades Council v. City of Portland*, 289 Or App 739 (2018), the court reversed LUBA's decision in part and affirmed in part. The Court found that the amendments are constitutional, and the City adequately demonstrated compliance with Goal 12.

The Court of Appeals decision was appealed to the Oregon Supreme Court. The Supreme Court denied review in *Columbia Pacific Building Trades Council v. City of Portland*, 363 Or 390 (2018).

On October 5, 2018, LUBA remanded Ordinance No. 188142 for City Council to demonstrate compliance with GLISP and demonstrate that the decision was supported by an adequate factual base.

The City intends to readopt the Fossil Fuel Terminal Zoning Amendments to comply with LUBA's Order. The Zoning Code amendments are similar to the changes adopted in 2016, except for a few minor adjustments to reconcile the Fossil Fuel Terminal Zoning Amendments with subsequent changes to the Zoning Code that have been adopted since 2016.

The November 20, 2019, City Council public hearing will focus on the consideration of additional evidence to ensure that the amendments are supported by an adequate factual base. Additionally, the findings will demonstrate that the amendments comply with the goals and policies in the 2035 Comprehensive Plan, which was adopted subsequent to the initial adoption of Ordinance No. 188142.

Timeline

In Resolutions 36959 and 36962, adopted in 2012, the City Council expressed opposition to coal trains traveling through Portland until a programmatic, comprehensive and area-wide Environmental Impact Statement and comprehensive Health Impact Assessment are completed.

The City's 2015 Climate Action Plan (adopted by Resolution 37135) identifies the need to establish a "fossil fuel export policy that considers lifecycle emissions, safety, economics, neighborhood livability and environmental impacts" (Climate Action Plan, action 3G, page 69). The City committed in its 2015 Climate Action Plan to advancing policy and programs to reduce local fossil fuel use both in the City's own operations and through community-wide initiatives.

Resolution 37168, adopted November 12, 2015, expressed the City Council's opposition to the "expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." It also expressed the Council's intent not to restrict improvements in safety, efficiency, or seismic resilience; the provision of service directly to end users; or infrastructure that will accelerate the transition to non-fossil fuel energy sources. The City Council also expressed support for accelerating the transition to non-fossil fuel energy sources. As part of that transition, the Oregon Department of Environmental Quality (ODEQ) is implementing the Oregon Clean Fuels Program, which requires a 10 percent reduction in average carbon intensity by 2025. Fuels that could be used to achieve the standards include ethanol, biodiesel, electricity, hydrogen, natural gas, propane, and biogas, which may require additional storage capacity. In order to facilitate implementation of the Clean Fuels Program, non-fossil fuel storage tanks are not subject to the capacity limits.

Portland's existing fossil fuel terminals

Portland's industrial districts are Oregon's largest seaport, rail hub and truck distribution center. The Northwest Industrial District in Portland is also the end of the Olympic Pipeline, which supplies most of Oregon's petroleum fuels from Puget Sound refineries. The ten petroleum terminals located in Northwest Portland are the gateway distribution facilities serving Oregon and Southern Washington markets. Additionally, NW Natural's GasCo terminal provides peak-consumption storage of natural gas for the region. In Northwest Portland, these "tank farm" storage facilities have direct access to pipeline, deep-water port, railroad and truck route infrastructure.

Figure 1. An example of petroleum terminals located in the Willbridge area of NW Portland.

33.140.050 Neighborhood Contact

As an alternative to a land use review, a public notice and meeting requirement applies to development of fuel storage structure, such as a new tank, at a Bulk Fossil Fuel Terminal, similar to the requirement for multi-dwelling residential development. This notice and meeting would create public awareness about the project and serve to discuss a proposal in an informal basis.

33.140.050 Neighborhood Contact in EG and I Zones

A. Purpose. Neighborhood contact is required when a new storage structure for any type of fuel will be built on a Bulk Fossil Fuel Terminal because of the impacts that fuel projects can have on the surrounding community.

B. Neighborhood contact requirement. Proposals meeting the following conditions are subject to the neighborhood contact requirement steps of 33.705.020.B., Neighborhood Contact II. All of the steps in 33.705.020.B. must be completed before an application for a building permit can be submitted:

1. The proposed development has not been subject to a land use review; and

2. The proposed development includes at least one new structure for the storage of any type of fuel.

Commentary

33.140.100 Primary Uses

The amendments to this section reflect changes to prohibit new Bulk Fossil Fuel Terminals in the employment and industrial base zones and reclassify existing terminals as limited uses. Regulation of Bulk Fossil Fuel Terminals implements policy direction in City of Portland Resolution 37168 (adopted November 2015) and, 2035 Comprehensive Plan Policies 4.79, 4.81, 4.82, 6.48, and 7.14 which address reducing natural hazard risks and fossil fuel distribution and storage facilities.

The limited use designation prohibits expansion of fossil fuel tank capacity at existing Bulk Fossil Fuel Terminals, but allows for the replacement and reconfiguration of existing tank capacity as a way to facilitate seismic and safety upgrades.

33.140.100 Primary Uses

A. No change

B. Limited uses. Uses allowed that are subject to limitations are listed in Table 140-1 with an "L". These uses are allowed if they comply with the limitations listed below and the development standards and other regulations of this Title. In addition, a use or development listed in the 200s series of chapters is also subject to the regulations of those chapters. The paragraphs listed below contain the limitations and correspond with the footnote numbers from Table 140-1.

1. – 16. No change

17. Bulk Fossil Fuel Terminals. This regulation applies to all parts of Table 140-1 that have a [17].

    a. Existing Bulk Fossil Fuel Terminals. Bulk Fossil Fuel Terminals that existed on [insert effective date] are allowed, but the total amount of fossil fuel that can be stored on the site in storage tanks is limited to the fossil fuel storage tank capacity that existed on [insert effective date]. Total fossil fuel storage tank capacity on the site in excess of the capacity that existed on [insert effective date] is prohibited. Storing coal on the site is prohibited.

    b. New Bulk Fossil Fuel Terminals are prohibited.

Commentary

Table 140-1 Employment and Industrial Zone Primary Uses

The amendments to this section reflect changes to prohibit new Bulk Fossil Fuel Terminals in all employment and industrial base zones and reclassify existing terminals as limited uses.

Commentary

33.910.030 Definitions

The definition of fossil fuels was added to clarify the land use category Bulk Fossil Fuel Terminals.

Petrochemicals that are used primarily for non-fuel products are excluded, such as asphalt, plastics, lubricants, fertilizer, roofing, and paints. However, methanol is an exception that is included as a fossil fuel, because large methanol storage and distribution facilities tend to have structural similarities to liquid natural gas (LNG) and liquid petroleum gas (LPG) terminals, including large-scale storage and gas pipeline access, and because they can have similar safety and climate impacts.

Fuels containing 5% or less fossil-fuel volume are not considered fossil fuels under this definition. For example, "pure" ethanol made from corn or other non-fossil source is required by the Alcohol and Tobacco Tax and Trade Bureau to be denatured in order to be transported to the site. Denatured ethanol typically contains up to 5% methanol, so that it is toxic and undrinkable.

Some fossil fuels under this definition are also classified as "renewable fuels" in the federal Renewable Fuel Standard and "clean fuels" in Oregon's Clean Fuel Standard, such as liquid natural gas and liquid propane gas. These federal and state standards require transportation fuel sold within their jurisdiction to contain a minimum volume of renewable or clean fuels. Renewable or clean fuels with more than 5 percent fossil fuel volume are defined as fossil fuels.

33.910.030 Definitions
The definition of words with specific meaning in the zoning code are as follows:

Fossil Fuel. Fossil fuels are petroleum products (such as crude oil and gasoline), coal, methanol, and gaseous fuels (such as natural gas and propane) that are made from decayed plants and animals that lived millions of years ago and are used as a source of energy. Denatured ethanol and similar fuel additives with less than 5 percent fossil fuel content, biodiesel/renewable diesel with less than 5 percent fossil fuel content, and petroleum-based products used primarily for non-fuel uses (such as asphalt, plastics, lubricants, fertilizer, roofing, and paints) are not fossil fuels.

Commentary

33.920.300 Bulk Fossil Fuel Terminal

Bulk Fossil Fuel Terminals are added as a new land use category to regulate their development in the Zoning Code. Regulation of Bulk Fossil Fuel Terminals implements policy direction in City of Portland Resolution 37168 and 2035 Comprehensive Plan Policies 4.79, 4.81, 4.82, 6.48, and 7.14 which address reducing natural hazard risks and fossil fuel distribution and storage facilities.

Bulk Fossil Fuel Terminals are characterized by having (1) marine, pipeline or railroad transport access and (2) either trans-loading facilities for transferring a shipment between transport modes (such as from rail to ship) or bulk storage facilities exceeding 2 million gallons of fossil fuels. The 2-million-gallon threshold is sized to include facilities that are large enough to unload unit trains. Functionally, these terminals tend to be regional gateway facilities, where fossil fuels enter and exit the region. Additionally, Policy 6.48 calls for limiting fossil fuel distribution and storage facilities to those necessary to serve the regional market. However, the use classification is intended to be clearly identifiable by physical characteristics and not rely on a definition of region.

The regional market area of Bulk Fossil Fuel Terminals varies by product and is difficult to define. Portland's 10 petroleum terminals generally serve Oregon and Southern Washington. This market area substantially exceeds the Portland metropolitan area, which is often colloquially referred to as the region.

The use description is clarified with criteria that are intended to prevent the aggregation of new facilities smaller than 2 million gallons on adjacent sites into a larger terminal that could effectively circumvent the terminal storage capacity threshold.

Resolution 37168 lists a specific exception to not restrict service directly to end users. At a small scale, services to end users include retail gasoline filling stations, natural gas access lines in street right-of-way to residential and business customers, and heating oil tanks at home sites. Larger scale end users with fossil fuel storage and access infrastructure also include manufacturers, jet fuel facilities for PDX Airport, vessel fuel facilities on Portland Harbor, and others, where fossil fuels are used as an input.

33.920.300 Bulk Fossil Fuel Terminal

A. Characteristics. Bulk Fossil Fuel Terminals are establishments primarily engaged in the transport and bulk storage of fossil fuels. Terminal activities may also include fuel blending, regional distribution, and wholesaling. The firms rely on access by marine, railroad, or regional pipeline to transport fuels to or from the site, and either have transloading facilities for transferring a shipment between transport modes, or have storage capacity exceeding 2 million gallons for fossil fuels. There is minimal on-site sales activity with the customer present.

B. Accessory uses. Accessory uses may include retail sales of petroleum products, offices, food membership distribution, parking, storage, truck fleet parking and maintenance areas, rail spur or lead lines, and docks.

C. Examples. Examples include crude oil terminals, petroleum products terminals, natural gas terminals, propane terminals, and coal terminals.

D. Exceptions.

1. Truck or marine freight terminals that do not store, transport or distribute fossil fuels are classified as Warehouse And Freight Movement uses.
2. Truck or marine freight terminals that do not have transloading facilities and have storage capacity of 2 million gallons or less are classified as Warehouse And Freight Movement uses. However, multiple fossil fuel facilities, each with 2 million gallons of fossil fuel storage capacity or less but cumulatively having a fossil fuel storage capacity in excess of 2 million gallons, located on separate parcels of land will be classified as a Bulk Fossil Fuel Terminal when two or more of the following factors are present:
   a. The facilities are located or will be located on one or more adjacent parcels of land. Adjacent includes separated by a shared right-of-way;
   b. The facilities share or will share operating facilities such as driveways, parking, piping, or storage facilities; or
   c. The facilities are owned or operated by a single parent partnership or corporation.
3. Gasoline stations and other retail sales of fossil fuels are not Bulk Fossil Fuel Terminals.
4. Distributors and wholesalers that receive and deliver fossil fuels exclusively by truck are not Bulk Fossil Fuel Terminals.
5. Industrial, commercial, institutional, and agricultural firms that exclusively store fossil fuel for use as an input are not Bulk Fossil Fuel Terminals.
6. Uses that involve the transfer or storage of solid or liquid wastes are classified as Waste-Related uses.
7. The storage of fossil fuels for exclusive use at an airport, surface passenger terminal, marine, truck or air freight terminal, drydock, ship or barge servicing facility, rail yard, or as part of a fleet vehicle servicing facility are not Bulk Fossil Fuel Terminals.
8. Uses that recover or reprocess used petroleum products are not Bulk Fossil Fuel Terminals.

Commentary

33.920.310~~300~~ Industrial Service

33.920.320~~310~~ Manufacturing And Production

33.920.330~~320~~ Railroad Yards

33.920.340~~330~~ Warehouse And Freight Movement

A. Characteristics. Warehouse And Freight Movement firms are involved in the storage, or movement of goods for themselves or other firms. Goods are generally delivered to other firms or the final consumer, except for some will-call pickups. There is little on-site sales activity with the customer present.

B. Accessory uses. Accessory uses may include offices, food membership distribution, truck fleet parking and maintenance areas, rail spur or lead lines, docks, and repackaging of goods.

C. Examples. Examples include separate warehouses used by retail stores such as furniture and appliance stores; household moving and general freight storage; cold storage plants, including frozen food lockers; storage of weapons and ammunition; major wholesale distribution centers; truck, marine, or air freight terminals; bus barns and light rail barns; parcel services; major post offices; grain terminals; and the stockpiling of sand, gravel, or other aggregate materials.

D. Exceptions.

1. Uses that involve the transfer or storage of solid or liquid wastes are classified as Waste-Related uses.
2. Miniwarehouses are classified as Self-Service Storage uses.
3. Establishments that engage in the transfer or storage of fossil fuels, rely on access by marine, railroad or regional pipeline to transport fuels to or from the site, and either have transloading facilities or have storage capacity exceeding 2 million gallons for fossil fuels are classified as Bulk Fossil Fuel Terminal uses.

33.920.350~~340~~ Waste-Related

33.920.360~~350~~ Wholesale Sales

A. Characteristics. Wholesale Sales firms are involved in the sale, lease, or rent of products primarily intended for industrial, institutional, or commercial businesses. The uses emphasize on-site sales or order taking and often include display areas. Businesses may or may not be open to the general public, but sales to the general public are limited as a result of the way in which the firm operates. Products may be picked up on site or delivered to the customer.

B. Accessory uses. Accessory uses may include offices, food membership distribution, product repair, warehouses, parking, minor fabrication services, and repackaging of goods.

C. Examples. Examples include sale or rental of machinery, equipment, heavy trucks, building materials, special trade tools, welding supplies, machine parts, electrical supplies, janitorial supplies, restaurant equipment, and store fixtures; mail order houses; and wholesalers of food, clothing, auto parts, building hardware, and office supplies.

Commentary

D. Exceptions.

1. Firms that engage primarily in sales to the general public are classified as Retail Sales And Service.
2. Firms that engage in sales on a membership basis are classified as either Retail Sales And Service or Wholesale Sales, based on a consideration of the characteristics of the use.
3. Firms that are primarily storing goods with little on-site business activity are classified as Warehouse And Freight Movement.
4. Establishments that engage in the regional wholesaling of fossil fuels, rely on access by marine, railroad or regional pipeline to transport fuels to or from the site, and either have transloading facilities or have storage capacity exceeding 2 million gallons for fossil fuels are classified as Bulk Fossil Fuel Terminal uses.

IMPACT STATEMENT

Legislation title: *Readopt remanded Ordinance No. 188142 to restrict bulk fossil fuel terminals. (Ordinance; Amend Title 33, Planning and Zoning)

Contact name: Tom Armstrong, Bureau of Planning and Sustainability
Contact phone: 503-823-3527
Presenter name: Andrea Durbin and Tom Armstrong, Bureau of Planning and Sustainability

Purpose of proposed legislation and background information:
This ordinance is a reconsideration of Fossil Fuel Terminal Zoning amendments (Ordinance No. 188142) that were adopted in 2016. That ordinance was appealed to the Oregon Supreme Court and is now back before City Council. These code changes restrict development and expansion of Bulk Fossil Fuel Terminals.

- Bulk Fossil Fuel Terminals are characterized by (a) marine, railroad, or pipeline transport access and (b) either storage capacity exceeding 2 million gallons or transload facilities (such as rail-to-ship loading)
- Fossil fuels include petroleum products (such as crude oil and gasoline), coal, natural gas, and propane, and methanol, which is produced from natural gas.
- No new Bulk Fossil Fuel Terminals are allowed.

The existing Bulk Fossil Fuel Terminals in Industrial and General Employment zones become “limited uses” that can continue to operate. Expansion of fossil fuel storage at these existing terminals would be prohibited, with limited exceptions.

The code changes will not apply to gas stations; distributors and wholesalers that receive and deliver fossil fuels exclusively by truck; industrial, commercial, institutional, and agricultural uses that store fossil fuels for use as an input; uses that involve the transfer or storage of solid or liquid wastes are classified as Waste-Related uses. Fossil fuel storage facilities for airports, marine terminals, rail yards, and fleet vehicle fuel facilities are specifically exempted.

Previous Council Actions
- Resolutions 36959 and 36962 adopted in 2012, the Council expressed opposition to coal trains traveling through Portland until a programmatic, comprehensive and area-wide Environmental Impact Statement and comprehensive Health Impact Assessment are completed.
- Resolution 37168, adopted November 12, 2015, expressed the City Council’s opposition to the “expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways.” It also expressed the Council’s intent not to restrict improvements in safety, efficiency, or seismic resilience; the provision of service directly to end users; or infrastructure that will accelerate the transition to non-fossil fuel energy sources.

- The 2015 Climate Action Plan to advancing policy and programs to reduce local fossil fuel use both in the City's own operations and through community-wide initiatives.
- The 2035 Comprehensive Plan sets policy direction (Policies 4.75 and 4.76) to encourage disaster-resilient development and specifically to reduce natural hazard risks to critical energy and transportation infrastructure in Portland Harbor.
- The original version (Ordinance No. 188142) was adopted in 2016 and appealed to the Oregon Land Use Board of Appeals (LUBA), the Oregon Court of Appeals, and the Oregon Supreme Court. It has been remanded back to the City of Portland for reconsideration of policies and additional evidence.

Financial and budgetary impacts:
- There are no long-term financial impacts for the City (e.g. ongoing debt payments, purchase of property requiring operations and maintenance, ratification of labor contract, etc.)
- There are no budget impacts – the action does not amend the budget.
- The legislation does not authorize additional spending on a new or existing project or program.
- There is no expected change in current and future revenues.
- The legislation does not create, eliminate or re-classify positions now or in the future. This legislation will require staff time to defend an expected appeal of this ordinance and on-going monitoring of development permits associated with the existing fossil fuel terminals.
- The legislation does not result in a new or modified financial obligation or benefit, including IAs, IGAs, MOUs, grants, contracts or contract amendments.

Community impacts and community involvement:
These regulations apply to only one type of business that makes up a minority part of the businesses found in Portland's industrial districts. The remaining industrial uses continue to operate under the current development review standards. The FFTZ amendments support the retention of existing fossil fuel terminals by designating them as a limited use that allows the terminals to continue to operate and invest in upgrades and supports opportunities for growth through exceptions, such as aviation or renewable fuels. Further, the use limitations provide flexibility to FFTs to replace and reconfigure existing storage tank capacity, such as consolidating smaller tanks into larger tanks, to meet future needs.

Given that this ordinance is a reconsideration of a previously adopted ordinance, BPS relied upon the previous public testimony that informed that ordinance. This ordinance is substantially the same ordinance with a few minor adjustments to reconcile the code amendments with the current Zoning Code.

The community involvement process for the previous ordinance included stakeholder focus group meetings with terminal owners and business groups as well as environmental groups. The process also included extensive public testimony that informed the Planning and Sustainability Commission recommendation as well as the final adoption by the City Council.

100% Renewable Goal:

- This action does not affect the City's total energy use.
- This action supports the City's renewable energy use by allowing for additional storage tank capacity for renewable fuels at existing fossil fuel terminals.
