Subject: Pass a full ban on new or expanded fossil fuel terminals!
Date: Saturday, November 05, 2016 12:26:13 PM

I fully support a COMPLETE ban on new or expanded fossil fuel terminals...ANYWHERE. We are killing our planet with oil, coal, LNG, pesticides, and GMOs. What the hell is wrong with those who put their PERSONAL profits above the viability of our planet? They need to GROW A BRAIN, you can't drink oil, you can't eat money, and you can't breathe car exhaust.

NO MORE FOSSIL FUELS - LEAVE IT IN THE GROUND

Thank you to the Planning and Sustainability Commission and the Bureau of Planning and Sustainability for its work in incorporating public input on its initial drafts of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes closer to the original intent of the 2015 Resolution.

However, the current Fossil Fuel Zoning Amendments recommended draft still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland." Although this draft prohibits new larger bulk terminals, it still allows new terminals up to 2 million gallons and allows existing terminals to expand by 10%. In order to protect our immediate health and safety and play our part in stopping catastrophic climate change, we must pass an ordinance that fully prohibits new fossil fuel storage tanks.

I want the City of Portland to:

Enact a full ban on new terminals, large or small. A 2 million gallon facility is still too large. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

Prohibit expansions at existing terminals and require them to make upgrades for Seismic Safety through State Building Codes.

Prevent NW Natural from getting a carve out. Allowing new LNG storage in Portland is unnecessary and bad for our safety and climate. NW Natural has no current plans for more LNG storage in Portland and should be included in this policy just like the other fossil fuel terminal operators.

Now more than ever the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,
Vesta

Dear Mayor Hales, Members of the Council, and Staff:

Thank you for your diligent work in bringing forward a new set of land use rules that could establish Portland as a global leader in transitioning away from fossil fuels. In November 2015, you voted unanimously to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Portland's resolution was an important step towards reducing the climate, safety, and environmental risks of oil trains, coal trains, and fossil fuel storage.

In translating Portland's landmark resolution into binding city rules, I ask that you take the strongest stand possible for our climate and safety. First, I ask that you do not allow existing terminals to expand. Allowing a 10% or greater expansion at existing terminals could increase the number of dangerous oil and coal trains coming through Portland and its uprail neighbors like Mosier, OR, where an oil train derailed and spilled causing a dramatic fire in the Gorge.

Secondly, I ask that you prohibit all new fossil fuel infrastructure. The language of your resolution was clear: "to actively oppose new fossil fuel infrastructure." Terminals of two million gallons or less are an unnecessary give-away to the fossil fuel industry. The proposed zoning code already has an exception for fuels that contain non-fossil energy.

Third, I ask that you resist pressure from the fossil fuel industry to exempt any fossil fuels or to weaken the proposed code language. Portland is poised to lead on climate, but we need you to stand firm and make sure the final fossil fuel code reflects the intent of your November 2015 vote.

Thank you for your effort, and I look forward to living in a city and a region that is determined to reduce its reliance on dangerous, polluting fossil fuels like oil and coal.

Sincerely,

Ashley McGraw

For moral and ethical reasons, all efforts in our power to stop the accumulation of greenhouse gases in Earth's atmosphere must be taken. What is at stake if we do not?
-More severe and life threatening weather systems.
-Rising ocean levels with inundation of major population centers.
-Compromised and threatened food and water supplies.
-Northward spread of tropical and warm weather infectious diseases.
-Worsening health for those with heart disease and lung disease as temperatures rise.

And, of course, those who will suffer the most will be the poor, the very young and the very old, and the chronically ill.

The City Council of Portland has the power to do its part in the global fight against climate change. I ask you to vote for the following:
1. Ban all new fossil fuel terminals, whether large or small.
2. Prohibit the expansion of existing terminals though insure that they comply with upgrades for seismic safety per OR state building codes.
3. Do not exempt NW Natural Gas from the ban on new terminals. In addition, It should not be allowed to expand existing terminals during the seismic upgrades.

Respectfully submitted,
Patricia Mizutani, MD

Thank you to the Planning and Sustainability Commission and the Bureau of Planning and Sustainability for it's work on the 2015 resolution.

I have recently spent 5 months in varying parts of Asia including China, and have seen the destruction of air quality caused by fossil fuels. The World Health Organization has routinely declared states of emergency and told people to remain indoors when the level of particulate matter in the air has increased to levels unsafe to breath. The particulate matter released into the air is caused from burning coal. If we allow ports to be built in Oregon to export coal to Asia, the fossil fuels that are burned in Beijing and other mega cities across China will not only pollute the air there, but also here in the USA. Studies have shown that some of the air pollution the United States is exposed to, has blown across the ocean directly from Asia. It does not make sense to export dirty energy sources across the ocean where they will be burned and then travel back to the USA contributing to asthma and other respiratory illnesses.

Please enact a full ban on fossil fuel terminals in Oregon, so that we can continue to breath in fresh air on the west coast.

Best,

Subject: Pass a full ban on new or expanded fossil fuel terminals!
Date: Saturday, November 05, 2016 9:03:06 AM

Please consider the catastrophic repercussions of global warming...stand up for the future generations ! No to BIG OIL Corporations ! We demand clean air, water, and food! No fossil fuel terminals! Current ones need seismic updating along with other infrastructures as well.

Thank you for listening...

Dear Mayor Hales, Members of the Council, and Staff:

Thank you for your diligent work in bringing forward a new set of land use rules that could establish Portland as a global leader in transitioning away from fossil fuels. In November 2015, you voted unanimously to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Portland's resolution was an important step towards reducing the climate, safety, and environmental risks of oil trains, coal trains, and fossil fuel storage.

In translating Portland's landmark resolution into binding city rules, I ask that you take the strongest stand possible for our climate and safety. First, I ask that you do not allow existing terminals to expand. Allowing a 10% or greater expansion at existing terminals could increase the number of dangerous oil and coal trains coming through Portland and its uprail neighbors like Mosier, OR, where an oil train derailed and spilled causing a dramatic fire in the Gorge.

Secondly, I ask that you prohibit all new fossil fuel infrastructure. The language of your resolution was clear: "to actively oppose new fossil fuel infrastructure." Terminals of two million gallons or less are an unnecessary give-away to the fossil fuel industry. The proposed zoning code already has an exception for fuels that contain non-fossil energy.

Third, I ask that you resist pressure from the fossil fuel industry to exempt any fossil fuels or to weaken the proposed code language. Portland is poised to lead on climate, but we need you to stand firm and make sure the final fossil fuel code reflects the intent of your November 2015 vote.

Thank you for your effort, and I look forward to living in a city and a region that is determined to reduce its reliance on dangerous, polluting fossil fuels like oil and coal.

Sincerely,

Jan Zuckerman

I want a full ban on new fossil fuel infrastructure projects.
Enact a full ban on new terminals, large or small. A 2 million gallon facility is still too large. We need NO new fossil fuel infrastructure.
Prohibit expansions at existing terminals and require them to make upgrades for Seismic Safety through State Building Codes.
Prevent NW Natural from getting a carve out. NW Natural wants to be exempted from this policy and we need to make sure the City Council does not add a last minute amendment on NW Natural's behalf.

Enact a full ban on new terminals, large or small. A 2 million gallon facility is still too large. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.
Prohibit expansions at existing terminals and require them to make upgrades for Seismic Safety through State Building Codes.
Prevent NW Natural from getting a carve out. Allowing new LNG storage in Portland is unnecessary and bad for our safety and climate. NW Natural has no current plans for more LNG storage in Portland and should be included in this policy just like the other fossil fuel terminal operators.

Dear Mayor Hales, Members of the Council, and Staff:

I want Portland to be a global leader in transitioning away from fossil fuels. We went a long way toward that goal in November 2015, when you voted unanimously to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways."

I now ask that you take the strongest stand possible for our climate and safety. First, I ask that you do not allow existing terminals to expand. Allowing a 10% or greater expansion at existing terminals could increase the number of dangerous oil and coal trains coming through Portland and its uprail neighbors like Mosier, OR, where an oil train derailed and spilled causing a dramatic fire in the Gorge.

Secondly, I ask that you prohibit all new fossil fuel infrastructure. The language of your resolution was clear: "to actively oppose new fossil fuel infrastructure." Terminals of two million gallons or less are an unnecessary give-away to the fossil fuel industry. The proposed zoning code already has an exception for fuels that contain non-fossil energy.

Third, I ask that you resist pressure from the fossil fuel industry to exempt any fossil fuels or to weaken the proposed code language. Portland is poised to lead on climate, but we need you to stand firm and make sure the final fossil fuel code reflects the intent of your November 2015 vote.

Thank you for your effort, and I look forward to living in a city and a region that is determined to reduce its reliance on dangerous, polluting fossil fuels like oil and coal.

Sincerely,

Paige Osberg

Thank you for your effort, and I look forward to living in a city and a region that is determined to reduce its reliance on dangerous, polluting fossil fuels like oil and coal.)

The above statement is from Columbia Riverkeeper and covers the issues that concern us. What I'd like to know is why would anyone want to invest in expensive infrastructure that will be obsolete before it is paid for. Fossil fuels are/must be on their way out. We can't afford to invest in yesterday's technology but must instead invest in the coming sustainable energy future.

Sincerely,

Robert Ranta

Subject: Pass a full ban on new or expanded fossil fuel terminals!
Date: Friday, November 04, 2016 11:45:42 PM

In regards to the Fossil Fuel Zoning Amendments, I would like the City of Portland to:

-Enact a full ban on new terminals, large or small. A 2 million gallon facility is still too large. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.
-Prohibit expansions at existing terminals and require them to make upgrades for Seismic Safety through State Building Codes.
-Prevent NW Natural from getting a carve out. Allowing new LNG storage in Portland is unnecessary and bad for our safety and climate. NW Natural has no current plans for more LNG storage in Portland and should be included in this policy just like the other fossil fuel terminal operators.

Let's be leaders in the movement to sustain life on this planet! Shifting our energy focus to renewables and away from fossil fuels could allow us to pass this land down to our children and grandchildren knowing we did our best to make it liveable! Now more than ever the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,
Mary Rose

Thank you to the Planning and Sustainability Commission and the Bureau of Planning and Sustainability for its work in incorporating public input on its initial drafts of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes closer to the original intent of the 2015 Resolution.

However, the current Fossil Fuel Zoning Amendments recommended draft still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland." Although this draft prohibits new larger bulk terminals, it still allows new terminals up to 2 million gallons and allows existing terminals to expand by 10%. In order to protect our immediate health and safety and play our part in stopping catastrophic climate change, we must pass an ordinance that fully prohibits new fossil fuel storage tanks.

I want the City of Portland to:

Enact a full ban on new terminals, large or small. A 2 million gallon facility is still too large. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.Prohibit expansions at existing terminals and require them to make upgrades for Seismic Safety through State Building Codes.Prevent NW Natural from getting a carve out. Subject: Full Ban No Exemptions
Date: Friday, November 04, 2016 6:40:58 PM

Dear City Council Members:

I know that you know all about climate change already. And you know how devastating fracking is to our water supply. And you already know what transporting coal does to air quality. And we just had a huge explosion in our backyard. Fossil fuels are the past. We need to turn our faces toward the future.

I would like to see Portland become a national leader on this issue. I want us to make the news. I want cities worldwide to hear that we just banned all new fossil fuel terminals in our city and we are turning toward renewables. Because it's the right thing to do, and because we all have to. No exceptions, no exemptions.

NW Natural has had a good run, and they will have to deal with market pressures just like any other business that extracts maximum profit. They will have to plan for energy descent and diversify, plain and simple. We don't owe them anything. It's funny how corporations love to talk about the market when it is in their favor, how they must sell out the common good for profit, but when the market shifts away from them, all the sudden they want to dip from the common well. Nope. It doesn't work that way.

To whom it concerns,

AUDITOR 11/03/16 PM12:13

My name is Nic Hofmann. I am a student at Lincoln High School, an athlete, a brother, a son, an environmentalist, and many more things, but everything I am depends on the environment in which I live. The success of our future, and most importantly our kids', and our grandkids' future depends on the condition we leave our environment in. As our city approaches this monumental moment you have the opportunity to change the future for our city, our state, our country, and even the world. Your decision will decide the future of those yet to come. In the words of Joshua Lawrence Chamberlain, Commander of the 20th Maine Infantry, at the battle of Gettysburg:

"...In a momentous struggle such as this, it is character that tells. I do not mean simply bravery. What I mean is a seasoned substance of soul. I mean such qualities as intelligence, thoughtfulness, conscientiousness, right-mindedness, patience, fortitude, and unconquerable resolve....

We know not the future, and cannot plan for it. But we can hold our spirits and our bodies so pure and high, we may cherish such thoughts and ideals, and dream such dreams of lofty purpose, that we can determine what manner of men we will be whenever and wherever the hour strikes, that calls to noble action."

In this time, our city calls YOU to noble action, and we seek leadership. We ask of you to display the qualities that Chamberlain speaks of. Now more than ever your thoughtfulness, fortitude, and right-mindfulness will change the world should you choose to.

OUR city needs to:
1. Enact a full ban on new terminals, large or small. A 2 million gallon facility is still too large.

2. Prohibit expansions at existing terminals and require them to make upgrades for Seismic Safety through State Building Codes.

3. Prevent NW Natural from getting an exemption. Allowing LNG storage in Portland is unnecessary and bad for our safety and climate. NW Natural has no current plans for more LNG storage in Portland and should be included in this policy just like the other fossil fuel terminal operators.

Intelligence, thoughtfulness, conscientiousness, right-mindedness, patience, fortitude, and unconquerable resolve, these qualities are what we ask of, these qualities are what will make history, these qualities are what will create a better world for those yet to come. These qualities will help you be for and of the people.

Sincerely,

Nic Hofmann

Spilled crude oil has poisoned land areas, our oceans. The world is moving forward to clean energy. We must divest from oil energy at a much greater rate than is happening now. New, expanded terminals to ship oil over our land and oceans is hardly working to phase out oil energy. Let us, the world, embrace the new clean energy technology already available. Let us implement this energy at a rate which addresses the environmental, atmospheric CRISIS facing our Earth. FAST & NOW, TODAY!

Please live up to your own spin. DO Ban all new terminals. Prohibit expansions at existing terminals. No carve out for NW Natural Gas. In this moment, when the entire planet must turn away from the use of fossil fuels, there is no beneficial expansion of fossil fuel infrastructure. Increasing or expanding existing infrastructure are not neutral acts without consequence. Accidents will happen. and be horribly destructive and environmentally devastating. Increased use of fossil fuels, by anyone anywhere increases catastrophic climate change. Survival of the interdependent systems of the planet require that we now change attitude and behavior to live sustainably together. Please act responsibly.

Date: Thursday, November 03, 2016 7:01:35 PM

Hi,

I work with Oregonians living below the poverty line, especially those who work in two of our states' big industries: Fishing and agriculture. I see how their lives are disproportionately impacted by rising temperatures associated with the burning of fossil fuels. These impacts include the following: Kidney damage from dehydration in hotter summers, heat stress on the body (risk of fainting, heart failure and death, as has happened in Washington this past year and California), more frequent falls from ladders as balance decreases with dehydration, more pesticides in the blood of children who live by farms as warmer winters kill less pests requiring more chemicals to be applied, and communities of color who have been displaced by this city's policy to build Legacy Emmanuel Hospital and push black residents out near I-205 where air quality from highways is poorer, then displace these communities again by failing to ensure funds from the Portland development commission go to minority residents to rebuild, a situation that combines the worst of environmental injustice with social injustice. In light of this city government's history of systematically placing poorer people more at risk by, for example, developing fossil fuel infrastructure in an earthquake zone right next to North Portlanders schools and homes without proper safety codes in the event of an earthquake, it is high time that this city government start addressing climate change because this is an issue affecting the immediate health and safety of residents every time they breathe or go to work, and the long term health of our communities' children.

The current draft is much improved, bringing the proposed changes closer to the original intent of the 2015 Resolution.

However, the current Fossil Fuel Zoning Amendments recommended draft still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland." Although this draft prohibits new larger bulk terminals, it still allows new terminals up to 2 million gallons and allows existing terminals to expand by 10%. In order to protect our immediate health and safety and play our part in stopping catastrophic climate change, we must pass an ordinance that fully prohibits new fossil fuel storage tanks.

I want the City of Portland to:
1. Enact a full ban on new terminals, large or small. A 2 million gallon facility is still too large. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

2. Prohibit expansions at existing terminals and require them to make upgrades for Seismic Safety through State Building Codes.

3. Prevent NW Natural from getting a carve out. Allowing new LNG storage in Portland is unnecessary and bad for our safety and climate. NW Natural has no current plans for more LNG storage in Portland and should be included in this policy just like the other fossil fuel terminal operators.

Now more than ever the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Danny Thiemann

I oppose any development on Portland's floodplain because due to climate change major flooding of the Willamette River now occurs every 20 years rather than 100 years. Which means we are for another doozy this winter. Most of the dams in the Pacific Northwest were not for flood control but rather for hydroelectric generation and irrigation. Up until recently, PGE's idea of flood control at Willamette Falls dam was hammering boards on top of its dam to hold back floodwaters. what that means is we cannot rely on the US Army Corps of Engineers to mitigate future extreme flooding events. So when a biblical flood comes, who is going to bail out the businesses and residential development that exists on Portland's floodplain? If you said the US Taxpayers, you are correct. The federal flood insurance program encourages foolish development on our valuable floodplain habitat. It is a massive subsidy to high risk private and commercial real estate developers. I pay enough taxes to Oregon and to Uncle Sam and I don't want my tax bill increased to support fossil fuel terminals or any other floodplain developments that the city of Portland is encouraging.

I feel like we're at a crossroads where ordinary citizens are becoming more aware than ever about the effects of oil, gas and coal on the environment and are asking themselves what kind of world do they want to leave their children. The time is now. The Paris Agreement on Climate Change came into effect on Friday and every country should see the writing on the wall because changes to the climate are occurring even faster than climate scientists had predicted. Bernie Sanders is on the right side of history when he says that we should be making investments in clean energy technologies, retraining people who work in the energy sector, in order to prevent the worst impacts of climate change, especially given that we are the largest consumer of energy in the world. That is why the protest at Standing Rock is so extremely important - because we should not be building infrastructure for dirty, polluting energy sources. We must fight that at every turn. It is my belief that we actually already have the technologies for clean energy solutions at our fingertips but the power of polluters is so strong. It is particularly disturbing that journalists are being arrested and that our police are being used against us to support corporate interests. Their motto is privatize the profits, socialize the losses - for example, we paid $10 billion in hard earned tax dollars to clean up the massive Gulf spill. That's outrageous! And yet, the media and most of our representatives in government are silent. As Leo DiCaprio says in his great film "After The Flood," there is no more time for 10 year plans. We're running out of time to do the right thing for our children and for our beautiful planet. Let's make Portland a leader on this very important issue. PLEASE ENACT A FULL BAN ON NEW TERMINALS FOR FOSSIL FUELS. PLEASE PROHIBIT EXPANSIONS OF EXISTING TERMINALS AND REQUIRE SEISMIC UPGRADES. LET'S MAKE PORTLAND A LEADER ON THIS ALL IMPORTANT ISSUE.

As a city, I want us to lead in the nation on putting sustainable energy policies in place.
I want the city of Portland to make it mandatory that all buildings constructed with PDC loans, matching programs and grants must include solar panels that saves on more than 50% energy costs. And I want any structures that have been built but need additional funding require energy saving solar panels. I want more programs offered to home owners to make it affordable to install solar panels and a new policy incentives for homeowners to convert to solar energy.

Now more than ever the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

While Portland's impact may be small, we need local governments to make these types of changes to push action on climate change at a national level. Don't back down. Please take a strong stand on fossil fuels.

Enact a full ban on new terminals, large or small. A 2 million gallon facility is still too large. We need NO new fossil fuel infrastructure.

Prohibit expansions at existing terminals and require them to make upgrades for Seismic Safety through State Building Codes.

Prevent NW Natural from getting a carve out. NW Natural wants to be exempted from this policy and we need to make sure the City Council does not add a last minute amendment on NW Natural's behalf.

We must keep fossil fuels in the ground.
We currently have all the scientific and technical knowledge and the physical resources to get all of the energy we need from renewables, according to Mark Z. Jacobson, Director of the Atmosphere/Energy Program and Professor of Civil and Environmental Engineering at Stanford University. Now add to that a new analysis, called "World Energy Revolution: A Sustainable World Energy Outlook 2015", produced by Greenpeace in collaboration with researchers from the German Aerospace Center, that says our world can make the switch to 100% renewable energy by 2050. Feed-in-tariffs--which have helped put Germany and Ontario, Canada at the forefront of the transition to green energy--are promoted by Oregonians for Renewable Energy Progress (OREP) as an important policy tool to incentivize this transition. Recent developments report that wind and solar is cheaper per kilawatt hour than other methods of power generation.
America's path to prosperity lies in a rapid switch-over to abundant, homegrown, renewable energy to power our homes, businesses, and vehicles--NOT in facilitating extracting and exporting of dirty, polluting coal, oil, and gas, which represents a retreat from the 21st Century economy. Renewable energy already employs 2.7 million workers (more than the fossil fuel industry) and studies have shown that green energy will continue to create far more jobs than the fossil fuel industries. [see: Sizing the Clean Economy, A National and Regional Green Jobs Assessment by the Metropolitan Policy Program at the Brookings Institute, 2011. Also, One Million Climate Jobs, 3rd Edition, 2014, edited by Jonathan Neale, published by the Campaign Against Climate Change] A U.S.-led, green, industrial revolution will move our economy forward, create millions of new jobs, and help ensure a livable planet for future generations.

Thank you Mayor Hales, Commissioner Frtiz, Commisioners Novick, Fish, Saltzman, for passing the bold Fossil Fuel Resolution last year making the commitment to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland." You may remember that Portland communities showed up in full force- from neighborhood associations to youth, from local businesses to raging grannies, from frontline communities to environmentalists, from physicians to union plumbers- to show their full support for a complete ban on new fossil fuel infrastructure.

Because the grim reality is that there is nearly 3X as much fossil fuel in existing global reserves as we can burn and have even a 50/50 chance of staying below temperatures past which our planetary life systems become critically unstable. That's even without any new wells being drilled in reserves already owned or leased by fossil fuel companies.

As Bill McKibben said numerous times: the nation and world is watching us here in Portland to see if you will live up to this commitment and lead the way on climate change.

To live up to this commitment there are some significant changes to this draft that need to be made: it still allows new terminals up to 2 million gallons (which is completely unnecessary if we are going to be rapidly weaning off of fossil fuels as the Climate Action Plan proposes; tanks built to be used under the definition of clean fuels are exempt anyway); it allows existing terminals to expand by 10% (also unnecessary; we don't need to expand fossil fuel infrastructure in order to require/regulate seismic upgrades). I urge you to pass an ordinance that fully prohibits new fossil fuel storage tanks.

I want the City of Portland to:

Enact a full ban on new terminals, large or small.
Prohibit expansions at existing terminals and require them to make upgrades for Seismic Safety through State Building Codes.
Don't give NW Natural a carve out. Allowing new LNG storage in Portland is unnecessary and bad for our safety and climate.

With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Fossil Fuel Policy Code Comments: Proposed Draft

November 2, 2016 /

Name: Austin Rose
Email: arosepdx@gmail.com

Comment:

Enact a full ban on all new fossil fuel terminals, large or small. An exception for new facilities that are 5 million gallons or less is unnecessary. The City's code changes should not allow more unit trains of dangerous fossil fuels like Bakken crude oil.
Strengthen restrictions on expansions allowed at existing terminals through adding binding limits in the City's non-conforming use review process.
Prevent any aggregate increase in fossil fuel infrastructure in Portland.

Name: Teresa Reitinger
Email: t_reitinger@yahoo.com

Comment:

The times beg for a full ban for the possible future of the planet

and the health of its children. Now is the time to take this important step in the hope that other municipalities will follow suit in the name of sanity.

Comment:

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much

improved, bringing the proposed changes closer to the original intent of the 2015 Resolution.

188142

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland". Although this draft prohibits new larger bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine).

While this proposal will mark any bulk terminals as 'non-conforming', it still needs to strengthen the regulations on the size and type of expansion to pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

I want the City of Portland and the Planning and Sustainability Commission to:

1 – Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

2 – Remove the exception for new facilities that are 5 million gallons or less which would allow more unit trains of dangerous fossil fuels like Bakken crude oil.
Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

3 – Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.

4 – Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments

188142

through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Craig Heverly

No new terminals of any size. And for that matter let's shut down existing terminals and make Portland 100% renewable with expanded transit like they have in Latin America. Solar & wind and massive weatherization by the city. Pay for it with our share of the money saved by cutting the 5.3 TRILLION per year subsidies to fossil fuel companies world wide.

Name: Gregg Kleiner
Email: kleinerg@comcast.net

Comment:

Given all the evidence of climate change taking place all around us (wildfires, flooding, rising sea levels, melting ice sheets), we simply cannot scrimp on enacting a FULL ban on all new fossil fuel terminals, no matter what the size. If we keep burning fossil fuels, the future is bleak. It's time to step up! Do NOT all ow an exception for new facilities that are five million gallons or less! That doesn't work.

At the same time, we MUST strengthen restrictions on expansions at existing terminals by adding binging limits and criteria for safety and impacts from climate change in the City's non-conforming use review process.

188142

The time is NOW. We don't have another option. Please prevent any increase in fossil fuel infrastructure in Portland. Our Planet can no longer tolerate our burning of fossil fuels. Thank you!

Name: Howard Shapiro
Email: howeird3@gmail.com

Comment:

If the pipeline is large enough to refill the 4,999,999 gallon storage tanks quickly the proposed limit is meaningless. there should be no new fossil fuel storage facilities allowed.

There should be no expansion of current facilities allowed.

If the PSC decided to recomment allowing any new construction I would like to see some kind of bonding language contained in the ordinance in the event of a spill.

If Portland is serious about keeping our city at the level of health and sustainability that we presently have, we cannot allow any loopholes in our codes and ordinances that high priced lawyers and planners can take advantage of because if they find them they will use them.

Fossil fuels, in particular ones whose transportation poses great

188142

danger to ecosystems and human communities, even though we are still dependent on them now, are already things of the past. Using them makes our planet a worse place to live.

The only sensible action to take in light of these facts is to ban any new terminals and minimize the use and impact of existing ones. We must adjust to this reality, which will involve some discomfort, but nothing compared to the grim alternative.

Message is simple. Please enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.
There's no reason to hedge in favor of fossil fuels now that we know the full cost of burning fossil fuels. Keep them out, so we can focus on moving forward with cleaner alternatives.

Name: John Rau
Email: jrau2@comcast.net

Comment:

As an environmental scientist I think Portland should certainly consider that shipping any fossil fuels to China is shipping fuels that our children may one day need away to fund the greed of the fossil fuel industry and in return gets us air pollution. The pollution China puts into the air eventually ends up here. If they don't have cheap fuels to use they will be motivated to develop renewable energy and that will help us all deal with global climate change. A full ban on fossil fuel export is the only strategy that makes long term sense.

Name: Janice Vranka
Email: javranka@gmail.com

Comment:

Please take a stand and put into place a FULL BAN on ALL new fossil fuel terminals. Period. No exceptions. As Portland residents and active members of our community we ask you to reject any expansions on exiting terminals AND increases in fossil fuel infrastructure. We want livable and safe communities now and in the future for the sake of our children and grandchildren.
Thank you for your consideration.

Hello! I am a teacher and artist living in Portland. I believe there is nothing more important for the city to do than to care for it's

188142

citizens and do what is safest and smartest for the people. Rejecting fossil fuel as a basis of our economy is vital to a livable future. Fully and effectively banning all new fossil fuel infrastructure is necessary to protect Portland and move us toward a more just and sustainable way of life.
I want you to enact a full ban on all new fossil fuel terminals, large or small. An exception for new facilities that are 5 million gallons or less is unnecessary. The City's code changes should not allow more unit trains of dangerous fossil fuels like Bakken crude oil. Pipelines can leak or explode, oil trains derail, coal dust falls off trains and barges. We don't want these in our region, or anywhere.
I urge you also to strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.
Do what you can to prevent any increase in fossil fuel infrastructure in Portland. To thrive in a changing climate, we must adapt to sustainable, local technologies, live simpler, and end systemic violence and racism. It is an important action to ban new fossil fuel infrastructure and expansion!

Comment:

Portland must send a strong message to the fossil fuel corporations and their transporters to PHASE OUT (not ramp up!) production, storage, and transportation of the stuff that is ruining our fragile mother Earth as we know and love it! If we have to find "greener" substitutes for oil, coal, and gas for everything from energy production to plastics, so be it. The City should do all it can to encourage production and distribution of these substitutes!

Please improve the Fossil Fuel Zoning Amendments by:
-Enacting a full ban on all new fossil fuel terminals, large or small. An exception for new facilities that are 5 million gallons or less is unnecessary.
-Strengthening restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.
-Preventing any aggregate increase in fossil fuel infrastructure in Portland.
Thank You.

Dear City of Portland,
Keep Portland the leader in combating climate change that we have always been by enacting the following:
1) Enact a full ban on all new fossil fuel terminals, large or small. An exception for
new facilities that are 5 million gallons or less is unnecessary.
2) The City's code changes should not allow more unit trains of dangerous fossil
fuels like Bakken crude oil.
3) Strengthen restrictions on expansions allowed at existing terminals through
adding binding limits as well as criteria for safety and climate impacts in the
City's non-conforming use review process.
4) Prevent any aggregate increase in fossil fuel infrastructure in Portland.

Comment:

Just that – please ban all new fossil fuel terminals. Go Portland.

Name: Briar Schoon
Email: briar.dayne@gmail.com

Comment:

I want to thank the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. While the current draft is much improved, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland".

188142

I want the City of Portland and the Planning and Sustainability Commission to:
1 – Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.
2 – Remove the exception for new facilities that are 5 million gallons or less which would allow more unit trains of dangerous fossil fuels like Bakken crude oil.
Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.
3 – Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.
4 – Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

We must transition away from fossil fuels immediately if we are to curb the worst impacts of climate change. The City of Portland has the opportunity to be a bold leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.
Sincerely,
Briar Schoon

Comment:

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes closer to the original intent of the 2015 Resolution.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland". Although this draft prohibits new larger bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine).

While this proposal will mark any bulk terminals as 'non-conforming', it still needs to strengthen the regulations on the size and type of expansion to pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

I want the City of Portland and the Planning and Sustainability Commission to:

1 – Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015

188142

Resolution, "to actively oppose" new fossil fuel infrastructure.

2 – Remove the exception for new facilities that are 5 million gallons or less which would allow more unit trains of dangerous fossil fuels like Bakken crude oil.
Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

3 – Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.

4 – Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Dear City of Portland,

As a Portlander, this ban is very important to me as well as my fellow friends and neighbors. We NEED a full ban. Any exceptions to a full ban are just plain wrong. In the world we live in today, we cannot afford to continue this behavior any longer. It is irresponsible. Please enact a full ban on ALL new fossil fuel terminals. Along with this is the need to place the strongest of restrictions of expanding existing terminals. Again, we cannot continue this behavior any longer. Let us be a leader for the rest of the country. It is what the people want!

Thank you

Comment:

Dear Mayor Hales & Portland City Council,

Portland made national and international headlines last year with the first-ever resolution calling for no new fossil fuel infrastructure projects in Portland. I was so proud of Portland that day! Now as you code that resolution into law, let's stay true to its intent and ensure that it is not watered down to allow

188142

projects that clearly violate the intent of the resolution. Specifically, this law should:
–Enact a full ban on all new fossil fuel terminals, large or small. An exception for new facilities that are 5 million gallons or less is unnecessary. The City's code changes should not allow more unit trains of dangerous fossil fuels like Bakken crude oil.
–Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.
–Prevent any aggregate increase in fossil fuel infrastructure in Portland.

Thanks for all you do to serve and protect this great city, and to make sure Portland leads the way to a clean and just energy future!

Sincerely,
Dr. Bernadette Rodgers

I would like to see a full ban on all new fossil fuel infrastructure in Portland. A full ban should not have exceptions for new facilities that are 5 million gallons or less. The code changes should not allow more unit trains of dangerous, highly combustible fossil fuels like Bakken crude oil. I would like to see the code strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. I would like to see the code prevent any aggregate increase in fossil fuel infrastructure in Portland.

Comment:

The US should not be exporting fossil fuels! We'll need them ourselves when the crunch comes. The US should be working on renewable energy, and phasing out fossil fuels. Therefore new fossil fuel terminals are unnecessary.

We know that fossil fuels have to be phased out and soon. It would be utter folly then to spend precious resources on new infrastructure for those fuels. That money must instead be diverted to renewables. That's the future and the future needs to start now. Fossil fuel companies must not be allowed to bring new terminals and other new infrastructure to Portland or Oregon for that matter. If they do they will clamor to recoup their investment by recovering and selling ever more fossil fuels.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes closer to the original intent of the 2015 Resolution.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland". Although this draft prohibits new larger bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine).

While this proposal will mark any bulk terminals as 'non-conforming', it still needs to strengthen the regulations on the size and type of expansion to pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

I want the City of Portland and the Planning and Sustainability Commission to:

1 – Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

2 – Remove the exception for new facilities that are 5 million gallons or less which would allow more unit trains of dangerous fossil fuels like Bakken crude oil.
Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

3 – Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.

188142

4 – Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Rachel Lewine

Comment:

Dear Portland Sustainability Council:
As a physician, mother, & grandmother, I urge you to enact a full ban on fossil fuel terminals–large or small. Please remember the 2015 Resolution–to 'actively oppose' new fossil fuel infrastructure.
Similarly, please remove the exception for new facilities that are <5 million gallons.

Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

And I urge you to strengthen restrictions on expansions allowed at existing terminals, through adding binding limits and safety criteria in re climate impacts in the City's use review process.

188142

And finally, please make your language precise to prevent smaller related "terminals" from clustering and aggregating, thus increasing fossil fuel shipments through our city.

The City of Portland can be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could be at the forefront on the most pressing concern of our time.

Comment:

Dear Commissioners,
The revised version of the fossil fuel proposal is much improved, however it still needs improvement in the following areas:

1) Enact a full ban on all new fossil fuel terminals, large or small. An exception for new facilities that are 5 million gallons or less is unnecessary. The City's code changes should not allow more unit trains of dangerous fossil fuels like Bakken crude oil.
2) Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.
3) Prevent any aggregate increase in fossil fuel infrastructure in Portland.

In order to keep global warming under 2C and have a livable future, we need to immediately transition to clean, renewable energy sources. We can't allow new multi-decade investments in fossil fuels that lock us into a world of climate chaos. Instead, we must draw the line to stop the growth of the fossil fuel industry, protect the health and safety of our community, and transition to a 100% renewable energy economy now!
Thank-you,

Name: Anne Hamburg
Email: akaseyh@yahoo.com

188142

Comment:

New and expanded fossil fuel terminals are not a good idea for Portland. If this does end up happening, please ensure the fossil fuel industry has and can prove it has it's own spill and fire suppression crews on duty at all times and ready to respond within a few minutes...do not waste our fire bureau resources on it. Please increase renewable and/or safe energy sources.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes closer to the original intent of the 2015 Resolution.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland". Although this draft prohibits new larger bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine).

While this proposal will mark any bulk terminals as 'non-conforming', it still needs to strengthen the regulations on the size and type of expansion to pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

I want the City of Portland and the Planning and Sustainability Commission to:

I want the City of Portland and the Planning and Sustainability Commission to:

1 – Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

2 – Remove the exception for new facilities that are 5 million gallons or less which would allow more unit trains of dangerous

188142

fossil fuels like Bakken crude oil.
Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

3 – Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.

4 – Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Tony and Phyllis DeCristofaro

Dear Mayor and City Council Members –
This is your opportunity to leave an historic legacy for future Portlanders. Enact a full ban on all new fossil fuel terminals, strengthen restrictions on expansions at existing terminals and prevent any increase in fossil fuel infrastructure in Portland. There is only one way forward to a future that will be sustainable for humanity and all life on the planet. Be the leaders you hoped to be. Thank you!

Comment:

I support a full ban on all new fossil fuel terminals, large or small. We should be urgently moving away from fossil fuel dependency, and the oil companies have the resources to do so and develop clean energy. The only thing preventing them from doing so is greed. If we make fossil fuel extraction and use less accessible and profitable, they will be forced to invest in the cleaner, safer alternatives. They will not do it willingly, therefore, it is up to us to force the redirection of effort and investment through our actions and legislation. The City of Portland has the power to change the energy/climate paradigm. Embrace this opportunity to be leaders and energy policy shapers for the betterment of our local and global environments.

I am writing to voice my opposition to any expansion of fossil fuel transport through my beloved city.

I moved to Portland in 2009 not because of job opportunities but because of Portland's reputation as a leader in all environmental issues. This is important to me because I am a person of faith and as such am called to environmental stewardship. Our miracle planet, it's vegetation, oceans, atmosphere, climate, humans and animals are all part of God's creation and are thus good and sacred.

Corporate greed for profit threatens all that is perfect in it's originally created state and our Rose City should not give into temptation and intimidation and thereby aid in the destruction of creation. This city, country, and world has more than enough acres of parking lots and rooftops for solar panels and plenty of wind to go around to spin countless wind turbines. Not to mention other renewables. I ask my city to stand on the side of righteousness and I want the following:

1.Enact a full ban on all new fossil fuel terminals, large or small. An exception for new facilities that are 5 million gallons or less is unnecessary. The City's code changes should not allow more unit trains of dangerous fossil fuels like Bakken crude oil.
2.Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.
3.Prevent any aggregate increase in fossil fuel infrastructure in

Portland.

Comment:

Thank you for the hard work done to date to develop the draft Fossil Fuel Terminal Zoning Amendments. I am writing today to encourage the addition of further restrictions on size and expansion of existing terminals to better meet the intent of the original City Council resolution, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland". Although this draft prohibits new larger bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine).

While this proposal will mark any bulk terminals as 'non-conforming', it still needs to strengthen the regulations on the size and type of expansion to pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's

188142

intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

I encourage the City and the Planning and Sustainability Commission to:

1 – Enact a full ban on all new fossil fuel terminals, large or small, as clearly stated in the 2015 resolution.

2 – Remove the exception for new facilities that are 5 million gallons or less which would allow more unit trains of dangerous fossil fuels like Bakken crude oil.
Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

3 – Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.

4 – Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now is the time to tighten up these amendments to ensure Portland's people and the natural environment are protected from fossil fuel transport and the location and expansion of terminals within our community. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Thank you for your consideration!

Comment:

We must have a full ban all new fossil fuel terminals of any size. There must be no exceptions; we must not allow any more trains fossil fuels, especially Bakken crude, through our city (and hopefully the state).
As it is now, trains dragging oil tanks run frighteningly close to Max tracks and our freeways. We cannot afford to increase the risk of explosions that would harm so many people.
In addition, we should prevent any aggregate increase in fossil fuel infrastructure in Portland. We are on the confluence of two rivers and risk pollution that can move far and wide via their waters. It was wise to pull out of the Pembina project last year. Let's shrink our risks and not allow ourselves to be used by big corporations to export their foul products.
We need to strengthen restrictions on any and all expansions at existing terminals by adding binding limits and criteria for safety and climate impacts in Portland's non-conforming use review process. In fact, it would be great to reduce terminals now in existence for our own safety.

Comment:

I appreciate that the Bureau of Planning and Sustainability incorporated public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes closer to the original intent of the 2015 Resolution.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the strong resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland". Although this draft prohibits new larger bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine).

While this proposal will mark any bulk terminals as 'non-conforming', it still needs to strengthen the regulations on the size and type of expansion to pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

I urge the City of Portland and the Planning and Sustainability Commission to enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure. The exception for new facilities that are 5 million gallons or less needs to be removed as it would allow more unit

188142

trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

Also, restrictions need to be strengthened on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. Finally, please add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Satya Vayu

It is time for us to boldly step into the change that needs to happen now. Portland has a chance right now to lead the way in the transition toward renewable energy. We cannot do so if we don't take the leap of banning new oil infrastructure. Please refine the Fossil Fuel Zoning Amendments to make this change possible.

I stand with many other Portlanders who want the City of Portland and the Planning and Sustainability Commission to:

1 – Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

2 – Remove the exception for new facilities that are 5 million gallons or less which would allow more unit trains of dangerous fossil fuels like Bakken crude oil.
Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

3 – Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.

4 – Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

I am writing to urge a full ban on new fossil fuel infrastructure in Portland. While I actually live in Washington, I follow issues of fossil fuel infrastructure and transportation in our region very closely. Since moving to Washington 3 years ago, I have done nothing in my community but fight the greedy oil companies that want to destroy my neighborhood. I feel like I am just treading water, trying to keep the place I love from falling into the wrong hands. Meanwhile, other important issues such as unemployment, homelessness, habitat restoration etc. go unresolved. Please, put an end to these constant fossil fuel projects so we can get back to work on other important issues! Thank you.

I will not take up time and space to delineate all the reasons for insisting upon a FULL BAN on all new fossil fuel, large and small, I insist upon removing any exceptions to proposed new facilities that are 5 million gallons or less.
You must strengthen restrictions on existing terminals through adding binding limits as well as safety measures and criteria for climate impacts.
Lastly, you need to add language to smaller, "related" terminals from clustering and aggregating to increase fossil fuel shipments through Portland.
I express these instructions as a Citizen Protector of the Earth and Water under my stewardship as a citizen of Cascadia and of the geopolitical territories in which I reside.

It's not that I don't care about the price of gas, I do. I want its price to include to include all its costs. Those would be, among many others, the far more expensive processes necessary to get the remaining less accessible oil out of the ground, the money that should be reimbursed to FEMA for the cost of every "natural" disaster caused or exacerbated by drilling or oil transport, the cost of every improvement to stormwater systems needed because too much land is covered by impermeable roadway, the cost of almost every action/war in the Middle East, and more that I'm not up to arguing on a tiny phone.

I have a car; I drive it on occasion. It is not entitled to cheap gas, nor am I, nor is anyone.

Please do not allow any more oil terminals in Portland.

I very much appreciate the opportunity to have input to your committee before you submit your report to City Council and I thank you for the improvements you have made to the initial draft. However, I think the current proposal still needs more improvement to be in accord with the original intent of the resolution passed last Fall.

The point was no expansion of fossil fuel infrastructure. This means no new terminals and no expansion of the current ones! Seems pretty clear and simple to me.

I also think it's very important that all the current fossil fuel storage be seismically improved. We all know the 'big one' is coming eventually, and it could be sooner rather than later. We must protect our city and river from fuel spills that will cause contamination and possible explosions and fires.

We need to be sure that there is no increase in trains carrying oil. Ideally, we should stop them all. They are a danger to our health and safety!

Dear Mayor and Commissioners,

I urge you to ban all fossil fuel infrastructure in Portland. Here are the specifics of my request:
1.Enact a full ban on all new fossil fuel terminals, large or small. An exception for new facilities that are 5 million gallons or less is unnecessary. The City's code changes should not allow more unit trains of dangerous fossil fuels like Bakken crude oil.
2. Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.
3. Prevent any aggregate increase in fossil fuel infrastructure in Portland.

I want Portland to continue to be a leader in protecting our precious planet. Fossil fuels must stay in the ground if we hope to slow and reverse the cataclysmic effects of climate change. I urge you to be a Protector!

Comment:

As a resident of Portland I urge you to adhere to the visionary resolution that Portland supported in the fall of 2015. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

I want the City of Portland and the Planning and Sustainability Commission to:

1 – Actively oppose new infrastructure by enacting a full ban on all new fossil fuel terminals, large or small.

2 – Remove the exception for new facilities that are 5 million gallons or less which would allow more unit trains of dangerous fossil fuels like Bakken crude oil.
Allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

3 – Strengthen restrictions on expansions allowed at existing terminals by adding binding limits and include criteria for safety and climate impacts in the City's non-conforming use review process.

4 – Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

The City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few improvements to the Fossil Fuel Zoning Amendments, Portland could again be on the forefront addressing the most critical concern of our time.

Sincerely,

188142

Comment:

It is time to enact a full ban on ALL new fossil fuel terminals in or around the city of Portland. An exception for facilities that allow five million or fewer gallons of dangerous fossil fuels such as the Bakken crude oil must never be allowed.
By using the City's non-conforming review process, it is time to strengthen restrictions on the expansion of existing terminals with binding limits as well as with the strongest safety and climate impacts criteria possible. We know the damage that the mining for and burning of fossil fuels creates to people, for our communities (especially the poorest in the direct impact zones) and for the planet as a whole. It is, therefore, a must that the fossil fuel infrastructure for the city of Portland be limited to what already exists with a future goal of downsizing it and then putting Portland (along with the state of Oregon) on a path to 100% renewables in the coming decades.
We chose to retire from the US Army in what we saw as the environmentally progressive city of Portland, OR. We hope the Planning and Sustainability Commission continues along this path of sanity and sustainability for every residents' well being and it begins with a full BAN on fossil fuel terminals.

Comment:

We all live downstream, and we say NO, NO, and NO to:
-Any new fossil fuel terminals!
-Expansions allowed at existing terminals!

-Additional fossil fuel infrastructure!
Even those of us who technically live upstream from Portland recognize that when it comes to the question of fossil fuels and their impact on the earth and on future generations, we all live downstream. Now is the time to shift away from fossil fuel dependence and toward more sustainable energy systems. Oregon can lead the way toward a more healthy and sustainable future! And the rest of Oregon looks to Portland to be at the forefront! Please say NO, NO, and NO when it comes to bringing more dirty and dangerous fossil fuels into Portland's ports! Thank you.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes closer to the original intent of the 2015 Resolution.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland". Although this draft prohibits new larger bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine).

While this proposal will mark any bulk terminals as 'non-conforming', it still needs to strengthen the regulations on the size and type of expansion to pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

188142

I want the City of Portland and the Planning and Sustainability Commission to:

1 – Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

2 – Remove the exception for new facilities that are 5 million gallons or less which would allow more unit trains of dangerous fossil fuels like Bakken crude oil.
Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

3 – Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.

4 – Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,
Beth Slikas

Comment:

It is imperative that commissioners set a standard for leadership on moving our economy off of fossil fuels as soon as possible. I urge you to ban all new fossil fuel terminals, regardless of size, strengthen restrictions on expansions of existing terminals to account for safety and climate hazards, and limit the aggregate fossil fuel structure to its current capacity. We cannot afford to be incentivizing this kind of energy activity at a time when we face such dire consequences from climate disruption. A decision to restrict fossil fuel infrastructure is a sound long-term business and public health decision.

Comment:

Thank you very much for the work you have done to to listen to the public and make changes to your original draft of the Fossil Fuel Terminal Zoning Amendments. There is still work to be done to "actively oppose" new fossil fuel infrastructure. A FULL

188142

ban on all new fossil fuel terminals, large or small does exactly that- opposes new fossil fuel infrastructure. Allowing facilities under 5 million gallons makes no sense, in fact, it waters down the resolution and sends a message to our children that we believe the fossil fuel industry still has a right to poison their atmosphere a little bit and that continuing on a path of relying on CO2 producing energy is good for their future. Also, any more infrastructure, no matter how small, will increase the oil transportation into our city, which right now, is at dangerous levels.
In addition, we must have binding limits on future expansion of existing terminals and make safety and climate impacts on our city a priority in the non-conforming use review process.
This is our opportunity, as a city, to set an example for the rest of the world, by being bold and brave. Please make the improvements to the Fossil Fuel Zoning Amendments that send the right message to our children that their lives are worth protecting and that we are ready and excited about moving in an energy direction that demonstrates this.
Thank you.

The Cully Association of Neighbors represents the most diverse neighborhood in Oregon, it is dedicated to working cooperatively to build a safe and livable neighborhood. The UP tracks run through Cully and are adjacent to schools parks and homes and business, recently UP increased the number of unit oil trains running through Cully, especially at night- we request an immediate moratorium on these potentially dangerous trains and terminals that support the shipment of more Fossil Fuels. The ban on all new fossil fuel infrastructure was applauded by Cully, changing the intention and to increase of facilities allowing 5,000,000 more gallons goes in opposition of what the city of Portland passed and what Cully Association of Neighbors desires and intended.

The Fossil Fuel Terminal Zoning Amendments need to follow the original intent of the 2015 Resolution, which was to "actively oppose" new fossil fuel infrastructure. That means it should include a full ban on new fossil fuel terminals, without an exception for smaller terminals. Existing terminals must not be allowed to expand, and must be subject to review for safety and climate impacts. The Amendments should also include language that prevents existing fossil fuel facilities of any kind, whether officially designated as "terminals" or not, from being leveraged in any way to increase shipments through the Portland area. To "actively oppose" new fossil fuel infrastructure means all of these things. It does not mean to allow the infrastructure to grow in smaller increments or in previously unanticipated ways. The climate crises means that we must be putting the brakes on fossil fuel use as rapidly as we can, not further abetting or even accelerating it.

We need to break our addiction to fossil fuels. Portland citizens and it's council can and should lead the nation in groundbreaking policies that will help us to develop new and sustainable energy resources, not polluting and dangerous ones.

Name: Andrew Crosby
Email: andrewcrosby1@gmail.com

Comment:

Dear Members of the Portland City Council –

Last November, you adopted a Fossil Fuel resolution that placed Portland in the vanguard of leadership toward a future that is not dominated by carbon combustion. It was a bold and historic action. Such actions are essential if we are to have any livable future at all. It is appropriate that Portland, along with other nodes of leadership like Vermont and California, set the tone for the rest of the nation.

Now it is time for you to show integrity by adopting regulations

that fully implement the clear intent of your resolution. At this critical time in the fight against impending climate chaos, any waffling on your part is unacceptable.

188142

My testimony is simple. Please adopt strong regulations/ordinances WITHOUT loopholes and compromises.

Specifically –

(1) Enact a full ban on all new fossil fuel terminals, large or small with NO exception for smaller facilities (less than 5 million gallons).

(2) Strengthen restrictions on expansions allowed at existing terminals by adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. Strong requirements for seismic upgrades should be required for any expansions and/or modifications of existing terminals.

(3) Prohibit any aggregate increase in fossil fuel infrastructure in Portland.

Thank you for considering my testimony.

Andrew Crosby

Comment:

Hi folks,
MY name's Tim Norgren, and I'm a member of the building trades through Laborer's local 737. I know from a few YEARS of conversations with others in the trades that I speak for many other workers in the Laborers, Carpenters, iron workers, pipefitters, and operating engineers unions (as well as a few staffers) who are afraid (or too busy with kids, work, etc.) to testify openly, when I ask you to pursue nothing less than a complete ban on new or expanded fossil fuel infrastructure, regardless of the size or whether some infrastructure already exists! This should include LNG! Northwest Natural has no current plans to expand its storage capacity and if we're to

188142

transition away from a fuel that leaks so much methane it's effectively worse than coal, then there's no need to think they ever will.
I remember when earthquakes in Oklahoma were unheard of. Now thanks to fracking there are increasing levels of quakes including two this year which were over five on the richter scale! We want jobs we can feel good about; not jobs that insure more children and families like our own will be hurt in earthquakes, exposed to poisonous water, or fooled into eating crops irrigated by such water, as has been the case in California and elsewhere! To add to the risks any new or expanded infrastructure would increase volatile tanker traffic through the region as well, and that is clearly not something any of us want. Mosier was more than enough warning, and the city council has already banned such an increase.
Please insure that these bans will be tangibly effective by including binding limits and criteria for safety and climate impacts in the City's non-conforming use review process.
Thank you. Sincerely, Tim Norgren

Comment:

I was so proud of my city in the fall when city council passed the resolution banning all new fossil fuel infrastructure. I originally moved to Portland because it was known as a leader on climate issues, and it has mostly lived up to that. This resolution was a major step in the right direction, and showed the kind of environmental leadership that I've come to love about this city.

I appreciate the work that the Bureau of Planning and Sustainability has done during the process of shifting the resolution toward policy. The most current draft represents significant progress from the first version. That being said, I feel that there is still more work to be done:

1) There should NOT be an exception for facilities under 5 million gallons. First of all, that is still a huge amount of fossil

fuels. Secondly, The resolution originally stated that we would "actively oppose" fossil fuel infrastructure, not allow loopholes for more of those facilities to pop up, as long as they're smaller.

188142

2) There should be stronger language to prevent expansion of existing terminals. The lack of such language would represent another loophole by which fossil fuel infrastructure could grow within our city.

Portland has long been a leader in climate action. I love that about my city. Please continue to take bold action by making this policy binding and strong.

Thank you,
David Kennedy

Dear City of Portland:
Thank you for your attention to this very important matter. If you haven't read Naomi Klein's book, This Changes Everything, I want to tell you the most important statement in the entire book. She says that the energy companies who want to produce this dirty energy and send it to Asia are heavily leveraged, and meanwhile the Saudis are keeping energy prices low and China is turning toward solar and other renewables in a big way. What this means is that if we can hold the line on West Coast fossil fuel terminals for just two years, that business model will DIE. It will no longer be feasible, and the U.S. government will have no choice but to turn toward renewables. We CAN win this. We need you.

Name: Bethany Thomas
Email: 33bethany@gmail.com

Comment:

Dear Commissioners,

As you consider the proposed draft of the code changes, I ask that you choose to enact a full ban on all new fossil fuel terminals and infrastructure in Portland. The risks to both human and environmental health and safety are too high, too costly. Please position Portland as a continued leader in progressive environmental policies. We can lead the way! Thank you for your leadership.

Sincerely,
Bethany Shetterly Thomas

To: Portland Planning and Sustainability Commission
Re: Fossil Fuel Terminal Zoning Amendments

The City of Portland has the opportunity to take a historical stand

by enacting a full ban on new fossil fuel terminals.

Human use of fossil fuels is causing global climate change. Due to rising temperatures, there are more severe weather systems, infectious disease are spreading beyond their usual latitudes, and rising temperatures are threatening our water supplies and food production. For those of us with chronic conditions such as emphysema and heart disease, rising temperatures are compromising our well being and will make our day-to-day existence more and more intolerable. All of us want a world which is safe and secure for ourselves, our children, and generations far into the future. For this to happen, we must act now to stop the expansion of fossil fuel use.

188142

We as a city need to do our part in these ways:
-Enact a full ban on all new fossil fuel terminals, large or small. Remove the exception for new facilities that are 5 million gallons or less which would allow more unit trains of dangerous fossil fuels like Bakken crude oil. We do not need new LNG storage in Portland.
-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.
-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Thank you for allowing we the public to voice our concerns.

Respectfully submitted,
Patricia Mizutani, MD

Comment:

Hello, My name is Danny thiemann. I am a poverty law attorney in the Hillsboro area, but I live and vote in portland. My clients tell me that warmer summers cause them greater heat stress as they work outside, where temperatures in the sun can reach 15 degrees warmer than the temperature listed in the newspaper for that day. Warmer summers also cause parents who move around for work to pull their children out of school earlier than planned as unseasonably temperatures change job start dates that no longer coincide with the school year. These warmer summers are linked to Oregons warmer climate and I recommend you enact a fossil fuel infrastructure policy that is as strong as possible to reduce impact of climate change on poorest workers. Oregon, unlike California, does not have heat stress protections. Please strengthen restrictions on fossil fuel infrastructure.

Thank you!!

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes closer to the original intent of the 2015 Resolution.

While this proposal is much needed, I believe that the standards could be even stronger. Climate change has impacted our habitat greatly already and to avoid further disruptions it would be best if no new fossil fuel terminals were allowed regardless of size.

Thank you for listening,
Sabolch

Name: G. Gibson

Comment:

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes closer to the original intent of the 2015 Resolution.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland". Although this draft prohibits new larger bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine).

While this proposal will mark any bulk terminals as 'non-conforming', it still needs to strengthen the regulations on the

188142

size and type of expansion to pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

I want the City of Portland and the Planning and Sustainability Commission to:

1 – Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

2 – Remove the exception for new facilities that are 5 million gallons or less which would allow more unit trains of dangerous fossil fuels like Bakken crude oil.
Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

3 – Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.

4 – Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

G. Gibson

Please ban ALL new fossil fuel infrastructure.
Portland already has a large fossil fuel handling and storage area.
The city's reputation as "green" apparently doesn't take this in to account. (Perhaps this should be publicized more.)
Portland is not only contributing in a significant way to climate change but also endangering the lives of all citizens in North Portland, along with the health of two rivers, with the present

infrastructure.
Your time would be better spent making sure that the tank farms and tracks already in place are prepared for disasters (i.e. earthquake, fire, sabotage). From where I live and stand directly across from this storage area, and from Hwy 30, it's plain to see that we are woefully unprepared.
Please do the right thing, both for our city and the planet.

Portland hails itself as a green leader in a fossil fuel dependent economy. It would be the height of fatalistic hypocrisy to allow new fossil fuel infrastructure to be built and further entrench our dependence on fossil fuels when the first thing we need to accomplish is to be able to move away from them. A full ban and further restrictions are the only options to decrease our fossil fuel dependency, give a boost to a green economy, and mitigate the disastrous effects of climate change.

No increase in fossil fuel infrastructure in Portland!!

Name: Tori Cole
Email: colet@seiu503.org

Comment:

My name is Tori Cole, and I am a union organizer for SEIU 503 and an

188142

environmental activist. Like others who have followed this process, I've seen

Portlanders demand meaningful action from their city on climate, and I hope that

their conviction—which drove City Council to pass this as a resolution—informs

the code changes made today. We need to reject the building of any new fossil fuel

infrastructure in our city. Our climate movement sorely needs local leadership, and

Portland should fulfill its rumored destiny as a climate leader today. Local action

does matter.

Taking this action today will be the first drop in the bucket, step one of what we

need to achieve a just transition away from fossil fuels and to 100% renewable

energy by 2050, as reports from Greenpeace and others tell us we must. It's time

for all of us to make deliberate choices in favor of our future. This year, SEIU

503's membership passed a resolution to prioritize acting against climate change,

and on Saturday the board voted unanimously to support solidarity with Standing

Rock Sioux Tribe in their fight against the Dakota Access Pipeline. The time for

us to stand together in this fight is long overdue.

Even those highest in the financial sector recognize that the era of fossil fuels is

coming to a close, and that investments in the oil and gas

industry are now risky

and ill advised. To realize a successful transition to renewables, governments from

188142

local to federal must commit to invest in renewable infrastructure, and to create

decent work opportunities and economic empowerment for workers who cannot be

left behind in the oncoming economic restructuring. We must not allow ourselves

to be divided into 'labor' and 'environmentalist' camps—the real choice is not

jobs or environment. It is both, or neither.

So I urge you to take bold action, and listen to what the people are asking for.

Vote in favor of our future, and reject any increase to fossil fuel infrastructure at

the city level. No exceptions. And let's talk about how we are going to work

together to ensure that the people who got the worst deal in the old economy will

be the first in line to benefit in the new economy.

188142

Time is short for addressing climate change. A recent study by NOAA says that we may see a 3 meter sea level rise by 2050-2060. That is much sooner than the IPCC report which is now much out of date. This amount of sea level rise will create hundreds of millions of climate refugees. There is much other evidence indicating the severity of our collective circumstances. At this point, the situation is so severe, that concerns over a companies profits are of no meaning. It is like the point in a disaster movie when everyone finally realizes that catastrophe has struck. Business as usual then comes to an end. We are already at that point. The usual considerations must be set aside and extraordinary measures taken. This is exactly what the science is telling us.

I want the City of Portland and the Planning and Sustainability Commission to:

1 – Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

2 – Remove the exception for new facilities that are 5 million gallons or less which would allow more unit trains of dangerous fossil fuels like Bakken crude oil.
Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

3 – Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.

4 – Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Sincerely,
Deva

More than the vitally important need to protect the Portland environment from the risk of a spill or other disaster is the necessity to by any means possible keep all remaining fossil fuel reserves in the ground if we are to keep global temperature from reaching the point of no return for habitability of the planet.

Comment:

Dear City Council,

I was so proud of our city when, last year, we showed our commitment to a clean energy future and passed the ban on new fossil fuel infrastructure. Portland is my home, and part of why I love it so much is because every day I see evidence that we are a community dedicated to social and environmental justice. We are willing to embrace the need to change our ways and move off of unsustainable fossil fuels.
Now the time has come to enact that ban, and our actions need to be as strong as our words. Every day we delay taking strong action, we create more difficult and complex climate challenges for all those who come after us. That is why I urge you to enact a full ban on all new fossil fuels. Allowing an exemption for smaller new facilities undermines the power of the ban both practically and symbolically. Similarly, if we do not strengthen limits on

188142

existing facilities, we will not only allow continued disastrous impacts on the climate, we send the message that solving this problem can be done slowly, step by step.

We are long past the time for slow and steady change. We need to be bold. Those of us living now are already seeing the impacts of climate change through more extreme weather, increased temperatures affecting crops and loss of biodiversity, and the many social effects of destabilized societies. All those who come after us will have to live with the results of the choices we make today. Let's make the strongest, bravest choices we can, to end fossil fuel dependence now, with no new fossil fuel terminals and no expansions to a dying industry.

Thank you for your leadership.

Like many Portlanders, I moved here in order to participate in a progressive city, and be able to enjoy the spectacular nature nearby. When I return home to my native Pittsburgh, I drive past billboard after billboard advertising "clean oil," "clean coal," and "safe fracking." Then I check the news and see another spill, another leak, another community devastated by the fossil fuel industry. And every time, the oil and gas companies are full of excuses as to why it's not their fault. It was the soil, the weather, a pipe, a well. It's always billed as a surprise, an unforeseeable circumstance. But pollution is not a surprise; it's a consequence of the fossil fuel industry. Don't allow any legal loopholes to endanger Portland's wildlife or its citizens.

Comment:

Considering that Portland City Council has issued a statement against the DAPL in North Dakota, which I applaud, the exact same arguments apply to why it is important to ban new terminals here in Portland. Doing anything else would be hypocritical and work against any claims the city might have to being on the forefront of environmental justice.

We know now without a doubt that climate is warming and fossil fuels are to blame. Why would a city like Portland want to do anything other than stand its ground on this issue? How can we continue to be part of a process that dooms life on Earth as we know it? There are plenty of other options to keep the economy ticking over–and there are no jobs on a dead planet.

Dear Commission Members,
I would like to suggest changes to your draft of the Fossil Fuel Terminal Zoning Amendments:
1. Do not make an exception for new storage facilities under 5 million gallons. The rules should apply to all terminals.
2. Existing terminals should become a non-conforming use and therefore any expansion of a terminal would have to go through a non-conforming use process.
3. The non-conforming use review process should be strengthened by adding climate impacts and safety criteria.
4. Total fossil fuel infrastructure increases should not be allowed. Don't allow the industry to build many small facilities that in total will be above the current infrastructure.

Name: Susan Braverman
Email: susan@susanbraverman.com

Comment:

Please, please don't lose this opportunity to ban an and all fossil fuel terminals and to prohibit oil trains from running through Portland. It is so important that we focus on other sources of energy instead of perpetuating the dangers of fossil fuels and the degradation of the earth as a result. As a resident of NW Portland, whose children and grandchildren also live here in NW, we are aware of the danger every day as we listen to the trains and drive past the storage facilities along Rt. 30. Knowing they are there, and being conscious about preparing for a possible Cascadia Fault major earthquake, I am pleading with you to not bring any more Bakken fuel or trains transporting it anywhere near Portland! Thank you!

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes closer to the original intent of the 2015 Resolution.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland". Although this draft prohibits new larger bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine).

While this proposal will mark any bulk terminals as 'non-conforming', it still needs to strengthen the regulations on the size and type of expansion to pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to

188142

the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

I want the City of Portland and the Planning and Sustainability Commission to:

1 – Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

2 – Remove the exception for new facilities that are 5 million gallons or less which would allow more unit trains of dangerous fossil fuels like Bakken crude oil.
Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

3 – Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.

4 – Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,
Elizabeth Milner

Thank you for considering what I have to say. As I'm sure PSC is coming to see, there is widespread popular opposition to continued investment in fossil fuel development, and this is because as an entire nation we are waking up to the reality of climate change, and we are afraid about the real possibility of not leaving a viable world for our children to inhabit. By 2050, when I am 63, the world's sea levels will have risen an average

188142

of no less than 9 ft above their current levels. Seeing the world respond to the current refugee crisis, I cannot imagine what will have transpired by the time many of the world's coastal cities are underwater. And we are already locked into this. The best we can hope for now is to mitigate even more catastrophic changes, and this is absolutely necessary, because it is entirely possible for us to raise the average global temperature well beyond what it has ever been while supporting life as we know it. This is what is at stake as you decide whether to set a bold and courageous precedent that will be felt around the country, and hence around the world. On the other side are people who act against not just my interest and yours, and your childrens', but inexplicably against their own. The time for accepting this has ended, by necessity, and you are in the rare and privileged position of actually playing a part in ending it. This is the moment of you to be heroic or cowardly; you have the heartfelt prayers of millions around the world behind you.

Thank you again.

Fossil Fuel Policy Code Comments: Discussion Draft

November 2, 2016 /

Name: Judith Lienhard
Email: lienjud@aol.com

Comment:

I want a full ban of new fossil fuel infrastructure, in particular oil, gas, and coal terminals in Portland.

The Fossil Fuel Terminal Zoning Amendments discussion draft has fallen far short of the 2015 Fossil Fuel Resolution that was passed last year. Where the resolution was bold, visionary, and historic; this discussion draft is short-sighted and prioritizes the fossil fuel industry over the health and safety of Portlanders.

I want:
1 – A full ban on new bulk terminals,
2 – Stronger limitations on expansions at existing facilities
3 – Provisions to require existing fossil fuel terminals make upgrades for seismic resilience to protect the health and safety of neighboring communities and the Willamette River. These changes are crucial because of the urgent threat that fossil fuel terminals pose to both the environment and public safety.

188142

Transporting and storing fossil fuels are never safe. The risks range from oil train derailments, pipeline spills, storage tank explosions and earthquakes, which is why the City of Portland needs to hold these industries accountable for improving their safety without promising them more room to grow. Presently, the discussion draft exempts existing facilities from regulation, which will only grow our carbon footprint past the point of being able to meet our carbon reduction goals. We need to shrink Fossil Fuel use, not grow it!

It is vital that the city strengthen the current draft of the fossil fuel code to reflect the original resolution that myself and thousands of other Portlanders supported last year. The revised version of the proposal should create a true ban on new fossil fuel infrastructure, have regulations that make Portland a safe place to live, and be legislation that will be sustainable for the earth in the long term.

Sincerely,

Name: Brian Johnson
Email: nogmo55@centurylink.net

Comment:

Hey this is Brian Johnson a lifelong resident of Multnomah and Clackamas Counties, aside from my military experience after high school (saving for and attending some) college and earning GI bill credits. A family man with two kids and a wife I met in college. I attended the hearings for Ambre Energy Coal and Pembina, in Portland, and also Millennium Bulk, and Oil by rail, in Longview and Olympia because I live near the tracks and have a vested interest in the Pacific NW, the nation and the planet. I'm very proud the mayor of Pdx and Milwaukie have declared climate change a high priority with proposals for no new fossil fuel infrastructure, and now in disbelief that, at least in Portland, this isn't happening. When the mayor makes a proposal like that, to me it means no new infrastructure, whether that's expanding existing plants, pipes, mines, wells, refineries, storage tanks, tracks, roads, bridges, for express prurpose to support operations, etc. In fact, taken to the letter, it may also

88142

include roads, roofs, flooring, and anything else composed of petroleum, etc. But I get it, and Portland certainly has its share of necessary maintenance and repairs to sidewalks, highways and roads. And if provisions for upgrades to minimize seismic disasters aren't made, at least make sure all energy companies are held responsible for all damages, not nothing at all or pennies on the dollar. If not them, their underwriters. Before you write this bill, be sure to google Arch and Peabody Coal companies treatment of miners and retirees "guaranteed" health coverages and pensions. And how they simultaneously wrote their chiefs millions in bonuses, presumably for successful bankruptcies which provided amnesty from their previous agreements to cover environmental costs and clean ups around their closed and closing mines. Come on, Portland, don't be like that! Show us what you're made of!

Name: Adam Brunelle
Email: brunelleadam@gmail.com

Comment:

1. A full ban on new bulk fossil fuel terminals
2. Limitations on expansions at existing facilities
3. Provisions that require existing fossil fuel terminals make upgrades for seismic resilience to protect the health and safety of neighboring communities and the Willamette & Columbia rivers.
4. Invest heavily in renewables with an urgency befitting the climate crisis, and in particular, in such a way that vulnerable communities are more resilient to the negative effects of climate change. Our strategy for confronting climate change should primarily focus on those communities most vulnerable, not corporate "bridge solutions" which are actually just death sentences.

3 – Provisions to require existing fossil fuel terminals to make upgrades for seismic resilience to protect the health and safety of neighboring communities and the Willamette River.

These changes are crucial because of the urgent threat that fossil fuel terminals pose to both the environment and public safety. Presently, the discussion draft allows new bulk terminals to be built and allows existing facilities to expand, which will grow our carbon footprint past the point of being able to meet our local and state carbon reduction goals. Further, transporting and storing fossil fuels are never safe, with risks ranging from oil train derailments and pipeline spills to storage tank explosions and tank destabilization from earthquakes. The City of Portland needs to hold these industries accountable for improving their safety without promising them more room to grow. We need to

shrink fossil fuel use, not grow it!

It is vital that the city strengthen the current draft of the fossil fuel code to reflect the intent of the original resolution that myself and thousands of other Portlanders supported last year.

It seems like the message of earlier this year has goten truncated as it has passed through City Hall and planning for our

future.
Please re-initiate the full on, kep 'em in the ground intentions citizens want!
No NEW TERMINALS (We will keep working on other options for energy and employment, of course! Like renewables...)
NO EXPANSIONS at exisiting sites of fossil fuel processimg or distribution (I kow you cannot affect Hanford's nuke plans, darn it)
WATCHDOG VIGILANCE on existing infrstructure by any fossil fuel company to be certain they are complying fully.
Thank you for being a good citizen and a future thinker!

Comment:

We must keep fossil fuels in the ground.
We currently have all the scientific and technical knowledge and the physical resources to get all of the energy we need from renewables, according to Mark Z. Jacobson, Director of the Atmosphere/Energy Program and Professor of Civil and Environmental Engineering at Stanford University. Now add to that a new analysis, called "World Energy Revolution: A Sustainable World Energy Outlook 2015", produced by Greenpeace in collaboration with researchers from the German Aerospace Center, that says our world can make the switch to 100% renewable energy by 2050. Feed-in-tariffs–which have helped put Germany and Ontario, Canada at the forefront of the

188142

transition to green energy–are promoted by Oregonians for Renewable Energy Progress (OREP) as an important policy tool to incentivize this transition.
America's path to prosperity lies in a rapid switch-over to abundant, homegrown, renewable energy to power our homes, businesses, and vehicles–NOT in facilitating extracting and exporting of dirty, polluting coal, oil, and gas, which represents a retreat from the 21st Century economy. Renewable energy already employs 2.7 million workers (more than the fossil fuel industry) and studies have shown that green energy will continue to create far more jobs than the fossil fuel industries. [see: Sizing the Clean Economy, A National and Regional Green Jobs Assessment by the Metropolitan Policy Program at the Brookings Institute, 2011. Also, One Million Climate Jobs, 3rd Edition, 2014, edited by Jonathan Neale, published by the Campaign Against Climate Change] A U.S.-led, green, industrial revolution will move our economy forward, create millions of new jobs, and help ensure a livable planet for future generations.

Comment:

Dear Bureau of Planning and Sustainability,

Although I have been very excited by the passage of the ban on new fossil fuel terminals, I am now concerned that the actual bill does not go as far as I was led to believe it would. The world is at a critical turning point, and if we are lucky, we can stop this devastating climate change before it's too late. Please do what's inevitable and ban ALL new bulk fossil fuel terminals. If they aren't banned today, they will certainly be banned in 40 years once our air is toxic and our oceans are empty.

Comment:

We already have oil terminals along the Willamette and Columbia Rivers, stupid locations in the first place. The storage

188142

and refinery areas near the Willamette are on literally shaky ground, with liquefaction a near sure thing with any significant earthquake. We should be dismantling and moving these to safer ground or decommissioning them entirely.

We must not expand any existing site, but put our efforts into replacing the fossil fuels with clean alternatives.

We cannot allow Big Oil to jeopardize our land and rivers for short-term gain. Our air, land, water and populace all stand to lose.

Fossil fuel terminals pose a serious threat to the environment and to public safety. These changes to the policy are crucial to protect our communities and our natural surroundings. Presently, the discussion draft allows new bulk terminals to be built and allows existing facilities to expand, which will grow our carbon footprint past the point of being able to meet our local and state carbon reduction goals. Further, transporting and storing fossil fuels are never safe, with risks ranging from oil train derailments and pipeline spills to storage tank explosions and tank destabilization from earthquakes. The City of Portland needs to hold these industries accountable for improving their safety

188142

without promising them more room to grow. We need to shrink fossil fuel use, not grow it!

It is vital that the city strengthen the current draft of the fossil fuel code to reflect the intent of the original resolution that myself and thousands of other Portlanders supported last year.

Sincerely,

Lin Reedijk

Dear Mr Mayor and Council,

What is going on in the City? While the previous Mayor and Council were basking in the admiration of the public in finally passing a good sense, people oriented resolution, the corporate powers were obviously working behind the scenes to erode that move.

188142

If this move is a mark of the new Mayor and council to pander to corporate fossil fuel interests, he is in for a long term fight for every inch he expects to make in promulgating his nefarious agenda.

I want a full ban on fossil fuel terminals, strict people approved expansion to existing facilities and people monitored surveys of existing facilities with regard to adequate seismic preparedness as well as general protection of the environment from spills and other known health and safety related results of this industry.

Hello.

Thank you for the opportunity to comment on this important issue.
In addition to asking for no further fossil fuel infrastructure to be

188142

built and of no expansion of existing infrastructure, I would also ask for the existing infrastructure to be upgraded asap.

I live directly across from the tank farms just north of the St John's bridge. It's obvious that there is a great risk, in fact an almost certain probability, that those tanks will be impacted by an earthquake.
What will happen to the river?
What will happen to this community?
What will happen to the railway and Hwy 30 if there are fires, explosions, and/or leaks?
Is any agency or company or lawmaker looking in to this issue?
Is there any substantive action on it?

Obviously if something happens (and it eventually will) it will be a very big deal even if everyone who can do something has, at this time, their heads somewhere besides between their shoulders.

Comment:

Dear Commission Members

Thank you to you and your staff for working every day as best you can to promote the safe, equitable, and sustainable growth of our city. There is no doubt this is not an easy job, and I appreciate your efforts to balance the many needs of the City.

I'm writing in regards to Resolution 37168, which contains the mandate for City Council to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." This is clear and unequivocal language that sets a clear mandate for a ban on all new or expanded facilities related to fossil fuels (with exemptions acknowledged).

Yet the proposed Zoning Code Amendments clearly state the goals of the amendments as to "allow for new terminal development large enough to
accommodate forecast growth" and to "Allow existing terminals to expand, particularly to support seismic upgrades and access to greener fuels."

Simply put, limiting the size of new developments and creating a

188142

broad allowance for existing terminals to expand, even for safety reasons, does not match the intent of the Resolution. The direction is to "actively oppose" new or expanded infrastructure, not balance the needs of the regional market or allow for expansions. For this reason, there should be NO new infrastructure allowed.

Additionally, while the Resolution exempts expansion for safety reasons, the burden of proof for need of expansion should be on the national and multinational corporations who run these facilities, and a broad allowance for expansion should not be codified, rather it should be applied for on an individual basis. The motive for allowing for broadly allowing expansion to increase their revenue so they can cover safety costs is not a valid one, as oil and gas companies are the richest organizations in the world. Allowing them concessions to make more money so they can have safer facilities is an incredibly distorted way of viewing protecting the public, as it is these companies that are in fact endangering the public through their industry.

Most importantly, the scope of Zoning Changes completely misses the point of the Resolution and of the climate challenge we face. Simply put, according to most experts, emissions need to STOP by 2017 to avoid 2 degrees in warming, already nearly catastrophic levels. The impacts will be felt locally as climate refugees flock to the Pacific Northwest, causing severe stress on the city in every imaginable capacity. Already the Northwest is in the midst of a major drought, one that will only get worse as warming increases. This is the time for governments, including the City of Portland to step up and ACTIVELY OPPOSE any new fossil fuel infrastructure development, not to allow for limited growth or expansion.

Now is NOT time for a balanced approach, rather a clear moral and ethical stance. Think of it this way: What world do you want YOUR children to live in? If you knew they were at risk (which they are), what choice would you make? Allow more fossil fuels, or set clear laws that give us a chance for a better future, or at least a less worse one?

As a Portland resident I cannot understand why the City would justify allowing for expanded fossil fuel growth in our borders

when it has passed resolutions barring it from doing so and fully recognizes the impact that climate change will have locally, regionally and worldwide.

188142

Please ensure that the zoning code update clearly meets the intent of the resolution and ACTIVELY OPPOSES all new and expanded infrastructure development. As citizens, we will be sure to be present to ensure the City keeps its word.

Thank you very much,
Jonathan Strunin, Sabin Community Resident

Comment:

Recently, Portland passed a resolution to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways."

The elected representatives of Portland spoke on behalf of the majority of the city's residents in this historic vote. Mayor Hales said about the vote, "The reality is, while climate change could be even more catastrophic, it's not too late to do something about it. If we're aggressive about carbon reduction, we can, city by city, make a difference."

Now, City staff have offered an initial draft of proposed code changes that would translate the City's sweeping resolution into binding land use rules. Instead of a ban these rules would do the exact opposite: allow new bulk fossil fuel terminals to be built and allow already existing ones to expand.

As a citizen of Portland I call for the rules to be rewritten to reflect precisely the intents and commitments of our City, our mayor, and our citizens. We must have a Fossil Fuel Policy that does indeed "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways.".

To the Bureau of Planning and Sustainabililty,

The 2015 Fossil Fuel Resolution passed in the City of Portland gives us the opportunity to chart a path for the rest of the United States. The resolution is brave – exactly what we need to be as a city and as a nation, in order to have any significant reduction in fossil fuel development and usage. The Zoning Amendments discussion draft, on the other hand, is weak. It upholds the status quo, supports fossil fuel development, and prevents Portland from setting a historic path for our country.

Portland is a special city. We aren't perfect, and we fall behind others in the areas of affordable housing, racial equality, and more. We do, however, have a strong history of environmental planning and legislation. We are the city most prepared, out of all the cities in the United States, to enact necessary fossil fuel restrictions and transitions to green energy. If the bold and visionary intents of the resolution are not upheld, then we fail in our duty as an American city – and as Americans – to make our country the best that it can be.

To reiterate: It is our duty as an American city to enact legislation that raises the United States up as a leader of the free world. But our country cannot be a leader while we are dependent, and plan for dependence, upon fossil fuels. Portland must set an example of independence from fossil fuels for the rest of the

188142

country. As a city, we are brave, forward-thinking, and unique. If we do not leverage these qualities for fossil fuel independence, we fail.

Please do not let fear motivate your decisions. Rather, let your decisions be motivated by hope, solidarity, bravery, and a sense of responsibility. Thank you for your time.

Sincerely,
Molly Jackson-Nielsen

Dear BPS Staff:

I was very happy last year when Mayor Hales directed BPS to develop a policy that would ban new fossil fuel facilities in Portland, gaining us major media coverage and bolstering Portland's reputation as a climate leader.

However, I was shocked to learn yesterday that instead, BPS has proposed a policy that dramatically *weakens* this directive, and would permit new and expanded fossil fuel facilities within the city of Portland. This is completely contrary to the will of the tens of thousands of citizens who commented, protested, and spoke at hearings on this issue.

I insist that this proposed policy be dramatically strengthened to include the following:

–A complete prohibition on new bulk fossil fuel terminals.
–Strict limitations on expansions of existing facilities
–A requirement that existing fossil fuel terminals (such as the NW Energy Hub) make upgrades for seismic resilience to protect the health and safety of Portland residents and the Willamette River.

Portland residents were told clearly in 2015 that Mayor Hales had committed to permitting NO new fossil fuel terminals in the city of Portland. Portland received international media attention for this decision. The proposed policy is Orwellian: the exact opposite of what it was intended to be. If you do not dramatically strengthen this proposal, you will be violating those promises, endangering local health and safety as well as the climate, and jeopardizing Portland's national leadership on this issue.

Thank you for your attention.

Comment:

To the City of Portland's Bureau of Planning and Sustainability,

I am writing to express my dismay at the weak proposal being put forth on new fossil fuel infrastructure. In terms of the changing climate, the hour is late. There is no need for new fossil fuel infrastructure. More accurately we cannot afford to build any new fossil fuel infrastructure. We must not build any more fossil fuel infrastructure.

If it is jobs you want to create for the trades, there are jobs. Yes, green jobs for sure–retrofitting buildings for efficiency, wind turbines, solar water heaters and panels and more. And how about we look at our roads, our schools and crumbling bridges. Let's put people to work on these projects. We also have a seismic disaster coming our way and we can see how we need to upgrade our bridges, roads and our airport. These are jobs that are positive work for the long-term health of our communities.

If you must throw a bone to the fossil fuel companies, have them work on upgrading the seismic resilience of the terminals on the Willamette. This will protect the health and safety of the people

that live there. Furthermore, if they do the job well those facilities will be available for use after the big earthquake.

To conclude, fossil fuel infrastructure is hazardous to the immediate well being of people living near these projects and secondly, it is absolutely lethal to our future well being. No new fossil fuel infrastructure. No loop holes. No exceptions.

Comment:

Dear City of Portland,

I am proud to live in a city that is on the forefront of environmental progress, and that has a forward thinking vision of the best way to create a livable environment. Portland has been coasting on the environmental innovations of two decades ago, and it is time for the next generation of environmental leadership. In this time of changing climate, oil train derailments, environmental devastation from extractive industries, Portland's next steps are clear.

I write to encourage the full ban on new bulk fossil fuel terminals, limitations on expansions at existing facilities, and provisions that require existing fossil fuel terminals to make upgrades for seismic resilience to protect the health and safety of neighboring communities and the Willamette and Columbia Rivers.

Sincerely,
Colleen McNally-Murphy

Comment:

Dear Bureau Members,
I have reviewed the draft resolution and thank you for your time spent protecting Portlander's health and safety. I would, however, request that the following be added to the draft::
1 – A full ban on new bulk terminals
2 – Stronger limitations on expansions at existing facilities
3 – Provisions to require existing fossil fuel terminals to make upgrades for seismic resilience to protect the health and safety of neighboring communities and the Willamette River.

These changes are crucial because of the urgent threat that fossil fuel terminals pose to both the environment and public safety. Presently, the discussion draft allows new bulk terminals to be built and allows existing facilities to expand, which will grow our carbon footprint past the point of being able to meet our local and state carbon reduction goals. Further, transporting and storing fossil fuels are never safe, with risks ranging from oil train derailments and pipeline spills to storage tank explosions and tank destabilization from earthquakes. The City of Portland needs to hold these industries accountable for improving their safety without promising them more room to grow. We need to shrink fossil fuel use, not grow it!

It is vital that the city strengthen the current draft of the fossil fuel code to reflect the intent of the original resolution that myself and thousands of other Portlanders supported last year.

Sincerely,
Sharon Miller

I grew up in Portland tho I do not live there now.
However, Portland has this opportunity to be a leader while taking effective significant action on greenhouse gas emissions. Your methane and CO2 affect me and mine (in Ashland) affect you and the whole planet. Thus I am very interested and concerned.

Please institute the strongest possible ban on new fossil fuel facilities and require upgrades on existing facilities to protect the health and safety of us all. That also means no expansions.

Thank you.

The Portland city council already voted to ban new and expanded fossil fuel terminals that might be used for export of these materials. Yet I understand that the draft plan for fossil fuel terminal zoning would not do this.

Climate change is already happening much more rapidly than predicted just 5-10 years ago, leading to record high temperatures in many parts of the world, increasing frequency of severe, multi-billion dollar storms and forest fires. this is no time to be facilitating the use of fossil fuels. Please honor the letter and spirit of the City council's resolution limiting fossil fuel transport through Portland.

Also, i am very worried about the high susceptibility of Portland's existing fossil fuel storage facilities to damage from a severe earthquake that is certain to come one of these days. High priority must be given to retrofitting these facilities to strengthen them seismically so that fuels will be available after a mega-quake to aid in our recovery.

Comment:

In order to honor the Fossil Fuel Resolution, I urge you to ban new fossil fuel terminals and make it more difficult to expand existing terminals in Portland, two things that the current Fossil Fuel Terminal Zoning Amendments do not support, but instead go against directly.

It is very important to combat climate change in this way by reducing our carbon footprint, as fossil fuels are extremely destructive and dangerous to transport. This danger was just seen in Mosier, a situation that could have been much worse, especially if the derailment had happened in the much-more populated Portland area. In addition, many of the fossil fuel terminals in the city are located in dangerous seismic zones that would make an inevitable earthquake much more of a dire situation than it otherwise would be.

By continuing the expansion of these terminals and the fossil fuel

188142

transportation such expansions would require, the city would putting in danger its citizens lives, the environment in the terminal and transportation blast zones, and the greater global community.

The Fossil Fuel Resolution was an unprecedented and radical step in the right direction when it comes to reducing and eventually eradicating fossil fuels in our city! Let's continue to be leaders in the climate justice movement by respecting the resolution through improvements to the Fossil Fuel Zoning Amendments!

Sincerely,
Rebecca Smith

I want a full ban on new fossil fuel terminals and no expansions of existing facilities and provisions that require existing fossil fuel terminals to make upgrades for seismic resilience to protect the health and safety of neighboring communities and the Willamette river. I don't want any trains transporting crude oil passing through our communities. Everything in our power must be done to curb climate change.

Name: Susan DeFreitas Timmons
Email: susan.defreitas@gmail.com

Comment:

The time for a few weak regulations has passed. We are in a climate crisis that's worsening every day, and Portland has the opportunity to lead the way.

The vast majority of Portland residents want a full ban on new

bulk fossil fuel terminals–as well as on expansions of existing fossil fuel terminals, which could easily be just as damaging, not only to the environment, but to our local quality of life.

188142

And while we're at it, let's address the looming threat to the health of our region and the ecosystems on which we depend by making those fossil fuel terminals we do have ready for the The Big One–because we know it's only a matter of time until a monster earthquake hits. Therefore, we want provisions in that require existing fossil fuel terminals to make upgrades for seismic resilience.

These are the baseline measures we need NOW to protect the health and safety of neighboring communities and the Willamette River.

Thank you for taking bold action now, on behalf of both current residents and future generations.

Best wishes,

Susan DeFreitas Timmons

Please honor the intention of the fossil fuel policy resolution City Council passed by creating strong regulations that actually will accomplish what the resolution calls for including banning new bulk fossil fuel terminals, limit the expansion of existing facilities and require upgrades to existing facilities to prevent fuel spills in the event of an earthquake. Anything less will not protect our ground and waterways.

Name: Bill Michtom
Email: wdmichtom@gmail.com

Comment:

Portland, and Oregon & Washington in general, needs a full ban of new fossil fuel infrastructure, in particular oil, gas, and coal terminals in Portland.

The 2015 Fossil Fuel Resolution that was passed last year was bold, visionary, and historic. Unfortunately, the Fossil Fuel Terminal Zoning Amendments discussion draft is none of those things. Instead of focusing on protecting the area and committing to ending fossil fuel use, it protects the fossil fuel industry.

We urgently need:
1 – A full ban on new bulk terminals
2 – Stronger limitations on expansions at existing facilities
3 – Provisions to require existing fossil fuel terminals to make upgrades for seismic resilience to protect the health and safety of neighboring communities and the Willamette River.

These changes are crucial because the discussion draft allows new bulk terminals to be built as well as allowing existing facilities to expand, growing our carbon footprint and preventing

188142

us from meeting our local and state carbon reduction goals. Furthermore, as was recently emphasized in Mosier, transporting and storing fossil fuels is never safe. We face serious risks from oil train derailments, pipeline spills, storage tank explosions, and tank destabilization from earthquakes.

The City of Portland needs to hold fossil fuel industries accountable for improving their safety without promising them more room to grow. We need to shrink fossil fuel use, period!

It is vital that the city strengthen the current draft of the fossil fuel code to reflect the intent of the original resolution that I and thousands of other Portlanders supported last year.

The Fossil Fuel Terminal Zoning Amendments discussion draft has fallen far short of the 2015 Fossil Fuel Resolution that was passed last year. Where the resolution was bold, visionary, and historic, this discussion draft is short-sighted and prioritizes the fossil fuel industry over the health and safety of Portlanders.

188142

I want:
1 – A full ban on new bulk terminals
2 – Stronger limitations on expansions at existing facilities
3 – Provisions to require existing fossil fuel terminals to make upgrades for seismic resilience to protect the health and safety of neighboring communities and the Willamette River.

These changes are crucial because of the urgent threat that fossil fuel terminals pose to both the environment and public safety. Presently, the discussion draft allows new bulk terminals to be built and allows existing facilities to expand, which will grow our carbon footprint past the point of being able to meet our local and state carbon reduction goals. Further, transporting and storing fossil fuels are never safe, with risks ranging from oil train derailments and pipeline spills to storage tank explosions and tank destabilization from earthquakes. The City of Portland needs to hold these industries accountable for improving their safety without promising them more room to grow. We need to shrink fossil fuel use, not grow it!

It is vital that the city strengthen the current draft of the fossil fuel code to reflect the intent of the original resolution that myself and thousands of other Portlanders supported last year.

Sincerely,

Imogen Taylor

Comment:

Reading the Fossil Fuel Terminal Zoning Amendments discussion draft was incredibly disappointing. After Portland was applauded by various news sources and environmental groups around the country for the resolution against new fossil fuel infrastructure, this discussion draft feels like a slap in the face. It is clear that fossil fuel companies have been pushing back against this progressive resolution, but we can't let them take away our future. These corporations are in it for the profit, but citizens of Portland need the ban for their lives and the lives of

188142

their children.

There needs to be a full ban on all new fossil fuel infrastructure, and the only reason an existing fossil fuel terminal should be improved is for safety and seismic upgrades, not expansion.

Let's think about our planet and the safety of our friends, family, and all other human beings impacted by the dangerous extraction, transportation, and use of fossil fuels. Portland can be a leader in the fight for climate justice. Let's get this policy right.

I am excited to participate in a new ban on fossil-fuel industries during this comment period. The regulations for this plan need to be STRONG, without loop-hole possibilities. They need to include:
FULL ban on new bulk fuel terminals.

STRONG limitations on expanding existing facilities.
Make seismic upgrades to protect existing facilities from earth quake damage, as well as neighboring communities and rivers. Let's keep endorsing to keep fossil fuels in the ground! Thank you, Ineke Deruyter

I am writing to say the Fossil Fuel Terminal Zoning Amendments are not strict enough. We need to put a full ban on new bulk terminals, limit expansions at existing facilities and require existing fossil fuel terminals to make upgrades for seismic resilience. These changes are the least Portland should enact. If we truly want to be a green city and start working towards our plans to reduce carbon, we should stop all transportation and storage of fossil fuels. It isn't safe and supporting its use rather than working for renewables is short-sighted.

Thank you,

Name: Darvel Lloyd

Comment:

Yes, I recall you made a resolution to ban new bulk fossil fuel terminals. Now, STAND BY your resolution and vote to ban them! Also, don't allow any expansion of existing fossil fuel facilities. They are going to be out of commission anyway in the next big subduction earthquake. And they won't be needed as wind and solar (and other renewable sources) energy facilities expand. WE MUST TRANSITION TO CLEANER ENERGY, AS THE EARTH IS RAPIDLY WARMING BECAUSE OF FOSSIL FUEL EMISSIONS! You know this as well as I do. So now is the time to do something about this crisis–the greatest ever faced my humankind!

Comment:

Portland and the Pacific Northwest needs a full ban on new bulk fossil fuel terminals, such as have been proposed at Clatskanie, OR, Vancouver and Kalama, WA, and elsewhere.
Portland and the Pacific Northwest needs limitations on expansions at existing fossil fuel facilities.
We need provisions that require existing fossil fuel terminals make upgrades for seismic resilience to protect the health and safety of neighboring communities and the Willamette and Columbia Rivers. The recent New Yorker article on "The Really Big One," July 20, 2015, by Kathryn Schulz, points out the dangers of existing tank farms located along the Willamette River north of Portland's downtown.
We must keep fossil fuels in the ground.
We currently have all the scientific and technical knowledge and the physical resources to get all of the energy we need from renewables, according to Mark Z. Jacobson, Director of the Atmosphere/Energy Program and Professor of Civil and Environmental Engineering at Stanford University. Now add to that a new analysis, called "World Energy Revolution: A Sustainable World Energy Outlook 2015", produced by Greenpeace in collaboration with researchers from the German Aerospace Center, that says our world can make the switch to 100% renewable energy by 2050. Feed-in-tariffs–which have helped put Germany and Ontario, Canada at the forefront of the transition to green energy–are promoted by Oregonians for Renewable Energy Progress (OREP) as an important policy tool to incentivize this transition.
America's path to prosperity lies in a rapid switch-over to abundant, homegrown, renewable energy to power our homes, businesses, and vehicles–NOT in facilitating extracting and exporting of dirty, polluting coal, oil, and gas, which represents a retreat from the 21st Century economy. Renewable energy already employs 2.7 million workers (more than the fossil fuel industry) and studies have shown that green energy will continue to create far more jobs than the fossil fuel industries. [see: Sizing the Clean Economy, A National and Regional Green Jobs

188142

Assessment by the Metropolitan Policy Program at the Brookings Institute, 2011. Also, One Million Climate Jobs, 3rd Edition, 2014, edited by Jonathan Neale, published by the Campaign Against Climate Change] A U.S.-led, green, industrial revolution will move our economy forward, create millions of new jobs, and help ensure a livable planet for future generations.

Comment:

Dear Bureau of Planning and Sustainability,

I'm writing to urge you to enact a full ban on the building of any new fossil fuel infrastructure – to include, but not be limited to – oil, gas and coal terminals in the City of Portland.

The 2015 Fossil Fuel Resolution was supported by our community and a unanimous City Council vote – it offered the public a real promise of a future free of these terminals, and their associated and deadly health and safety risks. It promised the citizens of Portland a dramatic shift in City policy – away from fossil fuel consumption and towards renewable energy sources. As your bureau is charged with sustainability as a mission, I'm deeply disappointed that you all aren't working to uphold and further the 2015 resolution – a forward-thinking accomplishment created by a collaborative process between the City Council and members of the public.

Instead the Fossil Fuel Terminal Zoning Amendments discussion draft has weakened the advances that were contained in the 2015 Resolution. I object to the way that the draft favors industry profits over public health and safety. I object to you not honoring and upholding the work accomplished by City Council and the public. The City often asks for public input and engagement, and the 2015 Resolution was a great example of citizens and elected leaders collaborating on an outcome that was unanimous – both entities were pleased with the outcome. It was held up by the City as a successful example of these kinds of collaborations. Why would the Bureau of Planning and Sustainability want to

188142

undo that accomplishment? Actions like that only sour citizens on engaging with the City and make your bureau look like you feel "know better" and that you don't feel an obligation to properly represent the public and City Council in your work. It gives the impression that you really only represent industry and their deep pockets.

I'm writing to urge you to do the following things:
1 – A full ban on new bulk terminals
2 – Stronger limitations on expansions at existing facilities
3 – Provisions to require existing fossil fuel terminals to make upgrades for seismic resilience to protect the health and safety of neighboring communities and the Willamette River.

These changes are crucial because of the urgent threat that fossil fuel terminals pose to both the environment and public safety. Presently, the discussion draft allows new bulk terminals to be built and allows existing facilities to expand, which will grow our carbon footprint past the point of being able to meet our local and state carbon reduction goals. Further, transporting and storing fossil fuels are never safe, with risks ranging from oil train derailments and pipeline spills to storage tank explosions and tank destabilization from earthquakes. The City of Portland needs to hold these industries accountable for improving their safety without promising them more room to grow.

If you are truly looking at sustainable energy solutions, you cannot be committing to expansion of fossil fuel use. If you are informed by science, you know that its far past the time for action to eliminate fossil fuel consumption, in order to address the very real current and future global peril induced by climate change.

It is vital that the city strengthen the current draft of the fossil fuel code to reflect the intent of the original 2015 resolution that myself and thousands of other Portlanders supported last year.

Dear Members of the City of Portland's Bureau of Sustainability and Planning,

My name is Meg Ruby. I own and I live at 3218 SE. Tibbets Street, Apt. A, Portland, OR 97202.

I am writing today to urged the city to finalize into law the fossil fuel ban enacted by Portland city Council this last year.

To cut to the chase, the following constitute the essential next steps:

A full ban on new bulk fossil fuel terminals;
Limitations on expansions at existing facilities;
Provisions that require existing fossil fuel terminals make necessary upgrades for seismic resilience in order to protect the health and safety of neighboring communities and the Willamette River.

Thank you for your continued leadership and specifically for leading the city through the completion of the final actions needed to codify into law the ban on fossil fuel exports.

Sincerely,

Meg Ruby, M.S.

Comment:

I am concerned that the Fossil Fuel Terminal Zoning Amendments discussion draft does not meet the intent of the 2015 Fossil Fuel Resolution that The Portland City Council passed in November, 2015. Where the resolution was bold, visionary, and historic, this discussion draft is insufficient and prioritizes the fossil fuel industry over the health and safety of Portlanders.

The improvements in the amendments which I request are as follows:

Prohibit new bulk fossil fuel terminals. Portland's resolution was clear in its intent to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or

188142

through Portland or adjacent waterways." The proposed code changes prohibit coal, and the amendments should do the same for other fossil fuels like oil, LNG, propane, and methanol.
Proposed code changes should restrict expansion of existing fossil fuel infrastructure as non conforming uses.
Non-conforming facilities (existing fossil fuel terminals) should be required to invest in seismic upgrades and to post fossil fuel risk bonds to protect public health and water quality. These requirements can be phased in over time to address the resolution's mandate to address the public safety risks of fossil fuels.
Rather than accept the fossil fuel companies' claim of increased demand, the code changes should plan for greener fuels and transition to100% Renewable Energy in Portland by 2050.
Involve the Portland Bureau of Emergency Management in addressing the risks of fossil fuel storage and transport at existing facilities in Portland's NW Industrial Area.
These changes are crucial because of the threats that fossil fuel terminals pose to both the environment and public safety. The discussion draft allows new bulk terminals to be built and allows existing facilities to expand, which will grow our carbon footprint past the point of being able to meet our local and state carbon reduction goals. Further, transporting and storing fossil fuels pose risks ranging from oil train derailments and pipeline spills to storage tank explosions and tank destabilization from earthquakes. The City of Portland needs to hold these industries accountable for improving their safety without promising them more room to grow. We need to shrink fossil fuel use, not grow it!

It is vital that the city strengthen the current draft of the fossil fuel code to reflect the intent of the original resolution which I and thousands of other Portlanders supported last year.

Comment:

I was disappointed to see how far short of the hopes of the supporters for the ban on new and expanded fossil fuel terminals ended up being. The draft is allowing for new bulk terminals to be built as well as present terminals be expanded. These

188142

provisions go against the sentiment that our carbon reduction footprint be reduced, not expanded. I am asking for the policymakers to strengthen the fossil fuel code to truly reflect the sentiment that we need to look for a new direction in our energy policy and fossil fuel use needs to be reduced for the future of our environment. In addition the facilities that are already in place should be upgraded for seismic resilience.
Thank you-

Comment:

Dear City Council and Mr Mayor –

As a Portland resident, I'm writing to express my concern over the draft of the fossil fuel code currently before you as an implementation tool for the resolution prohibiting any further fossil fuel infrastructure development in the City that you passed last year. By allowing an enormous expansion of some existing facilities and not rolling out plans to control fossil fuel

188142

infrastructure risks, the proposed code draft breaks faith with the resolution the Council passed last year. I urge you to amend it to severely limit any potential expansion of existing infrastructure, and to include steps to make the industry reduce their pollution levels and fire (and other) risks.

Moreover, as indicated in the original resolution, the implementing code draft is an opportunity to flesh out much further some concrete steps the City is willing to take to help ensure a Just Transition occurs as our area, and the whole country, shift more and more to a renewable-energy economy. This is a chance to reach out to communities of color and low-income people to train them for the green economy, and to expand the use of Community Benefits Agreements as piloted successfully in the City previously, working with unions to ensure their apprenticeship programs have opportunities to engage fully in a partnership with the City for a Just Transition. The draft code could and should spell out a City responsibility to develop these kinds of programs.

Thank you for your attention to these matters.

I just heard of your recommendations. How puzzling and disconcerting. You have heard of climate change, right? You do understand what the word sustainability in your title means, right? And you work for the city of Portland, and it's people, right?

If the answers to these questions are yes, then it's simple. Really, it is. Do the right thing. Without compromise, because however much compromise is touted as necessary in politics, in this case it translates to clearly foreseeable death and destruction.

We need a full ban on new bulk fossil fuel terminals. Expansions at existing facilities must be limited. And existing terminals must be required to make upgrades for seismic resilience.

Perhaps you were floating this joke just to see what the people would say. That's the only way I can understand your work. Ok, charade's over. Time to get real.

Where the resolution was bold, visionary, and historic, this discussion draft is short-sighted and prioritizes the fossil fuel industry over the health and safety of Portlanders.

I want:
1 – A full ban on new bulk terminals
2 – Stronger limitations on expansions at existing facilities
3 – Provisions to require existing fossil fuel terminals to make upgrades for seismic resilience to protect the health and safety of neighboring communities and the Willamette River.

These changes are crucial because of the urgent threat that fossil fuel terminals pose to both the environment and public safety. Presently, the discussion draft allows new bulk terminals to be built and allows existing facilities to expand, which will grow our carbon footprint past the point of being able to meet our local and state carbon reduction goals. Further, transporting and storing fossil fuels are never safe, with risks ranging from oil train derailments and pipeline spills to storage tank explosions and tank destabilization from earthquakes. The City of Portland needs to hold these industries accountable for improving their safety without promising them more room to grow. We need to shrink fossil fuel use, not grow it!

It is vital that the city strengthen the current draft of the fossil fuel code to reflect the intent of the original resolution that myself and thousands of other Portlanders supported last year.

Sincerely,

Kris Deelane

I live near the Central Energy Hub that the City should decide is risky enough as it is. Oregon Public Broadcasting's Field Guide made a 55-minute program illustrating what the state is in for during an expected, overdue earthquake, with special reference to the risks to fossil fuel tanks in Portland on the Willamette River. http://www.opb.org/news/series/unprepared/

The City should prohibit new or enlarged fossil projects, and the City should mandate the processes that Japan uses to stabilize liquefy-able ground under existing fuel projects.

Comment:

I have learned that strong public protest led to a meeting of mayors from several West Coast cities, who then took into consideration those protests and agreed to develop rules aimed at reducing fossil fuel infrastructure, and consumption. Now I have heard that a decision has been made to have public employees write their own rules instead. WHY?

Sabotaging the public will is not public service!

I want a full ban on new and expanded fossil fuel terminals! AND limitations on any expansion of existing such facilities!!!
Our nation and indeed the world desperately needs to cease use of fossil fuels and move toward cleaner, more sustainable energy sources in order to fight against climate change and the fragile ecosystem. Continuing to pour money into infrastructure supporting gas & oil use is totally counter to wise resource management.
I also want the existing terminals to immediately take action to ensure seismic resilience in the light of predicted earthquakes. Lessons must be learned from the recent derailing of fuel cargo along the Willamette valley. Our environment is precious and needs protection as does the human population.

I want a full ban of new fossil fuel infrastructure, in particular oil, gas, and coal terminals in Portland.

The Fossil Fuel Terminal Zoning Amendments discussion draft has fallen far short of the 2015 Fossil Fuel Resolution that was passed last year. Where the resolution was bold, visionary, and historic, this discussion draft is short-sighted and prioritizes the fossil fuel industry over the health and safety of Portlanders.

I want:
1 – A full ban on new bulk terminals
2 – Stronger limitations on expansions at existing facilities
3 – Provisions to require existing fossil fuel terminals to make upgrades for seismic resilience to protect the health and safety of neighboring communities and the Willamette River.

These changes are crucial because of the urgent threat that fossil fuel terminals pose to both the environment and public safety. Presently, the discussion draft allows new bulk terminals to be built and allows existing facilities to expand, which will grow our carbon footprint past the point of being able to meet our local and state carbon reduction goals. Further, transporting and storing fossil fuels are never safe, with risks ranging from oil train derailments and pipeline spills to storage tank explosions and tank destabilization from earthquakes. The City of Portland needs to hold these industries accountable for improving their safety without promising them more room to grow. We need to shrink fossil fuel use, not grow it!

It is vital that the city strengthen the current draft of the fossil fuel

code to reflect the intent of the original resolution that myself and thousands of other Portlanders supported last year. Let Portland be a leader and a healthy future for our country.

City of Porland: As a citizen concerned about environment and health of our community, there must be a complete BAN on any new fossil fuel facilities and limitations on expansions of current ones. Think about earthquakes and global warming!

Name: Deborah Einbender
Email: pursona@teleport.com

Comment:

Nothing less than a full ban on fossil fuel terminals is acceptable including limitations on existing terminals. Seismic upgrades are essential. Do the right thing for our future generations.

Name: Richard Houle
Email: houle5@comcast.net

Comment:

As a community and a collection of responsible citizens, it is incumbent upon us to recognize that the decisions we make now regarding expansion of fossil fuels and its infrastructure will dramatically affect future generations not only in our immediate vicinity, but throughout the world. Citizens here in the Pacific Northwest, and myself included do not want to add to the problem of global warming and climate change. Supporting the fossil fuel industry over renewable energy does exactly that, and it's flat out bad policy. Therefore, I do not support any expansion of existing fossil fuel infrastructure and certainly see no

justification for building new terminals. Please do right by us.

Having grown up in Portland, and now raising my kiddo here, the health of the air, water and soils are incredibly important to me. But now we live in an era where we also need to take into account global climate patterns and changes. The only rational course of action is to fully ban all building of fossil fuel infrastructure, both new and expanded terminals. There are so many immediate threats to human and ecological life as well as extended threats to dependence on the crumbling, antiquated fossil fuel industry. Resilience equals diversifying OUT of fossil fuels. Survival equals leaving fossil fuel dependence as soon as possible.

Name: Hal Anthony
Email: threepines@jeffnet.org

Comment:

Dear Portland, City of:

There are virtually zero safety measures required for oil depots for incidence like earthquakes. This needs to be addressed, ASAP, for existing plants, as we are quite overdue for a major

188142

NW seismic event, to mention one region.

Also, if future energy decisions, and all decisions by all people for that matter, are not made on the definitive side of "sustainable", then "adults" will continue to prove their hatred for children – period. Fact.

Think about it – all children are the most important beings on the planet. They MUST be protected sustainably and well so they can bail us out of our tragic and deadly human errors. "Sustainable" means "permanency", and it is the only path that can continue human viability.

Name: Pennelloppe Allee
Email: pennelloppe99@yahoo.com

Comment:

We should be urgently transitioning to clean energy sources and only investing in those. Expanding fossil fuel terminals is exactly the wrong course and an incredible waste of money. The sooner we wean ourselves from fossil fuel dependency, the better off we will be, environmentally and financially.

Comment:

I was very disappointed to learn that the BPS's recent draft Fossil Fuel Terminal Zoning Amendments backtracked on the

188142

language passed by City Council in November. The City Council passed a resolution clearly outlining that no new fossil fuel infrastructure should exist in the city, nor should existing infrastructure be expanded. This was groundbreaking and the city rightly received accolades and national media attention. Was this just for show? Now that you have received the credit for taking a tough stance for clean air and climate justice, you are willing to contradict what the people and city leaders asked? This is not only upsetting to me as someone who has lived in the city for a decade and fought hard to make Oregon a more healthy place to live, it is dishonest on the part of the BPS and city leaders to go against their word.

Please do what you said you would do and put a full ban on new bulk fossil fuel terminals and limit expansions on existing facilities. Please require existing fossil fuel terminals to upgrade for seismic resilience to protect our community. In a world where business rules all these seem radical, but these are nothing more than common sense approaches to address the severity and reality of climate change. And here in the Northwest, the impact (35% chance in the next 50 years) of a devastating earthquake. Furthermore, given recent revelations about problems with air quality in Portland neighborhoods, including several I have lived in, and lead in PPS water, the city needs to start taking seriously the risk industry poses to our health, not just offer us lip service while poisoning our children.

Failing to create strong and meaningful regulations that ban new bulk fossil fuel infrastructure and limit expansion of existing would be a missed opportunity for the city to take real leadership and establish a true green legacy.

Thank you for considering my comments. I am sure you will do the right thing.

The US does not need to export any raw materials, especially dirty energy sources. Exporting raw materials does not create jobs it destroys them. It turns us into a third world country. Transporting fossil fuels is dangerous and bad for the environment. The recent incident in Columbia Gorge should be a

lesson. We can create more jobs and have a better , healthier, and cleaner future by developing clean alternatives and eventually eliminating the use of fossil fuels. CLIMATE CHANGE IS REAL. It is killing the planet.

188142

Dear City Council,
When you passed the resolution last fall we truly believed you were committing to no expansion of fossil fuel infrastructure in our city. When I look at the draft, I see ideas that don't seem to be doing that.
We all know fossil fuels are on their way out so it makes no sense to be making investments in new infrastructure for it. That's why I thought it was so smart of you to pass the new policy. The investment in new infrastructure must be on clean energy, renewable energy. We must follow thru on the commitment to the new renewable economy. Please make sure the rules for implementing this resolution does this.
We need a complete ban on any new fossil fuel terminals.
We need limits on expansion of existing fossil fuel terminals.
And we very much need to feel safe in our city,that the fossil fuel storage at the existing terminals are seismically safe when the big one comes. Please make sure these terminals must seismically upgrade.
Thank you

Any investment that is done in energy infrastructure in Portland needs to be an investment in renewable energy. We can't say we are adhering to a Climate Action Plan with integrity while simultaneously allowing for expansion of existing fossil fuel terminals. There are jobs in clean energy and Portland has the chance to be a leading city in modeling a just transition. The Pacific Northwest has already begun to feel the effects of climate change and it is inevitably only going to get worse. We must do our part, even more than our part when we can, to stop the unsustainable and toxic practice of fossil fuel reliance. Now is the time for the City of Portland to embrace the science of climate change and discontinue it's contributions toward it. The water, air, soil, and health of Portland's residents have all been placed in jeopardy due to a lack of industry regulation and it is the moral imperative of all decision makers to place people over industry profits.

Comment:

Dear Portland Bureau of Planning and Sustainability,

As an environmental economist and young adult, the project that most gives me hope for my future is Portland's Fossil Fuel

Resolution. The Resolution acknowledges the risks of investments in fossil fuel infrastructure to a greater extent than I have seen in any other policy document, and I am proud to live in Portland as a result of this.

188142

However, I feel that the draft zoning code amendments do not fully apply the Resolution. It is important to apply the Resolution as fully as possible by including language addressing these three points:
1. A full ban on new bulk fossil fuel terminals
2. Limitations on expansions at existing facilities
3. Provisions that require existing fossil fuel terminals make upgrades for seismic resilience to protect the health and safety of neighboring communities and the Willamette River.

It is vital that the suggested draft BPS submits to City Council address these three points in addition to the existing draft amendments.

I live in Salem. I need you to go forward in this issue as an example to the rest of us. Thank you for your efforts.
I want a full ban of new fossil fuel infrastructure, in particular oil, gas, and coal terminals in Portland.
The Fossil Fuel Terminal Zoning Amendments discussion draft has fallen far short of the 2015 Fossil Fuel Resolution that was passed last year. Where the resolution was bold, visionary, and

historic, this discussion draft is short-sighted and prioritizes the fossil fuel industry over the health and safety of Portlanders.

188142

I want:
1 – A full ban on new bulk terminals
2 – Stronger limitations on expansions at existing facilities
3 – Provisions to require existing fossil fuel terminals to make upgrades for seismic resilience to protect the health and safety of neighboring communities and the Willamette River.

These changes are crucial because of the urgent threat that fossil fuel terminals pose to both the environment and public safety. Presently, the discussion draft allows new bulk terminals to be built and allows existing facilities to expand, which will grow our carbon footprint past the point of being able to meet our local and state carbon reduction goals. Further, transporting and storing fossil fuels are never safe, with risks ranging from oil train derailments and pipeline spills to storage tank explosions and tank destabilization from earthquakes. The City of Portland needs to hold these industries accountable for improving their safety without promising them more room to grow. We need to shrink fossil fuel use, not grow it!

It is vital that the city strengthen the current draft of the fossil fuel code to reflect the intent of the original resolution that myself and thousands of other Portlanders supported last year.

Sincerely,

Name: Cody Tucker

I want:
1 – A full ban on new bulk terminals
2 – Stronger limitations on expansions at existing facilities
3 – Provisions to require existing fossil fuel terminals to make upgrades for seismic resilience to protect the health and safety of neighboring communities and the Willamette River.
4 – Investment in sustainably sourced renewable energy like solar and wind

188142

These changes are crucial because of the urgent threat that fossil fuel terminals pose to both the environment and public safety. Presently, the discussion draft allows new bulk terminals to be built and allows existing facilities to expand, which will grow our carbon footprint past the point of being able to meet our local and state carbon reduction goals. Further, transporting and storing fossil fuels are never safe, with risks ranging from oil train derailments and pipeline spills to storage tank explosions and tank destabilization from earthquakes. If the earthquake were to come tomorrow the entirety of the Willamette-Columbia delta will become a dead zone, an environmetal catastrophe. As a citizens of Portland we depend on the health of our environment.

The City of Portland needs to hold these industries accountable for improving their safety without promising them more room to grow. We need to shrink fossil fuel use, not grow it!

It is vital that the city strengthen the current draft of the fossil fuel code to reflect the intent of the original resolution that myself and thousands of other Portlanders supported last year, not do the exact opposite.

Portland needs to remain the example of sustainable development in the United States. Expanding fossil fuel infrastructure will lead the city down a path much like every other American city. You need to do as the citizens asked, that is your job. We want a city that will lead not only Oregon, but America into a future that reallys on sustainable renewable energy sources that do not cause irreversible damage to future generations. Think of the future, the long term, not short term profits.

Sincerely,

Cody Tucker

Dear City Council,
Last year when you passed the resolution ban on new fossil fuel facilities, I was in the audience supporting your audacious move. Now you need to complete what you started. I understand from 350PDX that your Zoning Amendment discussion draft falls far short of the resolution. Please don't let this happen. We need a full ban on new bulk terminals, good strong limitations on existing facilities and provisions for existing terminals to retrofit for seismic resilience to protect our communities.

In addition, any new regulations that can decrease our carbon footprint would be welcome.
Sincerely, Lynn Youngbar

Dear Bureau of Planning and Sustainability,

Last fall, the Portland City Council took a strong and beautiful step towards a clean energy future when it voted to ban new fossil fuel terminals and set limits on expansions at existing facilities. Don't betray that moment, or the desires of the people of Portland, by implementing rules that will not enforce the strong intentions of the Council. Pleas ensure that implemented rules will enforce:
– A full ban on new bulk fossil fuel terminals;
– Limitations on expansions at existing facilities; and
– Required seismic safety upgrades for existing fossil fuel terminals.

We are truly at a moment where we cannot afford to delay a strong, rapid, transition off of fossil fuels. For the safety of our communities, and the health and well-being of our entire planetary ecosystem, please step up and do your part by crafting a strong and meaningful ban that means what the name implies: no new fossil fuel terminals. Thank you.

Comment:

To the City of Portland Bureau of Planning and Sustainability
Re: Proposed draft Fossil Fuel Terminal Zoning Amendments

The discussion draft indicates that you apparently did not read the fossil fuel resolution passed by the city council. Your draft proposes the following: " The Fossil Fuel Terminal Zoning Amendments project would restrict the development of large new Bulk Fossil Fuel Terminals, while providing for expansion at existing terminals and moderately sized new terminal development to accommodate the fuel needs of the region's growing population." This is unnacceptable. You have managed to reverse the intent of the resolution to allow the expansion of fossil fuel infrastructure! This is unconscionable! You are ignoring the people of this city who have passed this resolution and who also are taxpayers who pay your salaries. You are not listening to the will of the people of this city. Go back and correct this mess.
We want a FULL BAN on new bulk fossil fuel terminals. We want NO expansion at existing facilities except for health and safety

188142

upgrades. We want requirements that existing fossil fuel terminals make upgrades for seismic resilience to protect the health and safety of neighboring communities and the Willamette River. We definitelty do NOT want expansion of existing fossil fuel facilities or any new facilities to "accomodate the regions' growing population". We must address these needs with expansion of sustainable clean sources of energy, not fossil fuels and not nuclear power. This is the point of the resolution: to address climate change NOW. Please read and remember all the whereas statements in the resolution so you will understand why this is necessary to the survival of our city, and the planet. You have an opportunity to be leaders. Please don't waste the chance to do something historical.
Sincerely,
Theodora Tsongas, PhD, MS

COMMENTS to Bureau of Planning and Sustainability
re Fossil Fuel Terminal Zoning Amendments discussion draft, 2016

CC. Mayor Hales
Commissioners, Fish, Fritz, Saltzman, Novick

I> the following points are specific language changes / additions to the DRAFT

A. In section 1. INTRODUCTION on Climate Change include explicitly the language of the Nov ember 2015, Portland City Council adopted Resolution 37168 calling for opposition to expansion of fossil fuel infrastructure.
> ADD: exact language of resolution as policy direction.

B. In PROJECT SCOPE AND TIMING, what is the project that is referred to with this sentence: "This project is proposing a prompt, focused response to these market changes". Why limit the response to market changes?
>ADD : among factors show that public acceptance has changed [not merely market forces] as a result of climate change considerations post Paris. Numerous resolutions by Gorge communities opposing expansion of coal, oil propane delivering trains to feed export facilities [for inventory see Columbia River Keepers]

C. Make the project list in FIGURE 2 comprehensive to show WHEN these projects were proposed and their CURRENT STATUS. In addition, include also all those projects which are no longer being considered {withdrawn; not permitted; etc. as your reports states in other section , see 2nd sentence under GROWTH OPPORTUNITIES IN FOSSIL FUEL DISTRIBUTION] > MODIFY TABLE in Figure 2. Accordingly

188142

D. In section 3 PUBLIC AND STAKEHOLDER INVOLVEMENT, in paragraph What have we heard?
>ADD participation from multiple tribes in the Columbia River region.

E. Throughout the document the phrase "regional demand' is used.
>ADD definition to show that 'regional' means Portland, Oregon and SW Washington.

F. Members of the Oregon Congressional delegation have called for cessation of Baaken crude shipments till safety of the rail traffic is addressed.
>ADD to section 4 Oil Train Accidents the increasing public awareness re substantial risks {Spokane city tax proposal; Vancouver City Council resolution, etc.

II> The following points are broad policy criteria for structuring the draft to make it consistent with policy direction of resolution and change in public acceptance of expanded fossil fuel delivery means in view of shifts post PARIS on climate change actions by local jurisdictions:

The proposed draft should be so structured as to include:
1. A full ban on new bulk fossil fuel terminals
2. More conservative Limitations on expansions at existing facilities
3. Provisions that require [at any license review or permit request to City] from existing fossil fuel terminals to make upgrades for seismic resilience as a condition of approval in order to protect the health and safety of neighboring communities and the Willamette River,

The fossil fuel infrastructure ban that was passed by the City Council was historic. It was a beautiful day and people were crying in City Hall. Now I hear that you have written the code so that the "ban" allows new fossil fuel terminals and allows the expansion of existing infrastructure. This is cynical and not in the spirit of the resolution that was passed.

Please, amend the code to make the ban real: no new terminals, no expansion of existing fossil fuel infrastructure, and upgrades for earthquake resilience.

Thank you.

I was deeply impressed by the Fossil Fuel Policy Resolution passed by the City Council last November. It seemed a definitive, and appropriate way to address a global climate crisis. It promised to "actively oppose expansion of infrastructure" for transporting and storing fossil fuels But now when it comes to drafting code changes to implement policy I see a failure of nerve. It appears that staff have allowed the fossil fuel industry to write the code to allow new crude oil facilities, new LNG facilities, and new gasified fuel tanks based on some estimate of future needs.
I say NO. We need a full ban on new bulk fossil fuel terminals. We need restrictions on the existing infrastructure aimed at

188142

increasing public health and safety of citizens and our environment–particularly our Willamette River. I should point out that while coal may be prohibited, we also need to assure that any existing oil, LNG, propane or methane facilities meet seismic safety standards. Any new infrastructure must be directed to these requirements, or to new clean fuels.

Comment:

Please make sure the rules enacted look to the future, not the past. Don't let Mosier be a preview of a much larger disaster in Portland!

The Fossil Fuel Terminal Zoning Amendments discussion draft has fallen far short of the 2015 Fossil Fuel Resolution that was passed last year. Where the resolution was bold, visionary, and historic, this discussion draft is short-sighted and prioritizes the fossil fuel industry over the health and safety of Portlanders.

We are asking for:
1 – A full ban on new bulk terminals
2 – Stronger limitations on expansions at existing facilities
3 – Provisions to require existing fossil fuel terminals to make upgrades for seismic resilience to protect the health and safety of neighboring communities and the Willamette River.

These changes are crucial because of the urgent threat that fossil fuel terminals pose to both the environment and public safety. Presently, the discussion draft allows new bulk terminals to be built and allows existing facilities to expand, which will grow our carbon footprint past the point of being able to meet our local and state carbon reduction goals. Further, transporting and storing fossil fuels are never safe, with risks ranging from oil train derailments and pipeline spills to storage tank explosions and tank destabilization from earthquakes. The City of Portland needs to hold these industries accountable for improving their safety without promising them more room to grow. We need to shrink fossil fuel use, not grow it!

It is vital that the city strengthen the current draft of the fossil fuel code to reflect the intent of the original resolution that myself and thousands of other Portlanders supported last year.

Comment:

I am sorry to see that the BPS has drafted Zoning Amendments for Fossil Fuel Terminals that go explicitly against the will of the community and the sense and substance of the Resolution passed last year. It is apparent that the promoters of expanded Fossil Fuel Facilities have managed to influence the Bureau to gain an end run around the Resolution. Reducing these long term facilities is exactly what is needed now and the hardening of the existing ones against seismic damage is the only 'improvement' that should be allowed. The Bureau should reflect the will of the people and the council and remain faithful to the

188142

Resolutions' intent which was to institute:

*A comprehensive ban on new bulk terminals

*Forbid the expansion of existing facilities

*Harden the existing very vulnerable riverside tank farms and infrastructure against
seismic damage.

The time has come to get serious about reducing Fossil Fuel use and the resolution is a crucial first step on the path to a clean renewable energy future. The Bureau needs to adhere to that vision articulated by the council and the public.

Sincerely,

Mike Horner

Even though the "slow cook" makes it hard to feel, the climate crisis is an emergency. It calls for the most far reaching, innovative thinking we can do. Because our country is moving at such a snail's pace, it is up to cities and states to take bold, aggressive action. We simply can not afford the delays. Portland, let's live up to your reputation and the promises you made just a few month's ago! Let's have a full ban on new bulk fossil fuel terminals, and all new infrastructure for oil, gas and coal terminals in Portland.

The Fossil Fuel Terminal Zoning Amendments discussion draft has fallen far short of the 2015 Fossil Fuel Resolution that was passed last year. Where the resolution was bold, visionary, and historic, this discussion draft is short-sighted and prioritizes the fossil fuel industry over the health and safety of Portlanders.

Comment:

I am appalled that the City's Planning and Sustainability Commission draft on land use code for the fossil fuel industry allows new crude facilities up to 21 million gallons, new liquefied natural gas storage up to 7 million gallons and new gas fuels (like propane) storage up to 7 million gallons. In other words, these code changes allow expansion of existing fossil fuel infrastructure.

If the proposed code prohibits coal storage facilities, it should do the same for all fossil fuels – crude, LNG, and propane and methanol.

Proposed code changes should require seismic upgrades and infrastructure for greener alternative fuels.

There is a significant risk of storing and transporting fossils fuels in our city to our public health such as long term heart and lung diseases in children and adults including cancer.

You should abide by the Reolution 37168 adopted Nov,12,2015:
NOW, THEREFORE, BE IT RESOLVED, that the City Council will actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways; and
BE IT FURTHER RESOLVED, that this Resolution does not restrict:
1. improvements in the safety, or efficiency, seismic resilience, or operations of existing infrastructure;

Please address these egregious errors in the code draft.

Thank you for your attention.

Comment:

Dear City of Portland,

I was disappointed and angered to learn that the Bureau of Planning and Sustainability recently proposed a zoning draft that allows for the creation and expansion of fossil fuel infrastructure, in direct contravention of the historic resolution passed just last November. This draft must not become law. It will undermine the city's role as a leader in clean energy and sustainability, and it will undermine the public's trust in the city's government. This draft must be replaced with one that provides the following:

1. A full ban on new bulk fossil fuel terminals
2. Limitations on expansions at existing facilities
3. Provisions that require existing fossil fuel terminals make upgrades for seismic resilience to protect the health and safety of neighboring communities and the Willamette River

Do the right thing, stand on the right side of history, and scrap this draft.

Sincerely,
Jack

Comment:

It surprises me that Portland's Planning and Sustainability Commission proposal for City Code changes is so wimpy! The City's fossil fuel goals and the landmark November 2015 City Council Resolution to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways" is actively celebrated nationally and locally by almost every environmental and climate activist. Why would the PSC walk back from that commitment? Who is calling the shots here?

With regard to the proposed Code changes, I wish to make the following comments:

188142

1. The proposed Code changes prohibit new coal terminals, but the language must be expanded to include all other fossil fuel terminals as well.

2. Proposed Code changes for existing infrastructure should prohibit upgrades that will support expanded capacity, while they must allow and encourage safety and seismic upgrades. In fact, existing facilities should be required to upgrade for basic safety, though seismic upgrades (in light of what we now know about the Cascadia deep subduction fault) could be phased in over time.

3. Do not accept the fossil fuel companies' claims of increased demand. It is true that consumers will continue to use fossil fuels as long as we allow it. Regardless, we must make plans for a fossil fuel free future so, consistent with State and City policies, the Code should plan for 100 percent renewables by 2035.

4. Portland's Bureau of Emergency Management must be involved in addressing the risks of fossil fuel storage and transport at existing facilities in the North West Industrial Area. These companies cannot be allowed to make up their own plans without the expertise of the City's experts. There is just too much at stake!

I will be following the process for amending the PSC's proposal for the City code, and I plan to attend the public hearing on September 13, 2016. I do sincerely hope you will do the right thing here and revise your proposal to be more consistent with City policy, especially the City Council Resolution on fossil fuel infrastructure.

Comment:

So many people worked so hard for the fossil fuel resolution. I personally invested all my free time for weeks helping to spread

188142

awareness of the hearing, attended the hearing etc. I, as a member of the Portland community, see this as a humongous slap in the face. We are not interested in green wash nominal solutions so that we can Pat ourselves on the backs while we perpetuate the fossil fuel industry's crusade for capital that wrecks our planet, our economy and our health.

I want NO new terminals, as was demanded in the original resolution. I want NO expansion of existing facilities, or at the bare minimum strict limitations. I want existing facilities to upgrade their seismic resilience to help protect our city.

What happened to #citieslead ? Vancouver BC is going 100% renewable. Time to step up our game and put the well-being of Portland's citizens before all else.

Name: Brett Baylor
Email: baylorb@comcast.net

Comment:

The City of Portland, and especially our Bureau of Planning and Sustainability, need to now live up to the Fossil Fuel Resolution passed last fall as I and hundreds of other citizens watched and cheered. With such a short path to worldwide peril, my expectation is that the City of Portland will lead the way forward for other cities throughout the world to plan robust and comprehensive responses to global warming.

Somehow your draft changes in response to this resolution have devolved into something that could quite simply permit just the opposite of the intention of Council.

Please revise your draft to include:
1 – A full ban on new bulk terminals
2 – Stronger limitations on expansions at existing facilities
3 – Provisions to require existing fossil fuel terminals to make upgrades for seismic resilience to protect the health and safety of neighboring communities and the Willamette River.

Thank you for those changes.

Comment:

It seems to me the safest way to get Dakota Bakkan oil and gas to all our coasts and world markets is NOT through the Gorge. Instead, existing pipeline and rail corridors south through Oklahoma to Gulf refineries offers many safety advantages; should reduce demand for off-shore drilling in the Gulf, should build safety upgrades to existing petroleum facilities along the safer route.
It seems to me, Powder River coal CAN be left in the ground while the type of coal used to produce steel remain a vital industry necessary for national security.
It seems to me that electric vehicles (EVs) are safer cars and that plug-in hybrids (PHEVs) offer more potential to reduce CO2 emissions than all-battery (BEVs). PHEVs offer more economic incentives to drive less (reducing traffic), to walk and bike more and build communities to more conveniently use mass transit. It seems to me that the 4mpg standard 40' bus is obviously inappropriate for many routes and could be replaced with short wheelbase hybrid EVs based on new model paratransit vans. Seniors and disabled people need "Low-floor" entry and low-emission vans. It seems to me, municipalities should NOT continue to spend taxes on GM/Ford paratransit vans which are basic 1970's technology.

11/1/16

Mayor Hales and City Commissioners of Portland,

My name is Elizabeth Gazeley. I am a senior at Lincoln High School and a student in the Environmental Justice and Sustainability class. I've been an Outdoor School student leader for the past three years. I've been a sustainability advocate since I could utter the words, "reduce, reuse, recycle." But the first step is to reduce.

I believe that the Fossil Fuel Terminal Zoning Amendments needs to *reduce* the two million gallon facility to zero. We need to reduce the 10% expansion allowance to 0%, because big companies like Chevron, NW Natural, Conoco Phillips, BP, Shell, and too many others will not back down from our beautiful river shores, if we don't force them to. If we give them the opportunity to expand, they will. What wealthy, powerful business wouldn't want to expand their fossil fuel reign? I believe that NW Natural should be no exception to this policy.

I was overjoyed at the prospect of Portland ending fossil fuel infrastructure, becoming a national leader in environmental policy. I have always been so proud and grateful for the Portland's environmental focus and dedication to the preservation of our state's natural resources. This amendment will become a pioneer of environmental policy. Other cities nationwide will look to Portland as a model of legislation. We need to put our feet down on fossil fuels now, before our carbon emissions shove us over 2℃ and we reach the point of no return. The burning of fossil fuels, not only puts the lives of millions of individuals in jeopardy, but the future of everyone at risk. We need to take control of our future now. When I come back home, after I get my degree in environmental science, I want to see the same inspirational, gorgeous, revolutionary, and green city still thriving, free of fossil fuels. I want my children to grow up with clean air, clean water, sustainable energy, and the same natural resources that I have been blessed with throughout my childhood. Thank you so much for you work on the current Fossil Fuel Terminal Zoning draft!

Elizabeth Gazeley

From: Jan Polychronis
To: BPS Fossil Fuel Zoning
Subject: RE. Code Change Project restricting Bulk Fossil Fuel Terminals
Date: Tuesday, November 01, 2016 10:04:50 AM

I am writing to urge approval of City Resolution 37168 to implement new policy direction on fossil fuel distribution and storage. We need not only to prevent any new Bulk Fossil Fuel Terminals from being allowed, but also to restrict marine, railroad and pipeline transport access as well as restrict expansion of current bulk fuel terminals.

It is time to provide even greater support of the expansion of renewable energy and to prevent hazards to residents by restricting amounts of bulk fossil fuels to be transported into this state. This is most often for resale to other countries with specific businesses profiting from this sale. We also know of the hazards of burning fossil fuels. I pay slightly extra each month to have all of my energy provided from wind power and try to restrict my driving with a car that has higher mpg.

I was witness to the train derailment in Mosier earlier this summer. Ninety cars of crude oil were traveling on this track where only 4 years ago there were just a few cars on each train for local use per Union Pacific's own acknowledgement.

Please approve City Resolution 37168 as what Portland allows or prevents, affects us all.

Thank you,

Jan Polychronis
The Dalles, OR

From: M TL
To: BPS Fossil Fuel Zoning
Subject: ban Fossil Fuel terminal
Date: Tuesday, November 01, 2016 12:27:27 PM

I don't want more fossil fuel terminals when we have an earthquake bomb waiting to blow.

strengthen the code proposal by:

- Enacting a full ban on all new fossil fuel terminals by removing the exception for terminals under 2 million gallons. The proposed 2-million-gallon exception would still allow new fossil fuel facilities to be built in our communities
- Eliminating the provision that allows existing fossil fuel terminals to grow by as much as 10% in exchange for seismic upgrades. These upgrades should be required, not provided in exchange for even bigger facilities.
- Directing Portland Bureau of Emergency Management to develop proposals for State building code changes to require seismic upgrades
- Rejecting Northwest Naturals request to be exempted from these regulations.

Please act now to ensure Portland fulfills the promise to its historic fossil fuel resolution!

AUDITOR

Mayor Hales and City Commissioners of Portland,

I am a student in Lincoln High School's Environmental Justice and Sustainability class. My name is Emma Weightman, and I am a senior this year. I want to thank all of you for your support and understanding of the Fossil Fuel Terminal Zoning Amendment, and how powerful and important it is to the people of my generation, and those after me.

My introduction to climate justice was largely based off the fact that I wanted to take another elective class, and this one sounded interesting. I know that this seems unmotivated, but what happened after is something I never planned on happening. I found a love and appreciation for the beautiful community I have grown up in, through the fear that someday soon, all of it will be taken away. Luckily, I was able to cultivate this new passion through Environmental Justice class, thanks to the efforts of my school board and peers who fought to make sure this class could happen.

Portland is beautiful and unique, and without a doubt the best place to grow up. I am so thankful to be an hour or so drive from the coast, or the Gorge, and to be able to hike right around my backyard. Continuing the production of fossil fuels puts all of that at risk. Even worse, it puts our direct environment at risk. We are a city that is remarkably fortunate enough to be surrounded by rivers and hills. Those rivers are at extreme risk for pollution.

Being a senior and faced with the reality of leaving home, I would hate to come back and find it broken and destroyed. Thank you for your instrumental efforts for this fight, but the fight is far from finished. For my future, and the future of my friends, please continue your efforts to keep fossil fuel production to continue.

Sincerely,

188142

Emma Weightman

From: judy@yournaturecontect.com
To: BPS Fossil Fuel Zoning
Cc: Judy Todd
Subject: Strengthen the no fossil fuel code proposal
Date: Friday, October 28, 2016 10:36:15 AM

To Portland City Council:

I request you forward the promised actions against any fossil fuels infrastructure, extraction, distribution or transporting in Portland. You can move this forward by strengthening the **no fossil fuel** code proposal in these ways:

1. Enact a full ban on all new fossil fuel terminals.

2. Remove the exception for terminals under 2 million gallons. Les is not an advantage and undermines the principle of the ban.

3. Eliminate the provision that allows existing fossil fuel terminals to grow by as much as 10% in exchange for seismic upgrades. If upgrades are needed, require them without cutting expansion deals. This panders to the industry in ways that engages them in an endless loop of trying other avenues to advnace their agenda.

4. Reject Northwest Naturals request to be exempted from these regulations

Thank you for your service and for follow through on this vital code.

From: Liza Burney
To: BPS Fossil Fuel Zoning
Subject: Fossil Fuels code
Date: Thursday, October 27, 2016 3:57:42 PM

I urge you to strengthen the code proposal by:

- Enacting a full ban on all new fossil fuel terminals by removing the exception for terminals under 2 million gallons. The proposed 2-million-gallon exception would still allow new fossil fuel facilities to be built in our communities
- Eliminating the provision that allows existing fossil fuel terminals to grow by as much as 10% in exchange for seismic upgrades. These upgrades should be required, not provided in exchange for even bigger facilities
- Directing Portland Bureau of Emergency Management to develop proposals for State building code changes to require seismic upgrades
- Rejecting Northwest Naturals request to be exempted from these regulations

Liza

Subject: Please Strengthen your Code Proposal on Fossil Fuel Bans
Date: Thursday, October 27, 2016 4:47:10 PM

I would like to make comments to your Fossil Fuel Ban Code Proposal. As a resident of Portland, Oregon I would like to see the following accounted for:

- Enacting a full ban on all new fossil fuel terminals by removing the exception for terminals under 2 million gallons. The proposed 2-million-gallon exception would still allow new fossil fuel facilities to be built in our communities
- Eliminating the provision that allows existing fossil fuel terminals to grow by as much as 10% in exchange for seismic upgrades. These upgrades should be required, not provided in exchange for even bigger facilities
- Directing Portland Bureau of Emergency Management to develop proposals for State building code changes to require seismic upgrades
- Rejecting Northwest Naturals request to be exempted from these regulations

Please consider my comments and those of other residents. The future is our responsibility. Thank you!
Avery

From: Sandy Joos

Subject: Enact a full fossil fuel ban
Date: Thursday, October 27, 2016 4:38:45 PM

Last fall the Portland City Council passed a resolution to ban new fossil fuel facilities in the city. Now the City needs to implement this resolution into binding city code. The proposed code is a strong step forward, but it could be made stronger. I am writing to urge the following specific steps:

1) Enact a full ban on all new fossil fuel terminals by removing the exception for terminals under 2 million gallons. The proposed 2-million-gallon exception would still allow new fossil fuel facilities to be built in our communities.

2) Eliminate the provision that allows existing fossil fuel terminals to grow by as much as 10% in exchange for seismic upgrades. These upgrades should be required, period, and not provided in exchange for even bigger facilities.

3) Direct the Portland Bureau of Emergency Management to develop proposals for State building code changes to require seismic upgrades.

4) Reject Northwest Natural's request to be exempted from these regulations.

Please enact a full ban of fossil fuel expansion, as last fall's resolution called for.

From: Diana Lynn Kekule
To: BPS Fossil Fuel Zoning
Subject: THANK YOU
Date: Thursday, October 27, 2016 2:43:13 PM

Please act now to ensure Portland fulfills the promise to its historic fossil fuel resolution.
We urge you to strengthen the code proposal by:

- Enacting a full ban on all new fossil fuel terminals by removing the exception for terminals under 2 million gallons. The proposed 2-million-gallon exception would still allow new fossil fuel facilities to be built in our communities
- Eliminating the provision that allows existing fossil fuel terminals to grow by as much as 10% in exchange for seismic upgrades. These upgrades should be required, not provided in exchange for even bigger facilities
- Directing Portland Bureau of Emergency Management to develop proposals for State building code changes to require seismic upgrades
- Rejecting Northwest Naturals request to be exempted from these regulations

From: Walt Mintkeski
To: BPS Fossil Fuel Zoning
Subject: Comments on City of Portland Fossil Fuel Infrastructure Code
Date: Thursday, October 27, 2016 3:47:57 PM

I wish to thank the City of Portland for strengthening the draft Fossil Fuel Terminal Zoning Amendments.

However the final Code to be considered by City Council on November 10, 2016 needs to be strengthened by:

- Rejecting Northwest Natural's request to be exempted from these regulations
- Eliminating the provision that allows existing fossil fuel terminals to grow by as much as 10% in exchange for seismic upgrades. These upgrades should be required, not provided in exchange for even bigger facilities
- Directing Portland Bureau of Emergency Management to develop proposals for State building code changes to require seismic upgrades
- Enacting a full ban on all new fossil fuel terminals by removing the exception for terminals under 2 million gallons in capacity. The proposed 2 million gallon exception would still allow new fossil fuel facilities to be built in our communities

These changes are crucial because of the threats that fossil fuel terminals pose to both the environment and public safety. The proposed code allows new fossil fuel terminals under 2 million gallons to be built and existing facilities to expand by up to 10%, which will grow our carbon footprint past the point of being able to meet our local and state carbon reduction goals. Further, transporting and storing fossil fuels pose risks ranging from oil train derailments and pipeline spills to storage tank explosions and tank destabilization from earthquakes. The City of Portland needs to hold these industries accountable for improving their safety without promising them more room to grow.

It is vital that the city strengthen the proposed fossil fuel code to reflect the full intent of the original resolution which I and thousands of other Portlanders supported last year.

Thank you,

Subject: Comments on Draft Code Language for PDX"s Fossil Fuel Resolution
Date: Thursday, October 27, 2016 6:08:00 PM

To the Portland City Council,
Re: Comments on Draft Code Language for implementing Portland's historic Fossil Fuel Resolution
Dear Ms. And Sirs,
I urge the City Council to strengthen the current draft code to better adhere to the language and intent of the City's Fossil Fuel Resolution as a means to prevent fossil fuel infrastructure expansion to the fullest extent possible.
Atmospheric CO2 levels have already exceeded 400 ppm and the severe risks and implications of global warming are very real. For We The People and Our Planet, please revise the draft code with the following specific changes, as recommended by the Portland Audubon Society and to which I fully agree:

- Enacting a full ban on all new fossil fuel terminals by removing the exception for terminals under 2 million gallons. The proposed 2-million-gallon exception would still allow new fossil fuel facilities to be built in our communities
- Eliminating the provision that allows existing fossil fuel terminals to grow by as much as 10% in exchange for seismic upgrades. These upgrades should be required, not provided in exchange for even bigger facilities
- Directing Portland Bureau of Emergency Management to develop proposals for State building code changes to require seismic upgrades
- Rejecting Northwest Naturals request to be exempted from these regulations

Sincerely,

Subject: Ban of New Fossil Fuel Facilities in Portland
Date: Thursday, October 27, 2016 3:54:31 PM

Dear City Council,

The resolution passed last fall to ban new fossil fuel facilities in the city was truly historic, placing Portland at the forefront of the climate justice movement. I strongly urge you to strengthen this code proposal by implementing the following:

- Enacting a full ban on all new fossil fuel terminals by removing the exception for terminals under 2 million gallons. The proposed 2-million-gallon exception would still allow new fossil fuel facilities to be built in our communities
- Eliminating the provision that allows existing fossil fuel terminals to grow by as much as 10% in exchange for seismic upgrades. These upgrades should be required, not provided in exchange for even bigger facilities
- Directing Portland Bureau of Emergency Management to develop proposals for State building code changes to require seismic upgrades
- Rejecting Northwest Naturals request to be exempted from these regulations

Thank you for receiving my comments.
Kindly,
Lisa S.

Subject: Audubon comments to Council on Bulk Fossil Fuel Facility Amendments

September 19, 2016

Dear Mayor Hales and members of the Portland City Council,

Audubon Society of Portland (Audubon) appreciates the opportunity to comment on the draft Fossil Fuel Terminal Zoning Code Amendments (Amendments). We urge you adopt amendments that are strong, clear and fully meet the objectives laid out in the historic Fossil Fuel Resolution (Resolution #37168) that was passed unanimously by the Portland City Council last November. While this was an historic statement on the importance of preventing further expansion of our existing bulk fossil fuel infrastructure, it ultimately will only be as effective as the amendments that are adopted to implement it.

Audubon strongly supports that approach taken by the City in the draft amendments which would make bulk fossil fuel terminals a prohibited use and require that existing fossil fuel terminals be treated as a non-conforming use subject to a Type II nonconforming use review. We believe that prohibiting bulk fossil fuel facilities on the basis of the risk that they present public health and safety is one which is clearly supported by the science and also one which is clearly within the City's purview to regulate through the land-use process. It

utilizes well established designations (prohibited uses and non-conforming uses) that are clear, familiar and well tested in our community. Finally, and most importantly, with limited modifications delineated below, it substantially achieves the goals that were strongly supported by the community and adopted by the Portland City Council. We appreciate the work that the City has done to date to develop these amendments.

We strongly urge the City not to back away from this approach as is being advocated by some Fossil Fuel interests. Specifically we urge the City not to eliminate the Type II process that would be required for expansion of local faculties to meet local demand and instead replace it by either allow existing facilities a blanket allowance to expand up to 10% beyond the existing capacity on the date of adoption of these amendments or allow existing facilities a blanket allowance to expand up to 10% beyond the existing capacity on the date adoption plus additional expansions through the conditional use permitting process (options 2B and 2C in the September 9, 2016 Memo from Staff). Neither of these approaches is consistent with the City Council Resolution which would only allow expansion in order to meet regional demand. Options 2B and 2C would functionally allow existing facilities to expand for any reason at all, regardless of whether or not it is tied to regional demand.

We believe that this situation represents a textbook case for why we have the non-conforming use process in the first place. The expansion of existing facilities represents a real and significant threat to our communities and the non-conforming use process is the mechanism that the city in place to ensure that prohibited uses do not expand unnecessarily and that the public has adequate opportunity to engage in these decisions.

We do not believe that non-conforming use process would lead to excessively onerous work for the Bureau of Development Services (BDS). First, there are relatively few existing bulk fossil fuel facilities in Portland (11) so the number of non-conforming use applications would be limited. Second, most applications would be non-controversial and would simply result in a staff review. Third, those applications that are controversial deserve the extra scrutiny that a Type II process offers---again, these facilities pose serious risks to our communities and it is specifically for these types of situations that we have a public review process in place. We urge you to retain the Type II review process for non-conforming uses to address proposed expansions of existing fossil fuel terminal facilities—it provides an existing, understood and effective pathway that will allow expansions consistent with the objectives of the resolution and amendments, but provide the public with recourse in the event that those objectives are not achieved.

Additionally, we would recommend the following improvements to the proposed amendments which we believe will allow it to better achieve the objectives of the resolution:

1) **Significantly reduce or eliminate the new fossil fuel facility threshold of 5,000,000 gallons**: This threshold is meant to allow expansion of existing facilities or development of new facilities to meet regional fuel needs. However, the City provides no rational for setting the threshold at 5,000,000 gallons beyond simply asserting that a 5,000,000-gallon facility is too small to serve as a bulk terminal. We disagree. 5 million gallons represents almost 120,000 barrels of oils which is enough to fill nearly two unit trains. We believe that the threshold is set far above what is necessary to achieve this objective and creates significant opportunity for fossil fuel providers to create infrastructure to serve much broader objectives which go beyond the intent of the fossil fuel resolution. It could also promote significant expansion in the number of hazardous oil trains passing

through Portland placing our communities real and direct risk. We recommend eliminating this threshold altogether and simply relying upon the non-conforming use process in order to determine whether a new facility or expansion of an existing facility should be allowed. Alternatively, if the city is unwilling to eliminate this loophole in its entirety, it should lower it to under 2,000,000 gallons, which is less than the capacity of a single unit train (50,000 barrels/ 2.1 million gallons). This would still allow facilities to meet regional need but minimize the likelihood of fossil fuel providers gaming the system and triggering significant increases in the number of oil trains passing through our communities.

2) Add additional review criteria to the non-conforming use review for existing facilities by including criteria that address public safety and climate change impacts. We support the amendments that have been submitted by 350PDX to address these concerns.

We urge you to move forward with the draft amendments including the two recommended changes in this letter.

Thank you for your consideration of these comments.

Respectfully,

Bob Sallinger

Fossil Fuel Terminal Zoning

Portland City Council Hearing
November 10, 2016 at 2:00 P.M.

Council Chambers, City Hall
1221 SW 4th Avenue, Portland, Oregon.

Watch City Council sessions live: www.portlandoregon.gov/article/230361

City Council Hearing on:
Fossil Fuel Terminal Zoning

Why am I receiving this notice?

You are receiving this notice because you responded in writing to the matter, testified at a previous related hearing, or have requested notice of this hearing.

What is this project about?

This code change project would restrict development and expansion of Bulk Fossil Fuel Terminals. These code changes would implement new policy direction on fossil fuel distribution and storage facilities in City Resolution 37168.

- Bulk Fossil Fuel Terminals would be characterized by (a) marine, railroad, or pipeline transport access and (b) either storage capacity exceeding 2 million gallons or transload facilities (such as rail-to-ship loading)

- Fossil fuels include petroleum products (such as crude oil and gasoline), coal, natural gas, and propane, and methanol, which is produced from natural gas.

- No new Bulk Fossil Fuel Terminals would be allowed.

- The existing Bulk Fossil Fuel Terminals in Industrial and General Employment zones would become "limited uses" that can continue to operate. Expansion of fossil fuel storage at these existing terminals would be limited to improvements that (a) include "seismic upgrades" which replace existing tanks, (b) add no more than 10 percent of the capacity of replaced tanks, and (c) result in no more than 10 percent cumulative expansion of the total terminal capacity on the effective date of these code changes.

The code changes will not apply to gas stations; distributors and wholesalers that receive and deliver fossil fuels exclusively by truck; industrial, commercial, institutional, and agricultural uses that store fossil fuels for use as an input; uses that involve the transfer or storage of solid or liquid wastes are classified as Waste-Related uses. Fossil fuel storage facilities at airports, marine terminals, rail yards, and fleet vehicle fuel facilities are specifically exempted.

How can I review this proposal?

Get a copy of the report. The *Fossil Fuel Terminal Zoning Amendments Recommended Draft* will be available the week of October 24, 2016. You can pick up a copy at our office at 1900 SW 4th Avenue, 7th Floor. The Bureau receptionist will mail you a copy if you call 503-823-7700. The document will also be available on the Bureau of Planning and Sustainability website at www.portlandoregon.gov/bps/71118.

How can I comment on this proposal?

Testify at the City Council hearing. The hearing, on November 10, 2016 at 2:00 P.M., will be in Council Chambers at City Hall, 1221 SW 4th Avenue.

Write to City Council. Email written testimony to the Council Clerk at fossilfuelzoning@portlandoregon.govor send to 1221 SW Fourth Avenue, Room 130, Portland, Oregon 97204. Written testimony must be received by the time of the hearing and must include your name and address.

For more information

Contact Tom Armstrong, Supervising Planner, at the Bureau of Planning and Sustainability 503-823-3527 or tom.armstrong@PortlandOregon.gov or visit the Bureau of Planning and Sustainability's website: www.portlandoregon.gov/bps/71118.

DLCD FORM 1

NOTICE OF A PROPOSED CHANGE TO A COMPREHENSIVE PLAN OR LAND USE REGULATION

FOR DLCD USE
File No.:
Received:

Local governments are required to send notice of a proposed change to a comprehensive plan or land use regulation **at least 35 days before the first evidentiary hearing**. (*See* OAR 660-018-0020 for a post-acknowledgment plan amendment and OAR 660-025-0080 for a periodic review task). The rules require that the notice include a completed copy of this form.

Jurisdiction: **City of Portland**

Local file no.: **Fossil Fuel Terminal Zoning Amendments**

Please check the type of change that best describes the proposal:

☐ **Urban growth boundary (UGB) amendment** including more than 50 acres, by a city with a population greater than 2,500 within the UGB

☐ **UGB amendment** over 100 acres by a metropolitan service district

☐ **Urban reserve designation,** or amendment including over 50 acres, by a city with a population greater than 2,500 within the UGB

☐ **Periodic review task** – Task no.:

☒ **Any other change** to a comp plan or land use regulation (*e.g.*, a post-acknowledgement plan amendment)

Local contact person (name and title): Tom Armstrong
Phone: 503-823-3527 E-mail: tom.armstrong@portlandoregon.gov
Street address: 1900 SW 4th Ave., Ste. 7100 City: Portland, OR Zip: 97201-

Briefly summarize the proposal in plain language. Please identify all chapters of the plan or code proposed for amendment (maximum 500 characters):

Amended from 8/08/16 notice to DLCD. Project would implement policy direction in City Resolution 37168 on fossil fuel distribution and storage, consistent with City and State objectives on climate change and public safety. Draft code changes would prohibit new Bulk Fossil Fuel Terminals in all base zones and would limit expansion at existing terminals. Zoning Code Sections that would be amended include 100, 110, 120, 130, and 140 on base zones (allowed uses) and 910 and 920 on general terms.

Date of first evidentiary hearing: 09/13/2016
Date of final hearing: 11/10/2016

☐ This is a revision to a previously submitted notice. Date of previous submittal:

Check all that apply:

☐ Comprehensive Plan text amendment(s)

☐ Comprehensive Plan map amendment(s) – Change from to
Change from to

☒ New or amended land use regulation

☐ Zoning map amendment(s) – Change from to
Change from to

☐ An exception to a statewide planning goal is proposed – goal(s) subject to exception:

☐ Acres affected by map amendment:

Location of property, if applicable (site address and T, R, Sec., TL):

List affected state or federal agencies, local governments and special districts: ODEQ, ODOT, DOGAMI, ODOE, Business Oregon, Oregon Building Codes Division, USEPA, USDOT, USDOE, Metro, Port of Portland

NOTICE OF A PROPOSED CHANGE – SUBMITTAL INSTRUCTIONS

1. Except under certain circumstances,[1] proposed amendments must be submitted to DLCD's Salem office at least 35 days before the first evidentiary hearing on the proposal. The 35 days begins the day of the postmark if mailed, or, if submitted by means other than US Postal Service, on the day DLCD receives the proposal in its Salem office. **DLCD will not confirm receipt of a Notice of a Proposed Change unless requested.**

2. A Notice of a Proposed Change must be submitted by a local government (city, county, or metropolitan service district). DLCD will not accept a Notice of a Proposed Change submitted by an individual or private firm or organization.

3. **Hard-copy submittal:** When submitting a Notice of a Proposed Change on paper, via the US Postal Service or hand-delivery, print a completed copy of this Form 1 on light green paper if available. Submit **one copy** of the proposed change, including this form and other required materials to:

Attention: Plan Amendment Specialist
Dept. of Land Conservation and Development
635 Capitol Street NE, Suite 150
Salem, OR 97301-2540

This form is available here:
http://www.oregon.gov/LCD/forms.shtml

4. **Electronic submittals** of up to 20MB may be sent via e-mail. Address e-mails to plan.amendments@state.or.us with the subject line "Notice of Proposed Amendment."

Submittals may also be uploaded to DLCD's FTP site at http://www.oregon.gov/LCD/Pages/papa_submittal.aspx.

E-mails with attachments that exceed 20MB will not be received, and therefore FTP must be used for these electronic submittals. **The FTP site must be used for all .zip files** regardless of size. The maximum file size for uploading via FTP is 150MB.

Include this Form 1 as the first pages of a combined file or as a separate file.

5. **File format:** When submitting a Notice of a Proposed Change via e-mail or FTP, or on a digital disc, attach all materials in one of the following formats: Adobe .pdf (preferred); Microsoft Office (for example, Word .doc or docx or Excel .xls or xlsx); or ESRI .mxd, .gdb, or .mpk. For other file formats, please contact the plan amendment specialist at 503-934-0017 or plan.amendments@state.or.us.

6. **Text:** Submittal of a Notice of a Proposed Change for a comprehensive plan or land use regulation text amendment must include the text of the amendment and any other information necessary to advise DLCD of the effect of the proposal. "Text" means the specific language proposed to be amended, added to, or deleted from the currently acknowledged plan or land use regulation. A general description of the proposal is not adequate. The notice may be deemed incomplete without this documentation.

7. **Staff report:** Attach any staff report on the proposed change or information that describes when the staff report will be available and how a copy may be obtained.

8. **Local hearing notice:** Attach the notice or a draft of the notice required under ORS 197.763 regarding a quasi-judicial land use hearing, if applicable.

9. **Maps:** Submittal of a proposed map amendment must include a map of the affected area showing existing and proposed plan and zone designations. A paper map must be legible if printed on 8½" x 11" paper. Include text regarding background, justification for the change, and the application if there was one accepted by the local government. A map by itself is not a complete notice.

10. **Goal exceptions:** Submittal of proposed amendments that involve a goal exception must include the proposed language of the exception.

[1] 660-018-0022 provides:
(1) When a local government determines that no goals, commission rules, or land use statutes apply to a particular proposed change, the notice of a proposed change is not required [a notice of adoption is still required, however]; and
(2) If a local government determines that emergency circumstances beyond the control of the local government require expedited review such that the local government cannot submit the proposed change consistent with the 35-day deadline, the local government may submit the proposed change to the department as soon as practicable. The submittal must include a description of the emergency circumstances.

If you have any questions or would like assistance, please contact your DLCD regional representative or the DLCD Salem office at 503-934-0017 or e-mail plan.amendments@state.or.us.

Notice checklist. Include all that apply:

☒ Completed Form 1

☒ The text of the amendment (e.g., plan or code text changes, exception findings, justification for change)

☒ Any staff report on the proposed change or information that describes when the staff report will be available and how a copy may be obtained

☐ A map of the affected area showing existing and proposed plan and zone designations

☒ A copy of the notice or a draft of the notice regarding a quasi-judicial land use hearing, if applicable

☐ Any other information necessary to advise DLCD of the effect of the proposal

CONTENTS

Executive Summary ..... **xxii**

PART 1— PLANNING PROCESS AND COMMUNITY PROFILE **1**

1. Introduction to Hazard Mitigation Planning **1-1**

1.1 About Hazard Mitigation 1-1
1.1.1 What Is It? 1-1
1.1.2 When Does it Apply? 1-1
1.1.3 Who Is Responsible? 1-1
1.1.4 How Is It Developed and Implemented? 1-2
1.1.5 How It Relates to Other Phases of Emergency Management 1-2
1.2 Hazard Mitigation In the City of Portland 1-2
1.3 Who Will Benefit From This Plan? 1-5
1.4 How to read This Plan 1-5

2. Plan Update—What Has Changed **2-1**

2.1 The Previous Plans 2-1
2.2 Why Update? 2-1
2.2.1 Federal Eligibility 2-2
2.2.2 Changes in Development 2-2
2.2.3 Focus on Public Engagement and Equity 2-2
2.3 The 5-Year Progress Report 2-3
2.4 The Updated Plan—What Is Different? 2-4

3. Plan Update Approach **3-1**

3.1 Plan Update Approach 3-1
3.2 Formation of the Planning Team 3-1
3.3 Defining The Planning Area 3-2
3.4 Plan Kickoff 3-2
3.5 The Steering Committee 3-4
3.5.1 Membership 3-4
3.5.2 Ground Rules 3-7
3.5.3 Equity Trainings 3-8
3.6 Coordination with Other Agencies 3-12
3.7 Public Engagement Strategy 3-13
3.7.1 Strategy Development 3-13
3.7.2 Strategy Implementation and Results 3-14
3.7.3 Critical Energy Infrastructure Hub Stakeholder Outreach 3-26
3.8 Plan Development Chronology/Milestones 3-26

4. City of Portland Profile **4-1**

4.1 Historical Overview 4-1
4.2 Physical Setting 4-3
4.2.1 Topography and Geology 4-3
4.2.2 Seismic and Volcanic Features 4-4
4.2.3 Surface Waters 4-4
4.2.4 Climate 4-6

4.3 Major Past Hazard Events 4-8
4.4 Reporting Areas 4-9
4.5 Development Profile 4-12
4.5.1 Current Land Use and Zoning 4-12
4.5.2 Critical Facilities and Infrastructure 4-13
4.5.3 Future Trends in Development 4-17
4.6 Population 4-18
4.6.1 Growth 4-18
4.6.2 Age Distribution 4-19
4.6.3 Race and Ethnicity 4-19
4.7 Social Vulnerability And Hazard Mitigation 4-20
4.7.1 Understanding Social Vulnerability 4-20
4.7.2 Demographic Indicators for Social Vulnerability Risk Assessment 4-22
4.8 Economy 4-24
4.8.1 Income 4-24
4.8.2 Industry, Businesses and Institutions 4-24
4.8.3 Employment Trends and Occupations 4-25
4.9 Laws, Ordinances and Programs 4-27
4.9.1 Federal 4-27
4.9.2 State 4-32
4.9.3 Local 4-32

PART 2— RISK ASSESSMENT 1

5. Hazards and Compounding Factors 5-1

5.1 Identified Hazards of Concern 5-1
5.2 Compounding Factors and Secondary Hazards 5-2
5.2.1 Climate Change 5-2
5.2.2 Air Quality 5-6
5.2.3 Erosion 5-6
5.2.4 Invasive Species 5-9

6. Risk Assessment Methodology 6-1

6.1 Overall Risk Assessment Methodology 6-1
6.2 Mapping 6-2
6.3 Assessing Dam Failure, Earthquake, Flood 6-2
6.3.1 Overview of FEMA's Hazus-MH Software 6-2
6.3.2 Levels of Detail for Evaluation 6-3
6.3.3 Application for This Plan 6-3
6.4 Assessing Landslide, Severe Weather, Volcano, Wildfire 6-4
6.5 Assessing Drought 6-4
6.6 Assessing Space Weather 6-4
6.7 Assessing Social Vulnerability 6-4
6.8 Data Sources, Limitations and Gaps 6-5
6.8.1 Building Counts and Replacement Cost Value 6-5
6.8.2 Data Used for Spatial Analysis 6-5
6.8.3 Limitations and Data Gaps 6-5

7. Severe Weather 7-1

7.1 General Background 7-1
7.1.1 Thermal Extremes 7-1

7.1.2 Thunderstorms 7-4
7.1.3 Tornadoes 7-6
7.1.4 Windstorms 7-6
7.1.5 Winter Storms 7-6
7.2 Hazard Profile 7-9
7.2.1 Past Events 7-9
7.2.2 Location 7-14
7.2.3 Frequency 7-15
7.2.4 Severity 7-16
7.2.5 Warning Time 7-17
7.2.6 Compounding Factors and Secondary Hazards 7-17
7.3 Exposure 7-18
7.3.1 Population 7-18
7.3.2 Property 7-19
7.3.3 Critical Facilities and Infrastructure 7-19
7.3.4 Environment 7-19
7.4 Vulnerability 7-19
7.4.1 Population 7-19
7.4.2 Property 7-20
7.4.3 Critical Facilities and Infrastructure 7-21
7.4.4 Environment 7-21
7.4.5 Economic Impact 7-21
7.5 Future Trends in Development 7-21
7.6 Scenario 7-22
7.7 Issues 7-22

8. Earthquake 8-1

8.1 General Background 8-1
8.1.1 How Earthquakes Happen 8-1
8.1.2 Types of Earthquakes 8-1
8.1.3 Faults 8-3
8.1.4 Earthquake Classifications 8-3
8.1.5 Ground Motion 8-4
8.1.6 Effect of Soil Types 8-4
8.2 Hazard Profile 8-5
8.2.1 Past Events 8-5
8.2.2 Location 8-6
8.2.3 Frequency 8-12
8.2.4 Severity 8-15
8.2.5 Warning Time 8-15
8.3 Compounding Factors and Secondary Hazards 8-17
8.3.1 Overview 8-17
8.3.2 Climate Change 8-17
8.4 Exposure 8-17
8.4.1 Population 8-17
8.4.2 Property 8-17
8.4.3 Critical Facilities and Infrastructure 8-17
8.4.4 Environment 8-18
8.5 Vulnerability 8-18
8.5.1 Population 8-18

8.5.2 Property....8-21
8.5.3 Critical Facilities and Infrastructure....8-25
8.5.4 Environment....8-28
8.5.5 Economic Impact....8-29
8.6 Future Trends in Development....8-29
8.7 Scenario....8-29
8.8 Issues....8-30

9. Landslide....9-1

9.1 General Background....9-1
9.1.1 Landslide Types....9-1
9.1.2 Landslide Runout....9-2
9.1.3 Landslide Causes....9-3
9.1.4 Indicators of Possible Landslide....9-5
9.1.5 Landslide Management....9-5
9.2 Hazard Profile....9-6
9.2.1 Past Events....9-6
9.2.2 Location....9-9
9.2.3 Frequency....9-10
9.2.4 Severity....9-10
9.2.5 Warning Time....9-12
9.3 Compounding Factors and Secondary Hazards....9-12
9.3.1 Overview....9-12
9.3.2 Invasive Species and Erosion....9-13
9.3.3 Climate Change....9-13
9.4 Exposure....9-13
9.4.1 Population....9-13
9.4.2 Property....9-14
9.4.3 Critical Facilities and Infrastructure....9-14
9.4.4 Environment....9-17
9.5 Vulnerability....9-17
9.5.1 Population....9-17
9.5.2 Property....9-17
9.5.3 Critical Facilities and Infrastructure....9-18
9.5.4 Environment....9-18
9.6 Future Trends in Development....9-18
9.7 Scenario....9-18
9.8 Issues....9-19

10. Wildfire....10-1

10.1 General Background....10-1
10.1.1 Weather....10-1
10.1.2 Topography....10-1
10.1.3 Fuels....10-1
10.2 Hazard Profile....10-2
10.2.1 Past Events....10-2
10.2.2 Location....10-3
10.2.3 Frequency....10-5
10.2.4 Severity....10-6
10.2.5 Warning Time....10-6

10.3 Compounding Factors and Secondary Hazards 10-7
10.3.1 Overview 10-7
10.3.2 Air Quality 10-7
10.3.3 Invasive Species 10-7
10.3.4 Climate Change 10-7
10.4 Exposure 10-8
10.4.1 Population 10-8
10.4.2 Property 10-9
10.4.3 Critical Facilities and Infrastructure 10-10
10.4.4 Environment 10-11
10.5 Vulnerability 10-11
10.5.1 Population 10-11
10.5.2 Property 10-12
10.5.3 Critical Facilities and Infrastructure 10-12
10.5.4 Environment 10-12
10.5.5 Economic Impact 10-13
10.6 Future Trends in Development 10-13
10.7 Scenario 10-13
10.8 Issues 10-14

11. Flood 11-1

11.1 General Background 11-1
11.1.1 What Is a Floodplain? 11-1
11.1.2 Measuring Floods and Floodplains 11-2
11.2 Hazard Profile 11-3
11.2.1 Characteristics of Flooding in Portland 11-3
11.2.2 Past Events 11-4
11.2.3 Location 11-5
11.2.4 Frequency 11-7
11.2.5 Severity 11-7
11.2.6 Warning Time 11-8
11.2.7 Flood Management Programs and Projects 11-9
11.3 Compounding Factors and Secondary Hazards 11-18
11.3.1 Erosion 11-18
11.3.2 Climate Change 11-18
11.3.3 Other Secondary Hazards 11-19
11.4 Exposure 11-19
11.4.1 Population 11-19
11.4.2 Property 11-21
11.4.3 Critical Facilities and Infrastructure 11-22
11.4.4 Environment 11-26
11.5 Vulnerability 11-27
11.5.1 Population 11-27
11.5.2 Property 11-29
11.5.3 Critical Facilities and Infrastructure 11-33
11.5.4 Environment 11-34

Special Acknowledgments

The development of this plan would not have been possible without the dedication and commitment to this process by the Mitigation Action Plan Steering Committee. The dedication of this volunteer committee to allocate their time to this process is greatly appreciated. Also, the residents of the City of Portland are commended for their participation in the outreach strategy identified by the Steering Committee. This outreach success will set the course to the successful implementation of this plan during its next performance period. The planning team would also like to thank Portland Public Schools for the generous use of their facilities for steering committee meetings and trainings over the course of the planning process.

Dedication

This plan is dedicated to the memory of Glen Collins, who served as a member of the Mitigation Action Plan Steering Committee, and inspired us with his commitment to building resilience in the Portland metropolitan region.

Glen Collins, 1964 - 2016

EXECUTIVE SUMMARY

WHAT IS HAZARD MITIGATION?

Hazard mitigation is action that communities take before a disaster to reduce the potential for death, injury, and property damage. It is about acting to reduce potential impacts when such action is most effective: before a disaster strikes. *The Mitigation Action Plan* (MAP) identifies how natural hazard events like floods, landslides, and earthquakes might affect the City of Portland; it lists actions that City offices can take before a disaster to protect people, critical infrastructure, and natural resources, and ensure the continuation of services, livability, and economic stability for all Portlanders.

The MAP meets hazard mitigation planning requirements for funding eligibility under Federal Emergency Management Agency (FEMA) grant programs. It also meets the floodplain management planning requirements for FEMA's Community Rating System.

UPDATING THE CITY OF PORTLAND PLAN

The MAP is the second comprehensive update to the *City of Portland Natural Hazard Mitigation Plan* (NHMP), which was first developed in 2004. Since the development of the initial plan, the City has made significant progress in its mitigation programs and activities. A 5-year progress report conducted while developing the MAP determined that 75 percent of the 101 mitigation actions identified in the 2010 NHMP were initiated or completed during the plan's performance period. The MAP builds on those successes and enhances the 2010 NHMP in several ways:

- The public engagement strategy was significantly enhanced for development of the MAP, starting with a 32-member steering committee with broad representation from City bureaus, community groups, disability advocates, communities of color, subject-matter experts, and other stakeholders. The steering committee had 10 formal meetings and attended two equity trainings over the 18-month project.
- An equity lens was used throughout the planning process to ensure that the plan process and outcomes benefit people who are most likely to suffer from a natural hazard event.
- The vision, mission and goals were refined to reflect changes in community priorities and to enhance integration among community planning efforts. The vision is aligned with the City's Comprehensive Plan mission.
- The plan addresses eight main hazards of concern, an emerging hazard of concern, and several compounding factors relevant to adverse impacts from natural hazards.
- The risk and vulnerability assessments for all hazards of concern were updated using best available data and a more robust risk assessment platform.
- Significant revisions and enhancements were made to the action plan, including the identification of implementation parameters aimed at enhancing transparency and accountability.
- The updated strategy for implementing and maintaining the MAP includes a working group that will meet annually over the plan's performance period.

The MAP shows a commitment to regional collaboration and resilience by establishing a linkage procedure for special purpose districts in the City to formally link to the plan and establish their own eligibility for federal grant funds.

PLAN DEVELOPMENT APPROACH

Development of the MAP relied on broad participation from many stakeholders. The plan development strategy was designed to result in a plan that sets the stage for equitably reducing the adverse impacts of natural hazards in the City through actions embraced by both elected officials and the people of Portland. The process encompassed eight phases:

- Phase 1—Organize resources and review the prior plan
- Phase 2—Update the risk assessment
- Phase 3—Develop and implement a public engagement strategy
- Phase 4—Update goals, objectives and actions
- Phase 5—Review and update the plan maintenance strategy
- Phase 6—Assemble the updated plan
- Phase 7—Initiate and complete plan review and adoption
- Phase 8—Implement the approved, adopted plan.

Phases 2, 3, 4, 7 and 8 are described below; the MAP has information on all eight phases.

As the plan was developed, a simultaneous process assessed natural hazard risks for the City's Critical Energy Infrastructure Hub along the Willamette River. Results of this study are incorporated into the plan document as appropriate.

Update the Risk Assessment

Risk assessment is the process of measuring the potential loss of life, personal injury, economic injury, and property damage resulting from natural hazards. The risk assessment was used to rank risk and to gauge the potential impacts of each hazard of concern on the City. Risks were assessed for nine geographic "reporting areas" to compare risk throughout the City. Based on the risk assessment, hazards of concern were ranked for the risk they pose to Portland, as shown in Table ES-1. The ranking is based on the probability of occurrence of a hazard and likely impacts in three categories: impacts on people, impacts on property, and impacts on the local economy. The sections below describe key components of the risk assessment for the MAP.

Table ES-1. Hazard Risk Ranking

Hazard Ranking	Hazard[a]	Risk Rating
1	Severe weather	High
2	Earthquake	High
3	Landslide	Medium
3	Wildfire	Medium
4	Flood	Medium
5	Volcanic Activity	Low
6	Dam Failure	Low
7	Drought	Low

a. Space weather was identified as an emerging hazard of concern but a full risk assessment was not conducted and, therefore, risk is not ranked. This will be revisited at the next plan update.

Hazard Identification and Profiling

Eight hazards of concern, and one emerging hazard of concern (space weather) were selected:

- Severe weather
- Earthquake
- Landslide
- Wildfire
- Flood
- Volcano
- Dam failure
- Drought.

Assessment of the Impact of Hazards on Physical, Social and Economic Assets

The following are key findings for the five highest ranked hazards (see Table ES-1):

- **Severe Weather**—Since 1950, Portland has experienced at least 150 severe weather events, including high winds, heavy snow and rain, and excessive heat. Climate change and El Niño weather patterns could change the severity and frequency of severe weather events. Older buildings and utilities like power lines are more susceptible to damage from severe weather. People who depend on electricity for life support or people without homes are likely to suffer most from severe weather events.
- **Earthquake**—The Portland area has experienced numerous earthquakes in the past, ranging from Magnitude 4.5 to 9.0. Portland is certain to experience seismic events in the future. Many of Portland's buildings were built before seismic design requirements were included in building codes, or before modern codes were adopted. Over 13,000 of Portland's buildings are in areas with high liquefaction susceptibility, and during a Cascadia Subduction Zone earthquake, nearly 6,000 people in Portland may be displaced from their homes.
- **Landslide**—Hundreds of landslides have occurred in Portland in the past 20 years, and the City can expect many more in the future. Landslides are most likely on steep slopes when the ground is saturated from rainfall or poor drainage. More than 89,000 people in Portland live in landslide hazard areas, along with over $20 billion worth of buildings and contents.
- **Wildfire**—Portland is a wildland-urban interface community, meaning that its structures are near or within natural areas than are prone to wildfire. Wildfire season is usually from June through October, although climate change, increasing fuel load (including from invasive species), and drought conditions may cause this to vary. In Portland, over 68,000 people are estimated to live in wildfire hazard areas, and over 19,000 buildings. Over 96 percent of these buildings are residential.
- **Flood**—Portland is at the confluence of two major rivers, and has many smaller creeks and streams that flow within the city limits. The city is susceptible to flooding from the rivers and streams, as well as urban flooding from overwhelmed or blocked storm drains and runoff from impervious surfaces. There are 2,925 structures in the 1-percent-annual-chance flood hazard area, and over 9,500 people who live in these areas. Only about half of the people who live in the 1-percent-annual-chance flood hazard area have flood insurance. FEMA flood maps do not take into account the residual risk for properties protected by a flood-control levee, so there may be a misperception that the flood risk in these areas is zero.

Vulnerability Identification

Vulnerability identification includes an assessment of social vulnerability using demographic indicators. Vulnerability to natural hazards is affected by a person's social and economic circumstances in everyday life. People who lack access to resources and information are likely to suffer most in a disaster. The key vulnerability factors for this plan include: people under 15, people over 65, renter-occupied housing, people of color, people with disabilities, and limited English-speaking households.

Estimates of the Cost of Potential Damage

Some of the most costly scenarios include the following:

- A 0.2-percent-annual-chance flood (commonly referred to as a 500-year flood) could cause over $19 billion in damage to structures and their contents.
- The Portland Hills Magnitude-6.5 Earthquake Scenario could cause $24 billion in damage to structures and their contents.

Develop and Implement a Public Engagement Strategy

The public engagement strategy was developed through discussion with the steering committee, review of best practices, interviews with community members, and input from experts contracted to assist with development of the equity lens. The implemented strategy promotes effective cooperation between City government and community organizations. It encouraged public participation during the MAP development process and will facilitate continued engagement with residents after adoption of the MAP. The following were key features of the strategy:

- An online platform for information sharing with the MAP steering committee and the public
- Stakeholder involvement through more than 50 in-person meetings or presentations and countless phone calls and emails
- A public survey that received almost 3,000 responses
- Nine community workshops, attended by more than 175 participants, to learn about the public's perception of risk and to identify existing efforts, possible partnerships, and recommended actions
- Five town hall events to answer questions and receive feedback on the draft plan during the 45-day public comment period.

Feedback received from the public engagement strategy was used throughout the plan process, especially in action item identification and selection.

Update Goals, Objectives and Actions

Vision, Mission, Goals, and Objectives

The steering committee reviewed and updated the vision, mission and goals from the 2010 NHMP and developed a set of objectives, as shown in Table ES-2. Goals were selected to support the vision and mission. Objectives were selected that meet multiple goals. Actions were selected and prioritized in part based the number of objectives each would help to accomplish.

Recommended Actions

The MAP's action plan presents 161 mitigation actions to reduce losses from natural hazards. City of Portland bureaus selected these actions from a variety of sources, including a mitigation best practices catalog supplemented with steering committee and other stakeholder recommendations, the results of the risk assessment and identified issues, public input, other plans and programs, the results of the capability assessment, and actions identified in the 2010 NHMP.

Table ES-2. Vision, Mission, Goals, and Objectives

Vision	***Our desired future state.***
Portland is a prosperous, healthy, equitable and resilient city where everyone has access to opportunity and is engaged in shaping decisions that affect their lives	
Mission	***What we do, who we do it for, and how.***
To equitably reduce risk and the adverse impacts of natural hazards by building community resilience through collaborative, cost-effective actions and strategies.	
Goals	***General guidelines that explain what we want to achieve with the plan.***
1. Protect life and reduce injuries. 2. Engage and build capacity for the whole community. 3. Minimize public and private property damage. 4. Protect, restore, and sustain natural systems. 5. Minimize the disruption of essential infrastructure and services. 6. Integrate mitigation strategies into existing plans and programs. 7. Prioritize multi-objective actions that reduce risk to vulnerable communities.	
Objectives	***Broader than actions, but more specific than goals, objectives are specific enough to help determine whether a proposed project or program would advance the values expressed in the mission and vision. Objectives may also be thought of as 'policies.' In the planning process, objectives are used to define and prioritize actions.***
• Strengthen development codes and update land use designations to facilitate effective disaster risk reduction • Prevent or reduce mitigation-related disparities affecting under-served and under-represented communities through plans, investments and engagement • Promote the use of natural systems to limit natural hazard related impacts • Increase the resilience of high-risk and critical infrastructure through monitoring, planning, maintenance, investment, adaptive technology, and continuity planning • Coordinate land use plans and public facility investments between City bureaus, other public and jurisdictional agencies, businesses, community partners, and other emergency response providers • Support community outreach activities that increase stakeholder awareness and understanding of hazard risk, mitigation options, and preparedness strategies • Identify and seek various funding opportunities for mitigation activities and look for ways to leverage existing funds • Seek opportunities in which hazard mitigation also benefits other community goals • Collect data to track progress on meeting mitigation goals. • Use the best available data, science and technologies to improve understanding of the location and potential impacts of natural hazards, the vulnerability of building types and community development patterns, and the measures needed to protect life safety. • Retrofit, purchase, or relocate structures in high hazard areas, especially those known to be repetitively damaged. • Promote, incentivize and support the mitigation of private property. • Improve systems that provide warning and emergency communications. • Promote mutual information exchange and incorporate existing community networks in the identification and implementation of mitigation actions. • Build City staff and community capacity to ensure effective implementation and equitable outcomes of mitigation action efforts • Develop plans to reduce immediate impacts of natural hazard events, and to facilitate rapid and effective social and economic recovery.	

Action Evaluation and Prioritization

Several steps were carried out to evaluate each action recommended in the MAP:

- An equity analysis screening was performed.
- Implementation information was identified, such as lead agency and timeline.
- A qualitative benefit/cost review was conducted.

Based on these analyses, multiple priority rankings were assigned to each action:

- Each action was rated high, medium or low for implementation, based on the benefit/cost ratio and funding availability
- Each action was rated high, medium or low for grant pursuit, based on grant eligibility and expected benefits
- Actions were assigned an "E" rating if the target audience/beneficiary identified for the action is one of the groups of focus for the assessment

Selected actions identified as high or medium implementation priority and supporting equity initiatives are identified in Table ES-3.

Table ES-3. High and Medium-Priority Actions from the Mitigation Action Plan Matrix

Action Number and Description	Implementation Priority
PBEM-10—Work with Office of Neighborhood Involvement Disability Program Coordinator to promote participation in the Additional Needs Registry through the Public Alerts system.	High-E
PBEM-11— Support Bureau of Development Services in implementing recommendations from the City's Unreinforced Masonry Seismic Retrofit Project, including promoting and supporting policies for mandatory retrofits of unreinforced masonry buildings. This action needs high-level support from City Council and Office of Government Relations.	Medium-E
PBEM-12—Audit PBEM's suite of plans to evaluate whether plans meet the needs of people with disabilities, people with language barriers, and other access and functional needs populations. Develop a transition plan to update all plans.	High-E
PBEM-23—Develop an emergency communications plan to distribute emergency messages to immigrant and refugee communities in language-appropriate and culturally appropriate ways.	High-E
BPS-1—Promote and fund energy independence projects in low-income neighborhoods and communities.	High-E
BPS-2—Plan for solar + battery storage systems, which can serve as mini power-supply stations or provide residents the ability to shelter in place after any electricity supply-disrupting event, at varying scales (project, neighborhood and district) and locations (critical City facilities, low-income housing, community gathering spots).	High-E
BPS-3—Encourage solar + battery storage demonstration projects at critical City facilities, in low-income neighborhoods and in other strategic locations.	High-E
BPS-7—Support *2015 Climate Action Plan* and *Climate Change Preparedness Strategy* actions that relate to adaptation planning and natural hazard mitigation actions.	High-E
BPS-10—Develop an emergency service plan for solid waste removal in multifamily properties after a disaster event.	High-E
OEHR-1 — Prior to and during implementation, review all actions for negative externalities and to ensure vulnerable populations are protected from displacement or other disproportionate burdens.	High-E

Note: PBEM = Portland Bureau of Emergency Management; BPS = Bureau of Planning and Sustainability; OEHR = Office of Equity and Human Rights

Initiate and Complete Plan Review and Adoption

The MAP was submitted to Oregon's Office of Emergency Management, FEMA Region X, and the Community Rating System contractor (Insurance Services Office, Inc.) for review and approval. The MAP will be presented to and adopted by the City of Portland City Council.

Implement the Approved, Adopted Plan

Plan implementation will occur over the next five years as the lead agencies begin to implement the actions identified in this plan. The Implementation and maintenance strategy developed by the steering committee will guide this phase. This phase will be dependent on the commitment of all City bureaus, elected officials and Portlanders to reducing risk from natural hazards.

PART 1—PLANNING PROCESS AND COMMUNITY PROFILE

1. Introduction to Hazard Mitigation Planning

1.1 About Hazard Mitigation

1.1.1 What Is It?

As the cost of disasters rises, communities must find ways to reduce hazard risks. The term "hazard mitigation" refers to actions that reduce or eliminate long-term risks caused by hazards such as earthquakes, floods, storms, and wildfires. It involves strategies such as planning, policy changes, programs, projects, and other activities that can mitigate the impacts of hazards. These advance actions reduce potential hazard effects or risk and are already in place at the time of impact. Without an investment in hazard mitigation, repeated disasters result in repeated damage and rebuilding. This recurrent reconstruction becomes more expensive as the years go by. Hazard mitigation breaks this costly cycle of damage and reconstruction by taking a long-term view of rebuilding and recovering from disasters.

DEFINITIONS

- **Mitigation**—Advance actions to reduce potential hazard effects or risk. Protections are already in place at the time a hazard event occurs.
- **Preparedness**—Advance actions that strengthen the capability of government, residents, and communities to respond to disasters.
- **Prevention**—Building capabilities to avoid, prevent or stop a threatened or actual act of terrorism.
- **Recovery**—A phase of emergency management in which activities are carried out to restore essential services and repair damage caused by a hazard event.
- **Resilience**—The capability to anticipate, prepare for, respond to, and recover from significant multi-hazard threats with minimum damage to social well-being, the economy, and the environment.
- **Response**—A phase of emergency management that consists of immediate actions to save lives, protect property and the environment and meet basic human needs.

1.1.2 When Does it Apply?

The federal Disaster Mitigation Act (DMA) of 2000 requires state and local governments to develop hazard mitigation plans as a condition for federal disaster grant assistance. The DMA emphasizes planning for disasters before they occur. However, hazard mitigation is also essential to post-disaster recovery. After disasters, repairs and reconstruction often just restore damaged property to pre-disaster conditions. The implementation of additional hazard mitigation actions leads to building smarter, safer, and more resilient communities that are better able to reduce future injuries and damage. *The Mitigation Action Plan* (MAP) is the City of Portland's natural hazard mitigation plan under the DMA.

1.1.3 Who Is Responsible?

The responsibility for hazard mitigation lies with private property owners, business and industry, and local, state and federal governments. The Federal Emergency Management Agency (FEMA) encourages multi-jurisdictional planning under its guidance for the DMA, urging state and local authorities to work together. The planning network called for by the DMA helps local governments articulate needs for mitigation, resulting in faster allocation of funds and more cost-effective risk reduction projects. When feasible, multi-jurisdictional planning presents opportunities in the ability to pool resources and eliminate redundant activities in a planning area that has uniform risk exposure.

Because of these factors, the City of Portland developed the MAP at two levels. The base plan addresses risk and vulnerability within city boundaries and identifies actions within the capabilities of the City. In addition, the City has developed a procedure by which special purpose districts in the City can formally link to the base plan—identifying risk and vulnerabilities to the assets they own and manage and selecting mitigation actions to reduce these risks. This linkage process (see Chapter 20) will ensure that all eligible local governments within the City have the opportunity to establish eligibility for grant funds while fostering collaboration among local governments and other local stakeholders.

1.1.4 How Is It Developed and Implemented?

The DMA promotes sustainability for disaster resistance. "Sustainable hazard mitigation" includes the sound management of natural resources and the recognition that hazards and mitigation must be understood in the largest possible social and economic context. Efforts to reduce risks should be compatible with other community goals, which may be related to equity, economic development, sustainability, public and environmental health, or other issues. As communities plan for new development and improvements to existing infrastructure, mitigation should be an important consideration.

1.1.5 How It Relates to Other Phases of Emergency Management

The main goal of hazard mitigation is to reduce the time that it takes to move through the emergency management cycle and to recover from natural hazard events (see Figure 1-1) because proactive measures have been put in place to reduce the amount of damage that occurs. As a result, planning for hazard mitigation impacts all phases of emergency management.

Because of this, hazard mitigation often gets confused with hazard preparedness. It is important to understand the difference between the two phases in order to understand the main focus of this plan, which is mitigation. Mitigation plans do identify strategies and actions that impact other aspects of the emergency management cycle. Increasing capabilities, for example, is a valid strategy for mitigation; the capabilities may be related to preparedness or response or recovery. Figure 1-2 provides an illustration of how mitigation and preparedness are different yet complementary.

1.2 HAZARD MITIGATION IN THE CITY OF PORTLAND

City of Portland bureaus manage city infrastructure, plan for long-term capital improvement and community-level investments, and administer a wide variety of programs. These activities play a role in the city's resilience to natural hazards. There are many things that bureaus can do now as part of their normal activities—or add to their portfolios when opportunities arise—to reduce Portland's risk from natural hazards over time and improve the City's ability to bounce back when natural hazard events do happen. These projects and programs together contribute to Portland's overall strategy for reducing its risk from natural hazards.

By investing in mitigation projects, the City decreases the risk and consequently the cost of disaster. In the event of a disaster, City response resources will be stretched. Through prior planning and implementation of mitigation projects, the City can decrease the amount of damage to its assets and be able to use resources for the greatest response and rebuilding needs. The intent of this plan is to identify what can be done prior to disaster that will protect the most people, the most essential and critical infrastructure and the most natural resources to enable the continuation of services, livability and economic stability for all Portlanders.

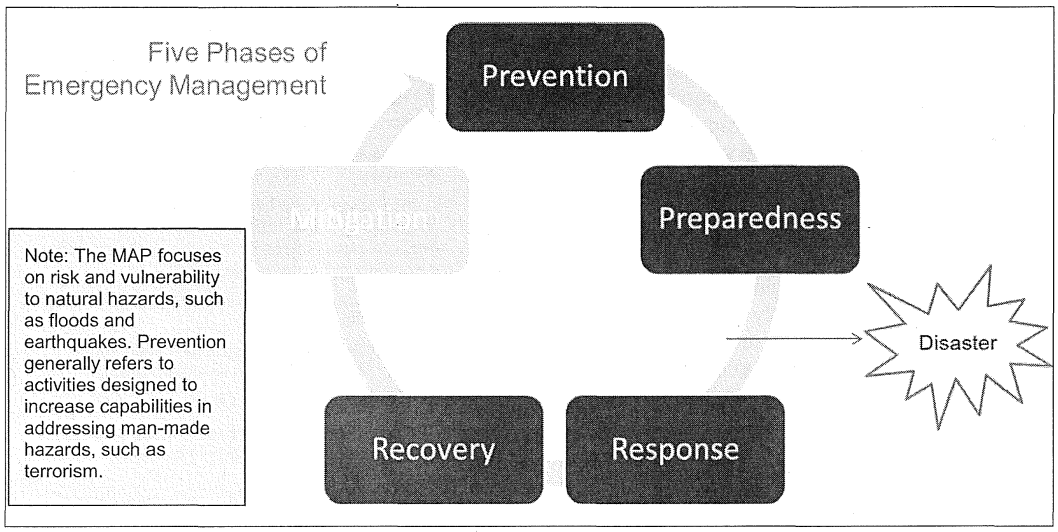

Figure 1-1. Five Phases of Emergency Management

Graphic by Danielle Butsick, PBEM

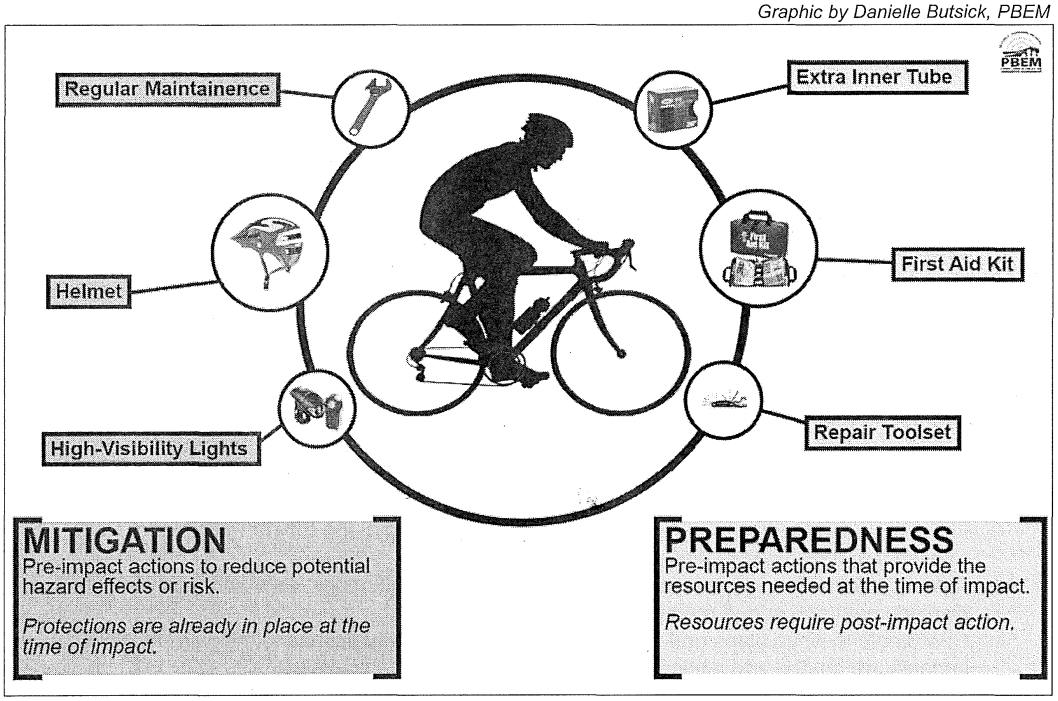

Figure 1-2. Mitigation and Preparedness Examples

The Mitigation Action Plan is the second comprehensive update to the *City of Portland Natural Hazard Mitigation Plan* (NHMP), which was first developed in 2004. This update identifies resources, information, and strategies for reducing risk from natural hazards. Elements and strategies in the plan were selected because they best meet the needs of Portland's bureaus and residents, and they also satisfy FEMA program requirements. The MAP will help guide and coordinate mitigation activities throughout the city. The main purpose of this planning effort was to identify risks posed by hazards and to develop strategies to reduce the impact of hazard events on people and property in the City of Portland; however, the plan was also developed to meet the following objectives:

- Incorporate Portland's equity goals into hazard mitigation planning to emphasize natural hazard risk reduction for Portland's most vulnerable residents.
- Involve people in Portland who represent communities of color, people with disabilities, senior citizens, and other groups who are potentially more vulnerable to natural hazards in the planning process, so that they have a say in the goals and actions selected and can communicate information about natural hazard risks within their communities.
- Develop a plan that reflects the priorities of Portland residents, bureaus, and offices while exceeding the requirements of the DMA.
- Meet the planning requirements of FEMA's Community Rating System (CRS), allowing the City to maintain or enhance its CRS classifications.
- Enable the City and all potential planning partners to use federal grant funding to reduce risk through mitigation.
- Set priorities for allocation of city funds and pursuit of federal and other grant funding opportunities to reduce risks from natural hazards.
- Improve understanding of risks and vulnerabilities specific to the City of Portland for Portland residents and decision-makers in City bureaus.
- Identify actions that will reduce the negative impacts of natural hazards and save lives, reduce displacement and speed recovery.
- Coordinate existing plans and programs so that high-priority actions to mitigate possible disaster impacts are funded and implemented.
- Foster collaboration between local government and residents.

REQUIRED CONTENT FOR LOCAL HAZARD MITIGATION PLANS (44 CFR 201.6(c))

- Documentation of the process used to develop the plan, including who was involved and how the public was involved.
- A risk assessment that provides the following information:

  A description of the type, location, and extent of all natural hazards that can affect the jurisdiction, previous occurrences of hazard events, and the probability of future hazard events.

  A description of the jurisdiction's vulnerability to the hazards in terms of:
  - Buildings, infrastructure and critical facilities located in hazard areas
  - Potential dollar losses
  - Development trends and the ability to consider mitigation in land use decisions.

  Assessment of each participating jurisdiction's risks where they vary from those of the entire planning area.
- A mitigation strategy for reducing potential losses identified in the risk assessment:
  - A description of mitigation goals.
  - A range of mitigation actions and projects to consider.
  - An action plan for each participating jurisdiction recommending and prioritizing specific mitigation actions.
- A plan maintenance process that includes:
  - A schedule for monitoring, evaluating, and updating the mitigation plan.
  - A process for incorporating the requirements of the mitigation plan into other local planning mechanisms.
  - A plan for ongoing public participation.
- Documentation that the plan has been formally adopted by the governing body of each jurisdiction requesting approval of the plan.

1.3 WHO WILL BENEFIT FROM THIS PLAN?

Effective hazard mitigation can provide the following benefits:

- Reduce the loss of life, property, essential services, and critical facilities; and reduce economic hardship.
- Reduce short-term and long-term recovery and reconstruction costs.
- Increase cooperation and communication in the community through the planning process.
- Increase potential for state and federal funding for pre- and post-disaster projects.

All residents, businesses, and visitors of the City of Portland are the ultimate beneficiaries of the MAP. However, the planning process to develop the MAP was performed through an equity lens, in order to focus the benefits of the plan on the people who are likely to suffer the greatest from a natural hazard event. The plan identifies strategies and actions that will reduce risk for those who live in, work in, and visit the City. It provides a viable planning framework for all foreseeable natural hazards that may impact Portland. Participation in the development of the plan by key stakeholders in the area helped ensure that outcomes will be mutually beneficial. The resources and background information in the plan are applicable citywide, and the plan's goals and recommendations can lay groundwork for the development and implementation of local mitigation activities and partnerships.

1.4 HOW TO READ THIS PLAN

In order to fulfill the requirements of the DMA and be eligible for federal disaster funding grant programs, a local hazard mitigation plan must contain a set of information as outlined in the Title 44 of the Code of Federal Regulations (44 CFR; see box at right). The MAP has been organized to provide all the required information. Notations are provided throughout the plan indicating specific requirements being addressed. The plan is divided into three parts:

- Part 1 includes the planning process and community profile.
- Part 2 includes the risk assessment.
- Part 3 includes the mitigation strategy and plan maintenance process.

The following appendices are also included to provide additional information or otherwise support the content outlined in the main document:

- Appendix A—5-year progress report (2010 through 2016)
- Appendix B—Steering Committee Ground Rules
- Appendix C—Public Engagement Materials
- Appendix D—Critical Energy Infrastructure Hub Study
- Appendix E—Reporting-Area-Scale Maps
- Appendix F—Data Sources and Methods used for Mapping
- Appendix G—Risk Assessment Data Gaps and Limitations
- Appendix H—Prior Plan Goals
- Appendix I—Mitigation Best Practices Catalog
- Appendix J—Expectations for Participating Bureaus
- Appendix K—Progress Report Template

The City's linkage strategy is outlined in Chapter 20 so that other eligible jurisdictions in Portland can use the information in this plan to ease their level of effort in meeting DMA requirements and becoming eligible for relevant grant programs.

2. PLAN UPDATE—WHAT HAS CHANGED

2.1 THE PREVIOUS PLANS

The City of Portland responded to the DMA by developing the initial *City of Portland Natural Hazard Mitigation Plan* (NHMP), which was approved on December 9, 2004. The NHMP underwent its initial 5-year update in conformance with DMA requirements and the update was approved on February 15, 2010. During the planning process for that first update, substantial revisions were made to all sections of the plan. Notably, four additional hazards of concern were added: severe weather, invasive plant species, erosion and volcanic activity. The original update process included the following (NHMP, 2010):

- **Preliminary Research**—Portland State University master degree program students in geology or urban studies researched plans, other city or county mitigation action items and the status of 2004 NHMP action items to provide background documents for the update.
- **Organize Resources**—The Portland Office of Emergency Management (now called Portland Bureau of Emergency Management) identified resources that could provide the technical expertise, historical information and research data to update the 2004 NHMP.
- **Update Hazard Profiles**—The planning team reviewed the hazards identified in the 2004 NHMP and assessed other hazards that have historically impacted the city. A hazard analysis was developed for eight hazards.
- **Update Risk Assessment**—The planning team reviewed the City's 2006 vulnerability analysis and used the results to develop a mitigation strategy.
- **Assess Capabilities**—The planning team reviewed the City's administrative, technical, legal, regulatory and fiscal capabilities and determined whether they adequately met existing requirements.
- **Update Mitigation Strategy**—The planning team reviewed the previous mitigation goals and actions to determine whether the goals still met the City's needs and whether the actions had been implemented, were in progress, or were no longer applicable. Based on the updated risk assessment, the planning team prioritized over 100 mitigation actions for implementation in a mitigation action plan.
- **Monitor Progress**—The planning team developed an implementation process for the mitigation action plan.

Changes to the 2004 plan were summarized in the 2010 update as shown in Table 2-1.

2.2 WHY UPDATE?

Portland's 2016 *Mitigation Action Plan* (MAP) is the next update to the City's natural hazard mitigation plan. Development of this new plan achieves a number of important goals, as described in the sections below.

Table 2-1. Summary of Changes in 2010 NHMP

2004 NHMP Section	Items Updated in 2010	2004 Items Deleted in 2010	Items Added in 2010
Planning Process	Planning process, planning team, list of sources, public outreach	N/A	N/A
Risk Assessment	Hazard profile history, asset inventory, vulnerability analysis & summaries	N/A	New hazards, repetitive Loss properties, National Flood Insurance Program requirements
Mitigation Strategy	Mitigation actions status, mitigation action implementation	Implemented & non-relevant mitigation actions	New mitigation actions, capability assessment
Plan Maintenance	Plan maintenance process	N/A	Appendix F

2.2.1 Federal Eligibility

Federal law (44 CFR) requires hazard mitigation plans to include a schedule for being monitored, evaluated and updated. This provides an opportunity to reevaluate recommendations, monitor the impacts of completed actions, and determine if there is a need to change the focus of mitigation strategies. A jurisdiction covered by a plan that has expired is not able to pursue elements of federal funding that require a current hazard mitigation plan.

2.2.2 Changes in Development

Hazard mitigation plan updates must be revised to reflect changes in development in Portland during the previous performance period of the plan (44 CFR Section 201.6(d)(3)). The plan must describe changes in development in hazard-prone areas that increased or decreased vulnerability since the last plan was approved. If no changes in development impacted overall vulnerability, plan updates may validate the information in the previously approved plan. The intent of this requirement is to ensure that the mitigation strategy continues to address the risk and vulnerability of existing and potential development and takes into consideration possible future conditions that could impact vulnerability.

Changes in risk due to development between the 2010 NHMP and the 2016 MAP are difficult to assess. The exposure and vulnerability assessment in the 2010 update was limited, and that update noted that the analysis should be updated and enhanced. No citywide tracking or assessment of exposure occurred during the performance period of the plan. The 2016 update includes a complete reassessment of risk and vulnerability in Portland, using more sophisticated data. It calculates replacement value from assessor records and uses a FEMA loss estimation model called Hazus-MH. More detailed information on the methodology used to assess risk is provided in Chapter 6. Now that the City is equipped with a baseline assessment of hazard vulnerability and a user-defined Hazus–MH model for Portland, a comparative analysis will be possible for future updates.

The MAP assumes that some new development triggered by an increase in population occurred in hazard areas. Because all such new development would have been regulated pursuant to local programs and codes, it is generally assumed that vulnerability did not increase even if exposure did. The City of Portland has a comprehensive plan that governs land-use decisions and policy-making (see Section 4.9.4), as well as a building code and specialty ordinances based on state and federal mandates.

2.2.3 Focus on Public Engagement and Equity

The 2010 NHMP met the federal requirements for community engagement and outreach. However, plan developers noted that the engagement strategy had fallen short of City of Portland standards and expectations. The 2016 planning process was developed to reinvigorate the dialogue between

residents, city government and other stakeholders and to use this dialogue to further existing equity goals. *The Portland Plan,* a strategic roadmap for the City, outlines the following vision for equity in the city (City of Portland, 2012):

- All Portlanders have access to a high-quality education, living wage jobs, safe neighborhoods, basic services, a healthy natural environment, efficient public transit, parks and greenspaces, decent housing and healthy food.
- The benefits of growth and change are equitably shared across communities. No one community is overly burdened by the region's growth.
- All Portlanders and communities fully participate in and influence public decision-making.
- Portland is a place where people's futures are not limited by race, gender, sexual orientation, disability, age, income, where they were born or where they live.
- Underrepresented communities are engaged partners in policy decisions.

Responsive to this vision, all City bureaus and offices are charged with promoting equity and reducing disparities. The MAP includes a strong emphasis on working to embrace equity in planning and to empower Portland's most vulnerable people to play a role in building the City's resilience. This is referred to as the application of an equity lens (see Figure 2-1). An equity lens is defined by the Portland Office of Equity and Human Rights (OEHR) as a critical thinking approach to undoing institutional and structural biases, which evaluates burdens, benefits and outcomes to underserved communities (OEHR, n.d. b). This equity lens was developed and applied throughout the planning process in all phases of the MAP's development and is discussed throughout the plan document.

Through this broad engagement and focus on equity, the City is working to reduce vulnerability from natural hazards for all communities so that the benefits of hazard mitigation, such as the following, can be shared by all Portlanders:

- A faster recovery and return to normal life for neighborhoods after a hazard event
- Reduced stress on responders and social services
- Workers' return to work more quickly after a hazard event, resulting in less economic disruption and fewer businesses closing
- Maintenance of the culture, diversity and distinct neighborhoods of the City of Portland.

2.3 THE 5-YEAR PROGRESS REPORT

The 2010 plan update included a plan maintenance protocol that called for annual review of mitigation actions. With the exception of monitoring the status of flood-related actions for the City's CRS program, organized annual progress reporting did not occur during the performance period of the 2010 plan. Therefore, a five-year progress report was completed as part of the 2016 plan update process. This progress report is included in Appendix A of this document and provides information on the following:

- Recent natural hazard events in Portland
- Mitigation success stories over the performance period of the plan
- A review of the action plan
- Recommendations for changes and enhancements.

The template used for the 5-year progress report was reviewed by City bureaus and the steering committee and was enhanced based on their feedback. The 2016 plan implementation and maintenance strategy outlines a reinvigorated approach for actively maintaining the plan and includes a progress report template updated to reflect the comments received during the planning process.

Graphic by Danielle Butsick, PBEM

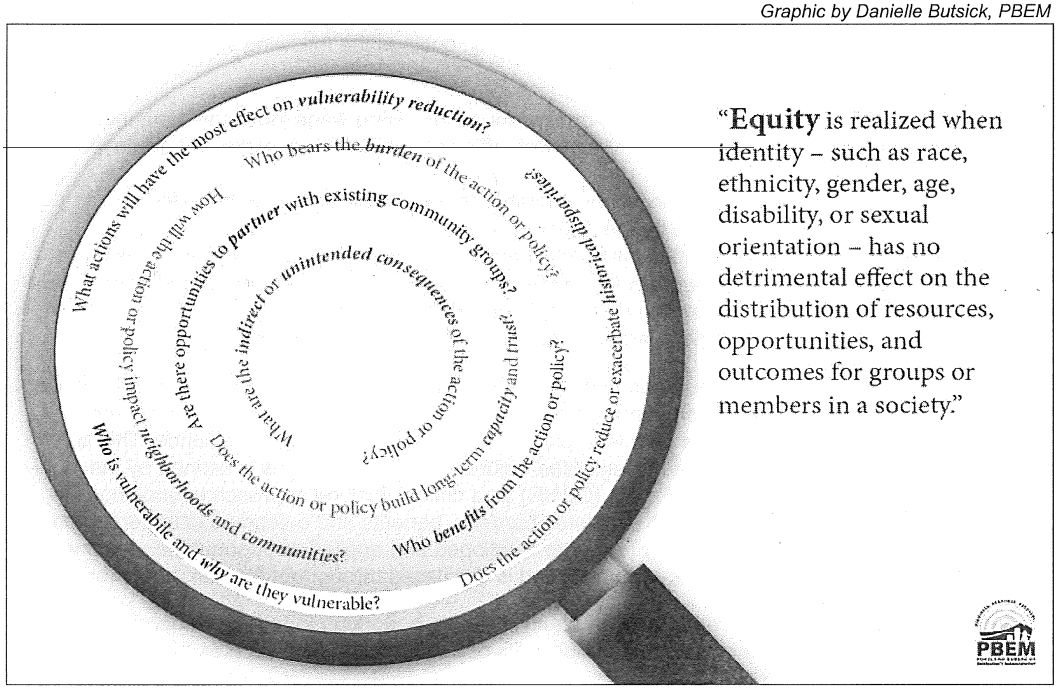

Figure 2-1. Mitigation Equity Lens

2.4 THE UPDATED PLAN—WHAT IS DIFFERENT?

The 2016 updated plan differs from the initial plan and the 2010 update in a variety of ways:

- The public engagement strategy used during the planning process was significantly enhanced, starting with a large number of non-governmental representatives serving on the plan steering committee.
- An equity lens was developed and applied throughout the planning process to assess in the evaluation of risk as well as the development of mitigation actions.
- The vision, mission and goals were revisited and refined to reflect changes in community priorities and to enhance integration among community planning efforts.
- The plan addressed eight main hazards of concern, an emerging hazard of concern, and several compounding factors relevant to adverse impacts from natural hazards.
- The risk and vulnerability assessments for all hazards of concern were updated using best available data and a more robust risk assessment platform.
- Significant revisions and enhancements were made to the action plan, including the identification of implementation parameters aimed at enhancing transparency and accountability.
- The plan implementation and maintenance strategy was revised and updated and includes a Mitigation Action Plan working group that will meet biannually over the plan's performance period.

Table 2-2 indicates the major changes between the 2010 and 2016 plans as they relate to 44 CFR planning requirements.

Table 2-2. Plan Changes Crosswalk

44 CFR Requirement	Previous Plan	Updated Plan
§201.6(b): In order to develop a more comprehensive approach to reducing the effects of natural disasters, the planning process shall include: (1) An opportunity for the public to comment on the plan during the drafting stage and prior to plan approval; (2) An opportunity for neighboring communities, local and regional agencies involved in hazard mitigation activities, and agencies that have the authority to regulate development, as well as businesses, academia and other private and non-profit interests to be involved in the planning process; and (3) Review and incorporation, if appropriate, of existing plans, studies, reports, and technical information.	The 2010 plan update was led by planning team members selected based on their program involvements, expertise and decision-making authority. Members of the public were involved in the planning process through intern assistance from the Portland State University Master's Program of Urban Planning and the Department of Geology; consultation with subject matter experts on hazard information; a website developed to provide information on the update process; a presentation to the City Council that was available for public viewing on the Cable Network; and presentations at citywide workshops. Technical difficulties prohibited the plan's public posting on the City website and the launch of a public survey.	The plan update was facilitated through a Steering Committee made up of stakeholders in Portland. The Steering Committee oversaw all phases of plan development including but not limited to the review and identification of goals and objectives, confirmation of a public involvement strategy, development of a plan implementation and maintenance strategy, and the recommendation of mitigation actions. All Steering Committee meetings were open to the public. Additional public input was received through public events early and late in the planning process and through a public survey. A 45-day public comment period was held before the draft plan was submitted for review. Agency coordination occurred through several avenues, including in-person and phone meetings with relevant agencies, monthly updates on plan progress and steering committee meetings distributed to a mailing list, attendance at steering committee meetings, the composition of the Steering Committee and the dissemination of the draft plan for public comment.
§201.6(c)(2): The plan shall include a risk assessment that provides the factual basis for activities proposed in the strategy to reduce losses from identified hazards. Local risk assessments must provide sufficient information to enable the jurisdiction to identify and prioritize appropriate mitigation actions to reduce losses from identified hazards.	The plan update included the identification, screening and profiling of eight hazards of concern. Five of these were also identified in the 2004 plan (earthquake, flood, landslide, severe weather and wildland urban interface fire). Three hazards were newly added (erosion, volcanic activity and invasive plant species).	A comprehensive risk assessment for Portland was developed that looked at eight natural hazards of concern: dam failure, drought, earthquake, flood, landslide, severe weather, volcanic activity, and wildfire. This assessment used the best available data and science with the Hazus-MH (version 2.2) risk assessment software and GIS analysis. In addition, the plan discussed impacts from an emerging hazard of concern and several compounding factors.
§201.6(c)(2)(i): [The risk assessment shall include a] description of the ... location and extent of all natural hazards that can affect the jurisdiction. The plan shall include information on previous occurrences of hazard events and on the probability of future hazard events.	Each hazard of concern was profiled including the history, location and extent, and probability of future impacts.	Comprehensive risk assessments of each hazard of concern are presented in Chapters 7 through 14. Each chapter includes the following: • Hazard profile, including maps of extent and location, historical occurrences, frequency, severity and warning time • Compounding factors and secondary hazards • Exposure of people, property, critical facilities and natural environment • Vulnerability of people, property, critical facilities and natural environment • Future trends in development • Scenarios • Issues. Each hazard is compared to each other hazard via a risk ranking described in Chapter 16.

44 CFR Requirement	Previous Plan	Updated Plan
§201.6(c)(2)(ii): [The risk assessment shall include a] description of the jurisdiction's vulnerability to the hazards described in paragraph (c)(2)(i). This description shall include an overall summary of each hazard and its impact on the community	Vulnerability was described for each hazard of concern although information provided was not specific or detailed in many instances.	Vulnerability was assessed for all hazards of concern. The Hazus-MH computer model was used for the dam failure, earthquake, and flood hazards. These were Level-2 (user-defined) analyses using coordinating agency and local data. Critical facilities and assets were defined and inventoried using the Hazus Comprehensive Data Management System and other available datasets. Outputs were generated for other hazards by applying an estimated damage function to affected assets when available. The asset inventory was extracted from the Hazus-MH model. Best available data were used for all analyses.
§201.6(c)(2)(ii): [The risk assessment] must also address National Flood Insurance Program insured structures that have been repetitively damaged floods	Repetitive loss properties within the City are described.	A description of the National Flood Insurance Program (NFIP) and repetitive loss areas is included to meet DMA and CRS planning requirements. For repetitive loss properties, the type of structure was determined, likely causes of flooding were cited, and the information was reflected on maps. NFIP compliance is assessed.
§201.6(c)(2)(ii)(A): The plan should describe vulnerability in terms of the types and numbers of existing and future buildings, infrastructure, and critical facilities located in the identified hazard area.	A generalized description of critical facilities and infrastructure in Portland is provided, as well as information on future critical facilities and infrastructure. Current and future exposure to the hazards of concern is discussed and Table 4-4-1a provides exposure estimates for Portland populations and buildings. Table 4-4-1b provides exposure estimates for City-owned critical facilities (erosion, invasive plant species and volcano hazards were undetermined).	A complete inventory of the numbers and types of buildings exposed was generated for each hazard of concern. The Steering Committee defined "critical facilities" for Portland, and these facilities were inventoried. Each hazard chapter provides a discussion of future development trends as they pertain to the hazard.
§201.6(c)(2)(ii)(B): [The plan should describe vulnerability in terms of an] estimate of the potential dollar losses to vulnerable structures identified in paragraph (c)(2)(i)(A) and a description of the methodology used to prepare the estimate.	Estimated losses from a 2004 Hazus-MH assessment were provided. Estimated losses were not provided for the invasive plant species and volcanic activity hazards.	Loss estimations were generated for all hazards of concern likely to impact property. These were generated by Hazus for the dam failure, earthquake, and flood hazards. For the other hazards, loss estimates were generated by applying a regionally relevant damage function to the exposed inventory. In all cases, a damage function was applied to an asset inventory. The asset inventory was the same for all hazards and was generated in the Hazus-MH model.
§201.6(c)(2)(ii)(C): [The plan should describe vulnerability in terms of] providing a general description of land uses and development trends within the community so that mitigation options can be considered in future land use decisions.	Nine action areas of *The Portland Plan* that intersect with the NHMP are described. Additional detail was also provided on land use and development trends in Portland.	There is a discussion on future development trends as they pertain to each hazard of concern. This discussion looks predominantly at future land use designated in the recently updated comprehensive plan and the current regulatory environment that dictates this land use.

44 CFR Requirement	Previous Plan	Updated Plan
§201.6(c)(3): The plan shall include a mitigation strategy that provides the jurisdiction's blueprint for reducing the potential losses identified in the risk assessment, based on existing authorities, policies, programs and resources, and its ability to expand on and improve these existing tools.	The mitigation strategy was reviewed and updated from the 2004 plan. It includes a description of mitigation success stories over the 2004-2009 performance period.	The 2010 mitigation strategy underwent a comprehensive review including identified vision, mission and goals, existing capabilities, and previously identified actions. In addition, new mitigation actions were selected to meet the updated goals and objectives as well as to address the issues identified during the risk assessment and public engagement process.
§201.6(c)(3)(i): [The hazard mitigation strategy shall include a] description of mitigation goals to reduce or avoid long-term vulnerabilities to the identified hazards.	The 2010 plan included the same vision statement as the 2004 plan. In addition a mission statement was developed. The 2004 goals were reviewed, edited and updated. Seven goals were identified.	The vision, mission and goals identified in the 2010 plan were reviewed and updated. The plan includes an updated vision and mission statement as well as seven goals and 16 objectives. Goals were selected that support the vision and mission, objectives were selected that meet multiple goals, and actions were selected and prioritized based, in part, on meeting multiple objectives.
§201.6(c)(3)(ii): [The mitigation strategy shall include a] section that identifies and analyzes a comprehensive range of specific mitigation actions and projects being considered to reduce the effects of each hazard, with particular emphasis on new and existing buildings and infrastructure.	Table 5-5-1a identifies 114 mitigation actions that were reviewed by the planning team for implementation over the five-year performance period. For each mitigation action, a brief assessment of benefits versus costs and technical feasibility was included.	A hazard mitigation best practices catalog was developed through an exercise that looked at strengths, weaknesses, obstacles and opportunities in Portland as well as previously identified best practices, and steering committee and other stakeholder input. This catalog identifies actions that manipulate the hazard, reduce exposure to the hazard, reduce vulnerability, or increase mitigation capability. The catalog segregates actions by scale of implementation. A table in the action plan section analyzes each action by mitigation type to illustrate the range of actions selected.
§201.6(c)(3)(ii): [The mitigation strategy] must also address the jurisdiction's participation in the National Flood Insurance Program, and continued compliance with the program's requirements, as appropriate.	A brief discussion on the National Flood Insurance Program and Community Rating System was provided in the flood hazard profile. Appendix I includes a review of NFIP compliance. Actions that address NFIP compliance are called out in Table 5-6-1a.	The NFIP capability of the City is assessed and actions supporting continued compliance and good standing under the program have been identified,
§201.6(c)(3)(iii): [The mitigation strategy shall describe] how the actions identified in Section (c)(3)(ii) will be prioritized, implemented, and administered by the local jurisdiction. Prioritization shall include a special emphasis on the extent to which benefits are maximized according to a cost benefit review of the proposed projects and their associated costs.	The planning team evaluated criteria to identify the action that would have the greatest impact on the most hazards, meet the greatest number of goals, have the resources to implement current projects, and align with citywide and individual bureau priorities and goals. The selection of mitigation actions and their prioritization are described within the plan.	Each recommended action is prioritized using a qualitative methodology that looked at the objectives the project will meet, the timeline for completion, how the project will be funded, the benefits of the project and the costs of the project. In addition, actions with the potential for equity impacts are identified with an "E." This prioritization scheme is detailed in Chapter 19.

44 CFR Requirement	Previous Plan	Updated Plan
§201.6(c)(4)(i): [The plan maintenance process shall include a] section describing the method and schedule of monitoring, evaluating, and updating the mitigation plan within a five-year cycle.	The planning team and the Emergency Management Steering Committee were responsible for monitoring and evaluating the NHMP. An annual review meeting was to be held during the anniversary week of the FEMA approval date. An annual review questionnaire was to be completed. The plan maintenance strategy was not implemented during the performance period of the plan.	A detailed plan maintenance strategy is provided that includes the following: • Annual review and progress reporting • Formation of a working group • Development of an equity implementation guide • Plan update triggers • Plan incorporation guidelines • Strategy for continuing public involvement • Implementation coordination amongst the lead agencies identified.
§201.6(c)(4)(ii): [The plan shall include a] process by which local governments incorporate the requirements of the mitigation plan into other planning mechanisms such as comprehensive or capital improvement plans, when appropriate.	A discussion of how the actions of the NHMP intersect with *The Portland Plan* was included. A discussion is provided on how development and land use planning requirements use hazard information. Information on implementation of the mitigation actions through existing planning mechanisms was provided in the plan maintenance strategy.	This is included in the plan maintenance strategy and discussed in the capability assessment.
§201.6(c)(4)(iii): [The plan maintenance process shall include a] discussion on how the community will continue public participation in the plan maintenance process.	Efforts for continued public involvement are described, including presentations to community organizations, maintenance of the website and contact information, the establishment of a schedule to implement public involvement, and the development of a citizen action plan. The level of continued public engagement specified was not maintained over the performance period of the plan.	This is included in the detailed plan maintenance strategy.
§201.6(c)(5): [The local hazard mitigation plan shall include] documentation that the plan has been formally adopted by the governing body of the jurisdiction requesting approval of the plan (e.g., City Council, County Commission, Tribal Council).	The Portland City Council adopted the 2010 NHMP update via resolution.	The Portland City Council will adopt the 2016 update via resolution.

3. PLAN UPDATE APPROACH

The Mitigation Action Plan was largely funded by a FEMA Pre-Disaster Mitigation grant received by the Portland Bureau of Emergency Management (PBEM) in 2015. It covered 69 percent of the cost for plan development. The balance was funded by City in-kind contributions.

3.1 PLAN UPDATE APPROACH

The approach to developing the 2016 MAP encouraged broad participation from many stakeholders. The plan development strategy was designed to result in the adoption and approval of a plan that sets the stage for equitably reducing the adverse impacts of natural hazards within the City through activities and strategies embraced by both elected officials and the people of Portland. The process encompassed eight key phases:

- Phase 1—Organize resources and review the prior plan
- Phase 2—Update the risk assessment
- Phase 3—Develop and implement a public involvement strategy
- Phase 4—Update goals, objectives and actions
- Phase 5—Review and update the plan maintenance strategy
- Phase 6—Assemble the updated plan
- Phase 7—Initiate and complete plan review and adoption
- Phase 8—Implement the approved, adopted plan.

Phases 1, 3 and 6 are described in Part 1 of this document. Phase 2 is described in Part 2. Phases 4, 5 and 8 are discussed in Part 3. In addition to these phases, a simultaneous process was pursued to assess natural hazard risks for the City's Critical Energy Infrastructure Hub along the Willamette River. Results of this study are incorporated into the plan document as appropriate and the full study is provided in Appendix D.

3.2 FORMATION OF THE PLANNING TEAM

The City of Portland hired Tetra Tech, Inc. to assist in preparation of the MAP. The Tetra Tech project manager and lead planner reported directly to the City of Portland project manager and project coordinator. The following planning team was formed to lead the planning effort:

- Danielle Butsick, Project Coordinator, PBEM
- Jonna Papaefthimiou, Project Manager, PBEM
- Paul Cone, GIS Support, City of Portland Corporate GIS
- Rob Flaner, Project Manager, Tetra Tech
- Kristen Gelino, Lead Planner, Tetra Tech
- Carol Baumann, Risk Assessment Lead, Tetra Tech.

The planning team facilitated the work of the steering committee, coordinated with other agencies, implemented the public engagement strategy, developed the plan document, and led the plan review and adoption process. The team met regularly throughout the planning process. As appropriate, other stakeholders and agency representatives were asked to participate in planning team calls.

3.3 DEFINING THE PLANNING AREA

The planning area was defined to consist of the entire area within the City of Portland city limits. Relevant Portland characteristics are described in Chapter 4.

3.4 PLAN KICKOFF

A kickoff event was held on June 22 (see Figure 3-1). The meeting was open to the public (see Figure 3-2) and had the following objectives:

- Introduce project goals
- Define mitigation and relevant laws
- Introduce the planning team and draft work plan
- Offer opportunities to be engaged.

At the meeting, local stakeholders were solicited to participate in the plan development. Stakeholders for this planning process were defined as persons and agencies that have a vested interest in the recommendations and implementation of the MAP. Stakeholders include residents, community groups, business owners, local, state and federal agencies, elected officials, visitors, and neighboring communities. Two stakeholder groups were identified at the kickoff meeting:

- Participatory stakeholders—Stakeholders who commit to being members of the Steering Committee overseeing the plan update process.
- Coordinating stakeholders—Stakeholders who cannot commit to the Steering Committee, but may attend meetings and want to be informed of plan progress.

Nineteen stakeholders signed up as participatory or coordinating stakeholders at the initial kickoff meeting.

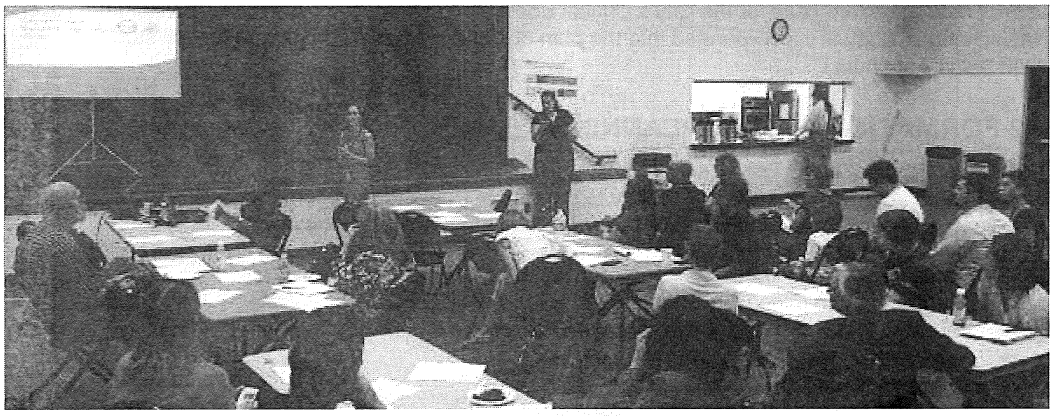

Figure 3-1. Plan Kickoff Meeting

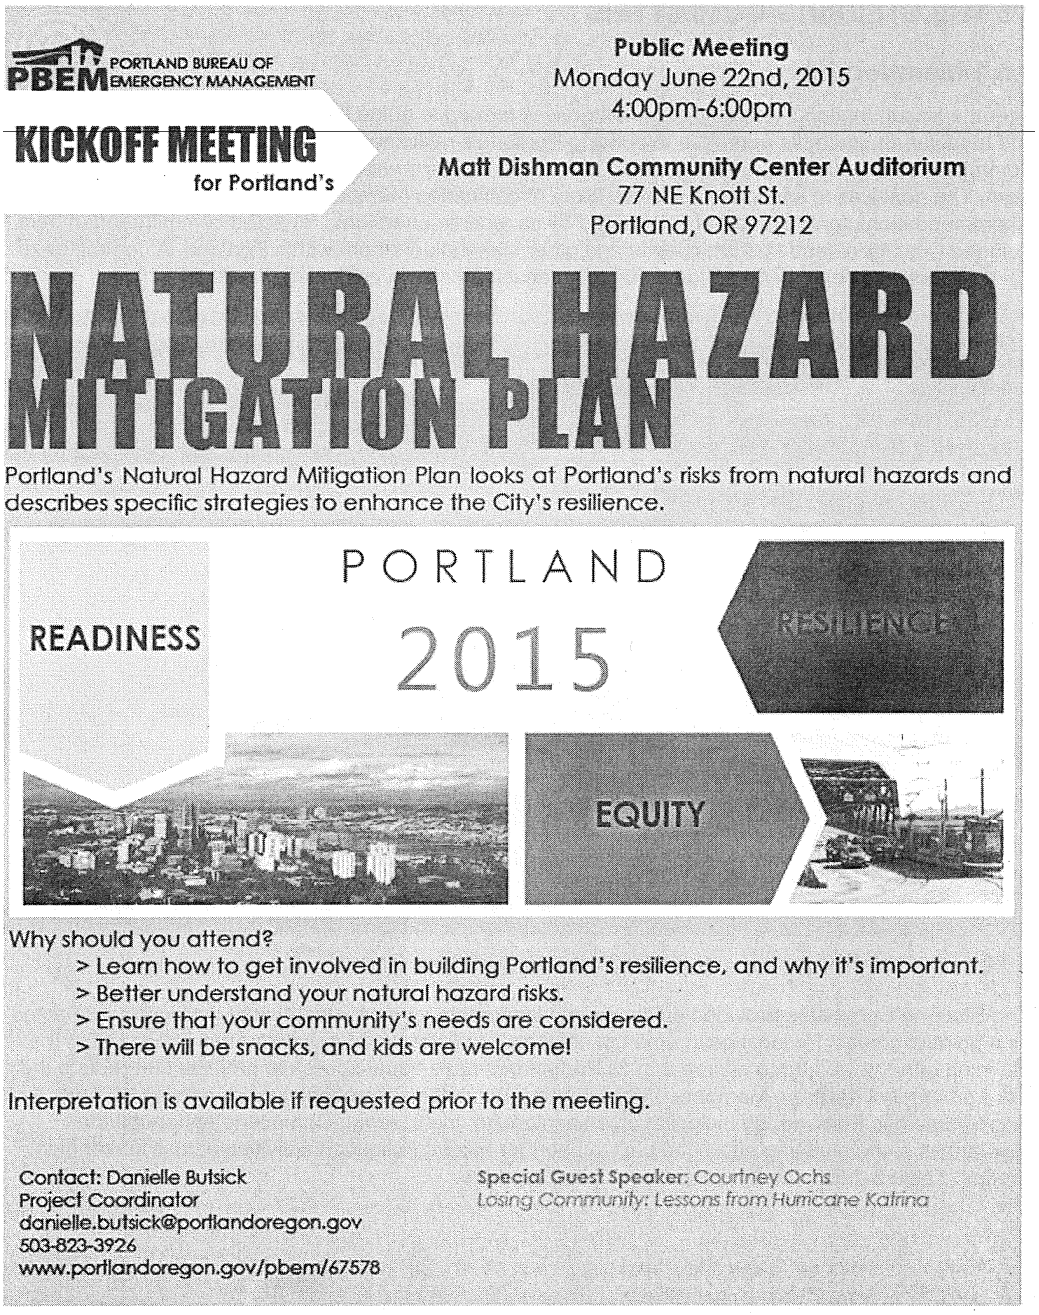

Figure 3-2. Kickoff Meeting Notice Poster

3.5 THE STEERING COMMITTEE

3.5.1 Membership

After the kickoff meeting, a steering committee was formed to guide the planning process for the update and to foster an equitable approach to building Portland's resilience to natural hazards. Steering Committee volunteers were solicited at the kickoff meeting and were also contacted by the planning team. The goal was to assemble a diverse array of committee members who could have recommendations for the plan or be impacted by its recommendations. Selected committee members included City of Portland staff, residents, and other stakeholders from within Portland. A committee of 32 members was confirmed to oversee the plan development process (see Figure 3-3).

Figure 3-3. Steering Committee

The Steering Committee provided guidance and leadership, oversaw the planning process, and acted as a point of contact for local governments, neighborhoods, and community groups interested in the planning effort. It worked to ensure that all Portlanders have equal access to projects that reduce their risk from natural hazards. Members of the Steering Committee represent a cross-section of views and interests across Portland. By including diverse interests, the Steering Committee enhanced the robustness of the planning effort and built support for hazard mitigation activities across stakeholder groups. Table 3-1 lists the Steering Committee members.

Table 3-1. Steering Committee Members

Representation[a]	Name	Title/Agency
Portland Government, Floodplain Management and Environmental Protection[c]		
Primary Member	Maggie Skenderian	Bureau of Environmental Services
Alternate Member	Kate Carone	Bureau of Environmental Services
Portland Government, Land Use and Comprehensive Planning[c]		
Primary Member	Kathryn Hartinger	Bureau of Planning and Sustainability
Alternate Member	Roberta Jortner / Sallie Edmunds	Bureau of Planning and Sustainability
Portland Government[c]		
Primary Member	Danielle Brooks	Office of Equity and Human Rights
Alternate Member	Judith Mowry	Office of Equity and Human Rights
Portland Government, Open Space Management		
Primary Member	Vicente Harrison	Parks & Recreation
Alternate Member	N/A	N/A
Portland Government, Public Safety[c]		
Primary Member	Laurent Picard	Fire and Rescue
Alternate Member	Leo Krick/Don Russ	Fire and Rescue
Stakeholder, Public Health[c]		
Primary Member	Jessica London (Co-Chairperson)	Oregon Health & Science University-Institute on Development and Disability/Oregon Office on Disability and Health
Alternate Member	Justin E. Ross	Oregon Health & Science University-Institute on Development and Disability/Oregon Office on Disability and Health
Stakeholder, Environmental Interests[c]		
Primary Member	Bob Sallinger	Audubon Society of Portland
Alternate Member	Micah Meskel	Audubon Society of Portland
Stakeholder, Community Health and Welfare		
Primary Member	Dean Alby	Oregon Food Bank
Alternate Member	N/A	N/A
Stakeholder, Community Organization		
Primary Member	Simeon Mamaril	Filipino American Community
Alternate Member	N/A	N/A
Stakeholder, Oregon Public Policy Committee[c]		
Primary Member	Jeff Soulages	Oregon Seismic Safety Policy Advisory Commission
Alternate Member	N/A	N/A
Stakeholder, Federal Agency		
Primary Member	Glen Collins	Department of Homeland Security
Alternate Member	N/A	N/A

Stakeholder, Local Government[c]		
Primary Member	Molly Emmons	Portland Public Schools
Alternate Member	N/A	N/A
Stakeholder, Community Organization		
Primary Member	Ranfis Giannettino Villatoro	MRG Foundation/Coalition of Communities of Color
Alternate Member	N/A	N/A
Portland Government, Emergency Management[c]		
Primary Member	Jonna Papaefthimiou	Bureau of Emergency Management
Alternate Member	Peter O'Farrell	Bureau of Emergency Management
Portland Government[c]		
Primary Member	Nickole Cheron	Disability Program, Office of Neighborhood Involvement[d]
Alternate Member	Brian Hoop	Office of Neighborhood Involvement
Stakeholder, Public Health		
Primary Member	Sherrie Forsloff	Oregon Health and Science University Emergency Management
Alternate Member	Mike Nurre	Oregon Health and Science University Emergency Management
Stakeholder, Community Organization[c]		
Primary Member	Casey Milne	Goose Hollow Foothills League
Alternate Member	Tom Milne	Goose Hollow Foothills League

Representation[a]	Name	Title/Agency
Stakeholder, Community Organization		
Primary Member	Dean Stearman	Volunteers of America
Alternate Member	N/A	N/A
Portland Government[c]		
Primary Member[b]	Rich Grant	Portland Bureau of Transportation
Alternate Member	N/A	N/A
Stakeholder, Community Organization[c]		
Primary Member[b]	Darise Weller	Portland Harbor Community Advisory Group
Alternate Member	N/A	N/A

a. Representatives from the Coalition of Communities of Color, Oregon School Boards Association and Rosewood Initiative were originally included on the committee roster, but needed to leave the committee due to a lack of resource, change of positions or other issue.
b. Steering Committee membership was approved by the committee at the fourth steering committee meeting.
c. Indicates that the steering committee member or his or her alternative missed three or fewer meetings over the course of the planning process.
d. Steering Committee member transitioned to representing the Disability Equity Program at the Office of Equity and Human Rights during the planning process.

3.5.2 Ground Rules

Leadership roles, ground rules (see Appendix B), and a charge statement were established at the first Steering Committee's meeting on July 28, 2015 and confirmed on August 19, 2015. The committee was charged with the following:

- Guide the planning process.
- Develop strategies for public involvement that foster mutual information exchange during plan development and implementation.
- Promote and advocate for equity in hazard mitigation.
- Support the development of mitigation strategies that promote a decrease in loss of life, property damage, and long-term impacts on social, environmental and economic systems from natural hazards.

The Steering Committee agreed to meet monthly as needed throughout the course of the plan's development. The planning team facilitated each Steering Committee meeting, which addressed a set of objectives based on the work plan established for the plan. The Steering Committee met 12 times from July 2015 through June 2016, including 10 steering committee meetings (see Figure 3-4) and two equity training sessions. All Steering Committee meetings were open to the public and agendas, handouts and meeting notes were posted to the hazard mitigation website. A summary of meeting objectives is included in the plan milestone table at the end of this chapter. Attendance logs are available for review upon request.

After leadership roles were confirmed at the August meeting, an executive steering committee meeting was held the week prior to each steering committee meeting. These meetings involved the steering committee co-chairs and members of the planning team. The agenda and meeting objectives were reviewed and discussed, as well as the forum in which each agenda item would be discussed (e.g. break out groups, full group discussion, etc.). Agendas were modified based on the executive committee feedback.

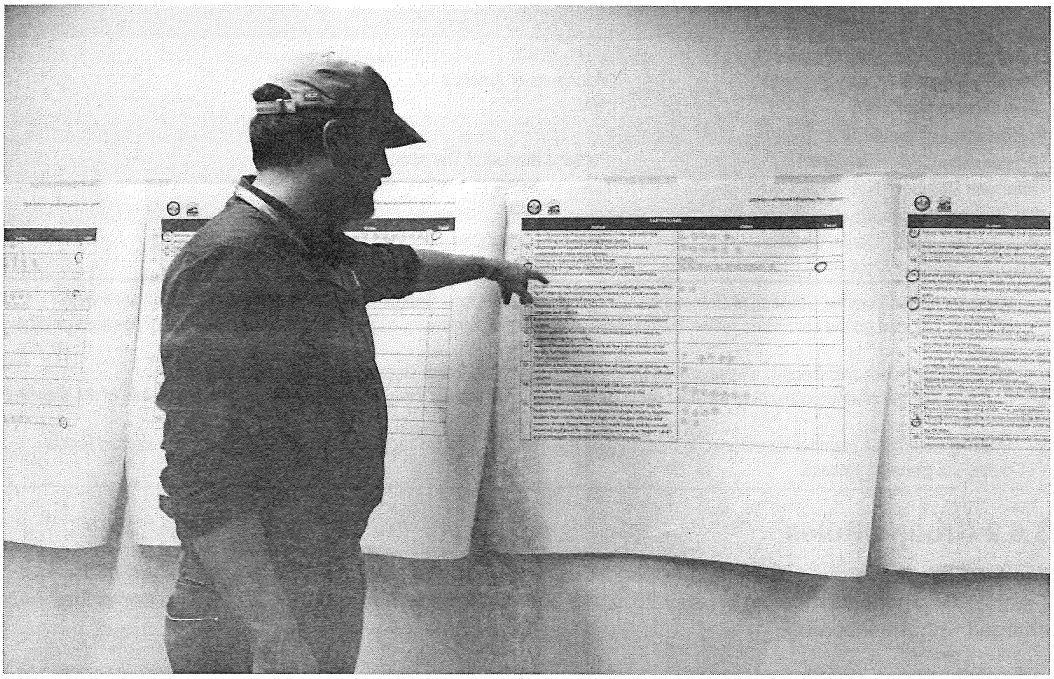

Figure 3-4. Discussion of Mitigation Actions at Steering Committee Meeting

3.5.3 Equity Trainings

In order to provide a baseline level of understanding of equity-related concerns in the City of Portland and in hazard mitigation planning in general, the planning team arranged for two equity training sessions for the steering committee. Interested members of the public and other stakeholders were also invited to attend these events. These trainings were used to inform and enhance the development of the equity lens applied throughout the planning process, including the public engagement strategy, the development of the risk assessment, the development of the mitigation strategy, and the plan implementation and maintenance strategy. City and contracted staff who provided this training also provided feedback and guidance on the development and application of the equity lens through the remainder of the plan development process.

City of Portland Office of Equity and Human Rights Training

On August 10, 2015, the Portland OEHR led a training to help participants recognize institutional and systemic barriers to just access to services and opportunities. Participants were asked to apply their skills to develop strategies that remove barriers in policies, programs, and practices, focusing on race and disability issues, and leading to the elimination of disparities and improved outcomes for all.

A conversational model was used to facilitate discussions, in order to create a supportive learning environment where people could express themselves without fear of judgment or recrimination. Activities at the training included brief presentations, short videos, small and large group conversations,

and practical exercises on real world scenarios. The training was designed to convey the following information:

- History of institutional/systemic racial biases and impacts today
- How implicit bias supports the status quo and disparities
- Why equality doesn't mean equity
- How to use equity questions to eliminate disparities and improve outcomes for all
- The City of Portland's commitment to equity as a value and mission.

A focus of the training was the distinction between an equity framework and an equality framework (see Figure 3-5). Equality implies equal treatment, while equity focuses on creating an equal opportunity for successful outcomes, which means that different groups and persons may need different allocations of resources. The working definition of equity applied during the training was as follows:

> Equity is realized when identity—such as race, ethnicity, gender, age, disability, or sexual orientation—has no detrimental effect on the distribution of resources, opportunities, and outcomes for groups or members in a society.

Source: OEHR

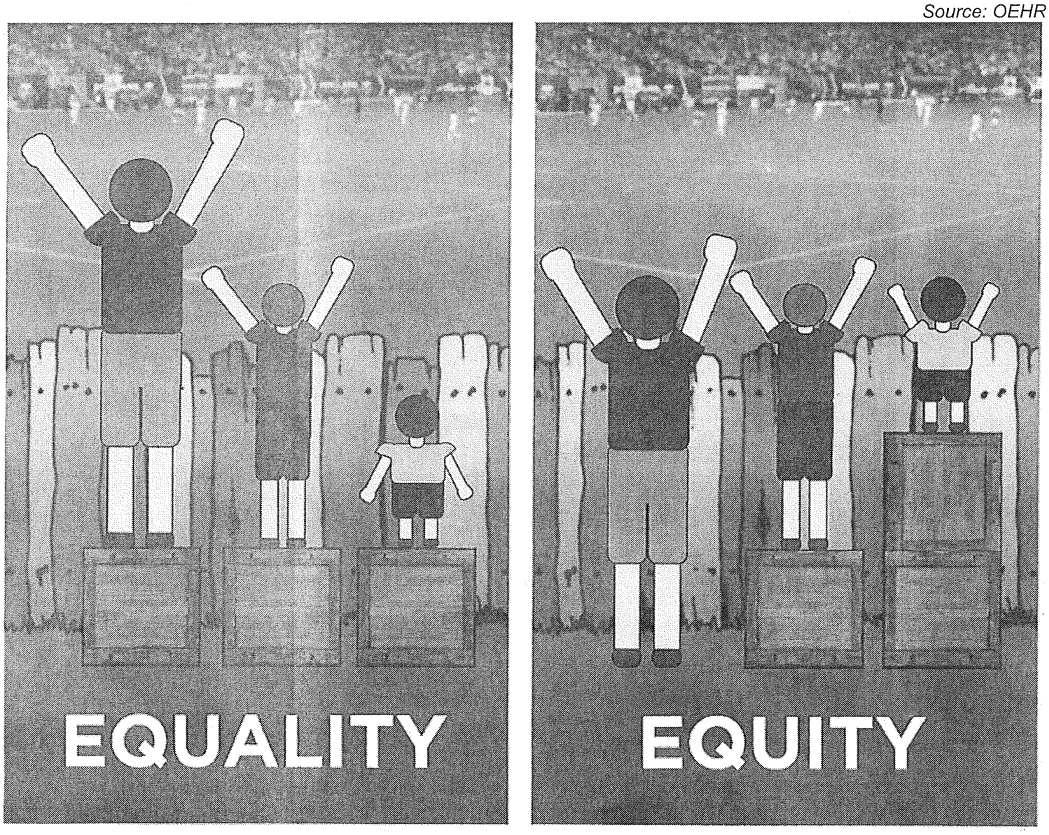

Figure 3-5. Equality versus Equity

Three scenarios were discussed in small groups by training attendees: the development of outreach strategies; communication mechanisms about a public health risk; and a willing-seller property acquisition program. Discussions considered the following:

- What assumptions serve as the basis for this policy, procedure or practice?
- How could this policy, procedure, or practice benefit communities of color or people with disabilities?
- How could this policy, procedure or practice burden communities of color or people with disabilities?
- What are some strategies for reducing negative impacts for communities of color or people with disabilities?

Natural Hazard Mitigation Focused Equity Training

On September 28, 2015 Dr. Himanshu Grover, assistant professor and co-director of the University of Washington's Institute for Hazard Mitigation and Planning, led a training to help participants to understand and recognize key equity issues in the planning and implementation of hazard mitigation policies (see Figure 3-6). The session was based on the "appreciative inquiry" approach to purposeful stakeholder interactions. This approach is useful for engaging with a broad range of stakeholders. It advocates collective inquiry into the development of a desired future state or policies that are compelling enough not to require the use of incentives, coercion or persuasion for implementation.

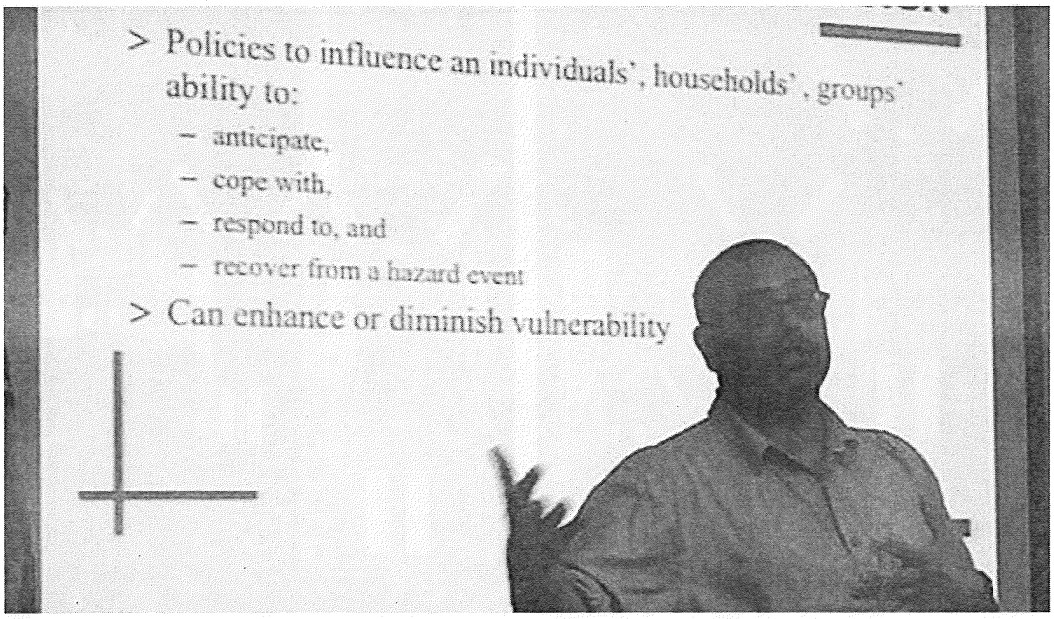

Figure 3-6. Natural Hazard Mitigation Focused Equity Training

This approach overcomes limitations of problem-solving by expanding human horizons and encouraging collective solutions. It assumes that communities are socially constructed phenomena and that problem-solving is limited only by human imagination and the agreements stakeholders make with

each other. The session was designed to stimulate a process of inquiry that results in better, more effective, sustainable and vital connections between stakeholders, toward the common objective of mitigating hazard risks to the community.

Participants were introduced to the role of hazard mitigation planning in reducing risks from hazard threats and were then asked to participate in a collaborative exercise to identify issues and challenges in the development and implementation of an effective hazard mitigation strategy for the City of Portland. Learning objectives for the training were as follows:

- Appreciate the role of the MAP in reducing risks and avoiding losses.
- Recognize key equity concerns in hazard mitigation planning.
- Actively participate in development of equity lens questions to eliminate disparities and improve outcomes for hazard mitigation policies and actions.
- Identify specific needs for targeted mitigation actions that can overcome traditional barriers and challenges to equity.
- Identify synergistic opportunities for implementing equitable hazard mitigation policies.

The training session focused on vulnerability and risk reduction in order to identify ways to achieve the following:

- Minimize the impacts of hazard events so that they do not become disasters.
- Provide a better quality of life to all groups and members of the community.
- Build trust and networks that can be relied upon for other developmental activity.
- Promote overall sustainability and resilience (enhance social equity).

Key factors identified for decreasing vulnerability and increasing social equity in hazard mitigation included the following:

- Access to resources (including information, knowledge, and technology)
- Social capital, including organizational trust, social networks and connections
- Beliefs and customs
- Age, gender, race
- Health and physical ability.

Common challenges in these processes include the following:

- **Framing**—Different stakeholders may have conflicting views of the issue.
- **Scope**—Who are those impacted and where are the impacts?
- **Transparency**—Trade-offs are not made explicit and hidden agendas seem to determine the outcome.
- **Inequity**—Decisions allot the risk and benefits unfairly.
- **Accountability**—Decision makers are isolated from the impact of their decision.
- **Alienation**—People or organizations are ignored: "authority knows best."
- **Trust**—Lack of trust in the process or the communication channel.
- **Paralysis by analysis**—Overly inclusive process that ultimately leads to a continuation of the status quo.

3.6 COORDINATION WITH OTHER AGENCIES

Opportunities for involvement in the planning process must be provided to neighboring communities, local and regional agencies involved in hazard mitigation, agencies with authority to regulate development, businesses, academia, and other private and nonprofit interests (44 CFR, Section 201.6(b)(2)). This task was accomplished by the planning team as follows:

- **Steering Committee Involvement**—Agency representatives were invited to participate on the Steering Committee. Many agencies contacted to participate as steering committee members ultimately elected to participate as coordinating stakeholders instead.
- **Stakeholder Notification**—The following agencies were invited to participate in the plan development process as coordinating stakeholders:

  - Centennial School District
  - City of Maywood Park
  - Clackamas County
  - Clark County
  - David Douglas School District
  - District Office of Congressman Earl Blumenauer, OR-3
  - Oregon Department of Geology and Mineral Industries (DOGAMI)
  - FEMA Region X
  - Marion County
  - Multnomah County Aging & Disability Services
  - Multnomah County Drainage District
  - Multnomah County Emergency Management
  - Multnomah County Health
  - Multnomah County Office of Citizen Involvement
  - Multnomah County Office of Diversity and Equity
  - Multnomah Youth Commission
  - Oregon Advocacy Commissions Office
  - Oregon Department of Environmental Quality
  - Oregon Department of Justice
  - Oregon Department of Land and Development
  - Oregon Department of Transportation (ODOT)
  - Oregon Emergency Management (OEM)
  - Oregon Health Authority (OHA)
  - Oregon Metro
  - Oregon Public Utility Commission
  - Port of Portland
  - Portland Public Schools
  - U.S. Coast Guard, Station Portland
  - Wasco County
  - Washington County

  These agencies received meeting announcements, meeting agendas, meeting handouts and meeting summaries by e-mail throughout the plan development process. Many supported the effort by attending meetings, providing feedback or comment, or providing data or studies. Distribution lists used for agency coordination are available upon request.

- **Pre-Adoption Review**—All the agencies listed above were provided an opportunity to review and comment on this plan, primarily through the City's hazard mitigation website (see Section 3.7.2). Each agency was sent an e-mail message informing them that the draft plan was available for review. In addition, the complete draft plan was sent to Oregon Office of Emergency Management, FEMA Region X, and the Insurance Services Office for a pre-adoption review to ensure program compliance.

3.7 PUBLIC ENGAGEMENT STRATEGY

Broad public participation in the planning process helps ensure that diverse points of view about local needs are considered and addressed. The public must have opportunities to comment on disaster mitigation plans during the drafting stages and prior to plan approval (44 CFR, Section 201.6(b)(1)). The Community Rating System expands on these requirements by making CRS credits available for optional public involvement activities.

- DEFINITIONS
- **Community**—All residents of the City of Portland and those who work and play here.
- **Engagement**—A two-way communication between local government and stakeholders.
- **Stakeholders**—Persons and agencies with a vested interest in the recommendations and implementation of the MAP. Stakeholders include residents, community groups, business owners, local, state and federal agencies, elected officials, visitors, and neighboring communities.

3.7.1 Strategy Development

Significant resources were invested in a public engagement strategy to ensure that the MAP development process benefited from a wide range of perspectives from all stakeholders. The City established the following goals for the public engagement strategy:

- Reach out to all stakeholders, specifically those living in higher risk areas.
- Create authentic opportunities for stakeholders to influence the planning process.
- Make use of existing community outreach capacities and networks.
- Partner with local organizations.
- Promote activities that meet the outreach requirements of the Disaster Mitigation Act and the Community Rating System.
- Propose activities that can be included and summarized in the plan.

The public engagement strategy was developed through discussion with the steering committee, review of best practices, interviews with community members, and input from technical support staff contracted to assist with development of the equity lens. Meetings held as part of this effort are summarized in Table 3-2.

Table 3-2. Equity and Outreach Strategy Development Meetings

Stakeholder	Meeting Date
Portland Office of Neighborhood Involvement	June 12, 2015
Portland Office of Equity and Human Rights	July 16, 2015
Portland Office of Neighborhood Involvement	September 18, 2015
Neighbors West/Northwest, Downtown Neighborhood Association	January 3, 2016
New Portlanders Program	March 14, 2016
Community Engagement Liaison Program	March 17, 2016

A recommended *Community Engagement Plan*, developed and reviewed by the steering committee and planning team, included the following recommended activities (see Appendix C):

- Online platform for information sharing
- Stakeholder identification and involvement
- Public hazard mitigation survey
- "Planning for Real" workshops
- Draft plan review and feedback (town hall meetings and public comment)

- Continued public engagement.

In addition to these activities recommended in the *Community Engagement Plan*, coordination was conducted with internal and external stakeholders as events were identified or information was requested. Although not all plan recommendations were implemented during the MAP development, the plan is a resource for continued public engagement during the performance period of the MAP, as well as a resource for the next hazard mitigation plan update. The following sections describe all public engagement activities carried out during development of the MAP.

The implemented strategy encouraged public participation during the MAP development process, will facilitate continued engagement with local residents after adoption of the MAP, and promotes effective cooperation between City government and civil society organizations within an integrated framework for community engagement. The strategy establishes public involvement that achieves the following:

- Results in City decisions that effectively respond to the needs and priorities of the community
- Makes community members and community resources part of the solution
- Involves the whole community, especially those who have not participated in the past
- Spreads knowledge of and support for public policies and programs
- Keeps government accountable.

3.7.2 Strategy Implementation and Results

Online Platform for Information Sharing

At the beginning of the plan development process, the PBEM hazard mitigation website was updated to provide information on the MAP development process and to serve as the information resource for mitigation within the city (see Figure 3-7): https://www.portlandoregon.gov/pbem/67578. The site includes the following:

- The 2010 NHMP
- Information on public engagement, including the survey, workshops and meetings
- The steering committee roster, ground rules, and meeting packets
- Links to equity resources
- Draft findings and reports
- Calendar of events
- Information on how to get involved in the planning process and where to submit comments and questions.

The site's address was publicized in all press releases, the survey and public engagement events. PBEM intends to keep a website active and up-to-date after the MAP's completion to keep the public informed about successful mitigation projects, progress on identified actions and future plan updates.

Figure 3-7. Sample Page from the Mitigation Action Plan Web Site

Stakeholder Identification and Involvement

The following activities were carried out in addition to formal public engagement meetings recommended in the Community Engagement Plan (meeting dates are listed in Table 3-3):

- **External Stakeholder Recruitment and Coordination—**Stakeholders were invited to join in the plan process as both participatory and coordinating stakeholders as described in Sections 3.5 and 3.6. Additionally, members of the planning team held several steering committee recruitment and stakeholder coordination meetings throughout the course of the planning process.
- **Internal Stakeholder Coordination—**Coordination with internal stakeholders occurred throughout the plan process through participatory and coordinating engagement. Several coordination meetings were held over the course of the MAP development process.
- **Identification of Barriers and Opportunities—**In-person and phone interviews were conducted with 41 representatives of neighborhood associations, community organizations and members of the public during the MAP development process to identify potential barriers to public engagement. City bureaus and offices and community organizations were surveyed to identify ongoing programs and initiatives, in order to leverage existing community linkages during development and implementation of the MAP. The results of these interviews and surveys are provided in Appendix C.
- **General Outreach and Presentations—**Additional outreach was conducted with internal and external stakeholders as events were identified or information was requested.

a. No member of the planning team was in attendance at this event. This outreach was conducted by community engagement liaisons and information was reported back to the planning team.

Public Hazard Mitigation Survey

A public survey was developed by the planning team with input from the steering committee. The survey was used to inform action item development and prioritization and to inform the planning team how best to communicate with the public about natural hazard risks and risk reduction. A survey distribution plan was developed (see Appendix C) to meet the goal of reaching a broad cross-section of the Portland population, with an emphasis on the populations most vulnerable to natural hazard risks: economically disadvantaged populations, communities of color, those with limited English proficiency, immigrants or refugees, and others who are historically underrepresented in government activities or experience greater likelihood of negative consequences from natural hazard events.

Survey Distribution

The public survey was launched February 5, 2016 (see Figure 3-8). It was distributed online in English, Spanish, Chinese, Russian, Ukrainian, and Vietnamese, through translation provided by Oregon Translation, LLC. It included questions to gather information about how Portlanders think about preparedness and reducing risk from natural hazards; questions to collect demographic information, such as income level, ethnic identification, household structure; and questions to identify the respondents' country of birth and language spoken at home. Data was also collected related to how the respondent learned about the survey and whether he or she would like to be contacted with additional related information. A sample page is shown on Figure 3-9. The complete survey and results can be found in Appendix C.

Figure 3-8. Flyer Used to Advertise the Public Survey

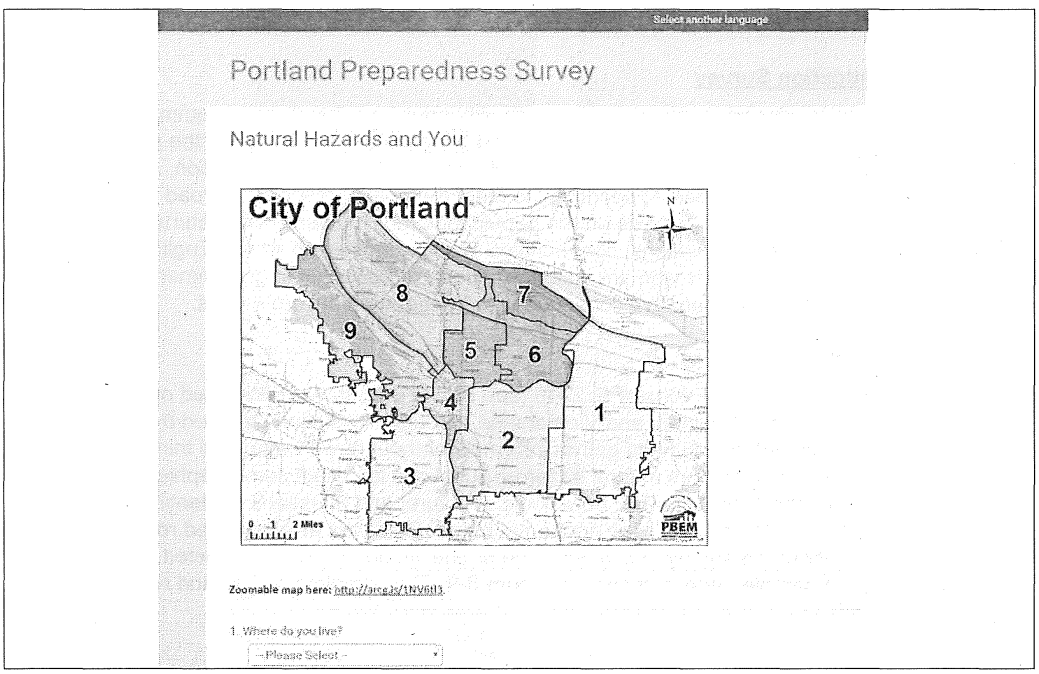

Figure 3-9. Sample Page from Survey Distributed to the Public

Survey Results

The survey remained open through the course of the MAP development; however, early results were compiled in May to inform action item development, plan content, and outreach strategies. There were 2,970 responses to the public survey through early April 2016. Key results are summarized below.

Geographic Representation and Residency Tenure

Survey responses were received from all risk reporting areas and from individuals who live outside of Portland; 75.5 percent of all respondents indicated that they live in Portland. When non-residents are excluded, the percent of responses from risk reporting areas is representative of the estimated population in some cases; however, there are some areas with under- and over-representation. Overrepresented areas included: Northeast, Southeast and Southwest. Under-represented areas include: Central City and East Portland. The remaining reporting areas were within 1 percent of the estimated population. See Table 3-4 for more information.

Table 3-4. Geographic Distribution of Survey Respondents

Reporting Area	Estimated City Population	Estimated % of City Populations	% of Survey Responses[a]	Difference
Airport	2,674	0.4%	0.2%	-0.2%
Central City	37,987	6.2%	3.6%	-2.6%
Central Northeast	47,644	7.8%	7.1%	-0.7%
East Portland	148,712	24.2%	9.6%	-14.6%
North Portland	68,047	11.1%	12.1%	+1.0%
Northeast	57,842	9.4%	15.9%	+6.5%
Southeast	153,952	25.1%	32.6%	+7.5%
Southwest	70,262	11.4%	13.8%	+2.4%
West/Northwest	26,875	4.4%	4.9%	+0.5%

a. Excluding respondents who indicated they reside outside of Portland.

The majority of respondents who live in Portland have lived in the City for 11 or more years (62 percent); 26 percent indicated that they have lived in the City for more than 25 years.

The top three areas where all survey respondents indicated that they and their families spend the most time are Central City (42 percent), Southeast (34 percent) and Southwest (25 percent). When non-Portland residents are excluded, the top areas are Central City (43 percent), Southeast (40 percent), Southwest and Northeast (about 25 percent each).

Demographics

Excluding non-Portland residents, 72 percent of respondents self-identified as middle income and 13 percent identified their household as low income. According to American Community Survey (ACS) estimates, approximately 12 percent of Portland families are surviving on incomes below the federal poverty line.

Excluding non-Portland residents, 99 percent of respondents indicated that they speak English at home. Only nine respondents indicated that they prefer languages other than English. The ACS estimates that limited English speaking households make up approximately 4 percent of Portland households.

Excluding non-Portland residents, 72 percent of respondents indicated that they own their home, and 27 percent indicated that they rent their home. The ACS estimates that 43 percent of the housing units in the City are renter-occupied.

Approximately 9 percent of respondents indicated that they have physical or mental disability. Thirteen respondents who indicated that they had a disability (about 7 percent) also indicated that they were 65 or older. According to U.S. census estimates, 9 percent of Portland residents under age 65 have a disability.

Respondents were able to enter their own racial identity rather than choosing from pre-determined options. The indicated racial identity was white/Caucasian or Anglo for 79 percent of respondents. According to ACS estimates, 78 percent of the Portland population is white.

Hazards of Concern

For Portland residents, the top three hazards of concern were earthquake (96 percent), severe weather (51 percent) and drought (34 percent). Dam failure (3.9 percent) and space weather (8 percent) were the least likely to be selected. The top three hazards remain the same when non-Portland residents are included. Of Portland residents, 53 percent indicated that they had experienced one of the hazards of concern.

Thoughts on Preparedness and Mitigation

Portlanders indicated that they have made efforts to reduce risk to their families. They clear storm drains (50 percent), have made non-structural retrofits, such as securing a water heaters (42 percent), and have planted drought-resistant plants (33 percent). Only 6 percent of Portlanders indicated that they have purchased flood insurance; 27 percent indicated that they have purchased earthquake insurance. Seventeen percent indicated that they had not done any of the options indicated. A large number of respondents indicated that they had not taken these measures because they rent or live in apartment buildings or condominiums.

The top three things Portlanders have done to prepare for a natural hazard event are obtaining emergency food and water (58 percent), having an emergency kit at home (54 percent) and registering for PublicAlerts (46 percent). Only 10 percent of respondents indicated that they had done nothing to prepare. When non-Portland residents are included, the results are similar.

Portlanders indicated the top three reasons for not preparing for emergencies as lack of money (40 percent), being too busy (34 percent) and preparing being too overwhelming (32 percent).

Portlanders indicated that power outage (67 percent), water system damage (65 percent) and bridge closures (43 percent) would impact them the most. Responses were similar when all survey respondents are included.

As the three most important things that the City of Portland government could do to reduce risk from natural hazards, Portlanders selected strengthening infrastructure such as bridges, sewer lines and water pipes (85 percent), strengthening public buildings (44 percent), and helping citizens reduce their individual natural hazard risks (36 percent). Strengthening schools was also commonly mentioned.

Planning for Real Workshops

Nine workshops were held in Portland between April 18 and May 14, 2016 using the "Planning for Real" workshop approach for community engagement:

- Seven of the workshops were open to the public and geographically focused.
- One workshop was held for the Coalition of Communities Color, Native American Youth and Family Center, Portland Voz, the Asian Pacific Network of Oregon (APANO), and the Latino Network
- One workshop was held for community engagement liaisons (CELs) representing Chinese, Zomi, Lao, Bhutanese, Somali, Latino, Iraqi, and Khmer immigrant and refugee communities (see Figure 3-10). CELs are leaders in their communities who are contracted with the City of Portland to act as a bridge between City government and immigrant and refugee communities. Following the CELs workshop, each participant was asked to schedule a meeting with at least 10 members of his or her community to share information about hazards in Portland and to provide any feedback received to the planning team

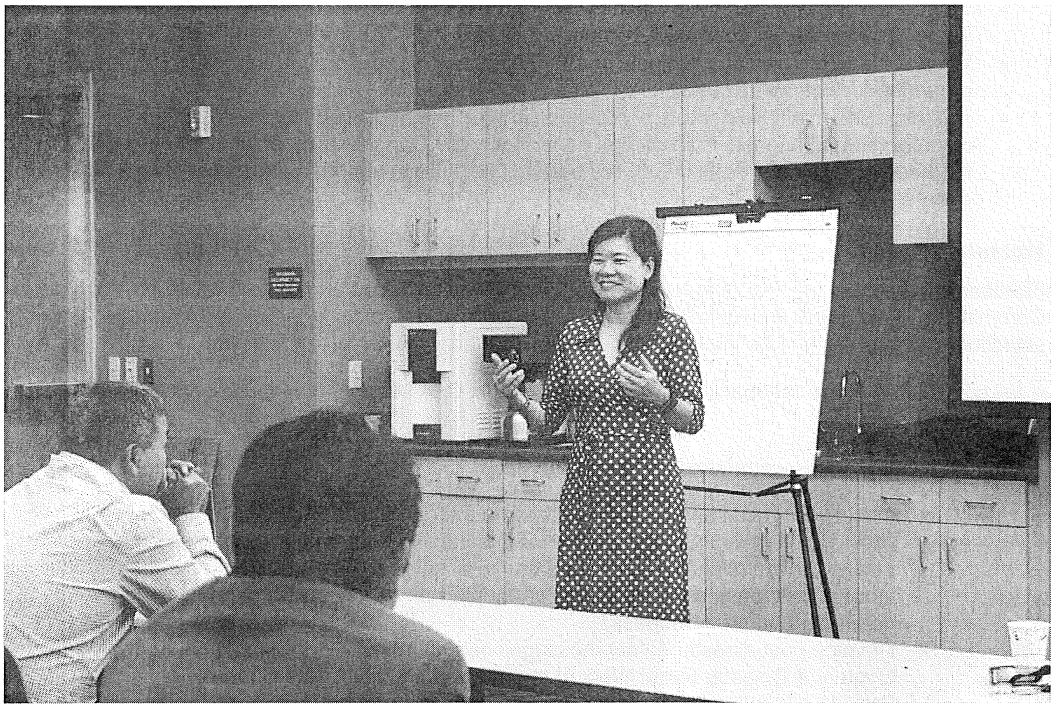

Figure 3-10. Community Engagement Liaisons (CELs) participate in "Planning for Real" Workshop

Workshop Content

The Planning for Real workshop process is described in the *Community Engagement Plan* provided in Appendix C. The content of each workshop varied based on lessons learned from previous workshops. Earlier workshops focused on the MAP development process and physical exposure to hazards of concern in the geographic area in which the workshop was held (primarily flood, earthquake, landslide, wildfire, and severe weather, with some discussion of drought, space weather, and volcano).

Later workshops were adapted based on feedback from early workshop attendees. The early workshop participants recommended less emphasis on the planning process and more information about projects

and programs the City is currently doing to reduce vulnerability, and ways for the City to partner with community organizations. Later workshops briefly covered natural hazard risks, then highlighted current city activities to reduce risk and vulnerability and potential collaborations between the city and community organizations.

For workshops with fewer attendees, discussions involved the whole group; workshops with larger groups were divided into discussion groups focused on specific hazards (wildfire, flood, earthquake, etc.). The following questions were discussed:

- Is your neighborhood in a hazard risk zone? Are there buildings or services you use on a daily basis that are in a hazard risk zone? What would the consequences be if they were impacted by a natural hazard?
- What are some ways that you could reduce the risk impacts and negative consequences at your home, at work, and in your neighborhood?
- What kinds of programs or projects can City offices do to support you and your neighbors in preparing for natural hazards?
- Are there potentially vulnerable populations in your neighborhood that could experience disproportionate impacts from natural hazard events? Can you think of ways to build capacity for these groups now, so that they are better positioned to absorb and recover from a hazard event?

Workshop Results

Feedback received at the Planning for Real workshops was compiled and shared with the Steering Committee, City bureaus and stakeholders. Bureaus were asked to consider this information in the selection of action items to be implemented over the performance period of the plan.

A full compilation of this feedback is included in Appendix C. A summary of key recommendations by topic follows:

- Planning process, communications and outreach:
    - Include full social and economic recovery after a disaster as a goal of the MAP.
    - Provide culturally and community-specific training for community leaders on home safety, hazard mitigation (e.g. non-structural seismic strengthening), food and supply storage, response considerations for people with special needs, and household and neighborhood preparedness.
    - Develop post-disaster safety messages based on the 2013 report Day Labor, Worker Centers & Disaster Relief Work in the Aftermath of Hurricane Sandy.
    - Provide education for rental property owners and property managers on hazard communication and mitigation actions.
    - Provide training on evacuation and sheltering for retirement home staff and all licensed nursing homes and assisted living care providers.
    - Increase PBEM's capacity to provide community trainings and partner with the Office of Neighborhood Involvement, Diversity in Civic Leadership program, and Community Engagement Liaisons program to connect underserved communities with training opportunities.
    - Expand the NET program (Neighborhood Emergency Team—volunteers trained by PBEM and Portland Fire & Rescue to provide emergency disaster assistance within their own neighborhoods) into every neighborhood in Portland and expand beyond the

neighborhood structure to non-geographic communities (e.g. immigrant and refugee communities).
- Update Portland Maps to be more user-friendly and visually map hazards.
- Culture- and language-appropriate webpage for new Portlanders to access emergency information, videos, and events in their preferred language.
- Postcard mailers to every household in Portland to share natural hazard risks and how to be prepared. Include this information in neighborhood newsletters.
- Hold a storytelling event to share disaster survivor stories and share information about hazards in an emotionally compelling way.
- Citywide preparedness tours to highlight exemplary projects.
- Do outreach for ATC-20 damage assessment trainings at neighborhood land use and transportation meetings. Provide ATC-20 training to NET members to support ATC-20 certified engineers and architects.

- All hazards:
  - Financial assistance and/or regulatory support for low-income residents and renters who are vulnerable to extreme heat or diminished air quality to install air conditioning systems.
  - Training and support for day laborers consistent with guidance in 2013 report *Day Labor, Worker Centers & Disaster Relief Work in the Aftermath of Hurricane Sandy*.
  - Funding for community organizations outside formal neighborhood structure whose projects focus on preparedness and community resilience.
  - Invest in and promote community gardens and local food production.
  - Invest in and promote rainwater collection systems in public, residential, and commercial properties.
  - Require new development to include onsite rainwater storage and/or emergency drinking water storage tanks. Include water storage solutions in seismic retrofit projects for schools and other public buildings.
  - Update city policies to include energy and water purification solutions promoted internationally by Green Empowerment.
  - Invest in and promote solar and other alternative energy in public, residential, and commercial properties.
  - Prioritize clearing bike paths so that non-automobile traffic can flow safely and develop plans to locate aid stations along these routes.
  - Prioritize road access to grocery stores, medical offices, and hospitals. Consider isolated communities in establishing road-clearing priorities.
  - Partner with community groups and critical social service organizations to ensure that they have continuity of operations plans.
  - Develop hazard-specific evacuation plans that consider likely impacts on bridges and other transportation infrastructure.
  - Develop a recovery plan to promote hazard-informed decision-making for post-disaster redevelopment and to take advantage of the opportunity to move critical assets to safer locations.
  - Provide neighborhood tool libraries for mitigation projects and post-disaster reconstruction. Partner with home improvement stores to build tool collections.
  - Require Portland's emergency responders to live within the city. Provide financial support to purchase or rent a home within the city limits.

- Landslide:
  - Financial support and education for property owners wishing to remediate their properties for erosion.
  - Emergency moratorium on all development in high landslide risk areas.
  - Enhanced communication with adjacent property owners and neighbors about how landslide risk is being minimized if development is permitted in landslide risk areas.
  - Erosion control projects using bio-swales and beneficial drainage systems.
  - Pre-established detour routes for access in and out of known landslide risk areas.
- Flood:
  - Replace unsafe or structurally compromised bridges and rebuild to more flood-resistant standards.
  - Identify high-traffic bridges and flood-prone routes and establish alternative routes to be used in case they are flooded.
  - Require construction of bio-swales for large construction projects where appropriate.
  - Promote the use of French drains and other on-site stormwater management systems.
- Earthquake:
  - Retrofit and/or move fuel infrastructure in Linnton. Maintain fuel reserves in safe locations for use in disaster recovery.
  - Strengthen levees to seismic standards.
  - Develop an inventory of and distribute information about which shelter facilities have been retrofitted.
  - Provide property owners with financial assistance for seismic strengthening, especially owners of multi-family and low-income housing.
  - Reinforce and fire-proof the Linnton Community Center as a place of refuge for residents who cannot evacuate.
  - Require automatic shutoff valves for gas lines in all new development.
  - Evaluate whether current seismic codes are sufficient for a 9.0 subduction zone earthquake. If not, adopt higher standards.
  - Assess seismic stability of large water towers throughout the city to determine whether they pose a risk or could be used as an emergency water source.
  - Communicate information about hazardous materials and potential plume areas prior to major event. Ensure firefighters and NET members know hazard types and response considerations.
  - Label unreinforced masonry buildings to notify occupants of their risks.
  - Require signage about risks and evacuation routes in hotels.
  - Retrofit and reinforce schools beyond life-safety standards so that they can be used as neighborhood shelters and storage locations for emergency supplies.
  - Stage emergency resources on the west side of the river in case bridges fail and east-west access is blocked.
  - Continually update water and sewer pipe systems, and continue with the project to build a seismically reinforced water pipe that crosses under the Willamette River
- Wildfire:
  - Require metal or composition roofing materials when replacing greater than 50 percent of a roof in a wildfire risk zone.

  - Provide NET members with training on fire response, especially how to use fire hydrants and hoses.
  - Provide clear information to the public on burn restrictions.

- Severe weather:
  - Primary concerns from workshop participants about severe weather were related to extreme heat and emergency shelters for all extreme weather conditions. All recommendations for severe weather are included under the all-hazards topic above.

- Drought:
  - Promote homeowners planting native and drought-resistant plants that require less water during drier months.
  - Provide water conservation education to kids in schools.

Press Releases, Media Coverage and Social Media

Press releases were distributed over the course of the MAP's development as key milestones were achieved and prior to each public meeting. Social media was also used to inform members of the public and other stakeholders on the status of the planning process. The planning effort received the following press coverage:

- Oregon Public Broadcasting, June 23, 2015: http://www.opb.org/news/article/portland-works-on-new-natural-hazard-mitigation-plan/
- Portland Tribune, June 22, 2015: http://portlandtribune.com/pt/9-news/264451-137767-city-event-kicks-off-natural-hazard-planning-
- Flash Alert Portland, June 22, 2015
- KOIN 6, July 28, 2015 http://koin.com/2015/07/28/linnton-most-dangerous-area-when-big-one-hits/
- Neighborhood Activist, Neighbors West-Northwest, July 2015

- Linnton Neighborhood Association Newsletter, March – April 2016
- Southwest Neighborhoods, Inc. August 2016 Newsletter
- KPAM, August 8, 2016, Get Ready

Draft Plan Review and Feedback

After a draft of the MAP was developed, it was presented to the public for review and comment. A 45-day public comment period was held from August 2, 2016 through September 15, 2016, with the following opportunities for comment:

- **Town Hall Events—**During the public review and comment period, five town hall events were held throughout Portland to give residents an opportunity to ask questions about and provide feedback on the draft MAP. Feedback requested from the public was specifically regarding action framing, opportunities to enhance benefits or diminish burdens, accessibility of the hazard maps, and clarification of items in the MAP that are confusing. Four of the meetings were open to the public and were informal open-house events held in city parks in each quadrant of the city. Participants were encouraged to review maps and interact with planning team and PBEM staff to learn about natural hazard risks in their area. The fifth meeting was held with members of the Coalition of Communities of Color, including Portland Voz, the Latino

Network, Native American Youth and Family, and APANO, to discuss the draft plan and how this group's comments from the Planning for Real workshop were included.

- **Other Public Comments—**Stakeholders were also invited to provide comments via email, postal mail, or phone.

In total, 56 comments were received on the draft MAP. These comments were addressed by the planning team in the draft plan as appropriate and/or forwarded to appropriate City bureaus as they were received. All comments were acknowledged by the planning team via email, phone or in person. A detailed list of all comments received is available upon request.

3.7.3 Critical Energy Infrastructure Hub Stakeholder Outreach

In addition to the outreach conducted as part of *The Mitigation Action Plan* development, focused outreach was carried out for a risk assessment of Portland's Critical Energy Infrastructure (CEI) Hub, which was conducted in conjunction with development of the MAP. Two formal stakeholder meetings were held on October 21, 2015 and February 25, 2016. Details on these meetings is provided in the CEI Hub Study (Appendix D). In addition to these formal meetings, additional outreach was conducted as shown in Table 3-5.

Table 3-5. CEI Hub Stakeholder Recruitment and Coordination

Stakeholder	Meeting Date

3.8 PLAN DEVELOPMENT CHRONOLOGY/MILESTONES

Table 3-6 summarizes the key milestones in the MAP development process.

Table 3-6. Mitigation Action Plan Development Chronology/Milestones

Date	Event	Description/Objectives	Attendance
2014			
7/08	Grant	PBEM received notice of the award of a Pre-Disaster Mitigation Grant to fund the hazard mitigation plan update.	N/A
2015			
1/26	Project staffing	• Hazard Mitigation Plan Project Coordinator Position Posted	N/A
1/05	Contractor solicitation	• PBEM advertised for contractor support for the plan update	N/A
3/12	Contractor selection	• PBEM selected Tetra Tech to facilitate plan development	N/A
5/4	Project staffing	• Hazard Mitigation Plan Project Coordinator Position filled	N/A
5/29	Internal Kickoff meeting	• Review project timeline • Form the planning team • Develop strategy for external kickoff • Develop strategy for CEI Hub task	4
6/22	External Kickoff meeting	• Introduce project goals • Define mitigation and relevant laws • Introduce the planning team and draft work plan • Offer opportunities to be engaged	37
7/28	1st Steering Committee Meeting	• Introduce the planning team and Steering Committee members • Introduce project goals, timeline and relevant laws • Develop Steering Committee ground rules • Introduce next steps and review action items	47
8/19	2nd Steering Committee Meeting	• Confirm chairpersons, meeting tools, and ground rules • Clarify the purpose of mitigation in emergency management • Review and briefly discuss the OEHR equity training • Perform a public involvement capability brainstorming session • Review plan review comments and discuss document outline • Identify hazards of concern • Introduce next steps and review action items	33
8/10	Equity Training	• OEHR Equity 101 Training	26
9/28	Equity Training	• Natural Hazard Mitigation Focused Equity Training	37
10/21	3rd Steering Committee Meeting	• Confirm steering committee role in planning process • Provide a brief review of equity training take home messages • Review the planning process and work plan • Present planning team recommendations for the risk assessment based on plan review survey • Confirm the hazards of concern • Confirm the hazard scenarios	27
10/21	1st CEI Hub Stakeholders Meeting	• Provide a natural hazard mitigation plan update overview • Describe CEI Hub component • Describe and discuss desired goals and outcomes • Describe stakeholder role in the planning process • Discuss any gaps in stakeholder representation • Describe information needs • Discuss data availability and possible sources • Identify and address data confidentiality and other concerns	22
11/18	4th Steering Committee Meeting	• Present the results of the vision, mission and goals homework survey • Discuss and confirm vision and mission statements • Discuss and confirm goal statements	28

Date	Event	Description/Objectives	Attendance
12/16	5th Steering Committee Meeting	• Present the planning team recommendation for risk reporting areas • Discuss and confirm risk reporting areas • Discuss and provide input on goals for the natural hazard mitigation public questionnaire including: what you would hope to find out, method of dissemination, method of advertisement, target audiences • Present the results of the critical facility homework survey • Discuss and confirm a critical facility definition • Discuss datasets being utilized for database development • Review the vision and mission • Discuss the results of the goals homework survey • Discuss and confirm goals • Introduce objectives development exercise	29
2016			
1/20	6th Steering Committee Meeting	• Present the Planning Team recommendation for objectives • Discuss and confirm objectives • Describe action plan development and introduce our next steps in moving towards action development • Present and discuss the 2010 Progress Report • Introduce and discuss plan implementation and maintenance	31
2/05	Public Engagement	• Natural Hazard Mitigation Survey opens	N/A
2/17	7th Steering Committee Meeting	• Present the general building stock loss estimate matrix • Describe mitigation best practices catalog development • Present and discuss the recommended public engagement plan	24
2/24	Webinar	• Discuss the results of the general building stock and answer questions pertaining to the risk assessment	6
2/25	2nd CEI Hub Stakeholders Meeting	• Review project objectives • Review results of Literature Review • Present Risk Assessment Model results • Identify possible actions for the City to consider for the Hazard Mitigation Plan	14
3/16	8th Steering Committee Meeting	• Present considerations and lessons learned from the Climate Action Plan for incorporating equity into mitigation planning • Set the stage for discussion about issues and action items • Reflect on issues and discuss capabilities that we have and those that we wish we had • Review mitigation best practices catalog • Small group action-storming	28
4/18	1st Planning for Real Workshop	• Northeast and Central Northeast Portland (joint workshop)	14
4/20	9th Steering Committee Meeting	• Present the recommendations from the CEI Hub report • Discuss the CEI Hub report recommendations and answer questions about the report • Present the planning team recommendation for the prioritization strategy • Discuss the strategy and provide recommendations for improvement • Small group action-voting and action-storming	28
4/23	2nd and 3rd Planning for Real Workshops	• Northeast Portland • North/Northwest Portland Central City (joint workshop)	7 and 29
4/24	4th Planning for Real Workshop	• Southeast Portland	42
4/30	5th Planning for Real Workshop	• North Portland	7
5/3	6th Planning for Real Workshop	• Southwest Portland	45

Date	Event	Description/Objectives	Attendance
5/7	7th Planning for Real Workshop	• Coalition of Communities of Color, Native American Youth and Family Center, and Latino Network	8
5/8	Public Engagement	• Survey Data Capture Date	2,970
5/10	8th Planning for Real Workshop	• East Portland	16
5/11	Bureau Action Selection Workshop	• Provide instruction and guidance on action selection	28
5/14	9th Planning for Real Workshop	• Community Engagement Liaisons (CELs) representing Chinese, Zomi, Lao, Bhutanese, Somali, Latino, Iraqi, and Khmer immigrant and refugee communities	12
6/15	10th Steering Committee Meeting	• Present the results of the MAP survey and the Planning for Real Meetings • Present the actions that have been selected by City bureaus and offices and any comments received to date • Receive additional comments on selected action items • Present the Plan Implementation and Maintenance Strategy • Review the next steps of the planning process • Receive feedback on steering committee's continued involvement • Discuss what worked in this planning process, did not work and ideas for improvement.	26
8/2	Start of the Public Comment Period	• Comment period opens and review draft posted online	N/A
8/9	1st Town Hall Meeting	• Coalition of Communities of Color	15
8/16	2nd Town Hall Meeting	• West/Northwest	15
8/17	3rd Town Hall Meeting	• North/Northeast	15
8/23	4th Town Hall Meeting	• East/Southeast	15
8/30	5th Town Hall Meeting	• Southwest	15
9/15	End of the Public Comment Period	• Comment period closes.	N/A
9/30	Plan Submitted to Review Agencies	• Plan submitted to Oregon Office of Emergency Management and FEMA Region X for concurrent review.	N/A
10/19	Plan Adoption	• Plan adopted by Portland City Council	N/A
X/X	Plan Submitted to Review Agencies	• Plan submitted to Insurance Services Office, Inc. for CRS assessment.	N/A
X/X	Final Plan Approval	• Final Plan Approval received by FEMA Region X	N/A

4. CITY OF PORTLAND PROFILE

The City of Portland is located primarily in Multnomah County in northwest Oregon, with small portions of the city extending into Washington and Clackamas counties (see Figure 4-1). The city covers 145 square miles centered on the Willamette River and its confluence with the Columbia River. Portland is the center of commerce, industry, transportation, finance and services for a metropolitan area of more than 2 million people. It is the largest city in Oregon, the seat of Multnomah County and the second largest city in the Pacific Northwest (after Seattle).

The Columbia River, which separates Oregon from Washington, is the city's northern boundary. Major jurisdictions adjacent to the city are Beaverton, Tigard and unincorporated Washington County to the west, Lake Oswego, Milwaukie, Happy Valley and unincorporated Clackamas County to the south, and Gresham, Fairview and unincorporated Multnomah County to the east. The small city of Maywood Park is an island within the Portland city limits, in the northeastern part of the city.

Major transportation routes through the city are Interstates 5, 84, 205 and 405, U.S. Highways 26 and 30, the Willamette and Columbia Rivers, and several major railroad lines. Portland International Airport is along the Columbia at the northern edge of the city. There are 10 vehicle bridges across the Willamette River in Portland, and two across the Columbia River. Willamette River crossings also include a railroad-only bridge and a new bridge serving only mass transit, bicycles and pedestrians. An aerial tram provides transportation from the South Waterfront area to the Marquam Hill neighborhood.

The city park system includes almost 12,000 acres in developed parks, natural areas, and built acreage (Portland Parks & Recreation, 2016). This includes Forest Park, the largest urban forest in the United States, at over 5,000 acres (Forest Park Conservancy, 2016).

4.1 HISTORICAL OVERVIEW

Portland was platted on the west bank of the Willamette River in 1845 on land that had been used until then by the Multnomah Chinooks. During the 1850s, Portland passed Oregon City to become the largest city in Oregon, a position it has held ever since. In its early decades, Portland depended on trade by water. The California Gold Rush created a market for Oregon wheat and lumber shipped to San Francisco by river and ocean, Willamette River steamboats delivered farm products from the state's agricultural areas, and Columbia River steamers connected to portage railroads to supply miners in Idaho and Montana (Oregon Historical Society, 2016).

Portland experienced further growth with the expansion of the regional railroad system from the 1880s to the 1910s. The Portland-centered rail network expanded with large and small lines opening the mountains in western Oregon and the Columbia Basin interior to logging, ranching, and agriculture. Flour mills, lumber mills, furniture factories, and shipyards lined the Willamette waterfront and major rail corridors. The first three bridges spanned the Willamette River between 1887 and 1891, and by 1906 the number of eastside residents surpassed the number of westside residents (Oregon Historical Society, 2016).

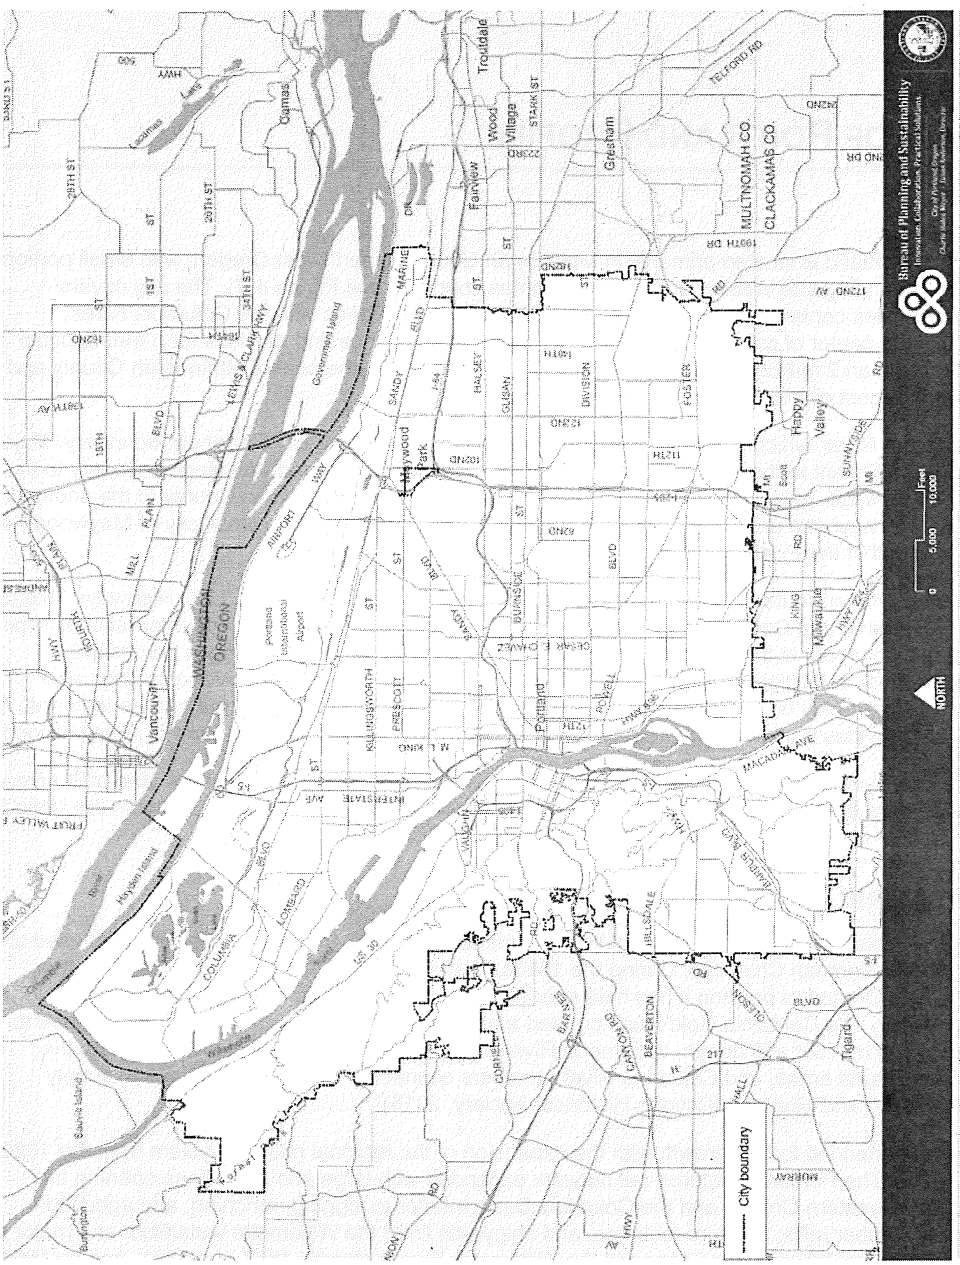

Figure 4-1. Main Features of Portland

Through a practice known as "red-lining" people of color were systematically excluded from living in most areas in Portland. In 1919, and continuing for decades, the Portland Realty Board's Code of Ethics banned members from selling property to people of color, in the interest of protecting property values. Red lines drawn on maps indicated where people of color could live, buy property, or obtain a mortgage. This ultimately concentrated Portland's population of people of color in a small, economically depressed district named Albina. During this time, it was widely known that employment opportunities for people of color were limited to domestic or railroad work. (Portland Housing Bureau, 2016). The effects of this practice can still be seen today, decades after it was declared illegal.

Shipbuilding became a significant local industry with the onset of World War II, with major shipyards on Swan Island and at St. Johns. Portland and Vancouver, Washington produced more than a thousand ocean-going combat and cargo ships from 1941 through 1945. The industry brought about a population boom, including many new African American residents in search of higher-paying jobs in the shipyards. Many newcomers settled in the City of Vanport, which was built in 1942–1943 adjacent to the Columbia River. That community was destroyed by flood in 1948, permanently displacing 18,000 residents, one quarter of whom were African American (Portland Housing Bureau, 2016; Oregon Historical Society, 2016). After the destruction from the flood, the land area making up the City of Vanport was annexed into the City of Portland.

In the late 1960s and 1970s, an expanding electronics industry and growing universities attracted new arrivals, and a new generation of civic activists became involved in city politics. Between 1968 and 1974, Portland leaders opted to replace a multi-lane expressway on the west shore of the Willamette River with what is now Tom McCall Waterfront Park. They also funded the city's first light-rail line, from downtown to Gresham. The Office of Neighborhood Associations was created during this period, and a landmark Downtown Plan was completed (Oregon Historical Society, 2016).

The City of Portland today is the center of a large integrated employment and market region. The U.S. Census Bureau has expanded its definition of the Portland metropolitan area from Multnomah, Washington, and Clackamas Counties in Oregon and Clark County in Washington to include Yamhill County, Columbia County, and Skamania County (Washington). Several public agencies, including Metro (an elected regional government), the Port of Portland, and the Tri-County Metropolitan Transportation District (TriMet) provide services for part or all of the greater Portland area (Oregon Historical Society, 2016).

4.2 PHYSICAL SETTING

4.2.1 Topography and Geology

Portland lies at the northern end of the Willamette River valley, at the Willamette's confluence with the Columbia River. The valley rises to the Coast Range of mountains on the west and to the Cascade Mountains on the east. The Willamette River begins in the Cascade Mountains almost 200 miles south of Portland. From Portland, the Columbia River Gorge flows northwest about 100 miles to the Pacific Ocean. Upstream to the east, the Columbia flows through the Columbia River Gorge, a break across the Cascade Mountains.

Elevations in the city range from about 20 feet above sea level along the Willamette River to over 1,000 feet in the Tualatin Mountains, which are more commonly called the West Hills (NHMP, 2010). The west side of the city is dominated by the West Hills, rising from a narrow terrace along the Willamette River. The east side is flat, with little elevation change except for a few volcanic buttes such as Mt. Tabor and Rocky Butte (Bureau of Environmental Services, 2006).

Soils on the west side of the Willamette River vary from clay loam with low permeability and relatively high erosion potential to gravelly loams, which are relatively well drained and moderately permeable. The flat areas along the west bank of the Willamette River are urban, with highly disturbed soil and unstable fill. On the east side of the Willamette River soils are highly variable, similar to the west side. Much of the area along the Columbia River has been filled with dredged sand, which drains very well. In undisturbed areas along the Columbia River, percolation (water flow through soil) rates are very slow. In the southeast areas of the city, soils vary from moderate to low permeability (NHMP, 2010).

4.2.2 Seismic and Volcanic Features

Most of the Pacific Northwest lies within the Cascadia Subduction Zone, where the Juan de Fuca and North American tectonic plates meet. The convergence of these plates puts most areas from western British Columbia to California at risk for a catastrophic earthquake with a potential magnitude of 9.0 or higher (Modified Mercalli Intensity Scale). Portland lies in this area of risk (NHMP, 2010).

Three major crustal fault lines run through Portland: the Portland fault, the East Bank fault and the Oatfield fault. Each is capable of generating moderately large (6.8) earthquakes (NHMP, 2010).

As a result of the subduction zone, there are active volcanoes nearby, including Mt. St. Helens, Mt. Hood, Mt. Adams and Mt. Jefferson. Major eruptions of these volcanoes may cause significant ash fall in the Portland area (NHMP, 2010).

Portland also lies atop the Boring Volcanic Field, a collection of cones and lava flows formed during one-time eruptive events. These include Mount Tabor, Rocky Butte and Powell Butte in east Portland. All existing Boring Volcanic centers are extinct, and the probability of an eruption in the Portland Metro area is very low (USGS, 2016a).

4.2.3 Surface Waters

The city of Portland lies within the watersheds of five primary surface waters, as described in the sections below.

Columbia Slough

The Columbia Slough Watershed drains an area of 51 square miles. The slough extends from Kelley Point Park on the west to Fairview Lake and Fairview Creek on the east. The watershed boundary includes portions of Portland, Troutdale, Fairview, Gresham, Maywood Park, Wood Village and unincorporated Multnomah County. Over the years, the watershed and waterway have been altered to accommodate industry and agriculture. Beginning in 1918, levees were built to provide flood protection. Wetlands and side channels were drained and filled to allow for development. Waterways were channelized, and dozens of streams were filled or diverted to underground pipes (PBES, 2006).

Today, the Columbia Slough includes an 18-mile main channel and 30 miles of secondary waterways, many ponds and lakes, including the Smith and Bybee Lakes complex near the Slough's confluence with the Willamette. The Upper and Middle Slough elevations and conveyance are managed by the Multnomah County Drainage District. The watershed's designation as an industrial area helps provide nearly 60,000 jobs. It is also the home to almost 160,000 people. Portland's Columbia South Shore Well Field, which supplies supplemental drinking water to a large portion of the region, is also in the Columbia Slough Watershed (PBES, 2006).

Johnson Creek

Johnson Creek originates in Clackamas County and flows west for 25 miles to its confluence with the Willamette River. The watershed covers 54 square miles and includes portions of the cities of Milwaukie, Portland, Gresham, Happy Valley and Multnomah and Clackamas Counties. Crystal Springs Creek and Kelley Creek are Johnson Creek's main tributaries and contribute the largest amount of flow to the main stem. Crystal Springs Creek is fed mostly by cold, clean groundwater from springs on the north side of Johnson Creek. Smaller tributary streams such as Mitchell, Errol, Deardorf, and Wahoo Creeks still flow, but about 38 percent of the watershed's historical tributaries are now piped or diverted to the combined sewer system. The northern watershed is characterized by large, flat floodplains, particularly in Lents neighborhood. The topography south of the main stem, where most of Johnson Creek's tributaries are located, is steep and varied (PBES, 2006).

One of the most significant changes in the watershed occurred in the 1930s when the Works Progress Administration attempted to control flooding by straightening, deepening and rock-lining the creek, creating a trapezoidal channel in 15 of the 25 stream miles. This work substantially altered the creek's ability to dissipate energy and absorb high winter flows. Because of these alterations, steady rainfall and surging stormwater runoff from hard surfaces overwhelm the confined stream channel. As a result, Johnson Creek has flooded 37 times since 1942, and at least seven floods caused major property damage in the last 35 years (PBES, 2006). The Johnson Creek floodplain has undergone substantial restoration in the last decade, after numerous properties in the floodplain were purchased by the City. Over 240 acre-feet of flood storage has been added through floodplain restoration, with a public investment of over $40 million.

Fanno Creek

Fanno Creek flows southwest for about 15 miles from its headwaters in Hillsdale to the Tualatin River near Durham. The Fanno Creek Watershed covers 32 square miles. About 4,529 acres are within the City of Portland. The remaining watershed area is mainly in Washington County. The Fanno Creek Watershed has steep slopes, steep stream gradients, and soils that are slow to infiltrate rain. These characteristics cause relatively high stormwater volumes and velocities, streambank instability and undercutting, erosion, instream sedimentation, and loss of streambank vegetation. More than 80 percent of the Fanno Creek Watershed in Portland is zoned for single-family residential use. The main stem Fanno Creek floodplain area has been cleared of vegetation and filled, reducing historical floodplain interactions and reducing habitat (PBES, 2006).

Tryon Creek

The Tryon Creek Watershed in southwest Portland covers about 6 square miles, about 21 percent of it outside the Portland city limits in Multnomah County, Clackamas County, and the City of Lake Oswego. The watershed is divided into three sub-watersheds: Tryon Creek, Arnold Creek, and Falling Creek. Arnold Creek and Falling Creek are Tryon Creek's main tributaries. Other smaller tributaries flow into Tryon Creek both within and outside Portland's city limits. The main stem of Tryon Creek is about 7 miles long from its headwaters near Multnomah Village (just north of Interstate 5 and Highway 99) to its confluence with the Willamette River in Lake Oswego at the Highway 43 crossing (PBES, 2006).

Significant residential development in the upper watershed above SW Boones Ferry Road has had negative effects on the condition of the watershed. Steep slopes and soils are slow to infiltrate water and increase surface runoff. These characteristics cause relatively high stormwater volumes and velocities, streambank instability and undercutting, erosion, instream sedimentation and loss of streambank vegetation. Residential development, impervious surfaces, and road crossings have severed the creek from its floodplain, decreased habitat and increased stream flow. Tryon Creek State

Natural Area is in the lower watershed, and the riparian area along Tryon Creek is largely intact, providing habitat diversity (PBES, 2006).

Willamette River

Portland's Willamette River Watershed covers about 69 square miles, about 0.5 percent of the river's total drainage basin. It is the most highly urbanized portion of the watershed and is a gateway for migrating salmon to the upper basin. It includes Forest Park, downtown's commercial core, industrial districts on both sides of the river and Portland's most densely populated residential neighborhoods (PBES, 2006).

The watershed is highly urbanized. Its east side is almost completely developed, and the small streams that once crossed the area have been diverted into the sewer system. The steeper slopes in the West Hills developed more slowly, and most of the watershed's remaining open stream channels are on the west side. Development, urban activities and structural changes throughout the watershed have diminished watershed functions and affected hydrology, physical habitat, water quality, and biological communities. Alterations to stream and riverbanks and channels has reduced floodplain functions and increased stream velocities (PBES, 2006).

The volume of water upstream of Portland and the presence there of dams and reservoirs severely constrain the City of Portland's ability to affect the hydrology of the Willamette River. Significant dredging, diking, and channeling of the main stem Willamette and its tributaries have altered habitat conditions. The main stem has been narrowed and deepened for flood control and navigation; off-channel habitat has been virtually eliminated, and the floodplain has been degraded. The river bank has been hardened with retaining walls and riprap, which prevents natural channel changes and minimizes the interaction between the river and riparian and floodplain vegetation (PBES, 2006).

4.2.4 Climate

Portland is in the marine west coast climate zone. The Coast Range helps to shield the Portland area from Pacific Ocean storms. The Cascades offer a steep slope over which moisture-laden westerly winds rise, resulting in moderate rainfall for the region. Precipitation falls mostly as rain, which varies across the Portland metropolitan area. The West Hills receive 60 inches of rain per year, but the airport receives only about 36 inches. The city averages 155 days of measurable precipitation a year. It is not uncommon to see relatively dry summers in Portland. Nearly 90 percent of Portland's annual rainfall occurs between mid-October and mid-May; only about 3 percent occurs in July and August (NOAA, 2016).

Winters can be mild to chilly and very moist, with January averaging 41.4 degrees Fahrenheit (°F). The Cascades generally block colder continental air masses from Canada, although cold air occasionally enters western Oregon through the Columbia River Gorge. Most temperatures during winter reach the 40s and lower 50s during the day and fall into the 30s at night. Temperatures below zero degrees are rare, occurring only six times since 1871. The city's lowest temperature was –3 °F in February 1950. Snow accumulations are not frequent. On average, only four days per year see measurable snow, and rarely more than 2 inches. Snow is most likely in areas above 500 feet or near the Columbia Gorge on Portland's east edge. The average winter snowfall total is 4.3 inches (NOAA, 2016b).

Spring is a transitional season. March and April are often damp and cool, with only a few warm dry days. May and June become drier, with warming weather. Generally, afternoon temperatures warm from the 60s or 70s in May to the 70s or lower 80s in June (NOAA, 2016b).

High pressure over the Pacific builds in the summer, with northwesterly winds prevailing in the afternoons and evenings. This high pressure prevents moisture from flowing into the area, so that summers often are dry and warm. August averages 69.5 °F. Afternoon highs in the 80s occur with regularity beginning in early July. Temperatures above 100 ºF are rare, usually occurring in July or August. The highest recorded temperature is 107 °F, most recently in August 1981 (NOAA, 2016b).

By early to mid- October, fall arrives with high temperatures back into the 60s. As nighttime hours increase, the valley cools more, allowing fog to form on clear nights. Fog can be dense during late night and early morning hours and can persist for several days (NOAA, 2016b).

Destructive storms are rare in Portland. Surface winds seldom exceed gale force (50 mph or greater) and have rarely exceeded 75 mph. Wind speeds average 7.5 mph over the course of a year. Thunderstorms can occur during any month, but are not common. Thunderstorms in winter and spring are weak, producing small hail and brief gusty winds. Those in summer can produce lightning, strong winds and large hail. Occasionally, thunderstorms will produce funnel clouds, but tornadoes are rare (NOAA, 2016b).

On average, the last occurrence of 32 ºF in the spring is March 30; the first of the fall occurs around November 8. First frost of fall is often around October 21, and the last frost of spring is typically near April 26. This makes for a long growing season (NOAA, 2016b).

Average climate conditions at two National Oceanic and Atmospheric Administration (NOAA) weather stations in Portland are shown in Table 4-1 and Table 4-2.

4.3 MAJOR PAST HAZARD EVENTS

Presidential disaster declarations are typically issued for hazard events that cause more damage than state and local governments can handle without assistance from the federal government. Although no specific dollar loss threshold has been established for these declarations, the availability of certain types of funding is limited by the ability to meet federally established damage thresholds. A presidential disaster declaration puts federal recovery programs into motion to help disaster victims, businesses and public entities. Some of the programs are matched by state programs.

FEMA reports presidential disaster declarations by county. Since 1964, 13 such declarations have applied to Multnomah, Washington or Clackamas County. These events are listed in Table 4-3.

Table 4-3. Presidential Disaster Declarations

Disaster Number	Declaration Date	Title	Declared County
DR-4258	2/17/2016	Severe winter storms, straight-line winds, flooding, landslides, and mudslides	Clackamas, Multnomah, Washington
DR-1956	2/17/2011	Severe winter storm, flooding, mudslides, landslides	Clackamas
DR-1824	3/2/2009	Severe winter storm, record and near record snow	Clackamas, Multnomah, Washington
DR-1733	12/8/2007	Severe storms, flooding, landslides, and mudslides	Washington
DR-1632	3/20/2006	Severe storms, flooding, landslides, and mudslides	Clackamas
EM-3228	9/7/2005	Hurricane Katrina evacuation (assistance for evacuees)	Clackamas, Multnomah, Washington
DR-1510	2/19/2004	Severe winter storms	Clackamas, Multnomah
DR-1107	3/19/1996	Severe storms and high winds	Washington
DR-1099	2/9/1996	High winds, severe storms and flooding	Clackamas, Multnomah, Washington
DR-985	4/26/1993	Earthquake	Clackamas, Washington
DR-413	1/25/1974	Severe storms, snowmelt & flooding	Clackamas, Washington
DR-319	1/21/1972	Severe storms & flooding	Clackamas, Multnomah, Washington
DR-184	12/24/1964	Heavy rains & flooding	Clackamas, Multnomah, Washington

Review of these events helps identify targets for risk reduction and ways to increase a community's capability to avoid large-scale events in the future. Still, many natural hazard events do not trigger federal disaster declaration protocol but have significant impacts on their communities. These events are also important to consider in establishing recurrence intervals for hazards of concern.

4.4 REPORTING AREAS

This plan assesses hazard risks for the City of Portland overall and for each of nine smaller areas that make up the city. The areas selected for risk assessment are those used in the City's budget mapping process, which roughly align with neighborhood coalition boundaries (although the central city is treated as a separate area). These risk reporting areas provide linkage to existing financial reporting areas, which is useful because mitigation actions often require financial expenditures. Budget reporting areas exclude the airport, so the airport was added as a separate reporting area for *The Mitigation Action Plan*. Table 4-4 provides summary descriptions of each area. A map of the areas is shown on Figure 4-2.

Table 4-4. Reporting Areas Used for Risk Assessment

Reporting Area	Corresponding Neighborhood Coalition Name	Population (2015)	Jobs (2014)	History	Current Conditions
Airport	None	N/A	N/A	• Mostly annexed 1960s–70s	• Predominantly commercial uses, some light industrial uses • Much of the area is devoted to the Portland International Airport. • There is one small residential area
Central City	Central City	36,087	134,883	• Annexed 1850–1900 • Oldest section of the City	• Smallest, and most densely populated • 34% of the City's jobs • Regional economic and transportation hub • Highest sidewalk coverage • Water and sewer infrastructure is old
Central Northeast	Central Northeast Neighborhood	46,535	27,072	• Annexed 1901–1990 • Largely incorporated by 1910 • Area from NE Prescott to NE Columbia Blvd incorporated after 1980	• Includes industrial lands north of Columbia and Sandy Boulevards • Cully neighborhood was annexed later than the rest of the area and has unimproved and substandard streets and lack of sidewalks.
East Portland	East Portland Neighborhood Office	150,822	48,722	• Mostly annexed in the mid-1980s • At the time of annexation many assets were below City standards	• Largest district in area, 29 square miles • Sewer system is relative new • 25% of the City's residents

Reporting Area	Corresponding Neighborhood Coalition Name	Population (2015)	Jobs (2014)	History	Current Conditions
North Portland	North Portland Neighborhood Services	65,661	38,488	• Annexed 1890–1990 • Inner neighborhoods mostly annexed 1890–1910 • St. Johns annexed by 1920	• Second largest district in area, 27 square miles • Land uses include large open spaces (Smith/Bybee Lakes and Kelly Point Park) and waterfront industrial (private and Port of Portland) • Street network generally meets City's connectivity standards • Water and sewer infrastructure is old
Northeast	Northeast Coalition Neighborhoods	59,723	23,513	• Annexed 1851–1900	• Second most dense district, with few large open spaces • Most inner neighborhoods have no walkable access to green space • Street network generally meets City's connectivity standards • Inner neighborhoods have some of the oldest water infrastructure in the City
Southeast	Southeast Uplift Neighborhood Coalition	153,937	49,487	• Annexed 1891–1990 • Incorporated by 1910, except some areas south of Woodstock Boulevard	• Water and sewer infrastructure is old • Street network generally meets the City's connectivity standards • 75 to 80% of streets have sidewalks • Most inner neighborhoods have no walkable access to green space • 25% of the City's residents
Southwest	Southwest Neighbors, Inc.	66,198	39,958	• Annexed 1891–1990 • Outer neighborhoods annexed in the 1980s	• Many streets are unimproved or unpaved • Most residential streets lack sidewalks • Major arterials follow hilly topography • Streets generally do not meet connectivity standards • Sewer system is relatively new and in good condition • Stormwater system has capacity deficiencies
West/ Northwest	Neighbors West/Northwest	26,815	32,161	• Annexed 1911–1990 • Close-in NW annexed by early 1900s.	• Least dense district, with only 27,000 residents • Forest Park is the largest single use • Home to significant industrial areas along the west bank of Willamette River

4.5 DEVELOPMENT PROFILE

4.5.1 Current Land Use and Zoning

Estimated Land Use

Portland has a total area of 145 square miles, of which 11.66 square miles is water. The City of Portland does not currently have a comprehensive inventory of existing land uses. Table 4-5 shows estimated current land use in the city derived from use descriptions provided in Multnomah County Assessor data. The distribution of land uses within the city will change over time.

Table 4-5. Current Land Use in Portland

Present Use Classification	Area (acres)[a]	% of total
Commercial	12,014	17.3%
Education	1,271	1.8%
Government	914	1.3%
Industrial	6,251	9.0%
Religious	639	0.9%
Residential	31,083	44.7%
Other—Vacant, Open Space, Unknown	17,379	25%
Total	**69,550**	**100%**

a. Area is based on tax lot boundaries and likely excludes public rights-of-way and water bodies.

Building Count

Because an accurate land use inventory is lacking, land use information is analyzed in this plan using building counts as a proxy. Table 4-6 shows the type and distribution of structures throughout Portland. This information is used for each hazard that has a defined spatial extent.

Table 4-6. Structure Type in Portland

	Number of Structures[a]						
	Residential	Commercial	Industrial	Religion	Government	Education	Total

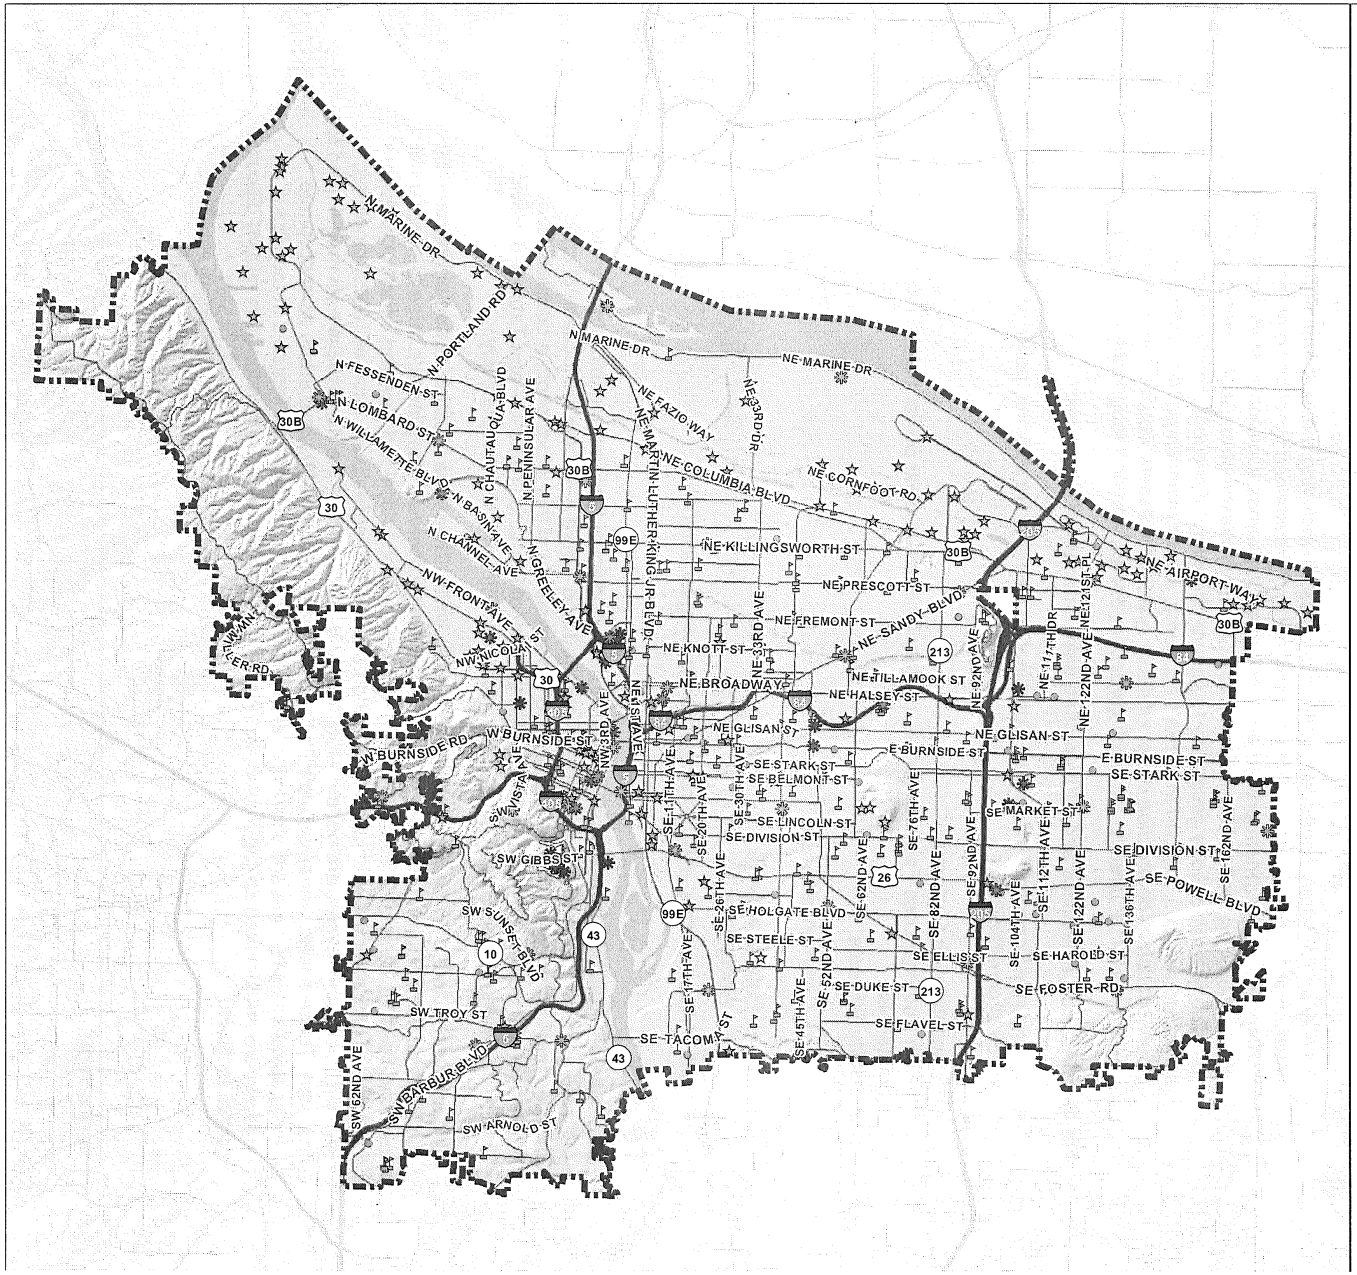
4.5.2 Critical Facilities and Infrastructure

Definition and Categories

The 2007 *Critical Infrastructure Protection Plan, Portland/Vancouver Urban Area* presents the following regional definition of critical infrastructure (CH2M Hill, 2007):

> *Publicly and privately controlled systems and assets, including the built and natural environments and human resources, essential to the sustained functioning of the Portland/Vancouver metropolitan area including Clackamas, Columbia, Multnomah and Washington Counties in Oregon and Clark County in Washington. Such systems and assets specifically include those necessary to ensure continuity of security, safety, health and sanitation services, support the area's economy, and/or maintain public confidence. Incapacitation or destruction of any of these systems or assets would have a debilitating impact on the area either directly, through interdependencies, and/or through cascading effects.*



For the MAP, critical facilities and infrastructure were categorized as follows:

- Emergency Services (Emergency Coordination Centers, fire stations, police stations, and medical care facilities)
- Schools
- Transportation Systems
- High Potential Loss Facilities (dams, military facilities, nuclear power plants, hazardous materials)
- Utility Systems:
    - Communications
    - Power
    - Potable water
    - Wastewater
- Other Assets (zoos, jails, nursing/assisted living facilities)

Inventory

The database was built from the best available data. Additional facilities and infrastructure will be included as new data becomes available. Figure 4-3 and Figure 4-4 show the location of critical facilities and infrastructure in Portland. Due to the sensitivity of this information, a detailed list of facilities is not provided. The list is on file with the City of Portland. Table 4-7 and Table 4-8 provide summaries of the general types of critical facilities and infrastructure, respectively.

The analysis included 75 facilities outside of the city limits. These are facilities owned or operated by the Portland Water Bureau associated with the Bull Run Reservoir. They include three high potential loss facilities and 72 potable water facilities. All point-location critical facilities and infrastructure were analyzed to help rank risk and identify mitigation actions. Linear features, such as roads, pipelines, railroad tracks and levees, are not currently able to be analyzed by the risk assessment model used for this plan. These assets were overlaid with the extent and location of hazard areas as appropriate. Linear asset totals by type are shown in Table 4-9. The linear features not included in the Hazus analysis are not included on Figure 4-3 and Figure 4-4. The risk assessment for each hazard discusses critical facilities.

Critical Energy Infrastructure Hub

The City of Portland is a major throughway for oil, gas and electric transmission lines connecting Oregon to California, Washington, and Canada. A significant portion of Portland's energy distribution infrastructure is along a 6-mile stretch of the Willamette River in Northwest Portland between the I-405 Fremont Bridge and Sauvie Island, an area referred to as the Critical Energy Infrastructure Hub (the CEI Hub). The importance of the infrastructure in this hub, as well as the potential risks associated with materials stored there, warrant particular attention for hazard mitigation planning. A separate study was conducted to assess this area's exposure and vulnerability to each of Portland's key hazards of concern. A report summarizing this study is provided in Appendix D. It identifies nine recommendations to improve resilience of the critical infrastructure in the CEI Hub. The recommendations have been incorporated as appropriate into the MAP action plan.

4.5.3 Future Trends in Development

The City of Portland limits new development in known hazard areas through codes and policies. City code outlines hazard-based restrictions on building and development under Title 24 (Building Regulations) and Title 33 (Planning and Zoning). The codes used to evaluate hazard resilience of properties to be developed will be assessed as the MAP is implemented, as will the alignment of mitigation actions in the various projects that address future development.

Portland's 2035 Comprehensive Plan (City of Portland, 2016) guides how and where land will be developed and infrastructure projects will be built to address future growth. The comprehensive plan's five guiding principles include "resilience," which it defines as reducing risk and improving the ability of individuals, communities, economic systems, and the natural and built environments to withstand, recover from, and adapt to changes from natural hazards, human-made disasters, climate change, and economic shifts. The risk assessment and action plan in the MAP, together with the resilience policies in the comprehensive plan, will help ensure that decisions guiding future development consider hazard risks and vulnerability. Future analysis of specific areas conducted during site review and permitting will include greater detail of the environment, demographics, buildings, infrastructure, and hazards. This will aid in a more definitive spatial analysis of buildable land. A study of buildable land inventory is a part of the Comprehensive Plan and hazards are integrated into the analysis.

Goal 7 of Oregon's *Statewide Planning Goals and Guidelines* is to protect people and property from natural hazards. It requires local governments to follow procedures, standards and definitions in statewide planning goals and commission rules to develop programs to achieve this goal. Natural hazards covered by this goal include floods, landslides, earthquakes and related hazards, tsunamis, coastal erosion and wildfires. The Portland Comprehensive Plan includes policies addressing risk related to landslide, wildfire, flooding and earthquake risks. The MAP provides actions that support this Statewide Planning Goal.

Risks to future development are analyzed in this plan for each identified hazard that has a defined spatial extent and location. For hazards that lack this spatial reference, Future land use information based on Comprehensive Plan land use designations is summarized in Table 4-10 by use category for Portland.

Table 4-10. Future Land Use Designations in Portland

Reporting Area	Total Acreage	Percent of total acres

4.6 POPULATION

Information about population is a critical part of planning because it directly relates to housing, industry, stores, public facilities and services, and transportation. The Population Research Center at Portland State University estimated Portland's population at 613,355 as of July 1, 2015.

4.6.1 Growth

Population changes are useful socio-economic indicators. A growing population generally indicates a growing economy, while a decreasing population signifies economic decline. Figure 4-5 shows the average annual population change from 1990 to 2015 for Portland and the State of Oregon. For both the city and the state, high growth rates in the 1990s dropped significantly in the 2000s and the first few years of the 2010s. Higher growth rates have since returned, and in Portland the 2014–2015 rate of 1.97 percent was greater than the 1.89-percent annual average of the 1990s. Table 4-11 shows the population in Portland since 1990 (PSU, 2016).

Source: PSU, 2016

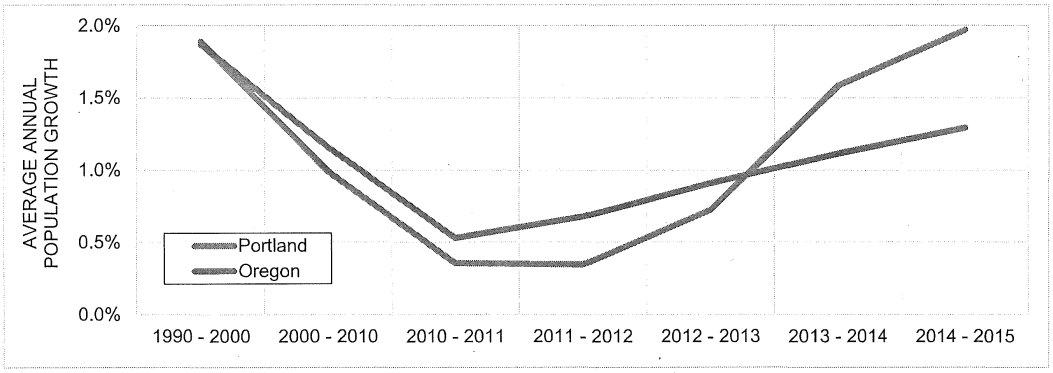

Figure 4-5. Oregon and City of Portland Population Growth

Table 4-11. Annual Population Data

Year	Population	Year	Population
1990	438,802	2012	587,865
2000	529,121	2013	592,120
2010	583,775	2014	601,510
2011	585,845	2015	613,355

Source: PSU, 2016

4.6.2 Age Distribution

The overall age distribution for Portland is illustrated in Figure 4-6. Based on U.S. Census data estimates, 11 percent of Portland's population is 65 or older, compared to the state average of 15 percent. According to U.S. Census data, 38.5 percent of the over-65 population has disabilities of some kind and 11.4 percent have incomes below the poverty line. Among children under 18 years old, 23.7 percent live below the poverty line. It is also estimated that 16 percent of the population is under 15 years old, compared to the state average of 18.2 percent.

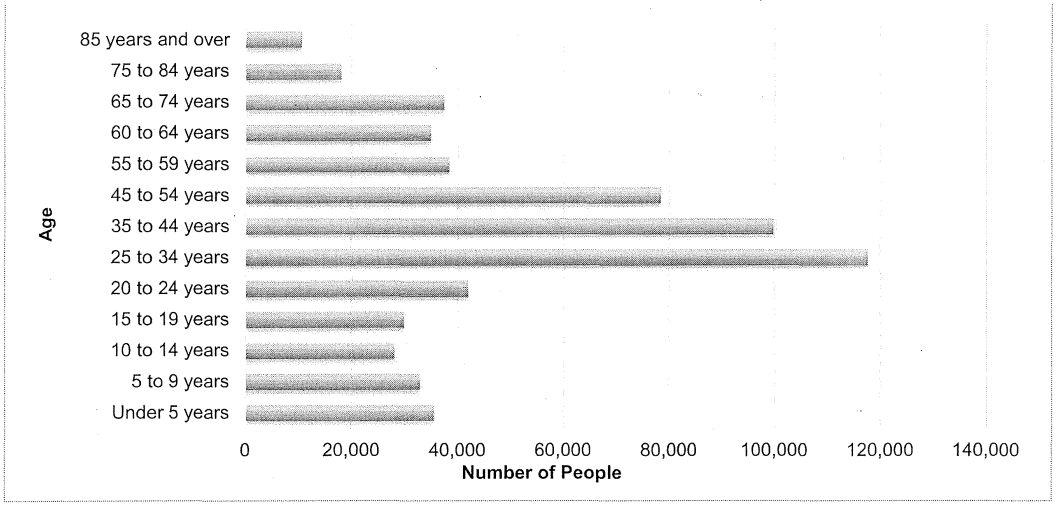

Figure 4-6. Portland Age Distribution

4.6.3 Race and Ethnicity

According to the U.S. Census, the racial composition of Portland is predominantly white, at about 77.3 percent. The largest minority populations are Asian at 7.5 percent and African American at 6.1 percent. Figure 4-7 shows the racial distribution in Portland.

Portland has a 14-percent foreign-born population. Other than English, the most commonly spoken language is Spanish. Portland has identified nine other "safe harbor" languages, defined as those that are spoken as a primary language by at least 1,000 people in Portland with limited English proficiency. They are Vietnamese, Chinese, Russian, Romanian, Ukrainian, Japanese, Somali, and Arabic, and Laotian (Lao communities are just under the 1,000-person threshold) (OEHR, n.d.a). The census estimates 8.9 percent of residents speak English "less than very well."

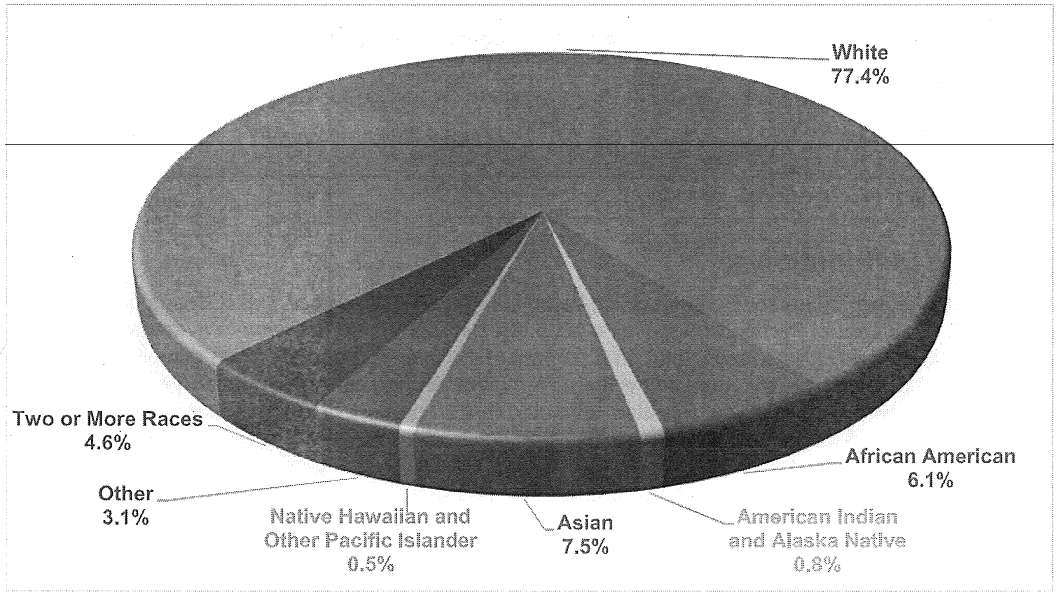

Figure 4-7. Portland Race Distribution

4.7 SOCIAL VULNERABILITY AND HAZARD MITIGATION

Hazard research has firmly established the importance of tailoring local hazard mitigation and emergency response policies to the needs of the community they serve. Vulnerability to natural hazard events arises out of the social and economic circumstances of everyday life (Morrow, 1999). Recent disasters such as Hurricane Katrina and Superstorm Sandy illustrated differences in impacts among different sections of the population, such as the poor, the elderly, immigrants, racial minorities, single-parent-headed households, and recent residents. These population groups are more vulnerable due to lack of material, economic, and political resources.

Identification and recognition of the spatial distribution of these groups is critical for formulating an effective hazard mitigation policy to build long-term community resilience. A social vulnerability lens is a valuable tool because it highlights where vulnerable groups are located within the community. This knowledge results in better hazard mitigation policies and improves the likelihood of achieving desired outcomes because many hazards of concern occur in defined locations.

4.7.1 Understanding Social Vulnerability

A number of broad contextual factors influence a person or household's vulnerability to a given hazard:

- Lack of material and financial resources to prepare for and recover from a hazard event
- Lack of access to information and knowledge required to respond to a hazard event
- Beliefs and norms
- Weak residential structures
- Poor access to infrastructure and lifelines.

Social vulnerability assessment is an innovative and useful way to identify spatial distribution of groups that are likely to suffer disproportionately in case of a hazard event, so that mitigation and capacity-building policies can be directed to these neighborhoods in order to minimize negative impacts of hazard events. Social vulnerability is defined as follows for hazard mitigation (Blaikie et al., 1994):

> "The characteristics of a person or group in terms of their capacity to anticipate, cope with, resist and recover from the impacts of a natural hazard. It involves a combination of factors that determine the degree to which someone's life and livelihood are put at risk."

Vulnerable groups are characterized by demographic and socio-economic conditions such as race, income or employment status (Blaikie et al., 1994; Hewitt, 1997; Tobin and Montz, 1997). Social vulnerability is an outcome of complex interactions between social factors that influence inequality, as well as elements of the built environment that contribute to vulnerability (houses, roads, utilities, etc.). Researchers have studied various dimensions of social vulnerability:

- Race/ethnicity:
  - Bolin 1986; Bolin and Bolton 1986
  - Perry and Mushkatel 1986
  - Peacock et al 1997
  - Bolin and Stanford 1998
  - Fothergill, Maestas, and Darlington 1999
  - Lindell and Perry 2004
- Economic status factors such as class, income, and poverty:
  - Peacock et al 1997
  - Dash et al 1997
  - Fothergill and Peek 2004
- The degree of urbanization and the quality of housing:
  - Cutter, Boruff and Shirley 2003
- Gender:
  - Enarson and Morrow 1997
  - Enarson and Morrow 1998
  - Fothergill 1999
- A host of other factors such as age, education, religion, etc.

Based on these studies, the following have been identified as key dimensions of social vulnerability:

- Income
- Gender
- Race, ethnicity
- Age
- Unemployment, dependence on social services
- Renting as opposed to owning a home
- Infrastructure lifelines
- Occupation/working conditions
- Family structures
- Educational attainment level
- Disabilities or access and functional needs.

While these factors have been identified with social vulnerability in general, demographic characteristics do not cause every person within a group to be more vulnerable to natural hazard events. Individuals with the identified demographic characteristics may have the resources needed to prepare for or respond to an emergency situation. The ability to avoid, withstand, cope with, respond to and recover from a disaster is an outcome of a host of internal and external characteristics, often shaped by circumstances beyond an individual's control. No group should be viewed as a victim group or a rescue group.

4.7.2 Demographic Indicators for Social Vulnerability Risk Assessment

Indicators are measures of abstract concepts, such as social vulnerability, that allow comparisons to be made across levels of assessment. To assess social vulnerability, it is common to use indicators from data that is collected during the decadal census and/or the U.S. Census Bureau's American Community Survey. For the social vulnerability component of the risk assessment for the MAP, the following indicators were selected:

- **Population Under 15 Years of Age**—Children, especially in the youngest age groups, often cannot protect themselves during a disaster because they lack the necessary resources, knowledge, or life experiences to effectively cope with the situation. Hazard mitigation planning needs to be tailored to ensure that the community is prepared to ensure that children are safe during disaster events, and that families with children have access to necessary information and tools.
- **Population Over 65 years of Age**—Persons aged 65 years and older are likely to require financial support, transportation, medical care, or assistance with ordinary daily activities, especially during disasters. Hazard mitigation activities need to account for such needs.
- **Renter Occupied Housing Units**—People who rent often do so because they do not have the financial resources for home ownership. They often lack access to information about financial aid during recovery. In the most extreme cases, renters lack sufficient shelter options when lodging becomes uninhabitable and limited supply causes housing costs to rise dramatically after a disaster. Renters commonly have limited opportunities for implementing mitigation measures at their home, and may not have insurance to cover their personal property. Additionally, renters may not be aware of hazard risks at the property. Hazard mitigation planning needs to explore ways to ensure that renters are aware of risks and opportunities available to them to mitigate known risks.
- **People of color**—Social and economic marginalization of certain racial and ethnic groups, including real estate discrimination, has resulted in greater vulnerability of these groups to all types of hazards. Based on data from a number of studies, African Americans, Native Americans, and populations of Asian, Pacific Islander, or Hispanic origin are likely to be more vulnerable than the broader community. These groups often have limited knowledge of local risks and modes of risk communication, have limited capacity to respond, and are likely to face major hurdles in navigating procedures to receive aid and assistance in a disaster event. Hazard mitigation plans need to identify the spatial distribution of these population groups and direct resources to reduce their vulnerability to hazards.
- **Families below the Poverty Level**—Economically disadvantaged families have limited ability to absorb losses due to hazard impacts. Wealth enables families to absorb and recover from losses more quickly, due to insurance and often the availability of low-cost credit. People with lower incomes tend not to have access to these resources. At the same time, poorer families are likely to inhabit poor quality housing and reside in locations that are most vulnerable to hazard events. Economically disadvantaged neighborhoods are also likely to have relatively

poor infrastructure and facilities, which exacerbate the disaster consequences for residents there.

- **Limited English Speaking Households**—Many households, specifically immigrants, are not fluent in English. For populations with limited English proficiency, disaster communication is difficult. This difficulty is especially true in communities whose first language is neither English nor Spanish and for whom translators and accurate translations of advisories may be scarce. Such households are likely to rely on relatives and local social networks (i.e., friends and neighbors) for information for preparing for a disaster event.
- **Persons with Disabilities**—Persons with disabilities or others with access and functional needs are more likely to have difficulty responding to a hazard event than the general population. Family, neighbors, and local government are the first level of response to assist these individuals, and coordination of efforts to meet their access and functional needs is paramount to life safety efforts. It is important for emergency managers to distinguish between functional and medical needs in order to plan for incidents that require evacuation and sheltering. Knowing the percentage of population with a disability allows emergency management personnel and first responders to understand and anticipate the services needed by those with access and functional needs.

These factors were selected based on factors likely to influence vulnerability, the equity priorities established by the City, and the availability of datasets at a small enough resolution to determine probable characteristics of populations within identified hazard areas. Table 4-12 summarizes the distribution of these social vulnerability indicators by risk-reporting area.

Table 4-12. Distribution of Social Vulnerability Indicators in Reporting Areas

Reporting Area	Percent of Total Population Included in the Indicator Group[a, b]							
	Population Under 15	Population Over 65	Renter Occupied Housing Units	People of Color	Families Below Poverty Level	Limited English Speaking Households	Persons with Disabilities[c]	
							Total Population	Population Under 65[d]
Airport	5.4%	5.1%	68.8%	31.8%	19.8%	20.6%	12.1%	9%
Central City	2.2%	10.1%	83.7%	20.9%	10.6%	3.9%	12.1%	9%
Central Northeast	18.1%	10.3%	35.1%	23.6%	11.7%	4.3%	12.1%	9%
East Portland	21.0%	12.7%	44.5%	30.4%	18.0%	10.2%	12.1%	9%
North Portland	17.1%	8.5%	39.4%	27.8%	14.9%	3.2%	12.1%	9%
Northeast	15.3%	9.1%	45.0%	24.2%	8.5%	0.9%	12.1%	9%
Southeast	14.0%	10.3%	47.4%	16.8%	9.9%	3.2%	12.1%	9%
Southwest	14.7%	14.0%	38.5%	12.6%	4.8%	1.3%	12.1%	9%
West/Northwest	11.4%	12.6%	53.0%	17.1%	4.6%	2.0%	12.1%	9%
Citywide	**16.2%**	**11.2%**	**45.8%**	**22.4%**	**11.7%**	**4.3%**	12.1%	9%

a. These estimates were made using the best available data (American Community Survey estimates), which does not correspond with hazard risk areas. It is expected that there is a degree of over- or under-estimation in these estimates, but they are adequate for planning purposes.
b. Red text fields indicate reporting area values at least 2 percent higher than the citywide average for that indicator.
c. The smallest level of unit for persons with disabilities is the census tract scale, which is not conducive to analysis by hazard extent and location; therefore, it is assumed that the population is evenly distributed in all reporting areas.
d. Percentage of persons with disabilities in the under-65 population is shown to distinguish this indicator from the over-65 indicator; much of the vulnerability of the over-65 population is associated with disabilities.

4.8 ECONOMY

4.8.1 Income

Other than in extreme circumstances, individual households in the United States prepare for, respond to and recover from disasters on their own. This means that households living in poverty are automatically disadvantaged when confronting hazards. Additionally, the poor typically occupy more poorly built and inadequately maintained housing. Mobile or modular homes, for example, are more susceptible to damage in earthquakes and floods than other types of housing. In urban areas, the poor often live in older houses and apartment complexes, which are more likely to be made of un-reinforced masonry, a building type that is particularly susceptible to damage during earthquakes. Furthermore, residents below the federal poverty level are less likely to have insurance to compensate for losses incurred from natural disasters. This means that residents below the poverty level have a great deal to lose during an event and are the least prepared to deal with potential losses. Personal household economics significantly impact people's decisions on evacuation. Individuals who cannot afford gas for their cars often decide not to evacuate. Table 4-13 summarizes recent income data from the U.S. Census Bureau for Portland and for the State of Oregon.

Table 4-13. 2014 Income Data for Portland and Oregon

	Portland	Oregon
2014 Per Capita Income	$32,438	$27,173
2014 Median Household Income	$52,230	$50,521
% of Households with Income of $100,000 or More	23%	20%
% of Households with Income Below $50,000	48%	49%
% of Residents with 2013-2014 Income Below the Poverty Level	18%	17%
% of Families with 2013-2014 Income Below the Poverty Level	12%	12%

4.8.2 Industry, Businesses and Institutions

Portland's economy has slowly diversified over the past decades. Steady growth in nontraditional sectors, such as the manufacture of electrical equipment, instruments and related products, has helped Portland's economy adapt to national and global trends.

The Port of Portland, which is responsible for air and marine port facilities, offers opportunities for expanding export industries, investments, business and travel:

- Portland's location on the Columbia River gives it advantages for freight shipping. The Columbia River navigation channel begins at the Columbia River bar and continues 5 miles upriver at a depth of 55 feet and a width of 2,640 feet. From there, it maintains a depth of 43 feet and a width of 600 feet for 100 miles to the Portland Harbor (Port of Portland, 2016a)
- The Port also manages Portland International Airport, which is served by 19 passenger carriers and eight air-cargo carriers. In 2015, the airport provided 185,000 commercial flights and served nearly 17 million passengers (Port of Portland, 2016b).

The city's economy is strongly based in the educational services, health care, and social assistance industry (25.3 percent), followed by the professional-scientific-management industry (13.7 percent) and arts-entertainment-recreation (11.7 percent) Figure 4-8 shows the breakdown of industry types in Portland.

Source: U.S. Census, 2016a

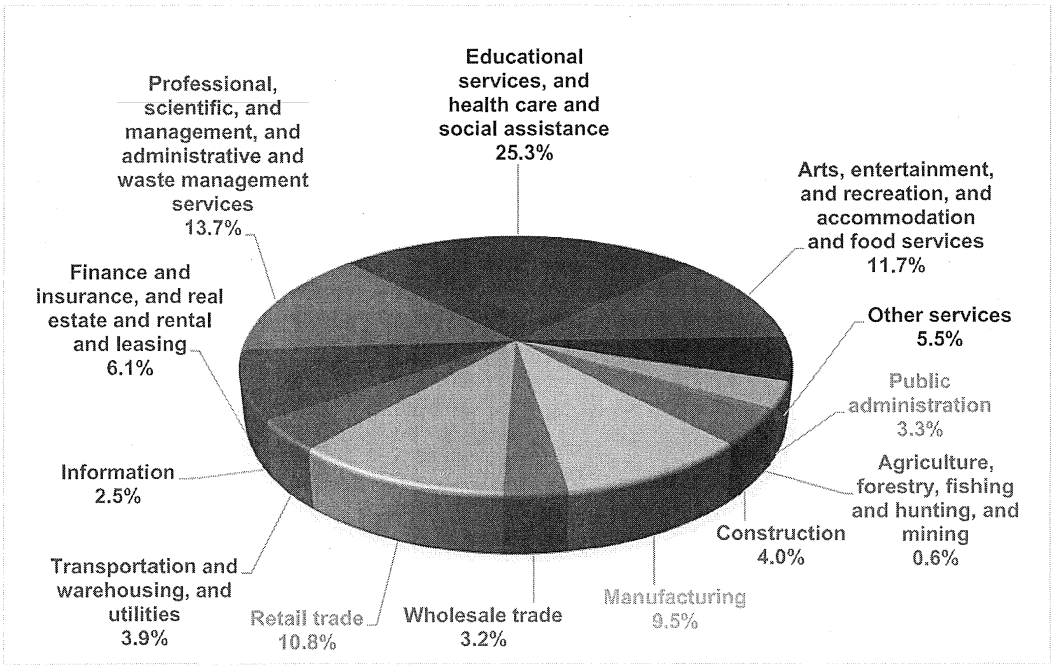

Figure 4-8. Industry in Portland

Semiconductor manufacturers, such as Intel and Siltronic, have established major facilities in the region. Other major private sector employers in the Portland metropolitan area include Tektronix, Nike, health systems Providence, Kaiser Permanente and Legacy, and retailers Safeway, Albertsons and Fred Meyer. Major public employers include Oregon Health and Science University (OHSU) and Portland State University (NHMP, 2010).

4.8.3 Employment Trends and Occupations

According to the American Community Survey, 69.4 percent of Portland's 16-and-older population is in the labor force—65.6 percent of women and 73.4 percent of men (U.S. Census, 2016a). Unemployment in the Portland-Vancouver-Hillsboro metropolitan area as estimated to be 4.4 percent in April 2016, a 0.8-percent decrease from one year earlier. That decrease ranked the area eighth nationally for year-over-year improvement in unemployment. Figure 4-9 compares Oregon's and the Multnomah County's unemployment trends from 2004 through 2014. The county's unemployment rate has generally been slightly below that of the state, though both have followed similar trends through the 2007–2009 recession and subsequent recovery (U.S. BLS, 2016).

Of the five occupation categories defined by the U.S. Census, the highest employment in Portland is in the management, business, science and arts occupation, and the lowest is in the natural resources, construction and maintenance occupation. As shown on Figure 4-10, employment since 2000 has been increasing in the management, business, science, and arts occupation and the service occupation, and decreasing in other occupation classes.

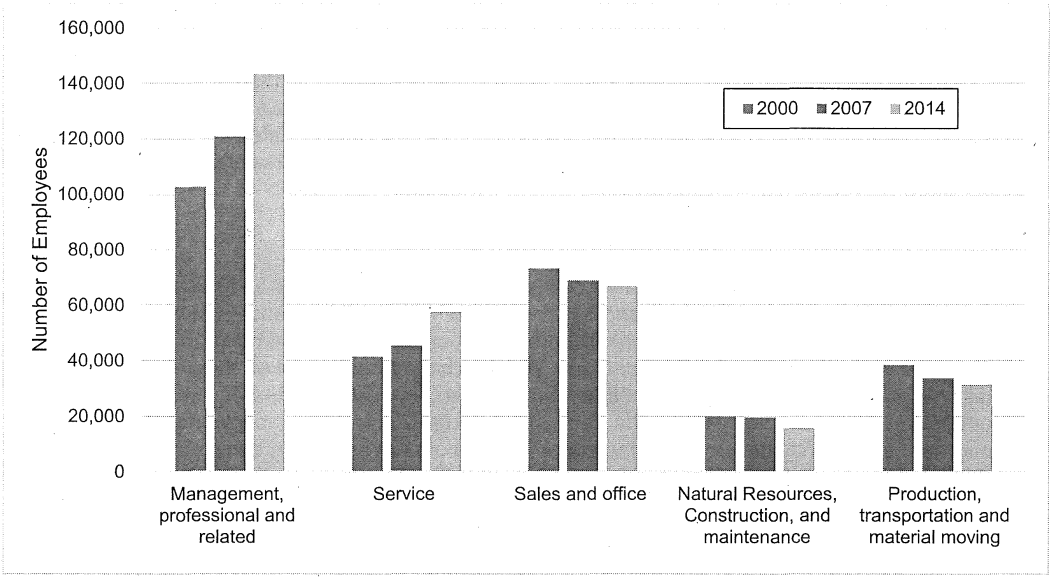

Figure 4-10. Occupations in Portland

The *City of Portland Economic Opportunities Analysis* summarizes key recent trends in city employment, including the following (E.D. Hovee & Company, LLC, 2016):

- In 2013, there were 393,742 jobs in Portland, 38 percent of all jobs in the seven-county metropolitan area.
- From 1980 to 2008, Multnomah County added 114,800 new jobs, a 1.1-percent average annual growth rate and 25 percent of the total metropolitan area job growth.
- From 2000 to 2008, Portland employment increased by 3,120 jobs—an annual average job growth of only 0.1 percent, and 5 percent of the total metropolitan area job growth.
- From 2008 to 2013, Portland had average annual job growth of 1.3 percent—23 percent of the total metropolitan area job growth.
- From 2000 to 2008, manufacturing jobs in the city declined by 3.3 percent per year. Retail jobs also declined. Employment in education and health care sectors increased at an average of 2.3 percent per year.
- Portland's geographic distribution of employment as of 2008 was as follows:
    - 27 percent in the Central City commercial areas
    - 5 percent in regional and town centers (or urban centers)
    - 18 percent in neighborhood commercial areas
    - 30 percent in industrial districts
    - 10 percent each in institutional and residential areas

The U.S. Census estimates that 58 percent of workers in Portland commute alone (by car, truck or van) to work, and mean travel time to work is 24.7 minutes (U.S. Census Bureau, 2016a).

4.9 LAWS, ORDINANCES AND PROGRAMS

Existing laws, ordinances, plans and programs at the federal, state, and local level can support or impact hazard mitigation actions identified in this plan. Hazard mitigation plans are required to include a review and incorporation, if appropriate, of existing plans, studies, reports, and technical information as part of the planning process (44 CFR, Section 201.6(b)(3)). Pertinent studies and reports are cited throughout *The Mitigation Action Plan*; federal, state, and local laws and programs are described below.

4.9.1 Federal

Disaster Mitigation Act

The DMA is the current federal legislation addressing hazard mitigation planning. It emphasizes planning for disasters before they occur, requiring plans to be in place before Hazard Mitigation Grant Program funds are available to communities. It specifically addresses planning at the local level. The MAP is designed to meet the requirements of DMA, improving eligibility for future hazard mitigation funds.

Americans with Disabilities Act

The Americans with Disabilities Act (ADA) seeks to prevent discrimination against people with disabilities in employment, transportation, public accommodation, communications, and government activities. Title II of the ADA deals with compliance with the Act in emergency management and disaster-related programs, services, and activities. It applies to state and local governments as well as third parties, including religious entities and private nonprofit organizations.

The ADA has implications for sheltering requirements and public notifications. During an emergency alert, officials must use a combination of warning methods to ensure that all residents have all necessary information. Those with hearing impairments may not hear radio, television, sirens, or other audible alerts, while those with visual impairments may not see flashing lights or other visual alerts. Two technical documents for shelter operators address physical accessibility needs of people with disabilities, as well as medical needs and service animals.

The ADA intersects with disaster preparedness programs in regards to transportation, social services, temporary housing, and rebuilding. Persons with disabilities may require additional assistance in evacuation and transit (e.g., vehicles with wheelchair lifts or paratransit buses). Evacuation and other response plans should address the unique needs of residents. Local governments may be interested in implementing a special-needs registry to identify the home addresses, contact information, and needs for residents who may require more assistance.

Clean Water Act

The federal Clean Water Act (CWA) employs regulatory and non-regulatory tools to reduce direct pollutant discharges into waterways, finance municipal wastewater treatment facilities, and manage polluted runoff. These tools are employed to achieve the broader goal of restoring and maintaining the chemical, physical, and biological integrity of the nation's surface waters for the protection and propagation of fish, shellfish, wildlife and recreation in and on the water.

Evolution of CWA programs over the last decade has included a shift to holistic, watershed-based strategies. Under this approach, equal emphasis is placed on protecting healthy waters and restoring impaired ones. A full array of issues are addressed, not just those subject to CWA regulatory authority. Involvement of stakeholder groups in the development and implementation of strategies for achieving and maintaining water quality and other environmental goals is a hallmark of this approach.

The CWA is important to hazard mitigation in several ways. There are often permitting requirements for any construction within 200 feet of water of the United States, which may have implications for mitigation projects identified by a local jurisdiction. Additionally, CWA requirements apply to wetlands, which serve important functions related to preserving and protecting the natural and beneficial functions of floodplains and are linked with a community's floodplain management program. Finally, the National Pollutant Discharge Elimination System is part of the CWA and addresses local stormwater management programs. Stormwater management plays a critical role in hazard mitigation by addressing urban drainage or localized flooding issues within jurisdictions. In the State of Oregon, the Department of Environmental Quality (DEQ) develops and administers National Pollutant Discharge Elimination System municipal stormwater permits. The Portland Group permit was reissued on January 31, 2011. Both the Port of Portland and City of Portland have Stormwater Management Plans under this permit.

Community Development Block Grant Disaster Resilience Program

In response to disasters, Congress may appropriate additional funding for the U.S. Department of Housing and Urban Development Community Development Block Grant programs to be distributed as Disaster Recovery grants (CDBG-DR). These grants can be used to rebuild affected areas and provide seed money to start the recovery process. CDBG-DR assistance may fund a broad range of recovery activities, helping communities and neighborhoods that otherwise might not recover due to limited resources. CDBG-DR grants often supplement disaster programs of the Federal Emergency Management Agency, the Small Business Administration, and the U.S. Army Corps of Engineers. Housing and Urban Development generally awards noncompetitive, nonrecurring CDBG-DR grants by

a formula that considers disaster recovery needs unmet by other federal disaster assistance programs. To be eligible for CDBG-DR funds, projects must meet the following criteria:

- Address a disaster-related impact (direct or indirect) in a presidentially declared county for the covered disaster
- Be a CDBG-eligible activity (according to regulations and waivers)
- Meet a national objective.

Incorporating preparedness and mitigation into these actions is encouraged, as the goal is to rebuild in ways that are safer and stronger.

Emergency Watershed Program

The USDA Natural Resources Conservation Service (NRCS) administers the Emergency Watershed Protection (EWP) Program, which responds to emergencies created by natural disasters. Eligibility for assistance is not dependent on a national emergency declaration. The program is designed to help people and conserve natural resources by relieving imminent hazards to life and property caused by floods, fires, windstorms, and other natural occurrences. EWP is an emergency recovery program. Financial and technical assistance are available for the following activities (National Resources Conservation Service, 2016):

- Remove debris from stream channels, road culverts, and bridges
- Reshape and protect eroded banks
- Correct damaged drainage facilities
- Establish cover on critically eroding lands
- Repair levees and structures
- Repair conservation practices.

Endangered Species Act

The federal Endangered Species Act (ESA) was enacted in 1973 to conserve species facing depletion or extinction and the ecosystems that support them. The act sets forth a process for determining which species are threatened and endangered and requires the conservation of the critical habitat in which those species live. The ESA provides broad protection for species of fish, wildlife and plants that are listed as threatened or endangered. Provisions are made for listing species, as well as for recovery plans and the designation of critical habitat for listed species. The ESA outlines procedures for federal agencies to follow when taking actions that may jeopardize listed species and contains exceptions and exemptions. It is the enabling legislation in the United States for the Convention on International Trade in Endangered Species of Wild Fauna and Flora. Criminal and civil penalties are provided for violations of the ESA and the Convention.

Federal agencies must seek to conserve endangered and threatened species and use their authorities in furtherance of the ESA's purposes. The ESA defines three fundamental terms:

- **Endangered** means that a species of fish, animal or plant is "in danger of extinction throughout all or a significant portion of its range." (For salmon and other vertebrate species, this may include subspecies and distinct population segments.)
- **Threatened** means that a species "is likely to become endangered within the foreseeable future." Regulations may be less restrictive for threatened species than for endangered species.
- **Critical habitat** means "specific geographical areas that are…essential for the conservation and management of a listed species, whether occupied by the species or not."

Five sections of the ESA are of critical importance to understanding it:

- **Section 4: Listing of a Species**—The National Oceanic and Atmospheric Administration Fisheries Service (NOAA Fisheries) is responsible for listing marine species; the U.S. Fish and Wildlife Service is responsible for listing terrestrial and freshwater aquatic species. The agencies may initiate reviews for listings, or citizens may petition for them. A listing must be made "solely on the basis of the best scientific and commercial data available." After a listing has been proposed, agencies receive comment and conduct further scientific reviews for 12 to 18 months, after which they must decide if the listing is warranted. Economic impacts cannot be considered in this decision, but it may include an evaluation of the adequacy of local and state protections. Critical habitat for the species may be designated at the time of listing.
- **Section 7: Consultation**—Federal agencies must ensure that any action they authorize, fund, or carry out is not likely to jeopardize the continued existence of a listed or proposed species or adversely modify its critical habitat. This includes private and public actions that require a federal permit. Once a final listing is made, non-federal actions are subject to the same review, termed a "consultation." If the listing agency finds that an action will "take" a species, it must propose mitigations or "reasonable and prudent" alternatives to the action; if the proponent rejects these, the action cannot proceed.
- **Section 9: Prohibition of Take—**It is unlawful to "take" an endangered species, including killing or injuring it or modifying its habitat in a way that interferes with essential behavioral patterns, including breeding, feeding or sheltering.
- **Section 10: Permitted Take**—Through voluntary agreements with the federal government that provide protections to an endangered species, a non-federal applicant may commit a take that would otherwise be prohibited as long as it is incidental to an otherwise lawful activity (such as developing land or building a road). These agreements often take the form of a "Habitat Conservation Plan."
- **Section 11: Citizen Lawsuits**—Civil actions initiated by any citizen can require the listing agency to enforce the ESA's prohibition of taking or to meet the requirements of the consultation process.

Federally funded projects, such as those for pre-disaster mitigation or flood mitigation, cannot jeopardize the continued existence of endangered or threatened species or adversely modify critical habitat (FEMA, 2015b). With the listing of salmon and trout species as threatened or endangered, the ESA has impacted most of the Pacific coast states. Some areas have been more impacted by the ESA than others due to the known presence of listed species, but the entire region is impacted by mandates, programs and policies based on the presumption of the presence of listed species. Most West Coast jurisdictions must now take into account the impact of their programs on habitat. The impacts may increase in the near future, resulting from recent court decisions and federal administrative actions involving the nexus between the ESA and the National Flood Insurance Program (NFIP) in the Puget Sound region of Washington (MSRC, 2016).

The Oregon Fish and Wildlife Commission (through the Oregon Department of Fish and Wildlife) maintains the threatened and endangered species list in the state of Oregon. The ESA program in the City of Portland is part of the Science, Fish and Wildlife Division of the Bureau of Environmental Services.

National Flood Insurance Program

The National Flood Insurance Program provides federally backed flood insurance in exchange for communities enacting floodplain regulations. Participation in the NFIP is voluntary; however, participation and good standing under NFIP are prerequisites to grant funding eligibility under the

Robert T. Stafford Act. The City of Portland participates in the NFIP and has adopted regulations that exceed the NFIP requirements. At the time of the preparation of this plan, the City of Portland was in good standing with NFIP requirements.

National Incident Management System

The National Incident Management System (NIMS) is a systematic approach for government, nongovernmental organizations, and the private sector to work together to manage incidents involving hazards. The NIMS provides a flexible but standardized set of incident management practices. Although participation is voluntary, federal departments and agencies are required to make adoption of NIMS by local and state jurisdictions a condition to receive federal preparedness grants and awards.

Presidential Executive Orders 11988 and 13690

Executive Order 11988 requires federal agencies to avoid to the extent possible the long and short-term adverse impacts associated with the occupancy and modification of floodplains and to avoid direct and indirect support of floodplain development wherever there is a practicable alternative. It requires federal agencies to provide leadership and take action to reduce the risk of flood loss, minimize the impact of floods on human safety, health, and welfare, and restore and preserve the natural and beneficial values of floodplains. The requirements apply to the following activities (FEMA, 2015a):

- Acquiring, managing, and disposing of federal lands and facilities
- Providing federally undertaken, financed, or assisted construction and improvements
- Conducting federal activities and programs affecting land use, including but not limited to water and related land resources planning, regulation, and licensing.

Executive Order 13690 expands Executive Order 11988 and acknowledges that the impacts of flooding are anticipated to increase over time due to the effects of climate change and other threats. It mandates a federal flood risk management standard to increase resilience against flooding and help preserve the natural values of floodplains. This standard expands management of flood issues from the current base flood level to a higher vertical elevation and corresponding horizontal floodplain. The goal is to address current and future flood risk and ensure that projects funded with taxpayer dollars last as long as intended (Office of the Press Secretary, 2015).

Presidential Executive Order 11990

Executive Order 11990 requires federal agencies to provide leadership and take action to minimize the destruction, loss or degradation of wetlands, and to preserve and enhance the natural and beneficial values of wetlands. The requirements apply to the following activities (National Archives, 2016):

- Acquiring, managing, and disposing of federal lands and facilities
- Providing federally undertaken, financed, or assisted construction and improvements
- Conducting federal activities and programs affecting land use, including but not limited to water and related land resources planning, regulation, and licensing.

Title VI of the Civil Rights Act of 1964

The Civil Rights Act of 1964 prohibits discrimination based on race, color, religion, sex or national origin and requires equal access to public places and employment. The act is relevant to emergency management and hazard mitigation in that it prohibits local governments from favoring the needs of one population group over another. Local government and emergency response must ensure the continued safety and well-being of all residents equally, to the extent possible.

4.9.2 State

The 2015 *Oregon Natural Hazards Mitigation Plan* has an exhaustive review of policies related to natural hazards in Oregon. Table 4-14 shows the identified polices relevant for the City of Portland. Detailed descriptions are provided in Section 3.4.1.2 of the state's NHMP (Oregon Department of Land Conservation and Development, 2015). Additional state programs and capabilities that are available as a resource to the City of Portland are described in Section 4.9.3.

Table 4-14. Policies Related to Specific Natural Hazards in Oregon

Hazard	Oregon Statewide Planning Goals[a] and Policies	Publications/Studies
Multi-Hazard	• Local Comprehensive Plans • Goal 2: Land use Planning • Goal 7: Natural Hazards • Oregon Building Codes	• Energy Assurance Plan • Natural Hazards Mitigation in Oregon: An Evaluation of Natural Hazards Mitigation Planning and Implementation in Oregon • Oregon Climate Adaptation Framework • Oregon Climate Assessment Report • Oregon Highway Plan • Oregon Resilience Plan • Oregon Transportation Plan • Planning for Natural hazards: Oregon Technical Resource Guide, 2000 • State Emergency Management Plan

4.9.3 Local

The planning team performed an inventory and analysis of existing authorities and capabilities called a "capability assessment." A capability assessment creates an inventory of an agency's mission, programs and policies, and evaluates its capacity to carry them out. Goals, objectives, policies and actions identified in programs and plans identified were reviewed during the development of the MAP and used to inform the development of the mitigation strategy and assess opportunities for plan

integration. Actions that expand or fill gaps identified in existing capabilities were considered during the development of the mitigation strategy. An assessment of legal and regulatory capabilities is presented in Table 4-15.

Table 4-15. Legal and Regulatory Capability

	Local Authority	Other Jurisdiction Authority	State Mandated
Building Code (Bureau of Development Services (BDS))	Yes	No	Yes
Comment: *Portland City Code, Title 24: Building Regulations; last amended December 4, 2015*

An assessment of fiscal capabilities is presented in Table 4-16. An assessment of administrative and technical capabilities is presented in Table 4-17. An assessment of education and outreach capabilities is presented in Table 4-18. Classifications under various community mitigation programs are presented in Table 4-19. The Steering Committee also identified the following additional local resources and capabilities:

- The MAP steering committee
- Potential legal authority identified through Unreinforced Masonry (URM) Workgroup to mandate seismic retrofits and other hazard mitigation related actions
- Strong personal and family preparedness for City employees
- Large membership of backyard habitat certified homes with strong natural science understanding; many of them are in landslide areas
- Strong communication system—Multnomah County Amateur Radio Emergency Service (ARES)
- Strong emergency preparedness education program for people with disabilities
- Robust education program for home retrofitting
- Strong network of community and marginalized groups.

Table 4-16. Fiscal Capability

Financial Resources	Accessible or Eligible to Use?
General Funds	Yes
Community Development Block Grants	Yes –Entitlement City
Capital Improvements Project Funding	Yes
Authority to Levy Taxes for Specific Purposes	Yes, with voter approval
User Fees for Water, Sewer, Gas or Electric Service	Yes—water, sewer, stormwater
Incur Debt through General Obligation Bonds	Yes, with voter approval
Incur Debt with Revenue Bonds	Yes, with voter approval
Incur Debt through Special Tax Bonds	Yes, with voter approval
Incur Debt through Private Activity Bonds	Yes, with voter approval or Board of County Commissioners Approval
Withhold Public Expenditures in Hazard-Prone Areas	No
State-Sponsored Grant Programs	Yes
Development Impact Fees for Homebuyers or Developers	Yes—System Development Charges
Other	• Possibly—National Fire Plan; Riparian Lands Tax Incentive; Fisheries Restoration and Enhancement Program

Table 4-17. Administrative and Technical Capability

Staff/Personnel Resources	Available?	Department/Agency/Position
Planners or engineers with knowledge of land development and land management practices	Yes	Bureau of Planning and Sustainability (BPS) - Planner
Engineers or professionals trained in building or infrastructure construction practices	Yes	BPS—Planner; Portland Bureau of Transportation (PBOT)—City Engineer, PWB – Chief Engineer, BES – Chief Engineer
Planners or engineers with an understanding of natural hazards	Yes	PBEM – Planner, PWB, PBOT & BES
Staff with training in benefit/cost analysis	Yes	Business Services/Watershed Services/Engineering Services, PWB – Engineering Planning
Surveyors (Not certified)	Yes	Watershed Services/Engineering Services, PWB – Engineering
Staff capable of making substantial damage estimates	Yes	BDS—ACT-20 Certified Engineers/Architects, PWB – Engineering
Personnel skilled or trained in GIS applications	Yes	CGIS; BPS; other bureaus with GIS experts
Scientist familiar with natural hazards in local area	Yes	DOGAMI; USGS; PSU Geology Department; NWS
Emergency manager	Yes	PBEM – Director, PWB Emergency Manager
Grant writers	Yes	PWB-Engineering; BES—Program Manager; PBEM—Planner; BPS - Planner

a. Many of these are state programs and resources that are described in detail in the *2015 Oregon Natural Hazards Mitigation Plan*. Others are regional agencies and resources connected to hazard mitigation planning.

Table 4-18. Education and Outreach

Criterion	Response
Do you have a Public Information Officer or Communications Office?	Yes – PBEM Public Information Officer and Senior Community Outreach & Information Representative
Do you have personnel skilled or trained in website development?	Yes- Bureau of Technology Services (BTS), Business Solutions/ eGovernment
Do you have hazard mitigation information available on your website?	Yes
If yes, please briefly describe:	Resources and links to hazard information Mitigation Action Plan website and related information
Do you utilize social media for hazard mitigation education and outreach?	Yes
If yes, please briefly describe:	PBEM uses Twitter, Facebook, and NextDoor to communicate with the public about hazard mitigation topics.
Do you have any citizen boards or commissions that address issues related to hazard mitigation?	Yes
If yes, please briefly specify:	Unreinforced Masonry Seismic Retrofit Project Mitigation Action Plan Working Group (forthcoming)
Do you have any other programs already in place that could be used to communicate hazard-related information?	Yes
If yes, please briefly describe:	Neighborhood Emergency Teams (NETs) Community Engagement Liaisons (CELs) Mutual Assistance Associations See also key stakeholders and networks in Appendix C
Do you have any established warning systems for hazard events?	Yes
If yes, please briefly describe:	Portland and Multnomah County PublicAlerts system

Table 4-19. Community Classifications

	Participating?	Classification	Date Classified
Community Rating System	Yes	6	May 1, 2016
Building Code Effectiveness Grading Schedule	Yes	2.2	December 2014
Public Protection	Yes	2	Last rating November 2015
Storm Ready	No	N/A	N/A
Firewise	No	N/A	N/A

PART 2—RISK ASSESSMENT

5. HAZARDS AND COMPOUNDING FACTORS

5.1 IDENTIFIED HAZARDS OF CONCERN

Hazard mitigation planning uses all available information to determine what types of disasters may affect a jurisdiction, how often they can occur, and their potential severity. For this plan, the Steering Committee considered the full range of natural hazards that could impact Portland and then identified hazards that present the greatest concern. The process incorporated review of state and local hazard planning documents, as well as information on the frequency, magnitude, and costs associated with hazards that have impacted or could impact Portland. Anecdotal information regarding natural hazards and the perceived vulnerability of Portland's assets to them was also used. Based on the review, this plan addresses the following hazards of concern:

- Severe weather
- Earthquake
- Landslide
- Wildfire
- Flood
- Volcanic activity
- Dam failure
- Drought

All hazards identified as impacting the region in which Portland is located (Region 2) in the Oregon Natural Hazards Mitigation Plan were included in the assessment. The steering committee elected to discuss windstorms and winter storms under the broader category of severe weather.

In addition the Steering Committee determined that information on space weather should be provided in the plan, although there was not enough information currently available for a full risk assessment. As a result, space weather is addressed as an emerging hazard of concern in this plan.

It is important to note that with the exception of dam failure, technological hazards (e.g., hazardous material incidents) and human-caused hazards (e.g., terrorist acts) are not addressed in this plan. Dam failure was selected for inclusion to enhance the Community Rating System (CRS) aspects of this plan, and because the dam failure hazard shares many similarities in modeling and risk assessment with other natural hazards of concern that other human or technological hazards do not.

In addition to the eight hazards of concern and one emerging hazard of concern, the Steering Committee considered including three additional hazards: air quality, erosion, and invasive species. Two of these hazards, erosion and invasive species, were assessed as hazards of concern in the 2010 natural hazard mitigation plan. After discussion and deliberation, the committee elected to discuss these hazards, along with climate change, as secondary hazards of concern or compounding factors. These hazards are discussed below and in the risk assessment profiles of each hazard of concern, as appropriate.

5.2 COMPOUNDING FACTORS AND SECONDARY HAZARDS

This section of the MAP looks at conditions that contribute to or result from hazard events:

- Compounding factors are characteristics of an area that can contribute to the likelihood or severity of a hazard event's occurrence.
- Secondary hazards are impacts that result from a hazard event in a more indirect way than the immediate hazard effects.

Some local conditions can both contribute to and result from a hazard. Table 5-1 shows how identified compounding factors and secondary hazards relate to the hazards of concern evaluated in this plan. The following sections provide further detail on each. The risk assessment for each hazard of concern addresses the compounding factors and secondary hazards specific to that hazard.

Table 5-1. Relationship Between Hazards, Compounding Factors, and Secondary Hazards

	Related Hazards of Concern	
	Compounding Factor	Secondary Hazard
Climate Change	Dam failure, drought, flood, landslide, severe weather, wildfire	Volcanic activity, wildfire
Air quality	Severe weather	Volcanic activity, wildfire
Erosion	Landslide	Dam failure, drought, flood, landslide, severe weather, wildfire
Invasive species	Flood, landslide, wildfire	

5.2.1 Climate Change

What is Climate Change?

Climate, consisting of patterns of temperature, precipitation, humidity, wind, and seasons, plays a fundamental role in shaping natural ecosystems and the human economies and cultures that depend on them. "Climate change" refers to changes in these patterns over a long period of time. Worldwide, average temperatures have increased 1.4°F since 1880 (NASA, 2015). Although this change may seem small, it can lead to large changes in climate and weather.

The warming trend and its related impacts are caused by increasing concentrations of carbon dioxide and other greenhouse gases in the earth's atmosphere. Greenhouse gases are gases that trap heat in the atmosphere, resulting in a warming effect. Carbon dioxide is the most commonly known greenhouse gas; however, methane, nitrous oxide and fluorinated gases also contribute to warming. Emissions of these gases come from a variety of sources, such as the combustion of fossil fuels, agricultural production, changes in land use, and volcanic eruptions. According to the U.S. Environmental Protection Agency (EPA), carbon dioxide concentrations measured about 280 parts per million (ppm) before the industrial era began in the late 1700s and have risen 43 percent since then, reaching 399 ppm in 2014 (see Figure 5-1). Furthermore, scientists are able to place this rise in carbon dioxide in a longer historical context through the measurement of carbon dioxide in ice cores. According to these records, carbon dioxide concentrations in the atmosphere are the highest that they have been in 650,000 years (NASA, 2016). According to NASA, this trend is of particular significance "because most of it is very likely human-induced and [it is] proceeding at a rate that is unprecedented in the past 1,300 years" (NASA, 2016). There is broad scientific consensus (97 percent of scientists) that climate-warming trends are very likely due to human activities (NASA, 2016). Unless emissions of greenhouse

gases are substantially reduced, this warming trend and its associated impacts are expected to continue.

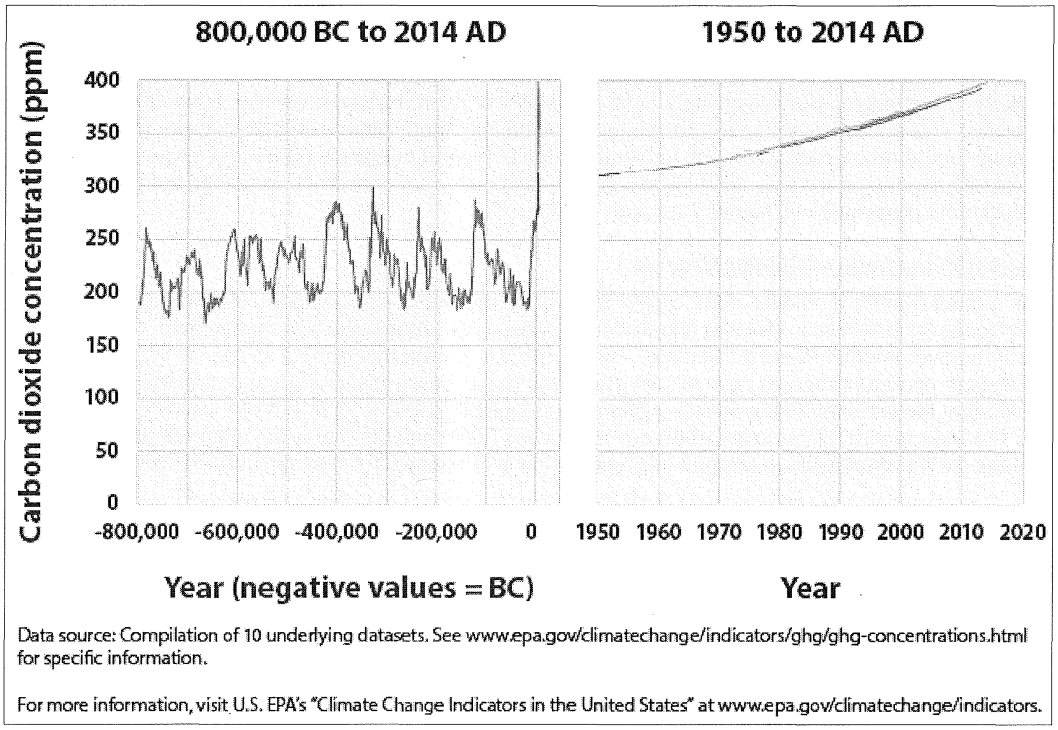

Figure 5-1. Global Carbon Dioxide Concentrations Over Time

Climate change will affect the people, property, economy and ecosystems of the City of Portland in a variety of ways. Climate change impacts are most frequently associated with negative consequences, such as increased flood vulnerability or increased heat-related illnesses/public health concerns; however, other changes may present opportunities. The most important effect for the development of this plan is that climate change will have a measurable impact on the occurrence and severity of natural hazards.

How Climate Change Affects Hazard Mitigation

An essential aspect of hazard mitigation is predicting the likelihood of hazard events in a planning area. Typically, predictions are based on statistical projections from records of past events. This approach assumes that the likelihood of hazard events remains essentially unchanged over time. Thus, averages based on the past frequencies of, for example, floods are used to estimate future frequencies: if a river has flooded an average of once every 5 years for the past 100 years, then it can be expected to continue to flood an average of once every 5 years.

For hazards that are affected by climate conditions, the assumption that future behavior will be equivalent to past behavior is not valid if climate conditions are changing. As flooding is generally

associated with precipitation frequency and quantity, for example, the frequency of flooding will not remain constant if broad precipitation patterns change over time. Specifically, as hydrology changes, storms currently considered to be a 1-percent-annual-chance event (100-year flood) might strike more often, leaving many communities at greater risk. The risks of drought, landslide, severe storms, extreme heat, and wildfire are all affected by climate patterns as well. For this reason, an understanding of climate change is pertinent to efforts to mitigate natural hazards. Information about how climate patterns are changing provides insight on the reliability of future hazard projections used in mitigation analysis. This section summarizes current understandings about climate change in order to provide a context for the recommendation and implementation of hazard mitigation measures. Expected impacts of climate change on the frequency or severity of each hazard of concern is assessed in the risk assessment presented in Chapter 7 through Chapter 10.

Current Indications of Climate Change

The major scientific agencies of the United States and the world—including the National Aeronautics and Space Administration (NASA), the National Oceanic and Atmospheric Administration (NOAA) and the Intergovernmental Panel on Climate Change (IPCC)—agree that climate change is occurring. Multiple temperature records from all over the world have shown a warming trend, and the IPCC has stated that the warming of the climate system is unequivocal (IPCC, 2014). Of the 10 warmest years in the 134-year record, all but one (1998) occurred since 2000, and 2015 was the warmest year on record (NASA, 2016). Worldwide, average temperatures have increased 1.4ºF since 1880 (NASA, 2016).

Rising global temperatures have been accompanied by other changes in weather and climate. Many places have experienced changes in rainfall resulting in more intense rain, as well as more frequent and severe heat waves (IPCC, 2014). The planet's oceans and glaciers have also experienced changes: oceans are warming and becoming more acidic, ice caps are melting, and sea levels are rising (NASA, 2016). Global sea level has risen approximately 6.7 inches, on average, in the last 100 years (NASA, 2016). This has already put some coastal homes, beaches, roads, bridges, and wildlife at risk (USGCRP, 2009).

NASA currently maintains information on the vital signs of the planet. At the time of the development of this plan, the following trends and status of these signs are as follows (NASA, 2016):

- Carbon Dioxide—Increasing trend, currently at 403.28 parts per million
- Global Temperature—Increasing trend,, increase of 1.4 degrees Fahrenheit since 1880
- Arctic Ice Minimum—Decreasing trend, 13.4 percent per decade
- Land Ice—Decreasing trend, 287.0 billion metric tons per year
- Sea Level—Increasing trend, 3.4 mm per year.

Projected Future Impacts

The Third National Climate Assessment Report for the United States indicates that impacts resulting from climate change will continue through the 21st century and beyond. Although not all changes are understood at this time and the impacts of those changes will depend on global emissions of greenhouse gases and sensitivity in human and natural systems, the following impacts are expected in the United States (NASA, 2016):

- Temperatures will continue to rise
- Growing seasons will lengthen
- Precipitation patterns will change
- Droughts and heat waves will increase

- Hurricanes will become stronger and more intense
- Sea level will rise 1-4 feet by 2100
- The Arctic may become ice free.

The 2015 Climate Action Plan states that the primary risks facing Multnomah County and the City of Portland (2015) include:

- Hotter, drier summer with more high-heat days
    - Increased temperatures (both day and night) and frequency of high heat days
    - Increased incidence of drought
    - Increased wildfire frequency and intensity
- Warmer winters with the potential for more intense rain events
    - Increased incidence and magnitude of damaging floods
    - Increased incidence of landslides.

Responses to Climate Change

Communities and governments worldwide are working to address, evaluate and prepare for climate changes that are likely to impact communities in coming decades. Generally, climate change discussions encompass two separate but inter-related considerations: mitigation and adaptation. The term "mitigation" can be confusing, because it's meaning changes across disciplines:

- Mitigation in restoration ecology and related fields generally refers to policies, programs or actions that are intended to reduce or to offset the negative impacts of human activities on natural systems. Generally, mitigation can be understood as avoiding, minimizing, rectifying, reducing or eliminating, or compensating for known impacts (CEQ, 1978).
- Mitigation in climate change discussions is defined as "efforts to reduce carbon emissions in order to slow climate change" (Multnomah County and the City of Portland, 2015). It includes strategies to reduce greenhouse gas sources and emissions and enhance greenhouse gas sinks.
- Mitigation in emergency management is typically defined as the effort to reduce loss of life and property by lessening the impact of disasters (FEMA, 2013).

In this section, mitigation is used as defined by the climate change community. In the other chapters of this plan, mitigation is primarily used in an emergency management context.

Adaptation is defined by the IPCC as "the process of adjustment to actual or expected climate and its effects. In human systems, adaptation seeks to moderate or avoid harm or exploit beneficial opportunities, In some natural systems, human intervention may facilitate adjustment to expected climate and its effects" (IPCC, 2014).

Mitigation and adaptation are related, as the world's ability to reduce greenhouse gas emissions will affect the degree of adaptation that will be necessary. Some initiatives and actions can both reduce greenhouse gas emissions and support adaptation to likely future conditions. Portland and Multnomah County's *Climate Action Plan* includes actions to reduce carbon emissions as well as actions to prepare for impacts.

5.2.2 Air Quality

Air quality can be impacted by a variety of natural and non-natural sources. Air pollution can come from human-created stationary sources such as factories, human-created mobile sources such as planes and automobiles, and naturally occurring sources such as volcanic eruptions and dust storms. The EPA defines air pollution as "the presence of contaminants or pollutant substances in the air that interfere with our health or welfare, or produce other harmful environmental effects." The Oregon Department of Environmental Quality (DEQ) is the state administrative agency charged with preserving and enhancing Oregon's air quality to support healthy, clean air for all Oregonians (Oregon DEQ, 2016).

The natural dispersal of air pollutants in Portland is inhibited by interactions of topography and climate. Portland is in a valley with mountains on either side, which limits the ability of winds to disperse pollutants horizontally across areas as they might in a flatter landscape. This is particularly of concern during the summer when winds tend to be lighter and from the north. This lack of dispersal is intensified when the vertical mixing of air is inhibited by an inversion—when warm air is found at higher elevations than cool air. Inversions are common in all seasons In Portland and in western Oregon (Johnson, 1987). Figure 5-2 illustrates the relationship between inversions and air quality during winter, when inversions tend to be strongest (NWS, 2016).

According to DEQ, Portland's air meets all federal air quality health standards for the six principal pollutants regulated under the Clean Air Act: carbon monoxide, ozone, particulate matter, nitrogen oxides, sulfur oxides and lead (Oregon DEQ, 2016). DEQ notes that in recent years concerns have been raised regarding air toxics in Portland. Air toxics are defined as air pollutants known or suspected to cause cancer and come from a variety of sources (cars, consumer products, burning, etc.). No federal standards currently exist for these toxics. The air quality discussion in the MAP is not primarily concerned with controlling or eliminating sources of regulated or non-regulated air pollution. The discussion for this plan is limited to air pollution as a secondary hazard or compounding factor as it relates to natural hazard mitigation.

Air quality forecasts and current conditions can be viewed online at AirNow:

https://www.airnow.gov/index.cfm?action=airnow.local_city&cityid=160

5.2.3 Erosion

The 2010 NHMP assessed erosion as a hazard of concern; however, the plan states that the magnitude and severity of erosion in the City are 'negligible' and that erosion occurrences are typically secondary events that are directly linked to other hazard events. Because of this assessment, the 2016 Steering Committee elected to address erosion as a secondary hazard or compounding factor as appropriate in the MAP.

General Background

The city experiences annual rain and wind events that impact river shorelines combined with landslides and debris flows within the watersheds, loss of plant cover in riparian areas and river-traffic-induced erosion. During severe storm events riverine erosion is magnified due to increased volume and velocity of the water flow. Erosion is a problem in developed areas where the disappearing land threatens development and infrastructure.

Source: NWS, 2016

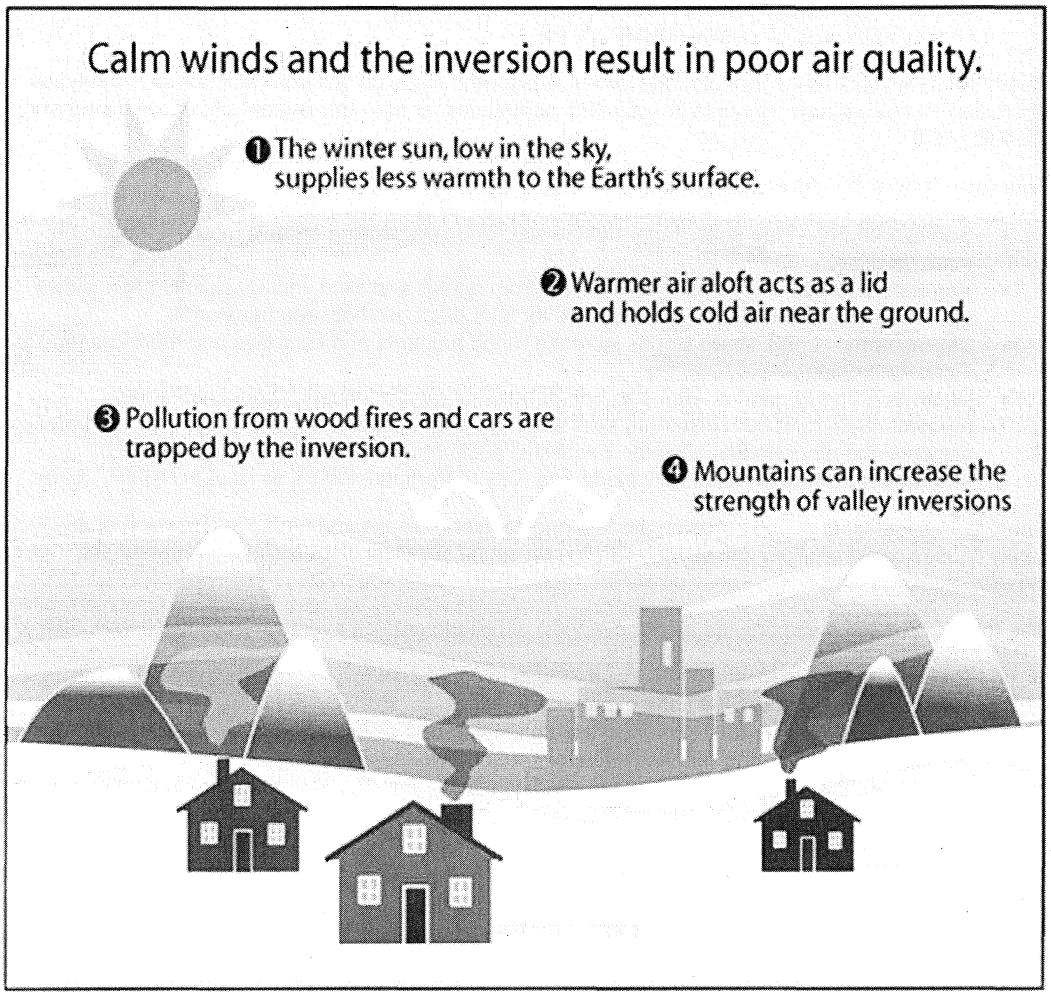

Figure 5-2. Impact of Inversion on Air Quality

There are two main types of erosion that affect human activity in Portland (NHMP, 2010).

- Riverine erosion results from the force of flowing water in and adjacent to river, creek, and tributary channels. This erosion affects the bed and banks of the channel and can alter or preclude any channel navigation or embankment development. In less stable braided channel reaches, erosion and material deposition are a constant issue. In more stable meandering channels, episodes of erosion may only occur occasionally.

- Wind erosion occurs when wind removes, moves and re-deposits soil. It can cause a loss of topsoil, hindering agricultural production. Blowing dust can also reduce visibility and have a negative effect on air quality (NHMP, 2010).

Runoff from rain cuts rills (channels) and gullies, while wind can strip soil from wide areas. Both types of erosion can move large amounts of sediment, sometimes far from the original site of soil disturbance (NHMP, 2010).

Four main factors influence erosion (NHMP, 2010):

- **Soil erodibility**—Fine soils, impermeable soils and soils lacking organic material tend to be more erodible.
- **Vegetative cover**—Vegetation shields soil from rainfall and wind, increases infiltration, slows runoff velocities, and retains soil moisture for later plant use between rainstorms.
- **Topography**—Long, steep slopes increase runoff amounts and velocities and therefore tend to increase erosion.
- **Weather**—The frequency, intensity, and duration of rainfall influence sediment release amounts. Sediment from disturbed soils can move into neighboring properties, streets, drainage systems and other bodies of water. Excessive sediment damages the functions of both stormwater sewers and natural watersheds (City of Portland, 2008b as cited in NHMP, 2010).

The City has identified riverine erosion areas along its rivers, creeks and tributaries. Erosion of any type rarely causes death or injury. However, erosion can cause significant destruction to property and infrastructure.

The following descriptions provide a brief overview of historic erosion events in the city (NHMP, 2010):

- Riverine erosion in local creeks occurred with minimal damage as culverts were filled and backed-up during the 1964 flood event.
- Wildfires in 2000 and 2001 removed vegetation that had stabilized hillsides. Subsequent erosion damage occurred during rain and snowmelt runoff events.
- Severe weather brings snow, rain and wind impacts to the city. Historical severe weather events surpassed the soil and the built environment's capacity to absorb or manage run-off, which results in erosion damage.

Location

Portland has many streams flowing down canyons in its hilly terrain. The intensity of the flow in the streams during the rainy season causes erosion to the banks. All rivers and creeks are subject to erosion. The city has two rivers and multiple streams and creeks. Some of those streams and rivers that are potentially threatened by erosion include: the Columbia and Willamette Rivers, Johnson, Tryon and Fanno Creeks; and the Columbia Slough. Hillside creeks are subject to erosion as a result of runoff caused by rain or melting snow pack (NHMP, 2010).

A variety of natural and human-induced factors influence the erosion process within the community. River orientation and proximity to upstream and downstream river bends can influence erosion rates. Embankment (earth or rock piled to keep back water or support a road) composition also influences erosion rates, (sand and silt will erode easily, whereas boulders or large rocks are more erosion resistant). Other factors that may influence riverine erosion include (NHMP, 2010):

- Geomorphology (land formations)
- Amount of encroachment in the high hazard zone

- Proximity to erosion-inducing structures
- Nature of the topography
- Density of development
- Structure types along the embankment
- Embankment elevation.

Erosion along the banks of the rivers and streams in the city is generally caused by a combination of factors; the natural process of a watercourse to find the path of least resistance; debris flows within the watershed; loss of riparian area plant cover; logging, wildfires, increased boat traffic close to the shoreline, and runoff from rainfall. While erosion has been identified as occurring within the city, few events have been reported that resulted in substantial damage.

Current Erosion Plan

The 2008 Erosion and Sediment Control Manual is a key reference for actions to be taken to mitigate erosion in development and maintenance situations. This plan describes vulnerability as not only in riverine areas, but any location where land is being moved and therefore impacts the natural areas.

Title 10 and this Erosion Control Manual apply to all ground-disturbing activities, whether or not a permit is required, unless such activities are otherwise exempted by Portland City Code.

Site planning and good site control are best practices that can be used to prevent discharges from a development site. The manual emphasizes careful planning and erosion prevention. Undisturbed groundcover must be retained whenever possible. This emphasis is particularly important in the Pacific Northwest immediately before and during the rainy season, when it is difficult to establish vegetation and the intense rains have high erosion potential.

5.2.4 Invasive Species

Invasive species was addressed as a hazard of concern in the 2010 natural hazard mitigation plan. It was the position of the 2016 Steering Committee that the hazard be assessed as a secondary hazard and compounding factor as appropriate in the MAP.

General Background

Invasive plants are those species that spread at such a rate that they cause harm to human health and the environment. In general, most invasive plants are non-native species, however, not all non-native plants are invasive (City of Portland, 2009 as cited in NHMP, 2010).

Invasive plants have been introduced into an environment in which they did not originate. They lack natural enemies, grow and reproduce quickly and are able to thrive in a wide variety of conditions. These characteristics allow plants to invade new habitats and out-compete natives, resulting in dense thickets of a single plant species. Dense thickets of invasive plants limit native plant diversity which in turn reduces food and shelter for wildlife. Invasive plants are the second leading cause of species extinction. Many invasive plants have shallow root systems that provide limited erosion control. Invasive plants also shade out native seedlings resulting in fewer trees. Less shade creates higher water temperatures, reducing oxygen for fish and other aquatic animals. Reduced tree cover also reduces storm water interception and absorption of $C0_2$ which interferes with the stabilization of the earth's temperature (NHMP, 2010). Invasive aquatic plants can decrease stormwater conveyance or cause debris blockages, increasing flood risk.

The City of Portland Bureau of Planning and Sustainability has developed lists of native, nuisance and prohibited plants. All of the species on the City's nuisance list and all of the species on its prohibited list are considered invasive plants. A native plant is a species that was likely found historically (prior to European settlement) in the Portland area. Nuisance plants are considered harmful to humans and plants and have a tendency to dominate plant communities (NHMP, 2010).

Arrival and Impacts

Most invasive plants arrived in Oregon through intentional introductions, however, in most cases, the uncontrolled spread was not anticipated. The number of new introductions has increased consistently with global trade and travel. Most invasive plant introduction pathways are human induced; the plants and their seeds travel on cars, trains, heavy equipment, boats, shoes and pets. The plants tend to become established along transportation corridors such as roads, utility easements, trails, parks and ports of entry. Humans also introduce new invasive plants through the nursery trade and gardening. Invasive plants are also transported through ecological pathways such as wind, wildlife, streams and other waterbodies. Land management practices such as mowing or constant soil disturbance also facilitate the establishment of and persistence of invasive plants (NHMP, 2010).

The following descriptions provide a brief overview of how invasive species have affected environmental health historically in the city (NHMP, 2010):

- **Water quality**—reduction in soil stability and of canopy diversity from invasive species results in increased stream temperatures and increased erosion.
- **Biodiversity**—rapid spread of invasive plant species creates monocultures by displacing native plants or by preventing their growth and establishment (which has affected water and air quality and stabilization of stream banks).
- **Habitat**—simplification of a plant community structure by an invasive plant monoculture reduces fish and wildlife habitat.
- **Tree Cover**—invasive cover in the shrub and groundcover layer prevents a natural forest regeneration processes.
- **Soil Health**—soils altered through allelopathy (the process of releasing chemicals that alter the soil chemistry and soil fungal processes thereby inhibiting the growth of neighboring plants, by another plant).
- **Wildfire**—some invasive plant species act as "fuel ladders" which facilitate the ability of a fire to travel into the tree canopy of conifers. Presence of invasive species makes the fire hotter, more difficult to control and more likely to continue to spread.
- **Stormwater**—forming monocultures, invasive species often preclude the establishment of native vegetation and tree canopy, altering vegetation cover types which can result in reduced stormwater interception by trees (City of Portland, 2008a as cited in NHMP, 2010).

Extensive infestations of invasive vines can also be implicated in multiple natural hazards. Trees overburdened with ivy or clematis vines are commonly found alongside several important traffic corridors in the city (Hwy. 26, Hwy. 30, Germantown Road). These overburdened trees are unstable and are often uprooted during rain or snow events and fall across power lines or roadways. When found on step unstable slopes these infested trees can be blown down and become involved in localized landslides (NHMP, 2010).

Fungal infestations can damage the health of native vegetation and contribute to increased wildfire risk. Swiss needle cast is a fungal disease affecting Douglas fir forests in Oregon, predominantly over the past 20 years. Although the fungus is native to Oregon, its detrimental impact may be increasing due to

rising spring and summer temperatures (Black et al., 2010) Douglas fir is one of the prominent tree species in Forest Park. A decline in the health of Forest Park's trees due to Swiss needle cast could contribute to increased fuel loads and combustibility, leading to greater risk and severity of wildfires in Portland. (Weiskittel et al., 2004).

For more information on invasive species in Portland, please visit the Bureau of Environmental Services Invasive Species Management website:

https://www.portlandoregon.gov/bes/45696

6. RISK ASSESSMENT METHODOLOGY

In hazard mitigation planning, risk is defined as the potential for damage, loss, or other impacts created by the interaction of natural hazards with community assets (see Figure 6-1).

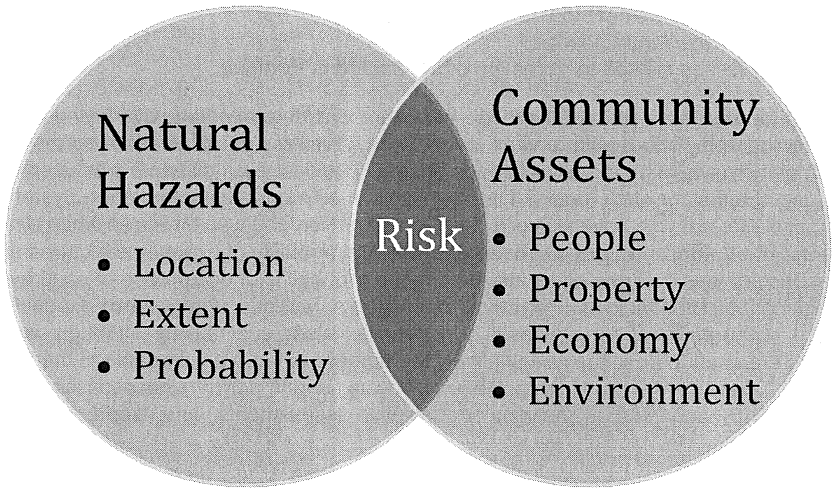

Figure 6-1. Risk in Hazard Mitigation

Risk assessment is the process of measuring the potential loss of life, personal injury, economic injury, and property damage that can result from natural hazards. It allows emergency management personnel to establish planning and response priorities by identifying potential hazards and vulnerable assets. The process focuses on the following elements:

- Vulnerability identification—Identify the people, property, environment, economic assets, and lands of Portland that could experience loss from natural hazard events.
- Cost evaluation—Estimate the cost of potential damage or the cost that could be avoided by taking steps to mitigate the risk.

6.1 OVERALL RISK ASSESSMENT METHODOLOGY

The risk assessments in Chapters 7 through 15 of this plan evaluate the risk of all identified hazards of concern prevalent in Portland. Each chapter describes the hazard, Portland's exposure and vulnerability, and probable event scenarios, meeting the requirements of the DMA (44 CFR, Section 201.6(c)(2)). The planning team reviewed existing studies, reports and technical information to determine the best available data to use in the risk assessment (44 CFR, Section 201.6(b)(3)). Information from these sources was incorporated into the hazard profiles and forms the basis of the

exposure and vulnerability assessment. The following steps were used to assess the risk of each hazard:

- **Profile each hazard**—The following information is given for each hazard:
  - Summary of past events
  - Geographic area most affected by the hazard
  - Event frequency estimates
  - A discussion of the severity of the hazard event
  - Warning time likely to be available for response
  - Secondary hazards or compounding factors associated with or resulting from the hazard of concern
  - Future development that may impact risk
  - Worst-case event scenario
  - Key issues related to mitigation of the hazard in Portland.
- **Determine exposure to each hazard**—Exposure was determined by overlaying hazard maps with demographic information and an inventory of structures, facilities and systems to determine which of them would be exposed to each hazard. The best available data was used to delineate the area of effect for each hazard. Data available in a Geographic Information System (GIS)-compatible format with coverage of the full extent of Portland was preferred when available.
- **Assess the vulnerability of exposed assets**—Vulnerability of exposed structures and infrastructure was determined by interpreting the probability of occurrence of each event and assessing the potential level of damage to structures, facilities, and systems exposed to each hazard. Vulnerability of populations is generally discussed qualitatively, although some model outputs are used to describe quantitatively the number of people vulnerable to the hazard event. FEMA's hazard-modeling program, Hazus-MH was used to perform this assessment for some hazards; GIS-based spatial analyses or qualitative assessments were used for others.

6.2 MAPPING

National, state and local spatial databases were reviewed for this planning effort. Maps were produced using GIS software to show the spatial extent of identified hazards when such data was available. These maps are included in the hazard profile chapters of this document. Maps at the reporting-area scale are included in Appendix E. Information on the data sources and methodologies used for hazard mapping is provided in Appendix F.

6.3 ASSESSING DAM FAILURE, EARTHQUAKE, FLOOD

6.3.1 Overview of FEMA's Hazus-MH Software

FEMA developed the Hazards U.S., or Hazus, model in 1997 to estimate losses caused by earthquakes. Hazus was later expanded into a multi-hazard methodology, Hazus-MH, with new models for estimating potential losses from hurricanes and floods. Hazus-MH is a GIS-based software program used to support risk assessments, mitigation planning, and emergency planning and response. The program maps and displays hazard data and the results of damage and economic loss estimates for buildings and infrastructure. The use of Hazus-MH for hazard mitigation planning offers numerous advantages:

- Provides a consistent methodology for assessing risk across geographic and political entities.

- Provides a way to save data so that it can readily be updated as population, inventory, and other factors change and as mitigation planning efforts evolve.
- Facilitates the review of mitigation plans because it helps to ensure that FEMA methodologies are incorporated.
- Supports grant applications by calculating benefits using FEMA definitions and terminology.
- Produces hazard data and loss estimates that can be used in communication with local stakeholders.
- Is administered by the local government and can be used to manage and update a hazard mitigation plan throughout its implementation.

6.3.2 Levels of Detail for Evaluation

Hazus-MH provides a wide range of inventory data, such as demographics, building stock, critical facilities, transportation and utility lifeline, and multiple models to estimate potential losses from natural disasters. The software's default data for inventory, vulnerability and hazards can be supplemented with local data to allow a more refined analysis. The model can carry out three levels of analysis, depending on the format and level of detail of information about Portland:

- **Level 1**—A Level 1 analysis estimates losses using only the software's default data. This data is derived from national databases and describes in general terms the characteristic parameters of a planning area.
- **Level 2**—A Level 2 analysis produces more accurate estimates of losses by supplementing the software's default data with detailed information in a GIS format about local geology, hydrology, hydraulics, building inventory, utilities and critical facilities.
- **Level 3**—This level of analysis generates the most accurate estimate of losses. It requires detailed engineering and geotechnical information to customize it for a local planning area.

6.3.3 Application for This Plan

The Hazus-MH model was used as follows for the hazards evaluated in this plan:

- **Flood**—A Level 2 analysis was performed for general building stock and for critical facilities and infrastructure. The effective Digital Flood Insurance Rate Map (DFIRM) for Portland was used to delineate flood hazard areas and estimate potential losses from the 10-, 100- and 500-year flood events. The effective DFIRM assumes the continued protection of FEMA-certified flood control levees and does not include residual exposure. Using the DFIRM floodplain boundaries and base flood elevation data and the City's 3-foot digital elevation model data, flood depth grids were generated and integrated into the Hazus-MH model. To estimate damage that would result from a flood, Hazus uses pre-defined relationships between flood depth at a structure and resulting damage, with damage given as a percent of total replacement value. Curves defining these relationships have been developed for damage to structures and for damage to typical contents within a structure. By inputting flood depth data and known property replacement cost values, dollar-value estimates of damage were generated.
- **Dam Failure**—The basis for this analysis was dam failure inundation mapping for Mt. Tabor Reservoirs 1, 5, and 6, and Washington Park Reservoirs 3 and 4. Inundation depth grids were created using inundation area boundaries and the City's 3-foot digital elevation model. The depth grids were imported into Hazus-MH and a Level 2 analysis was run using the flood methodology described above. Inundation area boundaries were not available for Portland's flood control levees at the time of this analysis.

- **Earthquake**—A Level 2 analysis was performed to assess earthquake risk and exposure. Earthquake shake maps and probabilistic data prepared by the U.S. Geological Survey (USGS) were used for the analysis of this hazard. National Earthquake Hazard Reduction Program (NEHRP) soils, liquefaction susceptibility and landslide susceptibility data were also integrated into the Hazus-MH model. Two scenario events and two probabilistic events were modeled:
  - The scenario events were a Magnitude-9.0 event on the Cascadia Subduction Zone and a Magnitude-6.5 event on the Portland Hills Fault.
  - The standard Hazus analysis was run for the 100- and 500-year probabilistic events.

6.4 ASSESSING LANDSLIDE, SEVERE WEATHER, VOLCANO, WILDFIRE

For landslide, severe weather, volcano and wildfire, historical data was not adequate to model future losses. However, areas and inventory susceptible to some of the hazards of concern were mapped by other means and exposure was evaluated. For other hazards, a qualitative analysis was conducted using the best available data and professional judgment.

6.5 ASSESSING DROUGHT

The risk assessment methodologies used for this plan focus on damage to structures. Because drought does not impact structures to the same degree as other hazards, the risk assessment for drought was more limited and qualitative than the assessment for the other hazards of concern.

6.6 ASSESSING SPACE WEATHER

Space weather is identified in this plan as an emerging hazard of concern; therefore, a detailed risk assessment of the hazard was not conducted. Additional information pertaining to risk from the space weather hazard will be monitored over the performance period of the plan; the potential for conducting a detailed risk assessment will be evaluated at the next plan update.

6.7 ASSESSING SOCIAL VULNERABILITY

Several demographic variables were extracted from the U.S. Census Bureau's American Community Survey database: total population, population under 15 years of age, population over 65 years of age, white population, people of color, total housing units, occupied housing units, owner-occupied housing units, renter-occupied housing units, total families, families below the poverty line, total households, and households speaking limited English. The number of people affected by a hazard in each demographic subset was first estimated for small areas called block groups, which are defined in the Census data:

- For each block group, the number of residential structures within the defined hazard zone was divided by the total number of residential structures in the block group.
- The resulting multiplier was applied to the population of each demographic subset in that block group to estimate the impacted number of people in each subset in each block group.
- The impacted populations of all block groups in a reporting area were totaled to get the impacted number of people in each subset in each reporting area.

6.8 DATA SOURCES, LIMITATIONS AND GAPS

6.8.1 Building Counts and Replacement Cost Value

The Hazus-MH modeling used GIS-based data on structure type, number and replacement cost. When available, an updated inventory was used in place of the Hazus-MH defaults for critical facilities and infrastructure. Replacement cost is the cost to replace an entire structure with one of equal quality and utility. It is based on industry-standard cost-estimation models published in *RS Means Square Foot Costs* (RS Means, 2015). Replacement cost of a structure is estimated based on its Hazus occupancy class (e.g., multi-family residential, commercial retail trade) and its square footage as indicated in the building data. For single-family residential, the construction class and number of stories also factor into the square foot costs.

6.8.2 Data Used for Spatial Analysis

Table 6-1 describes the data used for spatially based exposure and vulnerability assessments. If no database was available, it was noted as a gap (see Section 6.8.3).

6.8.3 Limitations and Data Gaps

General Limitations

Loss estimates, exposure assessments and vulnerability evaluations rely on the best available data and methodologies. However, results are subject to uncertainties associated with the following factors:

- Incomplete scientific knowledge about natural hazards and their effects on the built environment
- Approximations and simplifications necessary to conduct a study
- Incomplete or outdated structure, demographic or economic parameter data
- The variable nature, geographic extent and severity of each hazard
- Mitigation measures already employed
- The amount of advance notice residents have to prepare for a specific hazard event.

These factors can affect loss estimates by a factor of two or more. Therefore, potential exposure and loss estimates are approximate and should be used only to understand relative risk.

Despite their limitations, risk assessment techniques are able to indicate the possible extremes of hazard events. Their findings should be recognized as identification of potential hazard occurrences rather than as predictions of probable hazard events.

Identified Data Gaps and Specific Limitations

Hazus-MH currently represents the industry best management practice for assessing risk in support of hazard mitigation planning. However, Hazus and other models used for this risk assessment are limited by the availability of data to support their working components. Such models must use assumptions where firm data are not available. Assumptions are used, for example, to estimate ground deformation caused by liquefaction. These model limitations can lead to an understatement or overstatement of risk.

Table 6-1. Summary of Data Used for Spatial Analysis

Data	Source
Base Map Data	City boundaries, roads, water features, risk reporting areas provided by City of Portland.
General Building Stock Update	Building footprints and associated building information provided by City of Portland Bureau of Planning and Sustainability.
Critical Facility Database Update[a]	Emergency services (emergency operations centers, fire stations, medical care facilities, and police stations) provided by City of Portland and Regional Disaster Preparedness Organization.
	Schools provided by City of Portland.
	Transportation systems (airports, bus facilities, highway bridges, highway tunnels, railway bridges, rail facilities, and railway tunnels) provided by City of Portland and Regional Disaster Preparedness Organization
	Light rail bridges, facilities, and tunnels provided by TriMet.
	Port facilities provided by Port of Portland.
	Dams provided by Oregon Water Resources Department and the National Inventory of Dams.
	Hazardous materials facilities provided by the Oregon State Fire Marshall.
	Armories and nuclear reactor facilities provided by the City of Portland Bureau of Emergency Management.
	Military facilities provided by the Regional Disaster Preparedness Organization.
	Communications facilities provided by City of Portland and Hazus-MH default data.
	Electric power facilities provided by City of Portland, Regional Disaster Preparedness Organization, and Hazus-MH default data.
	Natural gas facilities provided by Oregon Public Health and Pacific Terminal Services.
	Petroleum facilities provided by Oregon Public Broadcasting, Regional Disaster Preparedness Organization, and Kinder Morgan.
	Potable water facilities provided by City of Portland Water Bureau.
	Wastewater facilities provided by City of Portland BES.
	Prisons provided by Regional Disaster Preparedness Organization.
	City-owned essential facilities, nursing homes and assisted living facilities provided by City of Portland.
Flood	Effective Digital Flood Insurance Rate Map downloaded from FEMA website.
	2014 3-foot resolution digital elevation model provided by City of Portland.
	Levee data provided by City of Portland.
	Repetitive loss data and active National Flood Insurance Program properties acquired from FEMA and geocoded by City of Portland.
Earthquake	Shake maps for Cascadia M-9.0 and Portland Hills M-6.5 downloaded from USGS website.
	Liquefaction susceptibility, landslide susceptibility, National Earthquake Hazard Reduction Program (NEHRP) soils, and active faults data provided by Oregon Department of Geology and Mineral Industries.
Landslide	Regulatory landslide hazard area and historical landslide deposits data provided by City of Portland.
Dam Failure	Mt Tabor Reservoirs 1, 5 and 6, and Washington Park Reservoirs 3 and 4 inundation areas data provided by City of Portland Water Bureau.
Wildfire	Wildfire fire hazard data provided by City of Portland.
Volcano	Mt. Hood Region volcano hazards data downloaded from USGS Cascade Volcano Observatory (CVO) website.
Demographics	2010-2014 American Community Survey 5-year Estimates (block group level) data downloaded from U.S. Census Bureau website.
Current and Future Land Use	Proposed comprehensive plan designations (future land use) data provided by City of Portland Bureau of Planning and Sustainability.

a. Not all requested data was received, so gaps in the database are present. Future planning efforts will work to address these gaps.

Appendix G presents findings from an evaluation of the data sources used for the risk assessment. It identifies gaps and potential impacts on the risk assessment results. The following are limitations specific to the datasets used in this planning process:

- City of Portland building data lacked certain detailed information, such as first floor elevation, so Hazus default building information was used. Detailed building information like this plays a major role in calculating replacement costs and evaluating how structures will behave during hazard events.
- Model data input requirements necessitate the conversion of building footprints into single-point features. Building locations are represented by single points at the centroid of the building footprint.
- Hazus does not currently have established depth-damage functions for estimating losses to houseboats during flood events.
- The current landslide data was produced at state-level scale. It is in the process of being updated at a county-level scale, which will be more appropriate for future exposure analyses for the City.
- The wildfire data is dated. This data will most likely be updated with LiDAR and new vegetation data that will improve the level of detail and accuracy.
- Not all critical facility data was available or complete. Appendix G outlines the specific gaps.
- Population estimates are generally based on where people are estimated to reside and do not take into account where individuals are likely to be at any given point in the day (e.g. school or work).
- Demographic data on persons with disabilities is aggregated at the tract level by the U.S. Census Bureau. This tract level data could not be used in a meaningful way for estimates for risk reporting areas.
- Potential exposure and vulnerability of linear critical infrastructure may overstate risk, as elevation and existing mitigation measures were not taken into consideration during the assessment.

7. SEVERE WEATHER

7.1 GENERAL BACKGROUND

Severe weather refers to any dangerous meteorological phenomena with the potential to cause damage, serious social disruption, or loss of human life. It includes thermal extremes, thunderstorms, tornadoes, windstorms, and winter storms.

The most common severe weather events that impact Portland are windstorms and winter storms, although extreme temperature events are becoming more common in recent years.

7.1.1 Thermal Extremes

Thermal extremes refer to relatively short-lived weather conditions that produce unusually hot or unusually cold conditions for an area. These events are deviations from normal or average seasonal temperatures and, thus, the threshold for an event varies based on average or typical conditions for a given locality. Normal temperatures for Portland are shown in Table 4-1 and Table 4-2.

Excessive Heat Events

Excessive heat events are defined by the U.S. EPA as "summertime weather that is substantially hotter and/or more humid than average for a location at that time of year" (U.S. EPA, 2006). Heat waves are excessive heat events that typically last two or more days. Because extreme heat is relative to the usual weather in a region, criteria that define an extreme heat event differ among jurisdictions and with the time of year. For Multnomah County, heat advisory protocols

DEFINITIONS

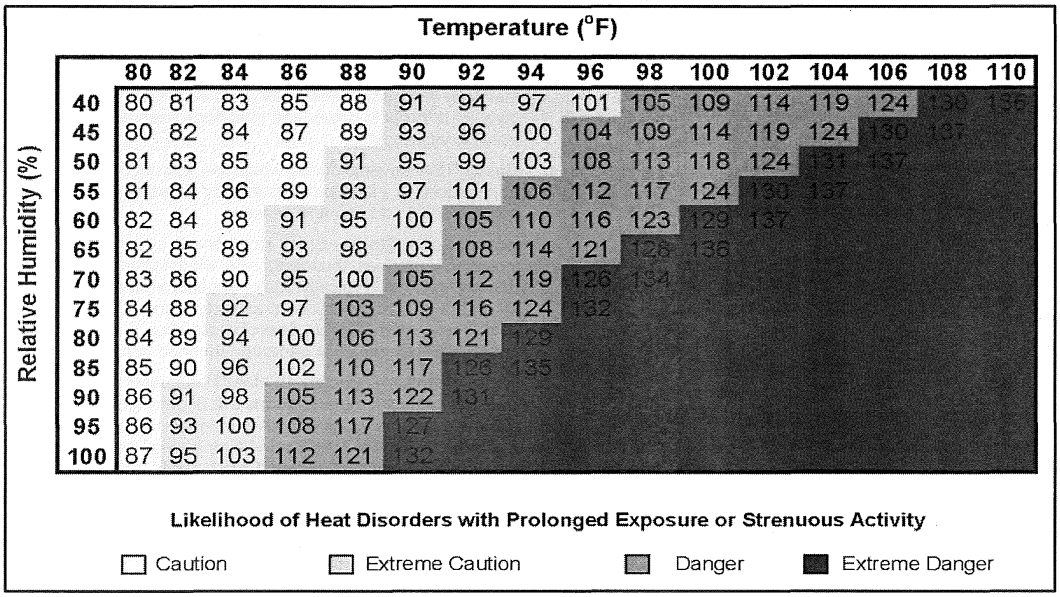
- **Freezing Rain**—The result of rain occurring when the temperature is below the freezing point. The rain freezes on impact, resulting in a layer of glaze ice up to an inch thick. In a severe ice storm, an evergreen tree 60 feet high and 30 feet wide can be burdened with up to six tons of ice, creating a threat to power and telephone lines and transportation routes.
- **Heavy Rain**—events during which the amount of rain experienced in a location substantially exceeds what is normal for the location and season.
- **Severe Local Storm**—Small atmospheric systems, including tornadoes, thunderstorms, windstorms, ice storms and snowstorms. Typically, major impacts from a severe storm are on transportation infrastructure and utilities. These storms may cause a great deal of destruction and even death, but their impact is generally confined to a small area.
- **Thunderstorm**—Typically 15 miles in diameter and lasting about 30 minutes, thunderstorms are underrated hazards. Lightning, which occurs with all thunderstorms, is a serious threat to human life. Heavy rains over a small area in a short time can lead to flash flooding. Strong winds, hail and tornadoes are also dangers associated with thunderstorms.
- **Tornado**—Tornadoes are funnel clouds of varying sizes that generate winds more than 300 miles per hour. A tornado is formed by the turbulent mixing of layers of air with contrasting temperature, moisture, density and wind flow. The mixing layers of air account for most of the tornadoes occurring in April, May and June, when cold, dry air meets warm, moister air moving up from the south. They can affect an area up to a mile wide, with a path of varying length. Tornadoes can come from lines of cumulonimbus clouds or from a single storm cloud. They are measured using the Fujita Scale ranging from F0 to F6.
- **Windstorm**—A storm featuring violent winds. Southwesterly winds are associated with strong storms moving onto the coast from the Pacific Ocean. Southern winds parallel to the coastal mountains are the strongest and most destructive winds. Windstorms tend to damage ridgelines that face into the winds.
- **Winter storm**—The National Weather Service defines a winter storm as having significant snowfall, ice, and/or freezing rain; the quantity of precipitation varies by elevation. Heavy snowfall is 4 inches or more in a 12-hour period, or 6 inches or more in a 24-hour period in non-mountainous areas; and 12 inches or more in a 12-hour period or 18 inches or more in a 24-hour period in mountainous areas.

are triggered by three consecutive days with an average maximum temperature above 95°F (City of Portland and Multnomah County, 2014).

Heat Index

Extreme heat events are often a result of ambient air temperature combined with other factors. Heat index tables (see Figure 7-1) provide information about how hot it feels based on meteorological conditions. Heat index values are for shady, light wind conditions; full sunshine can increase heat index values by up to 15°F. Strong winds with hot, dry air also can be hazardous (NWS, 2014a).

Source: National Weather Service/NOAA



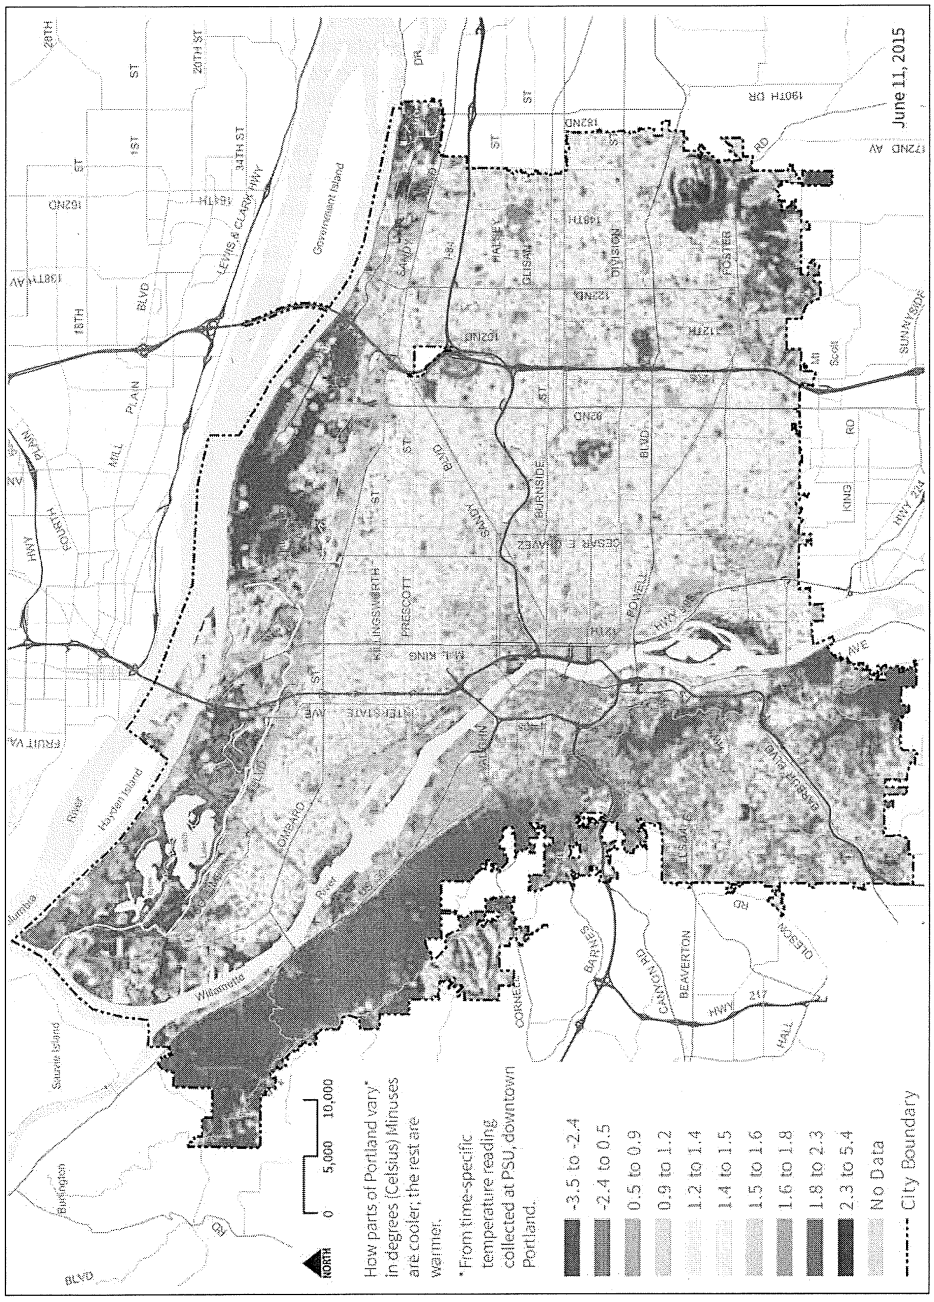


Figure 7-1. Heat Index Chart

Heat Islands

The *City of Portland and Multnomah County Climate Change Risk and Vulnerability Assessment* (2014) defines urban heat island effect as "the measureable increase in ambient urban air temperatures resulting primarily from the replacement of vegetation with buildings, roads, and other heat-absorbing infrastructure." Heat islands can increase peak summer energy demand, air pollution, greenhouse gas emissions, heat-related illness and death, and water quality degradation. Portland State University researchers studying of urban heat island effects (see Figure 7-2) have found differences up to 15ºF between paved and vegetated areas of the City.

Figure 7-2. Portland's Urban Heat Islands

Extreme Cold and Wind Chill

Weather that constitutes extreme cold varies across different parts of the U.S. In regions relatively unaccustomed to winter weather, near freezing temperatures are considered extreme cold (CDC, 2014). Extreme cold can often accompany severe winter storms. Wind can exacerbate the effects of cold temperatures by carrying heat away from the body more quickly, thus making it feel colder than is indicated by the temperature. This phenomenon is known as wind chill. Wind chill is the temperature that your body feels based on the combination of air temperature and wind speed (CDC, 2014). Figure 7-3 shows the value of wind chill based on ambient temperature and wind speed.

Source: National Weather Service/NOAA

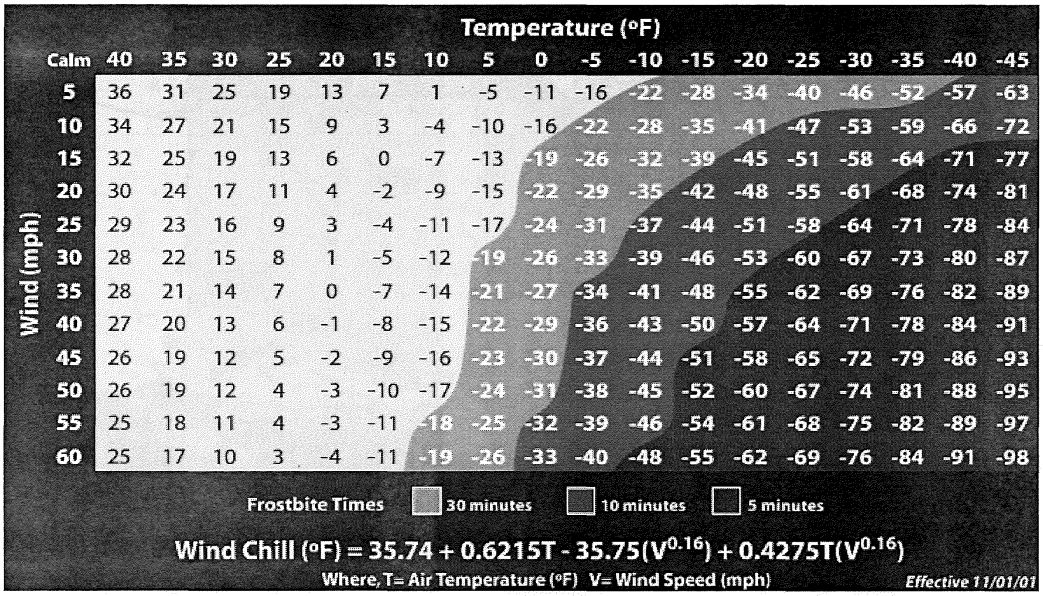

Figure 7-3. Wind Chill Chart

7.1.2 Thunderstorms

A thunderstorm is a rain event that includes thunder and lightning. Generally, the presence of three factors results in thunderstorm formation: moisture, rising unstable air, and a lifting mechanism. The lifecycle of a thunderstorm (see Figure 7-4) encompasses three stages (NSSL, 2016):

- Developing stage—A cumulus cloud is pushed upward, resembling a tower. Little to no rain is present, but occasional lightning may occur. This stage generally lasts for about 10 minutes.
- Mature stage—An updraft is still feeding the storm; however, precipitation begins to occur accompanied by a downdraft. A line of gusty winds is formed by this downdraft and rain-cooled air. This stage is the most likely time for hail, heavy rain, frequent lightning, strong winds, and tornadoes.
- Dissipating stage—After large amounts of precipitation, the downdraft becomes stronger than the updraft and the storm begins to dissipate. Precipitation generally decreases, but lightning may still be present.

Source: NOAA, 2015

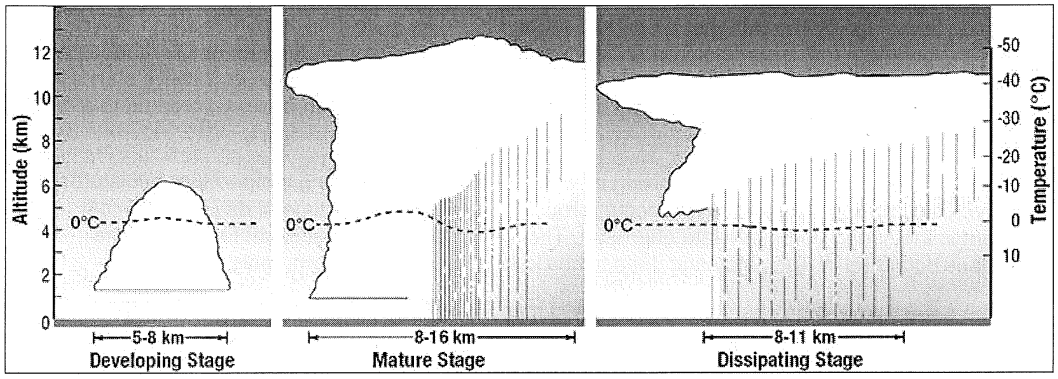

Figure 7-4. The Thunderstorm Life Cycle

A thunderstorm is classified as severe when it contains one or more of the following: hail with a diameter of 1 inch or greater, winds gusting in excess of 50 knots (57.5 mph), or tornado (NSSL, 2016).

Thunderstorms are usually short in duration (seldom more than 2 hours). Heavy rains associated with thunderstorms can lead to flash flooding during the wet or dry season. For more information on flooding see Chapter 11. Strong winds, hail and tornadoes are also dangers associated with thunderstorms.

Lightning

Lightning is an electrical discharge between positive and negative regions of a thunderstorm. A lightning flash is composed of a series of strokes, with an average of about four. The average duration of each stroke is about 30 microseconds (GHRC, 2016).

Lightning is one of the more dangerous weather hazards in the United States. Each year, lightning is responsible for deaths, injuries, and millions of dollars in property damage, including damage to buildings, communications systems, power lines, and electrical systems. Lightning also causes forest and brush fires and deaths and injuries to livestock and other animals. Property damage, increased operating costs, production delays, and lost revenue associated with lightning exceed $6 billion per year (NLSI, 2008). Impacts can be direct or indirect. People or objects can be directly struck, or damage can occur indirectly when current passes nearby.

Hail Storms

Hail is defined by the National Weather Service (2009) as "showery precipitation in the form of irregular pellets or balls of ice more than 5 millimeters in diameter, falling from a cumulonimbus cloud." Hail generally ranges from pea-size (0.25 inches) to softball size (4.5 inches) (NWS, 2009).

Hail occurs when updrafts in thunderstorms carry raindrops upward into extremely cold areas of the atmosphere where they freeze into ice. Super-cooled water may accumulate on frozen particles near the back-side of a storm as they are pushed forward across and above the updraft by the prevailing winds near the top of the storm. Eventually, the hailstones encounter downdraft air and fall to the ground (U.S. Claim Expert, 2016).

7.1.3 Tornadoes

A tornado is defined by the National Weather Service (2009) as a violently rotating column of air, usually descending from a cumulonimbus cloud, with circulation reaching the ground. Tornadoes can come from lines of cumulonimbus clouds or from a single storm cloud. They nearly always start as funnel clouds and may be accompanied by a loud roaring noise. They can affect an area up to a mile wide, with a path of varying length.

A tornado is formed by the turbulent mixing of layers of air with contrasting temperature, moisture, density and wind flow. Tornadoes can occur throughout the year at any time of day but are most frequent in the spring during the late afternoon. The mixing layers of air account for most of the tornadoes occurring in April, May and June, when cold, dry air meets warm, moister air.

With the potential for wind speeds exceeding 300 mph, a tornado is the most destructive of all atmospheric phenomena on a local scale. Figure 7-5, adopted from FEMA, illustrates the potential impacts and damage from tornadoes of different magnitude. Oregon has a relatively low risk compared to states in the Midwestern and Southern U.S.

7.1.4 Windstorms

Wind is air flow that travels parallel to the Earth's topography. High winds are defined as those that last longer than one hour at 40 mph or greater or wind gusts of 58 mph or greater. Windstorms are generally short-duration events involving straight-line winds or gusts of over 50 mph, strong enough to cause property damage. Wind speeds vary with individual storms. Windstorms often accompany snow, ice and extreme cold temperature during winter months (Wilde, 2009 as cited in NHMP, 2010).

Windstorms are especially dangerous in areas with significant tree stands and areas with exposed property, poorly constructed buildings, mobile homes (manufactured housing units), major infrastructure, and above-ground utility lines. A windstorm can topple trees and power lines, cause damage to residential, commercial and critical facilities, and leave tons of debris in its wake. Windstorms tend to damage ridgelines that face into the winds.

According to the *Oregon Natural Hazard Mitigation Plan* (2015), the most frequent and strongest wind storms impacting the area originate in the Pacific Ocean and travel from the southwest. Eastern winds that travel through the Columbia River Gorge also have impacts in the area.

7.1.5 Winter Storms

Blizzards and Snowstorms

The National Weather Service defines a winter storm as having significant snowfall, ice and/or freezing rain; the quantity of precipitation varies by elevation. Heavy snowfall is 4 inches or more in a 12-hour period, or 6 inches or more in a 24-hour period in non-mountainous areas; and 12 inches or more in a 12-hour period or 18 inches or more in a 24-hour period in mountainous areas.

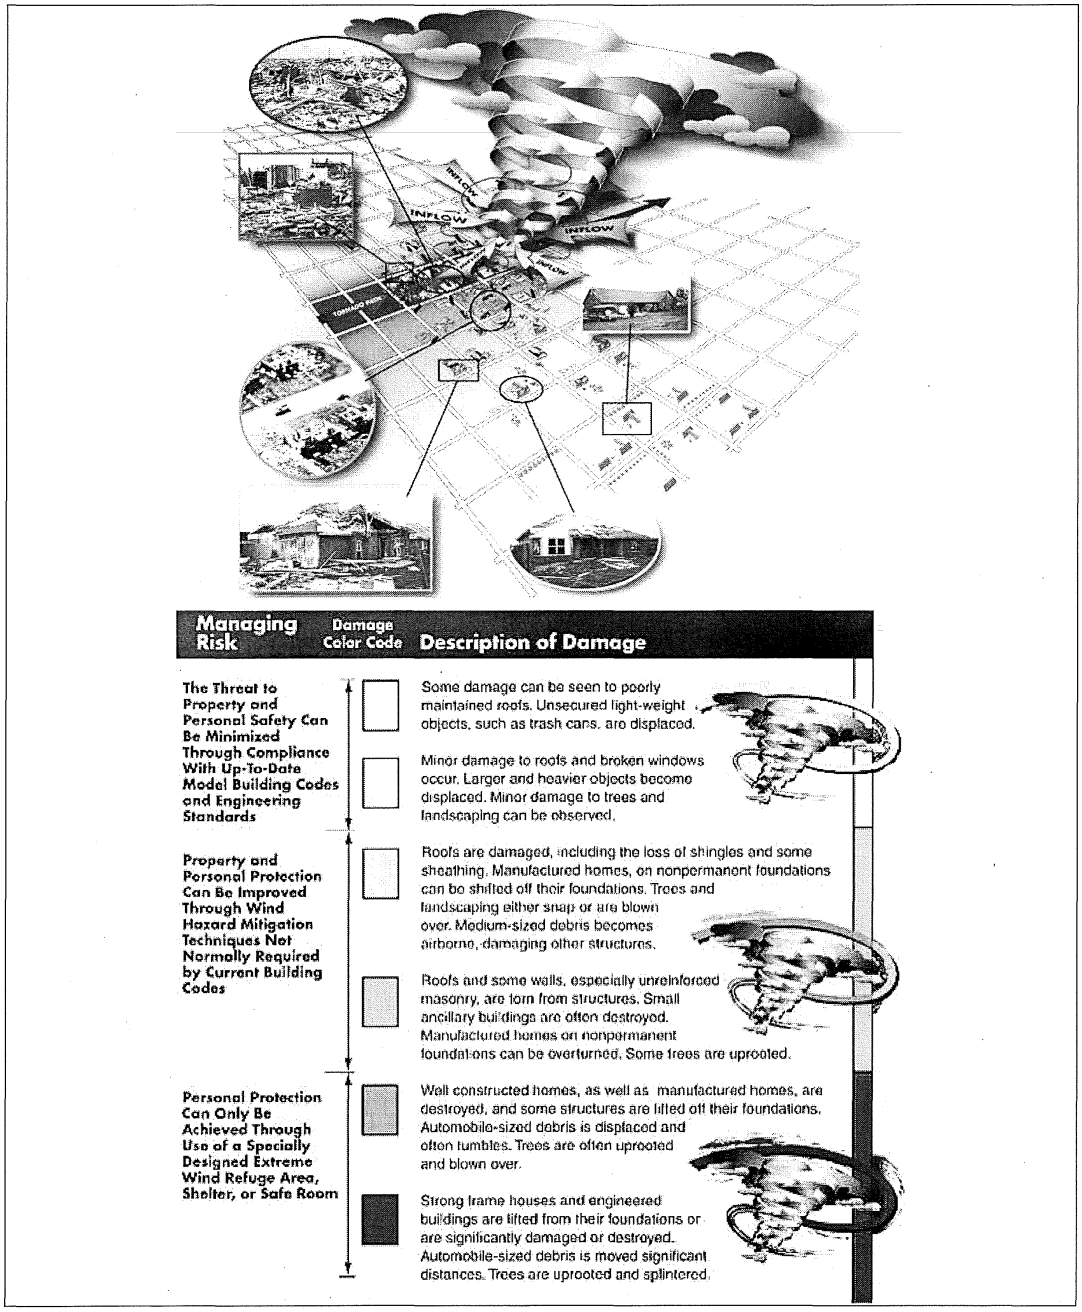

Figure 7-5. Potential Impact and Damage from a Tornado

There are three key ingredients to a severe winter storm:

- **Cold Air**—Below-freezing temperatures in the clouds and near the ground are necessary to make snow and/or ice.
- **Moisture**—Moisture is required in order to form clouds and precipitation. Air blowing across a body of water, such as a large lake or the ocean, is a typical source of moisture.
- **Lift**—Lift is required in order to raise the moist air to form the clouds and cause precipitation. An example of lift is warm air colliding with cold air and being forced to rise over the cold dome. The boundary between the warm and cold air masses is called a front. Another example of lift is air flowing up a mountain side.

While snow is relatively rare in the lower elevations of western Oregon, the Columbia Gorge provides a low-level passage through the mountains. Cold air, which lies east of the Cascades, often moves westward through the Gorge and into the Portland area. If a wet Pacific storm happens to reach the area at the same time, larger-than-average snow events may result (Taylor and Hannan, 1999 as cited in NHMP, 2010).

Ice Storms

The National Weather Service defines an ice storm as a storm that results in the accumulation of at least 0.25 inches of ice on exposed surfaces. Ice storms occur when rain falls from a warm, moist, layer of atmosphere into a below-freezing, drier layer near the ground. The rain freezes on contact with the cold ground and exposed surfaces, causing damage to trees, utility wires, and structures (see Figure 7-6).

Source: NWS, 2014b

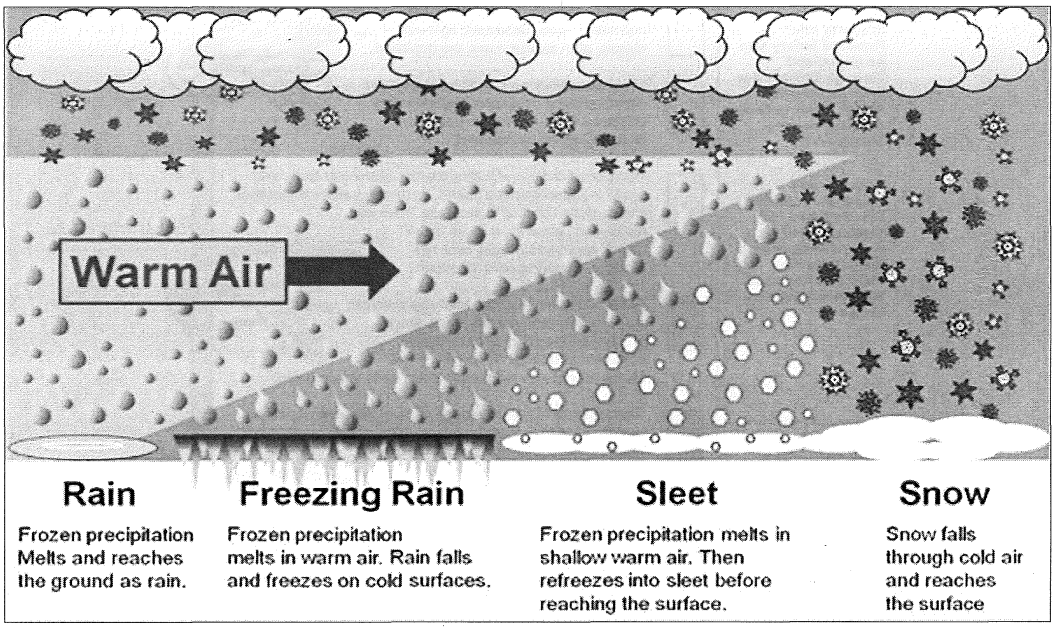

Figure 7-6. The Formation of Different Kinds of Precipitation

Ice accretion generally ranges from a trace to 1 inch. Accumulations between 1/4-inch and 1/2-inch can cause small branch and faulty limb breakage. Accumulations of 1/2-inch to 1 inch can cause significant breakage. Strong winds increase the potential for damage from ice accumulation.

7.2 HAZARD PROFILE

7.2.1 Past Events

Table 7-1 summarizes all severe weather events in and near Portland since 1950, as recorded by the National Oceanic and Atmospheric Administration (NOAA). Almost all of the disaster declarations impacting the City of Portland resulted to some extent from severe weather events. Table 7-2 provides detailed descriptions of severe weather events in Portland since 1991 that were reported to cause death, injuries or property damage.

Table 7-1. Summary of Severe Weather Event Impacts in Portland

Hazard Types Includes	# of Reported Events[a]	# of Events with Deaths, Injuries or Property Loss[a, b]
Strong Wind	15	15
High Wind	24	10
Excessive Heat	8	2
Extreme Cold/Wind Chill	0	0
Ice Storm	2	1
Heavy Snow	28	0
Winter Storm	8	2
Winter Weather	10	0
Lightning	5	3
Thunderstorm Wind	12	4
Hail	6	2
Funnel Cloud	3	0
Tornado	3	3
Heavy Rain	26	5
Total	**150**	**47**

a. Reported events since 1950 impacting Multnomah County and/or the Greater Portland Metro Area zone.
b. Only events that listed injuries and/or dollar amounts are included in these estimates. Some event descriptions include property damage that was not quantified.

Source: http://www.ncdc.noaa.gov/stormevents/

Table 7-2. Past Severe Weather Events Impacting Portland[a]

Date	Type	Deaths or Injuries	Property Damage
4/9/1991	Tornado	0	$250
Description: A thunderstorm produced a very small tornado and hail. A resident of a house which sustained minor damage recalled a steady progression of the wind effect. Initially, the neighbor's roof shingles lifted up, then their pool water was sucked out from underneath the poll cover, next, the first row of shingles on the witness' roof were turned up and small plants and a trellis were uprooted. Hail punctured a hole the size of a silver dollar in the garage screen door. At the same time this occurred, the U.S. Weather Service Office received a call from the same vicinity as the tornado reporting 0.5-inch hail and an unconfirmed report of 1-inch hail.			
11/12/1991	Tornado	0	$25,000
Description: A tornado occurred during a cold frontal passage. Eighty feet of fencing was damaged, part of a roof was torn off, an outbuilding was twisted and part of a wall was ripped out of a steel building.			
8/30/1999	Lightning	1	$0
Description: Lightning struck a boy from Gresham as he was bicycling near NE 230th Court in Wood Village at 1230 PDT. The lightning struck him in the head and exited through his groin. His companion at the time called 911 from a neighbor's house and paramedics arrived in about two minutes. The boy's heart had stopped, and he suffered a concussion and second degree burns on his face, chest, groin, and upper legs. He apparently did not receive the full force of the bolt directly, which spared his life. He was still on his bicycle with his hands on the handlebars when the paramedics arrived. He was revived in the ambulance en route to the hospital and he is expected to recover.			
12/18/2005	High Wind	0	$15,000
Description: A strong wind storm brought damaging winds to inland portions of northwest Oregon. The strongest wind gust reported was measured at 58 mph in the west hills of Portland. Many trees were reported downed by strong winds. Approximately 9,000 customers were reported without power in east Multnomah county. High winds also did damage to a few homes in the Gresham area, either by knocking down trees onto homes, or reported roof damage.			
1/1/2006	High Wind	0	$500,000
Description: A strong low pressure area off the Coast caused high winds in the Willamette Valley. McMinnville airport reported 44 mph sustained winds with a gust to 49 mph. Trees were reportedly blown down near Linfield College in Salem, including an 80 foot tall Cypress tree. A house in Aloha was destroyed by a falling tree. Nearly 22,000 customers were without power due to power lines downed by falling trees.			
2/3/2006	Strong Wind	0	$50,000
Description: A strong winter storm brought high winds to portions of northwest Oregon. Portland Airport reported 21 knots with gusts to 38 knots. Additionally, many residents experienced power outages due to trees blown down by strong winds.			
5/2/2007	Hail	0	$5,000
Description: During an afternoon under an unstable air mass, small thunderstorms moved across northwest Oregon. One storm produced a small hail storm, with enough hail accumulation to cover the ground. Hail covered the ground near the Gateway Transit Center, with biggest stones being half an inch in diameter.			
9/28/2007	Hail	0	$5,000
Description: In an unstable atmosphere, several thunderstorms moved over the forecast area. One such storm produced a short-lived tornado, that did considerable damage to a local farm. Dime size hail was also reported with the storm. Estimated half-inch hail fell near 162nd and Main.			
7/3/2008	Lightning	0	$2,000
Description: Lightning struck the Walt Morey Middle School in Troutdale, damaging some of the computer systems.			
12/20/2008	Winter Storm	0	$9 million property, $11.6 million crop
Description: The third in a series of an unusually cold storm systems brought heavy snow accumulations to northwest Oregon. The heavy snowfall created a significant impact to many communities across northwest Oregon. Fourteen to 24 inches of snow fell across the northern Willamette Valley. Some reports include 14 inches in Canby, 18 inches in Gladstone, 21 inches in Oregon City and 24 inches in Wilsonville. This storm was the most significant storm to hit the Portland Metro Area in the past 40 years. Freezing rain also occurred during this period with 1/4 to 3/4 inch of ice accumulation.			
12/24/2008	Winter Storm	0	$300,000
Description: Another cold storm system brought heavy snow accumulations to northwest Oregon. Four inches of snow fell over the Portland Metro area on Christmas eve. Freezing rain was also reported in the Portland and Troutdale areas. The snowfall combined with accumulations from the previous few days resulted in 4 roof collapses, 10 carports collapses and damage to 62 greenhouses.			

Date	Type	Deaths or Injuries	Property Damage
1/17/2009	High Wind	2	$30,000
Description: Strong winds caused some isolated power outages and downed a few trees in the Portland area.			
1/18/2009	High Wind	0	$25,000
Description: Strong east winds occurred across the Central Oregon Coast and through the Columbia River Gorge. A strong front produced strong winds that caused widespread power outages in Gresham, Troutdale and Multnomah Village. The high winds also downed several trees in southeast Portland, one of which fell on an automobile.			
6/4/2009	Thunderstorm Wind	0	$1,200
Description: A fairly vigorous upper level low pressure system had been blocked offshore and was finally allowed to progress onshore on June 4th. An upper level disturbance rotated around upper level low pressure system, enhancing divergence aloft and turning upper level flow easterly across much of western Oregon. This overall pattern resulted in enhanced vertical wind shear for the Willamette Valley, with southerly winds near the surface backing to easterly flow aloft. The June 4, 2009 was a significant thunderstorm outbreak by Northwestern Oregon standards, with several areas taking damage from strong thunderstorm wind gusts, minor urban area flooding, and rotation in a few storms resulted in one weak tornado. The top of a 70-foot tree was snapped off in downtown Portland at the intersection of SW Salmon Street and Park Avenue. A passer-by was nearly hit as it fell to the ground. Time of the event is estimated based nearby reports from the storm.			
11/16/2009	High Wind	0	$6,000
Description: Strong winds were estimated based on reports of damage to a downtown Portland residential home due to downed trees. Additionally, gusts of 43 – 48 knots were reported at the Portland home of a local television meteorologist. Power outages were reported across Clackamas county, with 1700 homes affected.			
9/22/2013	Strong Wind	0	$8 million
Description: A strong cold front resulted in high winds for the North and Central Oregon coast. This storm was the first storm of the Fall season, and also produced strong winds for the Northern Willamette Valley that resulted in structure damage and power outages for the Portland Metro area. Winds in the valley were 30 to 40 mph. These winds brought a tree down onto a house in SE Portland and left around 5000 people without power. Most of the power outages were in Washington County.			
9/28/2013	Strong Wind	0	$35,000
Description: A strong cold front resulted in strong winds across Northwest Oregon. Media reported via social media that a tree fell onto a mobile home near Hillsboro. Another social media report posted a picture of a tree that fell on two cars at the Fred Meyer in Oak Grove There were other reports of several large trees down around the Portland Metro Area. Portland General Electric reported over 25,000 customers were without power in Clackamas and Multnomah counties.			
11/7/2013	Strong Wind	0	$3,000
Description: A NWS Spotter estimated Winds of 55 mph, and reported several trees down along Highway 47 between Banks and Forest Grove. They reported power lines down and power outages in the area. A local media station KOIN stated that Pacific Power reported 12,500 customers without power in Northeast Portland for several hours. KOIN also said that Concordia University cancelled their morning classes. PGE reported that there were 2800 customers without power in Clackamas County.			
1/23/2014	Strong Wind	0	$7,000
Description: Strong east winds resulted in knocking two large trees over. One of these trees came down on an SUV in Milwaukie, and the other came down on an SUV in southwest Portland. There were also hundreds of people without power for at least an hour due to downed limbs on power lines.			
2/12/2014	Strong Wind	0	$1,000
Description: Strong winds downed a few trees and damaged a vehicle in Gresham.			
2/25/2014	Strong Wind	0	$7,000
Description: Strong and gusty east winds through the Columbia River Gorge resulted in impacts around the Portland Metro Area. Local media reported that a large tree fell onto a Max train and overhead wires in Gresham that closed that line for the rest of the day. Another downed tree crushed a SUV in Lake Oswego. A large tree took out power lines as it fell across Highway 43, disrupting power and closing the highway for a couple of hours. A Large tree branch fell and pierced through a window of a van that was driving on Highway 99 with luckily no injuries.			
3/6/2014	Strong Wind	0	$8,000

Date	Type	Deaths or Injuries	Property Damage
Description: Strong winds resulted in significant damage in the Portland Metro Area with area wind measurements between 30 and 48 mph. There were several reports of 12 to 24 inch diameter trees down. One landed on the Firestone Tire Building in downtown Portland, one closed a busy intersection at Hall and Bonita in Tigard, and another closed 'A' Avenue downtown Lake Oswego. There were numerous power outages, and tens of thousands of PGE customers were without power. Clackamas Community College cancelled all classes on March 6 due to the power outages.			
5/18/2014	Thunderstorm Wind	0	$11,000
Description: Winds from a thunderstorm resulted in a large oak tree falling on two parked cars in downtown Portland.			
10/25/2014	High Wind	0	$140,000
Description: Wind gusts up to 60 mph were reported throughout the Portland Metro Area. There were numerous trees downed by these winds with some landing on power lines. There were at least two homes that had major damage due to downed trees. Portland General Electric reported around 140,000 people without power by the end of the storm. One downed power line burned a hole in the road that it fell on. A NWS employee reported that a large gust blew doors open at a SW Portland restaurant, and ripped large paintings off the wall. Some of the downed trees blocked roads, and 2 lanes were blocked on Highway 30 for a couple of hours			
11/11/2014	High Wind	1	$32,000
Description: Strong winds resulted in downed trees throughout the Metro Area. Downed trees were responsible for the shut-down of several sections of the MAX line for several hours, and the closures of Cornelius Pass Road and Shattuck Road. One tree crashed the roof of a house in Oregon City and pinned the resident under a desk inside. A biker sustained serious injuries when a tree fell on him and a nearby car. A 54 mph easterly wind gust at the Portland Airport was the strongest east wind recorded since 1989.			
12/2/2014	Strong Wind	0	$15,000
Description: East winds blowing through the gorge were strong enough to knock over trees in the Portland Metro Area resulting in minor damage. One tree in Southwest Portland came down onto a house. Another tree knocked down near the Sellwood Bridge resulted in the closing of Highway 43 and caused major traffic delays. Several trees were knocked down in Gresham with at least one falling down on power lines and causing power outages. Another tree in Gresham fell onto a car.			
12/11/2014	High Wind	3	$80,000
Description: Gusty strong winds resulted in several downed trees for the Portland Metro Area. There were widespread road closures and power outages due to the downed trees. One fatality and one injury resulted from a tree falling onto a moving car. The Portland International Airport experienced re-routing and delays of aircraft, and the Portland Mass Transit, MAX system had system-wide delays due to power outages. In downtown Portland, loose material from a roof of a nearby building were lofted and blown against windows of the Standard Insurance Plaza damaging several windows on the fifteenth floor. A parapet of an apartment in NW Portland fell and caused major damage to the apartment building. At least one power pole was downed by the winds in Washington County. A large tree fell onto a moving car injuring a mother and killing her son.			
3/15/2015	Heavy Rain and High Wind	1	$118,000
Description: A series of storms along an atmospheric river of moisture produced a period of heavy rain from March 13 to March 15. Rainfall totals of 3 to 6 inches were measured for many areas of Northwest Oregon and a few local spots had over 7 inches of rain. The prolonged period of rain allowed the saturated soils to make large trees vulnerable to tip over if any winds developed (which did happen). No flooding was reported from this rain, but a mudslide did impact a residence in the west hills of Portland. *Around 50 trees were downed by strong winds in the afternoon on March 15 in the Portland Metro Area. A large tree fell onto a jeep and trapped an injured driver for several hours. Scaffolding was knocked off of a building downtown onto a few cars. A large tree even fell in the parking lot of the National Weather Service Forecast Office. Siding of a chimney in Southwest Portland was peeled off by the winds. Several roads were closed from trees and there were bus and train delays due to power outages. Four airplanes on route to Portland were diverted to other cities. A peak gust of 70 mph was measured at Chehalem Mountain, and a BPA weather station in Troutdale measured gusts of 63 mph.*			
6/7/2015	Heat	1	$0
Description: High Temperatures were in the low to mid 90s June 7 through June 9, which is around 22 degrees higher than the seasonal normal. The low temperatures were also unseasonably warm, and the low temperature on June 7 of 61 degrees at the Portland Airport tied the warmest low record that was previously set in 1948. There is one known indirect heat related fatality where a young man drowned while swimming in the Clackamas River near Gladstone. Multnomah County had 7 hospital visits for heat related illnesses.			
6/26/2015	Excessive Heat	1	$0

Date	Type	Deaths or Injuries	Property Damage
Description: Maximum temperatures were in the mid to upper 90s, which is 20 to 25 degrees above the seasonal normal. The low temperatures were in the mid 60s to low 70s. Several new daily temperature records were set for the warmest low temperatures. One man drowned after he fell off a jet ski in the Columbia River on June 27th. This accident occurred around 1 AM, but the warm nighttime temperatures likely contributed to him going into the river at night. The Multnomah County had 10 emergency room visits for heat related illnesses.			
8/29/2015	Strong Wind	0	$11,000
Description: Several locations measured wind gusts greater than 35 mph with the highest wind of 50 mph measured near the Oregon Zoo. There were several reports of downed trees and power lines that resulted in the loss of power for around 28,000 residents. Downed power lines closed Marine Drive, and a downed tree blocked a lane on US 30 on the Interstate 405 ramp at Thurman. A Twitter report showed a photo of downed tree damage to a couple of parked cars.			
10/31/2015	Heavy Rain	0	$150,000
Description: Heavy rain combined with clogged drains from leaves resulted in urban flooding. Portland Fire and Rescue received 32 calls in regards to street flooding, and assisted travelers in 5 cars from their stalled or trapped cars to dry land. Four roads were closed in the area for high water, and several Max lines were cancelled due to flooding under bridges. Thirteen Max trains were damaged by water and will be out of service for up to 2 weeks. One roof collapsed from the weight of rain water after the roof drains had been clogged, and several homes or businesses had flooded basements. A tree had fallen onto and damaged a parked car.			
12/1/2015	Ice Storm	0	$5,000
Description: A quarter to a half on an inch of ice was observed the eastern portions of the Portland Metro Area, mainly in Gresham and Troutdale. Tree limbs were broken by the ice and resulted in widespread power outages in eastern Multnomah County.			
12/7/2015	Heavy Rain and Strong Wind	0	$1.09 million
Description: Heavy rain resulted in urban flooding and small stream flooding throughout the Portland Metro Area. The rain was heavy enough to collapse a roof of a business in Gresham, Oregon, and cause a sink hole near Mt Hood College. High water flowing into Fairview Creek in Gresham snapped a sewage line. Several roads were closed due to high water and the TriMet Max operations were interrupted. Water crept into businesses and homes. There were at least two landslides in Portland; one on Corbett Hill, and the other on Cornell Road. *The media reported that strong winds resulted in tree damage near 5th and Jefferson in Oregon City. There was another report of a 1.5-foot diameter evergreen tree that fell onto a home in Clackamas and damaged the roof.*			
12/8/2015	Heavy Rain	0	$621,000
Description: Heavy rain resulted in urban flooding across the Portland Metro area. All Amtrak and freight trains were shut down between Portland and Vancouver due to flooding. A mobile home park in Gresham flooded. There were a couple of landslides on Highway 30 where debris covered the highway. One of these slides was near Germantown Road. The other slide was near the St John's Bridge, hit a car (with no injuries) as it happened, and covered all lanes of Highway 30.			
12/9/2015	Strong Wind	1	$107,000
Description: Strong winds combined with saturated soils from heavy rainfall resulted in property damage around the Portland Metro Area. A tree fell down and resulted in extensive damage to a home in Aloha. Another tree fell onto a home in Portland, killing a woman. Winds also damaged the Milwaukie Bridge. Broken tree limbs fell onto power lines that resulted in widespread power outages in Portland, Clackamas, and Beaverton.			
12/10/2015	Strong Wind	0	$60,000
Description: The media reported that a home in Aloha sustained significant damage as a tree downed by strong winds fell onto it.			
12/17/2015	Heavy Rain	0	$311,000
Description: Heavy rain resulted in new daily rainfall records for the Portland International Airport and downtown Portland. A new daily rainfall record of 1.87 inches at the airport broke the previous record of 1.02 inches from 1972. Downtown Portland measured 2.42 inches of rain, which broke the previous record of 2.26 inches from 1884. Standing water was reported on many roads in the area. The heavy rain caused a landslide on Highway 30 near the St Johns Bridge.			
12/21/2015	High Wind	0	$1.3 million
Description: High winds caused significant damage in the Portland Metro area as trees were downed onto homes and cars. Several roads were closed due to downed trees. Marine Drive was closed for several miles due to winds blowing a tractor trailer off of the road. One house caught on fire when a tree downed an electrical wire.			

Date	Type	Deaths or Injuries	Property Damage
3/1/2016	Strong Wind	1	$10,000
Description: Strong winds ahead of the front blew down a weak or dead tree onto a moving vehicle, killing the driver. Winds with the front downed several trees and branches near Beaverton resulting in power outages.			
3/13/2016	Strong Wind	0	$7,000
Description: Strong winds downed several trees in the Portland Metro Area. Some of these trees fell onto power lines and resulted in power outages, and others fell onto roadways and obstructed traffic. One tree fell onto a home in Portland with minor damage to the roof.			

a. Reported events since 1950 impacting Multnomah County and/or the Greater Portland Metro Area zone with reported injuries, fatalities, and/or property damage and event descriptions.

Source: http://www.ncdc.noaa.gov/stormevents/

7.2.2 Location

All areas of Portland are potentially exposed to severe weather events.

Thermal Extremes

Temperature extremes can occur throughout Portland. The Western Regional Climate Center notes several factors that have a significant impact on the local climate including terrain (such as the Cascade Range), the Pacific Ocean, and low pressure regions over the north Pacific Ocean. These climactic controls can cause significant climate differences in relatively short distances.

Thunderstorms

Thunderstorms affect relatively small localized areas, rather than large regions like winter storms and extreme temperature events. Thunderstorms can strike all regions of the United States, although they are most common in central and southern states. It is estimated that there are as many as 40,000 thunderstorms each day worldwide. The City of Portland can experience an average of 10 to 20 thunderstorm days each year (National Weather Service, 2010).

Tornadoes

Approximately 1,200 tornadoes occur in the United States each year, with the central portion of the country experiencing the most. The State of Oregon and the City of Portland have a lower risk for tornados than elsewhere in the country. Tornadoes are usually localized. Severe thunderstorms can result in conditions favorable to the formation of numerous or long-lived tornadoes.

Windstorms

All of the City of Portland is subject to high winds from thunderstorms and other severe weather events. According to FEMA, the City of Portland is located in Wind Zone I, where wind speeds can reach up to 130 mph. The City is also located in a special wind region along the west coast from Washington to Oregon. Figure 7-7 indicates how the frequency and strength of windstorms impacts the United States and the general location of the most wind activity. This is based on 40 years of tornado data and 100 years of hurricane data collected by FEMA.

Source: FEMA n.d.

Figure 7-7. Wind Zones in the United States

Winter Storms

Snow accumulation is most common at higher elevations, but can occur anywhere in Portland. Snow events occur if a wet Pacific storm reaches the area when a cold air mass is present. Cold air rarely travels west of the Cascade Range, as the mountains provide a natural barrier separating the Willamette Valley from the cold air to the east (NHMP, 2010). A natural break in the Cascade Mountains does occasionally allow cold air from the east to funnel through the Columbia Gorge into the Portland area, which can eventually settle south in the Willamette Valley and thus create snow and ice events (ONHW, 2004 as cited in NHMP, 2010). Ice events include freezing rain, sleet and hail.

7.2.3 Frequency

Portland can expect to experience exposure to some type of severe weather event at least annually. Many of the severe weather events for the City of Portland shown in Table 7-1 are related to high winds and severe winter weather. According to records, in 66 years, the city has experienced 150 severe weather events, an average of two to three events per year. Thunderstorms, windstorms and winter storms are likely to occur in the region annually. Not all storms produce damage.

The *2015 Oregon Natural Hazard Mitigation Plan*, identifies the following probabilities for winds of varying strength in Region 2, which includes Portland:

- A 25-year event for the region (4-percent annual probability) is 65 miles per hour.
- A 50-year event (2-percent annual probability) is 72 miles per hour.
- A 100-year event (1-percent annual probability) is 80 miles per hour.

Eight instances of thermal extreme events are listed for Portland between 1996 and 2015; however, this data likely underestimates the occurrence of such events. Extreme heat events can occur several times per year, especially in the summer.

There have been six reported funnel clouds or tornadoes in Portland since 1950. This amounts to about one such event every decade. Tornadoes can occur at any time of the year, with peak seasons at different times for different states (NSSL, 2015). In Oregon, tornadoes have been reported during all seasons; however, almost half of reported tornadoes have been reported in April, May and June (Storm events database, 2016). Based on historical records, tornadoes seem to be least likely in the state from January through March. Two of the tornadoes in or near Portland occurred in April and one occurred in November.

7.2.4 Severity

The most common problems associated with severe storms are immobility and loss of utilities. Fatalities are uncommon, but can occur. Roads may become impassable due to flooding, downed trees or a landslide. Power lines may be downed due to high winds or ice accumulation, and services such as water or phone may not be able to operate without power. Lightning can cause severe damage and injury. Physical damage to homes and facilities can be caused by wind, accumulation of snow or ice, and flooding resulting from heavy rain events. Even a small accumulation of snow can cause havoc on transportation systems.

Windstorms can be a frequent problem in Portland and have been known to cause damage to utilities. The predicted wind speed given in wind warnings issued by the National Weather Service is for a one-minute average; gusts may be 25 to 30 percent higher. Lower wind speeds typical in the lower valleys are still high enough to knock down trees and power lines and cause other property damage.

Ice storms accompanied by high winds can have especially destructive impacts, especially on trees, power lines, and utility services. While sleet and hail can create hazards for motorists when they accumulate, freezing rain can cause the most dangerous conditions in Portland. Ice buildup can bring down trees, communication towers and wires, creating hazards for property owners, motorists and pedestrians. Rain can fall on frozen streets, cars, and other sub-freezing surfaces, creating dangerous conditions.

The severity of an extreme heat event depends on how early the event occurs in the summer and the number of consecutive days it lasts (U.S. EPA, 2006). Urban heat island effect can exacerbate the severity of an extreme heat event. While the severity of an extreme heat event may vary, impacts include increased energy consumption, elevated emissions of air pollutants and greenhouse gases, compromised human health and comfort, and impaired water quality (U.S. EPA, 2015). Extreme heat can also impact infrastructure by warping bridges, causing roads to buckle, melting runways, and more.

Lightning severity is typically investigated for both property damage and life safety (injuries and fatalities). The number of reported injuries from lightning is likely to be low.

Tornadoes are potentially the most dangerous of local storms, but they are not common in Portland. If a major tornado were to strike within the populated areas of the city, damage could be widespread. Buildings could be damaged or destroyed. Businesses could be forced to close for an extended period or permanently, fatalities could be high, many people could be homeless for an extended period, and routine services such as telephone or power could be disrupted.

7.2.5 Warning Time

Meteorologists can often predict the likelihood of a severe storm. This can give several days of warning time. However, meteorologists cannot predict the exact time of onset or severity of the storm. Some storms may come on more quickly and have only a few hours of warning time.

7.2.6 Compounding Factors and Secondary Hazards

Secondary Hazards

The most significant secondary hazards associated with severe weather are floods, falling and downed trees, landslides and downed power lines. Rapidly melting snow combined with heavy rain can overwhelm both natural and man-made drainage systems, causing overflow and property destruction. Landslides occur when the soil on slopes becomes oversaturated and fails. Air quality issues can be exacerbated by severe weather events, particularly excessive heat. High temperatures can increase ground level ozone, a local air pollutant (City of Portland and Multnomah County, 2014).

Compounding Factors

El Niño-Southern Oscillation

The El Niño-Southern Oscillation (ENSO) climate pattern creates increased weather volatility such as hotter summers and colder winters, intense thunderstorms, lightning, hail, snow storms, freezing rain/ice storms, high winds and tornadoes. ENSO consists of two weather phenomena: El Niño and La Niña. While ENSO activities are not a hazard, they can lead to severe weather events and large-scale damage throughout Oregon, including Portland. Direct correlations were found linking ENSO events to severe weather across the Pacific Northwest, particularly drought, flooding and severe winter storms (Oregon, 2004 as cited in NHMP, 2010). Therefore, increased awareness and understanding of the impacts of ENSO events on regional weather are important (NHMP, 2010).

Climate Change

Several facets of climate change are likely to have impacts on the severe weather hazard that may increase the frequency of severe weather and result in those events becoming more extreme. Generally, these impacts are related to the following parameters (EPA, 2016):

- **Frequency**—Are events occurring more often than they did in the past?
- **Intensity**—Are events getting more severe, with the potential for more damaging effects?
- **Duration**—Are events lasting longer than "the norm"?
- **Timing**—Are events occurring earlier or later in the season or the year than they used to?

Figure 7-8 illustrates how the shift in climate normal can result in an increased frequency of extreme events.

Source: EPA, 2016

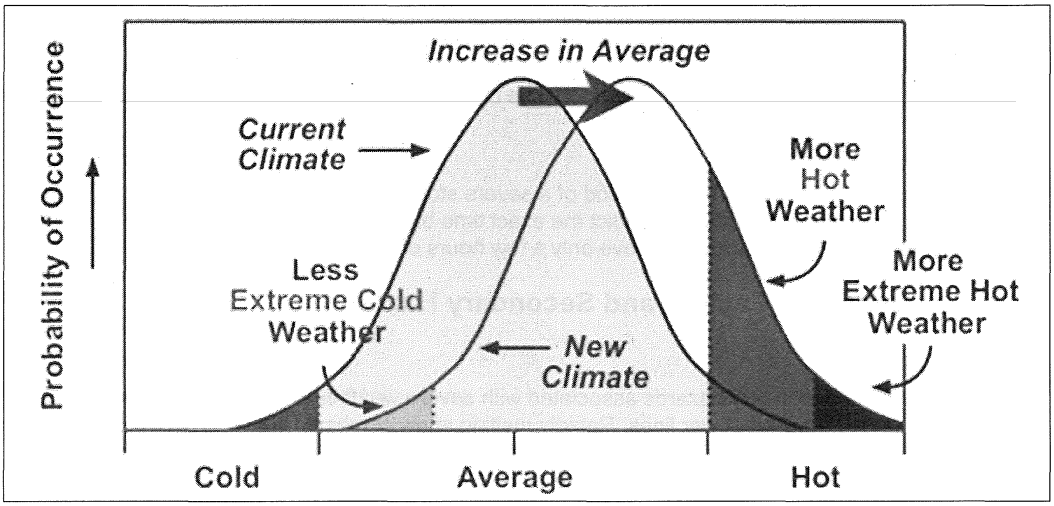

Figure 7-8. Impacts of Climate on Probability of Extreme Events

According to the *City of Portland and Multnomah County Climate Change Risk and Vulnerability Assessment* (2014), the following climate parameters related to severe weather are likely to have impacts for the City of Portland:

- Increase in average annual air temperature and likelihood of extreme heat events
- Changes in hydrology and water supply:
  - Reduced snowpack and water availability in some basins
  - Changes in water quality and timing of water availability (winter precipitation may be increasing)
- Increased incidence and magnitude of damaging floods and frequency of extreme precipitation events.

7.3 EXPOSURE

Portland's many micro-climates, hills and valleys, and the Columbia Gorge all contribute to weather variations. With major transportation routes that could be affected by ice and snow, bridges and hills to cross to get from one part of the city to the next and the economic impact of road closures, the exposure and vulnerability of the City to severe weather events is a reality every year (NHMP, 2010).

7.3.1 Population

All of Portland is exposed to some extent to severe weather. Some areas are more exposed due to geographic location and local weather patterns. People living at higher elevations with large stands of trees or power lines may be more susceptible to wind damage and lightning strikes. People in low-lying areas are at risk for possible flooding. People in densely populated urban areas without air conditioning, working outside, or in industrial corridors are likely to be more exposed to extreme heat events.

Economically disadvantaged households may be more exposed if heat and electricity are turned off during winter months. Residents who lack proper shelter are also more likely to be exposed to negative impacts from severe weather.

7.3.2 Property

According to the Multnomah County Assessor records used for this analysis, there are 193,837 structures in Portland. Most of these buildings are residential. All of these buildings are considered to be exposed to the severe weather hazard, but structures in poor condition or in particularly vulnerable locations (located on hilltops or exposed open areas) may risk the most damage. The frequency and degree of damage will depend on specific locations.

7.3.3 Critical Facilities and Infrastructure

All critical facilities exposed to flooding and landslide (see Chapters 10 and 11) are also likely exposed to severe weather. Additional facilities on higher ground may be exposed to damage from wind of falling trees. The most common problems associated with severe weather are loss of utilities. Downed power lines can cause blackouts, isolating large areas. Phone, water and sewer systems may not function. Roads may become impassable due to ice or snow or from secondary hazards such as landslides.

7.3.4 Environment

The environment is highly exposed to severe weather events. Natural habitats such as streams and trees are exposed to the elements during a severe storm and risk major damage and destruction. Prolonged rains can saturate soils and lead to slope failure. Flooding events caused by severe weather or snowmelt can produce river channel migration or damage riparian habitat.

7.4 VULNERABILITY

7.4.1 Population

Populations most vulnerable to severe weather events are those that are dependent on electricity for life support or that lack proper shelter. The elderly, young and persons with access and functional needs may be more vulnerable during extended power outages, especially if they are isolated. Population vulnerabilities to specific types of severe weather event are as follows:

- **Thermal Extremes**—Individuals with physical or mobility constraints, cognitive impairments, economic constraints, or social isolation are typically at greater risk to the adverse effects of excessive heat events. The average summertime mortality for excessive heat events is dependent upon the methodology used to derive such estimates. Certain medical conditions, such as heat stroke, can be directly attributable to excessive heat, while others may be exacerbated by excessive heat, resulting in medical emergencies. Individuals who lack shelter and heating are particularly vulnerable to extreme cold and wind chill.
- **Thunderstorms**—Nationally, lighting is one of the leading causes of weather-related fatalities (CDC, 2013). Lightning strikes are far more common in other areas of the country than they are in the Pacific Northwest. The majority of injuries and deaths associated with lighting strikes occur when people are outdoors; about one-third of lightning-related injuries occur indoors. Males are five times more likely than females to be struck by lighting and people between the ages of 15 and 34 account for 41 percent of all lightning strike victims (CDC, 2013).
- **Windstorms and Tornadoes**—Debris carried by extreme winds and trees felled by gusty conditions can contribute directly to loss of life and indirectly to the failure of buildings and other

structures that offer protection. Utility lines brought down by thunderstorms have also been known to cause fires, which start in dry roadside vegetation. Electric power lines falling down to the pavement create the possibility of lethal electric shock. Those with physical or mobility constraints may not be able to seek adequate shelter in the event of a tornado.

- **Winter Storms—**Many of the deaths that result from severe winter weather are indirectly related to the actual weather event, including deaths resulting from traffic accidents on icy roads and heart attacks while shoveling snow. Icy road conditions that lead to major traffic accidents can make it difficult for emergency personnel to travel. This may pose a secondary threat to life if police, fire, and medical personnel cannot respond to calls. Homeless populations that lack adequate shelter are also vulnerable to severe winter weather events.

Severe weather may have compounding impacts on socially vulnerable populations. For example, a severe winter storm that prompts school closures may result in the need for a parent to stay home from work to care for the children. Missing work could result in serious economic repercussions for economically disadvantaged households that spiral into much larger issues than a day of missed work.

7.4.2 Property

All property is vulnerable during severe weather events, but properties in poor condition or in particularly exposed locations may risk the most damage. Those in higher elevations and on ridges may be more prone to wind damage. Those that are located under or near overhead lines or near large trees may be vulnerable to falling ice or may be damaged in the event of a collapse. Table 7-3 shows the age of structures in Portland. Modern building code requirements regarding snow load came into effect in 2008. Structures built before 2008 may be more vulnerable to some severe weather events, such as heavy snow.

Table 7-3. Age of Structures in Portland

	Pre-2008[a]		2008-present[a]	
Reporting Area	Number of Structures	Percent	Number of Structures	Percent
Airport	594	92.4%	49	7.6%
Central City	2,575	97.2%	74	2.8%
Central Northeast	17,051	98.0%	355	2.0%
East Portland	42,463	97.0%	1,292	3.0%
North Portland	23,405	95.6%	1,084	4.4%
Northeast	19,932	96.4%	748	3.6%
Southeast	51,502	96.7%	1,768	3.3%
Southwest	22,539	97.5%	585	2.5%
West/Northwest	7,616	97.4%	205	2.6%
Total	**187,677**	**96.8%**	**6,160**	**3.2%**

a. Year built information was collected from Multnomah County Assessor data. When year built information was unavailable, it was estimated based on census block or county-wide average year built dates.

Loss estimations for the severe weather hazard are not based on damage functions, because no such damage functions have been generated. Instead, loss estimates were developed representing 10 percent, 30 percent and 50 percent of the replacement value of exposed structures. This allows emergency managers to select a range of potential economic impact based on an estimate of the percent of damage to the general building stock. Damage in excess of 50 percent is considered to be substantial by most building codes and typically requires total reconstruction of the structure. Table 7-4 lists the loss estimates.

Table 7-4. Loss Potential for Severe Weather

Reporting Area	Exposed Value	Potential Loss @ 1% Damage	@ 2.5% Damage	@ 5% Damage	@ 10% Damage	@ 50% Damage
Airport	$3,953,292,817	$39,532,928	$98,832,320	$1,976,646,409	$395,329,282	$1,976,646,408
Central City	$31,198,797,529	$311,987,975	$779,969,938	$15,599,398,765	$3,119,879,753	$15,599,398,765
Central Northeast	$10,886,322,033	$108,863,220	$272,158,051	$5,443,161,017	$1,088,632,203	$5,443,161,017
East Portland	$26,055,288,004	$260,552,880	$651,382,200	$13,027,644,002	$2,605,528,800	$13,027,644,002
North Portland	$23,502,220,863	$235,022,209	$587,555,522	$11,751,110,432	$2,350,222,086	$11,751,110,432
Northeast	$13,110,911,253	$131,109,113	$327,772,781	$6,555,455,627	$1,311,091,125	$6,555,455,626
Southeast	$30,396,480,542	$303,964,805	$759,912,014	$15,198,240,271	$3,039,648,054	$15,198,240,271
Southwest	$17,794,371,568	$177,943,716	$444,859,289	$8,897,185,784	$1,779,437,157	$8,897,185,784
West/Northwest	$13,908,090,256	$139,080,903	$347,702,256	$6,954,045,128	$1,390,809,026	$6,954,045,128
Total	$170,805,774,865	$1,708,057,749	$4,270,144,372	$85,402,887,433	$17,080,577,487	$85,402,887,433

7.4.3 Critical Facilities and Infrastructure

Incapacity and loss of roads are the primary transportation failures resulting from severe weather, mostly associated with secondary hazards. Landslides caused by heavy prolonged rains can block roads. High winds can cause significant damage to trees and power lines, blocking roads with debris, incapacitating transportation, isolating population, and disrupting ingress and egress. Snowstorms in higher elevations can significantly impact the transportation system and the availability of public safety services. Of particular concern are roads providing access to isolated areas and to the elderly.

Severe windstorms, downed trees, and ice can create serious impacts on power and above-ground communication lines. Freezing of power and communication lines can cause them to break, disrupting electricity and communication. Loss of electricity and phone connection would leave certain populations isolated because residents would be unable to call for assistance.

7.4.4 Environment

The vulnerability of the environment to severe weather is the same as the exposure.

7.4.5 Economic Impact

Prolonged obstruction of major routes due to landslides, snow, debris or floodwaters can disrupt the shipment of goods and other commerce. Large, prolonged storms can have negative economic impacts for an entire region.

7.5 FUTURE TRENDS IN DEVELOPMENT

All future development will be affected by severe storms. The ability to withstand impacts lies in sound land use practices and consistent enforcement of codes and regulations for new construction. The City of Portland has adopted the International Building Code. This code is equipped to deal with the impacts of severe weather events. Land use policies identified in the comprehensive plan also address many of the secondary impacts (flood and landslide) of the severe weather hazard. Additionally, the City of Portland has begun efforts to reduce severe weather impacts through low impact development and green infrastructure standards. With these tools, the City of Portland is well equipped to deal with future growth and the associated impacts of severe weather.

7.6 SCENARIO

A worst-case event would involve prolonged high winds during a snowstorm accompanied by freezing temperatures, followed by warmer weather and continued rain. Such an event would have both short-term and longer-term effects. Initially, schools and roads would be closed due to snow and downed tree obstructions. Power outages would be common. Later, as the weather warms and snow turns to rain, the sudden runoff could produce severe urban flooding in low-lying areas and landslides on steep slopes.

7.7 ISSUES

Important issues associated with a severe weather in Portland include the following:

- Redundancy of power supply throughout Portland must be evaluated to better understand which areas may be vulnerable.
- Many critical facilities in Portland may have limited or inadequate backup power generation, with only enough fuel on hand to run emergency generators for a short amount of time. This may result in loss of services, such as potable water, during extended power outages or may present risks to vulnerable populations such as those in hospitals or other care facilities.
- Debris management (downed trees, etc.) must be addressed, because debris can impact the severity of severe weather events, requires coordination efforts, and may require additional funding. A debris management plan is currently being developed.
- The effects of climate change may result in an increase in frequency of extreme heat events or more frequent, stronger storm systems.
- Older building stock in Portland is built to low code standards or none at all. These structures could be highly vulnerable to severe winter weather effects such as snow loads or high winds.
- Urban forest management programs should be evaluated to help reduce impacts from forest-related damage.
- Severe weather events cause or exacerbate many secondary hazard including power outages, poor air quality and landslides.
- Drainage systems and culverts in Forest Park and other areas throughout the City can and have been overwhelmed by heavy precipitation events, causing erosion and costly damage to fire access roads.

8. EARTHQUAKE

8.1 GENERAL BACKGROUND

8.1.1 How Earthquakes Happen

An earthquake is the vibration of the earth's surface following a release of energy in the earth's crust. This energy can be generated by a sudden dislocation of the crust or by a volcanic eruption. Most destructive quakes are caused by dislocations of the crust. The crust may first bend and then, when the stress exceeds the strength of the rocks, break and snap to a new position. In the process of breaking, vibrations called "seismic waves" are generated. These waves travel outward from the source of the earthquake at varying speeds. There are two main types of seismic waves (Michigan Technical University, 2007):

DEFINITIONS

- **Earthquake**—A sudden slip on a fault, volcanic or magmatic activity, and sudden stress changes in the earth that result in ground shaking and radiated seismic energy.
- **Liquefaction**—The complete failure of soils occurring when soils lose shear strength, flow horizontally, and behave like viscous fluids when liquefaction occurs.
- **Magnitude**—The measure of the strength of an earthquake, typically measured by the Richter scale. Each whole number step in the magnitude scale corresponds to the release of about 31 times more energy than the amount associated with the preceding whole number.

- Body waves travel through the earth's interior. They include P waves (primary waves) and S waves (secondary waves). P waves travel through solids and fluids, sending particles in the same direction that the wave is moving. Some animals, such as dogs, are able to hear P waves. S waves are the waves that are felt during an earthquake. These waves travel more slowly than P waves and are only transmitted through rock. S waves move particles up and down.
- Surface waves travel along the surface. They are lower frequency than body waves and arrive later. It is these waves that are primarily responsible for the destruction resulting from earthquakes. S waves also come in two types: Love waves and Rayleigh waves. Love waves travel exclusively on the surface of the earth and produce horizontal motion. Rayleigh waves travel like ocean waves, rolling the ground up and down. Most of the shaking felt during earthquakes is the result of these waves.

Earthquakes tend to reoccur along faults, which are zones of weakness in the crust. Even if a fault zone has recently experienced an earthquake, there is no guarantee that all the stress has been relieved. Another earthquake could still occur.

8.1.2 Types of Earthquakes

Four types of earthquakes affect the Portland area (see Figure 8-1):

- **Shallow Crustal earthquakes**—Shallow crustal earthquakes occur in the North America plate at depths of 20 miles or less (PNSN, n.d. a). These types of earthquakes occur frequently in the Pacific Northwest. Most are relatively small, but large, damaging events in the region have and will continue to occur. Generally, these earthquakes are expected to last from 20 to 60 seconds, with magnitudes less than 7.5. Aftershocks are likely (see #4 in Figure 8-1) (CREW, 2009).

Source: DOGAMI, 2010

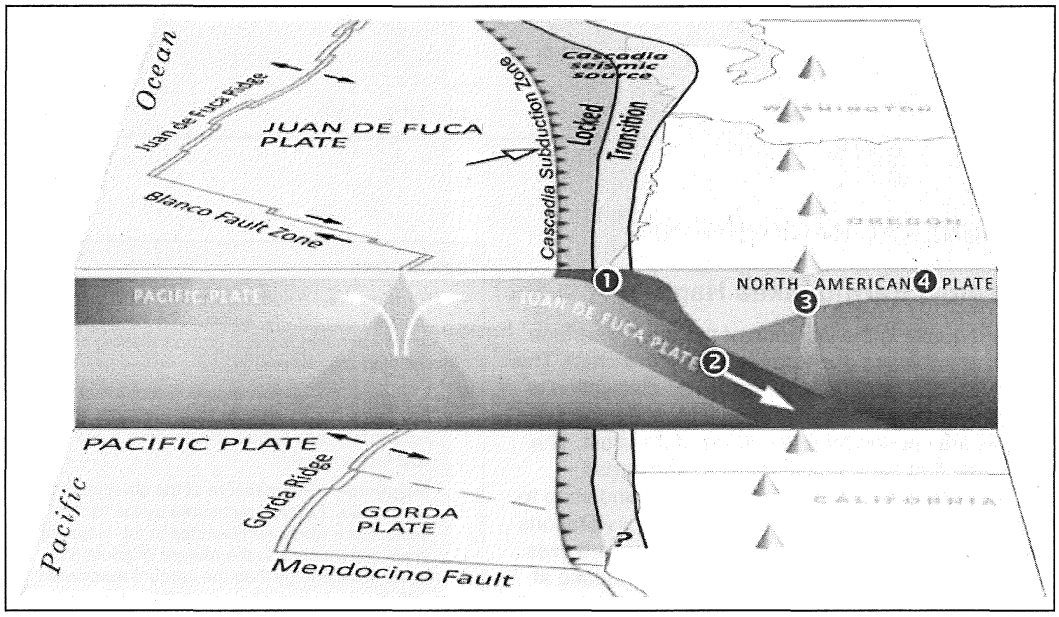

Figure 8-1. Earthquake Types in Oregon

- **Benioff Zone (Deep or Intraplate) Earthquakes**—Benioff Zone earthquakes occur in the Juan De Fuca plate as moves below the North American plate. They are deep earthquakes, 20 miles or more in depth (PNSN, n.d. b). Shaking from these earthquakes can last up to 60 seconds. Due to their depth, aftershocks are typically not felt. Generally, these earthquakes cause less damage than shallow earthquakes of similar magnitude but are felt over a wider area (CREW, 2009) (see #2 in Figure 8-1)
- **Subduction Zone Earthquakes**—Subduction Zone earthquakes occur at the interface between tectonic plates. A subduction zone earthquake affecting the City of Portland would be centered in the Cascadia Subduction Zone off the coast of Washington or Oregon. Such earthquakes typically have a minute or more of strong ground shaking, and are quickly followed by damaging tsunamis and numerous large aftershocks. The potential exists for large earthquakes along the Cascadia Subduction Zone, with a magnitude of 9 or more (CREW, 2009). This could produce a tsunami all along the fault line from British Columbia to Mendocino, California. The tsunami would not impact the City of Portland; however, lateral spreading and ground settlement would likely occur. Such an earthquake would produce catastrophic damage in the region (see #1 in Figure 8-1).
- **Volcanic activity** related seismic events, such as those occurring before an eruption of one of the volcanoes in the nearby Cascade Mountain Range, can also impact Portland. Such earthquakes can reach a magnitude of 5.5. The earthquake preceding the 1980 Mt. Saint Helens eruption was a magnitude 5.1 (see #3 in Figure 8-1) (Oregon Department of Land Conservation and Development, 2015).

8.1.3 Faults

Geologists classify faults by their relative hazards. Active faults, which represent the highest hazard, are those that have ruptured to the ground surface within the last 11,000 years. Potentially active faults are those that displaced layers of rock within the last 1.8 million years. Determining if a fault is active or potentially active depends on geologic evidence, which is not available for every fault. Additionally, earthquakes may occur on faults that have not been mapped and identified.

Faults are more likely to have earthquakes on them if they have more rapid rates of movement, have had recent earthquakes along them, experience greater total displacements, and are aligned so that movement can relieve accumulating tectonic stresses. A direct relationship exists between a fault's length and location and its ability to generate damaging ground motion at a given site. In some areas, smaller, local faults produce lower magnitude quakes, but ground shaking can be strong, and damage can be significant as a result of the fault's proximity to the area. In contrast, large regional faults can generate great magnitudes but, because of their distance and depth, may result in only moderate shaking in the area.

8.1.4 Earthquake Classifications

Earthquakes are typically classified in one of two ways: By the amount of energy released, measured as **magnitude**; or by the impact on people and structures, measured as **intensity**. Magnitude describes the size at the focus of an earthquake and intensity describes the overall felt severity of shaking during the event.

Magnitude

An earthquake's magnitude is a measure of the energy released at the source of the earthquake. It is expressed by ratings on the local magnitude scale (ML), commonly called the Richter scale, or the moment magnitude scale (M_w). Currently the most commonly used magnitude scale is the moment magnitude scale, with the follow classifications of magnitude:

- Great—$M_w \geq 8$
- Major—$M_w = 7.0 - 7.9$
- Strong—$M_w = 6.0 - 6.9$
- Moderate—$M_w = 5.0 - 5.9$
- Light—$M_w = 4.0 - 4.9$
- Minor—$M_w = 3.0 - 3.9$
- Micro—$M_w < 3$

One advantage of the moment magnitude scale is that, unlike other magnitude scales, it does not saturate at the upper end. That is, there is no value beyond which all large earthquakes have about the same magnitude. For this reason, moment magnitude is now the most often used estimate of large earthquake magnitudes. The magnitudes referenced in the scenario events used in the risk analysis are expressed in the moment magnitude scale.

Intensity

The intensity of an earthquake is based on the observed effects of ground shaking on people, buildings and natural features. Intensity of a given earthquake varies with location. The Modified Mercalli (MMI) scale expresses intensity of an earthquake and describes how strong a shock was felt at a particular location. Table 8-1 summarizes earthquake intensity as expressed by the Modified Mercalli scale.

Table 8-1. Mercalli Scale and Peak Ground Acceleration Comparison

Modified Mercalli Scale	Perceived Shaking	Potential Structure Damage		Estimated PGA[a] (%g)
		Resistant Buildings	Vulnerable Buildings	
I	Not Felt	None	None	<0.17%
II-III	Weak	None	None	0.17% - 1.4%
IV	Light	None	None	1.4% - 3.9%
V	Moderate	Very Light	Light	3.9% - 9.2%
VI	Strong	Light	Moderate	9.2% - 18%
VII	Very Strong	Moderate	Moderate/Heavy	18% - 34%
VIII	Severe	Moderate/Heavy	Heavy	34% - 65%
IX	Violent	Heavy	Very Heavy	65% - 124%
X – XII	Extreme	Very Heavy	Very Heavy	>124%

a. PGA measured in percent of g, where g is the acceleration of gravity
Sources: USGS, 2008a; USGS, 2010

8.1.5 Ground Motion

Earthquake hazard assessment is also based on expected ground motion. This involves determining the annual probability that certain ground motion accelerations will be exceeded, then summing the annual probabilities over the time period of interest. The most commonly mapped ground motion parameters are the horizontal and vertical peak ground accelerations (PGA) for a given soil or rock type. Instruments called accelerographs record levels of ground motion due to earthquakes at stations throughout a region. These readings are recorded by state and federal agencies that monitor and predict seismic activity.

Maps of PGA values form the basis of seismic zone maps that are included in building codes such as the International Building Code. Building codes that include seismic provisions specify the horizontal force due to lateral acceleration that a building should be able to withstand during an earthquake. PGA values are directly related to these lateral forces that could damage "short period structures" (e.g. single-family dwellings). Longer period response components determine the lateral forces that damage larger structures with longer natural periods (apartment buildings, factories, high-rises, bridges). Table 8-1 lists damage potential and perceived shaking by PGA factors, compared to the Mercalli scale.

8.1.6 Effect of Soil Types

The impact of an earthquake on structures and infrastructure is largely a function of ground shaking, distance from the source of the quake, and soil conditions and types. Liquefaction is a secondary effect of an earthquake in which soils lose their shear strength and flow or behave as liquid, thereby damaging structures that derive their support from the soil. Liquefaction generally occurs in soft sedimentary soils. A program called the National Earthquake Hazard Reduction Program (NEHRP) creates maps based on soil characteristics to help identify locations subject to liquefaction. Table 8-2 summarizes NEHRP soil classifications. NEHRP Soils B and C typically can sustain ground shaking without much effect, dependent on the earthquake magnitude. The areas that are commonly most affected by ground shaking have NEHRP Soils D, E and F. In general, these areas are also most susceptible to liquefaction.

Table 8-2. NEHRP Soil Classification System

NEHRP Soil Type	Description	Mean Shear Velocity to 30 meters
A	Hard Rock	1,500 meters/second
B	Firm to Hard Rock	760-1,500 meters/second
C	Dense Soil/Soft Rock	360-760 meters/second
D	Stiff Soil	180-360 meters/second
E	Soft Clays	< 180 meters/second
F	Special Study Soils (liquefiable soils, sensitive clays, organic soils, soft clays >36 m thick)	

8.2 HAZARD PROFILE

8.2.1 Past Events

Table 8-3 summarizes recorded historical earthquakes from before the current era (BCE) to the present that were believed to have been felt or to have caused damage in Portland. The largest recorded earthquake epicenter within 100 miles of Portland occurred in Scotts Mills on March 25, 1993. Its magnitude was 5.6 and it caused minor damage to some buildings. The shaking was intense enough to require damage assessment team deployments to perform bridge and key infrastructure inspections (NHMP, 2010). Federal disaster declaration DR-985, issued in response to this earthquake, applied to Clackamas and Washington Counties. There is geologic evidence that a magnitude 6.5 event may have occurred on the Portland Hills fault zone within the past 10,000 years; but, no events on that fault have been recorded in historic times (DOGAMI, 2001).

Table 8-3. Historical Earthquake Events in or Impacting Portland

Date	Location	Magnitude
February 2001[a]	Nisqually, Washington	6.8
March 25, 1993[b]	33.5 miles from Portland	5.6
1989[b]	82 miles from Portland	5.1
1981[b]	38 miles from Portland	5.5
1980[b]	60 miles from Portland	5.0
1980[b]	53 miles from Portland	5.0
March 27, 1964 [b]	Prince William Sound, Alaska	9.2
December 1963[a]	Portland area	4.5
November 1962[a]	Portland area	5.5
November 1961[a]	Portland area	5.0
December 1953[a]	Portland area	4.5
April 1949[a]	Olympia, Washington	7.1
December 1941[a]	Portland area	4.5
February 1892[a]	Portland area	5.0
October 1877[a]	Portland area	5.2
January 1700[a]	Cascadia Subduction Zone	About 9.0
1400 BCE, 1050 BCE, 600 BCE, 400 BCE, 400, 750, 900[a]	Cascadia Subduction Zone	Probably 8.0-9.0

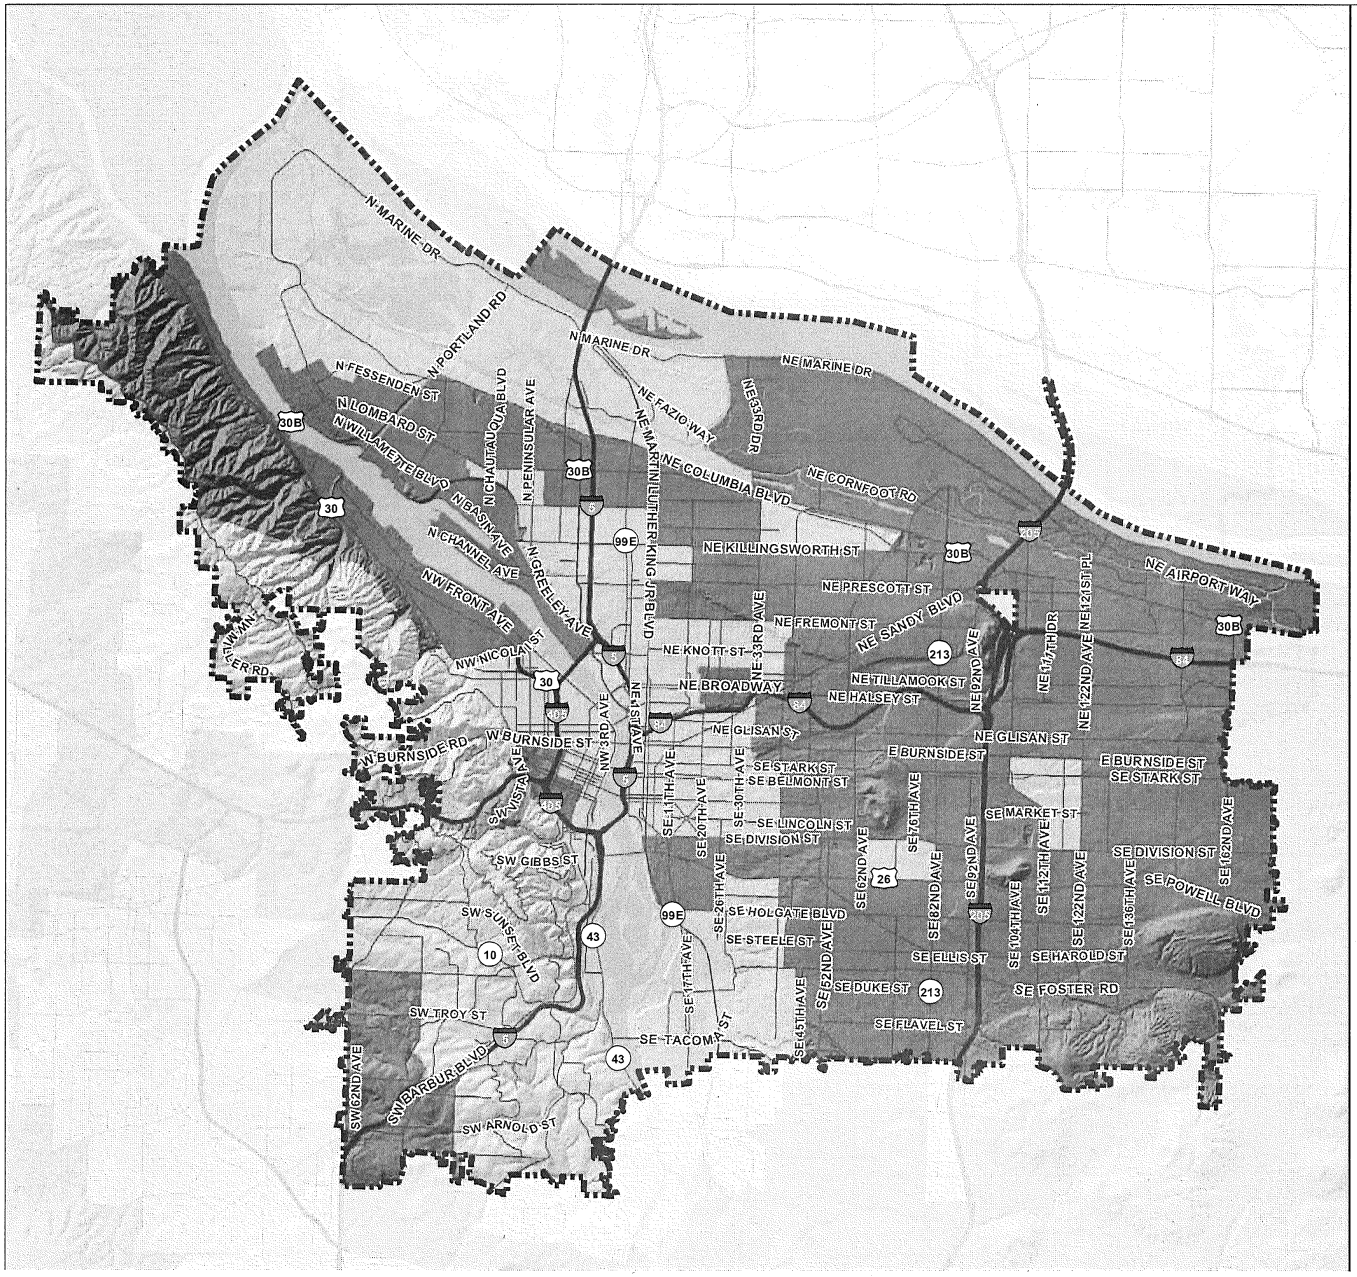
8.2.2 Location

Identifying the extent and location of an earthquake is not as simple as it is for other hazards such as flood, landslide or wildfire. The impact of an earthquake is a function of ground shaking, soil condition and type, and distance from the source (both horizontally and vertically). Mapping that shows the impacts of these components was used to assess the risk of earthquakes in Portland. While the impacts from each of these components can build upon each other during an earthquake event, the mapping looks at each component individually.

Identified Faults

The convergence of the Juan de Fuca and North American tectonic plates puts most areas of western Oregon, including the City of Portland, at risk for a catastrophic earthquake with a Magnitude 9 or higher. Figure 8-2 shows identified faults in and near the City of Portland. The City straddles three identified crustal faults (Oregon Department of Land Conservation and Development, 2015):

- The Oatfield fault, west of the northwest hills
- The East Bank fault, traversing the Willamette River into Oregon City
- The Portland Hills fault, running parallel to Forest Park into downtown Portland.



Shake Maps

A shake map is a representation of ground shaking produced by an earthquake. The information it presents is different from the earthquake magnitude and epicenter that are released after an earthquake because shake maps focus on the ground shaking resulting from the earthquake, rather than the parameters describing the earthquake source. An earthquake has only one magnitude and one epicenter, but it produces a range of ground shaking at sites throughout the region, depending on the distance from the earthquake, the rock and soil conditions at sites, and variations in the propagation of seismic waves from the earthquake due to complexities in the structure of the earth's crust. A shake map shows the extent and variation of ground shaking in a region immediately following significant earthquakes.

Ground motion and intensity maps are derived from peak ground motion amplitudes recorded on seismic sensors (accelerometers), with interpolation based on estimated amplitudes where data are lacking, and site amplification corrections. Color-coded instrumental intensity maps are derived from empirical relations between peak ground motions and Modified Mercalli intensity. Two types of shake map are typically generated from the data:

- A probabilistic seismic hazard map shows the hazard from earthquakes that geologists and seismologists agree are statistically likely to occur in a given time period. Figure 8-3 and Figure 8-4 show the estimated ground motion for the 100-year and 500-year probabilistic earthquakes in Portland.
- Earthquake scenario maps describe the expected ground motions and effects of hypothetical large earthquakes for a region. Two scenarios were chosen for this plan:
    - Cascadia Subduction Zone Scenario—A Magnitude 9.0 event off the Pacific Coast. See Figure 8-5.
    - Portland Hills Fault Scenario—A Magnitude 6.5 event with the epicenter near the border of Washington and Oregon. See Figure 8-6.

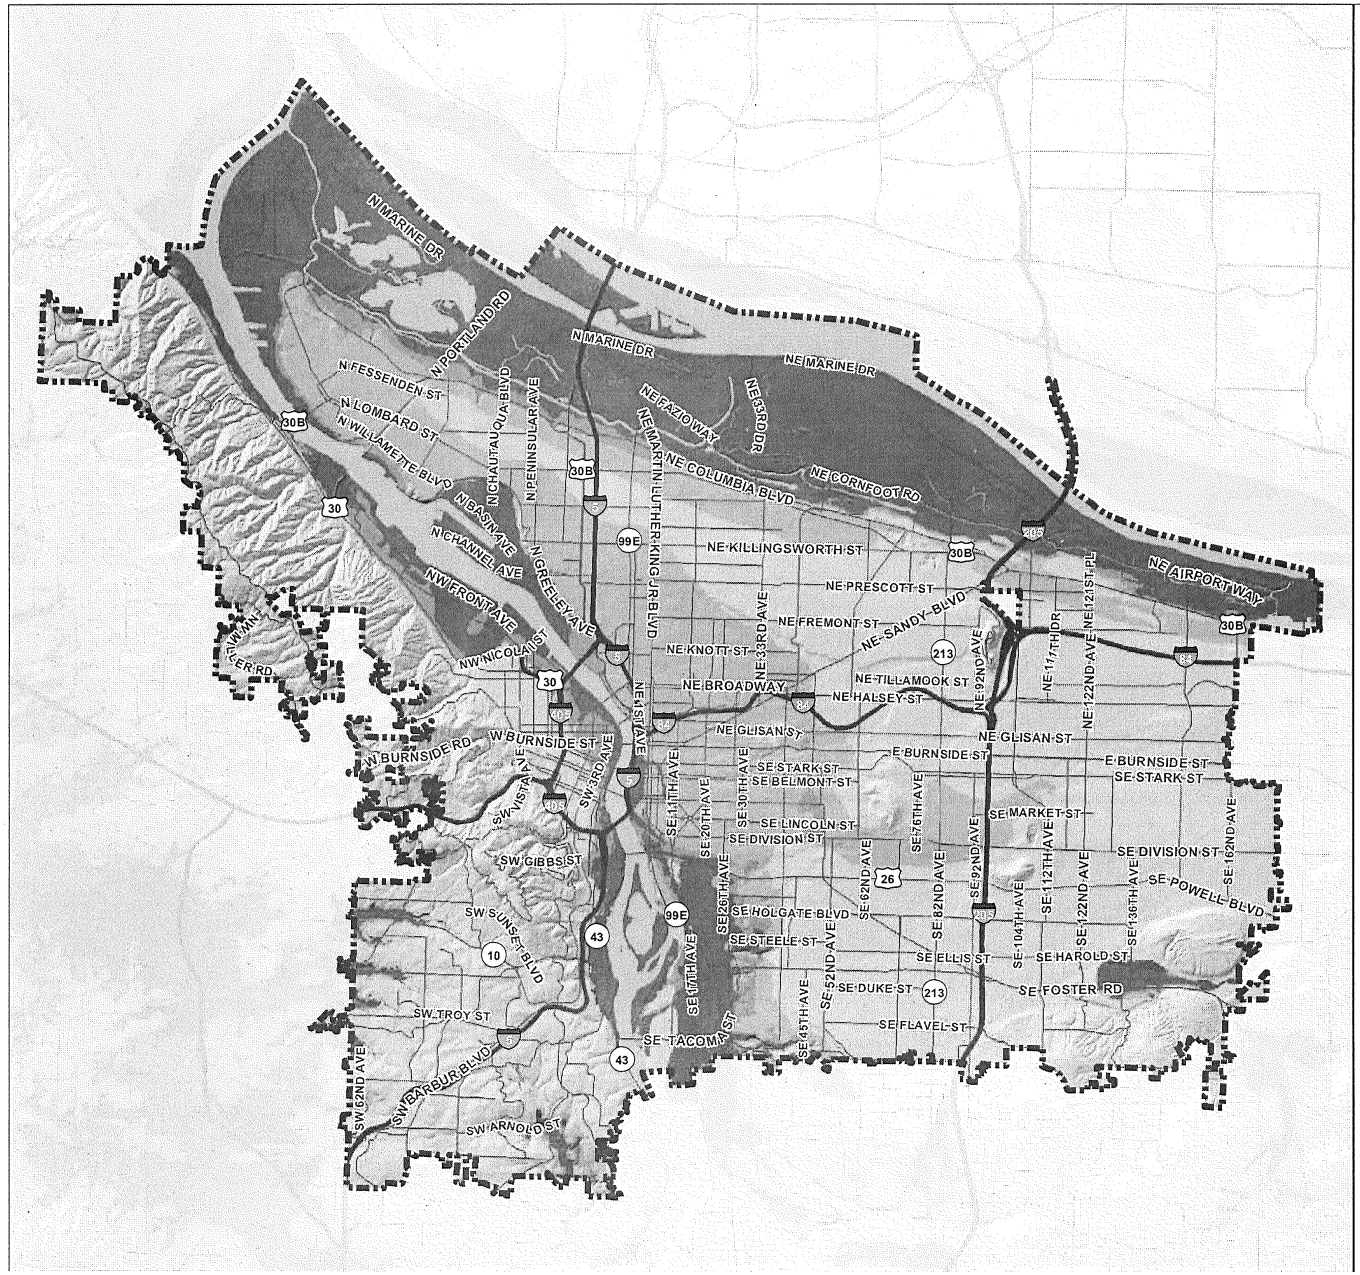
NEHRP Soil Maps

NEHRP soil types define the locations that will be significantly impacted by an earthquake. NEHRP Soils B and C typically can sustain low-magnitude ground shaking without much effect. The areas that are most commonly affected by ground shaking have NEHRP Soils D, E and F. Figure 8-7 shows NEHRP soil classifications in Portland.

Liquefaction Maps

Soil liquefaction maps are useful tools to assess potential damage from earthquakes. When the ground liquefies, sandy or silty materials saturated with water behave like a liquid, causing pipes to leak, roads and airport runways to buckle, and building foundations to be damaged. In general, areas with NEHRP Soils D, E and F are also susceptible to liquefaction. If there is a dry soil crust, excess water will sometimes come to the surface through cracks in the confining layer, bringing liquefied sand with it, creating sand boils. Figure 8-8 shows the liquefaction susceptibility in Portland.

8.2.3 Frequency



Many earthquake faults capable of producing damaging earthquakes exist in Portland. The greatest risk is from the Cascadia Subduction Zone fault, which lies just offshore of the Oregon coast. The Cascadia Subduction Zone has produced over 40 large magnitude earthquakes during the past 10,000 years, most recently on January 26, 1700. Based on the 10,000-year record of past Cascadia earthquakes, Oregon will certainly experience another Magnitude 8 to 9 earthquake (Goldfinger et al., 2012). The fault is divided into roughly four segments. Geologic records indicate that sometimes the entire fault ruptures at the same time and sometimes only some of the segments are involved (Stauth, 2016). It is believed that the southern portions of the fault rupture more frequently (between 220 and 380 years on average) and northern sections, most likely to impact Portland, rupture every 350 to 430 years on average (Stauth, 2016). Recent research conducted by Chris Goldfinger at Oregon State University indicates that a rupture of the segment off central and northern Oregon has a 15- to 20-percent chance of occurring in the next 50 years, while a rupture on the northern portion of the fault during the same time period has 10 to 17 percent chance of occurring in the next 50 years (Stauth, 2016). A large earthquake on this fault, which has the same type of subduction zone process as the 2011 Magnitude 9 earthquake in Japan, will be accompanied by a coastal tsunami.

The Portland Hills fault is located along the west bank of the Willamette River and can produce a Magnitude 7 earthquake (USGS, 2008a). The estimated likelihood of this earthquake occurring is 1 percent in the next 50 years (USGS, 2016d). The fault is 30 miles long and consists of a complex of fault zones, which include the Oatfield and East Bank faults (DOGAMI, 2001 and Wong et al., 2001).

The Portland Hills fault runs northwest to southeast through Portland. According to DOGAMI, "It starts roughly on the northern edge of Forest Park and runs along the foot of Portland's West Hills before turning east on West Burnside Street for a few blocks and then turning southeast again through the heart of downtown. The fault then crosses the Willamette River between the Marquam and Ross Island bridges to Milwaukie and ends about a mile south of the Clackamas River near Oregon City and Gladstone" (DOGAMI, 2001).

The Oatfield fault runs west of Northwest Skyline Road from Sylvan Hill to Germantown Road through Bonny Slope (DOGAMI, 2001). The East Bank fault on the east side of the Willamette River runs under the University of Portland, Mocks Bottom, the Oregon Convention Center, Lloyd Center and Benson and Central Catholic high schools. It appears to have been active within the last 11,000 years (DOGAMI, 2001 and Wong et al., 2001).

8.2.4 Severity

The severity of an earthquake can be expressed in terms of intensity or magnitude. Intensity represents the observed effects of ground shaking on people, buildings, and natural features. The USGS has created ground motion maps based on current information about several fault zones. These maps show the PGA that has a certain probability (2 percent or 10 percent) of being exceeded in a 50-year period. This can also be understood as a 0.04 percent annual chance of occurrence (roughly a 2,500-year event) or a 0.2-percent annual chance (roughly a 500-year event), respectively. The PGA is measured in numbers of g's (the acceleration associated with gravity). Figure 8-9 shows the PGAs with a 2-percent exceedance chance in 50 years in the United States.

Magnitude is related to the amount of seismic energy released at the hypocenter of an earthquake. The hypocenter is the point in the earth where are earthquake rupture starts. It is determined by the amplitude of the earthquake waves recorded on instruments. Whereas intensity varies depending on location with respect to the earthquake epicenter, magnitude is represented by a single, instrumentally determined value for each earthquake event.

Earthquakes can last from a few seconds to over 5 minutes; they may also occur as a series of tremors over several days. The actual movement of the ground in an earthquake is seldom the direct cause of injury or death. Casualties generally result from falling objects and debris, because the shocks shake, damage or demolish buildings and other structures. Disruption of communications, electrical power supplies and gas, sewer and water lines should be expected. Earthquakes may trigger fires, landslides or releases of hazardous material, compounding their disastrous effects. Additionally, earthquakes may induce dam failures. After the 1999 Chi earthquake in Taiwan, the Shi-kang Dam failed after one side of the concrete structure was raised by 30 feet by ground deformation (RMS, 2000).

Small, local faults produce lower magnitude quakes, but ground shaking can be strong and damage can be significant in areas close to the fault. In contrast, large regional faults can generate earthquakes of great magnitudes but, because of their distance and depth, they may result in only moderate shaking in an area.

In simplistic terms, the severity of an earthquake event can be measured in the following terms:

- How hard did the ground shake?
- How did the ground move? (Horizontally or vertically)
- How stable was the soil?
- How susceptible is the built environment in the area of impact (for example, building codes used and presence of unreinforced masonry buildings)?

8.2.5 Warning Time

There is currently no reliable way to predict the day or month that an earthquake will occur at any given location. Research is being done with warning systems that use the low energy waves that precede major earthquakes. The USGS and university partners are developing and testing an early warning system called ShakeAlert for the West Coast of the United States. The potential warning ranges from a few seconds to tens of seconds notice that a major earthquake is about to occur (Earthquake Early Warning, 2016). The warning time is very short but it could allow enough time to stop vehicles from crossing bridges, turn on backup generators, open elevators doors, or slow trains.

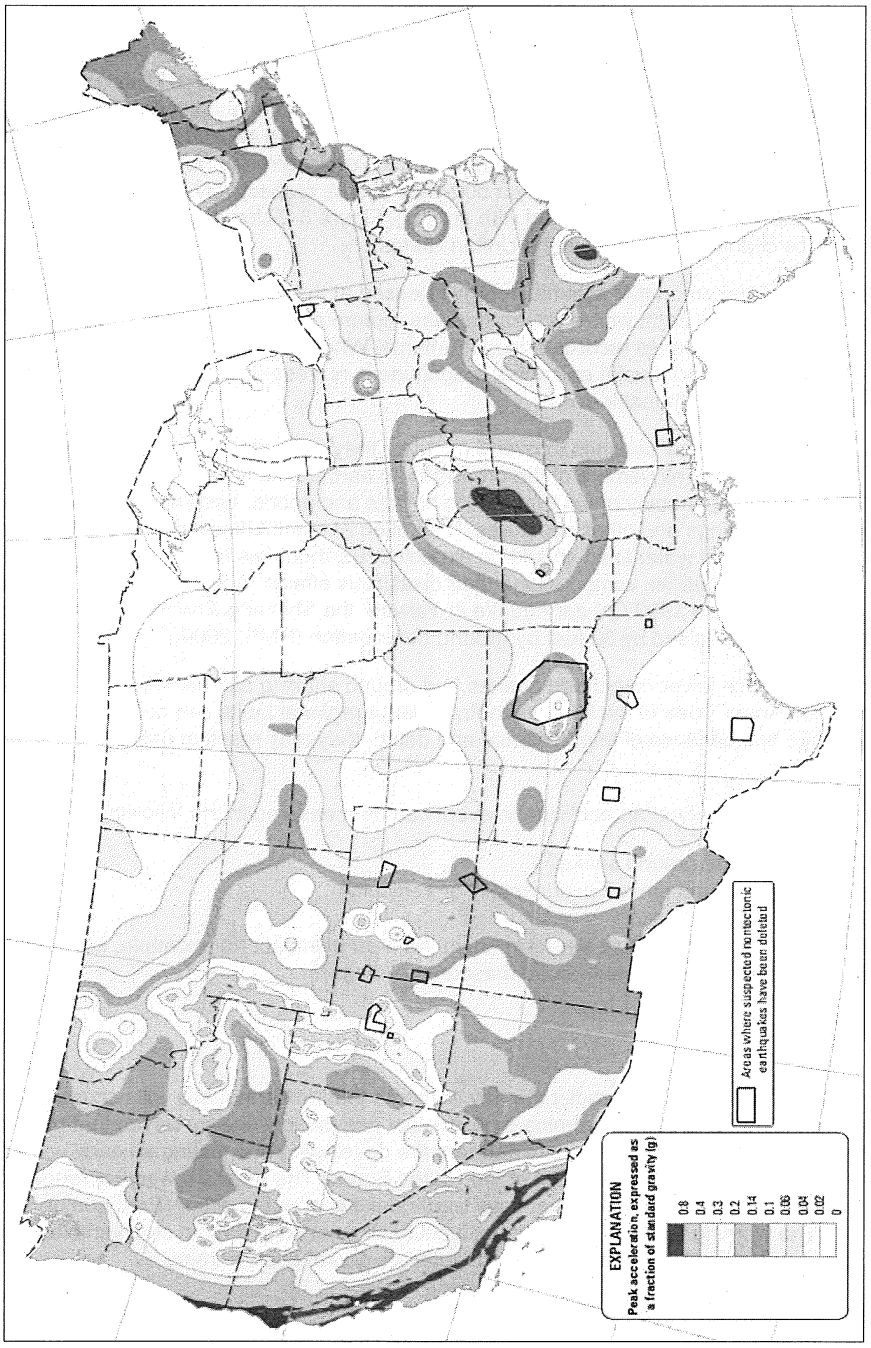

Figure 8-9. PGA with 2-Percent Probability of Exceedance in 50 Years

8.3 COMPOUNDING FACTORS AND SECONDARY HAZARDS

8.3.1 Overview

Earthquakes can cause large and sometimes disastrous landslides and mudslides. River valleys are vulnerable to slope failure, often as a result of loss of cohesion in clay-rich soils. Soil liquefaction occurs when water-saturated sands, silts or gravelly soils are shaken so violently that the individual grains lose contact with one another and float freely in the water, turning the ground into a pudding-like liquid. Building and road foundations lose load-bearing strength and may sink into what was previously solid ground. Unless properly secured, hazardous materials can be released, causing significant damage to the environment and people. Structure fires from broken gas lines also pose a significant hazard after earthquake events.

8.3.2 Climate Change

The impacts of global climate change on earthquake probability are unknown. Some scientists say that melting glaciers could induce tectonic activity. As ice melts and water runs off, tremendous amounts of weight are shifted on the earth's crust. As newly freed crust returns to its original, pre-glacier shape, it could cause seismic plates to slip and stimulate volcanic activity, according to research into prehistoric earthquakes and volcanic activity. NASA and USGS scientists found that retreating glaciers in southern Alaska may be opening the way for future earthquakes (NASA, 2004).

Secondary impacts of earthquakes could be magnified by climate change. Soils saturated by repetitive storms could experience liquefaction or an increased propensity for slides during seismic activity due to the increased saturation. Dams storing increased volumes of water due to changes in the hydrograph could fail during seismic events. There are currently no models available to estimate these impacts.

8.4 EXPOSURE

8.4.1 Population

The entire population of Portland is potentially exposed to direct and indirect impacts from earthquakes. The degree of exposure is dependent on many factors, including the age and construction type of the structures people live in, the soil type their homes are constructed on, their proximity to fault locations, etc. Whether directly impacted or indirectly impact, the entire population will have to deal with the consequences of earthquakes to some degree. Business interruption could keep people from working, road closures could isolate populations, and loss of functions of utilities could impact populations that suffered no direct damage from an event itself.

8.4.2 Property

According to Multnomah County Assessor records, there are 193,837 buildings in Portland, 92.7 percent of them residential, with a total replacement value of $170.8 billion. Since all structures in Portland are susceptible to earthquake impacts to varying degrees, this total represents the citywide property exposure to seismic events.

8.4.3 Critical Facilities and Infrastructure

All critical facilities in Portland are exposed to the earthquake hazard. Table 4-7 and Table 4-8 in Chapter 4 list the number of each type of facility by risk reporting area.

8.4.4 Environment

All environment in Portland is potentially exposed to the earthquake hazard. Habitat could be impacted by lateral spread, ground deformation or secondary impacts of earthquakes, such as landslides. Many of these changes would occur abruptly, such as a change in a stream direction, while others would occur more gradually, such as fallen trees allowing more light into an area and changing the composition of species.

8.5 VULNERABILITY

Earthquake vulnerability data was evaluated using a Level 2 Hazus-MH analysis. Once the location and size of a hypothetical earthquake are identified, Hazus-MH estimates the intensity of the ground shaking, the number of buildings damaged, the damage to critical facilities and infrastructure, the number of people displaced from their homes, and additional information that can be used to estimate the costs of repair and cleanup.

8.5.1 Population

Liquefaction Potential

There are estimated to be 35,966 people—5.6 percent of the total City population—residing in high liquefaction potential areas (see Table 8-4). The Southeast risk reporting area contains the largest share of this population, with an estimated 42 percent (15,111). This is followed by the Southwest risk reporting area with 24.1 percent (8,653), North Portland with 13.7 percent (4,920) and East Portland with 12.6 percent (4,540).

Table 8-4. Population Residing within High Liquefaction Potential Areas

	Population Residing within High Liquefaction Potential Areas [a, b]	
Reporting Area	Population Exposed	% of Exposure
Airport	784	2.2%
Central City	1,625	4.5%
Central Northeast	320	0.9%
East Portland	4,540	12.6%
North Portland	4,920	13.7%
Northeast	0	0.0%
Southeast	15,111	42.0%
Southwest	8,653	24.1%
West/Northwest	12	0.0%
Total	**35,966**	**100.0%**

a. Values based on an analysis of 2010-2014 American Community Survey 5-year estimates at the Census block group level.
b. Values calculated using block group statistics weighted by the number of residential structures in the hazard area as a percentage of the total residential structures in the block.

Table 8-5 shows social vulnerability indicators for the population residing in high liquefaction potential areas. Persons over 65 years of age and renters appear to be disproportionately residing in these areas. Elderly residents may have mobility issues that result in difficulty in moving to safe areas. Renters do not have the authority to make structural changes to their homes and, thus, are unable to pursue structural mitigation measures. They also may lack renters' insurance for their belongings.

Table 8-5. Distribution of Social Vulnerability Indicators in High Liquefaction Potential Areas

Reporting Area	Population Residing in High Liquefaction Potential Areas *a, b, c, d*					
	Percent Under 15 Years	Percent Over 65 Years	Percent of People of Color	Percent of Renter occupied Housing	Percent of Families Below Poverty Level	Percent of Limited English Speaking Households
Airport	5.4%	5.1%	31.8%	68.8%	19.8%	20.6%
Central City	2.6%	7.8%	12.9%	82.4%	13.8%	0.5%
Central Northeast	5.6%	5.2%	32.0%	66.5%	18.9%	19.7%
East Portland	17.6%	14.8%	26.3%	24.9%	10.7%	5.2%
North Portland	14.4%	17.7%	29.2%	22.1%	8.0%	3.8%

Southeast	13.6%	12.0%	12.7%	58.4%	7.3%	2.2%
Southwest	12.1%	16.6%	13.8%	54.1%	4.9%	1.4%
West/Northwest	13.6%	13.3%	11.6%	22.3%	1.4%	0.0%
Total	**13.1%**	**13.8%**	**17.5%**	**50.4%**	**7.6%**	**2.5%**

a. Values based on an analysis of 2010-2014 American Community Survey 5-year estimates at the Census block group level.
b. Values calculated using block group statistics weighted by the number of residential structures in the hazard area as a percentage of the total residential structures in the block group.
c. Values in red indicate percentages are at least 2 percent greater than the Citywide average (see Section 4.7).
d. Persons with disabilities not shown because the available data, at a census tract scale, is not conducive to analysis by hazard extent and location.

Displaced Households and Short-Term Shelter Needs

Displaced households and short-term shelter needs in Portland were estimated for the 100-year and 500-year probabilistic earthquakes and the two scenario events. The 100-year event can also be expressed as a 39-percent chance of exceedance in 50 years; 500-year events are also described as having a 10-percent chance of exceedance in 50 years.

Displaced households are estimated based on a loss of habitability, calculated from damage to the residential building stock and anticipated loss of utilities such as water and power. Short-term shelter is estimated based on the assumptions that all households residing in damaged structures will seek alternative shelter; however, some households may stay with friends or relatives or make other accommodations. Studies from past earthquake events also indicate that some households that experienced no damage will also seek shelter, as will most individuals who lacked suitable shelter before the event. These estimates are based on damaged structures and economic data, such as income, that serve as indicators for the need for publicly provided shelters.Injury and Casualty Estimates

Injury and casualty estimates in Portland were estimated for the 100-year and 500-year earthquakes and the two scenario events. Results are broken down into four severity levels:

- Level 1—Injuries require medical attention but hospitalization is not needed.
- Level 2—Injuries require hospitalization but are not considered life-threatening
- Level 3—Injuries require hospitalization and can become life threatening if not promptly treated.
- Level 4—Victims are killed by the earthquake.

Table 8-6 and Table 8-7 summarize the results. In general, the analysis shows that the Central City risk reporting area would experience the greatest number of persons requiring short-term shelter.

Injury and Casualty Estimates

Injury and casualty estimates in Portland were estimated for the 100-year and 500-year earthquakes and the two scenario events. Results are broken down into four severity levels:

- Level 1—Injuries require medical attention but hospitalization is not needed.
- Level 2—Injuries require hospitalization but are not considered life-threatening
- Level 3—Injuries require hospitalization and can become life threatening if not promptly treated.
- Level 4—Victims are killed by the earthquake.

Table 8-6. Estimated Earthquake Impact on Persons and Households

	Displaced Households[a]		Persons Requiring Short-Term Shelter[a]			
	100-Year	500-Year	100-Year Earthquake		500-Year Earthquake

Note: Values shown are accurate only for comparison among results in this plan. See Section 6.8 for a discussion of data limitations.

The estimates are provided for three times of day when community members are likely to be pursuing different activities and in different locations and types of buildings:

- 2:00 am—Community members are likely at home sleeping

- 2:00 pm—Community members are likely at school, work or other activities
- 5:00 pm—Peak commute time.

Table 8-8 summarizes the results. In general, the largest number of injuries and causalities are expected to occur during the day while persons are out in the community.

Table 8-8. Estimated Injury and Casualty Estimates from Earthquake Scenario Events

	Injury and Casualty County by Severity Level											
	2:00 AM				2:00 PM				5:00 PM			
	1	2	3	4	1	2	3	4	1	2	3	4
100-Year Earthquake	61	7	0	1	159	25	2	5	101	15	1	3

Portland Hills Fault, M6.5 Scenario	2,591	670	97	190	5,032	1,310	196	381	3,599	941	141	271

Note: Values shown are accurate only for comparison among results in this plan. See Section 6.8 for a discussion of data limitations.

The following summarizes the results for each scenario for the 2:00 pm timeframe:

- 100-Year Earthquake—191 persons killed or injured as a result of the earthquake, less than 0.1 percent of the total population
- 500-Year Earthquake—8,259 persons killed or injured as a result of the earthquake, 1.3 percent of the total population
- Cascadia Fault, M9.0 Scenario—1,696 persons killed or injured as a result of the earthquake, 0.3 percent of the total population
- Portland Hills Fault, M6.5 Scenario—6,919 persons killed or injured as a result of the earthquake, 1.1 percent of the total population

8.5.2 Property

Building Age

Building age—along with factors such as the soil a building is located on, retrofits for seismic resistance, and construction materials and methods—is a predictor of how well a building is likely to perform during an earthquake. Oregon first adopted a statewide building code in 1974, and seismic standards were adopted in 1993. Buildings constructed before 1974 are most likely to be damaged in a large earthquake, while those constructed after 1993 are most likely to be able to withstand impacts. It should be noted, however, that some buildings may have been retrofitted since their construction to more fully comply with modern seismic codes. Table 8-9 shows year-built information provided in Multnomah County Assessor records.

Table 8-9. Age of Structures in Portland

	Pre-1974[a]		1974-1993 [a]		Post-1993 [a]		Total
Reporting Area	Number of Structures	Percent	Number of Structures	Percent	Number of Structures	Percent	Number of Structures
Airport	396	61.6%	109	17.0%	138	21.5%	643
Central City	2,020	76.3%	301	11.4%	328	12.4%	2,649
Central Northeast	15,335	88.1%	870	5.0%	1,201	6.9%	17,406
East Portland	28,675	65.5%	7,116	16.3%	7,964	18.2%	43,755
North Portland	18,899	77.2%	1,793	7.3%	3,797	15.5%	24,489
Northeast	18,521	89.6%	551	2.7%	1,608	7.8%	20,680
Southeast	45,960	86.3%	2,925	5.5%	4,385	8.2%	53,270

Reporting Area	Pre-1974[a] Number of Structures	Pre-1974[a] Percent	1974-1993 [a] Number of Structures	1974-1993 [a] Percent	Post-1993 [a] Number of Structures	Post-1993 [a] Percent	Total Number of Structures
Southwest	14,846	64.2%	5,727	24.8%	2,551	11.0%	23,124
West/Northwest	4,369	55.9%	1,142	14.6%	2,310	29.5%	7,821
Total	**149,021**	**76.9%**	**20,534**	**10.6%**	**24,282**	**12.5%**	**193,837**

a. Year built information was collected from Multnomah County tax assessor data. When year built information was unavailable, it was estimated based on census block or county-wide average year built dates.

The age of the building stock in Portland can be summarized as follows:

- 76.9 percent of buildings (149,021) in Portland were built before 1974.
- 10.6 percent of buildings (20,534) were built between 1974 and 1993.
- 12.5 percent of buildings (24,282) were built in 1993 or later.

More than half of the building stock was built before 1974 in all risk reporting areas. Numbers ranges from almost 56 percent in the West/Northwest to almost 90 percent in the Northeast.

Liquefaction Potential

Table 8-10 shows the estimated number and type of structures in high potential liquefaction areas. There are 13,191 structures or 6.8 percent of the total building stock; 36 percent of these buildings (4,774) are in the Southeast and 28 percent (3,777) are in North Portland. In addition, 6,090 structures (3.1 percent of total structures) are in moderate liquefaction susceptibility areas.

Table 8-10. Structures Located in High Liquefaction Potential Areas

Reporting Area	Number of Structures[a] Residential	Commercial	Industrial	Religion	Government	Education	Total
Airport	257	105	170	0	111	0	643
Central City	107	234	29	2	16	1	389
Central Northeast	105	274	81	1	9	0	470
East Portland	844	299	48	2	18	4	1,215

West/Northwest	6	140	355	3	3	-	507
Total	**9,293**	**2,277**	**1,195**	**203**	**205**	**18**	**13,191**

a. Structure type assigned to best fit Hazus occupancy classes based on present use classifications provided by Multnomah County assessor's data. Where conflicting information was present in the available data, parcels were assumed to be improved.

Loss Potential

Structural and Non-Structural Loss

Property losses were estimated through the Level 2 Hazus-MH analysis for the 100-year and 500-year earthquakes and the two scenario events. Table 8-11 through Table 8-14 show the results for two types of property loss: structural loss (damage to building structures); and non-structural loss (the value of lost contents). A summary of the property-related loss results is as follows:

- For a 100-year probabilistic earthquake, the estimated damage potential is $903.3 million, or 0.5 percent of the total replacement value for Portland.
- For a 500-year probabilistic earthquake, the estimated damage potential is $22 billion or 12.9 percent of the total replacement value for Portland.
- For a 9.0-magnitude Cascadia Fault event, the estimated damage potential is $7.3 billion, or 4.3 percent of the total replacement value for Portland.
- For a 6.5-magnitude Portland Hills Fault event, the estimated damage potential is $23.8 billion, or 14 percent of the total replacement value for Portland.

Table 8-11. Loss Estimates for the 100-Year Earthquake

Reporting Area	Estimated Loss			Estimated Loss as % of Total Replacement Value
	Structure	Contents	Total	
Airport	$6,806,171	$2,097,634	$8,903,805	0.2%

Note: Values shown are accurate only for comparison among results in this plan. See Section 6.8 for a discussion of data limitations.

Building Damage

The Hazus-MH analysis estimated expected building damage by occupancy as follows:

- For a 100-year probabilistic earthquake, about 1.3 percent (2,543) of Portland buildings are expected to be at least moderately damaged. Less than 0.1 percent (31) are expected to be damaged beyond repair, including 17 residential structures.
- For a 500-year probabilistic earthquake, about 19.5 percent (37,739) of Portland buildings are expected to be at least moderately damaged. Approximately 1.8 percent (3,508) are expected to be damaged beyond repair, including 1,136 residential structures.
- For the Cascadia M9.0 scenario earthquake, about 7.1 percent (13,896) of Portland buildings are expected to be at least moderately damaged. Approximately 0.4 percent (848) are expected to be damaged beyond repair, including more than 306 residential structures.
- For the Portland Hills M6.5 scenario earthquake, about 21 percent (40,782) of Portland buildings are expected to be at least moderately damaged. Approximately 1.7 percent (3,225) are expected to be damaged beyond repair, including 1,239 residential structures.

Earthquake-Caused Debris

The Hazus-MH analysis estimated the amount of earthquake-caused debris for the 100-year and 500-year earthquakes and the two scenario events, as summarized in Table 8-15 and Table 8-16.

8.5.3 Critical Facilities and Infrastructure

Hazardous materials releases can occur during an earthquake from fixed facilities or transportation-related incidents. Transportation corridors can be disrupted during an earthquake, leading to the release of materials to the surrounding environment. Facilities holding hazardous materials are of particular concern because of possible isolation of neighborhoods surrounding them. During an earthquake, structures storing these materials could rupture and leak into the surrounding area or an adjacent waterway. This could have a disastrous effect on the environment and impede evacuations and access for emergency response.

Table 8-15. Estimated Earthquake-Caused Debris for Probabilistic Earthquake Events

	100-Year Earthquake		500-Year Earthquake	
Reporting Area	Debris to Be Removed (tons)[a]	Estimated Number of Truckloads [b]	Debris to Be Removed (tons)[a]	Estimated Number of Truckloads [b]

a. Debris generation estimates were based on updated general building stock dataset at a Census Tract analysis level.
b. Hazus-MH assumes 25 tons/trucks
Note: Values shown are accurate only for comparison among results in this plan. See Section 6.8 for a discussion of data limitations

Fire can be a secondary hazard of earthquake- or landslide-induced release of hazardous materials. The proximity of Forest Park to this concentration of Portland's fuel infrastructure may increase the risk of landslides or seismic events, leading to wildfires, especially under dry conditions. Much of Portland's critical infrastructure, particularly its energy infrastructure, is concentrated in a small area in the northwest corner of the City, along the Willamette River. A separate study was conducted as part of this plan update to evaluate risks and identify recommendations for improving resilience in the City's Critical Energy Infrastructure (CEI) Hub. This study can be found in Appendix J.

Level of Damage

Hazus-MH classifies the vulnerability of critical facilities to earthquake damage by assigning probabilities of the likelihood of each facility experiencing one of five damage states: no damage, slight damage, moderate damage, extensive damage, or complete damage. The model was used to assign a vulnerability category to each critical facility in Portland based on the likelihood that the facility would meet or exceed these damage states. The analysis was performed for all scenario events. The results from the two Scenario Earthquake Events are shown in Table 8-17.

Table 8-17. Estimated Damage to Critical Facilities from Scenario Events

	Cascadia M9.0					Portland Hills M6.5				
Category[a, c]	None	Slight	Moderate	Extensive	Complete	None	Slight	Moderate	Extensive	Complete
Emergency Services	46	19	0	0	0	12	5	25	21	2
High Potential Loss Facilities[b]	0	70	89	1	0	0	6	50	60	44
Schools	323	0	0	0	0	83	200	40	0	0
Other Assets	0	57	11	0	0	0	1	27	23	17
Transportation Systems	54	40	0	0	0	40	27	26	1	0
Utility Systems										
Communications	0	25	0	0	0	0	9	13	3	0
Power	0	357	0	0	0	0	20	330	7	0
Potable Water	10	336	0	0	0	11	264	45	26	0
Wastewater	0	140	0	0	0	0	90	49	1	0
Total	**433**	**1,044**	**100**	**1**	**0**	**146**	**622**	**605**	**142**	**63**

a. Numbers indicate facilities that were assigned the damage state indicated based on probabilities of meeting or exceeding the criteria for the damage state. Damage states were assigned to the highest state exceeding 50 percent probability, meaning it is more likely than not that facilities in this category will receive at least the amount of damage described by the damage state.
b. Hazus does not calculate damage states for dams.
c. See Table 6-1 for a description of the facilities included in each category.

Time to Return to Functionality

Hazus-MH estimates the time to restore critical facilities to fully functional use. Results are presented as probability of being functional at specified time increments: 1, 3, 7, 14, 30 and 90 days after the event. For example, Hazus-MH may estimate that a facility has 5 percent chance of being fully functional at Day 3, and a 95-percent chance of being fully functional at Day 90. The analysis of critical facilities in Portland was performed for all scenario events. The results for the Cascadia M9.0 Scenario and the Portland Hills M6.5 scenario are summarized below Table 8-18 and Table 8-19.

Page 1743

Liquefaction Potential

The potential for soil liquefaction was utilized in the Hazus model for the damage and functionality results for critical facility and point based features in the table above. Damage to linear based features, such as levees and roads, is not assessed by the Hazus model. Such facilities located on liquefiable soil may be particularly vulnerable to the earthquake hazards. The following describe critical infrastructure located in these areas:

Table 8-18. Functionality of Critical Facilities for Cascadia M9.0 Scenario Event

	# of Critical Facilities	Probability of Being Fully Functional (%)					
		at Day 1	at Day 3	at Day 7	at Day 14	at Day 30	at Day 90

Transportation Related Infrastructure

The following major roads in Portland pass through high liquefaction potential areas:

- N Hayden Island Dr.
- N Marine Dr., NE Marine Dr.
- N Martin Luther King Jr. Blvd., NE Martin Luther King Jr. Blvd.
- NE Airport Way
- NE Cascades Parkway
- NW Front Ave.
- NW Naito Parkway, SW Naito Parkway
- SE Bybee Blvd.
- SE Foster Rd.
- SE Grand Ave.
- SE Holgate Blvd.
- SE Johnson Creek Blvd.
- SE McLoughlin Blvd. (State Highway 99E)
- SE Milwaukie Ave.
- SE Powell Blvd.
- SE Water Ave.
- SW Beaverton Hillsdale Hwy
- SW Corbett Ave.
- SW Macadam Ave.
- SW Moody Ave.
- I-205
- I-5
- I-84
- SW Beaverton Hillsdale Hwy

In addition, 237.82 miles (63.4) of railroad lines are located in high potential liquefaction areas and an additional 79.33 miles (21.2 percent) are located in moderate liquefaction potential areas. The light rail lines may also be vulnerable with 12.05 miles (22.8 percent) located in high liquefaction areas and an additional 5.65 miles (10.7 percent) located in moderate liquefaction potential areas.

Utility Systems

Table 8-20 shows the mileage and percent of the citywide system located in high and moderate liquefaction potential areas. The Portland Water Bureau System is currently conducting a Water System Reliability Study to assess risk to the water system from seismic hazards.

Table 8-20. Utility Systems Within Liquefaction Potential Areas

	High Liquefaction Potential Areas		Moderate Liquefaction Potential Areas	
Infrastructure Type	Mileage	%	Mileage	%
Potable Water Backbone	27.49	18.8%	8.80	6.2%
Wastewater System Collection Pipes	406.47	15.4%	165.01	6.2%
Major Power Lines	112.17	23.5%	49.44	10.4%
Major Gas Lines	21.05	25.2%	15.58	18.7%

Levees

Almost all of the levees in Portland are located in high liquefaction potential areas (20.25 miles), with the remaining 0.2 miles in moderate liquefaction potential areas. An assessment of a small portion of the levee system conducted in 2001 determined that this portion of the system was safe for a 0.2-percent seismic risk (Magnitude 6.2 event) and 0.04-percent seismic risk (approximately magnitude 7.0 event). The study also concluded that it would be unlikely for a seismic event alone to cause flooding in areas protected by the levee. It was found that such flooding may occur if the earthquake occurred concurrently with a major flood, although the probability of such events occurring simultaneously was found to be low (USACE, 2001). However, other area levees may perform differently when exposed to the same parameters; further study is needed.

8.5.4 Environment

The environment vulnerable to earthquake hazard is the same as the environment exposed to the hazard. Groundwater supplies and adjacent water courses could be contaminated by spillage from storage tanks. Air quality could be significantly compromised by fires started due to secondary impacts from seismic events. Earthquake-induced landslides can significantly impact surrounding habitat. It is also possible for streams to be rerouted after an earthquake. This can change the water quality,

possibly damaging habitat and feeding areas. There is a possibility of streams fed by groundwater drying up because of changes in underlying geology.

8.5.5 Economic Impact

Economic impact will be largely associated with the disruption of services caused by an earthquake event. In general, significant events may cause damage to land, buildings, transportation infrastructure, and businesses. Estimates of functionality for critical facilities and infrastructure for the scenario events are shown in Table 8-18 and Table 8-19. Significant impacts may occur as a result of disruptions in the supply chain, a focus on expending resources to rebuild lost resources (especially for resources not covered by insurance), loss of wages, a downturn in tourism, and possibly a shortage in labor caused by residents relocating outside the damaged area. With an event of such significance, economic recovery could take years or decades, depending on available recovery funds.

8.6 FUTURE TRENDS IN DEVELOPMENT

Land use in Portland will be directed by the City's Comprehensive Plan. Development in Portland will be regulated through building standards and performance measures so that the degree of risk will be reduced. Hazard-resilient design is addressed in the City's Comprehensive Plan and it addresses geological hazards, including liquefaction potential, and the promotion of disaster resilient development. New development in Portland will likely be less vulnerable to earthquake hazards than older development due to higher regulatory standards for earthquake risk in modern building codes. In addition, the City has identified several actions that will seek to strengthen existing development codes and standards to the earthquake hazard.

New development in areas subject to liquefaction are of particular concern due to their increased vulnerability if proper structural measures are not taken. Although existing codes and ordinance should mitigate these risks, not all risk will be mitigated and critical infrastructure providing services to these areas may be negatively impacted. Table 8-21 and Table 8-22 show future land use designations in high and medium liquefaction potential areas, respectively. Citywide, the predominant land use in high potential areas is designated as employment and industrial (58.3 percent), followed by open space (24.9 percent).

8.7 SCENARIO

Any seismic activity of 6.0 or greater on faults in the general Portland region would have significant impacts throughout Portland. An earthquake in the Cascadia Subduction Zone would have disastrous consequences for the entire state and the region. Potential warning systems could give up to tens of seconds' notice that a major earthquake is about to occur.

Large magnitude earthquakes in the region could lead to massive structural failure of property on liquefiable soils. Structural failure may be intensified if the earthquake occurs during winter when soils are saturated. Heavy damage would also be expected in areas with substantial numbers of unreinforced masonry buildings or older building stock that has not been brought up to current seismic codes. Access to, from and around the City would be challenging, given the likelihood that bridges and major transportation routes may be impassable. These events could cause secondary hazards, including landslides and mudslides that would further damage structures. There is also a significant potential for major hazardous materials in the CEI Hub and other areas with large concentrations of hazardous materials on liquefiable soils.

8.8 ISSUES

The following issues have been identified over the course of the planning process:

- It is estimated that 76 percent of buildings (149,021) in Portland were built before 1974 when the first provisions for seismic criteria were implemented. (Note: Some buildings have been retrofitted, but data is not available to estimate the number and types of retrofits).
- It is estimated that an additional 10.5 percent of buildings (20,534) in Portland were built between 1974 and 1993 before modern seismic codes were in place.
- There are estimated to be 13,191 buildings located in high liquefaction susceptibility areas. This is about 7 percent of all buildings in Portland. 36 percent of these buildings (4,774) are located in the Southeast and 28 percent (3,777) are located in North Portland. An additional 6,090 buildings are located in moderate liquefaction susceptibility areas.

Table 8-21. Future Land Use Designations in Portland in High Potential Liquefaction Areas

		Percent of total acres					
		Residential

LUBA No. 2020-009
Page 1747

- The following social-vulnerability-related issues have been identified for high liquefaction potential areas:
  - People over 65 years of age may disproportionately reside in these areas in North Portland (18 percent), Southwest (17 percent), and East Portland (15 percent).
  - People of color may disproportionately reside in these areas in the Central Northeast (32 percent), Airport (32 percent), North Portland (29 percent) and East Portland (26 percent).
  - Renters may disproportionally reside in these areas in the Central City (82 percent), Airport (69 percent), Central Northeast (67 percent), Southeast (58 percent) and Southwest (54 percent).
  - Families with incomes below the poverty level may disproportionately reside in these areas in the Airport (20 percent), Central Northeast (19 percent), and Central City (14 percent).
  - Households with limited English speaking abilities may disproportionally reside in these areas in the Airport (21 percent) and Central Northeast (20 percent).
- The following issues have been identified based on the 100-year probabilistic earthquake scenario:
  - All risk reporting areas would experience damage.
  - It is estimated that 513 households will be displaced from their homes after an event and 243 of these people will seek shelter in public shelters. More than half of these people are expected to reside in the Central City.
  - More than 317,000 tons of debris would be expected from the event, which will require approximately 12,680 truckloads to remove. Most debris (more than 30,000 tons) will be in the Central City, North Portland, Southeast, and West/Northwest.
  - All risk reporting areas have estimated damage of less than 1 percent of the total value and about 0.5 percent of the total value of Portland would likely be damaged.
  - It is expected that 346 buildings in Portland will be extensively or completely damaged. An additional 2,197 would be expected to be moderately damaged.
- The following issues have been identified based on the Cascadia M9.0 event earthquake scenario:
  - All risk reporting areas would experience damage.
  - It is estimated that 5,838 households will be displaced from their homes after an event and 2,893 of these people will seek shelter in public shelters. About half of these people are expected to reside in the Central City.
  - More than 3.7 million tons of debris would be expected from the event, which will require approximately 148,000 truckloads to remove. Most debris (more than 500,000 tons) will be in the Central City, West/Northwest, Southwest and Southeast.
  - All risk reporting areas have estimated damaged of more than 2 percent of the total value. The following risk reporting areas are expected to have damage of more than 8 percent of the total value: North Portland, West/Northwest and Airport. About 4.3 percent of the total value of Portland would likely be damaged.
  - It is expected that 5,587 buildings in Portland will be extensively or completely damaged. An additional 8,309 would be expected to be moderately damaged.
- The following issues have been identified based on the 500-year probabilistic earthquake scenario:

- All risk reporting areas would experience damage.
- It is estimated that 19,726 households will be displaced from their homes after an event and 9,674 of these people will seek shelter in public shelters. About half of these people are expected to reside in the Central City. Additionally, more than 1,200 people in the West/ Northwest and Southeast may require shelter.
- More than 8.4 million tons of debris would be expected from the event, which will require approximately 338,000 truckloads to remove. More than half of this debris will be in the Central City and North Portland reporting areas.
- All risk reporting areas have estimated damaged of more than 4 percent of the total value. The following risk reporting areas are expected to have damage of more than 10 percent of their total value: Central City, West/Northwest, Southwest, and Northeast. About 12.9 percent of the total value of Portland would likely be damaged. About one third of this damage would come from the Central City alone.
- It is expected that 12,871 buildings in Portland will be extensively or completely damaged. An additional 24,868 would be expected to be moderately damaged.

- The following issues have been identified based on the Portland Hills M6.5 event earthquake scenario:

  - All risk reporting areas would experience damage.
  - It is estimated that 25,186 households will be displaced from their homes after an event and 12,437 of these people will seek shelter in public shelters. More than half of these people are expected to reside in the Central City. Additionally, more than 1,000 people in the West/ Northwest and Southeast may require shelter.
  - More than 9.5 million tons of debris would be expected from the event, which will require approximately 380,400 truckloads to remove. More than 75 percent of this debris will be in the Central City, North Portland, and West/Northwest reporting areas.
  - All risk reporting areas have estimated damaged of more than 5 percent of the total value. The following risk reporting areas are expected to have damage of more than 10 percent of their total value: Central City, West/Northwest, North Portland and Northeast. The Central City and West/Northwest would be expected to have damage in excess of 25 percent of the total value of the areas. About 14 percent of the total value of Portland would likely be damaged.
  - It is expected that 12,948 buildings in Portland will be extensively or completely damaged. An additional 27,834 would be expected to be moderately damaged.

- Critical facility owners should be encouraged to create or enhance continuity of operations plans using the information on risk and vulnerability developed for this plan.
- Earthquakes could potentially trigger other natural hazard events such as dam failures, levee failures and landslides, which could severely impact Portland or regional critical facilities.
- There may be additional faults in or around the City of Portland that have not yet been discovered.
- After a major seismic event, the City of Portland is likely to experience disruptions in the flow of goods and services due to the destruction of major transportation infrastructure across the broader region.
- In many outreach programs residents are instructed to be self-sufficient up to three days following a major earthquake without government response agencies, utilities, private sector services and infrastructure components. It is likely that after a major event, supplies for 72 hours would not be sufficient. Residents should continue to be encouraged to start with three days and over time build up supplies for up to two or three weeks.

- Natural hazards have a devastating impact on businesses. Of all businesses that close following a disaster, more than 43 percent never reopen, and an additional 29 percent close for good within the next two years. The Institute of Business and Home Safety has developed "Open for Business," which is a disaster planning toolkit to help guide businesses in preparing for and dealing with the adverse effects of natural hazards. The kit integrates protection from natural disasters into companies' risk reduction measures to safeguard employees, customers, and the investment itself. The guide helps businesses secure human and physical resources during disasters, and helps to develop strategies to maintain business continuity before, during, and after a disaster occurs.
- An early warning system, ShakeAlert, is currently under development, but is not ready for public use.

9. LANDSLIDE

9.1 GENERAL BACKGROUND

Landslide is a general term for the dislodgment and fall of a mass of soil or rocks along a sloped surface. Landslides include mudflows, mudslides, debris flows, rock falls, debris avalanches, debris slides and earth flows. The susceptibility of hillside and mountainous areas to landslides depends on geology, topography, vegetation and weather. Landslides may be triggered or exacerbated by development of sloping ground or the creation of cut-and-fill slopes in areas of inadequately stable geologic conditions (NHMP, 2010).

DEFINITIONS

- **Landslide**—The movement of masses of loosened rock and soil down a hillside or slope. Slope failures occur when the strength of the soils forming the slope is exceeded by the pressure, such as weight or saturation, acting upon them.
- **Mass Movement**—A collective term for landslides, debris flows, falls and sinkholes.
- **Mudslide (or Mudflow or Debris Flow)**—A river of rock, earth, organic matter and other materials saturated with water. Mudslides develop in the soil overlying bedrock on sloping surfaces when water rapidly accumulates in the ground, such as during heavy rainfall or rapid snowmelt. Water pressure in the pore spaces of the material increases to the point that the internal strength of the soil is drastically weakened. The soil's reduced resistance can then easily be overcome by gravity, changing the earth into a flowing river of mud or "slurry."

9.1.1 Landslide Types

Failure Types

Landslides are commonly categorized by the type of initial ground failure. Figure 9-1 through Figure 9-4 show common types of slides (Washington Department of Ecology, 2014). The most common is the shallow colluvial slide, occurring particularly in response to intense, short-duration storms. Deep-seated slides are the largest and most destructive landslides, but they are less common than other types. The point of failure for deep landslides is typically within bedrock (generally more than 15 feet deep); the point of failure for shallow landslides is commonly between the thin soil mantle and the top of the bedrock. Deep landslides can occur in semi-consolidated sedimentary rocks in the Troutdale Formation around the Portland area (Oregon Department of Land Conservation and Development, 2015).

Material and Movement Type

The following landslide types are defined by material type and movement mechanism (see Figure 9-5):

- **Slides**—A slide is a mass movement of material at a discrete weakness area, sliding from stable underlying material. A *rotational slide* occurs when there is movement along a concave surface; a *translational slide* originates from movement along a non-curved surface.
- **Flows**—Flows include debris flows, debris avalanches, mudflows, creeps, earth flows, and lahars. Channelized debris flows are commonly mobilized by other types of landslides on slopes near a channel or by accelerated erosion in a channel during heavy rainfall or snow melt. Debris flows tend to initiate in the upper reaches of a drainage and pick up material as they move down. They can travel for several miles at speeds of more than 35 mph. At the mouth of the channel, the material fans out due to reduced slope and lack of confinement. (DOGAMI, 2013).

Source: Washington Department of Ecology

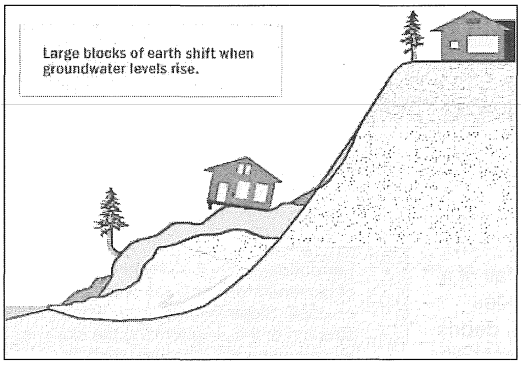

Figure 9-1. Deep Seated Slide

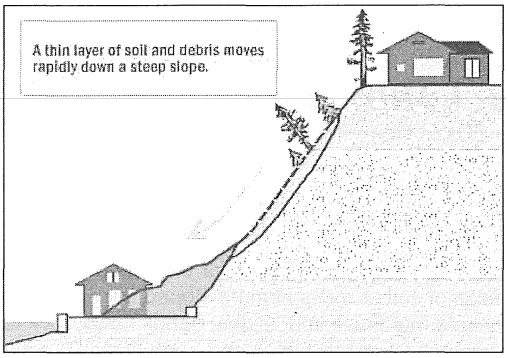

Figure 9-2. Shallow Colluvial Slide

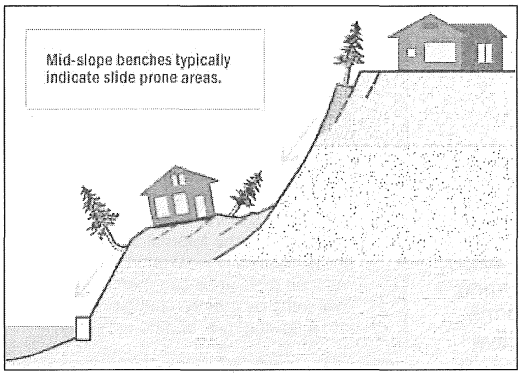

Figure 9-3. Bench Slide

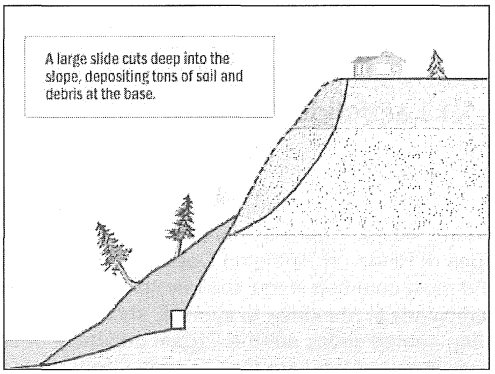

Figure 9-4. Large Slide

- **Spreads—**This type of landslide generally occurs on gentle slope or flat terrain. Lateral spreads are characterized by liquefaction of fine-grained soils. The event is typically triggered by an earthquake or human-caused rapid ground motion.
- **Falls—**Falls are the free-fall movement of rocks and boulders detached from steep slopes or cliffs.
- **Topples—**Topples are rocks and boulders that rotate forward and may become falls.
- **Complex—**Any combination of landslide types (USGS, 2004 and DOGAMI, 2008 as cited in NHMP, 2010).

9.1.2 Landslide Runout

In addition to the failure type, landslide risk assessment evaluates the post-failure movement of loosened material, called "runout." Runout is assessed for its travel distance and velocity. Mapping of landslide risk areas generally indicates the location of the potential failure, but mapping of areas that would be affected by the runout after the failure is not currently well-developed.

Source: DOGAMI Landslide Fact Sheet, 2008

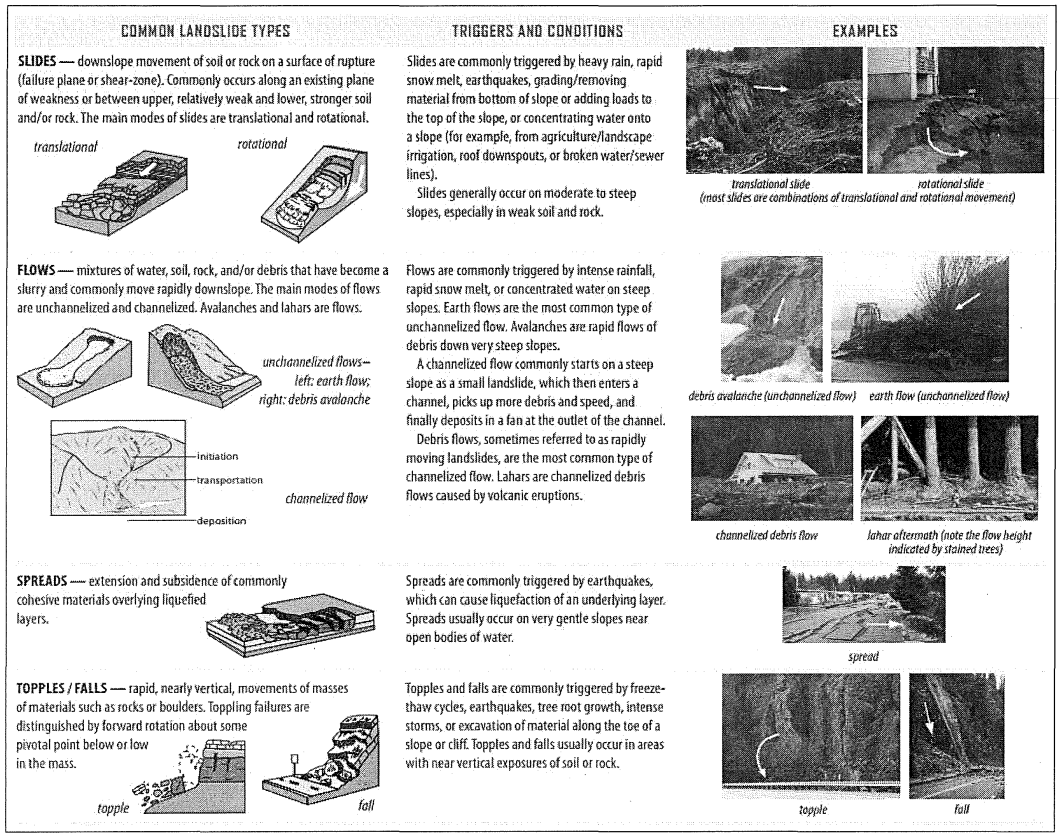

Figure 9-5. Common Landslide Types and Conditions

Recent events such as the Oso landslide in Washington in March 2014 have changed the thinking of the assessment of risk from landslide hazards. The Oso landslide was the deadliest single landslide event in U.S. history (43 fatalities, 49 homes destroyed, damage in excess of $10 million). The damage extended over 2.6 kilometers, although the failure location of the slide was less than a half-kilometer. Most of the area impacted was damaged by the slide runout. This indicates the importance of considering possible runout scenarios to accurately reflect the risk from landslide hazards.

9.1.3 Landslide Causes

Mass movements are caused by a combination of geological and climate conditions, as well as the encroaching influence of urbanization. Vulnerable natural conditions are affected by human residential, agricultural, commercial, and industrial development and the infrastructure that supports it.

Natural Conditions

Natural processes can cause landslides or re-activate historical landslide sites. Rainfall-initiated landslides tend to be smaller, while earthquake-induced landslides may be very large, but less frequent. Countless small slides each year result from the removal of supporting material along water bodies by currents and waves or undercutting during construction at the base of a slope. Seismic tremors can trigger landslides on slopes historically known to have landslide movement. Earthquakes can also cause lateral spreading on gentle slopes above steep stream and river banks. Landslides are particularly common along stream banks, reservoir shorelines, large lakes and seacoasts. Concave-shaped slopes with larger drainage areas appear to be more susceptible to landslides than other landforms. Landslides associated with volcanic eruptions can include volumes approaching a cubic mile of material. All soil types can be affected by natural landslide triggering conditions (Oregon Department of Land Conservation and Development, 2000).

Excavation and Grading

Slope excavation is common in the development of home sites or roads on sloping terrain. Grading can result in some slopes that are steeper than the pre-existing natural slopes. Since slope steepness is a major factor in landslides, these steeper slopes can be at an increased risk for landslides. The added weight of fill placed on slopes can also result in an increased landslide hazard. Small landslides can be fairly common along roads, in either the road cut or the road fill. Landslides occurring below new construction sites are indicators of the potential impacts stemming from excavation. In addition, historical landslide areas are more susceptible to construction-triggered sliding than are undisturbed slopes (Oregon Department of Land Conservation and Development, 2000).

A Portland State University study (Burns et al., 1998) found that changes to the slope through cutting or filling increased the risk of 76 percent of inventoried landslides in the Portland Metro region. The study documented 48 landslides that occurred in Oregon City in February 1996 and found that only about half the slides were considered natural. A Seattle landslide study found that human influence played some role in 84 percent of recorded slides (Winters, 2015).

Drainage and Groundwater Alterations

Water flowing through or above ground is often the trigger for landslides. Any activity that increases the amount of water flowing into landslide-prone slopes can increase landslide hazards. Broken or leaking water or sewer lines can be especially problematic, as can water retention facilities that direct water onto slopes. However, even lawn irrigation and minor alterations to small streams in landslide prone locations can result in damaging landslides. Ineffective stormwater management and excess runoff can also cause erosion and increase the risk of landslide hazards. Drainage can be affected naturally by the geology and topography of an area. Development that results in an increase in impervious surface impairs the ability of the land to absorb water and may redirect water to other areas. Channels, streams, flooding, and erosion on slopes all indicate potential slope problems. Road and driveway drains, gutters, downspouts, and other constructed drainage facilities can concentrate and accelerate flow. Ground saturation and concentrated flow are major causes of slope problems and may trigger landslides (Oregon Department of Land Conservation and Development, 2000).

Changes in Vegetation

Removing vegetation from very steep slopes can increase landslide hazards. A study by the Oregon Department of Forestry found that landslide hazards in three out of four steeply sloped areas were highest for roughly 10 years after timber harvesting (Oregon Department of Forestry, 1999). A more recent study of a heavy rain event on Vancouver Island, Canada found that low forest density,

indicating regrowth areas, and proximity to forest service roads were jointly associated with a 6- to 9-fold increase in the odds of a landslide (Goetz et al., 2015). Areas that have experienced wildfire and land clearing for development may have long periods of increased landslide hazard. In addition, woody debris in stream channels (both natural and man-made from logging) may cause the impacts of debris flows to be more severe (Oregon Department of Land Conservation and Development, 2000).

9.1.4 Indicators of Possible Landslide

The following are recognized indicators of a possible landslide (NHMP, 2010):

- Springs, seeps or wet ground that is not typically wet
- New cracks or bulges in the ground or pavement
- Soil subsiding from a foundation
- Secondary structures (decks, patios) tilting or moving away from main structures
- Broken water line or other underground utility
- Leaning structures that were previously straight
- Offset fence lines
- Sunken or dropped-down road beds
- Rapid increase in stream levels, sometimes with increased turbidity
- Rapid decrease in stream levels even though it is raining or recently stopped
- Sticking doors and windows, visible spaces indicating frames out of plumb.

9.1.5 Landslide Management

The largest landslides are often naturally occurring phenomena with little or no human contribution. The sites of large landslides are typically areas of previous landslide movement that are periodically reactivated by significant precipitation or seismic events. Such naturally occurring landslides can disrupt roadways and other infrastructure lifelines, destroy private property, and cause flooding, bank erosion and rapid channel migration. Landslides can create immediate, critical threats to public safety, and engineering solutions to protect structures from large active landslides are often prohibitively expensive.

In spite of their destructive potential, landslides can serve functions that are beneficial to the natural environment. They supply sediment and large wood to a stream network, contributing to complexity and dynamic channel behavior critical for aquatic and riparian ecological diversity. Effective landslide management should include the following elements:

- Continuing investigation to identify natural landslides, understand their mechanics, assess their risk to public health and welfare, and understand their role in ecological systems
- Regulation of development in or near existing landslides or areas of natural instability
- Preparation for emergency response to landslides to facilitate rapid, coordinated action among local government and state and federal agencies, and to provide emergency assistance to affected or at-risk residents
- Evaluation of options including landslide stabilization or structure relocation where landslides are identified that threaten critical public structures or infrastructure.

The State of Oregon has statewide planning goals that require comprehensive plans at the local level to reduce risk to people and property from natural hazards, which include geologically hazardous areas such as areas prone to landslide (Oregon Department of Land Conservation and Development, 2002). The City of Portland City Code 33.632 and Title 24 and the Oregon State Structural Specialty Code Section 1803 discourage development in landslide hazard areas; however, development may be allowed when certain requirements are met (Portland Bureau of Development Services, 2016). These

requirements include a mandatory landslide hazard study, to include the following (Portland Bureau of Development Services, 2014):

- Review of current landslide inventory and hazard maps, geologic literature, LiDAR, etc. for the site
- A visual reconnaissance of the site and surrounding area
- A description of current topography and observable geologic features and hazards
- Engineering recommendations for the layout and design of the land, including:
    - Identification of portions of the site that are suitable for development in a manner that reasonably limits the risk of landslide potential on the site and nearby properties
    - Recommendations for specific improvements, engineering requirements, or alternative development options to reasonably limit risks
    - Hazardous or no-build areas within the subdivision, if any, and/or building setback distances from slopes
    - Building locations and foundation designs
    - Driveway and/or street locations
    - Utility trench locations
    - Retaining walls, associated drainage and discharge systems, if any
    - Grading requirements for building sites, driveways or streets
    - Impact of tree removal on slope stability
    - Stormwater and groundwater disposal methods for new lots and evaluation of existing systems to remain, as well as evaluation of runoff and stormwater disposal from adjacent property that may impact the proposed development
    - Infiltration testing per the Bureau of Environmental Services Stormwater Management Manual, unless both the certified engineering geologist and professional engineer determine the site is not suitable for onsite infiltration
    - Subsurface exploration logs
    - Slope stability calculations.
- A statement of on-site slope stability after the proposed development is complete
- A statement of the estimated effect of the development on stormwater and groundwater runoff as it relates to slope stability and landslide hazard, and a proposed method of control.

9.2 HAZARD PROFILE

9.2.1 Past Events

Landslides are a major geologic hazard in Oregon and the impact of landslides on property and life safety for Oregonians will increase as population increases and development advances into more landslide-prone urban areas. In a typical year, an estimated $10 million is spent on landslide losses in Oregon (DOGAMI, 2008 as cited in NHMP, 2010). Since 2006, there have been seven Presidential Disaster Declarations in response to landslides in Oregon (FEMA, 2016b). Recent studies by DOGAMI have determined that 35 percent of Oregon is in high or very high landslide susceptibility zones (DOGAMI, 2016).

Landslides have created problems in and around Portland's hills. Landslides result in private property damage, and many impact transportation corridors, fuel and energy conduits and communication facilities. In October 2008, a devastating landslide destroyed two homes and severely compromised

another three. There were no casualties from this event, but it displaced the families from the destroyed homes and shut down a transportation route for an extended period of time (NHMP, 2010).

Much of the terrain in northwest Oregon is hilly and susceptible to slides; however, many slides take place in undeveloped areas and are unreported or even unnoticed. A statewide DOGAMI survey of winter storm landslides in 1996 and 1997 reported 9,582 documented slides (NHMP, 2010). This included 700 in the Portland Metropolitan region (Burns et al., 1998). In the City of Portland, 17 homes were completely destroyed and 64 were badly damaged. There were no serious injuries associated with the landslides in Portland or in other urban areas of Oregon during the 1996 storms (Oregon Department of Land Conservation and Development, 2015).

Historically, long periods of winter rain and heavy snowfall trigger landslides. These landslides may affect city roads and key emergency transportation routes. Wildfires have removed vegetation from hillsides and significantly increased runoff and landslide potential. On the steep-sloped Willamette Escarpment (Oaks Bottom and Mocks Crest Park natural areas) fires followed by repeated landslides have left many areas void of vegetation. Table 9-1 and Table 9-2 give an overview of the historical landslides and their impacts.

9.2.2 Location

The best available predictor of where movement of landslides might occur is the location of past events. Past landslides can be recognized by their distinctive topographic shapes, which can remain in place for thousands of years. Most landslides recognizable in this fashion range from a few acres to several square miles. Most show no evidence of recent movement and are not currently active. A small proportion of them may become active in any given year, with movements concentrated within all or part of the landslide masses or around their edges.

In general, the probability of slope failure increases with an increase in slope incline. However, depending on factors such as soil type and water content, a slope having a relatively low incline could be at greater risk of failure than another slope having a relatively high incline. Other factors that influence susceptibility include rock type, water content, vegetative cover and type, slope aspect, permeability and rate of infiltration, proximity to seismic sources, and magnitude of seismic events. In addition, unconsolidated deposits of alluvial and glacial outwash materials are subject to accelerated stream bank erosion and landslides. The possibility of failure also increases in sloped areas where humans have disturbed the soil and vegetation such as cutback projects and timber reduction areas (NHMP, 2010).

Several data sets identify existing landslide areas for Oregon and Portland. These include DOGAMI SP-34 (landslide points from the 1996-1997 storms) and DOGAMI State Landslide Identification Database of Oregon (SLIDO), which was recently updated to version 3.2 in 2014 (landslide polygons from previous geologic and hazard mapping).

Recent studies have shown that the use of LiDAR to map landslides results in a significant improvement in the ability to locate historical landslides. DOGAMI has compared landslide mapping using existing techniques (time-series air photo survey and three other remote sensing types of data sets) to mapping with LiDAR in the Portland Hills. The LiDAR reveals many more slides and allows spatially accurate delineation of slide boundaries. Oregon City was the first city in the state to have a landslide map created by DOGAMI using the LiDAR technology (Burns and Madin, 2008 as cited in NHMP, 2010). Since then LiDAR maps of landslide hazards have become available for many counties and communities across Oregon (DOGAMI, 2016). The City of Portland has been working with DOGAMI to create such maps, which are now in the process of review (NHMP, 2010).

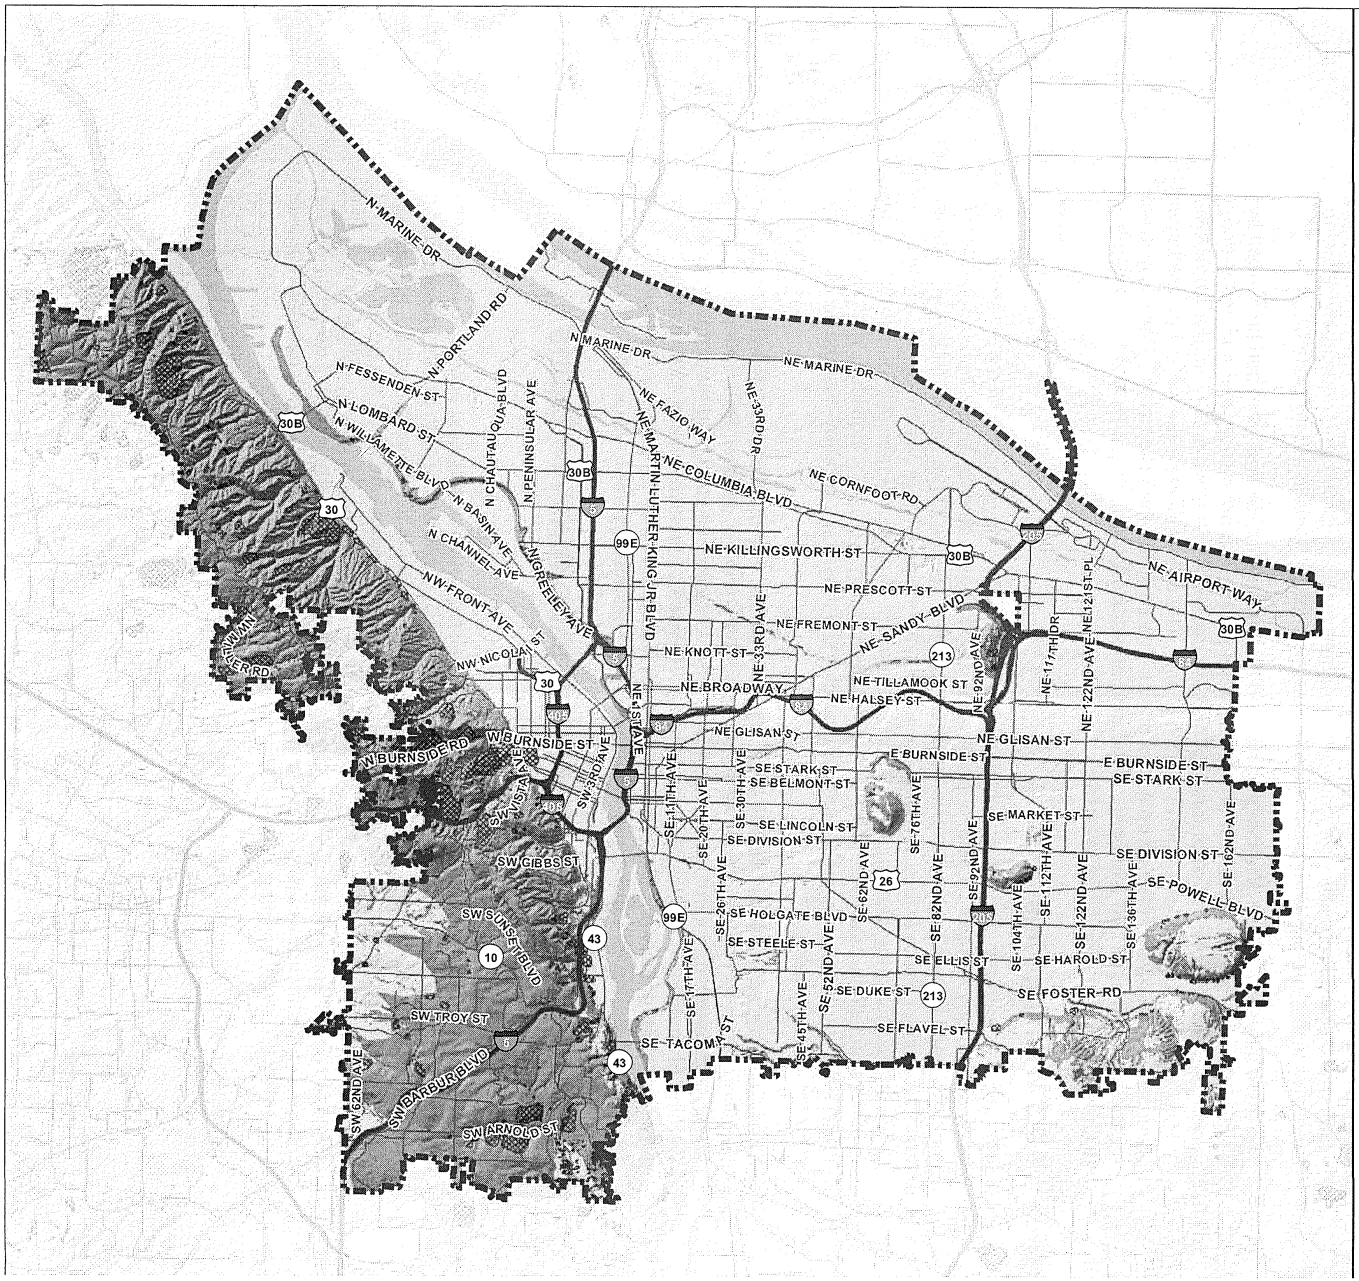
The most recent product by DOGAMI is a landslide susceptibility map for the entire state of Oregon. This map will provide landslide hazard information for regional planning and specifically identify areas where more detailed landslide mapping is needed (2016).

Two data sets were used for the risk assessment of the landslide hazard (see Figure 9-6):

- DOGAMI historical landslide deposits.
- City of Portland regulatory landslide hazard area—This dataset is currently used for permitting purposes and was created from three sources:
    - Areas identified and mapped by Metro as earthquake hazard areas
    - Areas delineated as zones of high landslide potential in a study conducted by Portland State University based on the mapping of 676 landslide events that occurred as a result of the February 1996 storms
    - All land within the City that has a slope of 15 percent or greater.

The Oregon Department of Forestry's *Storm Impacts and Landslides of 1996: Final Report* assesses the impacts of landslides for the 1996 winter storms. The study included eight study areas, but did not provide a detailed inventory of landslide prone areas outside the very small study area. This study concluded that the highest hazard for shallow rapid landslides in western Oregon occurs on slopes of over 70 percent to 80 percent, depending on landform and geology (NHMP, 2010).

The geographic extent of landslide events is essentially the same as slide location. The effects depend on what infrastructure is in the way of a slide, as well as the magnitude and force of the slide itself. The extent can be limited to one building or property or can be region-wide, as in the case of a major transportation disruption, slide-induced dam failure or utility outage (NHMP, 2010).



9.2.3 Frequency

Landslides are an annual occurrence in Oregon during the rainy months, October through May. They generally result from intense or prolonged rainfall, particularly during a rain on snow event. Slope alteration and shape can affect recurrence-interval. Recurrence intervals for steep terrain can range from 50 to 5,000 years, with some debris flow recurrence intervals of less than 10 years (Oregon, 2004 as cited in NHMP, 2010). Several steep-sloped natural areas are prone to yearly landslides: Forest Park, Terwilliger Wildlands, Marquam Nature Park and the Willamette Escarpment east of the Willamette River are notable (NHMP, 2010).

In general, landslides are most likely during periods of higher than average rainfall. The ground must be saturated prior to the onset of a major storm for significant landslides to occur. Most local landslides occur in January after the water table has risen during the wet months of November and December. Water is involved in nearly all cases; and human influence has been identified in more than 80 percent of reported slides.

9.2.4 Severity

Landslides destroy property and infrastructure and can take the lives of people. Slope failures in the United States result in an average of 25 lives lost per year and an annual cost to society of about $1.5 billion. According to NOAA, the 1997 and 2006 storms caused in excess of $20 million in property damage due to landslides. This was about half of all damage caused by the storm. The landslides caused by the storm also caused tens of millions of dollars of damage to road infrastructure.

PBEM

The potential impacts from landslides can be widespread. Landslides can impact transportation and rail routes, utility systems, and water and wastewater treatment infrastructure, along with public, private and business structures adjacent to steep slopes, along riverine embankments, or within alluvial fans or natural drainages. Utility disruptions are usually local and terrain-dependent. Damage may require reestablishing electrical, communications, and gas pipeline connections occurring from specific breakage points. Initial debris clearing from emergency routes and high traffic areas may be required. Water and wastewater utilities may need treatment to quickly improve water quality by reducing excessive water turbidity and reestablishing waste disposal capability (NHMP, 2010).

The 2014 landslide in Oso, Washington showed the devastating damage that can be caused by landslides. The slide traveled over 60 mph, covering over a square mile of land and depositing a thickness of 15 to 75 feet in some areas. The slide caused 43 fatalities and 12 injuries, destroyed 37 homes, and destroyed over a mile of state highway. The debris blocked the North Fork Stillaguamish River for over 24 hours, backing up a pool of water that flooded the valley about 2 miles upstream and reached approximately 20 feet deep, inundating an additional six homes. Total property damage was estimated at $60 million (NOAA, 2015).

9.2.5 Warning Time

Mass movements can occur suddenly or slowly. The velocity may range from a slow creep of inches per year to many feet per second, depending on slope angle, material and water content. Some methods used to monitor mass movements can provide an idea of the type of movement and the amount of time prior to failure. It is also possible to determine what areas are at risk during general time periods. Assessing the geology, vegetation and amount of predicted precipitation for an area can help in these predictions. However, there is no practical warning system for individual landslides. The current standard operating procedure is to monitor situations on a case-by-case basis, and respond after the event has occurred.

The USGS has an installation in the West Hills of Portland that monitors and detects changes in local conditions such as rainfall, groundwater pressure and soil water content. Data collection at this site supports research on hydrologic factors that control landslide initiation, and may provide advance warning of landslide conditions in the local area. Residents can also receive hazard alerts through National Weather Service advisories, through the federal Wireless Emergency Alert system, or through the Portland Bureau of Emergency Management's PublicAlerts website (DOGAMI, 2015).

9.3 COMPOUNDING FACTORS AND SECONDARY HAZARDS

9.3.1 Overview

Landslides can cause several types of secondary effects, such as blocking access to roads, which can isolate residents and businesses and delay commercial, public and private transportation. This could result in economic losses for businesses and prevent residents from accessing food, medicines, and other important supplies. Other potential problems resulting from landslides are power and communication failures. Vegetation or poles on slopes can be knocked over, resulting in possible losses to power and communication lines. Landslides also have the potential of destabilizing the foundation of structures, which may result in monetary loss for residents. They can damage rivers or streams, potentially harming water quality, fisheries and spawning habitat.

Landslides often occur with other natural hazards and human-caused activities, thereby exacerbating conditions, as described below (NHMP, 2010):

- Earthquake shaking can trigger events ranging from rock falls and topples to massive slides.
- Intense or prolonged precipitation can saturate slopes and cause failures leading to landslides.
- Landslides into a reservoir can indirectly compromise dam safety; a landslide can even affect the dam itself.
- Wildfires can remove vegetation from hillsides, significantly increasing runoff and landslide potential.
- Volcanic eruptions have been known to cause some of the largest landslides in the world.
- Development related activities such as increased runoff, excavation in hillsides, non-engineered fill and shocks and vibrations from construction can contribute to or trigger landslides. Construction projects accomplished without regard to geography, landslide toe locations, or historic slide events can increase landslide potential.
- Broken underground water mains can saturate soil and destabilize slopes, initiating slides.
- Blocked culverts can increase and alter water flow, thereby increasing the potential for a landslide event in an area with high natural risk.
- Natural weathering and decomposition of geologic material and alterations in flow of surface water or groundwater can further increase the potential for landslides (NHMP, 2010).

9.3.2 Invasive Species and Erosion

The presence of invasive species and erosion can impact the likelihood of a landslide occurring. Invasive species often have shorter root systems, providing less anchoring capabilities for slopes that may be likely to fail. Invasive fungal species that damage trees and other vegetation, such as Swiss needle cast disease infecting Douglas fir trees throughout Portland, can contribute to increased wildfire risk and lead to increased incidence of landslides. Landslides are impacted by erosion, especially if the erosion is occurring in areas undercutting steep slopes susceptible to slides.

9.3.3 Climate Change

Climate change may impact storm patterns, increasing the probability of more frequent, intense storms with varying duration. Warming temperatures also could increase the occurrence and duration of droughts and insect and fungal infestations, which would increase the probability of wildfire, reducing the vegetation that helps to support steep slopes. All of these factors would increase the probability for landslide occurrences. The City of Portland and Multnomah County Climate Change Preparation Strategy (2014) indicates that an increased incidence of landslides due to climate change as a result of season precipitation patterns is likely.

9.4 EXPOSURE

9.4.1 Population

A population estimate for exposure to the landslide hazard was made by determining the percent of residential buildings in each risk reporting area located in mapped landslide areas and multiplying this percent by the total population for each area. This method may underestimate actual exposure to the landslide hazard area, as potential runout areas have not been identified and were not included in the assessment. Using this approach, the estimated population living in the landslide risk areas is 89,133 or 14.5 percent of the city-wide population. Table 9-3 shows the landslide hazard exposure by risk reporting area. The West/Northwest and Southwest area have substantial exposure to this hazard, with 78 percent and 82 percent of the population exposed, respectively. Table 9-4 shows the estimated percent of the population residing in landslide hazard areas by social vulnerability indicators. City-wide, the elderly population may be disproportionately residing in these hazard areas.

Table 9-3. Estimated Population Residing in Landslide Risk Areas

Reporting Area	Population Exposed[a]	% of Total Population
Airport	0	0.0%
Central City	3,723	9.8%
Central Northeast	454	1.0%
East Portland	3,597	2.4%
North Portland	1,200	1.8%
Northeast	255	0.4%
Southeast	1,574	1.0%
Southwest	57,440	81.8%
West/Northwest	20,890	77.7%
Total	**89,133**	**14.5%**

a. Value calculated as percent of residential buildings exposed multiplied by the estimated population.
Note: Values shown are accurate only for comparison among results in this plan. See Section 6.8 for a discussion of data limitations.

Table 9-4. Distribution of Social Vulnerability Indicators in Landslide Hazard Areas

	Population Residing in High Landslide Hazard Areas *a, b, c, d*					
Reporting Area	Percent Under 15 Years	Percent Over 65 Years	Percent of People of Color	Percent of Renter occupied Housing	Percent of Families Below Poverty Level	Percent of Limited English Speaking Households
Airport	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%
Central City	4.8%	13.5%	16.0%	75.0%	6.0%	0.3%
Central Northeast	11.4%	24.0%	21.8%	37.8%	13.1%	8.3%
East Portland	22.3%	11.4%	25.8%	22.5%	7.1%	7.2%
North Portland	12.8%	8.8%	17.4%	38.8%	9.5%	1.6%
Northeast	7.0%	21.2%	16.5%	68.3%	2.9%	0.1%
Southeast	12.0%	18.4%	12.2%	29.8%	3.7%	1.9%
Southwest	15.1%	13.1%	12.5%	35.5%	5.1%	1.3%
West/Northwest	14.4%	13.4%	16.9%	33.8%	3.5%	1.2%
Total	**15.0%**	**13.2%**	**14.4%**	**35.4%**	**4.8%**	**1.5%**

a. Values based on an analysis of 2010-2014 American Community Survey 5-year estimates at the Census block group level.
b. Values calculated using block group statistics weighted by the number of residential structures in the hazard area as a percentage of the total residential structures in the block group.
c. Values in red indicate percentages are at least 2 percent greater than the Citywide average (see Section 4.7).
d. Persons with disabilities not shown because the available data, at a census tract scale, is not conducive to analysis by hazard extent and location.

9.4.2 Property

Table 9-5 shows the number and replacement value of structures exposed to the landslide risk. There are more than 26,000 structures in the landslide risk areas, with an estimated value of $20.6 billion. Over 96 percent of the exposed structures are dwellings. Table 9-6 lists the type of structures exposed.

9.4.3 Critical Facilities and Infrastructure

Table 9-7 and Table 9-8 summarize the critical facilities and infrastructure exposed to the landslide hazard.

Table 9-5. Exposure and Value of Structures in Landslide Risk Areas

Reporting Area	Number of Buildings Exposed	Value Exposed			Exposed Value as % of Total Replacement Value
		Structure	Contents	Total	
Airport	0	$0	$0	$0	0.0%
Central City	136	$304,493,439	$228,473,839	$532,967,278	1.7%

a. See Table 6-1 for a description of the facilities included in each category.

The following linear infrastructure can be exposed to landslides:

- **Roads**—Access to major roads is crucial to life-safety after a disaster event and to response and recovery operations. Landslides can block egress and ingress on roads, causing isolation for neighborhoods, traffic problems and delays for public and private transportation. This can result in economic losses for businesses. The following major roads in Portland cross through mapped landslide hazard areas:
  - I-205
  - I-5
  - I-84
  - I-405
  - N Interstate Ave.
  - N Willamette Blvd.
  - NW Cornell Rd.
  - NW Germantown Rd.
  - NW Skyline Blvd.
  - NW St Helens Rd (US Highway 30)
  - SE McLoughlin Blvd (State Highway 99E)
  - SW Barbur Blvd.
  - SW Beaverton-Hillsdale Highway
  - SW Boones Ferry Rd.
  - SW Capitol Highway
  - SW Macadam Ave.
  - SW Montgomery Dr.
  - SW Multnomah Blvd.
  - SW Naito Pkwy
  - SW Sunset Highway (US Highway 26)
  - SW Taylors Ferry Rd.
  - SW Terwilliger Blvd.
  - W Burnside Rd.
- **Bridges**—Landslides can significantly impact road bridges. They can knock out bridge abutments or significantly weaken the soil supporting them, making them hazardous for use.
- **Power Lines**—Power lines are generally elevated above steep slopes, but the towers supporting them can be subject to landslides. A landslide could trigger failure of the soil underneath a tower, causing it to collapse and ripping down the lines. Power and communication failures due to landslides can create problems for vulnerable populations and businesses. There are 87.61 miles (18.4 percent of the city-wide system) of power lines in mapped landslide hazard areas.
- **Gas Lines**—There are 12.43 miles of major gas lines in landslide hazard areas. Almost half of this exposure is in West/Northwest; another 43 percent is in Southwest.
- **Rail Lines**—25.51 miles (6.8 percent) of rail lines and 4.09 miles (7.7 percent) of light rail lines are in mapped landslide hazard areas.

9.4.4 Environment

Environmental problems as a result of mass movements can be numerous. Landslides that fall into streams may significantly impact fish and wildlife habitat, as well as affecting water quality. Hillsides that provide wildlife habitat can be lost for prolonged periods of time due to landslides. The Bull Run Watershed may be adversely impacted by landslides. Although no water supply related structures are located in known landslide hazard areas in the watershed, it is possible that large or numerous slides in the watershed could result in turbidity and the need to close the water source for a time.

9.5 VULNERABILITY

9.5.1 Population

In general, all of the estimated 89,133 persons exposed to the landslide hazard areas are considered to be vulnerable. Elderly and disabled residents and others with access and functional needs may have difficulty evacuating in the event of a quickly moving slide. Additionally, residents with mobility challenges may be less likely to notice the warning signs that typically proceed a slide event (see Section 9.1.4) if they are having challenges keeping up with house and yard maintenance activities.

If population and development on steep slopes or other potential landslide hazard areas increase, vulnerable populations may also increase. The City of Portland Bureau of Development Services regulates and reviews proposed development projects, including residential developments, located in known and potential landslide hazard areas.

9.5.2 Property

Loss estimations for the landslide hazard are not based on damage functions, because no damage functions have been generated. Instead, potential loss estimates were developed representing 10 percent, 30 percent and 50 percent of the replacement value of exposed structures. This allows emergency managers to select a range of economic impact based on an estimate of the percent of damage to the general building stock. Damage in excess of 50 percent is considered to be substantial by most building codes and typically requires total reconstruction of the structure. Table 9-9 shows the general building stock loss potential in landslide risk areas.

Table 9-9. Loss Potential for Landslide

Reporting Area	Exposed Value	Potential Loss @ 10% Damage	Potential Loss @ 30% Damage	Potential Loss @ 50% Damage
Airport	$0	$0	$0	$0
Central City	$532,967,278	$53,296,728	$159,890,183	$266,483,639
Central Northeast	$141,588,635	$14,158,864	$42,476,591	$70,794,318
East Portland	$454,704,349	$45,470,435	$136,411,305	$227,352,175
North Portland	$912,207,088	$91,220,709	$273,662,126	$456,103,544
Northeast	$179,186,615	$17,918,662	$53,755,985	$89,593,308
Southeast	$588,007,563	$58,800,756	$176,402,269	$294,003,782
Southwest	$14,098,055,479	$1,409,805,548	$4,229,416,644	$7,049,027,740
West/Northwest	$3,789,704,748	$378,970,475	$1,136,911,424	$1,894,852,374
Total	$20,696,421,756	$2,069,642,176	$6,208,926,527	$10,348,210,878

9.5.3 Critical Facilities and Infrastructure

There are almost 200 critical facilities exposed to the landslide hazard to some degree. No loss estimation of these facilities was performed due to the lack of established damage functions for the landslide hazard. A more in-depth analysis of the mitigation measures taken by these facilities to prevent damage from mass movements should be done to determine if they could withstand impacts of a mass movement. At this time, all infrastructure and transportation corridors identified as exposed to the landslide hazard are considered vulnerable until more information becomes available.

9.5.4 Environment

The environment vulnerable to landslide hazard is the same as the environment exposed to the hazard.

9.6 FUTURE TRENDS IN DEVELOPMENT

The City of Portland is equipped to handle future growth within landslide hazard areas. Its comprehensive plan addresses landslide risk areas through goals and polices related to environmental health, directing growth away from high-risk areas through downzoning, designing with nature and the promotion of hazard resilient design. BDS regulates development in potential landslide hazard areas. A geotechnical report is required for commercial and residential permit applications on steep slopes, as well as recommendations for mitigating the risk from landslide. The City of Portland has committed to the continued integration of the Comprehensive Plan and the MAP. This enhances the opportunity for wise land use decisions as future growth impacts landslide hazard areas.

Table 9-10 shows the future land use designations for mapped landslide hazard area. The majority of the land area is designated as single-dwelling residential (50.3 percent), followed by open space (38.7 percent).

Table 9-10. Future Land Use Designations in Portland in Landslide Hazard Areas

		Percent of total acres					
	Total	Residential			Employment &	Mixed Use &	
Reporting Area	Acreage	Single-Dwelling	Multi-Dwelling	Commercial	Industrial	Institutional	Open Space
Airport	0.8	35.40%	5.70%	0.00%	0.00%	0.00%	58.90%
Central City	166.6	0.60%	12.80%	35.10%	46.70%	0.10%	4.60%
Central Northeast	236.7	37.10%	0.20%	0.00%	4.80%	7.40%	50.40%

Source: Future land use categories are based on the proposed comprehensive plan designations as of February 2016.

9.7 SCENARIO

Major landslides in Portland occur as a result of soils that have been affected by severe storms, groundwater or human development. The worst-case scenario would generally correspond to a severe storm that had heavy rain and caused flooding. Landslides are most likely during late winter when the

water table is high. After heavy rains from November to December, soils become saturated with water. As water seeps downward through upper soils that may consist of permeable sands and gravels and accumulates on impermeable silt, it will cause weakness and destabilization in the slope. A short, intense storm could cause saturated soil to move, resulting in landslides. As rains continue, the groundwater table rises, adding to the weakening of the slope.

Landslides are becoming more of a concern as development moves outside of city centers into areas with less infrastructure. Most landslide would be isolated events affecting specific areas. It is probable that private and public property, including infrastructure, would be affected. Landslides could affect bridges that pass over landslide-prone ravines and knock out rail service throughout Portland. Road obstructions caused by landslides would create isolation problems for residents and businesses in sparsely developed areas. Property owners exposed to steep slopes may suffer damage to property or structures. Landslides carrying vegetation such as shrubs and trees may cause a break in utility lines, cutting off power and communication access to residents.

Continued heavy rains and flooding will complicate the problem further. As emergency response resources are applied to problems with flooding, it is possible they will be unavailable to assist with landslides occurring all over Portland.

9.8 ISSUES

Important issues associated with landslides in Portland include the following:

- There are existing homes in landslide risk areas throughout Portland. The degree of vulnerability of these structures depends on the codes and standards the structures were constructed to. Information to this level of detail is not currently available.
- Future development could lead to more homes in landslide risk areas.
- The risk associated with the landslide hazard overlaps the risk associated with other hazards such as earthquake, flood and wildfire. This provides an opportunity to seek mitigation alternatives with multiple objectives that can reduce risk for multiple hazards.
- All risk reporting areas aside from the Airport area have landslide exposure.
- It is estimated that more than 89,000 people reside in landslide hazard areas. More than half of this exposure is in the Southwest reporting area and an additional 25 percent is in the West/Northwest risk reporting area. Eighty-two percent and 77 percent of the total population in these areas are believed to be exposed to the landslide hazard.
- More than 26,370 buildings are estimated to be exposed to the landslide hazard. The risk reporting areas with more than 1,000 buildings exposed include Southwest, West/Northwest, and East Portland. More than 70 percent of the buildings exposed are in the Southwest reporting area.
- The total value of exposed contents and structures in Portland is estimated to be more than $20.6 billion, or 12.1 percent of the total value of Portland. About 68 percent of this exposure is in the Southwest reporting area.
- The vast majority of buildings exposed are residential (96 percent, 25,341). There are also 742 commercial buildings exposed, 64 government buildings, 62 religious services buildings, and 61 industrial buildings.
- The following social-vulnerability-related issues have been identified for landslide hazard areas:
    - Children under 15 years of age may disproportionately reside in landslide hazard areas in the East Portland (22 percent) risk reporting area.

- People over 65 years of age may disproportionately reside in landslide hazard areas in the Central Northeast (24 percent), Northeast (21 percent), Southeast (18 percent), Central City (14 percent), Southwest (13 percent) and West/Northwest (13 percent) risk reporting areas.
- People of color may disproportionately reside in landslide hazard areas in the East Portland risk reporting area (26 percent).
- Renters may disproportionately reside in landslide hazard areas in the Central City (75 percent) and Northeast (68 percent) risk reporting areas.
- Households with limited English speaking abilities may disproportionally reside in landslide hazard areas in the Central Northeast (8 percent) and East Portland (7 percent) risk reporting areas.

- There are 192 critical facilities in the landslide hazard area.
- Mapping and assessment of landslide hazards are constantly evolving. As new data and science become available, assessments of landslide risk should be reevaluated. This is especially true for runout modelling, which is not currently well understood.
- The impact of climate change on landslides is uncertain. Climate change impacts that alter vegetation patterns, increase the occurrence of wildfires or alter precipitation patterns may increase exposure to landslide risks.
- Landslides may cause negative environmental consequences, including water quality degradation.
- Areas with significant landslide risk should be monitored, to the extent possible, immediately following a possible triggering event.
- Facilities that contain hazardous materials located in landslide hazard areas may present additional risks for Portland.
- Currently available maps do not indicate runout (where a landslide might go). Current maps show the area that might be unstable, but do not offer a complete picture of areas at risk. New mapping is currently being developed by DOGAMI.

10. WILDFIRE

10.1 GENERAL BACKGROUND

DEFINITIONS

- **Wildland-Urban Interface (WUI) Area**—An area where structures are adjacent to or are intermingled with natural vegetative fuels which is prone to the occurrence of wildland fires (Oregon OEM, 2015).
- **Wildfire Hazard Zone**— the portion of a local government jurisdiction that has been determined to be at risk of a catastrophic wildfire (Oregon OEM, 2015).

A wildfire is any uncontrolled fire on undeveloped land that requires fire suppression. Wildfires can be ignited by lightning or by human activity such as smoking, campfires, equipment use, or arson. Oregon's Building Code encourages local governments to designate portions of their jurisdictions subject to catastrophic fire as Wildfire Hazard Zones. The purpose of these zones is to define areas where buildings need to be made more survivable from fires spreading through adjacent wildlands. Three factors vital to wildfire risk are included in the methodology for mapping these zones: weather, topography, and vegetative fuel factor.

10.1.1 Weather

Extreme weather leads to extreme fire events, and it is often a moderation of the weather that marks the end of a wildfire's growth. High temperatures and low humidity can produce vigorous fire activity. Winds may play a dominant role in directing the course of a fire. Strong, dry winds produce extreme fire conditions. The most damaging firestorms are usually marked by high winds.

10.1.2 Topography

The movement of air over the terrain tends to direct a fire's course. Gulches and canyons can funnel air and act as a chimney, intensifying fire behavior and inducing faster rates of spread. Saddles on ridge tops offer lower resistance to the passage of air and will draw fires. Solar heating of drier, south-facing slopes produces upslope thermal winds that can complicate fire behavior. On steep slopes, fuels on the uphill side of a fire are closer to the source of heat. Fire travels downslope much more slowly than it does upslope, and ridge tops often mark the end of wildfire's rapid spread.

10.1.3 Fuels

Fuels are classified by weight or volume and by type, including living and dead vegetation on the ground, brush and small trees on the surface, and tree canopies above the ground. Fuel loading, often expressed in tons per acre, indicates the amount of vegetative material available. Some fuels burn more easily or release more energy than others. Lighter fuels such as grasses, leaves and needles quickly expel moisture and burn rapidly, while heavier fuels such as tree branches, logs and trunks take longer to warm and ignite.

In Portland, wildfires burn fuels in large natural area parks and open spaces at the wildland urban interface and in the interior of the city. Wildfires can be categorized as occurring in the following locations (NHMP, 2010):

- **Wildland Urban Interface (WUI)**—Fires involving the wildland/urban interface occur in areas where urbanization and the presence of natural vegetation fuels allow a fire to spread rapidly from natural fuels to structures and vice versa. Especially in the early stage of such fires, structural fire suppression resources can be quickly overwhelmed, increasing the potential number of structures destroyed. Such fires are known for the large number of structures simultaneously exposed to fire. Nationally, wildland/urban interface fires commonly produce widespread losses.
- **Urban**—While these fires rarely spread out of control, due to proximity to fire resources and less fuel between buildings, urban conflagration is a hazard in densely populated areas. Many of the same factors that influence hazard in wildland/urban interface areas come into play in urban centers. Drought, high temperatures and fuel load are joined by factors such as flammable building materials, aging electrical wiring and closely packed structures to increase fire hazard.

10.2 HAZARD PROFILE

10.2.1 Past Events

All of Portland's natural ecosystems have been highly modified by humans. Historically, indigenous people purposely ignited large portions of the basin valley annually for agriculture, hunting, communication, warfare, visibility, safety and sanitation. Such systemic burning continued to shape the landscape to protect timber and property in the region (NHMP, 2010). When Anglo settlers arrived, they plowed native prairies and logged or cleared evergreen forests. Strategic seasonal burning ceased. As a result, woodlands grew denser and deciduous trees grew in among the evergreens. The mixed evergreen-deciduous forests we see today are much less fire prone than are pure evergreen forests. In part as a result of historic fires and logging, 70 percent of Forest Park is fairly fire resistant as is much of the forest that rings Powell Butte. But over several decades these forests will grow back to evergreens (NHMP, 2010).

The Multnomah County Community Wildfire Protection Plan (2011), lists the following dates and descriptions of fires that have impacted the City of Portland area:

- **1889**—Balch Creek Canyon Fire started with what is now known as the NW Industrial area burned westerly over Portland's West hills towards the Cascade Mountains in a roughly 2 mile by 7 mile swath, or approximately 9000 acres. Source: Portland Fire & Rescue
- **August 7, 1939**—The fire began in the Dutch Creek Canyon area near Scappoose, just west of Forest Park. The flames spread to Pisgah Mountain Home, an Asylum with about 60 elderly inmates. Despite the efforts of over 200 firefighters, 20 mile per hour winds fanned the fire to jump the canyon into a large timber stand. As the fire spread into Washington County, near North Plains, the Northwest Oregon Forest Protective Association deployed over 1500 men to fight the blaze. Although many farmers and timber operators lost homes and equipment, the most serious loss was to forested timberlands. Over 14,000 acres were lost. Investigators attributed the destruction to a carelessly tossed cigarette. Source: The Chronicle Area news Archives
- **1940**—The Bonny Slope Fire kindled in the southern portion of what is now known as Forest Park and burned westerly along the ridges then turned somewhat north as it crested the west hills towards the housing development now known as Forest Heights. It burned approximately an area approximately 1,000 acres. Source: Portland Fire & Rescue
- **August 19, 1951**—Burma Road Fire was a quick-moving urban wildfire started in Forest Park near Leif Erikson Road. The fire raced up and over view point ridge flames 50 feet high were recorded as the fire consumed over 100 acres in the span of one evening. Over 500 City of

Portland staff battled the blaze. Firefighters made a fire lane on Thompson Road on Skyline Ridge to carry equipment and personnel to the fire. The fire burned to the southwest broke over to Forest Heights. When the fire was finally extinguished 3,000 acres in the heart of forest park were burned. Source: Portland Fire & Rescue

- **August 8, 2001 and 2002**—Mocks Crest Fire caused Residents living on the Willamette Boulevard bluff near University of Portland nearly lost their homes and a large part of their community. In a dramatic team effort firefighters and citizens stopped the 5 Alarm wildland urban interface fire just before it overwhelmed the structures in its path. It burned approximately 38 acres. This area ignited again the following year, burning 10 acres. Source: Portland Fire & Rescue
- **August 2002 and September 2003**—Powell Butte had three relatively small wildland urban interface fires that totaled 54.75 acres. Source: Portland Fire & Rescue

The Oregon Natural Hazard Mitigation Plan records only one significant wildfire event impacting the region surrounding the City of Portland. The Columbia fire, which occurred in 1902 burned approximately 170,000 acres in Clackamas and Multnomah counties (Oregon Department of Land Conservation and Development, 2015). According to the FEMA Disaster Declarations database there have been no federally declared disasters involving fire in Portland (FEMA, 2016b).

10.2.2 Location

Designated Wildfire Hazard Zones

According to the Oregon Natural Hazard Mitigation Plan, the Portland metropolitan area is designated as a wildland-urban interface community (Oregon Department of Land Conservation and Development, 2015). The City of Portland, responsive to changes in Oregon Building code, designated areas of the City as vulnerable to wildfire hazards in 2002 (see Figure 10-1). The purpose of these zones is to define areas where buildings need to be made more survivable from fires spreading through nearby wildlands.

Much of the land area designated as at risk to wildfire in the city includes parks, open space and adjacent areas. The city's park natural areas designated as wildfire hazard areas include Powell Butte, the Willamette Bluffs or Escarpment, (Oaks Bottom and Mock's Crest) Marquam Nature Park, Terwilliger Wildlands, Kelly Butte, Rocky Butte and Mt. Tabor. The two largest areas are Forest Park and Powell Butte (NHMP, 2010). These natural areas have been identified as high risk by Oregon Department of Forestry and Portland Fire and Rescue because high-density commercial and residential development immediately surround the natural area parks and open spaces (NHMP, 2010).

Forest Park comprises the city's largest urban natural area which encompasses over 5,000 acres extending approximately eight miles along the northeast slope of the Tualatin Mountains. This area includes a diverse ecosystem with myriad bird, plant and animal species. Mixed deciduous (70 percent) and conifer (30 percent) growth reduce catastrophic fire potential in this location but could quickly change during intense dry seasons. Grasslands and large patches of flammable invasive species are at the edges of the park and in power line and utility corridors. These areas are often susceptible to fire (NHMP, 2010).

PBEM

Powell Butte Nature Park, the adjacent Clatsop Butte Park natural area, and the treed Johnson Creek floodplain encompass over 1,000 acres of parks, dense tree canopy and urban interface development in Southeast Portland. Powell Butte is also the site of the Water Bureau's above and underground reservoir system. Powell Butte's vast meadowlands and interspersed forests are the focus of the wildfire threat in this area. The park's east side is at risk due to the close proximity of development to the meadow and the east winds of late summer and early autumn which, if ignited, could spread fires west to the forested area of the park. With the exception of some housing in close proximity to the meadow near the park entrance most development is downhill from the park, on the west slopes, sheltered from the dry winds (NHMP, 2010).

In Southwest and Northwest Portland the steep slopes of Forest Park, Marquam Nature Park and Terwilliger Wildlands, face into the strong, dry, east winds that funnel out of the Columbia Gorge most autumns. In Southeast Portland, Powell Butte, Mt. Tabor Park, Kelley Butte and Rocky Butte have a similar landscape position facing the east winds. Many of the developments that hug the west side of Forest Park or are at the top of the Willamette Escarpment were built without consideration of the path of historic fires (NHMP, 2010).

The Willamette Bluffs fires of 2000 and 2001 refocused the City's attention to reducing fuel loads through intergovernmental coordination. The Portland Wildfire Readiness Assessment and Gap Analysis Plan (City of Portland, 2009) funded through Pre-Disaster Mitigation Grant funds, suggested that work is needed to "reduce wildfire risks to homes and their neighborhoods closest to the city's heavily forested areas. The Plan recommended improving zoning codes that require or encourage fire-resistant building materials, reducing hazardous fuels within a few hundred feet of buildings and maintaining adequate emergency vehicle access (Portland 2009c)." (as cited in NHMP, 2010). According to a recent status report on the implementation of the Gap Analysis recommendations (see Attachment A of the 5-year progress report) such code changes have not yet been adopted and implemented by the City.

Community Wildfire Protection Plan Communities at Risk

In 2010 the Oregon Department of Forestry, Multnomah County Emergency Management, and the City of Portland's Wildfire Technical committee began work on the development of a community wildfire protection plan. Through this planning process local communities at risk were identified that were determined to be particularly vulnerable to wildfire. The results of this assessment are non-regulatory in nature and were intended to provide a starting point for "coordination and collaboration among agencies and the public in the County to identify and prioritize future wildfire projects and assists in meeting federal planning requirements and qualifying for assistance programs" (Multnomah County, 2011). It was noted in the plan that although the mapping produced for the assessment was more recent, the Portland Wildfire Zones provide greater detail (Multnomah County, 2011). Communities at risk within the areas covered by Portland Fire & Rescue and the Port of Portland Airport Fire Department are shown in Table 10-1.

10.2.3 Frequency

In Oregon, wildfire season normally begins in late June, peaks in August, and ends in October. However, a combination of above normal-temperatures and drought can increase the length of the typical fire season. Wildfire hazards would be highest during prolonged periods of drought, especially after periods of below normal rainfall, which would result in a combination of high fuel loads and unusually dry conditions (NHMP, 2010). Based on the historical record of seven fires impacting Portland in the past 127 years, the average recurrence interval for a fire is 18 years.

Table 10-1. Community Wildfire Protection Plan Communities at Risk

Priority Level	Communities at Risk	
	Portland Fire & Rescue	Port of Portland Airport
High	• Linnton • Forest Park/Skyline Road • Forest Heights • Willamette Bluffs Escarpment • Rocky Butte • Kelly Butte • Powell Butte • Johnson Creek Watershed • Oaks Bottom	• Elrose Road • Government Island
Medium	• Mount Tabor • Springwater and Flavel • Pittock Mansion Area • Tryon Creek • Terwilliger Creek • Zoo and Hoyt Arboretum	
Low	• Southwest Portland Cemetery • Sullivan's Gulch • Smith-Bybee Lake

10.2.4 Severity

Wildfires can range from isolated burns affecting a few acres to severe events that burn hundreds of thousands of acres. Large fires usually occur when groups of smaller fires merge. Property damage from wildfires can be severe and can significantly alter entire communities.

Potential losses from wildfire include human life, structures and other improvements, and natural resources. There are no recorded incidents of loss of life from wildfires in Portland.

10.2.5 Warning Time

Wildfires are often caused by humans, intentionally or accidentally. There is no way to predict when one might break out. Since fireworks often cause brush fires, extra diligence is warranted around the Fourth of July when the use of fireworks is highest. Dry seasons and droughts are factors that greatly increase fire likelihood. Dry lightning may trigger wildfires. Severe weather can be predicted, so special attention can be paid during weather events that may include lightning. Reliable National Weather Service lightning warnings are available on average 24 to 48 hours prior to a significant electrical storm.

If a fire does break out and spread rapidly, residents may need to evacuate within days or hours. A fire's peak burning period generally is between 1 p.m. and 6 p.m. Once a fire has started, fire alerting is reasonably rapid in most cases. The rapid spread of cellular and two-way radio communications in recent years has further contributed to a significant improvement in warning time.

10.3 COMPOUNDING FACTORS AND SECONDARY HAZARDS

10.3.1 Overview

Wildfires can generate a range of secondary effects, which in some cases may cause more widespread and prolonged damage than the fire itself. Fires can cause direct economic losses in the reduction of harvestable timber and indirect economic losses in reduced tourism. Wildfires can contaminate reservoirs, destroy transmission lines and contribute to flooding. They strip slopes of vegetation, exposing them to greater amounts of runoff and erosion. This can weaken soils and cause slope failures. Major landslides can occur several years after a wildfire. Wildfires can bake soils, especially those high in clay content, thus increasing the imperviousness of the ground. This increases the runoff generated by storm events, thus increasing the chance of flooding.

10.3.2 Air Quality

Wildfires across Oregon negatively impacted air quality in the Portland Metro region in August of 2015 causing County health departments to issue warnings. This is a common secondary hazard associated with wildfire and is discussed in more detail in the population vulnerability discussion of this profile.

10.3.3 Invasive Species

Invasive species can contribute to the fuel load in area, thus increasing the severity of fires. Since 2006, Portland Parks and Recreation and the Bureau of Environmental Services have begun work to reduce hazardous wildfire fuels by removing non-native and invasive vegetation in the most highly threatened natural area parks and adjacent open space areas (City of Portland, 2009 as cited in NHMP, 2010).In addition, invasive species can also present issues after a fire as non-native woody plant species frequently invade burned areas. When weeds become established, they can dominate the plant cover over broad landscapes, and become difficult and costly to control (NHMP, 2010).

Fungal infestations can damage the health of native vegetation and contribute to increased wildfire risk. Swiss needle cast is a fungal disease affecting Douglas fir forests in Oregon, predominantly over the past 20 years. Although the fungus is native to Oregon, its detrimental impact may be increasing due to rising spring and summer temperatures (Black et al., 2010) Douglas fir is one of the prominent tree species in Forest Park. A decline in the health of Forest Park's trees due to Swiss needle cast could contribute to increased fuel loads and combustibility, leading to greater risk and severity of wildfires in Portland (Weiskittel et al., 2004).

10.3.4 Climate Change

Climate change can affect multiple elements of the wildfire system: fire behavior, ignitions, fire management, and vegetation fuels. Hot dry spells create the highest fire risk. Increased temperatures may intensify wildfire danger by warming and drying out vegetation. Climate change also may increase winds that spread fires and thunderstorms producing lightning that ignites fires. Forest response to increased atmospheric carbon dioxide could contribute to more tree growth and thus more fuel for fires, although the effects of carbon dioxide on mature forests are still largely unknown. In turn, increased wildfires could release stores of carbon and further contribute to the buildup of greenhouse gases.

According to the City of Portland and Multnomah County Climate Change Preparation Strategy (2014) "in Oregon, the likelihood of increased frequency and intensity of wildfire is very high under the climatic changes expected in the coming decades (State of Oregon, 2010). In addition, an increasing pattern of hot, dry summers and earlier springs increases the likelihood of more and prolonged wildfires."

10.4 EXPOSURE

10.4.1 Population

Population estimates for those residing in wildfire hazard areas were calculated by multiplying the percent of residential structures within the hazard area for each risk reporting area by the total estimated population of that area. These estimates are shown in Table 10-2. Approximately 11 percent of the citywide population is believed to reside in these areas. Exposure as a percent of total population is most significant in the West/Northwest and Southwest reporting areas. Estimates for our social vulnerability indicators are shown in Table 10-3. Citywide estimates indicate that a disproportionate number of young and elderly residents may be residing within these areas. In addition, homeless or transient populations residing in City parks would have considerable exposure to the wildfire hazard.

Table 10-2. Population within Wildfire Hazard Areas

	Population Exposed[a]	% of Total Population
Airport	0	0.0%
Central City	2,925	7.7%
Central Northeast	691	1.5%
East Portland	11,808	7.9%
North Portland	836	1.2%
Northeast	0	0.0%
Southeast	0	0.0%
Southwest	31,550	44.9%
West/Northwest	20,205	75.2%
Total	**68,015**	**11.1%**

a. Value calculated as percent of residential buildings exposed multiplied by the estimated population.

Note: Values shown are accurate only for comparison among results in this plan. See Section 6.8 for a discussion of data limitations.

Table 10-3. Distribution of Social Vulnerability Indicators in Wildfire Hazard Areas

	Population Residing in High Wildfire Hazard Areas *a, b, c, d*					
Reporting Area	Percent Under 15 Years	Percent Over 65 Years	Percent of People of Color	Percent of Renter occupied Housing	Percent of Families Below Poverty Level	Percent of Limited English Speaking Households
Central City	8.6%	11.6%	15.6%	61.9%	4.5%	0.8%
Central Northeast	8.4%	28.6%	26.4%	44.6%	16.3%	10.0%
East Portland	23.0%	10.5%	25.9%	20.4%	5.9%	6.7%
North Portland	13.1%	9.5%	16.8%	29.9%	7.4%	1.6%
Southwest	14.6%	14.2%	12.8%	35.2%	4.1%	1.1%
West/Northwest	16.9%	13.1%	17.5%	30.2%	4.5%	2.4%
Total	15.5%	13.5%	16.9%	27.3%	3.3%	1.4%

a. Values based on an analysis of 2010-2014 American Community Survey 5-year estimates at the Census block group level.
b. Values calculated using block group statistics weighted by the number of residential structures in the hazard area as a percentage of the total residential structures in the block group.
c. Values in red indicate percentages are at least 2 percent greater than the Citywide average (see Section 4.7).
d. Persons with disabilities not shown because the available data, at a census tract scale, is not conducive to analysis by hazard extent and location.

The entire population of Portland would be exposed to air quality issues resulting from a wildfire, although the extent of exposure would depend on weather conditions. Populations without access to air conditioning or who work outdoors would increase their risk of exposure.

10.4.2 Property

Property damage from wildfires can be severe and can significantly alter entire communities. The number of structures in wildfire hazard areas within Portland and their estimated replacement values are listed in Table 10-4. Table 10-5 lists the structure types. The Southwest and West/Northwest reporting areas have the most exposure in the City, with 55 percent and 24 percent of total value exposed, respectively. Citywide, 9.5 percent of the total replacement value of Portland is believed to be exposed to the wildfire risk. Most of the exposed structures are residential (96.6 percent), followed by commercial (2.2 percent).

Table 10-4. Exposure and Value of Structures in Wildfire Hazard Areas

Reporting Area	Number of Buildings Exposed	Value Exposed			Exposed Value as % of Total Replacement Value
		Structure	Contents	Total	
Airport	0	$0	$0	$0	0.0%
Central City	79	$97,606,665	$60,662,292	$158,268,957	0.5%
Central Northeast	259	$162,630,647	$103,979,744	$266,610,391	2.4%
East Portland	3,328	$928,498,538	$484,931,548	$1,413,430,086	5.4%
North Portland	344	$543,255,169	$641,920,056	$1,185,175,224	5.0%
Northeast	0	$0	$0	$0	0.0%
Southeast	0	$0	$0	$0	0.0%
Southwest	10,277	$5,453,618,530	$4,337,521,920	$9,791,140,450	55.0%
West/Northwest	4,949	$2,161,912,229	$1,230,447,391	$3,392,359,620	24.4%
Total	**19,236**	**$9,347,521,776.57**	**$6,859,462,951.32**	**$16,206,984,728**	**9.5%**

Table 10-5. Structure Type Exposed in the Wildfire Hazard Area

Reporting Area	Number of Structures[a]						
	Residential	Commercial	Industrial	Religion	Government	Education	Total
Airport	0	0	0	0	0	0	0
Central City	66	8	2	2	1	0	79
Central Northeast	233	5	0	20	1	0	259
East Portland	3,289	35	0	4	0	0	3,328
North Portland	271	27	14	1	1	30	344
Northeast	0	0	0	0	0	0	0
Southeast	0	0	0	0	0	0	0
Southwest	10,012	150	21	28	12	54	10,277
West/Northwest	4,720	194	16	1	11	7	4,949
Total	**18,591**	**419**	**53**	**56**	**26**	**91**	**19,236**

a. Structure type assigned to best fit Hazus occupancy classes based on present use classifications provided by Multnomah County assessor's data. Where conflicting information was present in the available data, parcels were assumed to be improved.

10.4.3 Critical Facilities and Infrastructure

Critical facilities and infrastructure exposed to the wildfire hazard in Portland are listed in Table 10-6 and Table 10-7. 104 critical facilities and infrastructure are located in wildfire risk areas within the city (16.9 percent). In addition, it is likely that all Portland Water Bureau facilities located outside of the City boundaries are exposed to wildfire risk to some extent, although, the data used for this analysis did not provide information for these facilities. In addition linear features exposed to the wildfire hazard are shown in Table 10-8.

Table 10-6. Critical Facilities in Wildfire Hazard Area

	Number of Critical Facilities in Wildfire Hazard Areas[b]				
Reporting Area	Emergency Services	High Potential Loss Facilities[a]	Schools	Other Assets	Total
Airport	0	0	0	0	**0**
Central City	0	0	1	0	**1**
Central Northeast	0	0	2	1	**3**
East Portland	0	0	1	0	**1**
North Portland	0	2	1	0	**3**
Northeast	0	0	0	0	**0**
Southeast	0	0	0	0	**0**
Southwest	5	1	26	6	**38**
West/Northwest	1	3	4	1	**9**
Total	**6**	**6**	**35**	**8**	**55**

a. Includes 4 hazardous material facilities.
b. See Table 6-1 for a description of the facilities included in each category.

Table 10-7. Critical Infrastructure in Wildfire Hazard Area

	Number of Critical Infrastructure Facilities in Wildfire Hazard Areas[b]					
		Utility Systems				Total
Reporting Area	Transportation Systems	Communications	Power	Potable Water[a]	Wastewater	
Airport	0	0	0	0	0	**0**
Central City	0	0	0	0	0	**0**
Central Northeast	1	1	0	2	1	**5**
East Portland	0	1	1	18	1	**21**

Total	**9**	**7**	**3**	**66**	**14**	**99**

a. It is likely that the 75 facilities located outside of the City boundaries are also exposed to the wildfire hazard.
b. See Table 6-1 for a description of the facilities included in each category.

Table 10-8. Linear Critical Facilities in Wildfire Hazard Area

	Facilities in Wildfire Hazard Area
Utility Systems	
Power Lines	60.74 miles, 12.7% of citywide total
Gas Lines	5.06 miles, 6.1% of citywide total
Transportation Systems	
Railroads	6.48 miles, 1.7% of citywide total
Light Rail	1.65 miles, 3.1% of citywide total
Major Roads	NW Cornell Rd, NW St Helens Rd (US Highway 30), SE Bybee Blvd, SW Bertha Blvd, SW Scholls Ferry Rd, SW Sunset Hwy (US Highway 26).

Note: The wildfire dataset used for this analysis does not include road right of ways in the hazard area.

10.4.4 Environment

Fire is a natural and critical ecosystem process in most terrestrial ecosystems, dictating in part the types, structure, and spatial extent of native vegetation. Portland natural areas and open spaces are fire-prone and fire-adapted ecosystems. The local forests, woodlands and grasslands evolved with fire over thousands of years. The moist western Oregon, natural plant communities burn less frequently, but when they do, the fires tend to be large and intense. Wildfires are part of the natural ecology and natural life cycles of wildlands. Fires create open spaces with different habitats for both plants and animals than existed previously. Fires also reduce fuel loads in areas, which in turn decreases the potential for large catastrophic fires (NHMP, 2010).

In addition to threatening humans, animals and infrastructure, wildfires in forested areas have a severe impact on natural resources. Wildfires strip the land of vegetation and destroy forest resources. Soil exposed to intense heat may lose its capability to absorb moisture and support life. Exposed soils erode quickly and enhance siltation of rivers and streams, thus increasing flood potential, harming aquatic life and degrading water quality. Lands stripped of vegetation are also subject to increased debris flow hazards (City of Portland, 2004a as cited in NHMP, 2010).

10.5 VULNERABILITY

Structures, above-ground infrastructure, critical facilities and natural environments are all vulnerable to the wildfire hazard. There is currently no validated damage function available to support wildfire mitigation planning. Except as discussed in this section, vulnerable populations, property, infrastructure and environment are assumed to be the same as described in the section on exposure.

10.5.1 Population

All population that is exposed to wildfire risk is vulnerable to wildfire risk. The most vulnerable individuals are those who are not able to evacuate risk areas quickly, such as older populations or those with access and functional needs. Generally, few people die in wildfires because warning time is sufficient to allow for evacuation.

Wildfires also threaten the health and safety of those fighting the fires. First responders are exposed to the dangers from the initial incident and after-effects from smoke inhalation and heat stroke. Smoke and air pollution from wildfire can also be a severe health hazard for those living near or downwind from wildfires. This is especially true for sensitive populations, including children, the elderly and those with respiratory and cardiovascular diseases. Smoke generated by wildfire consists of visible and invisible emissions that contain particulate matter (soot, tar, water vapor, and minerals), gases (carbon

monoxide, carbon dioxide, nitrogen oxides), and toxics (formaldehyde, benzene). Emissions from wildfires depend on the type of fuel, the moisture content of the fuel, the efficiency (or temperature) of combustion, and the weather. Public health impacts associated with wildfire include difficulty in breathing, odor, and reduction in visibility.

10.5.2 Property

Loss estimations for the wildfire hazard are not based on damage functions, because no such damage functions have been generated. Instead, loss estimates were developed representing 10 percent, 30 percent and 50 percent of the replacement value of exposed structures. This allows emergency managers to select a range of economic impact based on an estimate of the percent of damage to the general building stock. Damage in excess of 50 percent is considered to be substantial by most building codes and typically requires total reconstruction of the structure. Table 10-9 lists the loss estimates for each risk reporting area.

Table 10-9. Loss Potential for Wildfire

Reporting Area	Exposed Value	Potential Loss		
		@ 10% Damage	@ 30% Damage	@ 50% Damage
Airport	$0	$0	$0	$0
Central City	$158,268,957	$15,826,896	$47,480,687	$79,134,479
Central Northeast	$266,610,391	$26,661,039	$79,983,117	$133,305,196
East Portland	$1,413,430,086	$141,343,009	$424,029,026	$706,715,043
North Portland	$0	$0	$0	$0
Northeast	$0	$0	$0	$0
Southeast	$9,791,140,450	$979,114,045	$2,937,342,135	$4,895,570,225
Southwest	$3,392,359,620	$339,235,962	$1,017,707,886	$1,696,179,810
West/Northwest	$1,185,175,224	$118,517,522	$355,552,567	$592,587,612
Total	**$16,206,984,728**	**$1,620,698,473**	**$4,862,095,418**	**$8,103,492,364**

10.5.3 Critical Facilities and Infrastructure

Critical facilities of wood frame construction are especially vulnerable during wildfire events. In the event of wildfire, there would likely be little damage to most infrastructure. Most roads and railroads would be without damage except in the worst scenarios. Power lines are the most at risk from wildfire because most poles are made of wood and susceptible to burning. Fires can create conditions that block or prevent access and can isolate residents and emergency service providers. Wildfire typically does not have a major direct impact on bridges, but it can create conditions in which bridges are obstructed. Many bridges in areas of high to moderate fire risk are important because they provide the only ingress and egress to large areas and in some cases to isolated neighborhoods.

10.5.4 Environment

The vulnerability risks are the same as those described for exposure. In addition, there are four registered hazardous material containing structures in wildfire risk zones. During a wildfire event, these materials could rupture due to excessive heat and act as fuel for the fire, causing rapid spreading and escalating the fire to unmanageable levels. In addition they could leak into surrounding areas, saturating soils and seeping into surface waters, and have a disastrous effect on the environment.

10.5.5 Economic Impact

A large fire could have significant economic impacts for Portland, especially damage to utilities and the expense incurred fighting.

10.6 FUTURE TRENDS IN DEVELOPMENT

The City's Comprehensive Plan establishes goals, policies and projects for reducing wildfire risk, including through site design, designing with nature, promoting hazard resilient design, managing risk through plans and investments, and ensuring adequate resources and facilities for response. In addition, the City has identified actions that seek to strengthen fire-related development codes.

Table 10-10 shows future land use designations in mapped wildfire risk areas. Over half of the land area is designated as open space, which is a low risk use for landslide hazard areas. Approximately, 42.5 percent of the remaining area is designated as single-family dwelling.

Table 10-10. Future Land Use Designations in Portland

Reporting Area	Total Acreage	Percent of total acres					
		Residential					
		Single-Dwelling	Multi-Dwelling	Commercial	Employment & Industrial	Mixed Use & Institutional	Open Space
Airport	0	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%
Central City	23	4.0%	57.8%	35.7%	0.0%	0.0%	2.5%
Central Northeast	244	45.9%	3.9%	0.0%	0.0%	13.1%	37.1%
East Portland	2,949	49.1%	2.6%	0.0%	1.7%	0.2%	46.5%

TOTAL	19,200	42.5%	2.1%	0.0%	2.1%	3.1%	50.2%

Source: Future land use categories are based on the proposed comprehensive plan designations as of February 2016.

10.7 SCENARIO

A major fire in Portland might begin with a wet spring, adding to fuels on the forest floor. Flashy fuels would build throughout the spring. The summer could see the onset of insect infestation. A dry summer could follow the wet spring, exacerbated by dry hot winds. Carelessness with combustible materials or a tossed lit cigarette, or a sudden lighting storm could trigger a multitude of small isolated fires. The embers from these smaller fires could be carried miles by hot, dry winds. The potential for large-scale destruction from such fires would be increased if there were an active fire season in the American west. This may lead to thinly spread resources being available to support local crews.

To further complicate the problem, heavy rains could follow the burns, causing flooding and landslides and releasing tons of sediment into rivers, permanently changing floodplains and damaging sensitive habitat and riparian areas. Such a fire followed by rain could release millions of cubic yards of sediment into streams for years, creating new floodplains and changing existing ones. With the forests removed from the watershed, stream flows could easily double. Floods that could be expected every 50 years may occur every couple of years. With the streambeds unable to carry the increased discharge because of increased sediment, the floodplains and floodplain elevations would increase.

10.8 ISSUES

The following issues were identified for the wildfire hazard:

- Wildfire hazard areas have been identified in all risk reporting areas aside from the following: Airport, Northeast and Southeast.
- 68,015 people are estimated to reside in wildfire hazard areas. This includes approximately 75 percent of the West/ Northwest population and nearly 45 percent of the Southwest population.
- There are estimated to be 19,236 buildings exposed to the wildfire hazard. More than half of these are in the Southwest reporting area. The majority of the remaining structures are in the West/Northwest and East Portland reporting areas.
- More than $16.2 billion is estimated to be exposed to the wildfire hazard. This is approximately 9.4 percent of the total value of Portland, more than 55 percent of the Southwest risk reporting area and almost 25 percent of the West/ Northwest area.
- More than 96 percent of the exposed buildings are thought to be residential structures. About 2 percent of the remaining buildings are commercial.
- The following social-vulnerability-related issues have been identified for wildfire hazard areas:
    - Children under 15 years of age may disproportionately reside in wildfire hazard areas in the East Portland risk reporting area (23 percent).
    - People over 65 years of age may disproportionately reside in wildfire hazard areas in the Central Northeast (29 percent) and West/Northwest (13 percent) risk reporting areas.
    - People of color may disproportionately reside in wildfire hazard areas in the Central Northeast (26 percent) and East Portland (26 percent) risk reporting areas.
    - Renters may disproportionately reside in wildfire hazard areas in the Central City (62 percent) risk reporting area.
    - Families with incomes below the poverty level may disproportionately reside in wildfire hazard areas in the Central Northeast risk reporting area (16 percent).
    - Households with limited English speaking abilities may disproportionally reside in wildfire hazard areas in the Central Northeast (10 percent) and East Portland (7 percent) risk reporting areas.
- There are 104 critical facilities located in the wildfire hazard area. The wildfire hazard presents a significant risk to the City's water supply.
- Portland's largest natural area and largest area exposed to wildfire risk—the 5,500 acre Forest Park—is surrounded on three sides by industrial and residential development (NHMP, 2010).
- The risk of loss to homes and businesses built at the wildland urban interface is significant and growing due to the buildup of hazardous wildfire fuels (including invasive species), longer dry seasons and changing weather patterns (NHMP, 2010).
- Public education and outreach to people living in or near the fire hazard zones should include information about and assistance with mitigation activities such as how to maintain defensible space, and advance identification of evacuation routes and safe zones.
- Area fire districts need to continue to train on wildland-urban interface events.
- Continued efforts at vegetation management activities are needed.
- Many of the actions identified in the 2009 Gap Analysis report and 2011 community wildfire protection plan still need to be implemented.
- Additional clarification and guidance is needed when discussing burn restrictions with the public.
- NET members could be trained to assist in fire-fighting when resources are stretched thin.

11. FLOOD

11.1 GENERAL BACKGROUND

11.1.1 What Is a Floodplain?

A floodplain is the area adjacent to a river, creek or lake that becomes inundated during a flood. Floodplains may be broad, as when a river crosses an extensive flat landscape, or narrow, as when a river is confined in a canyon.

DEFINITIONS

- **1-Percent Annual Chance Flood (100-Year Flood)**—The flood magnitude that has a 1-percent chance of being equaled or exceeded in any given year. On a statistical average over a long term, this magnitude can be expected to occur once every 100 years; in fact though, such a flood can occur multiple times in a few years, or even in a single year.
- **1-Percent Annual Chance Flood Hazard Area (100-Year Floodplain)**—The area that is inundated during a 1-percent annual chance (100-year) flood.
- **Flood**—The inundation of normally dry land resulting from the rising and overflowing of a body of water.
- **Floodplain**—The land area along the sides of a river that becomes inundated with water during a flood.
- **Riparian Area**—The area along the banks of a natural watercourse.

Floodplain Benefits

Floodplains are a natural component of the City of Portland environment. Understanding and protecting their natural functions can reduce flood damage and protect people and property. The benefits of preserving floodplains include the following:

- **Flood and erosion control**—Floodplains are like natural sponges, storing and slowly releasing floodwaters. This reduces the height of a flood and the speed of a river. When a river is cut off from its floodplain by levees and dikes, flood heights often increase and downstream damage can be greater.
- **Water quality improvement**—As water travels through floodplains, plants serve as natural filters, trapping sediments and capturing pollutants. Floodplains help to moderate temperature fluctuations that can harm aquatic life. They also help remove from the water soil and pollutants that can harm aquatic life.
- **Groundwater recharge**—Floodplains promote infiltration and recharge of underlying aquifers.
- **Fish and wildlife habitat**—Floodplains maintain biodiversity. They provide breeding and feeding grounds, create and enhance waterfowl areas, and protect habitat for rare and endangered species.

The natural processes of flooding add sediment and nutrients to floodplain areas. When floodwaters recede after a flood event, they leave behind layers of rock and mud. These gradually build up to create a new floor of the floodplain. Floodplains generally contain accumulations of sand, gravel, loam, silt or clay, often extending below the bed of the stream. These sediments provide a natural filtering system, with water percolating back into the ground and replenishing groundwater. These are often important aquifers, the water drawn from them being filtered compared to the water in the stream. Fertile, flat reclaimed floodplain lands are commonly used for agriculture, commerce and residential development.

Floodplains can support ecosystems that are rich in plant and animal species. A floodplain can contain 100 or even 1,000 times as many species as a river. Wetting of the floodplain soil releases an

immediate surge of nutrients: those left over from the last flood, and those that result from the rapid decomposition of organic matter that has accumulated since then. Microscopic organisms thrive and larger species enter a rapid breeding cycle. Opportunistic feeders (particularly birds) move in to take advantage. The production of nutrients peaks and falls away quickly, but the surge of new growth endures for some time. This makes floodplains valuable for agriculture. Species growing in floodplains are markedly different from those that grow outside floodplains. For instance, riparian trees (trees that grow in floodplains) tend to be very tolerant of root disturbance and very quick-growing compared to non-riparian trees.

A river and its floodplain together form a complex physical and biological system that supports a variety of natural resources and provides natural flood and erosion control. When a river is separated from its floodplain with levees and other flood control facilities, natural, built-in benefits can be lost, altered, or significantly reduced.

Effects of Human Activities

Because they border water bodies, floodplains have historically been popular sites to establish settlements. Human activities tend to concentrate in floodplains for a number of reasons: water is readily available; land is fertile and suitable for farming; transportation by water is easily accessible; and land is flatter and easier to develop. But human activity in floodplains frequently interferes with the natural function of floodplains. It can affect the distribution and timing of drainage, thereby increasing flood problems. Human development can create local flooding problems by altering or confining drainage channels. This increases flood potential in two ways: it reduces the stream's capacity to contain flows, and it increases flow rates or velocities downstream during all stages of a flood event. Additionally, human development typically results in increases in impervious surfaces, such as paved roadways and roofs. These areas increase stormwater runoff and flood risk, especially when the stormwater is contributing to a system designed for a lower level of flooding. Human activities can interface effectively with a floodplain as long as steps are taken to mitigate the activities' adverse impacts on floodplain functions.

11.1.2 Measuring Floods and Floodplains

The magnitude of floods is commonly rated based on the probability in any given year of the river discharge (flow) level reached during the flood being equaled or exceeded. Flood studies use historical records to determine the probability of occurrence or flood frequency for different discharge levels. The flood frequency equals 100 divided by the probability of occurrence. For example, the flow level with a 1-percent chance of being equaled or exceeded in any given year is referred to as the 100-year flood. These measurements reflect statistical averages only; it is possible for two or more floods with a 100-year or higher flood frequency to occur in a short time period. The same flood can have different flood frequency at different points on a river.

The 1-percent annual chance (100-year) flood is sometimes referred to as the base flood. Many communities have maps that show the extent and likely depth of flooding for the base flood. The inundated area shown on such maps is called the special flood hazard area (SFHA). Its boundary is used as a regulatory boundary as part of the National Flood Insurance Program (NFIP).

11.2 HAZARD PROFILE

11.2.1 Characteristics of Flooding in Portland

Portland is subject to flooding from river overflow from the Columbia, Willamette, Tualatin and Sandy Rivers, smaller rivers and lesser waterways, as well as flooding from local stormwater drainage. The city is susceptible to winter rain flooding between October and April, while between May and July snowmelt and runoff can create floods. Typically, the most severe floods are winter rainfall floods from December to February, when heavy or prolonged rain or snowmelt creates water flows that exceed the carrying capacity of river channels or other water courses and storage facilities. As storms from the Pacific move across the Oregon Coast Range, air rises and cools and heavy rainfall develops over high-elevation streams—as much as 4 to 6 inches of rain over a 24-hour period. Severe and prolonged storms can raise rivers and streams to their flood stages for three to four days or longer (NHMP, 2010). Three types of flooding are typical: riverine floods, urban flooding, and flash floods.

Riverine Flooding

Riverine flooding along channels of rivers and streams due to high water is the most common form of flooding in Portland. Flooding in large river systems typically results from large-scale weather systems that generate prolonged rainfall over a wide geographic area, causing floods in hundreds of smaller streams that drain into major rivers. Terrain helps determine the dynamics of riverine flooding. In relatively flat areas, shallow, slow-moving floodwater may cover the land for days or even weeks (NHMP, 2010).

Human development changes hydrologic systems in a watershed. As land is converted from fields or woodlands to roads and parking lots, it loses its ability to absorb and then slowly release rainfall. Water moves to the ground and into streams at a much faster rate in urban areas, as heavy rainfall collects and flows faster on impervious concrete and asphalt surfaces. These changes can result in floodwaters that rise very rapidly and peak with violent force. The resulting high water volume and turbidity (suspended sediments in the water) both contribute to the erosion of stream banks (NHMP, 2010).

Shallow area flooding is a special type of riverine flooding. FEMA defines shallow flood hazards as areas that are inundated only 1 to 3 feet deep by the 1-percent annual chance flood. These areas are generally flooded by low-velocity sheet flows of water (NHMP, 2010).

Urban Flooding

Urban flooding can occur when the amount of rainfall and runoff exceeds the capacity of a stormwater system, such as a creek, ditch or storm drain, to remove it. A majority of land in Portland is urbanized and has a high concentration of impervious surfaces that either collect water or concentrate flow in unnatural channels. During periods of urban flooding, streets can become swift moving rivers and basements can fill with water. Storm drains and catch basins can back up with vegetative debris and trash and cause additional, localized flooding (NHMP, 2010).

Numerous areas are currently subject to urban flooding, and the number of at-risk areas could increase without proper infrastructure to guide water overflow. The continued increase of impervious surfaces related to development significantly contributes to Portland's future flood risk as increased runoff exceeds the capabilities of drainage infrastructure (NHMP, 2010).

Flash Floods

In hilly areas, a flood can begin only minutes after a heavy rain. Such flash floods provide little or no notice and can move so fast that they are particularly dangerous to people and property in their path.

11.2.2 Past Events

Significant historic flooding occurred in the Willamette and Columbia River basins in 1861, 1880, 1881, 1909, 1913, 1927, 1928, 1942, 1946, 1948, 1961, 1964/65, 1996 and 2007. (NHMP, 2010). Table 11-1 summarizes flood events for which federal disaster declarations have been issued. The sections below provided narrative descriptions of the most significant historical Portland floods.

Table 11-1. Portland Flood Events for Which Federal Disaster Declarations Were Issued

Disaster Number	Declaration Date	Title
DR-4258	2/17/2016	Severe winter storms, straight-line winds, flooding, landslides, and mudslides
DR-1956	2/17/2011	Severe winter storm, flooding, mudslides, landslides
DR-1733	12/8/2007	Severe storms, flooding, landslides, and mudslides
DR-1632	3/20/2006	Severe storms, flooding, landslides, and mudslides
DR-1099	2/9/1996	High winds, severe storms and flooding
DR-413	1/25/1974	Severe storms, snowmelt & flooding
DR-319	1/21/1972	Severe storms & flooding
DR-184	12/24/1964	Heavy rains & flooding

May 1948

Vanport was a residential community at a site that is now occupied by the Portland International Raceway and the Heron Lakes Golf Club. In 1944, it lay between the Portland city limits and the Columbia River and was completely encircled with a levee system and embankments. Its ground elevation was several feet below the Columbia River's normal water level. The community was built to house ship workers employed at Henry Kaiser's shipyards during World War II, and peaked in population in 1944 when it had approximately 42,000 residents and nearly 10,000 housing units (Abott, 2016). By 1948, as the war came to a close, the population of Vanport had declined substantially but it was still home to many of Portland's low-income and minority communities. On Memorial Day 1948, a railroad embankment was breached, resulting in a catastrophic flood. The community of 18,500 was flooded with debris-laden water 10 to 20 feet deep. Most of the buildings were substantially damaged or destroyed, and at least 15 people lost their lives. Many others were never found but were not officially recorded as fatalities. Others were permanently displaced, as the city ceased to exist (NHMP, 2010).

December 1964

Nearly every river in Oregon exceeded its flood stage in December 1964 as weather stations recorded new records for precipitation. Known as the Christmas Flood, the event triggered debris flows, bridge failures and flooding that caused thousands to evacuate and closed airports, railways and hundreds of miles of roads across the state. Ultimately, the event caused more than $157 million in damage and 20 people were killed (NHMP, 2010).

February 1996

One of the more severe flood years on record occurred in 1996, when many rivers and creeks throughout the Willamette River watershed rose to 100-year flood levels due to a combination of warm temperatures, heavy snow pack and four consecutive days of record-breaking rain. The floods caused five deaths statewide, forced thousands of people into shelters, and destroyed hundreds of homes. Portland was forced to erect makeshift barriers to prevent floodwaters from moving into the downtown area. On February 9, 1996, the Willamette River crested just inches away from overtopping the barriers. The Columbia River crested at 11 feet 2 inches above flood stage, testing the strength of

levees that protect Portland International Airport and areas north of Columbia Boulevard. Johnson Creek crested at 6 feet 5 inches above flood stage (NHMP, 2010).

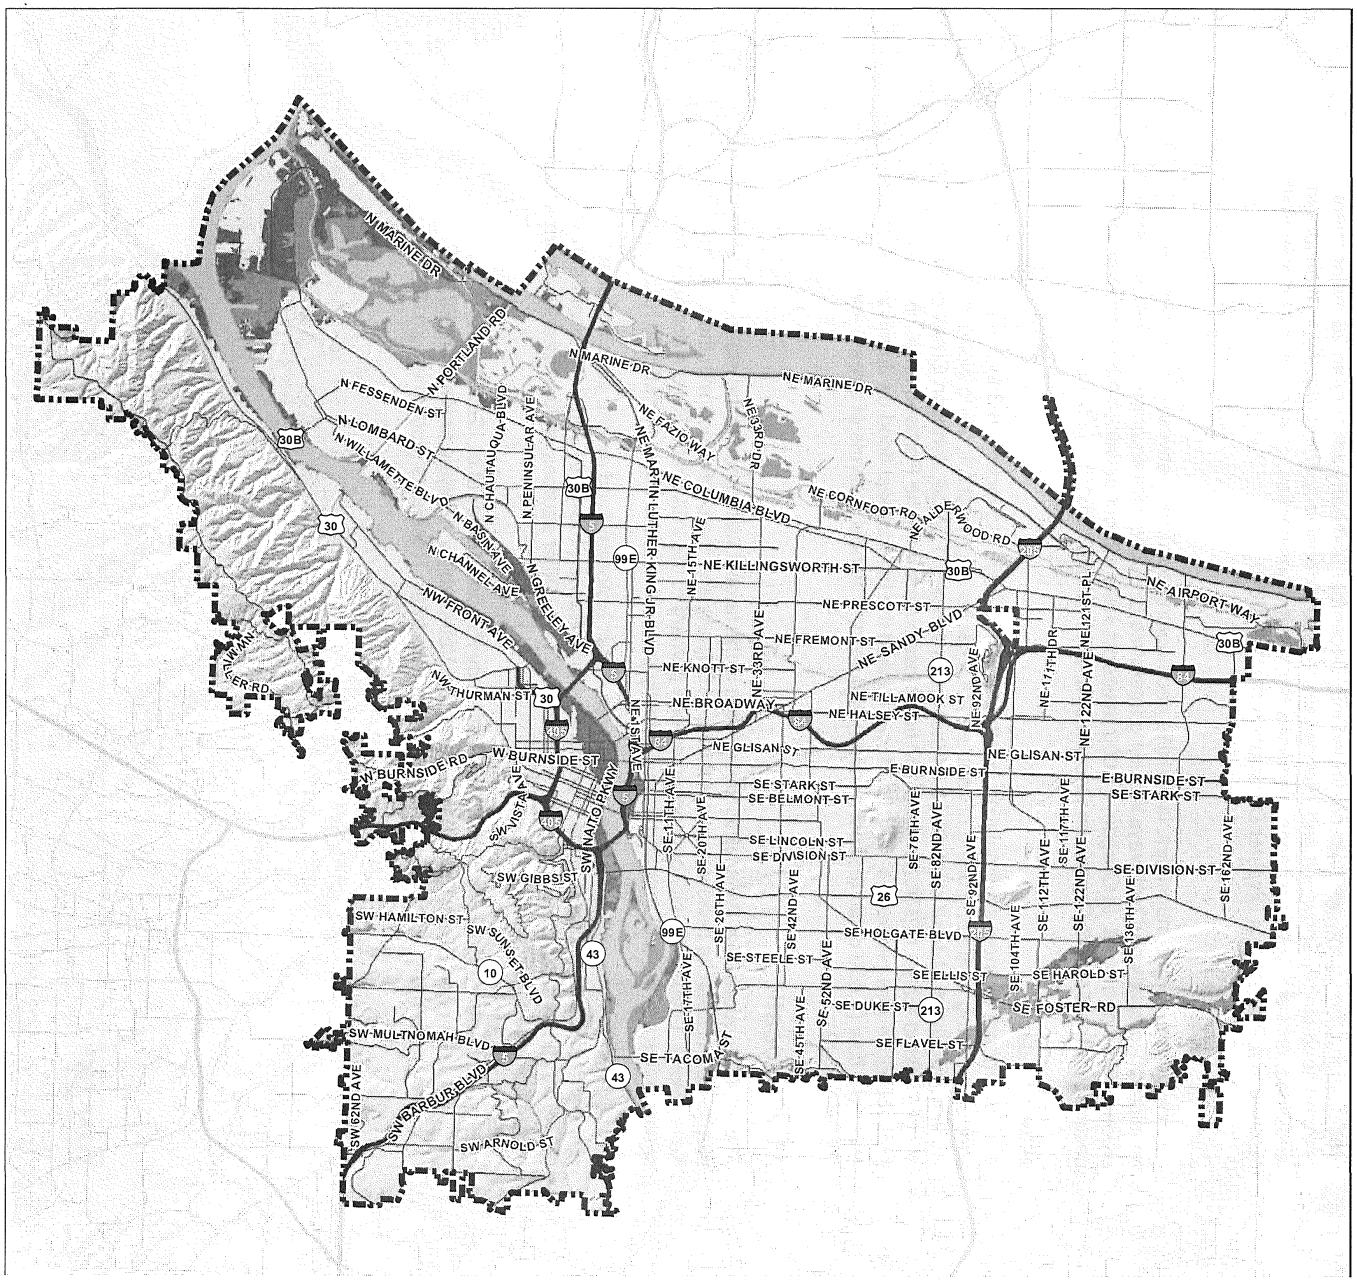
Winter 1996-97

In November 1996, a tropical air mass swept across Oregon, again bringing record-breaking precipitation. The stormy weather continued into December and early January as 26 major rivers reached flood stage. Snowmelt and intense rain caused extensive flooding that led to widespread landslides, erosion, power outages, damaged homes and businesses, closed roads and eventually resulted in a Presidential Disaster Declaration (NHMP, 2010).

December 2007

Severe storms, winds, mudslides, landslides and flooding occurred between December 1 and 17, 2007 shutting down roads and highways including Interstate 5. Public infrastructure, homes and personal property were damaged. In Oregon, 73,000 residents were without power. A major disaster was declared for the State of Oregon on December 8, 2007 (NHMP, 2010).

January 2009



A great amount of snow accumulation in late December 2008 (15 inches to 3 foot drifts) and then a sudden warming at the beginning of January 2009 caused significant flooding along local streams. Portland received 24-hour rainfall of 3.04 inches on January 1, 2009. Johnson Creek crested at 3.7 feet above its flood stage. FEMA received 187 flood loss claims from the Portland area, six of which were from repetitive loss properties. This flood was ranked the third largest flood on Johnson Creek in terms of stream flow (2,430 cubic feet per second) and second highest in terms of stream level (14.69 feet) (NHMP, 2010).

11.2.3 Location

The 11,460-square-mile Willamette River Basin is the largest watershed in the state, with 13 major tributaries between its headwaters southeast of Eugene and the confluence with the Columbia River at Kelley Point. Though the city only occupies one percent of the Willamette River's drainage basin, its 17 square miles are the most urbanized and heavily used of all in the basin (NHMP, 2010).

FEMA Flood Insurance Rate Maps for the area depict historical flood extent, defining most of the flood-prone streams and delineating the 1-percent annual chance (100-year) and 0.2-percent annual chance (500-year) flood hazard areas, as shown in Figure 11-1. Other sources of flood location information can be found in the following:

- Lents Neighborhood Climate Resiliency Report (Berger et al., 2015)
- Johnson Creek Floodplain Residential Vulnerability Analysis (Judelman, 2015a)
- Summary Vulnerability of East Lents Floodplain Residents (Judelman, 2015b).

PBEM

11.2.4 Frequency

The following factors contribute to the frequency and severity of riverine flooding (NHMP, 2010):

- Rainfall intensity and duration
- Antecedent moisture conditions
- Watershed conditions, including steepness of terrain, soil types, amount and type of vegetation and density of development
- The existence of attenuating features in the watershed, including natural features such as wetlands and lakes and human-built features such as dams
- The existence of flood control features, such as levees and flood control channels
- Velocity of flow
- Tide heights and storm surge
- Availability of sediment for transport and the erodibility of the bed and banks of the watercourse.

These factors are evaluated using a hydrologic analysis to determine the probability that discharge of a certain size will occur and to determine the characteristics and depth of the flood resulting from that discharge. Portland typically experiences flooding after more than three days of heavy rainfall or when saturated conditions combine with significant rainfall or storms over short periods of time. Based on previous occurrences, it is probable that a flood has greater than a 33 percent likelihood of occurring in any given year (NHMP, 2010).

11.2.5 Severity

Nationwide, floods result in more deaths than any other natural hazard. Floods result in excessive expenditures for emergency response and generally disrupt the normal function of a community.

Typical flood damage can include the following (NHMP, 2010):

- Inundation of structures
- Erosion of stream banks, road embankments, foundations, footings for bridge piers and other features
- Impact damage from high-velocity flow and from debris
- Debris accumulation on bridge piers and in culverts, increasing loads on these features or causing overtopping or backwater damage
- Destruction of croplands
- Release or runoff of sewage and hazardous or toxic materials from damaged pipelines, tanks and facilities
- Economic loss (local facilities, utilities, communications, agriculture).

Problems related to flooding include sediment deposition and stream bank erosion. Deposition is the accumulation of soil, silt and other particles on a river bottom or delta. It leads to the destruction of fish habitat and presents a challenge for navigational purposes. It reduces channel capacity, resulting in increased flooding or bank erosion. Stream bank erosion is the removal of material from the stream bank. When bank erosion is excessive, it becomes a concern because it results in loss of streamside vegetation, loss of fish habitat and loss of land and property (NHMP, 2010). Erosion on a levee bank can also increase the risk of levee failure.

The principal factors affecting flood damage are flood depth and velocity. The deeper and faster flood flows become, the more damage they can cause. Shallow flooding with high velocities can cause as

much damage as deep flooding with slow velocity. Flood severity is often evaluated by examining peak discharges; Table 11-2 lists peak flows used by FEMA to map floodplains in Portland.

Table 11-2. Summary of Peak Discharges in Portland

11.2.6 Warning Time

Due to the sequential pattern of meteorological conditions needed to cause serious flooding, it is unusual for a flood to occur without warning. Warning times for floods can be between 24 and 48 hours. Flash flooding can be less predictable, but potential hazard areas can be warned in advanced of potential flash flooding danger.

The Portland Bureau of Emergency Management (PBEM) disseminates advisories relating to flooding. The Bureau of Environmental Services (BES) serves as technical expert to PBEM and other bureaus on local flooding and hydrology. Both PBEM and BES rely upon USGS real-time river gage data and the National Weather Service's (NWS) flood prediction service. Through this service, BES and other City staff receive severe weather and emergency email briefings in real-time. BES performs additional monitoring and analysis of USGS data and NWS predictions throughout the wet season (typically November 1 through March 31). Up to 10 BES staff each year are designated as emergency managers.

During periods of heavy precipitation or contiguous days of moderate precipitation, a subset of BES staff monitor real-time online USGS river gage data and NWS hydrograph predictions. USGS gages continuously collect discharge rates, water surface elevation, and temperature data and transmit that data every 15 minutes. Data is accessible online via USGS and NWS websites within an hour of collection. NWS predictive hydrologic models are run every 12 hours using the most current gage data and are also shared online. The following are the primary USGS gages monitored by the City of Portland:

- USGS 14144700, Columbia River, Vancouver, WA, under the I-5 Bridge
- USGS 14211820, Columbia Slough, Portland, OR, N Lombard St. & N Kelly Point Park Rd.
- USGS 14206900, Fanno Creek, Portland, OR, SW 56th & SW Seymour Ave.
- USGS 14211315, Tryon Creek, Portland, OR, G Ave. & Cumberland Pl.
- USGS 14211720, Willamette River, Portland, OR, under the Morrison Bridge
- USGS 14211550, Johnson Creek, Milwaukie, OR, SE Milport Rd. & SE McBrod Ave.
- USGS 14211500, Johnson Creek, in Portland, OR, SE 152nd Ave. & SE Foster Rd.
- USGS 14211499, Kelley Creek, Portland, OR, SE 159th Dr. & SE Foster Rd.
- USGS 14211400, Johnson Creek, Gresham, OR, SE Regner Rd. & SE Roberts Rd.

Portland's most frequent disruptive flooding occurs along Johnson Creek; as a result, much of the City's flood risk monitoring and response planning efforts are focused in this geographic area.

BES staff access hydrologic data multiple times per day once recorded water surface elevations are within 3 feet of bank-full levels and continue monitoring until the threat has passed. BES issues a Level 1 event advisory in Johnson Creek when the Sycamore Gage height reaches 10 feet (approximately 3 feet below bank-full). Coordinated monitoring intensifies at that point to include emergency conference calls, field checks of gages and river levels at locations most likely to flood, and interpretation of additional data. Technical staff review the hydrograph in depth and assess how quickly discharge rates are increasing at different points along the system; discuss predictions with NWS staff and request models be updated more frequently if conditions are rapidly evolving; review precipitation levels over preceding days; assess soil conditions (saturation, freezing levels, presence of snow, etc.) and likely impacts on river levels; compare current conditions against historic patterns and flood outcomes; and review flood inundation maps to ensure familiarity with modeled outcomes.

11.2.7 Flood Management Programs and Projects

Protecting Portland from Flood Losses

Columbia and Willamette Rivers

Multnomah County Drainage District maintains flood management systems including 27 miles of levees and 45 miles of ditches, sloughs, streams and culverts along the Columbia Slough and the lower Columbia River (MCDD, 2016). The ditches and sloughs were constructed and are maintained to accommodate a 1-percent annual chance flood. Stormwater enters into these ditches and sloughs through pipes that drain water from the streets and parking lots of Portland. About 20 miles of levees protect the city from flooding due to high water in the Columbia River and Lower Columbia Slough (see Figure 11-2). The system has been extensively improved since the 1996 flood. Pump station, levee and conveyance system upgrades, as well as a series of computers, repeaters and antennas that allow 24-hour real-time monitoring from remote locations, all make the system a reliable means to protect the managed floodplain from catastrophic flooding (NHMP, 2010).

Properties protected by the Multnomah County Drainage District system of levees are valued at more than $5.5 billion and protect approximately $16 billion in economic activity including the Portland International Raceway, the Portland Expo Center, the Portland International Airport, the Columbia Industrial Corridor, several residential neighborhoods, and the City's drinking water well system (MCDD, n.d.). The cost of replacing the infrastructure protected by Multnomah County Drainage District would be devastating (NHMP, 2010).

Flood control storage reservoirs have substantially reduced flood potential along the Columbia River and other major waterways. Upstream of Multnomah County, the Columbia River has 22 major reservoirs and the Willamette River has 11. These reservoirs have reduced, but not eliminated flood potential (NHMP, 2010).

Johnson Creek

Public acquisition of homes and land in the Johnson Creek floodplain has significantly reduced the impacts of regular flooding. The area surrounding SE Foster Road flooded on average every other year until Portland invested over $40 million in floodplain restoration. Johnson Creek, which provides habitat to several native species of salmon, now floods approximately every 6 to 8 years.

Floodplain property purchases also contribute to the City's rating under the Community Rating System (CRS) program. Floodplain restoration projects along Johnson Creek have added over 240 acre-feet of flood storage to mitigate flood impacts. BES is currently developing a city-wide Stormwater System Plan that will complements the Johnson Creek Restoration Plan, which is focused on mitigating nuisance flooding. The Stormwater System Plan will identify a comprehensive set of actions focused on uplands, tributaries and drainage patterns to minimize the impacts of stormwater runoff on flooding. Implementation of such actions can help improve the City's CRS ranking with FEMA (NHMP, 2010).

Federal Flood Programs

National Flood Insurance Program

The National Flood Insurance Program (NFIP) makes federally backed flood insurance available to homeowners, renters, and business owners in participating communities. For most participating communities, FEMA has prepared a detailed Flood Insurance Study that presents water surface elevations for floods of various magnitudes, including the 1-percent annual chance flood and the 0.2-percent annual chance flood. Base flood elevations and the boundaries of the floodplains are shown on Flood Insurance Rate Maps (FIRMs), which are the principle tool for identifying the extent and location of the flood hazard. FIRMs are the most detailed and consistent data source available, and for many communities they represent the minimum area of oversight for the local floodplain management program.

Participants in the NFIP must, at a minimum, regulate development in floodplain areas in accordance with NFIP criteria. Before issuing a permit to build in a floodplain, participating jurisdictions must ensure that three criteria are met:

- New buildings and those undergoing substantial improvements must, at a minimum, be elevated to protect against damage by the 1-percent annual chance flood.
- New floodplain development must not worsen existing flood problems or damage to other properties.
- New floodplain development must exercise a reasonable and prudent effort to reduce its adverse impacts on threatened salmonid species.

Since the NFIP's inception, additional legislation has been enacted to strengthen the program, ensure its fiscal soundness and inform its mapping and insurance rate-setting through expert consultation, reports and studies. Most recently, the Biggert-Waters Flood Insurance Reform Act of 2012 (Public Law 141, Title II) and the Homeowner Flood Insurance Affordability Act of 2014 (Public Law 113-89) directed FEMA to make substantial changes to the NFIP by October 1, 2017. Administration, rating and application of key functional components of the NFIP could be directed by this legislation.

The Community Rating System

The CRS is a voluntary program within the NFIP that encourages floodplain management activities that exceed the minimum NFIP requirements. Flood insurance premiums are discounted to reflect the reduced flood risk resulting from community actions meeting the following three goals of the CRS:

- Reduce flood losses.
- Facilitate accurate insurance rating.
- Promote awareness of flood insurance.

For participating communities, flood insurance premium rates are discounted in increments of 5 percent. For example, a Class 1 community would receive a 45 percent premium discount, and a Class 9 community would receive a 5 percent discount. (Class 10 communities are those that do not participate in the CRS; they receive no discount.) The CRS classes for local communities are based on 18 creditable activities in the following categories:

- Public information
- Mapping and regulations
- Flood damage reduction
- Flood preparedness.

Figure 11-3 shows the nationwide number of CRS communities by class as of October 1, 2015, when there were 1,368 communities receiving flood insurance premium discounts under the CRS program. In Oregon there are 27 CRS communities (FEMA, 2016a). Although CRS communities represent only 6 percent of the over 22,000 communities participating in the NFIP, more than 70 percent of all flood insurance policies are written in CRS communities.

Source: FEMA, 2016a

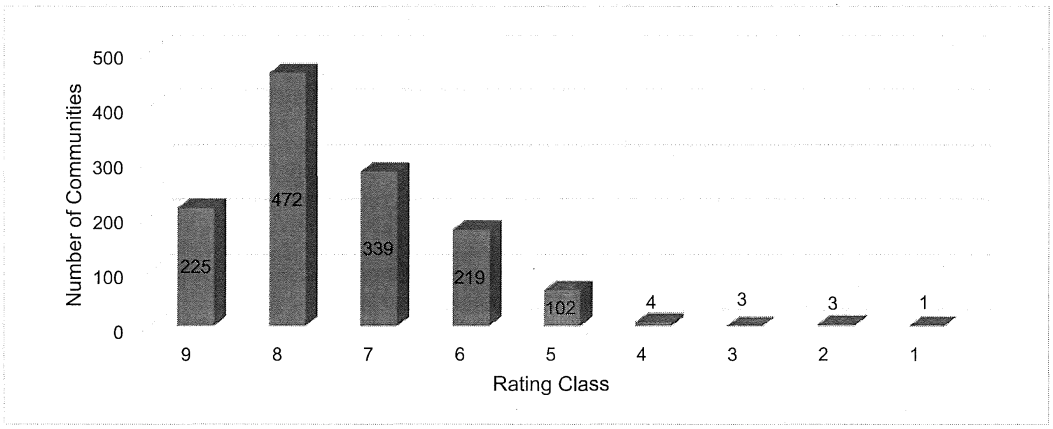

Figure 11-3. CRS Communities by Class Nationwide as of October 1, 2015

Portland Participation in NFIP and CRS

The City of Portland entered the NFIP on October 15, 1980. Currently, structures permitted or built in Portland before then are called "pre-FIRM" structures, and structures built afterwards are called "post-FIRM." However, the rating rules associated with this terminology may be subject to change due to

flood insurance reform discussed below. The insurance rate is different for the two types of structures. The effective date for the current FIRM is November 26, 2010. This map is a DFIRM (digital flood insurance rate map).

The City of Portland is currently in good standing with the provisions of the NFIP. Compliance is monitored by FEMA regional staff and by the Oregon Department of Land Conservation and Development (DLCD) under a contract with FEMA. Table 11-3 summarizes the City's current compliance with NFIP requirements. Maintaining compliance under the NFIP is an important component of flood risk reduction. The City of Portland has identified actions to maintain its compliance and good standing.

Table 11-3. National Flood Insurance Program Compliance

Criteria	Response
When did Portland enter the NFIP?	10/15/80
When did the current Flood Insurance Rate maps become effective?	11/26/10
What local department is responsible for floodplain management?	Bureau of Environmental Services
Who is the City's floodplain administrator? (department/position)	Bureau of Development Services
• **Is this a primary or auxiliary role?**	Primary
Are any certified floodplain managers on staff in Portland?	Yes
What is the date of adoption of the flood damage prevention ordinance?	Last amended in part on November 26, 2010
• **Does the floodplain management program meet or exceed minimum requirements?**	Yes
• **If so, in what ways?**	See CRS Classification status
When was the most recent Community Assistance Visit or Community Assistance Contact?	June 25, 2015
Does Portland have any outstanding NFIP compliance violations that need to be addressed?	No
Do the flood hazard maps adequately address the flood risk within the city?	No
• **If no, please state why.**	BES is constantly in the state of revision of the City's currently effective FIRM based on flood mitigation efforts being deployed by BES.
Does Portland's floodplain management staff need any assistance or training to support its floodplain management program?	Not at this time
• **If so, what type of assistance/training is needed?**	
Does Portland participate in the Community Rating System (CRS)?	Yes
• **Is Portland seeking to improve its CRS Classification?**	BES is always seeking ways to improve its CRS classification within the City's current capabilities and resources
• **How many Flood Insurance policies are in force in Portland?**	1,759
• **What is the insurance in force?**	$453,478,800 (04/30/2016)
• **What is the premium in force?**	$1,338,250 (04/30/2016
• **Average Premium**	$761 (04/30/2016)
• **% of Policies outside SFHA**	62.3% (04/0/2016)
• **How many total loss claims have been filed in Portland?**	224 (4/30/2016)
• **How many claims were closed without payment or are still open?**	70 (4/30/2016)
• **What were the total payments for losses?**	$2,829,285.23 (04/30/2016)
• **Average Claim Paid**	$12,868

The City of Portland is currently participating in the CRS program. Its CRS status is as follows:

- NFIP Community #—410183
- CRS Entry Date—10/1/2001
- Current CRS Classification—5
- % Premium Discount, SFHA/non-SFHA—25 percent/10 percent
- Total Annual Premium Savings—$234,329

Many of the mitigation actions identified in this plan are creditable activities under the CRS program. Therefore successful implementation of this plan offers the potential to enhance the CRS classification.

Natural Beneficial Functions

What Are Beneficial Floodplain Functions?

Flooding is a natural event, and floodplains provide many natural and beneficial functions. Riparian areas—the zones along the edge of a river or stream that are influenced by or are an influence upon the water body—generally have a greater diversity and structure of vegetation than upland areas. Shelter, space, food and water available in these areas determine the health of wildlife populations. Riparian communities are of special importance for many animals since water supply is a major limiting factor to the animals' population. Animals depend upon a supply of water for their existence.

CRS Credit for Protecting Natural Floodplain Functions

Wildlife and fisheries are impacted when plant communities are eliminated or fundamentally altered to reduce habitat. Human disturbance to riparian areas can limit wildlife's access to water, remove breeding or nesting sites, and eliminate suitable areas for rearing young. Changes in hydrologic conditions also can alter the plant community. FEMA's Community Rating System provides credits for adopting plans that protect one or more natural functions within a community's floodplain (Activity 510), such as the following (FEMA, 2013):

- A habitat conservation plan that explains and recommends actions to protect rare, threatened, or endangered aquatic or riparian species
- A habitat protection or restoration plan that identifies critical habitat within the floodplain, actions to protect remaining habitat, or actions to restore fully functioning habitat
- A green infrastructure plan that identifies open space corridors or connected networks of wetlands, woodlands, wildlife habitats, wilderness, and other areas that support native species, maintain natural ecological processes, or sustain air and water resources (the corridors or networks must include some floodplains)
- All or part of a comprehensive or other community plan that includes an inventory of the ecological attributes of a watershed or floodplain and recommends actions for protecting them through a mechanism such as a development regulation, development order, grant program, or capital improvement plan.

The credit requires that the following criteria be met:

- The plan may cover more than one community, but it must have an impact on natural floodplain functions within the community seeking credit.
- The plan must be adopted. If the plan is not a community plan adopted by the community's governing body, it must be adopted by an appropriate regional agency.

- The plan must be updated at least once every 10 years. The update must include a review of any changes to conditions as well as progress made since the original plan was prepared. Any changes to the adopted plan must be approved by the original adopting agency.
- The plan must include action items for protecting one or more identified species of interest and natural floodplain functions. The action items must describe who is responsible for implementing the action, how it will be funded, and when it will be done. General policy statements with no means of implementation are not considered action items.
- The plan must include a comprehensive inventory of the natural floodplain habitat within the community. It must identify areas that warrant protection or preservation in order to maintain fully functioning habitat for the species of interest. Where threatened or endangered species are present, each species must be addressed and a restoration plan must be included.
- A community can get credit for other plans that meet these credit criteria. These could be single-issue or single-species plans or plans that cover only one area of the community's floodplain.
- There is no credit under CRS Activity 510 for a plan that addresses water quality issues as a requirement for a permit under the National Pollution Discharge Elimination System (credit for such plans may be available under other CRS activities).

The following sections describe eight City of Portland documents that meet these requirements.

Balch Creek Watershed Protection Plan

The *Balch Creek Watershed Protection Plan* (Portland Bureau of Planning, 1991a), adopted by the City of Portland on February 8, 1991, protects the natural resources of the Balch Creek Watershed. The purpose for this plan was to identify and protect fish and wildlife habitat, ecologically and scientifically significant natural areas, open spaces, water bodies, wetlands and the functions and values of the watershed as a whole. This document is one of several natural resource plans completed by the City of Portland to comply with the State's Land Conservation and Development Commission (LCDC) Statewide Planning Goal 5, which requires all jurisdictions in Oregon to conserve open space and protect natural and scenic resources, using the following steps:

- Inventory—Identify, describe and evaluate the location, quality, and quantity of each natural resource within the City
- Analysis—Evaluate the economic, social, environmental and energy consequences of allowing, limiting and prohibiting uses that conflict with each identified resource
- Decision—Chose to protect or not to protect each identified resource.

The plan inventoried 15 sites, 13 of which were within the City of Portland. Resources identified within the watershed include: a full-year stream with associated floodplain, an isolated population of cutthroat trout and old conifer forest. The plan identifies protection and implementation measures for each of the 15 inventory areas. These protection and implementation measures are still being enforced today.

Columbia Corridor Industrial/Environmental Mapping Project

The Portland Bureau of Planning (now the Bureau of Planning and Sustainability) studied the Columbia River Corridor to make recommendations to the City of Portland Planning Commission for updating city Comprehensive Plan map designations and zones in the Columbia Corridor:

1. **Recommended Industrial and Annexation Rezoning for the Columbia Corridor (Portland Bureau of Planning, 1989a)**—This document contains the Planning Commission recommendations for converting old city industrial Comprehensive Plan map designations and

zones to new city industrial plan designations and zones and applying city plan designations and zones to certain annexed properties.

2. **Inventory and Analysis of Wetlands, Water Bodies and Wildlife Habitat Areas (Portland Bureau of Planning, 1989b)**—This document provides the inventory, analysis and proposal for protection of significant natural resources.
3. **Recommended Mapping for the Columbia Corridor (Portland Bureau of Planning, 1989c)**—This document provides detailed existing and recommended zoning for Phases 1 and 2. The zoning designations appear on the quarter section and full section Multnomah County Assessor's Maps.
4. **Appendix to the Inventory and Analysis of Wetlands, Waterbodies and Wildlife Habitat Areas (Portland Bureau of Planning, 1989d)**—This phase provided additional information that may be of benefit to more clearly understand the purpose and process of the natural resources portion of the project.

The findings and recommendations of this project are still valid and being implemented by the City.

East Buttes, Terraces and Wetlands Conservation Plan

The *East Buttes, Terraces and Wetlands Conservation Plan* (Portland Bureau of Planning, 1993) provides the inventory, analysis and recommendations for protection of significant East Portland natural, scenic, and open space resources. Portland is made up of 10 resource sites in East Portland: Mt. Tabor, Kelly Butte, Rocky Butte and seven additional upland sites. This plan complies with Statewide Planning Goal 5 and was adopted by the City on June 25, 1993. It identified four implementation measures that that are currently in effect:

- Amend the Portland Comprehensive Plan goals and policies to refer to the East Buttes, Terraces and Wetlands Conservation Plan.
- Adopt the East Buttes, Terraces and Wetlands Conservation Plan policies and objectives as the policy document for the area.
- Amend Title 33, Planning and Zoning to implement the conservation plan.
- Amend the official zoning maps to apply the "environmental zone" designation to identified resource areas, apply the open space (OS) zone to certain publicly owned lands and remove the Significant Environment Concern (SEC) zone from Rocky Butte.

Fanno Creek and Tributaries Conservation Plan

The *Fanno Creek and Tributaries Conservation Plan* (Portland Bureau of Planning, 1994a) provides the inventory, analysis and recommendations for protection of significant natural, scenic, and open space resources in the watershed of Fanno Creek and its tributaries. The planning effort identified the following objectives:

- Bring the City's comprehensive plan, zoning code and zoning maps into compliance with Oregon Statewide Planning Goal 5
- Reduce the threat to public health, safety and welfare from erosion, landslides, earthquakes and flooding
- Help the City comply with state and federal water quality regulations
- Facilitate development that maintains and enhances natural values provided by Fanno Creek and its tributaries.

The plan inventories and analyzes eight resource sites. Implementation measures were identified for each site. Each of these implementation measures are still in effect.

Johnson Creek Basin Protection Plan

The *Johnson Creek Basin Protection Plan* (Portland Bureau of Planning, 1991b) identifies, evaluates and protects significant fish and wildlife habitats, ecologically and scientifically significant natural areas, open spaces, water bodies, wetlands and the functions and values of the Johnson Creek basin as a whole. It adopts management recommendations on specific ways to retain and restore the natural habitat areas and values. The plan was designed to comply with Oregon Statewide Planning Goal 5. It identifies three natural resource protection measures that are still relevant and being implemented by the City:

- Limit housing density in areas that are difficult or hazardous to build on due to physical constraints such as floodways, steep slopes, floodplains or wetlands.
- Expand plan district requirements to include natural resource and neighborhood values.
- Protect or restore habitat within the resource area as an approval criterion for new development.

Northwest Hills Natural Areas Protection Plan

The *Northwest Hills Natural Areas Protection Plan* (Portland Bureau of Planning, 1991c) provides the inventory, analysis, and recommendations for protection of significant natural resources on the eastern slope of Portland's Northwest Hills. The study area covers 6,000 acres from NW St. Helens Road and the Willamette Greenway up to NW Skyline Boulevard, and from the Willamette Heights area to the Portland city limits near NW Newberry Road. This plan was written to comply with Statewide Planning Goal 5. It identified five implementation measures that that are currently in effect:

- Amend Portland's Comprehensive Plan goals and policies to refer to the protection plan.
- Adopt the protection plan policies and objectives as the policy document for the area.
- Amend Title 33, Planning and Zoning, and Title 34, Subdivisions and Partitioning Regulations, to implement the plan.
- Amend the Comprehensive Plan map designations and official zoning maps to apply the environmental zones, change base zones and correct open space mapping errors.
- Adopt an exception to Statewide Planning Goal 4, Forest Lands, to meet Federal Clean Water Act requirements and comply with Statewide Planning Goal 6, Air, Water and Land Resources Quality.

Skyline West Conservation Plan

The *Skyline West Conservation Plan* (Portland Bureau of Planning, 1994b) provides the inventory, analysis, and recommendations for protection of significant natural resources along the west slope of Tualatin Mountain ridge in northwest Portland. This plan was written to comply with Statewide Planning Goal 5. It inventories and analyzes three resource areas and identifies four implementation measures that that are currently in effect:

- Amend the Portland Comprehensive Plan goals and policies to refer to the conservation plan.
- Adoption of the conservation plan policies and objectives as the policy document for the area.
- Amend Title 33, Planning and Zoning, to implement the conservation plan.
- Amend the official zoning maps to apply the "environmental zone" designation to identified resource areas, apply the OS zone to certain public lands and remove the interim resource protection zone.

Southwest Hills Resource Protection Plan

The *Southwest Hills Resource Protection Plan* (Portland Bureau of Planning, 1992) provides the inventory, analysis and recommendations for protection of significant natural resources in southwest Portland. The study area covers 7,000 acres south of the Balch Creek basin and downtown Portland, including areas that drain directly into the Willamette River. This plan was written to comply with Statewide Planning Goal 5. The plan authorizes the following actions:

- Amend Portland's Comprehensive Plan goals and policies to refer to the protection plan.
- Adopt the protection plan policies and objectives as the policy document for the area.
- Amend Title 33, Planning and Zoning, to implement the protection plan.
- Amend the official zoning maps to apply the environmental zones to designated resources.
- Adopt a resolution directing the Bureau of Planning to study and prepare a recommendation on the concept of establishing a land bank for parks and natural areas acquisition.
- Repeal water features designations from the Southwest Hills Resource Protection Plan area.

Plan Integration

To ensure full integration of the above referenced natural beneficial functions plans, the City has identified mitigation actions that involve coordination of actions identified in the plans. There is a significant overlap in the goals and objectives of these plans, and coordinating their implementation will help ensure the success of all as well as the MAP. The maintenance strategy for the MAP will enhance the City's abilities to coordinate these plans. Each natural resource plan will be reviewed for its relevance to hazard mitigation and community resilience upon each future update to this plan.

11.3 COMPOUNDING FACTORS AND SECONDARY HAZARDS

11.3.1 Erosion

The most problematic secondary hazard for flooding is bank erosion, which in some cases can be more harmful than actual flooding. Riverine erosion results from the force of flowing water in and adjacent to river and creek channels. It affects the bed and banks of the channel and can alter or preclude any channel navigation or embankment development. During flood events, riverine erosion is magnified due to increased volume and velocity of the water flow. Flooding can generate high volume and velocity runoff that will concentrate in a river's lower drainages. When the stress applied by flood flows exceeds the resistance of the embankment material, erosion will occur. The erosion rate depends on the sediment supply and amount of runoff reaching the watercourse.

Erosion of any type rarely causes death or injury. However, erosion can cause significant destruction to property and infrastructure. Streams and rivers that are potentially threatened by erosion include the Columbia and Willamette Rivers; Johnson, Tryon and Fanno Creeks; and the Columbia Slough (NHMP, 2010).

11.3.2 Climate Change

Use of historical hydrologic data has long been the standard of practice for designing and operating water supply and flood protection projects. For example, historical data are used for flood forecasting models and to forecast snowmelt runoff for water supply. This method of forecasting assumes that the climate of the future will be similar to that of the period of historical record. However, the hydrologic record cannot be used to predict changes in frequency and severity of extreme climate events such as floods. Going forward, model calibration or statistical relation development must happen more

frequently, new forecast-based tools must be developed, and a standard of practice that explicitly considers climate change must be adopted. Climate change is already impacting water resources, and resource managers have observed the following:

- Historical hydrologic patterns can no longer be solely relied upon to forecast future conditions.
- Precipitation and runoff patterns are changing, increasing the uncertainty for water supply and quality, flood management and ecosystem functions.
- Extreme climatic events will become more frequent, necessitating improvement in flood protection, drought preparedness and emergency response.

As hydrology changes, what is currently considered a 1-percent-annual-chance (100-year flood) may strike more often, leaving many communities at greater risk. Planners will need to factor a new level of safety into the design, operation, and regulation of flood protection facilities such as dams, bypass channels and levees, as well as the design of local sewers and storm drains.

According to the City of Portland and Multnomah County Climate Change Preparation Strategy (2014), floods in Portland are likely to increase, particularly in Portland's urbanized environment. These events will likely be the result of more intense rain events in mid-winter and will most likely take the form of urban nuisance flooding.

11.3.3 Other Secondary Hazards

Flooding is also responsible for hazards such as landslides when high flows over-saturate soils on steep slopes, causing them to fail. Hazardous materials spills and runoff are also a secondary hazard of flooding if storage tanks rupture and spill into streams, rivers or storm sewers.

11.4 EXPOSURE

The Level 2 (user-defined) Hazus-MH protocol was used to assess the risk and vulnerability to flooding in Portland. The model used census data at the block level and FEMA floodplain data, which has a level of accuracy acceptable for planning purposes. Where possible, the Hazus-MH default data was enhanced using local GIS data from county, state and federal sources.

11.4.1 Population

Population counts of those living in the floodplain in Portland were generated by estimating the percent of the total residential buildings in each risk reporting area within the 1-percent and 0.2-percent annual chance flood hazard areas and multiplying this percentage by the total population in the risk reporting area. Using this approach, it was estimated that the exposed population for the entire City is 9,590 persons within the 1-percent annual chance flood hazard area (1.6 percent of the total City population) and 18,333 within the 0.2-percent annual chance flood hazard area (3.0 percent of the total). Table 11-4 shows the population estimates by risk reporting area.

Table 11-5 and Table 11-6 show the estimated percent of the population believed to be residing in mapped floodplains for the social-vulnerability-related demographics of concern. Citywide there is a disproportionate number of elderly residents living in the 1-percent-annual-chance flood hazard area. Additionally, rental properties may make up a substantial portion of development in the 0.2-percent annual chance flood hazard area, particularly in the Airport, Central City, Central Northeast and Southwest.

Table 11-4. Population within Flood Hazard Areas[a]

Risk Reporting Area	1% Annual Chance Flood Hazard Area		0.2% Annual Chance Flood Hazard Area	
	Population Exposed[b]	% of Total Population	Population Exposed[a]	% of Total Population
Airport	2,528	94.6%	2,528	94.6%
Central City	798	2.1%	7,402	19.5%
East Portland	3,048	2.0%	4,893	3.3%

c. Values in red indicate percentages are at least 2 percent greater than the Citywide average (see Section 4.7).
d. Persons with disabilities not shown because the available data, at a census tract scale, is not conducive to analysis by hazard extent and location.

11.4.2 Property

Structures in the Floodplain

Some land uses, such as single-family homes, are more vulnerable to flooding than others, such as agricultural land or parks. Table 11-7 and Table 11-8 summarize the total area and number of structures in the floodplain by risk reporting area and by structure type. Structure types were based on land use descriptions in Multnomah County assessor data. There are 2,925 structures within the 1-percent annual chance flood hazard area and 4,356 structures within the 0.2-percent annual chance flood hazard area. In the 1-percent annual chance flood hazard area, about 74 percent of these structures are in North Portland or East Portland (43 and 31 percent, respectively). Seventy-four percent (2,153) of the structures in the 1-percent annual chance flood hazard area are residential.

Table 11-7. Area and Number of Structures in the 1% Annual Chance Flood Hazard Area

Reporting Area	Area in Floodplain (acres)	Number of Structures in 1% Annual Chance Flood Hazard Area[a]

Exposed Value

Table 11-9 and Table 11-10 summarize the estimated value of exposed buildings in Portland. This methodology estimated $6.7 billion worth of building-and-contents exposed to the 1-percent annual chance flood, representing 4.0 percent of the total replacement value of Portland, and $19.1 billion worth of building-and-contents exposed to the 0.2-percent annual chance flood, representing 11.2 percent of the total.

11.4.3 Critical Facilities and Infrastructure

Critical facilities and infrastructure in the floodplain are summarized in Table 11-11 through Table 11-14. Details are provided in the following sections. In addition linear features exposed to the flood hazard are shown in Table 11-15.

Table 11-9. Value of Structures in the 1% Annual Chance Flood Hazard Area

Reporting Area	Number of Buildings Exposed	Value Exposed			Exposed Value as % of Total Replacement Value
		Structure	Contents	Total	
Airport	265	$64,994,573	$36,784,946	$101,779,519	2.6%
Central City	50	$912,058,805	$622,430,862	$1,534,489,668	4.9%

Table 11-15. Linear Critical Facilities in Flood Hazard Areas

	Facilities in Flood Hazard Areas	
	1% Annual Chance Flood Hazard Area	0.2% Annual Chance Flood Hazard Area
Utility Systems		
Power Lines	36.62 miles, 7.7% of citywide total	59.49 miles, 12.5% of citywide total
Gas Lines	1.99 miles, 2.4% of citywide total	10.87 miles, 13.0% of citywide total
Transportation Systems		
Railroads	26.43 miles, 7.0% of citywide total	100.92 miles, 26.9% of citywide total
Light Rail	2.10 miles, 4.0% of citywide total	6.31 miles, 12.0% of citywide total

Hazardous Material Facilities

Hazardous material facilities use or store materials that can harm the environment if damaged by a flood. One facility in the 10-percent annual chance flood hazard area, nine facilities in the 1-percent annual chance flood hazard area flood hazard area and 26 facilities in the 0.2-percent annual chance flood hazard area report having hazardous materials according to the Oregon State Fire Marshal. During a flood event, containers holding these materials can rupture and leak into the surrounding area, having a disastrous effect on the environment as well as residents.

Utilities and Infrastructure

Flood damage to infrastructure presents numerous risks. Roads or railroads that are blocked or damaged can isolate residents and can prevent access throughout the city, including for emergency service providers needing to get to vulnerable populations or to make repairs. Bridges washed out or blocked by floods or debris also can cause isolation. Floodwaters can back up drainage systems, causing localized flooding. Culverts can be blocked by debris from flood events, also causing localized urban flooding. Floodwaters can get into drinking water supplies, causing contamination. Sewer systems can be backed up, causing waste to spill into homes, neighborhoods, rivers and streams. Underground utilities can also be damaged. Dikes and levees can fail or be overtopped, inundating the land that they protect. The following sections describe impacts and exposure to these types of infrastructure.

Roads

The following major roads in Portland pass through the 1-percent annual chance flood hazard area flood hazard area and thus are exposed to flooding. Main highways that intersect the flood zone are all elevated above flood levels although it is possible that scour or debris carried by a flood could damage the support apparatus for elevated structures:

- N Marine Drive
- NE Marine Drive
- SE Foster Road
- SE Holgate Boulevard
- SE Johnson Creek Boulevard
- SE McLoughlin Boulevard
- SE 111th Ave.
- SE 122nd Ave.
- SE Harold St.
- SW Moody Ave.
- SW Shattuck Rd

Some of these roads are built above the flood level, and others function as levees to prevent flooding. Still, in severe flood events these roads can be blocked or damaged, preventing access to some areas.

Bridges

Flooding events can significantly impact road bridges. These are important because often they provide the only ingress and egress to some neighborhoods. An analysis showed that there are three light rail bridges, and four highway bridges that are in or cross over the 10-percent annual chance flood hazard area, three light rail bridges, and seven highway bridges in the 1-percent annual chance flood hazard area, and five light rail bridges and seven highway bridges in the 0.2-percent annual chance flood hazard area.

Rail Lines

Rail-based transportation systems can be negatively impacted by flood events. If rails are covered by flood waters trains may need to significantly slow their speed in order to pass or may not be able to pass at all. Flood waters can scour and undermine support systems and block lines with debris.

When a railroad embankment serves as a flood barrier during high water events, the risk of embankment failure is higher because the embankment was not engineered as a levee. In Portland, the railroad embankment that breached in 1948 would still serve as a flood barrier for Peninsula Drainage District #1, where Portland International Raceway and Blue Heron golf course are. This railroad embankment will be considered through Levee Ready Columbia.

Water and Sewer Infrastructure

Water and sewer systems can be affected by flooding. Floodwaters can back up drainage systems, causing localized flooding. Culverts can be blocked by debris from flood events, also causing localized urban flooding. Floodwaters can get into drinking water supplies, causing contamination. Sewer systems can be backed up, causing wastewater to spill into homes, neighborhoods, rivers and streams.

11.4.4 Environment

Flooding is a natural event, and floodplains provide many natural and beneficial functions. Nonetheless, flooding can impact the environment in negative ways. Migrating fish can wash into roads or over dikes into flooded fields, with no possibility of escape. Pollution from roads, such as oil, and hazardous materials can wash into rivers and streams. During floods, these can settle onto normally dry soils, polluting them for agricultural uses. During future rain or flood events, these contaminants can be re-mobilized into streams and rivers. Human development such as bridge abutments and levees, and logjams from timber harvesting can increase stream bank erosion, causing rivers and streams to migrate into non-natural courses.

Many species of mammals, birds, reptiles, amphibians and fish live in plant communities that are dependent upon streams, wetlands and floodplains. Changes in hydrologic conditions can result in a change in the plant community. Wildlife and fish are impacted when plant communities are eliminated or fundamentally altered to reduce habitat. Wildlife populations are limited by shelter, space, food, and water. Since water supply is a major limiting factor for many animals, riparian communities are of special importance.

Riparian areas are the zones along the edge of a river or stream that are influenced by or are an influence upon the water body. Human disturbance to riparian areas can limit wildlife's access to water, remove breeding or nesting sites, and eliminate suitable areas for rearing young. Wildlife rely on riparian areas and are associated with the flood hazard in the following ways:

- Mammals depend upon a supply of water for their existence. Riparian communities have a greater diversity and structure of vegetation than other upland areas. Beavers and muskrats are now recolonizing streams, wetlands and fallow farm fields, which are converted wetlands. As residences are built in rural areas, there is an increasing concern with beaver dams causing flooding of low-lying areas and abandoned farm ditches being filled in, which can lead to localized flooding.
- A great number of birds are associated with riparian areas. They swim, dive, feed along the shoreline, or snatch food from above. Rivers, lakes and wetlands are important feeding and resting areas for migratory and resident waterfowl. Other threatened or endangered species (such as the bald eagle or the peregrine falcon) eat prey from these riparian areas.
- Amphibians and reptiles are some of the least common forms of wildlife in riparian areas. However, some state threatened species, such as the western pond turtle and the spotted frog, are known to inhabit the waterways and wetlands.
- Fish habitat throughout Portland varies widely based on natural conditions and human influence. Many ditches were dug throughout the City to make low, wet ground better for

farming. As the water drained away and the wetlands were converted to farm fields, natural stream conditions were altered. Agriculture along many rivers extends to the water's edge and smaller side channels have been tilled to drain better. Within developing areas, small streams were placed in pipes and wetland was filled in to support urban development. While salmonids prefer clear, free-flowing streams, other species like the Olympic mud-minnow inhabit the calm, backwater areas of sloughs and wetlands.

11.5 VULNERABILITY

Many areas exposed to flooding may not actually experience serious flooding or flood damage. This section describes vulnerabilities in terms of population, property, infrastructure and environment.

11.5.1 Population

Generally, there is substantial warning time for flood events in Portland. Populations who may not understand or have access to available flood warning systems may be more vulnerable. In particular, many homeless people in Portland camp along floodplain areas, including along the Springwater Corridor Trail, which runs along Johnson Creek. These groups tend not to have access to technology and are unable to receive electronic evacuation notifications. Additionally, those who have difficulty evacuating, including the elderly and those with access and functional needs, may be more vulnerable if warning time is limited. Persons with limited incomes residing in the floodplain may not have flood insurance and may be more vulnerable to severe economic consequences in the event of a flood. The costs to evacuate during a flood event are also likely to disproportionately impact people with limited incomes. Persons driving or otherwise trying to cross flooded roadways are particularly at risk of physical harm.

Displaced Households and Persons Requiring Short Term Shelter

Impacts on persons and households in Portland were estimated for the 10-percent, 1-percent and 0.2-percent annual chance floods through the Level 2 Hazus-MH analysis. Table 11-16 summarizes the results.

Table 11-16. Estimated Flood Impact on Persons and Households

Public Health and Safety

Floods and their aftermath present numerous threats to public health and safety:

- **Unsafe food—**Floodwaters contain disease-causing bacteria, dirt, oil, human and animal waste, and farm and industrial chemicals. Their contact with food items, including food crops in agricultural lands, can make that food unsafe to eat. Refrigerated and frozen foods are affected during power outages caused by flooding. Foods in cardboard, plastic bags, jars, bottles, and paper packaging may be unhygienic with mold contamination.
- **Contaminated drinking and washing water and poor sanitation—**Flooding impairs clean water sources with pollutants. The pollutants also saturate into the groundwater. Flooded wastewater treatment plants can be overloaded, resulting in backflows of raw sewage. Private wells can be contaminated by floodwaters. Private sewage disposal systems can become a cause of infection if they or overflow.
- **Mosquitoes and animals—**Floods provide new breeding grounds for mosquitoes in wet areas and stagnant pools. The public should dispose of dead animals that can carry viruses and diseases only in accordance with guidelines issued by local animal control authorities. Leptospirosis—a bacterial disease associated predominantly with rats—often accompanies floods in developing countries, although the risk is low in industrialized regions unless cuts or wounds have direct contact with disease-contaminated floodwaters or animals.
- **Mold and mildew—**Excessive exposure to mold and mildew can cause flood victims—especially those with allergies and asthma—to contract upper respiratory diseases, triggering cold-like symptoms. Molds grow in as short a period as 24 to 48 hours in wet and damp areas of buildings and homes that have not been cleaned after flooding, such as water-infiltrated walls, floors, carpets, toilets and bathrooms. Very small mold spores can be easily inhaled by human bodies and, in large enough quantities, cause allergic reactions, asthma episodes, and other respiratory problems. Infants, children, elderly people and pregnant women are considered most vulnerable to mold-induced health problems.
- **Carbon monoxide poisoning—**In the event of power outages following floods, some people use alternative fuels for heating or cooking in enclosed or partly enclosed spaces, such as small gasoline engines, stoves, generators, lanterns, gas ranges, charcoal or wood. Built-up carbon monoxide from these sources can poison people and animals.
- **Hazards when reentering and cleaning flooded homes and buildings—**Flooded buildings can pose significant health hazards to people entering them. Electrical power systems can become hazardous. Gas leaks can trigger fire and explosion. Flood debris—such as broken bottles, wood, stones and walls—may cause injuries to those cleaning damaged buildings. Containers of hazardous chemicals may be buried under flood debris. Hazardous dust and mold can circulate through a building and be inhaled by those engaged in cleanup and restoration.
- **Mental stress and fatigue—**People who live through a devastating flood can experience long-term psychological impact. The expense and effort required to repair flood-damaged homes places severe financial and psychological burdens on the people affected. Post-flood recovery can cause, anxiety, anger, depression, lethargy, hyperactivity, and sleeplessness. There is also a long-term concern among the affected that their homes can be flooded again in the future.

Current loss estimation models such as Hazus are not equipped to measure public health impacts such as these. The best level of mitigation for these impacts is to be aware that they can occur, educate the public on prevention, and be prepared to deal with them in responding to flood events.

11.5.2 Property

Hazus-MH calculates losses to structures from flooding by looking at depth of flooding and type of structure. Using historical flood insurance claim data, Hazus-MH estimates the percentage of damage to structures and their contents by applying established damage functions to an inventory. For this analysis, local data on facilities was used instead of the default inventory data provided with Hazus-MH.

Building Age

Table 11-17 summarizes the age of buildings in the city relative to the initial FIRM date and the enactment of freeboard requirements.

Table 11-17. Pre-FIRM Buildings and Pre-Freeboard Requirement Buildings in 1% Annual Chance Flood Zone

	Pre-FIRM Buildings in Flood Zone[a]		Pre-Freeboard Buildings in Flood Zone[a]	
Reporting Area	Number	% of Total	Number	% of Total

a. Indicates that building was built before the Flood Insurance Rate Maps became effective (before 1981).
b. Indicates that building was built before Freeboard requirements were in place (before 1996)

Estimated Losses Due to Flooding

Loss estimates for the 10-percent annual chance, 1-percent annual chance and 0.2-percent annual chance floods are presented in Table 11-18 through Table 11-20. It is estimated that there would be up to $369.2 million of flood loss from a 1-percent annual chance flood in Portland. This represents 0.2 percent of the total replacement value for Portland. It is estimated that there would be $1.9 billion of flood loss from a 0.2-percent annual chance flood, representing 1.1 percent of the total replacement value.

National Flood Insurance Program

The use of flood insurance in Portland is below the national average. Only 22.7 percent of insurable buildings in Portland are covered by flood insurance (see Table 11-21). According to an NFIP study, about 49 percent of single-family homes in special flood hazard areas are covered by flood insurance nationwide.

Table 11-18. Loss Estimates for 10% Annual Chance Flood

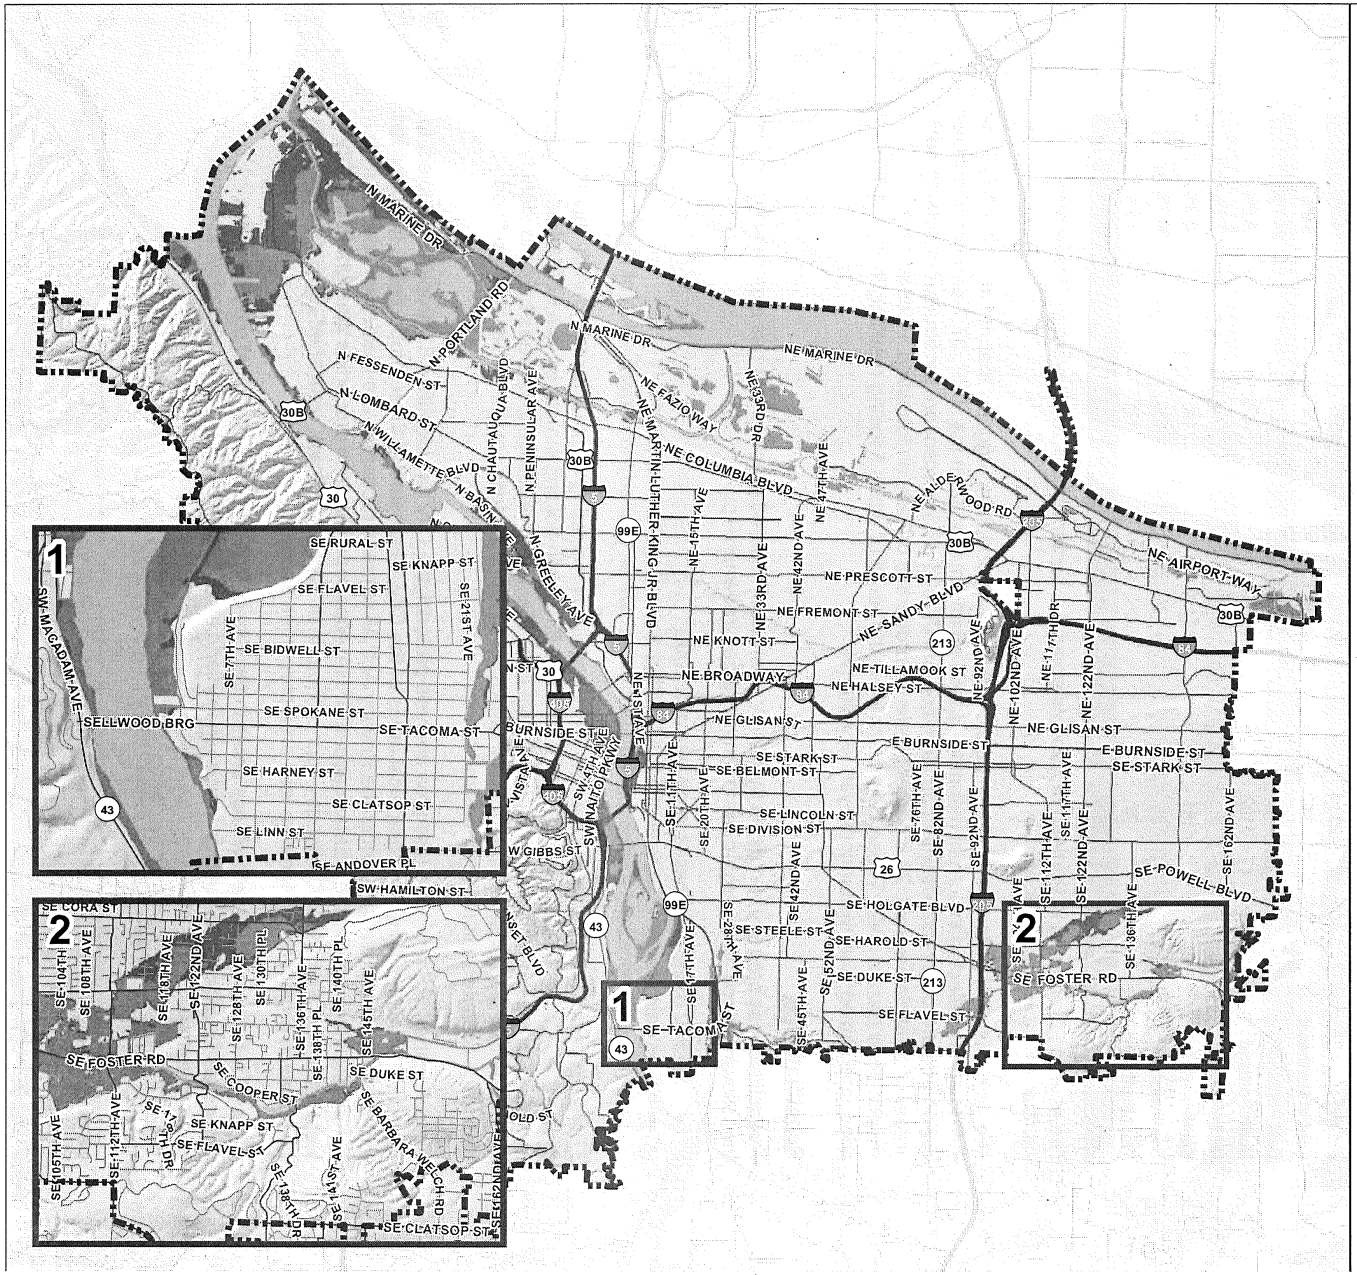
West/Northwest	26	0.0%	171	0.6%
Total	**2617**	**23.0%**	**4113**	**18.8%**

The average claim paid in Portland represents about 3.1 percent of the 2015 average Replacement value of structures in the floodplain.

The percentage of policies and claims outside a mapped floodplain suggests that not all of the flood risk in Portland is reflected in current mapping. Based on information from the NFIP, 37.7 percent of policies in Portland are on structures within an identified SFHA, and 62.3 percent are for structures outside such areas. Of total claims paid, 23.8 percent were for properties outside an identified 1-percent annual chance flood hazard area. These claims are likely the result of urban flooding resulting from a lack of adequately sized stormwater conveyance systems.

Repetitive Loss



A repetitive loss property is defined by FEMA as an NFIP-insured property that has experienced any of the following since 1978, regardless of any changes in ownership:

- Four or more paid losses in excess of $1,000
- Two paid losses in excess of $1,000 within any rolling 10-year period
- Three or more paid losses that cumulatively equal or exceed the current value of the property.

FEMA-sponsored programs, such as the CRS, require participating communities to identify repetitive loss areas. A repetitive loss area is the portion of a floodplain holding structures that FEMA has identified as meeting the definition of repetitive loss. Identifying repetitive loss areas helps to identify structures that are at risk but are not on FEMA's list of repetitive loss structures because no flood insurance policy was in force at the time of loss.

Following the CRS repetitive loss area analysis protocol, the City has identified 83 properties subject to repetitive flooding within 7 geographical areas of the City. Disclosure of these properties is not provided in the plan due to protection under the Privacy Act. All of these properties are residential and are in or immediately adjacent to the FEMA-mapped SFHA. Nine repetitive loss properties throughout the City were identified after the 2009 floods—four of them in the Johnson Creek watershed. BES disseminates an outreach project to all repetitive loss area properties annually.

Figure 11-4 shows the repetitive loss areas in the City of Portland. FEMA's list of repetitive loss properties identifies nine such properties in Portland as of November 30, 2014, none of which have been mitigated.

PBEM

Repetitive loss properties make up only 1 to 2 percent of flood insurance policies in force nationally, yet they account for 40 percent of the nation's flood insurance claim payments. In 1998, FEMA reported that the NFIP's 75,000 repetitive loss structures have already cost $2.8 billion in flood insurance payments and that numerous other flood-prone structures remain in the floodplain at high risk. The government has instituted programs encouraging communities to identify and mitigate the causes of repetitive losses. A report on repetitive losses by the National Wildlife Federation (2006) found that 20 percent of these properties are outside any mapped 1-percent annual chance flood hazard area. The key identifiers for repetitive loss properties are the existence of flood insurance policies and claims paid by the policies.

11.5.3 Critical Facilities and Infrastructure

Hazus-MH was used to estimate the flood loss potential to critical facilities exposed to flood risk. Using depth/damage function curves to estimate the percent of damage to the building and contents of critical facilities, Hazus-MH correlates these estimates into an estimate of functional down-time (the estimated time it will take to restore a facility to 100 percent of its functionality). This helps to gauge how long Portland could have limited usage of facilities deemed critical to flood response and recovery. The Hazus critical facility results are as summarized in Table 11-22 through Table 11-24.

Table 11-22. Estimated Damage to Critical Facilities and Infrastructure from 10-Percent Annual Chance Flood

11.5.4 Environment

The environment vulnerable to flood hazard is the same as the environment exposed to the hazard. Loss estimation platforms such as Hazus-MH are not currently equipped to measure environmental impacts of flood hazards. The best gauge of vulnerability of the environment would be a review of damage from past flood events. Loss data that segregates damage to the environment was not available at the time of this plan. Capturing this data from future events could be beneficial in measuring the vulnerability of the environment for future updates.

11.6 FUTURE TRENDS IN DEVELOPMENT

Land use can exacerbate flood impacts. Development and fill in the floodplain can push floodwaters into areas that did not previously flood or worsen existing impacts. Development in the uplands can remove vegetation that absorbs and attenuates stormwater. Impervious surfaces shed stormwater toward flood-prone areas. Table 11-25 and Table 11-26 show the proposed distribution of future land uses within the 1-percent annual chance and 0.2-percent annual chance flood hazard areas.

Table 11-25. Future Land Use Designations in the 1% Annual Chance Flood Hazard Area

a. Future land use areas based on proposed comprehensive plan designations as of February 2016.

The City of Portland is equipped to handle future growth within flood hazard areas. Its comprehensive plan addresses frequently flooded areas through a variety of goals and polices pertaining to directing growth away from high-risk areas through downzoning; encouraging the preservation of open space and preserving and supporting natural and beneficial functions of floodplains; designing with nature; promoting hazard resilient design; protecting, restoring and preserving environment and watershed health; and ensuring comprehensive flood management. The City has committed to linking the comprehensive plan to the MAP. This creates an opportunity for wise land use decisions as future growth impacts flood hazard areas.

Additionally, the City of Portland participates in the NFIP and has adopted flood damage prevention ordinances in response to its requirements and has committed to maintaining its good standing under the NFIP through actions identified in this plan. The purpose of Chapter 24.50.010 of the Portland City Code is to protect the public health, safety, and welfare by restricting or prohibiting uses that are dangerous to health, safety, or property in times of flood or which cause increased flood heights or velocities and by requiring that uses and structures vulnerable to floods be protected from flood danger at the time of initial construction. The provisions of this chapter regulate development and construction in flood hazard areas.

11.7 SCENARIO

The primary water courses in Portland have the potential to flood at irregular intervals, generally in response to a succession of intense winter rainstorms. Storm patterns of warm, moist air usually occur between early November and late March. A series of such weather events can cause severe flooding in Portland. The worst-case scenario is a series of storms that flood numerous drainage basins in a short time. This could overwhelm the response and floodplain management capability in Portland. Major roads could be blocked, preventing critical access for many residents and critical functions. High in-channel flows could cause water courses to scour, possibly washing out roads and creating more isolation problems. In the case of multi-basin flooding, the City of Portland would not be able to make repairs quickly enough to restore critical facilities and infrastructure without significant disruption.

11.8 ISSUES

The following general issues related to the flood hazard were identified during the planning process:

- Not all structures located within the 1 percent annual chance flood hazard area have flood insurance. Flood insurance uptake is estimated to be 50 percent or less in all risk reporting areas, except in the Northeast where there is no mapped flood risk and the Central City where there is 60 percent uptake in flood insurance.
- Only about 18 percent of structures located in the 0.2 percent annual chance flood hazard area are thought to have flood insurance.
- There are a significant number of Pre-FIRM buildings in Portland. Approximately 75 percent of the buildings in the 1 percent annual chance flood hazard area are believed to have been built before 1981.
- Approximately 93 percent of the buildings in the floodplain were built before freeboard requirements were in place (1996).
- There are 9 repetitive loss properties in Portland that have structures on them. All of these properties are residential and are in or immediately adjacent to the FEMA-mapped SFHA.
- The Flood Insurance Study conducted by the Federal Emergency Management Agency (Flood Insurance Number 410183V000B) in January 2010, serves as the basis for Flood Insurance Rate Maps. This study does not include the impact of the 1996 flood nor the amount of construction which has occurred in the Portland area later than 1977. This is also the document that the buildable land inventory for the City is based on concerning property in floodplain areas.
- FEMA National Levee Accreditation Policies are currently under review and revision. These revisions are likely to impact accreditation of existing flood management systems.
- The risk associated with the flood hazard overlaps the risk associated with other hazards such as earthquake liquefaction. This provides an opportunity to seek mitigation alternatives with multiple objectives that can reduce risk for multiple hazards.
- The potential future impacts of climate change on flood frequency and severity are not well understood. This lack of understanding creates challenges for predicting and planning for various flood scenarios.
- More information is needed on flood risk to support the concept of risk-based analysis of capital projects.
- Ongoing flood hazard mitigation will require funding from multiple sources.
- The concept of residual risk should be considered in the design of future capital flood control projects and should be communicated with residents living in the floodplain.
- Flood insurance should continue to be promoted as a means of protecting private property owners from the economic impacts of frequent flood events.
- A sustained effort should be made to gather historical damage data, such as high water marks on structures and damage reports. The collection of this information will assist with determining the cost-effectiveness of future mitigation projects and will provide more information on the nature of the hazard.
- Flood hazards do not recognize jurisdictional boundaries, and actions in jurisdictions can impact upstream or downstream neighbors. Coordination is necessary to ensure that these connections are understood and hazards are effectively mitigated.
- Floodplain residents need to continue to be educated about flood preparedness and the resources available before, during, and after floods. Flood preparedness can help residents reduce risk to property and lives. Resources that are made available after flood events can help residents make informed decisions that may mitigate future risk to lives and property.

- The location of hazardous materials within the floodplain could result in secondary hazards during or after a flood event.
- FEMA maps do not recognize residual risk outside the mapped area. Where levees are accredited, there may be a misperception that there is no flood risk. Public outreach and awareness efforts should, therefore, emphasize the residual risk behind levees.
- Existing floodplain-compatible uses such as agricultural and open space need to be maintained.

The following issues have been identified specific to the 10-percent annual chance (10-year) flood:

- Immediate impacts will be felt within all risk reporting areas except for the Northeast. However, the Central City and West/Northwest are expected to be most severely impacted.
- It is estimated that 4,052 people will be displaced from their homes after an event and 3,458 of these people will seek shelter in public shelters.
- 82 buildings are expected to be impacted by the flood event resulting in more than $182.3 million in damage. This is less than 1 percent of the total value of the risk reporting areas impacted and just about 0.1 percent of the total value of Portland.
- More than 16,255 tons of debris would be expected from the flood event, which will require approximately 650 truckloads to remove. Most debris will be in the North Portland area, Southeast area and the Central City.
- There are 20 critical facilities located in the flood hazard area.

The following issues have been identified specific to the 1-percent annual chance (100-year) flood:

- Immediate impacts will be felt within all risk reporting areas except for the Northeast. The risk reporting areas with the greatest number of buildings impacted (more than 100) will include East Portland and North Portland.
- It is estimated that 4,499 people will be displaced from their homes after an event and 3,664 of these people will seek shelter in public shelters.
- Of the 2,925 buildings exposed, 972 buildings are expected to be impacted by the flood event resulting in more than $369.2 million in damage. This is less than 1 percent of the total value of the risk reporting areas impacted and just about 0.22 percent of the total value of Portland.
- More than 39,639 tons of debris would be expected from the flood event, which will require approximately 1,585 truckloads to remove. Most debris (more than 5,000 tons) will be in the North Portland area, Southeast area, the Central City and the East Portland.
- There are 80 critical facilities located in the flood hazard area.
- For the social vulnerability demographics of concern, exposure to the 1-percent-annual-chance floodplain exceeds the citywide average by more than 2 percent in individual reporting areas as follows:
  - Population under 15 years of age—17 percent exposure in the East Portland area.
  - Population over 65 years of age—21 percent exposure in North Portland, 17 percent exposure in Southwest and Southeast, and 14 percent exposure in East Portland.
  - People of color—32 percent exposure in the Airport area and Central Northeast.
  - Renter-occupied housing—80 percent exposure in Central City, 69 percent exposure in the Airport area and Central Northeast, and 60 exposure percent in Southwest.
  - Families with incomes below the poverty level—20 percent exposure in the Airport area and Central Northeast

- Households with limited English speaking abilities—21 percent exposure in the Airport area and 20 percent exposure in Central Northeast.

The following issues have been identified specific to the 0.2-percent annual chance (500-year) flood:

- Immediate impacts will be felt within all risk reporting areas except for the Northeast. The risk reporting areas with the greatest number of buildings impacted will include North Portland (1,567 buildings), East Portland (1,456 buildings), and Central City (573 buildings).
- It is estimated that 11,709 people will be displaced from their homes after an event and 10,622 of these people will seek shelter in public shelters.
- Of the 4,536 buildings exposed, 2,261 buildings are expected to be impacted by the flood event, resulting in more than $1.9 billion in damage. This is more than 3.4 percent of the total value of the North Portland and more than 2.5 percent of the total value of the Central City risk reporting areas. In total damage would account for about 1.1 percent of the total value of Portland.
- More than 65,307 tons of debris would be expected from the flood event, which will require approximately 2,612 truckloads to remove. Most debris (more than 15,000 tons) will be in the Central City, North Portland area, and Southeast area
- There are 185 critical facilities located in the flood hazard area.
- For the social vulnerability demographics of concern, exposure to the 0.2-percent-annual-chance floodplain exceeds the citywide average by more than 2 percent in individual reporting areas as follows:
  - Population under 15 years of age—19 percent exposure in the East Portland area.
  - Population over 65 years of age—21 percent exposure in North Portland, 18 percent exposure in Southwest, and 16 percent exposure in Southeast.
  - People of color—32 percent exposure in the Airport area and Central Northeast.
  - Renter-occupied housing—77 percent exposure in Central City, 69 percent exposure in the Airport area and Central Northeast, and 59 exposure percent in Southwest.
  - Families with incomes below the poverty level—20 percent exposure in the Airport area and Central Northeast
  - Households with limited English speaking abilities—21 percent exposure in the Airport area and Central Northeast.

12. VOLCANIC ACTIVITY

12.1 GENERAL BACKGROUND

A volcano is a vent or opening in the earth's crust from which molten lava (magma), pyroclastic materials and volcanic gases are expelled onto the surface. Volcanoes can unleash destructive power greater than a nuclear bomb and pose a serious hazard if located near populated areas (NHMP, 2010).

There are four general types of volcanoes found within a short distance of the city (NHMP, 2010 and Allen, 1975):

- **Lava domes** are formed when lava erupts and accumulates near the vent, such as those found at the Boring Volcanic Field.
- **Cinder cones** are formed by accumulation of cinders, ash and other fragmented materials originating from an eruption. Mount Tabor and Powell Butte are local examples of cinder cone volcanoes.
- **Shield volcanoes** are broad, gently sloping volcanic cones of flat domical shape, usually several tens or hundreds of square miles in extent, built chiefly of overlapping and intertwined basaltic lava flows. Larch Mountain, Mount Sylvania and Highland Butte are local examples of shield volcanoes.
- **Composite or stratovolcanoes** are typically steep-sided, symmetrical cones of large dimensions built of alternating layers of lava flows, volcanic ash, cinders and blocks. Most composite volcanoes have a crater at the summit containing a central vent or clustered group of vents.

DEFINITIONS

- Lahar—A rapidly flowing mixture of water and rock debris that originates from a volcano. While lahars are most commonly associated with eruptions, heavy rains, and debris accumulation, earthquakes may also trigger them.
- Lava Flow—The least hazardous threat posed by volcanoes. Cascades volcanoes are normally associated with slow moving andesite or dacite lava.
- Stratovolcano—Typically steep-sided, symmetrical cones of large dimension built of alternating layers of lava flows, volcanic ash, and cinders, rising as much as 8,000 feet above their bases.
- Tephra—Ash and fragmented rock material ejected by a volcanic explosion
- Volcano—A vent in the planetary crust from which magma (molten or hot rock) and gas from the earth's core erupts.

12.1.1 Cascade Range Volcanoes

The City of Portland is near the Cascade Range, an 800-mile-long chain of volcanoes that extends from northern California to southern British Columbia (see Figure 12-1). There are 20 volcanoes in the Cascade Range, five of which have been active in historical times: Mount Baker, Glacier Peak, Mount Rainier, Mount St. Helens, Mount Adams and Mount Hood. Volcanoes can lie dormant for centuries between eruptions, and the risk they pose is not always apparent. All of the volcanoes in the Cascade Range are stratovolcanoes, which have seven different types of hazard associated with volcanic activity. Figure 12-2 presents a graphic overview of the geological hazards present during a volcanic event.

Source: USGS, 2013

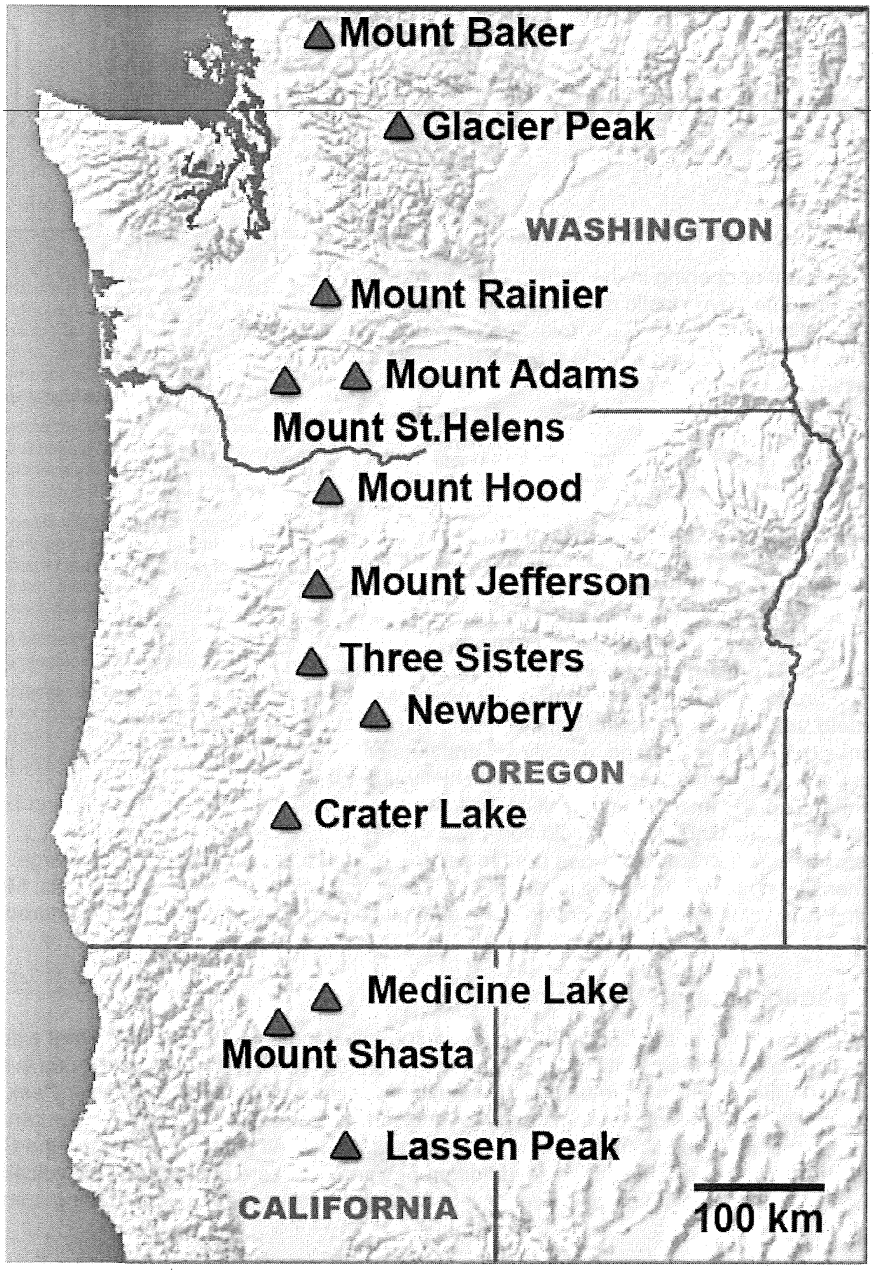

Figure 12-1. Cascade Range Volcanoes

Source: USGS, 2014c

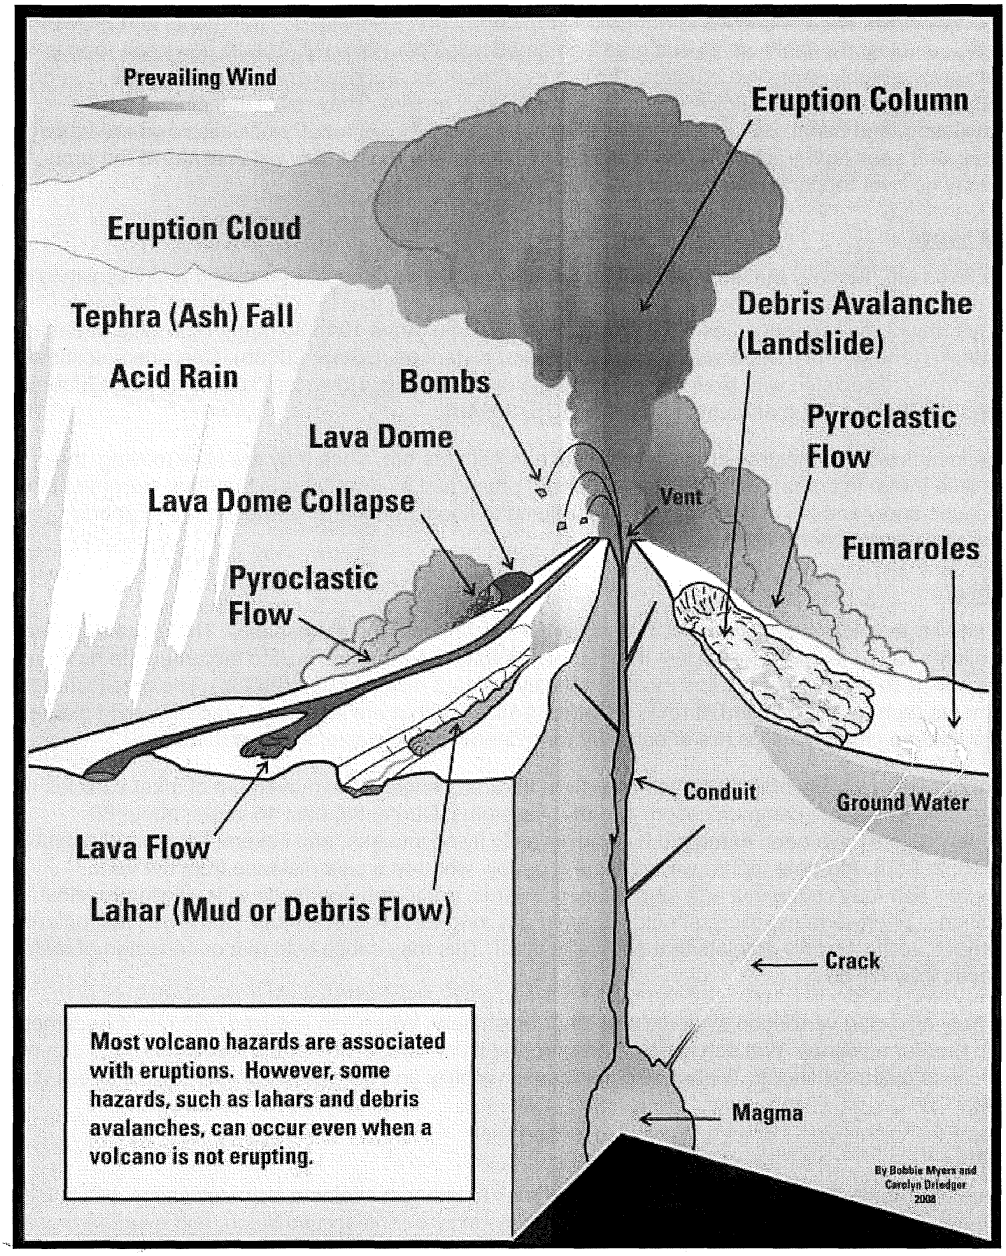

Figure 12-2. Geologic Hazards at Volcanoes

Pyroclastic Flows and Surges

Pyroclastic flows are avalanches of hot (200ºC to 700°C), dry, volcanic rock fragments and gases that descend a volcano's flanks at speeds greater than 50 miles per hour. Pyroclastic flows can form in three ways: a highly explosive eruption, "boiling over" from an eruptive vent, or collapse of a lava dome (USGS, 2016b). Pyroclastic flows and surges are a lethal hazard. They result in incineration, asphyxiation, and burial. Because of their speed they cannot be outrun. Pyroclastic flows are heavier than air and seek topographically low areas. Hot mixtures of gas and rock will flow above the ground and may go over topographical barriers such as ridges and hills.

Lava Flows

Lava flows are normally the least hazardous threat posed by volcanoes. The speed and viscosity of a lava flow are determined by the silica content of the lava. The higher the silica content, the more viscous (thick) the lava becomes. Low silica basalt lava can move 10 to 30 mph. High silica andesite and dacite tend to move more slowly and travel short distances (USGS, 2008b). Cascade volcanoes are normally associated with slow moving andesite or dacite lava. However, 3,000 years ago Mount St. Helens produced a large amount of basalt (USGS, 2014a).

Large lava flows may destroy property and cause forest fires but, since they are slow moving, they pose little threat to human life. The greater hazard presented by lava flows is that their extreme heat can cause snow and ice to melt very quickly, adding to flooding hazards or the lahar and debris avalanche hazards described below.

Tephra

Ash and large volcanic projectiles can erupt from a volcano into the atmosphere. These materials are sometimes called tephra. The largest fragments (bombs, >64 mm) fall back to the ground fairly near the vents, as close as a few yards and most commonly within 2 miles (USGS, 2008b). The smallest rock fragments (ash) are composed of rock, minerals, and glass that are less than 2 millimeters in diameter. Tephra plume characteristics are affected by wind speed, particle size, and precipitation.

Tephra poses a variety of threats. Ash only 1 cm thick can impede the movement of most vehicles and disrupt transportation, communication, and utility systems. During the past 15 years, about 80 commercial jets have been damaged by inadvertently flying into ash, and several have nearly crashed (USGS, 2008b). Airborne tephra will seldom kill people who are a safe distance from the vent. However, ash may cause eye and respiratory problems, particularly for those with existing medical conditions. Short-term exposure should not have any long-term health effects. Some ash fall materials may have acidic aerosol droplets that adhere to them. This may cause acid rain or corrosion of metal surfaces they fall on.

Ash may also clog ventilation systems and other machinery. When ash is mixed with rain it becomes a much greater nuisance. Wet ash is much heavier and it can cause structures to collapse. Wet ash may also cause electrical shorts. Tephra also decreases visibility and may cause psychological stress and panic.

Lahars

Lahars are rapidly flowing mixtures of water and rock debris that originate from volcanoes. While lahars are most commonly associated with eruptions, heavy rains, debris accumulation, and even earthquakes may also trigger them. They may also be termed debris or mud flows. Lahars can travel over 50 miles downstream, reaching speeds between 20 and 40 mph (USGS, 2008b). Beyond the flanks of a

volcano, lahars will normally be channeled into waterways. The threat from lahars comes from their speed and from the debris they carry. Abrasion from the heavy sediment and impacts from heavy debris can destroy forests as well as human-made structures, including bridges, dams, roads, pipelines, buildings, and farms. Lahars may also fill in channels, obstructing shipping lanes and impacting a channel's ability to handle large volumes of water.

Debris Avalanches

Debris avalanches occur when the flank of a volcano collapses and slides downslope. The avalanche may initially include rock, soil and snow, and incorporate additional materials, such as trees and buildings, as it moves toward the valley floor. If avalanches incorporate a significant amount of water as they rush down the volcano, they may transition to lahars. Avalanche scars are typically noticeable as horseshow shaped craters (USGS, 2015a).

Volcanic Gases

All active volcanoes emit gases. These gases may include steam (water vapor), carbon dioxide, sulfur dioxide, hydrogen sulfide, hydrogen, and fluorine. Sometimes, these chemicals can be absorbed by ash and impact groundwater, livestock, and metal objects. Even when a volcano is not erupting, gases can escape through small surface cracks. The greatest danger to people comes when large quantities of toxic gases are emitted from several sources or when there are topographic depressions that collect gases that are heavier than air. These gases can accumulate to the point where people or animals can suffocate (USGS, 2016c).

Lateral Blast

Lateral blasts are explosive events in which energy is directed horizontally instead of vertically from a volcano. They are gas-charged, hot mixtures of rock, gas and ash that are expelled at significantly high speeds. Lateral blasts vary in size, but large ones are fairly rare, with only a few historical examples worldwide. The most recent was the 1980 eruption of Mount St. Helens when almost everything within the blast zone (about 230 square miles) perished. The Mount St. Helens lateral blast is estimated to have reached a velocity of 670 mph, and there have been speculations that the velocity may have gone even higher, reaching a supersonic rate of 735+ mph for at least a few moments (USGS, 1997a).

12.2 HAZARD PROFILE

12.2.1 Past Events

Mt. St. Helens has been the most active volcano in the Cascade Range during the past 10,000 years. Early 19th century settlers in the region witnessed eruptions occurring along the north flank area of the mountain. In Oregon, awareness of the potential for volcanic eruptions has greatly increased since the May 18, 1980 eruption, which killed 57 people. The upper portion of the summit collapsed in a massive landslide triggered by volcanic tremors. That portion of the mountain is now a horseshoe-shaped crater partially filled by a lava dome (NHMP, 2010).

As a result of the 1980 Mt. St. Helens eruption and the far-reaching extent of the lateral blast, damage and reconstruction exceeded $1 billion. The coverage area was 230 square miles and reached 17 miles northwest of the crater. Impacts from pyroclastic flows covered six square miles and reached five miles north of the crater. Landslides covered 23 square miles. Lahars (mudflows) affected the North and South Forks of the Toutle River, the Green River and ultimately the Columbia River, as far as 70 miles from the volcano. Mt. St Helens' most recent eruption began in October of 2004, with initial steam and

ash eruptions giving away to slow-moving lava flows which ceased in January of 2008. In October of 2004 ash was pushed more than 10,000 feet into the air and lava flows continued until January 2008, after which activity ceased. The volcano has since been downgraded to inactive, although another eruption in the near future is likely (NHMP, 2010).

In 1781, Mount Hood erupted, which resulted in lahar flows that reached the Columbia River (USGS, 2013b). There were additional reports of eruptive activity in 1859 and 1865 from early settlers. Reports included sightings of fire, smoke, flying rock, and steaming (USGS, 2012). Two other minor eruption periods occurred during the last 500 years with some lava flow near the summit. The eruptions created pyroclastic flows and lahars with little ash fall. Other volcanoes throughout the Pacific Northwest have undergone similar formation and eruption cycles (MHFC, 2005 as cited in NHMP, 2010).

Table 12-1 and Figure 12-3 summarize past eruptions in the Cascades. Seven Cascade volcanoes have erupted since the beginning of the 18th century (USGS, 2013b).

Table 12-1. Past Eruptions near the City of Portland

Volcano	Number of Eruptions	Type of Eruptions
Mount Adams	3 in the last 10,000 years, most recent was 1,000 to 2,000 years ago	Andesite lava
Mount Hood	3 in the last 2000 years	Pyroclastic flows, lahars, steam explosions, tephra
Mount Jefferson	Last eruption approximately 15,000 years ago	Lava domes
Mount St Helens	19 eruptions in last 13,000 years	Pyroclastic flows, lahars, lava, and tephra

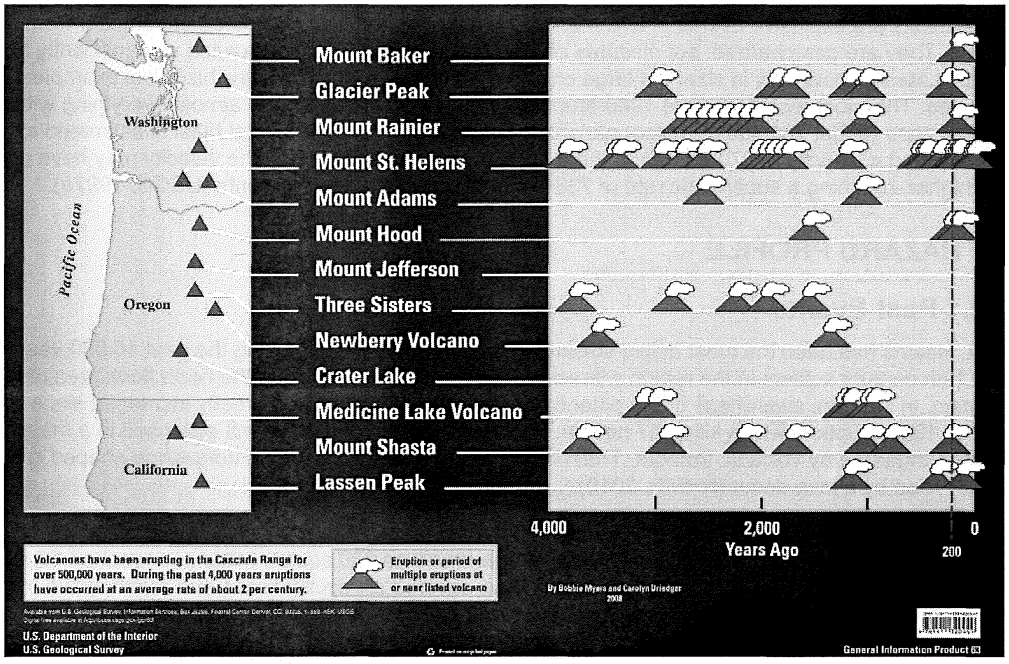

Figure 12-3. Cascade Range Eruptions in the Past 4,000 Years

12.2.2 Location

The extensive north-south chain of volcanoes in the Cascade Range was formed by earthquakes originating from the Cascadia Subduction Zone. As the Juan de Fuca Plate sinks beneath the North American Plate, it heats up and begins to melt, providing a vast reservoir of the heat and molten rock that create the magma chambers that become volcanoes (NHMP, 2010).

The USGS provides descriptions of the four closest volcanoes to the city, Mt. Adams, Mt. Hood, Mt. St. Helens and Mt. Jefferson, all located to the east of the city (USGS, 2009a as cited in NHMP, 2010):

- Mt. Adams stands approximately 31 miles due east of Mt. St. Helens. The towering stratovolcano (12,276 feet) is marked by a dozen glaciers, most of which are fed radially from its summit icecap. In the Cascades, Mt. Adams is second in eruptive volume only to Mt. Shasta and it far surpasses its loftier neighbor Mt. Rainier. Mt. Adams' main cone exceeds 124 cubic miles.
- Mt. Hood is located approximately 47 miles east-southeast of Portland and is the most accessible Oregon volcano. Access to the volcano is provided by US Highway 26 from the south and west and Oregon Highway 35 from the east. Other paved roads provide further access to this most often-climbed peak in the Pacific Northwest. In the winter, the mountain hosts winter sports. At 11,239 feet, Mt. Hood is the highest peak in the state and is part of the Mt. Hood National Forest (USGS, 2009a as cited in NHMP, 2010).
- Mt. Jefferson is located in the Mt. Jefferson Wilderness area and the Warm Springs Indian Reservation, approximately 70 miles from Portland. It is the second highest peak in Oregon at 10,497 feet. Access is provided by Highway 22 east of Salem and US Forest Service roads and trails that lead into the wilderness area (USGS, 2009 as cited in NHMP, 2010).
- Mt. St. Helens, a stratovolcano, is located approximately 50 miles northeast of Portland in Skamania County, Washington and has an elevation of 8,365 feet. Access is provided from the west in Cowlitz County by State Route 504. (USGS 2009a, as cited in NHMP, 2010).

Mt. St. Helens is believed to be the volcano with the greatest potential to have a near-term impact on the region because of its recent activity since the cataclysmic event in May 1980. A large eruption of Mt. St. Helens can eject tephra to altitudes of 12 to 20 miles and to deposit tephra over an area of 40,000 square miles or more. Wind direction and velocity, along with the vigor and duration of the eruption, will control the location, size and shape of the area affected by tephra fall (NHMP, 2010).

Due to proximity, the major hazard for the city would be impacts from ash or tephra. (i.e., minor ash falls from eruptions from Mt. St. Helens, or lesser ash falls from Mt. Hood or more distant volcanoes). Prevailing wind is a factor in how much ash is disbursed within the city. Volcanic eruptions may impact water bodies. River valleys are susceptible to debris flows, landslides and lahars that, under extreme conditions, may require dredging to maintain channel depths for navigation (NHMP, 2010). Figure 12-4 shows the potential area at risk of this hazard.

12.2.3 Frequency

Many Cascade volcanoes have erupted in the recent past and will be active again in the foreseeable future. Given an average rate of one or two eruptions per century during the past 12,000 years, these disasters are not part of our everyday experience; however, in the past hundred years, California's Lassen Peak and Washington's Mount St. Helens have erupted with terrifying results. The U.S. Geological Survey classifies Mount Hood, Mount Jefferson, Three Sisters, Newberry and Crater Lake as potentially active volcanoes in Oregon.

PBEM

Mt. St. Helens, in Washington State, is by far the most active volcano in the Cascades, with four major explosive eruptions in the last 515 years. Still, the probability of an eruption in any given year is extremely low. Figure 12-5 shows the annual probability of an ash fall accumulation of 4 inches or more (10 cm). The eastern portion of the City of Portland sits at the 0.02 percent range, or about once every 5,000 years. The rest of the City of Portland sits in the 0.01 percent range, or once every 10,000 years. However, frequencies of smaller accumulations in shorter timeframes are certainly possible.

Source: USGS, 2011

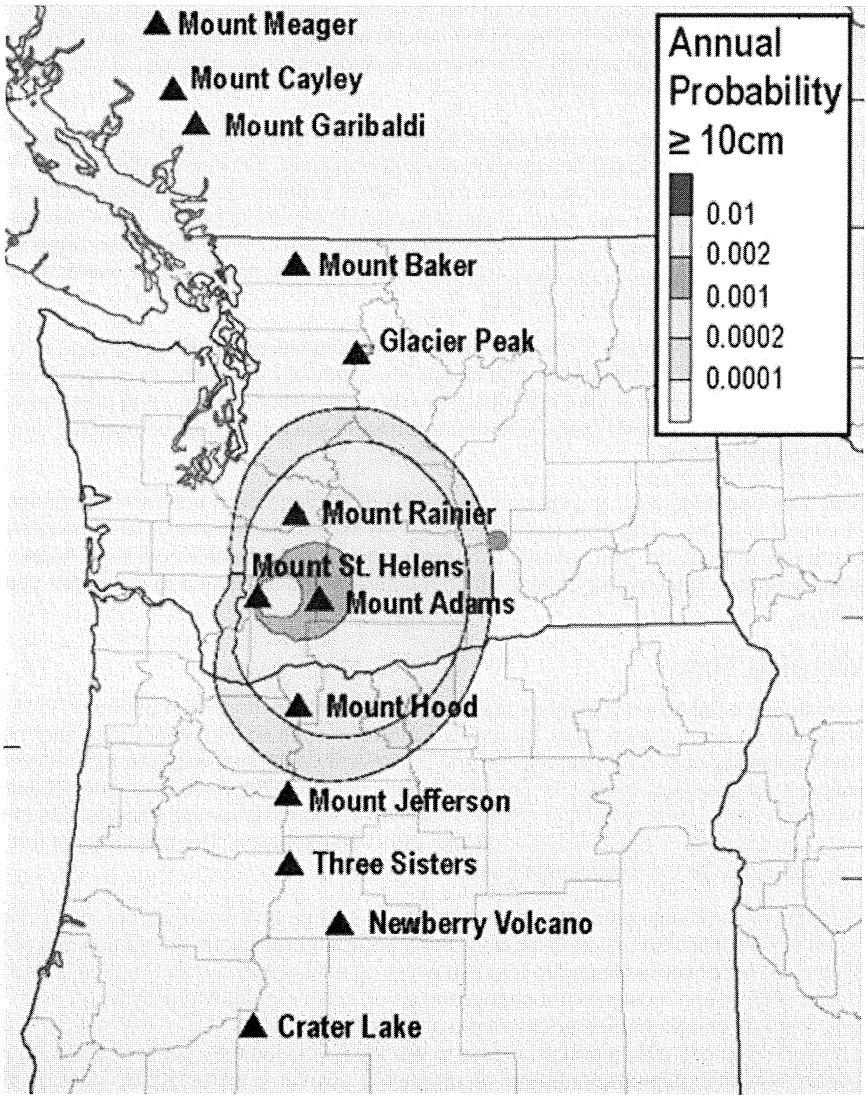

Figure 12-5. Probabilistic Hazard Map of Tephra Accumulation of 10 Centimeters or Greater

12.2.4 Severity

The most predominate threat to the city would occur from volcanic ash clouds, drifting downwind potentially landing several miles from the volcano. Events can vary from minor to heavy, with minor events reducing visibility and increasing respiratory and breathing difficulty. Driving can become potentially treacherous from reduced visibility and particulate ingested engine damage. Other problems common from air-entrained ash particles could include clogged and damaged sewage systems, mechanical equipment failure caused by the abrasive nature of volcanic ash and economic losses caused by business slowdowns and the cost of ash removal. Heavy tephra fall could affect humans and aquatic life as the ash accumulation increases the natural turbidity of waterbodies, causing increased treatment requirements. Heavier ash fall collects on all surfaces such as rooftops, decks and parking lots and requires removal. (NHMP, 2010).

A 1-inch deep layer of ash weighs an average of 10 pounds per square foot, causing danger of structural collapse. In addition to the concern for structural collapse, ash is corrosive and can be electrically conductive. This can lead to metallic roof surfaces experiencing increased deterioration. The abrasive and corrosive nature of ash not only causes potential minor but painful burns to humans, it can also damage computer and electronic systems. While volcanic ash is most often associated with structural instability, it can also cause issues with agriculture, health, power supply, water supply, transportation, and wastewater (USGS, 2015b).

Secondary impacts would be dust clouds generated by ash removal and surface damage from the scratchy nature of the tephra particulates. Ash clouds are especially damaging to jet aircraft as ash clouds can drift great distances at high altitudes. The city's international airport and other area airports are especially vulnerable and temporary flight restrictions and diversions may be required during active ash fall events (NHMP, 2010).

Although it is near both Mount St. Helens and Mount Hood, Portland does not have a large degree of exposure to direct impacts, aside from tephra. Figure 12-6 shows the severity of lahar hazards just to the east of the City of Portland. The severity of impacts from lahar hazards would likely depend on the severity of the eruption. The severity of impacts from tephra would be related to the extent of the accumulation.

12.2.5 Warning Time

Constant monitoring of all active volcanoes means that there will be more than adequate time for evacuation before an event. Since 1980, Mount St. Helens has settled into a pattern of intermittent, moderate and generally non-explosive activity, and the severity of tephra, explosions, and lava flows have diminished. All episodes, except for one very small event in 1984, have been successfully predicted several days to three weeks in advance. However, scientists remain uncertain as to whether the volcano's current cycle of explosivity ended with the 1980 explosion. The possibility of further large-scale events continues for the foreseeable future.

The best warning of a volcanic eruption is one that specifies when and where an eruption is likely and what type and size eruption should be expected. Such accurate predictions are sometimes possible but still rare. The most accurate warnings are those in which scientists indicate an eruption is probably only hours to days away, based on significant changes in a volcano's earthquake activity, ground deformation, and gas emissions. Experience from around the world has shown that most eruptions are preceded by such changes over a period of days to weeks. A volcano may begin to show signs of activity several months to a few years before an eruption. However, a warning that specifies months or years in advance when it might erupt are extremely rare.

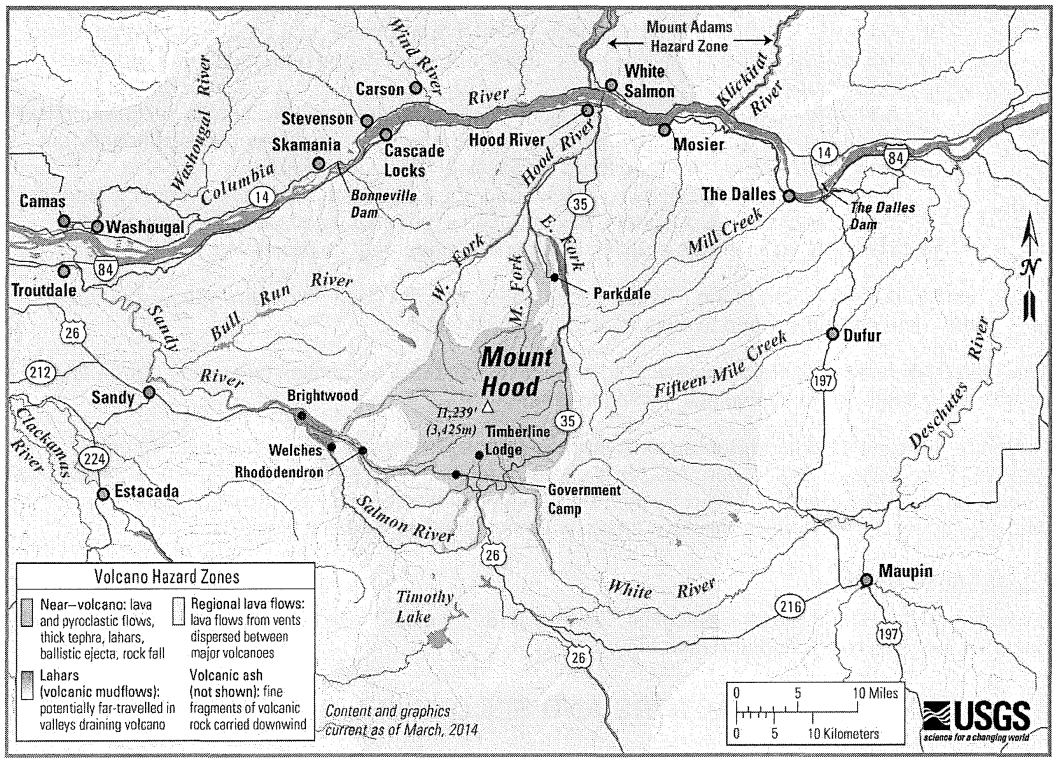

Figure 12-6. Potential Impact Area for Ground-Based Hazards during a Mount Hood Event

Monitoring Volcanic Activity

The USGS and the Pacific Northwest Seismograph Network conduct seismic monitoring of all Cascade volcanoes in Oregon and Washington. During the past decade, monitoring networks on Mount Hood and Mount St. Helens have been expanded (USGS, 2014b).

Volcanic Event Notification

Members of the public may sign up for the USGS Volcano Notification Service email subscription service on the USGS website. Notifications include several types: volcano activity notices; daily, weekly or monthly updates; status reports; volcano observatory notices for aviation; and information statements.

Volcano-alert notifications are based on analysis of data from monitoring networks, direct observations, and satellite sensors. They are issued for both increasing and decreasing volcanic activity and include text about the nature of the activity and about potential or current hazards. Scientists describe a volcano's status using alert levels and color codes and issue different types of notifications to address specific information needs. These alert levels consist of two parts (USGS, 2016e):

- Ranked terms to inform people on the ground about a volcano's status:
  - **Normal**—Volcano is in typical background, non-eruptive state or, after a change from a higher level, volcanic activity has ceased and volcano has returned to non-eruptive background state.
  - **Advisory**—Volcano is exhibiting signs of elevated unrest above known background level or, after a change from a higher level, volcanic activity has decreased significantly but continues to be closely monitored for possible renewed increase.
  - **Watch**—Volcano is exhibiting heightened or escalating unrest with increased potential of eruption, timeframe uncertain, OR, eruption is underway but poses limited hazards.
  - **Warning**—Hazardous eruption is imminent, underway, or suspected.
- Ranked colors to inform the aviation sector about airborne hazards (green, yellow, orange and red generally correspond to alert level term definitions).

This alert level ranking offers a framework that the public and civil authorities can use to gauge and coordinate a response to a developing volcano emergency.

Currently, the City of Portland Bureau of Emergency Management uses the federal system called Wireless Emergency Alerts to warn residents about impending risks posed from different hazards. Combined with the Emergency Alert System and Community Emergency Notification System, residents who sign up for these services will have ample warning about any volcanic hazards.

Lahar Travel Times

According to the United States Geological Survey (2013a), it would take more than 3.5 hours for distal hazard impacts to reach Portland (see Figure 12-7).

12.3 COMPOUNDING FACTORS AND SECONDARY HAZARDS

12.3.1 Overview

The secondary factors most commonly caused by volcanic eruptions are mud flows and landslides. Volcanic ash fall also contributes significantly to poor air quality as discussed in the population vulnerability section of this profile.

12.3.2 Climate Change

Climate change is not likely to affect the risk associated with volcanoes; however, volcanic activity can affect climate change. Volcanic clouds absorb terrestrial radiation and scatter a significant amount of incoming solar radiation. By reducing the amount of solar radiation reaching the Earth's surface, large-scale volcanic eruptions can lower temperatures in the lower atmosphere and change atmospheric circulation patterns. The massive outpouring of gases and ash can influence climate patterns for years following a volcanic eruption.

Source: USGS, 2013a

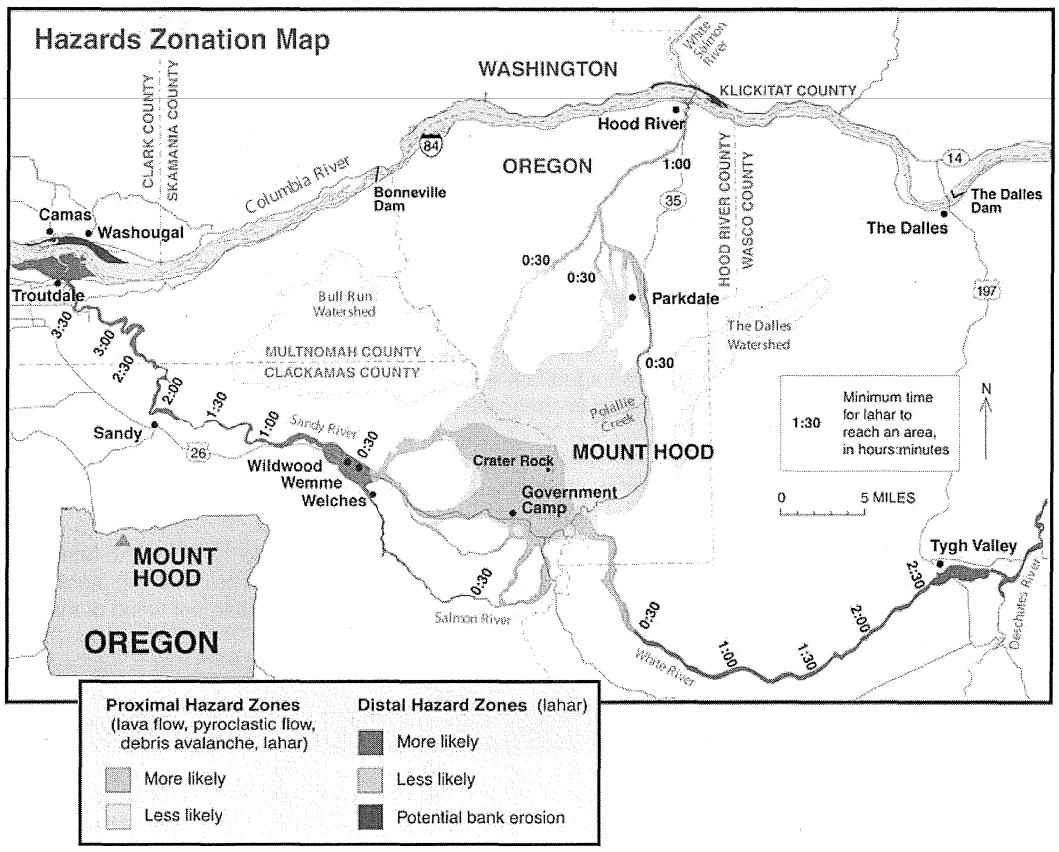

Figure 12-7. Mount Hood Hazard Zones and Lahar Travel Times

12.4 EXPOSURE

The City will likely experience damage only from volcanic eruption columns and clouds that contain volcanic gases, minerals and rock. The columns and clouds form rapidly and extend several miles above an eruption. Solid particles in the clouds present a serious aviation threat, can distribute acid rain (sulfur dioxide gas and water), can create risk of suffocation (carbon dioxide is heavier than air and collects in valleys and depressions) and pose a toxic threat from fluorine, which clings to ash particles, potentially poisoning grazing livestock and contaminating domestic water supplies (NHMP, 2010).

Buildings, streets and roads throughout the City would require minor cleanup with negligible impacts. Temporary utility interruptions are likely and minor cleanup may be required for electrical and other utility services. Water treatment facilities may be required to address highly turbid water. Columbia and Willamette River traffic could be impacted by sediment deposition from a large Mt. St. Helens or Mt. Hood eruption. Channel dredging to restore acceptable depths could be required after such an incident. Health complications associated with respiratory problems may also result (NHMP, 2010).

Portland is exposed to a Mt. Hood eruption that generates lahar and tephra. All that is in the path of the lahar is exposed to potential damage. Tephra exposure is assumed to apply to the entire city.

12.4.1 Population

The entire population of Portland is exposed to the effects of tephra. Populations residing in the northeast portion of the East Portland risk reporting area could be impacted by lahar hazards. Based on the percent of residential structures located in the lahar hazard areas it is estimated that approximately 25 people reside within the hazard area. The estimated social vulnerability indicators for those residing in this area is as follows:

- 7.7 percent under 15 years of age
- 23.8 percent over 65 years of age
- 8.8 percent people of color
- 6.9 percent renters
- 0 percent economically disadvantaged families
- 0 percent limited English speaking households.

12.4.2 Property

Lahar

All property in the lahar inundation areas would be exposed to lahar flows. Table 12-2 lists the total number of Portland structures in the lahar hazard zones and their values. All general building stock exposure is located in East Portland accounting for 1.8 percent of the total replacement value of the risk reporting area and less than 1 percent of the total replacement value of the city.

Table 12-2. Exposure and Value of Structures in Lahar Hazard Zone

Reporting Area	Number of Buildings Exposed	Value Exposed			Exposed Value as % of Total Replacement Value
		Structure	Contents	Total	
Airport	0	$0	$0	$0	0.0%
Central City	0	$0	$0	$0	0.0%
Central Northeast	0	$0	$0	$0	0.0%
East Portland	43	$233,499,088	$247,304,890	$480,803,978	1.8%
North Portland	0	$0	$0	$0	0.0%
Northeast	0	$0	$0	$0	0.0%
Southeast	0	$0	$0	$0	0.0%
Southwest	0	$0	$0	$0	0.0%
West/Northwest	0	$0	$0	$0	0.0%
Total	**43**	**$233,499,087.95**	**$247,304,890.38**	**$480,803,978**	**0.3%**

The 43 buildings located in the lahar hazard area are the following occupancy classes:

- Residential – 7 (16.3 percent)
- Commercial – 24 (55.8 percent)
- Industrial – 7 (16.3 percent)
- Education – 5 (11.6 percent).

Tephra

All property in Portland would be exposed to tephra accumulation from a volcanic eruption.

12.4.3 Critical Facilities

Lahar

Infrastructure exposed to lahar inundation includes highway bridges and a section of Union Pacific Railway that cross the Sandy River in the lahar zone, just outside Portland. Also outside Portland are 46 potable water facilities primarily operated by the Portland Water Bureau that are exposed to a lahar flow. These facilities are mostly wells and pumps in the Columbia South Shore Well Field. Table 12-3 and Table 12-4 summarize the exposed critical facilities in Portland.

Table 12-3. Critical Facilities in Lahar Inundation Zone

	Number of Critical Facilities in Lahar Hazard Areas[a]				
Reporting Area	Emergency Services	High Potential Loss Facilities	Schools	Other Assets	Total
Airport	0	0	0	0	0
Central City	0	0	0	0	0
Central Northeast	0	0	0	0	0
East Portland	0	4	0	0	4
North Portland	0	0	0	0	0
Northeast	0	0	0	0	0
Southeast	0	0	0	0	0
Southwest	0	0	0	0	0
West/Northwest	0	0	0	0	0
Outside City Boundary	0	0	0	0	0
Total	0	4	0	0	4

a. See Table 6-1 for a description of the facilities included in each category.

Table 12-4. Critical Infrastructure in Lahar Inundation Zone

	Number of Critical Infrastructure Facilities in Lahar Hazard Areas[a]					
		Utility Systems				
Reporting Area	Transportation Systems	Communications	Power	Potable Water	Wastewater	Total
Airport	0	0	0	0	0	0
Central City	0	0	0	0	0	0
Central Northeast	0	0	0	0	0	0
East Portland	0	1	1	35	1	38
West/Northwest	0	0	0	0	0	0
North Portland	0	0	0	0	0	0
Northeast	0	0	0	0	0	0
Southeast	0	0	0	0	0	0
Southwest	0	0	0	0	0	0
Outside City Boundary	3	0	0	46	0	49
Total	3	1	1	81	1	87

a. See Table 6-1 for a description of the facilities included in each category.

There are 1.34 miles of levees (6.6 percent of the total mileage in Portland) exposed to lahar flows in the distal hazard zone. Additionally, 2.60 miles of major power lines (0.6 percent of the total mileage in Portland) are also exposed.

Tephra

All transportation routes are exposed to tephra accumulation, which could create hazardous driving conditions on roads and highways and hinder evacuations and response.

12.4.4 Environment

The environment is highly exposed to the effects of a volcanic eruption. Even if ash fall from a volcanic eruption were to fall elsewhere, it could still be spread throughout Portland by surrounding rivers and streams. A volcanic blast would expose the local environment to many effects such as lower air quality, and many other elements that could harm local vegetation and water quality. Environment in the path of a lahar would be subject to additional impacts.

12.5 VULNERABILITY

12.5.1 Population

Lahar

Since there is generally adequate warning time before a volcanic event, the population vulnerable to distal hazards consists of those who choose not to evacuate or are unable to evacuate. The latter includes the elderly, the very young, those with access and functional needs, and those who may not have access to or be able to understand warnings.

Tephra

The entire population of Portland is vulnerable to the damaging effects of volcanic tephra, or ash fall, in the event of a volcanic eruption. The elderly, very young and those who experience ear, nose and throat problems are especially vulnerable to the tephra hazard. Ash is harsh, acidic, gritty, and smelly. Although the gases are usually too diluted to constitute danger to a person in normal health, the combination of acidic gas and ash may cause lung problems. Extremely heavy ash can clog breathing passages and cause death. When an ash cloud combines with rain, sulfur dioxide in the cloud combines with water to form diluted sulfuric acid that may cause minor, but painful burns to the skin, eyes, nose, and throat. Hydrochloric acid rains following eruptions have also been reported. Additionally, tephra decreases visibility and may cause psychological stress and panic.

12.5.2 Property

Lahar

There are currently no generally accepted damage functions for volcanic hazards in risk assessment platforms such as Hazus-MH. All properties listed in Table 12-5 are considered vulnerable to lahar hazards. The most vulnerable structures would be those that are located closest to the Columbia and Sandy River hazard areas, and those that are not structurally sound. Loss estimates for lahar hazards are shown in Table 12-5 representing 10, 30, and 50 percent of the exposed property value.

Table 12-5. Loss Estimates for Volcano Lahar Hazards

		Estimated Loss Potential from Lahar Hazards		
	Exposed Value	10% Damage	30% Damage	50% Damage
East Portland	$480,803,978	$48,080,398	$144,241,193	$240,401,989

Note: Values shown are accurate only for comparison among results in this plan. See Section 6.8.3 for a discussion of data limitations.

Tephra

All of the property exposed to nature in Portland is exposed to the effects of tephra accumulation. Among these properties, the most vulnerable structures are those that are not as structurally sound and may collapse under the excessive weight of tephra and possible rainfall. There are no current regulations regarding the weight of tephra on roof structures, however current snow load requirements for new buildings built in Portland have been in effect since being adopted in 2008 by the Oregon Building Codes Division. Table 12-6 shows the percentage of properties in the City of Portland that were built before snow load codes went into effect. Pre-2008 properties are likely to be more vulnerable to potential roof collapse due to tephra accumulation. Additional vulnerable property includes equipment and machinery left out in the open whose parts can become clogged by the fine dust. Infrastructure, such as drainage systems, is potentially vulnerable to the effects of tephra, since the fine ash can clog pipes and culverts. This may be more of a problem if an eruption occurs during winter or early spring when precipitation is highest and floods are most likely.

To estimate the loss potential for this hazard, a qualitative approach was used, based on recommendations from FEMA guidelines on state and local mitigation planning. For this study, it was decided to use 0.1 percent as the loss ratio for the tephra hazard. Replacement valuations for all of Portland were the basis for these estimation, resulting in a loss estimate of $170,805,775.

Table 12-6. Age of Structures in Portland

	Pre-2008[a]		2008-present[a]	
Reporting Area	Number of Structures	Percent	Number of Structures	Percent
Airport	594	92.4%	49	7.6%
Central City	2,575	97.2%	74	2.8%
Central Northeast	17,051	98.0%	355	2.0%
East Portland	42,463	97.0%	1,292	3.0%
West/Northwest	7,616	97.4%	205	2.6%
North Portland	23,405	95.6%	1,084	4.4%
Northeast	19,932	96.4%	748	3.6%
Southeast	51,502	96.7%	1,768	3.3%
Southwest	22,539	97.5%	585	2.5%
Total	187,677	96.8%	6,160	3.2%

a. Year built information was collected from Multnomah County tax assessor data. When year built information was unavailable, it was estimated based on census block or county-wide average year built dates.

12.5.3 Critical Facilities

Lahar

Transportation routes that intersect with the lahar inundation zone are most vulnerable, especially depending on their structural stability. This would include roads, bridges and the Union Pacific Railway. The most vulnerable spots are those that directly intersect with a lahar outflow area and are not structurally sound. Utilities are vulnerable to damage from lahars due to the debris that may be carried. Most vulnerable are those that are located on or near parcels that intersect with the lahar outflow area or those that receive input from area streams and rivers that lahar flow through. Water treatment plants, potable water wells and wastewater treatment plants are vulnerable to contamination from debris that may be carried by a lahar.

Tephra

All transportation routes are exposed to tephra accumulation, which could create hazardous driving conditions on roads and highways and hinder evacuations and response. Machinery and equipment using these transportation routes would also be vulnerable. Water treatment plants and wastewater treatment plants are vulnerable to contamination from ash fall. Visibility in the short aftermath of an eruption would also be problematic.

12.5.4 Environment

The environment is very vulnerable to the effects of a volcanic eruption. A lahar could be very damaging to area rivers and streams and could redirect water flow and cause changes in water courses. Tephra accumulation would expose the local environment to lower air quality and other effects that could harm vegetation and water quality. This is particularly significant for the Bull Run watershed, where heavy ash fall could cause turbidity and water quality issues. The sulfuric acid contained in volcanic ash could be very damaging to area vegetation, water, wildlife, and air quality. Rivers and streams are also vulnerable to damage due to tephra.

12.5.5 Economic Impact

Volcanic eruptions can disrupt the normal flow of commerce and daily human activity without causing severe physical harm or damage. Ash that is a few inches thick can halt traffic, cause rapid wear of machinery, clog air filters, block drains, creeks and water intakes, and impact agriculture. Removal and disposal of large volumes of deposited ash can have significant impacts on government and business. The interconnectedness of the region's economy can be disturbed after a volcanic eruption. Roads, railroads and bridges can be damaged by lahars and mudflows. The Mount St. Helens May 1980 eruption demonstrated the negative effect on the tourism industry. Conventions, meetings, and social gatherings were canceled or postponed in cities and resorts throughout Oregon in areas not initially affected by the eruption. Columbia River shipping traffic was disrupted by mudflows that deposited more than 65 million cubic yards of sediment along the river bottom, reducing the depth of the navigational channel from 39 feet to less than 13 feet (USGS, 1997b). However, the eruption did lead to the creation of a thriving tourist industry for decades following the event.

The disruption of regional activity is further demonstrated by the 2010 eruption of Iceland's Eyjafjallajokull volcano, which led to European air travel being halted for several days. The movement of goods via major highways can also be halted due to tephra in the air. The Mount St. Helens event in May 1980 cost trade and commerce an estimated $50 million in only two days, as ships were unable to navigate the Columbia River. Clouds of ash often cause electrical storms that start fires, and damp ash can short-circuit electrical systems and disrupt radio communication. Volcanic activity can also lead to the closure of nearby recreation areas as a safety precaution long before the activity ever culminates in an eruption. Lloyd's City Risk Index estimates that a volcanic eruption from a nearby source could cause as much as $720 million of lost gross domestic product annually.

12.6 FUTURE TRENDS IN DEVELOPMENT

12.6.1 Lahar

Lahar zones are not identified as natural hazard areas under the Oregon Statewide Planning Goals or in the City's Comprehensive Plan. There are no known higher regulatory standards for development in these areas. The lahar inundation areas within the City are quite small (estimated to be less than 530 acres) and the likelihood of an eruption of the magnitude required to produce such lahars is quite low.

Future land use designations in the volcano distal hazard area in East Portland include:

- 66.0 percent Employment and Industrial
- 29.3 percent Open Space
- 4.7 percent Single-Dwelling Residential.

12.6.2 Tephra

All future development in Portland will be susceptible to the potential impacts from volcanic eruptions causing ash fall within the region. While this potential impact on the built environment is not considered to be significant, the economic impact on industries that rely on machinery and equipment such as agriculture or civil engineering projects could be significant. Since the extent and location of this hazard is difficult to gauge because it is dependent upon many variables, the ability to institute land use recommendations based on potential impacts of this hazard is limited. While the impacts of tephra are sufficient to warrant risk assessment for emergency management purposes, they are not sufficient to dictate land use decisions.

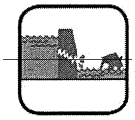
12.7 SCENARIO

12.7.1 Lahar

In the event of a volcanic eruption in Portland, there would probably not be any loss of life, due to adequate warnings. However, there could be great loss of property, especially in lahar inundation areas. The potential halting of Columbia River shipping traffic could severely impact the City of Portland's economy. There would also be the possibility of severe environmental impacts due to lahar flows in area rivers and streams.

12.7.2 Tephra

A large area could be affected by tephra accumulation. The most severe impacts would be on the environment. Any eruption of Mt. Hood would likely produce significant amounts of tephra in Portland. This impact is totally dependent upon the prevailing wind direction during and after the event. No one in Portland would likely be injured or killed by tephra, but businesses and non-essential government would be closed until the cloud passes. People and animals without shelter would be affected. Structures would be safe, but private property left out in the open might be damaged by the fine ash dust. Clean-up from such an event could be costly, depending upon the magnitude of the event.



12.8 ISSUES

Since volcanic episodes have been fairly predictable in the recent past, there is probably not much concern about loss of life, but there is concern about loss of property, infrastructure and severe environmental impacts.

- All of Portland may be exposed to a tephra event.
- The East Portland risk reporting area is exposed to lahar hazards from a large magnitude event at Mount Hood.
- 25 people are estimated to reside in areas that may be impacted by lahar hazards.
- 43 buildings at an estimated replacement value of $480 million are exposed to the hazard. This represents about 1.9 percent of the risk reporting area and less than 1 percent of the total value of Portland.

- Buildings exposed are predominately commercial (24). There are also 7 residential, 7 industrial, and 5 educational buildings exposed.
- Residents who are 65 years or ago or older may be disproportionately exposed to the lahar hazard (24 percent).
- There are 91 critical facilities and critical infrastructure facilities located in the volcano hazard area.
- Tephra from volcanic eruptions can cause significant damage to heating and air conditioning systems and combustion systems.
- Tephra could cause turbidity and water quality issues in the Bull Run watershed.
- Tephra increases in weight significantly when wet and cleanup efforts can be extremely challenging.
- Lahars and mudflows could deposit large amounts of sediment into the Columbia River, significantly affecting shipping traffic and the local economy.
- Researchers continue to develop methods to predict volcanic eruptions accurately. Indications that an eruption may be imminent include swarms of small earthquakes as the magma rises up through the volcano, increases in gas emissions, and physical swelling or deformation of mountain slopes. Although warning time should be sufficient to prevent loss of life, the advent of these signs and the beginning of eruptive activity may be short.
- A regional Mount Hood Coordination plan has been developed to coordinate and plan for response activities in the event of an eruption. This plan should continue to be updated.

13. DAM FAILURE

13.1 GENERAL BACKGROUND

13.1.1 Causes of Dam Failure

Dam failures in the United States typically occur in one of four ways:

- Overtopping of the primary dam structure, which accounts for 34 percent of all dam failures, can occur due to inadequate spillway design, settlement of the dam crest, blockage of spillways, and other factors.
- Foundation defects due to differential settlement, slides, slope instability, uplift pressures, and foundation seepage can also cause dam failure. These account for 30 percent of all dam failures.
- Failure due to piping and seepage accounts for 20 percent of all failures. These are caused by internal erosion, erosion along hydraulic structures such as spillways, erosion due to animal burrows, and cracks in the dam structure.
- Failure due to problems with conduits and valves, typically caused by the piping of embankment material into conduits through joints or cracks, constitutes 10 percent of all failures.

The remaining 6 percent of U.S. dam failures are due to miscellaneous causes. Many dam failures in the United States have been secondary results of other disasters. The prominent causes are earthquakes, landslides, extreme storms, massive snowmelt, equipment malfunction, structural damage, foundation failures, and sabotage (ASDSO, 2016).

DEFINITIONS

- **Dam**—A hydraulic structure built above the natural ground grade line that is used to impound water. Dams include all appurtenant structures, and together are sometimes referred to as "the works." Dams include wastewater lagoons and other hydraulic structures that store water, attenuate floods, and divert water into canals (Oregon Administrative Rule, 2015)
- **Dam Failure**—An uncontrolled release of impounded water due to structural deficiencies in dam.
- **Emergency Action Plan**—A formal document that identifies potential emergency conditions at a dam and specifies actions to be followed to minimize property damage and loss of life. The plan specifies actions the dam owner should take to alleviate problems at a dam. It contains procedures and information to assist the dam owner in issuing early warning and notification messages to responsible downstream emergency management authorities of the emergency situation. It also contains inundation maps to show emergency management authorities the critical areas for action in case of an emergency. (FEMA 64)
- **High Hazard Dam**—Dams where failure or improper operation will probably cause loss of human life. (FEMA 333)
- **Significant Hazard Dam**—Dams where failure or improper operation will result in no probable loss of human life but can cause economic loss, environmental damage or disruption of lifeline facilities, or can impact other concerns. Significant hazard dams are often located in rural or agricultural areas but could be located in areas with population and significant infrastructure. (FEMA 333)

Poor construction, lack of maintenance and repair, and deficient operational procedures are preventable or correctable by a program of regular inspections. Terrorism and vandalism are serious concerns that all operators of public facilities must plan for; these threats are under continuous review by public safety agencies.

13.1.2 Regulatory Oversight

The dam failure risk assessment and mitigation strategies developed for this plan focus on impacts on people and property once a dam failure has occurred. The focus is not on dam operations to prevent dam failures from occurring, although a brief synopsis of regulatory programs impacting dam operations is included for reference.

National Dam Safety Act

The potential for catastrophic flooding due to dam failures led to passage of the National Dam Safety Act (Public Law 92-367). The National Dam Safety Program (NDSP) requires a periodic engineering analysis of every major dam in the country. The goal of this FEMA-monitored effort is to identify and mitigate the risk of dam failure so as to protect the lives and property of the public. The NDSP is a partnership between states, federal agencies, and other stakeholders that encourages individual and community responsibility for dam safety. State assistance funds have allowed participating states to improve their programs through increased inspections, emergency action planning, and the purchase of needed equipment. FEMA has also expanded existing and initiated new training programs. Grant assistance from FEMA provides support for improvement of dam safety programs that regulate most of the dams in the United States.

Oregon Dam Safety Guidelines

The Dam Safety Program of Oregon's Water Resources Department monitors dams at the state level. Reservoir storage permits are required for dams that are 10 feet or over in height and store at least 9.2 acre-feet of water (Oregon Water Resources Department, 2016b). The Department reviews design and specifications for dam construction and modification, conducts routine inspections and takes enforcement actions on dams that do not ensure the safety of life and property. Routine inspections for dams are conducted based on the hazard classification of the dam and range from annual inspections for high hazard dams to every six years for low hazard dams. (Oregon Administrative Rule, 2015).

U.S. Army Corps of Engineers Dam Safety Program

The U.S. Army Corps of Engineers is responsible for safety inspections of some federal and non-federal dams in the United States that meet the size and storage limitations specified in the National Dam Safety Act. The Corps has inventoried dams; surveyed each state and federal agency's capabilities, practices, and regulations regarding design, construction, operation and maintenance of the dams; and developed guidelines for inspection and evaluation of dam safety (U.S. Army Corps of Engineers, 2011).

Federal Energy Regulatory Commission Dam Safety Program

The Federal Energy Regulatory Commission (FERC) cooperates with a large number of federal and state agencies to ensure and promote dam safety. More than 3,000 dams are part of regulated hydroelectric projects in the FERC program. Two-thirds of these are more than 50 years old. As dams age, concern about their safety and integrity grows, so oversight and regular inspection are important. FERC inspects hydroelectric projects on an unscheduled basis to investigate the following:

- Potential dam safety problems
- Complaints about constructing and operating a project
- Safety concerns related to natural disasters
- Issues concerning compliance with the terms and conditions of a license.

Every five years, an independent FERC-approved engineer must inspect and evaluate projects with dams higher than 32.8 feet (10 meters), or with a total storage capacity of more than 2,000 acre-feet.

FERC monitors and evaluates seismic research and applies it in structural analyses of hydroelectric projects. FERC also evaluates the effects of potential and actual large floods on the safety of dams. During and following floods, FERC visits dams and licensed projects, determines the extent of damage, if any, and directs any necessary studies or remedial measures the licensee must undertake. The FERC publication *Engineering Guidelines for the Evaluation of Hydropower Projects* guides the FERC engineering staff and licensees in evaluating dam safety. The publication is frequently revised to reflect current information and methodologies.

FERC requires licensees to prepare emergency action plans and conducts training sessions on how to develop and test these plans. The plans outline an early warning system if there is an actual or potential sudden release of water from a dam due to failure. The plans include operational procedures that may be used, such as reducing reservoir levels and reducing downstream flows, as well as procedures for notifying affected residents and agencies responsible for emergency management. These plans are frequently updated and tested to ensure that everyone knows what to do in emergency situations (FERC, 2005).

13.2 HAZARD PROFILE

13.2.1 Past Events

Dam failures can occur suddenly and without warning. They may occur during normal operating conditions or during a large storm event. Significant rainfall can quickly inundate an area and cause floodwaters to overwhelm a reservoir. If the spillway of the dam cannot safely pass the resulting flows, water will begin flowing in areas not designed for such flows, and a failure may occur.

According to the Association of State Dam Safety Officials, there have been no recorded dam incidents in or near the City of Portland (ASDSO, 2016). Between 1953 and 2015, FEMA has not declared any major disasters or emergencies from dam failure events in Portland. The Oregon Natural Hazard Mitigation Plan notes that a major dam failure occurred near Hermiston in Umatilla County in 2005 and in Klamath Lake in 2006 (Oregon Department of Land Conservation and Development, 2015).

13.2.2 Location

There are seven dams located in Portland, three in the Bull Run Watershed, and one located upstream of the City on the Columbia River. The single dam on the main-stem of the Willamette River is a natural weir-type dam with hydroelectric generation, located at Willamette Falls, 10 miles upriver from downtown Portland. It also has a system of navigation locks, which are out of service as of 2011. The dam, owned by Portland General Electric (PGE), is a run-of-river dam and does not provide usable water storage or flood control (LIHI, 2016). There are also dams on tributaries of the Willamette that could impact Portland, but any such impacts would be expected to be minor. A review of the inundation mapping for these dams indicates that a failure of any of the dams located in the Bull Run Watershed would not be expected to impact the City of Portland. Impacts for the City of Portland from the Bonneville Dam on the Columbia River are not clearly understood at this time.

Information on dams located in or near Portland is listed in Table 13-1. Four are inspected by federal agencies, and the remainder are under the jurisdiction of the state.

Table 13-1. Dams in Portland

Name	*National ID #*	River	Height (feet)	Storage Capacity (acre-feet)	Last Inspection	Hazard Class
Bonneville Dam[c]	OR00001	Columbia	110.0	277,000	4/3/2008 (Federal)	High
Bull Run Lake Dam[b]	OR00300	Bull Run River	55.0	14,500	4/28/1995 (Federal)	Low
Bull Run Dam 1 (upper)[b]	OR00327	Bull Run River	194.0	33,760	6/12/2012 (Federal)	High
Bull Run Dam 2 (lower)[b]	OR00317	Bull Run River	125	21,000	6/12//2012 (Federal)	High
Mt. Tabor Reservoir #1[a]	OR00667	Bull Run River (off-stream)	30	37	11/12/2015	High
Mt. Tabor Reservoir #5[a]	OR00670	Bull Run River (off-stream)	55	153	11/12/2015	High
Mt. Tabor Reservoir #6[a]	OR00671	Bull Run River (off-stream)	28	230	11/12/2015	High
Washington Park Reservoir #3[a]	OR00668	Bull Run River (off-stream)	53	50	11/12/2015	High

c. Located upstream of the City.
Source: Oregon Water Resources Department Dam Inventory Query, 2016a and U.S. Army Corps National Inventory of Dams, 2016

13.2.3 Frequency

Dam failure events are infrequent and usually coincide with events that cause them, such as earthquakes, landslides and excessive rainfall and snowmelt; however, dam failures can occur at any time. There is a residual risk associated with dams. Residual risk is the risk that remains after safeguards have been implemented. For dams, the residual risk is associated with events beyond those that the facility was designed to withstand. However, the probability of any type of dam failure is low in today's regulatory and dam safety oversight environment.

13.2.4 Severity

Dam failure can be catastrophic to all life and property downstream. The Oregon Dam Safety Program classifies dams and reservoirs in a three-tier hazard rating system primarily using the results of dam breach analyses. Dams are classified as high, medium or low based on the following criteria (Oregon Administrative Code, 2015):

a) An inundation depth of flowing water of at least two feet over the finished floors of dwellings, other frequently occupied buildings, or road surfaces where a vehicle is likely to be present establishes a "high hazard" rating.
b) Any inundation depth of water over the floorboards of structural buildings establishes a "significant hazard" rating.
c) For other roads and vulnerable utilities, an inundation depth of two feet or evidence of depth and velocity capable of creating damage establishes a "significant hazard" rating.
d) Wherever heavy recreational or other frequent use occurs downstream a "high hazard" rating shall be established to prevent probable loss of life. Such designation shall not depend on the presence of downstream infrastructure

e) For water depths close to those listed in the subsections (a) and (c), the Department may also consider water velocity in its determination of hazard rating.

The U.S. Army Corps of Engineers developed the classification system shown in Table 13-2 for the hazard potential of dam failures. The Oregon and Corps of Engineers hazard rating systems are both based only on the potential consequences of a dam failure; neither system takes into account the probability of such failures.

Table 13-2. Corps of Engineers Hazard Potential Classification

Hazard Category[a]	Direct Loss of Life[b]	Lifeline Losses[c]	Property Losses[d]	Environmental Losses[e]
Low	None (rural location, no permanent structures for human habitation)	No disruption of services (cosmetic or rapidly repairable damage)	Private agricultural lands, equipment, and isolated buildings	Minimal incremental damage
Significant	Rural location, only transient or day-use facilities	Disruption of essential facilities and access	Major public and private facilities	Major mitigation required
High	Certain (one or more) extensive residential, commercial, or industrial development	Disruption of essential facilities and access	Extensive public and private facilities	Extensive mitigation cost or impossible to mitigate

a. Categories are assigned to overall projects, not individual structures at a project.
b. Loss of life potential based on inundation mapping of area downstream of the project. Analyses of loss of life potential should take into account the population at risk, time of flood wave travel, and warning time.
c. Indirect threats to life caused by the interruption of lifeline services due to project failure or operational disruption; for example, loss of critical medical facilities or access to them.
d. Damage to project facilities and downstream property and indirect impact due to loss of project services, such as impact due to loss of a dam and navigation pool, or impact due to loss of water or power supply.
e. Environmental impact downstream caused by the incremental flood wave produced by the project failure, beyond what would normally be expected for the magnitude flood event under which the failure occurs.

Source: U.S. Army Corps of Engineers, 1995

13.2.5 Warning Time

Warning time for dam failure varies depending on the cause of the failure. In events of extreme precipitation or massive snowmelt, evacuations can be planned with sufficient time. In the event of a structural failure due to earthquake, there may be no warning time. A dam's structural type also affects warning time. Earthen dams do not tend to fail completely or instantaneously. Once a breach is initiated, discharging water erodes the breach until either the reservoir water is depleted or the breach resists further erosion. Concrete gravity dams also tend to have a partial breach as one or more monolith sections are forced apart by escaping water. The time of breach formation ranges from a few minutes to a few hours (U.S. Army Corps of Engineers, 1997).

The City of Portland has established protocols for flood warning and response to imminent dam failure in the flood warning portion of its adopted emergency operations plan. These protocols are tied to the emergency action plans created by the dam owners.

13.3 COMPOUNDING FACTORS AND SECONDARY HAZARDS

13.3.1 Overview

Dam failure can cause severe downstream flooding, depending on the magnitude of the failure. Other potential secondary hazards of dam failure are landslides around the reservoir perimeter, bank erosion on the rivers, and destruction of downstream habitat.

13.3.2 Climate Change

Dams are designed partly based on assumptions about a river's hydrograph. If changes in weather patterns have significant effects on hydrographs, the dam can lose some or all of its designed margin of safety, also known as freeboard. If freeboard is reduced, dam operators may be forced to release increased volumes earlier in a storm cycle in order to maintain required margins of safety. Such early releases can increase flood potential downstream. The dams assessed in this risk assessment are off-stream dams meaning that they are not located on a river course. This means that they are not as likely to experience changes in operations resulting from changes in the region's hydrograph.

13.4 EXPOSURE

The flood module of Hazus-MH was used for a Level 2 assessment of dam failure. Hazus-MH uses census data at the block level, which has a level of accuracy acceptable for planning purposes. Where possible, the Hazus-MH data was enhanced for this risk assessment using GIS data from local, state and federal sources. The exposure and vulnerability estimates provided below are based on failure events of Mount Tabor Reservoirs 1, 5, and 6, and Washington Park Reservoirs 3 and 4. Inundation maps and depth grids were prepared for this analysis, but are not included in the publicly available version of this plan due to security concerns. It should be noted that the inundation events used for this analysis were conducted before the recent plans to improve the Washington Park Reservoir and to decommission and make adjustments to the Mt. Tabor reservoirs. Risk and vulnerability to this hazard should be reassessed when improvements, adjustments and decommissioning activities are complete.

13.4.1 Population

All populations in an inundation zone would be exposed to the risk of a dam failure. The potential for loss of life is affected by the capacity and number of evacuation routes available to populations in areas of potential inundation as well as the amount of warning time before the event. The estimated population living in the mapped inundation areas in Portland is 15,277 or 2.5 percent of the city's population; however, there is some overlap between the Mount Tabor inundation areas, so total exposure of those residing in these areas may be overestimated. Table 13-3 summarizes the at-risk population in Portland by risk reporting area. Population exposure is concentrated in the Southeast area for the Mount Tabor reservoirs and in the Central City for the Washington Park reservoirs. Population exposure may increase depending on the time of day and whether or not residents are at home, work, school or commuting. Both Mount Tabor and Washington Park are used heavily by residents and tourists for recreation, so they may have significantly higher populations during pleasant weather conditions.

Table 13-4 shows the estimated percent of the population believed to be residing in mapped inundation areas for our social vulnerability indicators. Based on these estimates, a disproportionate number of limited English speaking households may be exposed to the Mount Tabor reservoir 1 inundation area, while a disproportionate number of renters and families living in poverty may be exposed to Washington Park inundation areas.

Table 13-3. Population within Dam Failure Areas

Reporting Area	Mount Tabor Reservoir 1		Mount Tabor Reservoirs 5 and 6		Washington Park Reservoirs 3 and 4	
	Population Exposed[a]	% of Total Population	Population Exposed[a]	% of Total Population	Population Exposed[b]	% of Total Population

Central City	2.1%	4.6%	19.3%	90.3%	27.1%	1.7%

a. Values based on an analysis of 2010-2014 American Community Survey 5-year estimates at the Census block group level.
b. Values calculated using block group statistics weighted by the number of residential structures in the hazard area as a percentage of the total residential structures in the block group.
c. Values in red indicate percentages are at least 2 percent greater than the Citywide average (see Section 4.7).

13.4.2 Property

Table 13-5 summarizes the value of Portland buildings in the mapped inundation areas. Less than 2 percent of the total replacement value of Portland is exposed to the dam failure hazard. Table 13-6 lists the structure type of buildings in the inundation areas. In the Mount Tabor inundation areas residential properties comprise much of the exposure. A majority of the structures impacted by the Washington Park Reservoirs are believed to be for commercial uses.

Table 13-5. Exposure and Value of Structures in Dam Failure Inundation Areas

13.4.3 Critical Facilities

GIS analysis determined that there are critical facilities in the mapped inundation area as listed in Table 13-7 through Table 13-9.

13.4.4 Environment

In general, reservoirs held behind dams affect many ecological aspects of a river. River topography and dynamics depend on a wide range of flows, but rivers below dams often experience long periods of very stable flow conditions or saw-tooth flow patterns caused by releases followed by no releases. Water releases from dams usually contain very little suspended sediment; this can lead to scouring of river beds and banks. The dam failure inundation scenarios assessed for this assessment are located off-stream, so significant impacts on river ecosystems would not be expected. The environment would still be exposed to a number of risks in the event of dam failure.

Table 13-7. Critical Facilities in Inundation Areas

Highways	Highways in Portland may be exposed to the dam inundation hazard, but they are likely to be elevated above potential inundation areas		

13.5 VULNERABILITY

13.5.1 Population

Vulnerable populations are all populations downstream from dam failures that are unlikely to escape the area within the allowable time frame. This includes the elderly, young or others with access and functional needs, who may be unable to get themselves out of the inundation area. Vulnerable populations also include those who would not have adequate warning from a cell phone, television or radio emergency warning system or are unable to understand warnings provided due to language barriers or other disabilities. It likely that many households living in the inundation areas are not aware that they reside in such areas, renters may be less likely to be so informed.

Estimates for the number of people who would be displaced and require short-term shelter were estimated for dam failure events through the Level 2 Hazus-MH analysis. Table 13-10 summarizes the results.

Table 13-10. Estimated Dam Failure Impact on Persons and Households

	Displaced Population[a]		Persons Requiring Short-Term Shelter[a]	
	Number	% of Population	Persons	% of Population
Mt Tabor Reservoir 1 Inundation Scenario				
Southeast	924	0.6%	754	0.5%

a. Calculated using a Census block level, general building stock analysis in Hazus 2.2, and adjusted to reflect the estimated population.

13.5.2 Property

Vulnerable properties are those closest to the inundation areas. These properties would experience the largest, most destructive surge of water. Low-lying areas are also vulnerable since they are where the reservoir waters would collect.

A failure of the Mount Tabor Reservoirs 5 and 6 would be expected to lead to the most significant damage, with 2,990 structures impacted, resulting in more than $644 million in expected losses (about 0.4 percent of the total replacement value of Portland). Table 13-11 shows loss estimates for each scenario.

Table 13-11. Loss Estimates for Dam Failure

Reporting Area	Number of Structures Impacted	Estimated Loss			Estimated Loss as % of Replacement Value	
		Structure	Contents	Total	Area	City

13.5.3 Critical Facilities

Estimated damage to critical facilities and infrastructure in the dam inundation areas is summarized in Table 13-13 through Table 13-15.

Transportation routes are vulnerable to dam inundation and have the potential to be wiped out, creating isolation issues. This includes all roads and railroads in the path of the dam inundation. Those that are most vulnerable are those that are already in poor condition and would not be able to withstand a large water surge. Utilities such as overhead power lines, cable and phone lines could also be vulnerable. Loss of these utilities could create additional isolation issues for the inundation areas. Facilities containing hazardous materials or the containers used to store them could be damaged during a dam failure event resulting in material releases that could be harmful to people, property and environment in the area.

13.5.4 Environment

The extent of the vulnerability of the environment is the same as the exposure of the environment. As with any significant natural hazard event, large of amounts of debris generated from the damaged buildings and infrastructure could have significant environmental impacts. These impacts were estimated for the dam failure event through the Level 2 Hazus-MH analysis. Table 13-16 summarizes the results.

In addition, habitat of plants and animals would be detrimentally effected by the surge of water resulting from the failure. Hazardous materials could be released into the environment during the inundation. This release could have both immediate and long-term impacts to the natural environment as well as human health and safety.

Table 13-16. Estimated Dam Failure-Caused Debris

b. Hazus-MH assumes 25 tons/trucks
Note: Values shown are accurate only for comparison among results in this plan. See Section 6.8 for a discussion of data limitations.

13.5.5 Economic Impact

In general, dam failure presents the potential for significant disruption, including loss of life, massive property damage, and other long-term consequences. All of these are likely to impact the local economy, directly and indirectly. Economic losses can include the cost to rebuild structures and properties, the cost of response, and recovery, and long-term costs to repair environmental damage. It can also have a hidden impact, by reducing public morale and confidence, resulting in decreased spending in local stores and businesses near the event's occurrence. Such indirect and cascading impacts, however, are difficult to quantify, even though FEMA recognizes their significance and probability. FEMA provides resources to assist jurisdictions in estimating both direct and indirect economic consequences after a dam failure (Homeland Security, 2011)

13.6 FUTURE TRENDS IN DEVELOPMENT

Land use in Portland will be directed by the Portland Comprehensive Plan adopted under state law. The City has established comprehensive policies regarding sound land use in identified flood hazard areas; however, these policies and related regulations in the local municipal code are unlikely to impact land use and development decisions in dam inundation areas, because these areas are off stream and generally unconnected to floodplains.

Table 13-17 shows the future land use designations in the dam inundation areas. The majority of the land area in both the Mount Tabor 1 and 5 and 6 inundation scenarios is designated as single-family dwellings, while the dominant use in the Washington park inundation area is commercial.

Table 13-17. Future Land Use Designations in Dam Failure Inundation Areas

13.7 SCENARIO

An earthquake in the region could lead to liquefaction or sliding of soils around a dam. This could occur without warning during any time of the day. Failure of a high hazard dam in the City would likely result

in the loss of life, roadways, structures and property and cause severe impacts on the local economy. While the possibility of failure is low, results of such an event would be devastating.

13.8 ISSUES

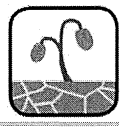
The most significant issue associated with dam failure involves the properties and populations in the inundation zones. Flooding as a result of a dam failure would significantly impact these areas. There is often limited warning time for dam failure. These events are frequently associated with other natural hazard events such as earthquakes, landslides or severe weather, which limits their predictability and compounds the hazard.

The following issues have been identified based on the Mt Tabor Reservoir 1 inundation scenario:

- Immediate impacts will be contained within the Southeast risk reporting area.
- More than 2,100 people are estimated to reside within the inundation areas. Of these, it is estimated that 924 people will be displaced from their homes after an event and 754 of these people will seek shelter in public shelters.
- Of the 739 buildings exposed, 572 are expected to be impacted by a dam failure event, resulting in more than $95.4 million in damage. This is less than 1 percent of the total value of the Southeast risk reporting area and less than 0.1 percent of the total value of Portland.
- The structures exposed to the hazard are predominantly residential (97 percent); however, there are also 9 structures identified as educational occupancy, 12 commercial structures and 1 religious structure in the exposure area.
- More than 12,120 tons of debris would be expected from the inundation event, which will require approximately 485 truckloads to remove.
- Only 1 building in the inundation area is believed to have flood insurance.
- There are 2 critical facilities located in the inundation area.
- Limited English speaking households may disproportionately reside in inundation areas in the Southeast risk reporting area (6 percent).

The following issues have been identified based on the Mt Tabor Reservoir 5 and 6 inundation scenario:

- Immediate impacts will be contained within the Central City and Southeast risk reporting areas. The vast majority of exposure is in the Southeast (96 percent of inundation area).
- 12,477 people are estimated to reside within the inundation areas. Of these, it is estimated that 7,662 people will be displaced from their homes after an event and 2,983 of these people will seek shelter in public shelters.
- There are 4,300 buildings estimated to be exposed to the dam inundation area.
- The vast majority of exposed structures in the Southeast reporting area are residential (95 percent).
- More than 59,741 tons of debris would be expected from the inundation event, which will require approximately 2,390 truckloads to remove.
- Of the 4,106 buildings exposed, 2,990 are expected to be impacted by a dam failure event, resulting in more than $2.3 billion in damage. This is 1.3 percent of the total value of the Southeast risk reporting area and less than 0.1 percent of the total value of Portland.
- Only 9 buildings in the inundation area are believed to have flood insurance.
- There are 14 critical facilities located in the inundation area.



The following issues have been identified based on the Washington Park Reservoirs 3 and 4 inundation scenario:

- Immediate impacts will be contained predominantly within the Central City and the West/Northwest risk reporting area. There is one government building exposed in the Southwest.
- 621 people are estimated to reside within the inundation areas. Of these, it is estimated that 285 people will be displaced from their homes after an event and 275 of these people will seek shelter in public shelters.
- It is estimated that over 90 percent of the population exposed to the dam failure hazard reside in renter occupied housing and that more than 27 percent of families in the hazard area have incomes below the poverty level.
- Of the 52 buildings exposed, 44 are expected to be impacted by a dam failure event, resulting in more than $66 million in damage. This is less than 1 percent of the total value of the risk reporting areas impacted and less than 0.1 percent of the total value of Portland.
- All structures exposed within the West/Northwest area are commercial structures. Structures exposed in the Central City are mixed: 14 residential, 21 commercial, 5 industrial.
- More than 4,056 tons of debris would be expected from the inundation event, which will require approximately 162 truckloads to remove. Most debris will be in the Central City.
- No buildings in the inundation areas are believed to have flood insurance.
- There are 3 critical facilities located in the inundation area.
- Renters and families with incomes below the federal poverty level may disproportionately reside in the inundation areas in the Central City risk reporting area (90 percent and 27 percent, respectively).

The following general issues have been identified:

- It is unclear whether dam failure warning and notification strategies will be viable if dam failure occurs as a result of a significant earthquake that interrupts communication systems.
- Those with access and functional needs may not be able to evacuate if warning time for an event is limited.
- There is the potential for available warnings to be missed or misunderstood as a result of language or other cultural barriers.
- Downstream populations are often not aware that they are located in a dam failure inundation area and do not know the risks associated with probable dam failure.
- Balancing the need to address security concerns and the need to inform the public of the risk associated with dam failure is a challenge for public officials.
- The vast majority of structures located in the dam inundation areas do not have flood insurance.

14. DROUGHT

14.1 GENERAL BACKGROUND

Most regions experience drought conditions periodically. According to the National Drought Mitigation Center, drought originates from a deficiency of precipitation over an extended period of time, usually a season or more. This results in a shortage of water needed to support a specific activity, group, or environmental sector. Drought is the result of a significant decrease in water supply relative to what is "normal" in a given location. Unlike most disasters, droughts normally occur slowly but last a long time. There are four generally accepted operational definitions of drought (National Drought Mitigation Center, 2006):

DEFINITIONS

- **Drought**—The cumulative impacts of several dry years on water users. It can include deficiencies in surface and subsurface water supplies and generally impacts health, well-being, and quality of life.
- **Meteorological Drought**—An abnormally low level of precipitation over a period of time.
- **Agricultural Drought**—When there is not enough soil moisture to support crop needs at a particular time.
- **Hydrological Drought**—Deficiencies in surface and subsurface water supplies.
- **Socioeconomic Drought**—Drought impacts on a population's health, well-being and quality of life.

- **Meteorological drought** is an expression of precipitation's departure from normal over a period of time. Meteorological measurements are the first indicators of drought. Definitions are usually region-specific, and based on an understanding of regional climate. A definition of drought developed in one part of the world may not apply to another, given the wide range of meteorological definitions.
- **Agricultural drought** occurs when there is not enough soil moisture to meet the needs of a particular crop at a particular time. Agricultural drought happens after meteorological drought but before hydrological drought. Agriculture is usually the first economic sector to be affected by drought.
- **Hydrological drought** refers to deficiencies in surface and subsurface water supplies. It is measured as stream flow and as lake, reservoir, and groundwater levels. There is a time lag between lack of rain and less water in streams, rivers, lakes and reservoirs, so hydrological measurements are not the earliest indicators of drought. After precipitation has been reduced or deficient over an extended period of time, this shortage is reflected in declining surface and subsurface water levels. Water supply is controlled not only by precipitation, but also by other factors, including evaporation (which is increased by higher than normal heat and winds), transpiration (the use of water by plants), and human use.
- **Socioeconomic drought** occurs when a physical water shortage starts to affect people, individually and collectively. Most socioeconomic definitions of drought associate it with the supply and demand of an economic good.

Defining when drought begins is a function of the impacts on water users, and includes consideration of the supplies available to local users as well as the stored water available in surface reservoirs or groundwater basins. Different water agencies have different criteria for defining drought. Some issue drought watch or drought warning announcements to their customers. Determinations of regional or

statewide drought conditions are usually based on a combination of hydrologic and water supply factors. The State of Oregon has a statutory definition of drought (Oregon Revised Statute §539.710), described as a potential state emergency when a lack of water resources threatens the availability of essential services and jeopardizes the peace, health, safety, and welfare of the people of Oregon.

14.2 HAZARD PROFILE

Droughts originate from a deficiency of precipitation resulting from an unusual weather pattern. If the weather pattern lasts a short time (a few weeks or a couple months), the drought is considered short-term. If the weather pattern becomes entrenched and the precipitation deficits last for several months or years, the drought is considered to be long-term. It is possible for a region to experience a long-term circulation pattern that produces drought, and to have short-term changes in this long-term pattern that result in short-term wet spells. Likewise, it is possible for a long-term wet circulation pattern to be interrupted by short-term weather spells that result in short-term drought. The El Niño Southern Oscillation (ENSO), a weather phenomenon that occurs every two to seven years in the Pacific Ocean, causes ocean currents and winds to shift while generating warmer water temperatures. During an ENSO phase, the Pacific Northwest can experience hotter winters that reduce snowpack, which leads to drought the following summer (National Drought Mitigation Center, 2016).

14.2.1 Past Events

In the past century, Oregon has experienced a number of droughts, some of the most severe occurring in 1976-77, 1992, and 2001-2002. The most recent droughts in the state occurred in 2005 and 2015 (Oregon Department of Land Conservation and Development, 2015 and Oregon Office of Emergency Management and Oregon Water Resources Department, 2016). NOAA's National Climatic Data Center does not list any drought events impacting the counties the City of Portland resides in (Multnomah, Washington and Clackamas) between 1950 and 2015.

Between 1954 and 2015, Oregon experienced one FEMA-declared drought-related emergency (EM-3039). This was the 1977 event, which has been identified as the worst drought in state history; however, the counties that the City of Portland resides in were not included in the declaration (FEMA, 2016b). The U.S. Secretary of Agriculture (USDA) is authorized to designate counties as disaster areas to make emergency loans to agricultural producers suffering losses due to drought. One-half to two-thirds of the counties in the U.S. have been designated as drought disaster areas in each of the past several years. Between 2012 and 2015, Oregon has been included in 307 USDA drought declarations. Multnomah, Washington and Clackamas counties have been included in seven of these declarations, all of them in 2015—June 10, 2015; July 22, 2015; August 5, 2015, August 12, 2015, August 19, 2015; and September 2, 2015, September 23, 2015 (USDA, 2016).

14.2.2 Location

Drought impacts could occur anywhere in Portland. NOAA has developed several indices to measure drought impacts and severity and to map their extent and locations. Values are reported in these indices by U.S. Climatological Divisions (NOAA, 2016c). These indices change regularly depending on local weather patterns and are snapshots of drought impacts at a specific point in time:

- The ***Palmer Crop Moisture Index*** measures short-term drought on a weekly scale and is used to quantify drought's impacts on agriculture during the growing season. Figure 14-1 shows this index for the week ending July 2, 2016.
- The ***Palmer Z Index*** measures short-term drought on a monthly scale. Figure 14-2 shows this index for June 2015.

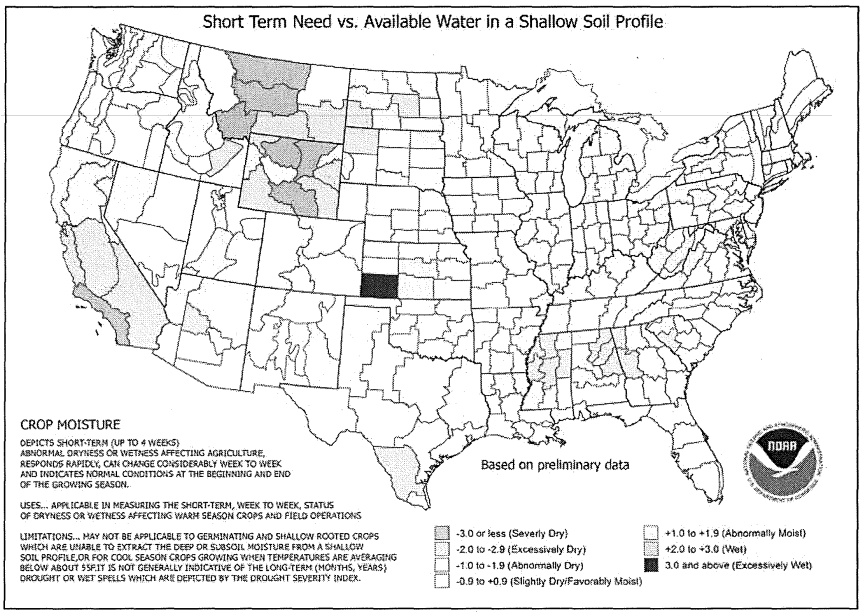


Figure 14-1. Crop Moisture Index for Week Ending July 2, 2016

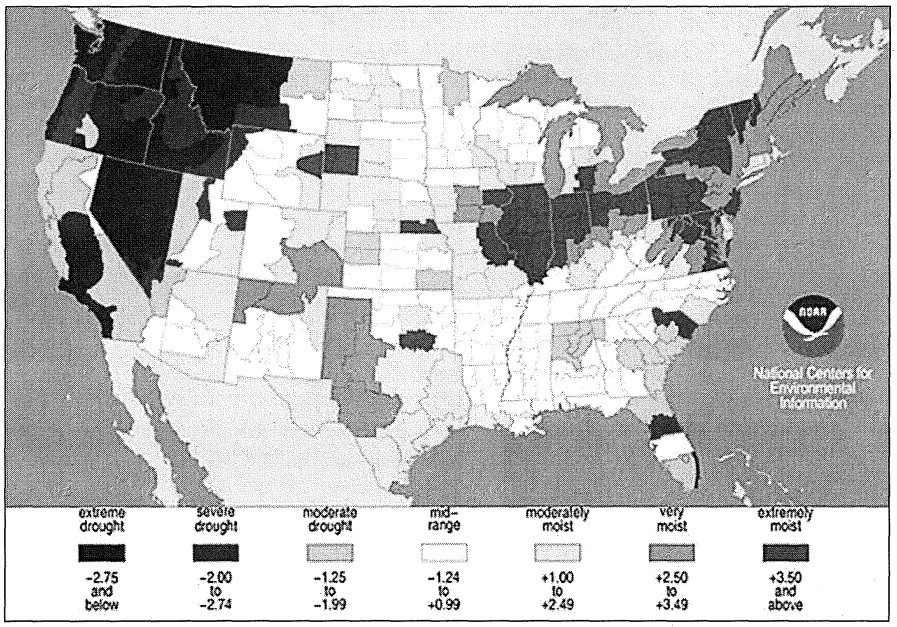

Figure 14-2. Palmer Z Index Short-Term Drought Conditions (June 2015)

- The ***Palmer Drought Index*** measures the duration and intensity of long-term drought-inducing circulation patterns. Long-term drought is cumulative, so the intensity of drought during a given month is dependent on the current weather patterns plus the cumulative patterns of previous months. Weather patterns can change quickly from a long-term drought pattern to a long-term wet pattern, and the Palmer Drought Index can respond fairly rapidly. Figure 14-3 shows this index for June 2015.
- The hydrological impacts of drought (e.g., reservoir levels, groundwater levels, etc.) take longer to develop and it takes longer to recover from them. The ***Palmer Hydrological Drought Index***, another long-term index, was developed to quantify hydrological effects. The Palmer Hydrological Drought Index responds more slowly to changing conditions than the Palmer Drought Index. Figure 14-4 shows this index for August 2015.

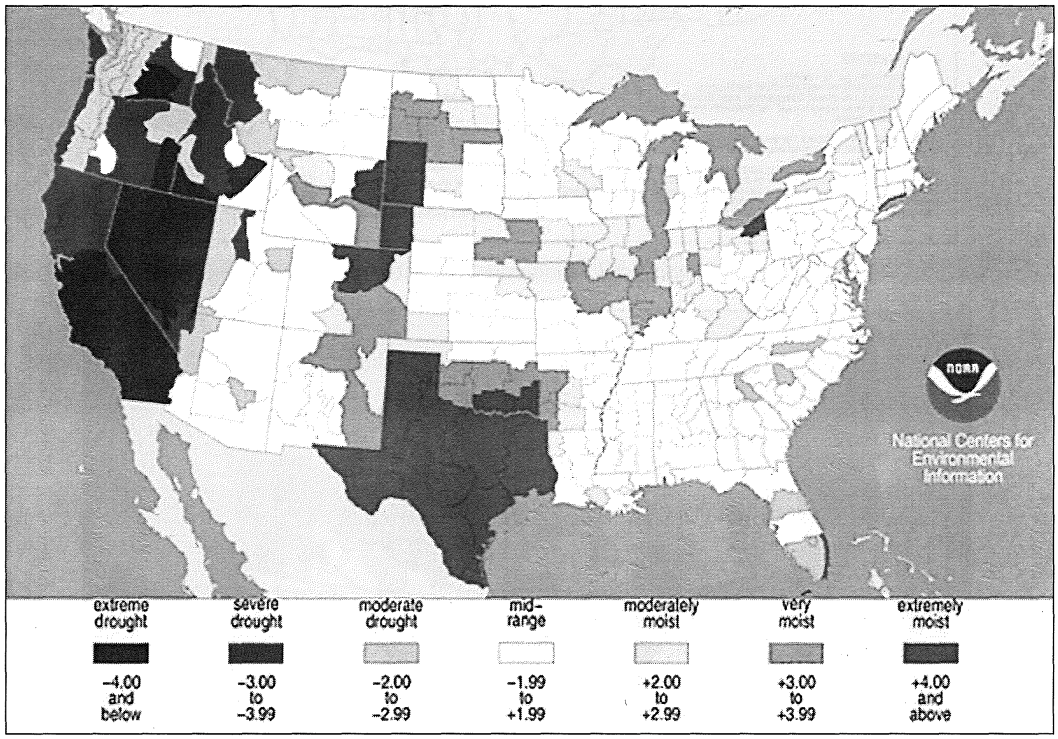

Figure 14-3. Palmer Drought Severity Index (June 2015)

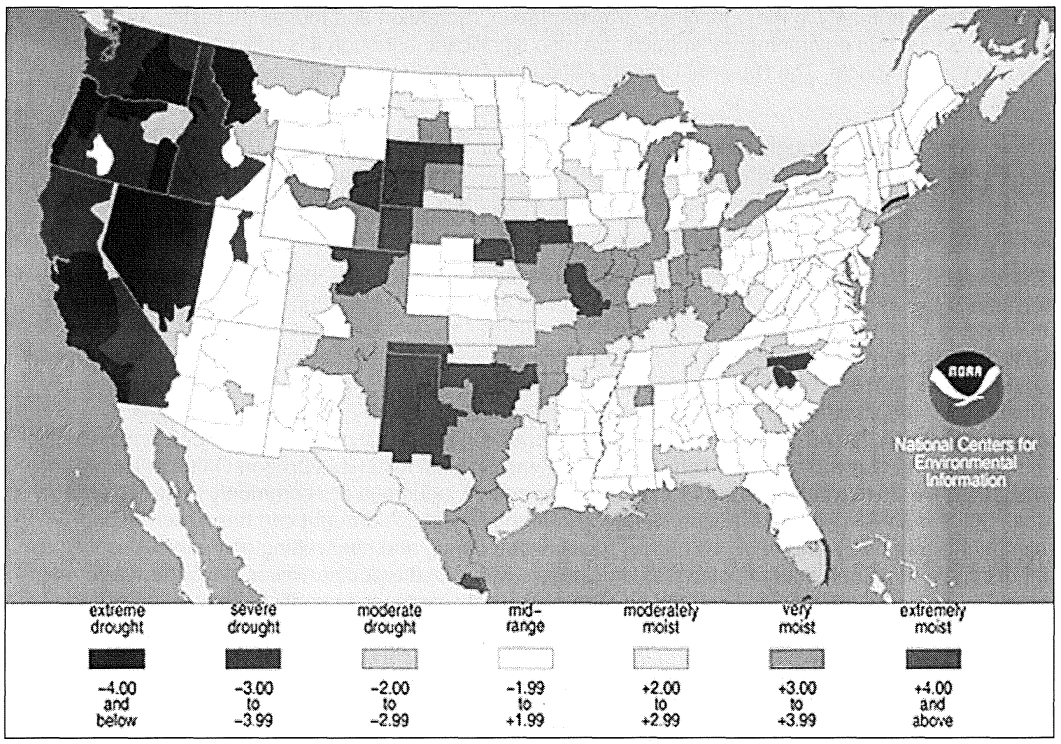

Figure 14-4. Palmer Hydrological Drought Index Long-Term Hydrologic Conditions (August 2015)

14.2.3 Frequency

Historical drought data for the region indicate there have been 7 significant droughts in the last 66 years. This equates to a drought every 9.4 years on average, or a 10.6 percent chance of a drought in any given year. However, severe droughts are uncommon in the Portland metropolitan area. Between 1992 and 2014, there were no Governor-declared droughts in the City of Portland or the surrounding counties (Oregon Department of Land Conservation and Development, 2015).

Drought is a normal, recurrent feature of climate, although many erroneously consider it a rare and random event. It is a temporary condition and differs from aridity because the latter is restricted to low rainfall regions and is a permanent feature of climate. It is rare for drought not to occur somewhere in North America each year. Despite impressive achievements in the science of climatology, estimating drought probability and frequency continues to be difficult. This is because of the many variables that contribute to weather behavior, climate change, and the absence of historic information. Climate change is expected to contribute to increasing drought risk in the future (Department of Land Conservation and Development, 2015).

14.2.4 Severity

Drought can have a widespread impact on the environment and the economy, although it typically does not result in loss of life or damage to property, as do other natural disasters. Nationwide, the impacts of

drought occur primarily in the agriculture, transportation, recreation and tourism, forestry, and energy sectors. Social and environmental impacts are also significant, although it is difficult to put a precise cost on these impacts. The National Drought Mitigation Center uses three categories to describe likely drought impacts:

- Agricultural—Drought threatens crops that rely on natural precipitation.
- Water supply—Drought threatens supplies of water for irrigated crops and for communities.
- Fire hazard—Drought increases the threat of wildfires from dry conditions in forest and rangelands.

The severity of a drought depends on the degree of moisture deficiency, the duration, and the size and location of the affected area. The longer the duration of the drought and the larger the area impacted, the more severe the potential impacts. From 1980 to 2015 there have been 23 drought events in the United States with losses exceeding $1 billion. Of these 23 events, the State of Oregon was impacted by 11 (NOAA, 2016a). When measuring the severity of droughts, analysts typically look at economic impacts. All people could pay more for water if utilities increase their rates due to shortages. Agricultural impacts can result in loss of work for farm workers and those in related food processing jobs, as well as Native American Tribes which depend on local fisheries (Oregon Office of Emergency Management, 2015). Other water- or electricity-dependent industries are commonly forced to shut down all or a portion of their facilities, resulting in further layoffs. A drought can harm recreational companies that use water (e.g., swimming pools, water parks, and river rafting companies) as well as landscape and plant nursery businesses. In Oregon, where hydroelectric power plants generate nearly over 70 percent of the electricity produced, drought also threatens the supply of electricity, with the potential to affect the cost of power (U.S. Energy Information Administration, 2016).

Drought generally does not affect groundwater sources as quickly as surface water supplies, but groundwater supplies generally take longer to recover. Reduced precipitation during a drought means that groundwater supplies are not replenished at a normal rate. This can lead to a reduction in groundwater levels and problems such as reduced pumping capacity or wells going dry. Shallow wells are more susceptible than deep wells. Reduced replenishment of groundwater affects streams. Much of the flow in streams comes from groundwater, especially during the summer when there is less precipitation and after snowmelt ends. Reduced groundwater levels mean that even less water will enter streams when stream flows are lowest.

14.2.5 Warning Time

Scientists at this time do not know how to predict drought more than a month in advance for most locations. Predicting drought depends on the ability to forecast precipitation and temperature. Anomalies of precipitation and temperature may last from several months to several decades. How long they last depends on interactions between the atmosphere and the oceans, soil moisture and land surface processes, topography, internal dynamics, and the accumulated influence of weather systems on the global scale.

Because drought conditions in Oregon are often related to deficiencies in snowpack accumulation, some warning is available through monitoring snowpack accumulation through the winter. The U.S. Natural Resources Conservation Service's snow survey and water supply forecasting program conducts snow surveys to develop accurate and reliable water supply forecasts (USDA, 2014). The system, called SNOTEL (short for Snow Telemetry) provides information for local governments, water consumers and providers and the general public on snowpack conditions that may impact water resources in future months. When snowpack levels are below average, communities may make

changes to their water management programs and practices to reduce impacts from a possible future drought.

NOAA's National Integrated Drought Information System (NIDIS) launched a Drought Early Warning System (DEWS) for the Pacific Northwest in February of 2016. DEWS draws upon new and existing federal, tribal, state, local and academic partner networks to make climate and drought science readily available, easily understandable and usable for decision makers. The system improves stakeholders' abilities to monitor, forecast, plan for and cope with the impacts of drought (NIDIS, 2016).

14.3 COMPOUNDING FACTORS AND SECONDARY HAZARDS

14.3.1 Overview

The secondary hazard most commonly associated with drought is wildfire. A prolonged lack of precipitation dries out vegetation, which becomes increasingly susceptible to ignition as the duration of the drought extends. Millions of board feet of timber have been lost, and in many cases erosion occurred, which caused serious damage to aquatic life, irrigation, and power production by heavy silting of streams, reservoirs, and rivers.

Drought also is often accompanied by extreme heat, exposing people to the risk of sunstroke, heat cramps and heat exhaustion. Pets and livestock are also vulnerable to heat-related injuries. Crops can be vulnerable as well.

Environmental losses are the result of damage to plants, animals, wildlife habitat, and air and water quality; forest and range fires; degradation of landscape quality; loss of biodiversity; and soil erosion. Some of the effects are short-term and conditions quickly return to normal following the end of the drought. Other environmental effects linger for some time or may even become permanent. Wildlife habitat, for example, may be degraded through the loss of wetlands, lakes, and vegetation. However, many species will eventually recover from this temporary aberration. The degradation of landscape quality, including increased soil erosion, may lead to a more permanent loss of biological productivity.

14.3.2 Climate Change

Global water resources are already experiencing the following stresses without climate change:

- Growing populations
- Increased competition for available water
- Poor water quality
- Environmental claims
- Uncertain reserved water rights
- Groundwater overdraft
- Aging urban water infrastructure

With a warmer climate, droughts could become more frequent, more severe, and longer-lasting. According to the National Climate Assessment, "higher surface temperatures brought about by global warming increase the potential for drought. Evaporation and the rate at which plants lose moisture through their leaves both increase with temperature. Unless higher evapotranspiration rates are matched by increases in precipitation, environments will tend to dry, promoting drought conditions (Globalchange.gov, 2014).

Portland's drinking water supply is a rain-, rather than a snow-fed system. This means that increases in temperatures may have less of an impact on water supply in Portland than in other areas in the American west. By addressing current stresses on water supplies and by building a flexible, robust program, the City will be able to more adeptly respond to changing conditions and to survive dry years.

14.4 EXPOSURE

All people, property and environments in Portland would be exposed to some degree to the impacts of moderate to extreme drought conditions.

14.5 VULNERABILITY

Drought produces a complex web of impacts that spans many sectors of the economy and reaches well beyond the area experiencing physical drought. This complexity exists because water is integral to the ability to produce goods and provide services. Drought can affect a wide range of economic, environmental and social activities. The vulnerability of an activity to the effects of drought usually depends on its water demand, how the demand is met, and what water supplies are available to meet the demand.

The 2016 Drought Annex to the State of Oregon Emergency Operations Plan defines counties as being vulnerable to drought if a "severe and continuing drought" is in progress or likely to exist. This determination is made by the Water Supply Availability Committee, which is made up of several state and federal agencies, and evaluates drought status and vulnerability based on these indicators:

- Snowpack
- Precipitation
- Temperature Anomalies
- Long range temperature outlook
- Storage in key reservoirs
- Long range precipitation outlook
- Current stream flows and behavior
- Spring and summer streamflow forecasts
- Ocean surface temperature anomalies
- Soil and fuel moisture conditions
- NRCS Surface Water Supply Index.

This information is supplied to the Drought Readiness Council, which is an advisory body of state agencies involved with natural resources management, public health and emergency services. This council assesses how drought conditions may affect the vulnerability of various sectors across the state and makes recommendations to the Governor regarding the need for drought declarations (Oregon Office of Emergency Management and Oregon Water Resources Department, 2016).

The City of Portland and the counties it resides in, Multnomah, Washington and Clackamas, were not among the 25 counties that were in a state of drought declared by the Governor in 2015, one of the most recent severe droughts on record. Based on a review of Governor drought declarations since 1992, the City of Portland could be considered less vulnerable to drought impacts than many other parts of the state (Oregon Department of Land Conservation and Development, 2015).

14.5.1 Population

The City of Portland has the ability to minimize any impacts on residents and water consumers should several consecutive dry years occur. The nature of the Bull Run Watershed as a rain-fed source, as well as a supplemental aquifer-fed water source in the Columbia South Shore Wellfield, ensures that Portland residents will continue to have sufficient water even during dry years. No significant direct life or health impacts are anticipated as a result of drought in Portland.

14.5.2 Property

No structures will be directly affected by drought conditions, though some structures may become vulnerable to wildfires, which are more likely following years of drought. Droughts can also have significant impacts on landscapes, which could cause a financial burden to property owners. However, these impacts are not considered critical in planning for impacts from the drought hazard.

14.5.3 Critical Facilities

Critical facilities as defined for this plan will continue to be operational during a drought. Critical facility elements such as landscaping may not be maintained due to limited resources, but the risk to Portland's critical facilities inventory will be largely aesthetic. For example, when water conservation measures are in place, landscaped areas will not be watered and may die. These aesthetic impacts are not considered significant.

14.5.4 Environment

Environmental losses from drought are associated with damage to plants, animals, wildlife habitat, and air and water quality; forest and range fires; degradation of landscape quality; loss of biodiversity; and soil erosion. Some of the effects are short-term and conditions quickly return to normal following the end of the drought. Other environmental effects linger for some time or may even become permanent. Wildlife habitat, for example, may be degraded through the loss of wetlands, lakes and vegetation. However, many species will eventually recover from this temporary aberration. The degradation of landscape quality, including increased soil erosion, may lead to a more permanent loss of biological productivity. Although environmental losses are difficult to quantify, growing public awareness and concern for environmental quality has forced public officials to focus greater attention and resources on these effects.

14.5.5 Economic Impact

The economic impact of drought is largely associated with industries that use water or depend on water for their business. For example, landscaping businesses are affected as the demand for their service significantly declines because landscaping is not being watered. Livestock owners experience increased expenses for watering their herds. Agricultural industries are impacted if water usage is restricted for irrigation. Drought can lead to a reduction in power-generating capacity in hydroelectric-dominated systems, such as those found in Oregon. Reductions in capacity can lead to interruptions in the power supply that may have economic impacts in the region. Lloyd's City Risk Index estimates that a drought in the City of Portland could cause up to $540 million of lost gross domestic product annually.

14.6 FUTURE TRENDS IN DEVELOPMENT

The City of Portland has an established comprehensive plan that includes policies directing land use and dealing with issues of water supply and the protection of water resources. The plan works to

increase resilience and manage risk through a variety of policies including promoting the resilience of natural systems, including their ability to withstand drought, and through infrastructure investments that create redundancy in the water supply (City of Portland, 2016). This plan provides the capability at the local level to protect future development from the impacts of drought. Additionally, the City has identified an action to continue to address the potential drought related climate change impacts to the City's primary water supply, the Bull Run watershed.

14.7 SCENARIO

An extreme multiyear drought more intense than the 1977 drought could impact the region with little warning. Combinations of low precipitation and unusually high temperatures could occur over several consecutive years. Intensified by such conditions, extreme wildfires could break out in or near Portland, increasing the need for water. If such conditions persisted for several years, the economy of the City of Portland could experience setbacks, especially in water dependent industries.

14.8 ISSUES

The following drought-related issues have been identified in the course of the planning process:

- The need for the identification and development of alternative water supplies, especially in relation to the potential secondary impacts to water supply form drought-induced wildfire.
- There are no quantitative estimates for general building stock impacts for the drought hazard.
- Water resource management strategies have changed significantly over the last several decades. Managers must now consider the needs of communities, industries, power-generating facilities and the environment. Issues associated with meeting the needs of these competing demands with limited resources will likely increase as population growth continues and the impacts of climate change intensify.
- The use and promotion of water-saving and reclamation technologies even during non-drought periods may decrease the effects of drought in Portland.
- Promotion of native and drought-resistant landscaping should continue.
- Predicting droughts can be challenging, although warning systems are currently under development.
- Changes in the timing, frequency and duration of precipitation events may present challenges for current water storage and management practices in the region. Climate change may also increase the frequency and duration of meteorological drought conditions.

15. SPACE WEATHER

15.1 HAZARD PROFILE

Space weather is identified in this plan as an emerging hazard of concern; therefore, a detailed risk assessment of the hazard was not conducted. Additional information pertaining to risk from the space weather hazard will be monitored over the performance period of the plan; the potential for conducting a detailed risk assessment will be evaluated at the next plan update.

15.1.1 Background Information

According to NOAA's Space Weather Prediction Center, space weather refers to variations in the space environment between the sun and Earth. It includes phenomena that impact systems and technologies in orbit and on Earth. Figure 15-1 shows potential space weather related phenomena.

Source: NOAA and NWS Space Weather Prediction Center

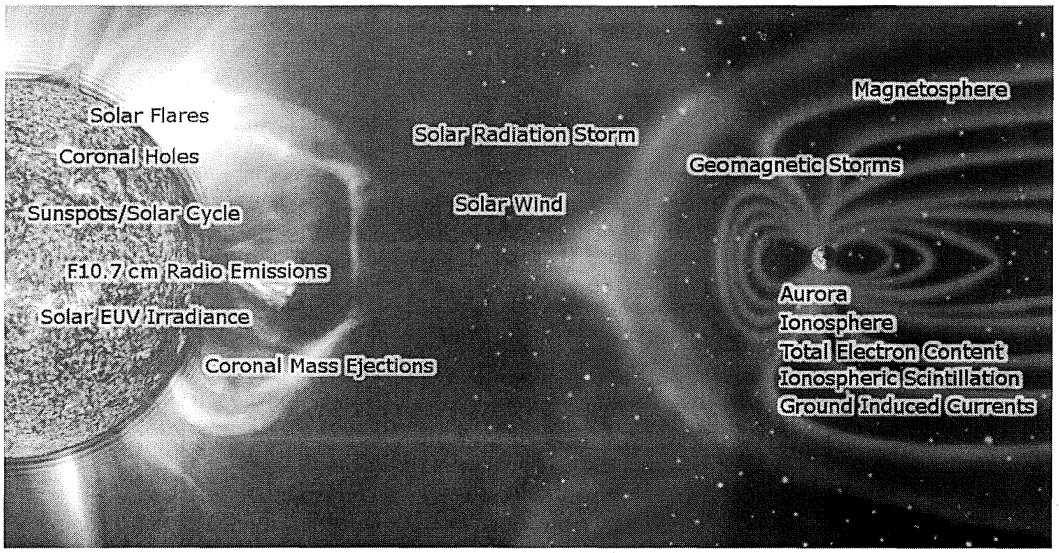

Figure 15-1. Space Weather Phenomena

Most space weather events start as bursts of plasma on the sun called coronal mass ejections. A coronal mass ejection event passes through the sun's corona and into the solar wind. When it reaches Earth, it energizes the magnetosphere and accelerates electrons and protons down to Earth's magnetic field lines, where they collide with the atmosphere and ionosphere, particularly at high latitudes. Different types of space weather can affect different technologies on Earth (NOAA, 2016d):

- During events known as radio blackout storms, solar flares can produce strong bursts of radiation that degrade or block high-frequency radio waves used for radio communication. Solar radiation from these flares also poses risks to passengers and crew of commercial aircraft flying in polar regions during the storm.
- Solar energetic particles can penetrate satellite electronics and cause electrical failure. These particles also block radio communications at high latitudes during solar radiation storms.
- Coronal mass ejections can cause geomagnetic storms on Earth and induce extra currents in the ground that can degrade power grid operations. Geomagnetic storms can also modify the signal from radio navigation systems, causing degraded accuracy.
- Induced current from geomagnetic storms can accelerate corrosion in long pipelines. Most pipelines have corrosion-control systems to prevent this, but not all.

15.1.2 Past Events

The strongest geomagnetic storm on record is the Carrington Event that occurred in September 1859. This storm caused telegraph lines to electrify, in some cases shocking technicians and setting telegraph paper on fire. The aurora generated by the magnetic effects could be seen as far south as Hawaii and Cuba (FEMA, 2016d).

More recent events include a space weather storm on March 13, 1989 that disrupted the hydroelectric power grid in Quebec, Canada. This system-wide outage lasted for 9 hours and left 6 million people without power. In October 2003, space weather cause a simultaneous shutdown of satellites and air traffic precision navigation for several hours. In early December of 2006, geomagnetic storms and solar flare activity disabled Global Positioning System (GPS) signal acquisition over the United States (SDR, 2010).

15.1.3 Warning Time

Space weather prediction services in the United States are provided primarily by the Space Weather Prediction Center and the U.S. Air Force's Weather Agency. The Space Weather Prediction Center draws on a variety of data sources, both space- and ground-based, to provide forecasts, watches, warnings, alerts, and summaries to civilian and commercial users (FEMA, 2016d).

15.2 EXPOSURE

There is no clearly defined extent of space weather exposure. All of Portland is potentially exposed to the direct and indirect impacts of space weather.

15.3 VULNERABILITY

15.3.1 Population

The potential impacts of space weather on human health on Earth are not well known. There are many theories about human health impacts from space weather associated with the disruption of electrical pulses within the body. There have not been enough significant occurrences of space weather events to confirm these theories. If they are accurate, then all populations in the City of Portland would be vulnerable to space weather events.

Power outages induced by space weather can be life-threatening to those dependent on electricity for life support.

15.3.2 Property

All property in the City of Portland would be vulnerable to indirect impacts associated with loss of power triggered by space weather events. The potential impacts from electromagnetic pulses from space weather events on power grids is generally accepted by experts in this field, but has not been widely studied, due to the infrequency of space weather events. Direct structural damage resulting from space weather is not likely.

15.3.3 Environment

Cosmic rays are high energy particles reaching Earth from sources outside our solar system. There is a theory that cosmic rays can create nucleation sites in the atmosphere, which seed cloud formation and create cloudier conditions. If this is true, then there would be a significant impact on climate. During the portion of the sun's 11-year solar cycle called "solar minimum," cosmic rays are at a maximum. Therefore, the duration of solar minimum may have an impact on Earth's climate. (NOAA, 2016d).

15.3.4 Economy

The economic consequences resulting from a citywide power outage caused by space weather would be severe and long-lasting. Without a stable electrical grid, every sector of Portland's economy would be impacted. Lloyd's City Risk Index estimates a solar storm could cause up to $250 million of lost gross domestic product annually (Lloyd's, 2015).

15.4 ISSUES

The October 2015 National Space Weather Action Plan developed by the National Science and Technology Council includes a goal of improving space-weather services by advancing understanding and forecasting. The objectives associated with this goal are as follows:

- Improve understanding of user needs for space-weather forecasting to establish lead-time and accuracy goals.
- Ensure that space-weather products are intelligible and actionable to inform decision-making.
- Establish and sustain a baseline observational capability for space-weather operations.
- Improve forecasting lead-time and accuracy.
- Enhance fundamental understanding of space weather and its drivers to develop and continually improve predictive models.
- Improve effectiveness and timeliness of the process that transitions research to operations.

It should be noted that these actions and challenges associated with space weather are for the most part, outside the control of the City of Portland and its leaders. The most important issue regarding space weather in Portland is the potential for disruption to the electrical systems resulting in cascading impacts on people and property. Additional issues include potential impacts on GPS systems, satellite operations and aviation.

16. RISK RANKING

A risk ranking was performed for the hazards of concern described in this plan for the City of Portland as a whole and for each risk reporting area. These risk rankings assess the probability of each hazard's occurrence as well as its likely impact on the people, property, and economy of Portland:

- The probability of occurrence of a hazard is indicated by a probability factor based on likelihood of annual occurrence.
- Hazard impacts were assessed in three categories: impacts on people, impacts on property and impacts on the local economy:
  - **People**—Values were assigned based on the percentage of the total ***population exposed*** to the hazard event.
  - **Property**—Values were assigned based on the percentage of the total ***property value vulnerable*** to the hazard event.
  - **Economy**—Values were assigned based on the percent of ***critical facilities exposed*** to a hazard in Portland.

The impacts of each hazard category were assigned a weighting factor to reflect the significance of the impact. These weighting factors are consistent with those typically used for measuring the benefits of hazard mitigation actions: impact on people was given a weighting factor of 3; impact on property was given a weighting factor of 2; and impact on the economy was given a weighting factor of 1. Table 16-1, Table 16-2 and Table 16-3 summarize the impacts for each hazard.

Table 16-1. Impact on People from Hazards

Hazard Event	Impact (high, medium, low)	Impact Factor	Multiplied by Weighting Factor (3)
Dam Failure[a]	Medium (2.0%)	2	2 x 3 = 6
Drought[b]	None (0%)	0	0 x 3 = 0
Earthquake	High (100%)	3	3 x 3 = 9
Flood[c]	Low (1.6%)	1	1 x 3 = 3
Landslide	Medium (14.5%)	2	2 x 3 = 6
Severe weather	High (100%)	3	3 x 3 = 9
Volcanic Activity[d]	Medium (estimated)	2	2 x 3 = 6
Wildfire	Medium (11.1%)	2	2 x 3 = 6

a. The Mt. Tabor Reservoirs 5 and 6 scenario is used for risk ranking.
b. The occurrence of a drought event rarely causes direct injury or death.
c. 1 percent annual chance flood event is used for risk ranking
d. Although the entire population is potentially exposed to ash fall, death or injury is unlikely unless an underlying condition is exasperated.

Table 16-2. Impact on Property from Hazards

Hazard Event	Impact (high, medium, low)	Impact Factor	Multiplied by Weighting Factor (2)
Dam Failure[a]	Low (less than 1%)	1	1 x 2 = 2
Drought[b]	Low (estimated)	1	1 x 2 = 2
Earthquake[c]	Medium (4.3%)	2	2 x 2 = 4
Flood[d]	Medium (less than 1%)	1	1 x 2 = 2
Landslide[e]	Low (estimated)	2	2 x 2 = 4
Severe weather[f]	Low (estimated)	1	1 x 2 = 2
Volcanic activity[g]	Low (estimated)	1	1 x 2 = 2
Wildfire	Low (estimated)	1	1 x 2 = 2

a. Mt. Tabor Reservoirs 5 and 6 scenario is used for risk ranking.
b. The occurrence of a drought event rarely causes structural damage.
c. Cascadia M9.0 scenario is used for risk ranking. Estimates were moved to medium due to an increase in severity resulting from more than 1 minute of shaking.
d. Impacts are assigned as medium due to unmapped urban drainage issues.
e. 12.1% of property is exposed, but landslides are unlikely to occur simultaneously as a standalone hazard.
f. Although all property is exposed, it is unlikely that more than 5 percent would be damaged.
g. 9.5% of property is exposed, but is unlikely that all property would be lost in any one event.

Table 16-3. Impact on Economy from Hazards

Hazard Event	Impact (high, medium, low)	Impact Factor	Multiplied by Weighting Factor (1)
Dam Failure[a]	Low (less than 1 percent)	1	1 x 1 = 1
Drought[b]	Low (estimated)	1	1 x 1 = 1
Earthquake[c]	High (100 percent)	3	3 x 1 = 3
Flood[d]	Low (5.0%)	1	1 x 1 = 1
Landslide[e]	Low (estimated)	1	1 x 1 = 1
Severe weather[f]	Medium (estimated)	2	2 x 1 = 2
Volcanic Activity[g]	Medium (5.6% + 100%)	2	2 x 1 = 2
Wildfire	Low (9.7%)	1	1 x 1 = 1

a. Mt. Tabor Reservoirs 5 and 6 scenario is used for risk ranking.
b. The occurrence of a drought event rarely causes large economic impacts in urbanized areas.
c. Cascadia M9.0 scenario is used for risk ranking
d. 1 percent annual chance flood event is used for risk ranking
e. 12% of facilities are exposed, but landslides are unlikely to occur simultaneously as a standalone hazard.
f. All facilities are exposed, but it is unlikely that more than 25 percent would be damaged. Economic impacts would occur as a result of transportation disruptions.
g. 9.7% of facilities are exposed, but is unlikely that all those exposed would impacted in any one event.

16.1 PROBABILITY OF OCCURRENCE

The probability of occurrence of a hazard is indicated by a probability factor based on likelihood of annual occurrence:

- High—Hazard event is likely to occur within 25 years (Probability Factor = 3)
- Medium—Hazard event is likely to occur within 100 years (Probability Factor =2)
- Low—Hazard event is not likely to occur within 100 years (Probability Factor =1)
- No exposure—There is no probability of occurrence (Probability Factor = 0)

The assessment of hazard frequency is generally based on past hazard events in the area, although the likelihood of future events has been taken into consideration in this assessment. Table 16-4 summarizes the probability assessment for each hazard of concern for this plan.

Table 16-4. Probability of Hazards

Hazard Event	Probability (high, medium, low)	Probability Factor
Dam Failure	Low	1
Drought	High	3
Earthquake[a]	Medium	2
Flood[b]	High	3
Landslide	High	3
Severe weather	High	3
Volcanic Activity	Low	1
Wildfire	High	3

a. Cascadia M9.0 scenario is used for risk ranking
b. 1 percent annual chance flood event is used for risk ranking

16.2 IMPACT

Hazard impacts were assessed in three categories: impacts on people, impacts on property and impacts on the local economy. Numerical impact factors were assigned as follows:

- **People**—Values were assigned based on the percentage of the total ***population exposed*** to the hazard event. Impact factors were assigned as follows:
  - High—25 percent or more of the population is exposed to a hazard (Impact Factor = 3)
  - Medium—10 percent to 25 percent of the population is exposed to a hazard (Impact Factor = 2)
  - Low—10 percent or less of the population is exposed to the hazard (Impact Factor = 1)
  - No impact—None of the population is exposed to a hazard (Impact Factor = 0)
- **Property**— Values were assigned based on the percentage of the total ***property value vulnerable*** to the hazard event. Impact factors were assigned as follows:
  - High—Estimated loss from the hazard is 10 percent or more of the total replacement value (Impact Factor = 3)
  - Medium—Estimated loss from the hazard is 5 percent to 10 percent of the total replacement value (Impact Factor = 2)
  - Low—Estimated loss from the hazard is 5 percent or less of the total replacement value (Impact Factor = 1)
  - No impact—No loss is estimated from the hazard (Impact Factor = 0)
- **Economy**—Values were assigned based on ***critical facility exposure*** for critical facilitates and infrastructure on Portland. Impact factors were assigned as follows:
  - High—25 percent or more of total facilities are exposed (Impact Factor = 3)
  - Medium—Between 10 and 25 percent of facilities are exposed (Impact Factor = 2)
  - Low—Less than 10 percent of facilities are exposed (Impact Factor = 1)
  - No Impact—No critical facilities are exposed to the hazard (Impact Factor = 0)

16.3 RISK RATING AND RANKING

The risk rating for each hazard was determined by multiplying the probability factor by the sum of the weighted impact factors for people, property and economy, as summarized in Table 16-5. Based on these ratings, a priority of high, medium or low was assigned to each hazard. City-wide the hazards ranked as being of highest concern are severe weather and earthquake. Hazards ranked as being of medium concern are flood, landslide and wildfire. The hazards ranked as being of lowest concern are volcanic activity, dam failure and drought. Table 16-6 shows the hazard risk ranking for the City of Portland. A similar ranking process was performed for each reporting area; the results from those efforts are summarized in Table 16-7 and Table 16-8.

Table 16-5. Hazard Risk Rating

Hazard Event	Probability Factor	Sum of Weighted Impact Factors	Total (Probability x Impact)
Dam Failure	1	6 +2+1 = 9	9
Drought	3	0+2+1 = 3	9
Earthquake	2	9+4+3 = 16	32
Flood	3	3+4+1 = 8	24
Landslide	3	6+2+1 = 9	27
Severe weather	3	9+2+2 = 13	39
Volcanic activity	1	6+2+2 = 10	10
Wildfire	3	6+2+1 = 9	27

Table 16-6. Hazard Risk Ranking

Hazard Ranking	Hazard Event	Category
1	Severe weather	High
2	Earthquake	High
3	Landslide	Medium
3	Wildfire	Medium
4	Flood	Medium
5	Volcanic activity	Low
6	Dam Failure	Low
7	Drought	Low

Table 16-7. Hazard Risk Rankings by Reporting Area

PART 3—MITIGATION STRATEGY

17. VISION, MISSION, GOALS AND OBJECTIVES

Hazard mitigation plans must identify goals for reducing long-term vulnerabilities to identified hazards (44 CFR Section 201.6(c)(3)(i)). The Steering Committee established a vision, a mission, goals and objectives for this plan, based on a review of the 2010 NHMP goals, the State of Oregon Hazard Mitigation Plan goals, and other locally relevant community plans and programs, such as the Portland Comprehensive Plan. Following this review, the 2010 NHMP goals were updated to most accurately reflect current community needs and values and changing community priorities (see Appendix H for 2004 and 2010 goals).

A working draft of the vision, mission, goals and objectives was established through facilitated exercises and group discussion. Figure 17-1 shows the most commonly used terms in steering committee member comments on the vision and mission development process (words shown in larger fonts were mentioned more frequently).

Figure 17-1. Vision and Mission Development Word Cloud

The goals and objectives continued to be revised throughout the plant update process based on the results of the risk assessment and feedback received during the public engagement process. The vision, mission, goals and objectives selected for this plan and presented below, along with the actions

outlined in Chapter 19, all support each other. Goals were selected to support the vision and mission. Objectives were selected that meet multiple goals. Actions were prioritized based the number of objectives each would help to accomplish.

17.1 VISION

Vision is defined in this planning process as the City of Portland's desired future state. *The Mitigation Action Plan* was designed to support and inform the comprehensive plan, which is the implementing document for the Portland Plan. Therefore, it was determined that the vision for the MAP should align with the overall community vision for Portland, as follows:

> Portland is a prosperous, healthy, equitable and resilient city where everyone has access to opportunity and is engaged in shaping decisions that affect their lives (City of Portland 2035 Comprehensive Plan).

17.2 MISSION

The mission for the MAP defines what the plan aims to achieve and how:

> To equitably reduce risk and the adverse impacts of natural hazards by building community resilience through collaborative, cost-effective actions and strategies.

17.3 GOALS

The following goals were selected as general guidelines for the MAP that explain what the plan should achieve:

- Protect life and reduce injuries.
- Engage and build capacity for the whole community.
- Minimize public and private property damage.
- Protect, restore, and sustain natural systems.
- Minimize the disruption of essential infrastructure and services.
- Integrate mitigation strategies into existing plans and programs.
- Prioritize multi-objective actions that reduce risk to vulnerable communities.

17.4 OBJECTIVES

Objectives for this planning process are broader than actions but more specific than goals—specific enough to help determine whether a proposed project or program would advance the values expressed in the mission and vision. Objectives were used to define and prioritize actions. They also may be thought of as policies. Each objective meets multiple goals, serving as a stand-alone measurement of the effectiveness of a mitigation action, rather than as a subset of a goal.

Table 17-1 shows the objectives for the MAP and the goals that each objective supports. Some objectives were taken from or adapted from other local programs, and the source of those objectives is provided in parentheses after the description of the objective.

Table 17-1. 2016 Mitigation Action Plan Objectives

	Objective	Related Goals						
		Life	Whole Community	Property	Natural Systems	Infrastructure	Integrate	Prioritize
1	Strengthen development codes and update land use designations to facilitate effective disaster risk reduction (Adapted from Portland Comprehensive Plan 4.78)	✓		✓	✓		✓	
2	Prevent or reduce mitigation-related disparities affecting under-served and under-represented communities through plans, investments and engagement (Adapted from Portland Comprehensive Plan 7.2)	✓	✓	✓		✓	✓	✓
3	Promote the use of natural systems to limit natural hazard related impacts (Adapted from Portland Comprehensive Plan 7.4b)				✓		✓	
4	Increase the resilience of high-risk and critical infrastructure through monitoring, planning, maintenance, investment, adaptive technology, and continuity planning (Portland Comprehensive Plan 8.25)	✓		✓		✓	✓	
5	Coordinate land use plans and public facility investments between City bureaus, other public and jurisdictional agencies, businesses, community partners, and other emergency response providers (Adapted from Portland Comprehensive Plan 8.99)		✓	✓		✓	✓	
6	Support community outreach activities that increase stakeholder awareness and understanding of hazard risk, mitigation options, and preparedness strategies (Adapted from Multnomah County NHMP O1.2)	✓	✓	✓	✓			
7	Identify and seek various funding opportunities for mitigation activities and look for ways to leverage existing funds (Adapted from Multnomah County NHMP O1.5)	✓		✓		✓	✓	
8	Seek opportunities in which hazard mitigation also benefits other community goals (Adapted from Multnomah County NHMP O3.4)	✓	✓	✓	✓	✓	✓	✓
9	Collect data to track progress on meeting mitigation goals.	✓	✓	✓	✓	✓	✓	✓
10	Use the best available data, science and technologies to improve understanding of the location and potential impacts of natural hazards, the vulnerability of building types and community development patterns, and the measures needed to protect life safety.	✓		✓	✓			

Objective		Related Goals						
		Life	Whole Community	Property	Natural Systems	Infrastructure	Integrate	Prioritize
11	Retrofit, purchase, or relocate structures in high hazard areas, especially those known to be repetitively damaged.	✓		✓		✓		
12	Promote, incentivize and support the mitigation of private property.	✓	✓	✓				✓
13	Improve systems that provide warning and emergency communications.	✓	✓		✓	✓		
14	Promote mutual information exchange and incorporate existing community networks in the identification and implementation of mitigation actions.		✓				✓	
15	Build City staff and community capacity to ensure effective implementation and equitable outcomes of mitigation action efforts (Adapted from Portland 2015 Climate Action Plan)		✓				✓	
16	Develop plans to reduce immediate impacts of natural hazard events, and to facilitate rapid and effective social and economic recovery.	✓	✓	✓			✓	
TOTAL		12	11	12	7	8	11	4

Note: Objectives are numbered for reference, not to indicate priority.

18. MITIGATION ALTERNATIVES

Risk is a function of the hazard, the level of exposure, the level of vulnerability, and the available capability to respond to or prepare for hazard events. Risk can be mitigated by manipulating the hazard, reducing exposure to the hazard, reducing vulnerability, or increasing capability. Where mitigation is not yet possible, risk can be reduced through preparation, response or recovery.

Over the course of the MAP planning process, catalogs of mitigation alternatives were developed (in compliance with 44 CFR (Section 201.6(c)(3)(ii))) from best practices, steering committee recommendations, and stakeholder input. One catalog was developed for each hazard of concern, as well as a catalog for actions that would mitigate all hazards. The catalogs present alternatives that are categorized in two ways:

- By who would have responsibility for implementation:
    - Individuals (public scale)
    - Businesses (private scale)
    - Government (government scale).
- By what the alternative would do:
    - Manipulate the hazard
    - Reduce exposure to the hazard
    - Reduce vulnerability to the hazard
    - Increase the ability to respond to or be prepared for the hazard.

The steering committee brainstormed mitigation actions to be included in these catalogs, voted to identify top-rated actions, and then developed a list of recommended actions. The list of top-rated actions is available in Appendix I, along with the full list of mitigation actions for all hazards.

These catalogs are not exhaustive. Their purpose was to provide a list of what could be considered to reduce risk to hazards within Portland. The City of Portland, in collaboration with stakeholders, reviewed the catalogs to identify ways to apply the actions they contain for specific needs and situations. The catalogs provide a baseline of mitigation alternatives that are backed by a planning process, are consistent with the established goals and objectives, and are likely within the capabilities of the City of Portland to implement. Actions in the catalog that are not included in the City's action plan were not selected for one or more of the following reasons:

- The action is not currently feasible.
- The action is already being implemented.
- There is an apparently more cost-effective alternative.
- The action does not have public or political support.
- The action is not within the capabilities of the City.
- The potential for equitable impacts cannot be assessed at this time.

19. Action Plan and Implementation

19.1 Bureau Action Selection Workshop

On May 11, 2016 a workshop was held to provide guidance to City bureaus on selecting the mitigation actions to be included in *The Mitigation Action Plan*. This workshop was attended by 28 staff members from 11 City bureaus or offices. At the workshop, the planning team reviewed and discussed the following:

- The planning process
- The concept of mitigation
- The tool kit assembled by the planning team for use in action selection
- The instructions for completing relevant implementation information for each identified action.

Each bureau participating in development of the MAP was provided with a set of expectations (see Appendix J) and asked to do the following:

- Complete a letter of intent (provided with the set of expectations)
- Designate points of contact
- Attend bureau workshop
- Apply an equity lens to project selection, development and prioritization
- Pursue mitigation implementation opportunities
- Attend annual reporting and update meeting.

In addition, bureaus were encouraged to support the steering committee and the public involvement strategy. All bureaus identified as lead agencies in action items selected for implementation were asked to complete and sign this letter of intent. The following sections of this chapter outline the end result of this workshop and the internal work done within each bureau to reconcile previously identified actions and identify new actions for the MAP.

19.2 Status of Previous Plan Actions

The 2010 NHMP identified 101 mitigation actions for implementation. For the current update, these actions were reviewed by City bureaus and offices and other relevant agencies. For each action, it was determined whether the action had been completed, was in progress or had not been started. Incomplete actions were reviewed to determine if they should be carried over to the 2016 plan or removed from the plan due to a change in priorities, capabilities, or feasibility. In total, 75 (75 percent) of the identified actions have been started or completed, and 26 (25 percent) showed no progress. Of the 101 identified actions 39 (39 percent) were carried over to the 2016 plan. Each has a new action number assigned to it for the 2016 plan, and many were reworded to more clearly state their intent.

Table 19-1 summarizes the status of the recommended actions from the 2010 NHMP. More detailed information on many actions, especially those that were completed or are in progress, is provided in the 2016 Progress Report in Appendix A.

Table 19-1. Status of Actions Identified in the 2010 Natural Hazard Mitigation Plan

Action Item	Completed	Carry Over to MAP	Removed; No Longer Feasible
ST MH #1— Continue to involve the public in updating the Natural Hazard Mitigation Plan. (education & outreach)		✓	
***Comment**: Carried over, PBEM-15.*			
ST MH #2 — Form a committee to identify and coordinate critical transportation (street and highway) networks. (mapping, asset management)	✓		
***Comment**: There is no committee, but we have identified emergency transportation routes for key facilities. If new facilities are built, transportation routes would be re-evaluated.*			
ST MH #3 — Coordinate emergency standard operating procedures and plans between disaster responder organizations in the Portland metro region, to coordinate and expedite decision making during emergencies. (planning)	✓		
***Comment**: Regional Multi-Agency Coordination on operations. Internally de-conflicted the County Basic Emergency Operations Plan with the City Basic Emergency Operations Plan. PBEM reviews other bureaus' emergency procedures.*			
ST MH #4 — Develop a multiple-agency multi-hazard evacuation plan (earthquake, flood, fire and landslide at a minimum).	✓		
***Comment**: Evacuation Plan developed. Certain areas of highest risk have individualized plans (Linnton).*			
ST MH #5 — Acquire Light Detection and Ranging (LiDAR) images of the Portland Metro area to facilitate natural hazard area risk assessment and vulnerability analysis. (mapping) (NFIP Compliance)	✓		
***Comment**: Acquisition complete. Analysis in progress.*			
ST MH #6 — Use findings from Portland's Risk Assessment (HAZUS-MH) to enhance existing debris removal plan. HAZUS-MH will need to be updated. (existing GIS Mapping)	✓		
***Comment**: The 2003 HAZUS analysis was used to update Metro's debris removal plan from the 1990s in 2013. Debris modelling is being updated regionally. A new HAZUS analysis is being completed as part of the 2016 plan update.*			
ST MH #7 — Create a mitigation mapping committee to index and maintain GIS mapped inventory and develop prioritized list of critical facilities, residential and commercial buildings within known hazard areas such as earthquake, erosion, the 100-year and 500-year floodplains, invasive plant species, landslide and wildfire areas. (NFIP Compliance) Identify parameters and methods for new maps as needed to meet multi-hazard mitigation goals and to improve communication with the public.	✓		
***Comment**: CGIS maintains inventory in Portland Maps. No such committee exists. Much of this will be accomplished through the MAP update. Parks, BES data, PBOT erosion data, and others are included. PBEM also promotes the Map Your Neighborhood initiative.*			
ST MH #8 — Partner with utilities as they ensure continuity of service to the City and the Columbia South Shore Well field to provide for redundancy in case of primary power outage. (asset management)		✓	
***Comment**: Carried over, PWB-21.*			
ST MH #9 — Develop a city employee emergency response plan to assure that city employees know what is expected of them to continue City operations. (education, outreach)	✓		
***Comment**: All bureaus have submitted Continuity of Operations Plans (COOP) and recognize accountability requirements. PBEM is hiring a COOP planner. The mayor sends out emails informing employees what to do in an emergency.*			
ST MH #10 — Develop educational materials (television and print media) for residents that identify and define their risk to multi hazards: define and offer mitigation measures that residents can take home or share, determine method of distribution of the educational materials and coordinate with the media to reduce conveyance of misinformation. (education, outreach)	✓		
***Comment**: PBEM hired a comm. outreach representative, supports preparedness campaigns, promotes preparedness materials, and has offered seismic strengthening programs. Public Information Officer works with local news (KOIN) on post-disaster collaboration.*			

Action Item	Completed	Carry Over to MAP	Removed; No Longer Feasible
ST MH #11 [a] — Implement actions in the 2005 Portland watershed management Plan (planning) (NFIP Compliance)		✓	
***Comment**: Carried over, BES-1.*			
LT MH #1 [a] — Revise Portland's Comprehensive Plan to address and implement Citywide policies, land use improvements and mapping changes to natural hazards including, but not limited to, earthquakes, erosion, floods, invasive plants, landslides, volcano, severe weather and wildfires. (mapping, planning) (NFIP Compliance)		✓	
***Comment**: Carried over, BPS-5, BPS-6.*			
LT MH #3 — Increase the responsiveness of the emergency permitting procedures for post-hazard event periods through development of a procedural plan and the purchase of a mobile permitting van. (planning)		✓	
***Comment**: Carried over, BDS-1. Eliminated "purchase of a mobile permitting van" as this was determined to be cost-prohibitive.*			
LT MH #6 — Promote the development of TriMet communications and dispatch capability to immediately implement changes to transit routes and service due to disruption of streets, roads, bridges, rail transit tracks and the information technology that provides connectivity. (planning)	✓		
***Comment**: PBOT has encouraged TriMet to utilize WebEOC as the information sharing tool during severe weather events.*			
LT MH #8 [a] — Review and amend City Code and other compliance documentation to require that all facilities that store or handle hazardous materials (including large tanks) and which are located in the 500-year floodplain, landslide, or other hazard areas, develop a hazardous materials inventory statement. This statement will be made available for Fire Bureau review. Require that these storage tanks are either adequately protected or relocated outside of the 500 year floodplain, landslide, or other hazard areas. (asset management) (NFIP Compliance)		✓	
***Comment**: City Resolution 36156 (Water Bureau) requires businesses in the Columbia South Shore Well Field Wellhead Protection Area that meet hazmat thresholds to report a hazardous materials inventory every November 30. 2016 Critical Energy Infrastructure Hub Risk Assessment report includes recommendations to begin accomplishing this. Carry over, PBEM-19.*			
LT MH #9 — Identify and pursue funding opportunities from outside agencies to fund and implement identified mitigation projects and activities. (education, outreach)	✓		
***Comment**: FHA grant funding for PBEM/PBOT transportation planner. PDM 13 grant for MAP update, Hazard Mitigation Program grant for seismic retrofitting of private residences, PDM 15 grant application for seismic retrofit of private residences. PBEM annually applies for and receives Emergency Management Performance Grants, Urban Areas Security Initiative grants, and others on a regular basis. *Note: PBEM did not receive the Urban Areas Security Initiative grant in 2013.*			
LT MH #10 — Assess the stability of levees in the Columbia Corridor Area and develop appropriate emergency plans to address potential levee failure and associated hazards. (planning)		✓	
***Comment**: Carried over, PBEM-14, OMF-1.*			
LT MH #11 [a] — Support development of a multiple-agency plan for Marine Drive closure coordination. (planning)	✓		
***Comment**: PBOT is part of the Multnomah County Drainage District Flood Emergency Action Plan (2016) to install stop log closures along Marine Drive as necessary. Marine Drive closure is outlined in the City's evacuation plan for the Districts, which is an annex to the BEOP.*			
LT EQ #11 [a] — Work with local jurisdictions to assess the capacity of landfill to accommodate earthquake debris: develop coordination plans for disposal of debris in the aftermath of an earthquake. (planning)		✓	
***Comment**: Carried over, PBEM-4.*			

Action Item	Completed	Carry Over to MAP	Removed; No Longer Feasible
New MH #1 [a] — Cross reference and incorporate mitigation planning provisions into all community planning processes such as comprehensive, capital improvement and land use plans, to demonstrate multiple bureau benefits and strengthen eligibility from multiple funding sources. This action is also identified in LTFL#8, IS#94 & SW#117. (planning)	✓		
***Comment**: 2010 Natural Hazard Mitigation Plan components incorporated into Climate Action Plan and Comp. Plan update. PBEM regularly provides comments on citywide planning efforts and requests comments or participation from other bureaus on PBEM planning activities*			
New MH #2 — Identify and list repetitively flooded structures and infrastructures, analyze the threat to these facilities and prioritize mitigation actions to protect the threatened population. (NFIP Compliance)		✓	
***Comment**: Carried over, BES-4.*			
New Reworded MH — Acquire (buy-out), demolish, or relocate structures from hazard prone area. Property deeds shall be restricted for open space uses in perpetuity to keep people from rebuilding in hazard areas. (planning) (NFIP Compliance)		✓	
***Comment**: Carried over, BES-4.*			
New MH #3 [a] — Develop and incorporate building ordinances commensurate with building codes to reflect survivability from all hazards to ensure occupant safety. (NFIP Compliance)		✓	
***Comment**: Carried over, BDS-2.*			
New MH #4 [a] — Update the Infrastructure Master Plan and System Vulnerability Assessment, Sewer Failure Response Plan. (asset management, planning)	✓		
***Comment**: The Infrastructure Master Plan was updated in 2014 and was renamed the Citywide Systems Plan. The Sewer Failure Response Plan was updated in 2012 to comply with National Pollutant Discharge Elimination System permit requirements, and named the Sewer Release Response Plan.*			
New MH #5 — Partner with agencies to develop a west side operations center to be used during an emergency if the east side Emergency Control Center and other City facilities become inoperable.		✓	
***Comment**: Carried over, OMF-2.*			
New MH #6 [a] — Promote 09 Climate Action Plan action items with similarities to adaptation planning and mitigation actions. (planning)		✓	
***Comment**: Carried over, BPS-7.*			
ST EQ #2 [a] — Assess existing earthquake related mitigation plans and vulnerability studies to identify areas of conflict, duplication or gaps between studies & secondary hazards of earthquake. (planning)			✓
***Comment**: Removed as it was determined that this is not a priority and not a productive use of staff time.*			
ST EQ #3 [a] — Update the vulnerability analysis of Columbia Boulevard Wastewater Treatment Plant Tryon Creek Wastewater Treatment Plant and wastewater pump stations. (Asset management, planning)		✓	
***Comment**: Carried over, BES-3.*			
ST EQ #4 — Prioritize the return of power to treatment plants (Tryon Creek and Columbia Boulevard) and pump stations.		✓	
***Comment**: Carried over, BES-2.*			
ST EQ #8 — Study the feasibility of mandatory or voluntary installation of seismic shutoff valves on natural gas meters at commercial and residential buildings.	✓		
***Comment**: PBEM pursued this, but it did not come to fruition. Valves are expensive, and take time and professional services to turn back on after being shut off. BPS and BDS have advocated for disclosure of seismic information upon sale of homes.*			
LT EQ #3 [a] — Develop a plan to strengthen sewer infrastructure in areas where street overlays and sewers have potential to collapse in a seismic event. (asset management)		✓	
***Comment**: Carried over, CAMG-1.*			

Action Item	Completed	Carry Over to MAP	Removed; No Longer Feasible
LT EQ #6 — Assess the vulnerability of the water distribution system to seismic events: work toward hardening the system.		✓	
***Comment**: Carried over, PWB-1.*			
LT EQ #8 [a] — Study development regulations and policies to ascertain if regulations can be made to limit development of high risk facilities in known areas of earthquake hazards.		✓	
***Comment**: Carried over, BPS-4, BPS-13, and BPS-15.*			
SW #2 — Acquire an additional facility for storage of anti-icing materials and expand anti-icing vehicle inventory.		✓	
***Comment**: PBOT acquired additional plows, sanders and anti-icing equipment. Storage for additional anti-icing material is planned for the Jerome Sears Westside facility once project is completed. Carried over, OMF-2.*			
ST SW #6 — Insulate residential buildings that house at risk populations.	✓		
***Comment**: This action is being accomplished through different means. BPS created Clean Energy Works, Oregon which is now a non-profit organization that conducts energy audits and provides homeowners with low-cost energy efficient upgrades.*			
ST SW #7 — Prioritize existing building stock for active review of Title 29 (Dangerous Building Code) This needs to be updated with intern information or information sent from individuals that are on the team.			✓
***Comment**: Removed because it is not feasible, not a productive use of staff time, and not directly related to hazards.*			
ST FL #1 — A covenant is recorded with the deed of new development in the floodplain to ensure that space below the base flood elevation is not converted to habitable space. This should be codified to improve compliance. (NFIP Compliance)		✓	
***Comment**: Carried over, BDS-3.*			
ST FL #2 — Continue to co-fund improvements to river and stream gauges in the Portland metropolitan area with the United Geological Survey.		✓	
***Comment**: Carried over, BES-7.*			
ST FL #4 — Secure the agreements necessary to design and implement the redevelopment of Freeway Land Company site. (within the Lents Urban Renewal Area)			✓
***Comment**: Removed. Determined to be overly specific. Incorporated into BES-18.*			
ST FL #5 — Acquire outside funding to hire a consultant to lead the application process to maintain a Class 5 rating when the City seeks Community Rating System re-certification.	✓		
***Comment**: Recently completed reverification. Portland is likely to be a Class 6 Community follow an extremely rigorous reverification process. New, more robust guidelines in the 2013 CRS Coordinators' Manual made it impossible to retain Class 5 status.*			
ST FL #6 [a] — Support Multnomah County Drainage District (MCDD) in the continued calibration and update of hydraulic models for conveyance and internal flood impacts to the four floodplains managed by MCDD #1.		✓	
***Comment**: BES-20*			
ST FL #8 — Identify funding for the design and construction of the Springwater Wetlands Complex, a 30-acre floodplain wetland restoration project in the Lents area of Johnson Creek.			✓
***Comment**: Removed. Determined to be overly specific. Incorporated into BES-18.*			
ST FL #9 — Secure funding to implement the passive flood management projects that are recommended in the Johnson Creek Restoration Plan & other watershed management plans. Coordinate with Portland Development Commission's urban renewal efforts in Lents and with other partners in other parts of the watershed.			✓
***Comment**: Removed. Determined to be overly specific. Incorporated into BES-18.*			
ST FL #10 — Improve definitions and refine standards for stormwater retention in the Storm water Management Manual.	✓		
***Comment**: New Stormwater Management guidelines have just been released, with clarifying definitions and standards.*			

Action Item	Completed	Carry Over to MAP	Removed; No Longer Feasible
LT FL #1 — Increase funding for the Johnson Creek Willing Seller Program; establish willing seller programs in other watersheds where flood hazard and priority restoration areas coexist. (NFIP Compliance)		✓	
***Comment**: Carried over, BES-6.*			
LT FL #3 [a] — Develop a plan for addressing flooding in the Holgate Lake area. (planning) (NFIP Compliance)			✓
***Comment**: Removed. Outside of scope of Johnson Creek Willing Seller area and not identified in Johnson Creek Restoration Plan. Not a current or future priority for BES.*			
LT FL #4 — Improve hydraulic bottleneck that prevents discharge of chlorinated effluent to the Willamette River during high river levels. (NFIP Compliance)			✓
***Comment**: Removed. Does not directly address risk from natural hazards.*			
LT FL #5 [a] — As Waterfront Park remodeling is designed, ensure that Portland's downtown property and critical facilities remain protected from floodwaters. (asset management)		✓	
***Comment**: Carried over, PP&R-1.*			
LT FL #6/#7 [a] — Partner with Army Corps of Engineers to conduct modeling of the Willamette River upstream of Portland to identify areas that, if acquired or restored, would contribute to mitigate of peak flows in Portland or result in significant reduction of flood damages. (NFIP Compliance)			✓
***Comment**: Removed. This is beyond the city's (specifically BES's) capabilities and responsibilities.*			
LT FL #8 [a] — Develop goals, policies and implementation measures to manage the amount of new impervious surface and remove existing impervious surfaces where appropriate. These goals, policies and measures may be at the citywide, watershed, or sub-watershed level. (planning) (NFIP Compliance)		✓	
***Comment**: Draft Comprehensive Plan contains goals and policies, and updated CAP and new Climate Change Preparation Strategy include objectives and actions to limit and reduce impervious area. BES would lead implementation measures to actually remove pavement. Carried over, BPS-17.*			
LT FL #9 — Upgrade trestles that carry the main conduits of the water delivery system. (Sandy River Crossing interties completed) (asset management)		✓	
***Comment**: Carried over, PWB-55.*			
FL #10 — Create redundancy in the water delivery system at the three Sandy River crossings by burying conduits under the river (in progress).		✓	
***Comment**: Carried over, PWB-56.*			
LT FL #11 — Provide funding for and participate in development of a flood inundation model for the managed floodplains and downtown sea wall. (mapping) (NFIP Compliance)			✓
***Comment:** Removed. Lead agency would be FEMA. New floodplain mapping requirements under the FEMA biological opinion will require FEMA to do this work with specific climate projections and mapping protocols.*			
LT FL #12 — Install a river gauge in the vicinity of the bridge over Johnson Creek at 108th. The gauge should be able to send data to remote monitoring sites.	✓		
***Comment**: The bridge was removed as part of the Foster Floodplain Natural Area construction, which created an additional 120 acre feet of flood storage along SE Foster Rd. We have installed a crest gage however to determine flood levels during over-bank events.*			
LT FL #13 — Install one-way valves on the outlet pipes of the storm inlets on SE Foster Road between 101st and 112th.	✓		
***Comment**: These outlets now go to a stormwater facility that is part of the Foster Floodplain Natural Area.*			
FL #1 [a] — Complete update to the Johnson Creek Restoration Plan. Develop individual plans for each sub-watershed to address the sources of excess stormwater runoff that exacerbates flooding. (NFIP Compliance)			✓
***Comment**: This action was determined to be redundant with ST MH #11*			

Action Item	Completed	Carry Over to MAP	Removed; No Longer Feasible
FL #2 [a] — Establish flood mitigation priorities for critical facilities and residential and commercial buildings located within the 100- year floodplain using survey elevation data. (NFIP Compliance)		✓	
***Comment**: Rolled over, CAMG-2.*			
ST-LS #1 [a] — Continue to maintain and Improve internal City communications to facilitate coordination of landslide mitigation activities. (education, outreach)		✓	
***Comment**: Carried over, PBOT-5.*			
ST-LS #3 — Mitigate Portland's water supply infrastructure from landslide hazards. (asset management)		✓	
***Comment**: Carried over, PWB-57.*			
ST-LS #4 — Initiate more operations and maintenance pilot projects along roads that inform about the development of standards for managing stormwater in ditches in landslide prone areas. (education, outreach)		✓	
***Comment**: Carried over, BES-11.*			
LT-LS #1 — Develop a comprehensive landslide map for the City of Portland to identify hazard areas and to improve communications with the public. (mapping)		✓	
***Comment**: Carried over, PBEM-9.*			
New LT LS #3 — Evaluate the role of drainage systems in the West Hills, including pipes, streams and drainage ways and options for protecting and improving their functions and increasing their resiliency. (planning)			✓
***Comment**: This action was determined to be redundant with ST MH #11*			
LT LS #4 [a] — Review the effectiveness of existing regulations related to development in landslide hazard areas. (planning)	✓		
***Comment**: Complete. Downzoning completed as part of Comprehensive Plan update.*			
LT-LS #6 — Employ alternative construction methods such as trenchless construction on City projects to reduce the impact that development can have in landslide prone areas	✓		
***Comment**: PBOT accomplishes this for sewer repair. City bureaus use a variety of practices depending on site and system conditions.*			
LT LS #7 — Continue development of standards for small pump stations as an alternative to gravity sewers in accessible or high risk areas.			✓
***Comment**: Removed. Not directly related to reducing risk from natural hazards.*			
ER #1 [a] — Develop recommendations for high and low ranking streamside plants that provide more erosion control, such as reducing erosion from high water and wave actions.		✓	
***Comment**: Carried over, BES-12.*			
ER #2 [a] — Implement projects that retain native vegetation, increase vegetation diversity and increase the complexity of the vegetation strata (having three vegetation strata: herbs, shrubs, trees).		✓	
***Comment**: Carried over, BES-13.*			
ER #3 [a] — Implement policies to increase the extent of coverage of the Greenway zones along the rivers and further limit proposed activities within these areas.	✓		
***Comment**: Complete. Expanded Greenway Zones included in 2035 Comprehensive Plan.*			
ER #4 [a] — Develop standards for soil backfill in vegetated areas, especially sloped areas. (planning)			✓
***Comment**: Removed. Not a priority action for City bureaus.*			
ER #5 [a] — Establish regulations that prevent installation of slopes steeper than 3:1 and prohibit development on slopes steeper than 3:1. (planning)			✓
***Comment**: Removed. Determined to be an ineffective strategy.*			
ER #6 — Implement projects that layback and/or regrade riverbank slopes and secure wetland sod mats composed of native emergent/grasses, etc.	✓		
***Comment**: Complete. Established practice for restoration projects.*			

Action Item	Completed	Carry Over to MAP	Removed; No Longer Feasible
ER #7 — Construct and install bio-engineered slope protective measures to reduce or eliminate erosion	✓		
***Comment**: Complete. Established practice for restoration projects.*			
ER #8 — Implement projects that increase large wood structures that act to soften the effect of wave action on shorelines as well as provide habitat for migrating salmonids.		✓	
***Comment**: Carried over, BES-14.*			
ER #9 — Secure large wood [boles w/ attached root wads] or log rafts to reduce high wave action that can result in erosion.			✓
***Comment**: Removed. Redundant with ER #8/BES-14.*			
ST WF #1 — Consolidate unassigned and/or unmanaged vegetated areas owned by the City under a single land management umbrella. (asset management)			✓
***Comment**: Removed. Not a priority and does not directly reduce risk from natural hazards. Intent is served by ST WF #2.*			
ST WF #2 — Procure funding for management of vegetated natural areas with high wildfire danger, including public and private properties.	✓		
***Comment**: Parks does not seek funding from outside sources, but this is a typical management practice and is integral to Parks SOPs and management/planning documents.*			
ST WF #4 — Provide wildfire management training to staff. (education, outreach)	✓		
***Comment**: Each year, Portland Fire & Rescue (PF&R) provides seasonal wildland training to all line personnel by reviewing and exercising procedures. In 2016, PF&R will conduct a spring Training Block that all line staff will complete, with basic state level hands-on wildland training.*			
ST WF #5 [a] — Amend the Portland Plant List and other related City plant lists and landscaping guides to include/identify fire resistant native plants and planting strategies that could be encouraged or required in local landscaping. (planning)	✓		
***Comment**: The Portland Plant List was updated to provide information about fire resistant native plants. Other landscaping and tree guides are maintained by BDS and Portland Parks & Recreation (PP&R).*			
ST WF #6 [a] — Integrate, as appropriate, fire prevention goals and provisions into City policies, plans and codes. Identify and address ambiguities or conflicts among city requirements. (planning)	✓		
***Comment**: The draft Comprehensive Plan includes policies and map changes to reduce future risks and impacts from natural hazards, including wildfire. The draft plan also includes new urban forest related policies that recognize the need to manage for wildfire.*			
ST WF #7 [a] — Identify conditions of approval and mitigation strategies that could be applied to new development or redevelopment in high risk areas.		✓	
***Comment**: Carried over, BPS-11.*			
ST WF #9 [a] — Improve the system for identifying new construction in areas subject to wildfires and communicating this information to the affected land owners. (planning)	✓		
***Comment**: It is not clear what exactly this strategy means. It seems to imply a new mapping tool or interface. BTS upgraded the online mapping platform at PortlandMaps.com, which shows fire risk by parcel.*			
ST WF #10 — Conduct systematic reviews of Portland's large, publicly owned, wildland tracts regarding fire safety and ecological health to ensure informed land management decisions. (asset management)	✓		
***Comment**: Complete. This is part of PP&R standard operating procedures and planning documents.*			
ST WF #11 — Adopt the national "Fire Danger Rating System" and install the signs at key points in the City.			
***Comment**: This is part of Parks' standard operating procedures and planning documents.*			

Action Item	Completed	Carry Over to MAP	Removed; No Longer Feasible
ST WF #12 — Implement a neighborhood wildland interface disaster planning program. (education, outreach)	✓		
Comment: *"Ready, Set, Go!" was developed and managed by the International Association of Fire Chiefs. We adopted the program last year, and have information on our website and handouts for citizens to learn how to protect themselves.*			
ST WF #13 [a] — Review and potentially refine City contract specifications for machinery operations during "Red Flag" weather conditions. (asset management)	✓		
Comment: *Complete. City of Portland's General Construction Safety Provisions for Owner Controlled Insurance Program document was updated by BES and PWB in January, 2011.*			
ST WF #14 [a] — Convene a standing wildland interface fire technical group. (planning)		✓	
Comment: *Carried over, PF&R-2.*			
ST WF #15 [a] — Index City wildfire mitigation plans and activities. (asset management)	✓		
Comment: *The 2011 Multnomah County Community Wildfire Protection Plan indexes recommendations from the 2010 NHMP, the 2009 Wildfire Readiness Assessment Gap Analysis Report, and the Forested and the 2005 Wildland Interface Areas Protection Annex recommendations into one comprehensive list.*			
WF [a] — Develop and implement protocol for defining and mapping Wildland Urban Interface Zones and develop recommended policies, regulations and landscape options for incorporation into City plans and programs. (planning)		✓	
Comment: *Carried over, PF&R-3.*			
ST WF #16 — Identify water grid engineering requirements for firefighting in wildfire areas. (asset management)	✓		
Comment: *Complete. PWB has extended the infrastructure or grid into some of these wildfire prone areas. There are City requirements for minimum fire flow standards in new developments throughout the WUI.*			
LT WF #2 [a] — Review the feasibility of adopting portions of nationally recognized wildfire interface codes to strengthen building standards in wildfire risk areas.	✓		
Comment: *Complete. The City of Portland has adopted the State of Oregon wildland urban inter-face requirements which are regulated by Bureau of Developmental Services.*			
LT WF #3 — Design and conduct a study to determine the effectiveness of maintenance agreements that are established when new land divisions are approved to manage vegetation in open space tracts.		✓	
Comment: *Carried over, BES-9.*			
LT WF #4 — Complete an assessment to characterize high priority wildfire risk areas and recommend specific mitigation strategies.			✓
Comment: *Removed. LiDAR data collected in 2014 may be processed with vegetation classifications to develop a wildfire risk zones dataset. This data is owned by the region, and this effort would be coordinated regionally.*			
LT WF #5 — Explore avenues for funding wildfire interface home construction upgrades to low income homeowners.			✓
Comment: *Removed. Not a priority - anecdotal cost-benefit analysis does not show this as being an efficient use of city resources.*			
WF [a] — Act upon all Mitigation Actions outlined in the Wildfire GAP Analysis Report		✓	
Comment: *Carried over, PF&R-3.*			
IS #1 — Update Invasive Species Plants List by consolidating nuisance and prohibited plant lists into one "Nuisance Plants List" and assigning priority ranks to the Nuisance Plants List.	✓		
Comment: *Completed in 2010*			
IS #2 [a] — Clarify zoning regulations to require removal of plants on the Nuisance Plants List in the Environmental, Greenway and Pleasant Valley Natural Resources Overlay Zones and the Columbia South Shore and Johnson Creek Basin Plan Districts.			✓
Comment: *There is no additional plan to require removal of all nuisance plants in the specific areas identified in the action.*			
IS #3 [a] — Initiate a process to ensure the Erosion Control Manual be made consistent with City goals to control and eradicate invasive plants. (planning)	✓		
Comment: *The Erosion Control Manual was updated in 2010. In this update, invasive species were called out as specifically prohibited.*			

Action Item	Completed	Carry Over to MAP	Removed; No Longer Feasible
IS #4 [a] — Initiate a process to ensure the Tree and Landscaping Manual, the Recommended Street Tree List and the Stormwater Management Manual be made consistent with City goals to control and eradicate invasive plants. (planning)			✓
***Comment**: Removed. Invasive species are considered in all documents as a general practice.*			
IS #5 [a] — Coordinate with the Portland Plan project to help ensure that invasive species are addressed in the Comprehensive Plan update and Portland Plan work plan. (planning)	✓		
***Comment**: The draft Comprehensive Plan contains policies to manage and prevent the spread of invasive plants.*			
IS #6 [a] — Research the feasibility of establishing a local noxious or invasive weed law.	✓		
***Comment**: Completed. Invasive Plant Policy Review and Regulatory Improvement Project completed in 2011.*			
LT V #1 [a] — Work with the state and other impacted jurisdictions to implement and update the various volcano Inter-Agency Coordination Plans.		✓	
***Comment**: Carried over, PBEM-7.*			
V [a] — Work with the state and other impacted jurisdictions to implement and update the various volcano Inter-Agency Coordination Plans.			✓
***Comment**: This action was determined to be redundant with LT V #1*			

a. Action was identified as a plan integration action by the planning team. See Section 19.5.5 for more information.

19.3 ACTIONS SELECTED FOR IMPLEMENTATION IN THE 2016 PLAN

City bureaus and offices were encouraged to review a wide variety of sources of actions for inclusion in the MAP:

- **Mitigation Best Practices Catalog**—A catalog that includes FEMA and other agency identified best practices, steering committee and other stakeholder recommendations, and recommendations from the Critical Energy Infrastructure Hub report.
- **Risk Assessment and Issues**—The results of the risk assessment information and issues identified during the planning process including the exposure and vulnerabilities of critical facilities that bureaus and offices may own or operate or upon which they depend.
- **Public Input**—The results of the public survey and summary notes from the Planning for Real workshops.
- **Other Plans and Programs**—Projects or actions that have been identified in other plans and programs such as the Climate Action Plan, Local Energy Assurance Plan, Capital Improvement Program, etc.
- **Capability Assessment**—Items listed in the capability assessment that the City does not currently have and would like to pursue.
- **2010 Natural Hazard Mitigation Plan**—Actions that were identified as "carry-over" actions from the 2010 plan.

Bureaus were asked to include a special emphasis on selecting actions that were identified by the steering committee and/or identified during the course of the broader public engagement efforts.

19.3.1 Equity Analysis Screening

After bureaus had performed a cursory review of potential actions and developed a working list for inclusion, an equity analysis screening for each action was performed using the following question matrix and review tool. Bureaus were encouraged to make revisions based on the review or to hold off on the pursuit of some actions until more information about equitable implementation could be identified.

A NOTE ON EQUITY:

The Portland Plan defines equity as follows:

- When everyone has access to the opportunities necessary to satisfy their essential needs, advance their well - being and achieve their full potential. We have a shared fate as individuals within a community and communities within society. All communities need the ability to shape their own present and future. Equity is both the means to healthy communities and an end that benefits us all.
- Equity concerns that are of particular importance in hazard mitigation include policies and programs that influence an individual's, household's, or group's ability to:
  - Anticipate
  - Cope with
  - Respond to, and
  - Recover from a hazard event.
  - Policies and programs can enhance or diminish vulnerability.

Review Tool

The equity screening review tool presented in Table 19-2 was developed by the Portland Bureau of Planning and Sustainability as part of the Climate Action Plan Equity Implementation Guide and adapted with guidance from the Portland Officer of Equity and Human Rights. Questions were reviewed and discussed by bureaus as appropriate during the equity analysis screening process.

Question Matrix

The question matrix (see Table 19-3) was designed as a conversation tool. Bureaus were asked to talk through these questions for each identified action and were encouraged to have a group discussion about actions so that multiple perspectives were brought into the screening process.

Table 19-2. Equity Screening Review Tool

	Procedural	Distributive	Structural
Programs/ Services	How was the target audience included in the design of the program? What actions will be taken to ensure that services and programs are physically and programmatically accessible and inclusive? What are the criteria for participation or receipt of benefits?	Is the program or service designed to meet the needs of underserved and underrepresented communities? If not what would need to be changed to ensure their equitable participation? How will program dollars be allocated to ensure inclusive and accessible service delivery? Does the cost structure of the program result in disparate use?/Does the fee structure of the service result in increased burdens for low-income communities?	Does this program/service create unintended consequences for communities that are underserved and underrepresented? How will they be mitigated? Is there an opportunity to extend additional benefits through this program/service that can help support the healing of past harms to communities? Does the program empower and build capacity of a community
Capital Investments	What are the criteria for prioritizing projects and investments? Does the data and information used consider the demographic, geographic and real-world experience of residents and businesses in the area? If data gaps exist, what are you using to guide decisions? What process will be used to get input from the community? How will you reach underserved populations?	Will the investment provide improved safety, health, access or opportunity for the communities who need it most? How will the underserved people who currently live and work in the area benefit from the investment?	What measures will be taken to mitigate the potential impacts of involuntary displacement in the project? How will business or employment opportunity created through the project be extended to communities of color, people with disabilities, and low-income people? How will community benefits be negotiated?
Regulation	Has analysis been done on the impacts to communities of color, people with disabilities, low-income populations, seniors, children, renters, and other historically underserved or excluded groups? How will impacted communities be able to learn about and understand changes with the regulation? How will the regulation be enforced?	Will the regulation provide improved safety, health, access or opportunity for the communities who need it most? How will the regulation alleviate any cost-burden for those who are already in a position where it is difficult to pay?	Does the regulation create or inhibit opportunity for communities of color, people with disabilities, and low-income populations? Will enforcement disproportionately negatively affect low-income communities or communities of color? How will this be mitigated?
Planning	How will impacted communities be involved in the planning process? What measures will be taken to ensure the process is fair and inclusive?	How does the plan prioritize and address the needs of the most impacted or vulnerable in the community? Does the plan improve safety, health, access or opportunity for the communities who need it most? How will resources shift to ensure equitable implementation of the plan?	What measures will be taken to mitigate the potential impacts of involuntary displacement? How will policies support community development? What support is needed to build the community's ownership and self-determination with the plan?

a. Procedural equity—ensuring that processes are fair and inclusive in the development and implementation of any program or policy
b. Distributive equity—ensuring that resources or benefits and burdens of a policy or program are distributed fairly, prioritizing those with highest need first.
c. Structural equity—a commitment and action to correct past harms and prevent future negative consequences by institutionalizing accountability and decision-making structures that aim to sustain positive outcomes

Source: BPS Presentation, Climate Action Plan and Equity: Connecting the Dots with the Community

Table 19-3. Equity Screening Question Matrix

Evaluation Question	Response
1. What issue/problem/risk is the action designed to address? And what are the expected benefits?	Issue: Benefits:
2. Who is the target audience/beneficiary for this action? Who is affected if no action is taken?	
3. How would you classify the mitigation action? (Programs/Service; Capital Investment; Regulation; Planning). *Refer to questions in table above based on your answer to this question.*	
4. Will any community groups be involved in the design/implementation of this action? (i.e. potential partners)	
5. Will this action reduce risk from natural hazards for the following groups? How?	
Communities of color	
Persons with disabilities and/or access and functional needs	
Households with limited English Proficiency	
Renters	
Economically disadvantaged families	
Seniors (age 65 or older)	
Children (under 15 years of age)	
6. How could this action benefit the following groups? Or How could this action be modified so that there are benefits?	
Communities of color	
Persons with disabilities and/or access and functional needs	
Households with limited English Proficiency	
Renters	
Economically disadvantaged families	
Seniors (age 65 or older)	
Children (under 15 years of age)	
7. How could this action burden/negatively impact/leave out the following groups, for example through communication, transportation, physical or programmatic barriers?	
Communities of color	
Persons with disabilities and/or access and functional needs	
Households with limited English Proficiency	
Renters	
Economically disadvantaged families	
Seniors (age 65 or older)	
Children (under 15 years of age)	
8. If you have identified burdens, barriers, or negative impacts, or opportunities for benefits please revisit the action to identify strategies to reduce or eliminate burdens or negative impacts; remove communication, transportation, physical or programmatic barriers; or enhance potential benefits.	
9. Have you identified a performance metric for evaluating progress on this action? How will you know when this action is complete? (please provide) Have you considered outcomes for communities of color, people with disabilities, low-income families, people with limited English proficiency, renters, seniors, and children?	

19.3.2 Selected Actions

Table 19-4 shows the 161 actions that were selected for implementation during the performance period of the MAP. Actions are named and numbered by the lead agency identified for implementation. This agency will be the primary contact for annual progress reports as discussed in the plan implementation and maintenance strategy described in Section 0. In addition to the action name and description, the following information is provided for each identified action:

- **Lead agency**—The lead agency in administering the project.
- **Potential partners**—Potential partners that may be able to assist with implementation.
- **Hazard addressed**— The specific hazard(s) the action will mitigate.
- **Action Source**—Where the action came from, for example Climate Action Plan or Steering Committee Recommendation.
- **Performance Metric**—How the lead agency will measure progress on this action.
- **New or existing assets**— Indicates whether the action mitigates hazards for new or existing assets or both.
- **Funding**—Funding sources identified for the action.
- **Timeframe**—Timeframe is listed as follows:
  - **Near-term** (plan adoption to May 2018)
  - **Mid-term** (June 2018 to December 2021)
  - **Long-term** (2022 or beyond)
  - **Existing/on-going** (currently underway or annual/semi-annual schedule)
  - **Uncertain** (depends on funding/other factors)
- **Objectives met**—The mitigation plan objectives identified by number that the action addresses (see Table 17-1).
- **In previous plan**—Indicates if the action was a carry-over action from the 2010 plan and the former action item number.

The actions selected are projects, programs, and policies that City of Portland bureaus and offices hope to implement over the next five years. It is important to note that this action plan includes only those actions that fall under the jurisdictional authorities of the City of Portland. Many other agencies, jurisdictions, districts, and organizations exist within the City of Portland, and have responsibilities outside of this plan.

Table 19-4. Actions Selected for Implementation

Hazards Addressed	New or Existing Assets	Funding Options	Timeframe	Objectives Met	In Previous Plan? (# from previous plan)
PBEM-1 — Continue to engage and inform the public about hazards, including through a "disaster survivor" storytelling event and through postcard mailers sent to every household in Portland with easy-to-understand and graphic-heavy information about hazards and actionable instructions on how to be prepared. Include information about how to register for Public Alerts with all outreach efforts.					
Lead Agency: Portland Bureau of Emergency Management (PBEM)		**Partner Agencies:** Office of Neighborhood Involvement (ONI), Immigrant and Refugee Community of Oregon (IRCO), Local media partners, Coalition of Communities of Color			
Action Source: Public Workshops		**Performance Metric:** # of postcard mailers sent; # of new Public Alerts registrants; # of attendees at events			
All Hazards	N/A	Staff Time/Budget Reallocation	Short-term	2, 6, 8, 10, 12, 15	No
PBEM-2 — Expand the Neighborhood Emergency Team (NET) program into every neighborhood in Portland and expand beyond the neighborhood structure to non-geographic and cultural communities (e.g. immigrant and refugee communities, disability community organizations), and work with Community Engagement Liaisons to provide trainings in languages other than English.					
Lead Agency: Portland Bureau of Emergency Management (PBEM)		**Partner Agencies:** Community Engagement Liaisons (CELs) program; Office of Neighborhood Involvement (ONI); neighborhood associations			
Action Source: Public Workshops		**Performance Metric:** # of additional neighborhoods with established NETs; NET diversity reporting			
All Hazards	N/A	Staff Time/Budget Reallocation	Long-term	2, 6, 8, 14, 15	No
PBEM-3 — Expand PBEM's capacity to provide community trainings and partner with the Office of Neighborhood Involvement (ONI), Diversity in Civic Leadership (DCL) program, Community Engagement Liaisons, and Multnomah County programs, as well as Non-Governmental Organizations and community-based programs to connect under-resourced and underserved communities with disaster preparedness, home safety, emergency response, and other training opportunities.					
Lead Agency: Portland Bureau of Emergency Management (PBEM)		**Partner Agencies:** Office of Neighborhood Involvement (ONI), Diversity in Civic Leadership (DCL) program, Community Engagement Liaisons (CELs) program, Multnomah County, Non-Governmental Organizations			
Action Source: Public Workshops		**Performance Metric:** # of additional trainings provided per year; # of trainings provided in underserved communities; geographic distribution of training			
All Hazards	N/A	Staff Time/Budget Reallocation	Long-term	2, 6, 12, 14, 15	No
PBEM-4 — Advocate in regional debris planning process for consideration of equity and environmental justice implications of temporary debris storage sites.					
Lead Agency: Portland Bureau of Emergency Management (PBEM)		**Partner Agencies:** Metro			
Action Source: 2010 NHMP		**Performance Metric:** Equity and environmental justice promoted as a priority in identifying temporary debris storage sites.			
Earthquake	N/A	Staff Time	Long-term	2, 16	Yes (LT EQ #11)
PBEM-5 — Support Multnomah County in developing a robust, inclusive, and equitable sheltering plan.					
Lead Agency: Portland Bureau of Emergency Management (PBEM)		**Partner Agencies:** Multnomah County			
Action Source: Steering Committee		**Performance Metric:** Participation in Multnomah County sheltering plan process.			
All Hazards	N/A	Staff Time	Mid-term	2, 6, 16	No

Hazards Addressed	New or Existing Assets	Funding Options	Timeframe	Objectives Met	In Previous Plan? (# from previous plan)
PBEM-6— Support public school districts in developing a prioritization strategy for seismic strengthening of existing schools to facilitate rapid re-opening of schools.					
Lead Agency: Portland Bureau of Emergency Management (PBEM)		**Partner Agencies:** public school districts			
Action Source: Steering Committee		**Performance Metric:** Participation in prioritization process for seismic strengthening.			
Earthquake	Existing	Staff Time	Mid-term	4, 5, 11, 16	No
PBEM-7— Remain informed about inter-agency volcano coordination planning to communicate and understand agency roles and capabilities and potential sheltering needs for evacuees.					
Lead Agency: Portland Bureau of Emergency Management (PBEM)		**Partner Agencies:** Portland Bureau of Transportation (PBOT), Mount Hood Facilitating Committee			
Action Source: 2010 NHMP		**Performance Metric:** City emergency managers aware of volcano coordination plans.			
Volcano	N/A	Staff Time	Long-term	6, 16	Yes (V #1)
PBEM-8— Coordinate with owners and operators of key communications infrastructure (i.e. internet and telecom) located in unreinforced masonry (URM) buildings or buildings not designed for the purpose of housing this infrastructure; assess risks to these assets, and develop a strategy that identifies alternatives and funding sources for implementing seismic strengthening projects.					
Lead Agency: Portland Bureau of Emergency Management (PBEM)		**Partner Agencies:** Owners/operators of communications infrastructure			
Action Source: PBEM Strategic Plan		**Performance Metric:** Development of a strategy for funding and implementing seismic strengthening projects to protect key communications infrastructure.			
Earthquake	Existing	Staff Time	Long-term	4, 7, 10, 12, 13	No
PBEM-9— Update risk assessment information about landslides and develop new MAP action items based on updated 2017-2018 Department of Geology and Mineral Industries (DOGAMI) landslide data and recommendations.					
Lead Agency: Portland Bureau of Emergency Management (PBEM)		**Partner Agencies:** Department of Geology and Mineral Industries (DOGAMI), BDS, MAP Working Group			
Action Source: Steering Committee		**Performance Metric:** MAP landslide chapters updated in 2017.			
Landslide	N/A	Staff Time	Short-term	10, 16	No
PBEM-10 — Work with Office of Neighborhood Involvement (ONI) Disability Program Coordinator to promote participation in the Additional Needs Registry through the Public Alerts system.					
Lead Agency: Portland Bureau of Emergency Management (PBEM)		**Partner Agencies:** Office of Neighborhood Involvement (ONI), Portland Police Bureau (PPB), PF&R, Bureau of Emergency Communications (BOEC), Multnomah County, Elders in Action			
Action Source: PBEM Strategic Plan		**Performance Metric:** # of additional registrants for Additional Needs Registry;			
All Hazards	N/A	Staff Time/Budget Reallocation	Long-term	2, 6, 9, 13, 15	No
PBEM-11— Support Bureau of Development Services (BDS) in implementing recommendations from the City's Unreinforced Masonry (URM) Seismic Retrofit Project, including promoting and supporting policies for mandatory retrofits of URM buildings. This action needs high-level support from City Council and Office of Government Relations (OGR).					
Lead Agency: Portland Bureau of Emergency Management (PBEM)		**Partner Agencies:** BDS, Portland Development Commission (PDC), Office of Government Relations (OGR), Portland Housing Bureau (PHB), City Council			
Action Source: PBEM Strategic Plan		**Performance Metric:** Adoption of mandatory retrofit codes; # of city buildings retrofitted; # of affordable housing units retrofitted			
Earthquake	Existing	Staff Time	Long-term	1, 4, 11	No

Hazards Addressed	New or Existing Assets	Funding Options	Timeframe	Objectives Met	In Previous Plan? (# from previous plan)
PBEM-12 — Audit PBEM's suite of plans to evaluate whether plans meet the needs of people with disabilities, people with language barriers, and other access and functional needs populations. Develop a transition plan to update all plans.					
Lead Agency: Portland Bureau of Emergency Management (PBEM)		**Partner Agencies:** Regional Disaster Preparedness Organization (RDPO), Office of Equity and Human Rights (OEHR), Office of Neighborhood Involvement (ONI)			
Action Source: PBEM Strategic Plan		**Performance Metric:** Completion of audit.			
All Hazards	N/A	Staff Time/Budget Reallocation	Short-term	2, 15, 16	No
PBEM-13 — Expand ATC-20 damage assessment trainings and certifications to non-city employees to increase pool of qualified post-earthquake building inspectors, including through advertisements to registered Minority, Women-Owned, and Emerging Small Business architecture and structural engineering firms.					
Lead Agency: Portland Bureau of Emergency Management (PBEM)		**Partner Agencies:** Oregon Office of Emergency Management (OEM), University of Portland, Structural Engineers Association of Oregon (SEAO)			
Action Source: Steering Committee, PBEM Strategic Plan		**Performance Metric:** # of additional ATC-20 certifications issued			
All Hazards	N/A	Staff Time/Budget Reallocation	Long-term	6, 14, 15	No
PBEM-14— Support Multnomah County Drainage District (MCDD) and Levee Ready Columbia in risk assessment and flood response planning efforts.					
Lead Agency: Portland Bureau of Emergency Management (PBEM)		**Partner Agencies:** MCDD, Portland Water Bureau (PWB), BES, PBOT			
Action Source: Steering Committee, 2010 NHMP		**Performance Metric:** PBEM participation in Levee Ready Columbia meetings and planning projects.			
Flood	Existing	Staff Time	Long-term	4, 5, 6	Yes (LT MH #10)
PBEM-15 — Continue to involve the public in updating the MAP, including by establishing a standing committee with community representation to oversee progress reporting and implementation of MAP action items, and oversee annual updates to the MAP. Perform outreach consistent with the MAP Community Engagement Strategy, and ensure reports are written in plain, accessible language.					
Lead Agency: Portland Bureau of Emergency Management (PBEM)		**Partner Agencies:** BES, BPS, BDS, PP&R, PF&R, PWB, OEHR, MAP Steering Committee			
Action Source: Steering Committee		**Performance Metric:** Committee established, meets quarterly, and updates plan annually.			
All Hazards	N/A	Staff Time	Long-term	2, 5, 6, 9, 10, 16	Yes (ST MH #1)
PBEM-16 — Maintain and promote registration in Public Alerts system, including registration in languages other than English, and improve accessibility of the online interface for languages other than English. Integrate into other public outreach activities.					
Lead Agency: Portland Bureau of Emergency Management (PBEM)		**Partner Agencies:** Multnomah County, Public Alerts Steering Committee			
Action Source: PBEM Strategic Plan		**Performance Metric:** # of new Public Alerts registrants; # of new Public Alerts registrants in languages other than English			
All Hazards	N/A	Staff Time/Budget Reallocation	Long-term	2, 6, 9, 13	No

Hazards Addressed	New or Existing Assets	Funding Options	Timeframe	Objectives Met	In Previous Plan? (# from previous plan)
PBEM-17 — Hire a permanent planner to help City bureaus update continuity of operations plans and set aside a percentage of time to work with key social services organizations such as food banks and homeless shelters to develop continuity of operations plans.					
Lead Agency: Portland Bureau of Emergency Management (PBEM)		**Partner Agencies:** Oregon Food Bank, local homeless shelters			
Action Source: Steering Committee		**Performance Metric:** Number of social service organizations with continuity of operations plans.			
All Hazards	N/A	Staff Time	Long-term	2, 6, 14, 15, 16	No
PBEM-18— Expand Neighborhood Emergency Team (NET) trainings to include teachers and principals and include information about non-structural retrofits in classrooms.					
Lead Agency: Portland Bureau of Emergency Management (PBEM)		**Partner Agencies:** BDS, public school districts			
Action Source: PBEM Strategic Plan, Steering Committee		**Performance Metric:** # of teachers and principals trained			
All Hazards	N/A	Staff Time	Long-term	2, 6, 14, 15	No
PBEM-19 — Advocate for implementation of Critical Energy Infrastructure (CEI) Hub Risk Assessment recommendations, including establishment of Critical Energy Infrastructure (CEI) Hub Disaster Resilience Workgroup.					
Lead Agency: Portland Bureau of Emergency Management (PBEM)		**Partner Agencies:** Office of Government Relations, Regional Disaster Preparedness Organization (RDPO) Policy Committee, City Council			
Action Source: CEI Hub Stakeholders		**Performance Metric:** CEI Hub Disaster Resilience Workgroup established; CEI Hub recommendations implemented			
All Hazards	Both	Staff Time	Mid-term	4, 5, 10, 11	No
PBEM-20 — Develop a post-disaster recovery plan to guide post-disaster redevelopment that considers hazard exposure and relocation of critical infrastructure outside of high-hazard areas, prioritizes the restoration of natural systems to limit future hazard impacts, and includes whole-community recovery strategies to reduce the potential for involuntary displacement.					
Lead Agency: Portland Bureau of Emergency Management (PBEM)		**Partner Agencies:** BPS			
Action Source: Steering Committee, PBEM Strategic Plan		**Performance Metric:** Recovery plan developed.			
All Hazards	Both	Staff Time	Long-term	2, 3, 5, 8, 11, 16	No
PBEM-21 — Increase the City's capacity to establish post-earthquake communication nodes throughout the city after a major earthquake, including through expansion of training and additional communications equipment cache placements for the Basic Earthquake Emergency Communication Nodes (BEECN) program.					
Lead Agency: Portland Bureau of Emergency Management (PBEM)		**Partner Agencies:** Office of Neighborhood Involvement (ONI), PF&R, Amateur Radio Emergency Service (ARES)			
Action Source: PBEM Strategic Plan		**Performance Metric:** BEECN program at full capacity of 444 trained BEECN volunteers; BEECN diversity reporting (age, gender, racial identity)			
All Hazards	N/A	Staff Time/Budget Reallocation	Long-term	2, 6, 13, 14, 15	No
PBEM-22 — Develop a Transportation Recovery Plan.					
Lead Agency: Portland Bureau of Emergency Management (PBEM)		**Partner Agencies:** Portland State University (PSU)			
Action Source: Steering Committee, PBEM Strategic Plan		**Performance Metric:** Transportation Recovery Plan developed.			
All Hazards	Both	Budget Allocation	Near-term	4, 5, 10, 16	No

Hazards Addressed	New or Existing Assets	Funding Options	Timeframe	Objectives Met	In Previous Plan? (# from previous plan)
PBEM-23 — Develop an emergency communications plan to distribute emergency messages to immigrant and refugee communities in language-appropriate and culturally appropriate ways.					
Lead Agency: Portland Bureau of Emergency Management (PBEM)		**Partner Agencies:** Community Engagement Liaisons (CELs) program			
Action Source: PBEM Strategic Plan, Public Workshops		**Performance Metric:** communications plan developed			
All Hazards	N/A	Staff Time/Budget Reallocation	Long-term	2, 6, 14, 15, 16	No
PBEM-24 —Through a public process with key stakeholders, create an inventory of fossil fuel facilities and infrastructure in Portland that includes characteristics related to seismic safety such as date of construction, construction type, and whether seismic upgrades have been made. This action requires high-level support from City Council.					
Lead Agency: Portland Bureau of Emergency Management (PBEM)		**Partner Agencies:** Bureau of Development Services			
Action Source: Public Comments		**Performance Metric:** Final inventory of fossil fuel infrastructure and facilities.			
All Hazards	Existing	New budget allocation	Short-term	1, 4, 6, 9, 10, 12	No
PP&R-1 — Consider known natural hazards on Portland Parks & Recreation (PP&R) owned or managed properties when developing future plans for these properties, to ensure future plans do not adversely alter or modify these hazards.					
Lead Agency: Portland Parks & Recreation (PP&R)		**Partner Agencies:** various depending on site			
Action Source: PP&R Master Plans		**Performance Metric:** Future Park and Trail Master Plans with known natural hazards will include discussion of those hazards.			
All Hazards	Existing	Staff Time/GF/CIP/System Development Charge (SDC)	Long-term	3, 5, 6	Yes (LT FL #5)
PP&R-2 — Consistent with PP&R management practices and standard operating procedures, allocate funding for management of vegetated natural areas with high wildfire danger, including public and private properties.					
Lead Agency: Portland Parks & Recreation (PP&R)		**Partner Agencies:** various depending on site			
Action Source: 2010 NHMP		**Performance Metric:** Properties identified as high wildfire danger are actively managed.			
Wildfire	Existing	Staff Time/GF/CIP/System Development Charge (SDC)	Long-term	3, 5, 12	Yes (ST WF #2)
PP&R-3 — Conduct systematic reviews of Portland's large, publicly owned, wildland tracts regarding fire safety and ecological health to ensure informed land management decisions.					
Lead Agency: Portland Parks & Recreation (PP&R)		**Partner Agencies:** various depending on site			
Action Source: 2010 NHMP		**Performance Metric:** Systematic reviews performed per SOPs and Parks and Trails plans.			
Wildfire	Existing	Staff Time/GF/CIP/System Development Charge (SDC)	Long-term	3, 5, 6	Yes (ST WF #10)
PF&R-1 — Adopt the national "Fire Danger Rating System" and install the signs at key points in the City.					
Lead Agency: Portland Fire & Rescue (PF&R)		**Partner Agencies:** Parks and Recreation			
Action Source: 2010 NHMP		**Performance Metric:** Locations for signage identified and all necessary signage placed in these locations			
Wildfire	Existing	Existing PF&R FTEs	Mid-term	4, 6, 10, 13, 14,	Yes (WF #11)

Hazards Addressed	New or Existing Assets	Funding Options	Timeframe	Objectives Met	In Previous Plan? (# from previous plan)
PF&R-2 — Convene a standing wildland interface fire technical group to plan for and address wildland urban interface (WUI) hazards.					
Lead Agency: Portland Fire & Rescue (PF&R)		**Partner Agencies:** PBEM, Parks and Recreation			
Action Source: 2010 NHMP		**Performance Metric:** Quarterly meeting of standing wildfire interface technical group to plan for and address WUI hazards of concern			
Wildfire	Existing	Existing PF&R FTEs	Near-term	1, 3, 4, 5, 6, 7, 9, 10, 13, 14	Yes (WF #14)
PF&R-3 — Act upon all Mitigation Actions outlined in the Wildfire Gap Analysis Report.					
Lead Agency: Portland Fire & Rescue (PF&R)		**Partner Agencies:** Parks, PBEM			
Action Source: 2010 NHMP		**Performance Metric:** All action items in Gap analysis completed			
Wildfire	Existing	Existing PF&R FTEs	Mid-term	1, 3, 4, 5, 6, 7, 9, 10, 12,13, 14	Yes (WF)
PF&R-4 — Inventory critical PF&R assets and review critical PF&R infrastructure vulnerability and identify a 50-year plan to strengthen, retrofit, relocate or otherwise increase resiliency.					
Lead Agency: Portland Fire & Rescue (PF&R)		**Partner Agencies:** None			
Action Source: Steering Committee		**Performance Metric:** Inventory and Review Completed			
Earthquake	New	Existing PF&R FTEs.	Mid-term	4, 5, 10, 11	No
PF&R-5 — Require defensible spaces and water turrets around structures in wildfire risk areas					
Lead Agency: Portland Fire & Rescue (PF&R)		**Partner Agencies:** BDS			
Action Source: Steering Committee		**Performance Metric:** N/A			
Wildfire	New	Existing PF&R FTEs.	Mid-term	1, 4, 5, 10, 12	No
PF&R-6 — Partner with the Forest Park Conservancy and individual land owners to develop a fire risk reduction plan for Forest Park.					
Lead Agency: Portland Fire & Rescue (PF&R)		**Partner Agencies:** Portland Parks & Recreation (PP&R)			
Action Source: Steering Committee		**Performance Metric:** Development of Forest Park fire risk reduction plan			
Wildfire	New	Existing PF&R FTEs.	Mid-term	6, 8, 12, 13, 14	No
PF&R-7 — Continue to engage and train Neighborhood Emergency Team (NET) volunteers to assists with mitigation, response and recovery efforts post disaster. Ensure training takes place in ADA-accessible fire stations, Neighborhood Emergency Teams (NETs) perform outreach activities to underrepresented groups.					
Lead Agency: Portland Fire & Rescue (PF&R)		**Partner Agencies:** PBEM			
Action Source: Steering Committee		**Performance Metric:** Bi-annual fire station-based training opportunities for s members.			
All Hazards	New	Existing PF&R FTEs.	Near-term	2, 6, 13, 14, 15	No
PF&R 8 — Ensure that Additional Needs Registry Data is appropriately utilized and ensure that emergency responders are aware of locations of disabled Portlanders.					
Lead Agency: Portland Fire & Rescue (PF&R)		**Partner Agencies:** Multnomah County, Bureau of Emergency Communications (BOEC), PBEM			
Action Source: : Steering Committee		**Performance Metric:** Ensure that BOEC's Computer Aided Dispatch (CAD) system is updated with most recent Additional Needs Registry Data.			
All Hazards	New	Existing PF&R FTEs.	Near-term	2, 6, 13	No
PF&R-9 — Perform non-structural assessments and mitigation activities (e.g. anchor bookcases to the wall).					
Lead Agency: Portland Fire & Rescue (PF&R)		**Partner Agencies:** None			
Action Source: : Steering Committee		**Performance Metric:** Prioritize mitigation activities at PF&R facilities and implement high priority mitigation action items.			
Earthquake	New	Existing PF&R FTEs.	Long-term	4, 10, 11	No

Hazards Addressed	New or Existing Assets	Funding Options	Timeframe	Objectives Met	In Previous Plan? (# from previous plan)
BPS-1 — Promote and fund energy independence projects in low-income neighborhoods and communities.					
Lead Agency: Bureau of Planning and Sustainability (BPS)		**Partner Agencies:** PBEM; Private sector; Bonneville Power Administration (BPA)			
Action Source: Public Workshops; BPS Strategic Plan		**Performance Metric:** Promotional materials / communications created; # projects begun or completed			
All Hazards / Earthquake	New	Staff time	Mid-term	2, 8, 12	No
BPS-2 — Plan for solar + battery storage systems, which can serve as mini power-supply stations or provide residents the ability to shelter in place after any electricity supply-disrupting event, at varying scales (project, neighborhood and district) and locations (critical City facilities, low-income housing, community gathering spots).					
Lead Agency: Bureau of Planning and Sustainability (BPS)		**Partner Agencies:** Private sector; Bonneville Power Administration (BPA)			
Action Source: Public Workshops; BPS Strategic Plan		**Performance Metric:** Progress made on complete plan.			
All Hazards / Earthquake	New	Staff time	Mid-term	2, 4, 8, 12	No
BPS-3 — Encourage solar + battery storage demonstration projects at critical City facilities, in low-income neighborhoods and in other strategic locations.					
Lead Agency: Bureau of Planning and Sustainability (BPS)		**Partner Agencies:** Private sector; Bonneville Power Administration (BPA)			
Action Source: Public Workshops; BPS Strategic Plan		**Performance Metric:** Successful formation of coalitions / partnerships; # projects begun or completed			
All hazards / Earthquake	New	Staff time	Mid-term	2, 4, 8, 12	No
BPS-4 — Explore ability to waive System Development Charge (SDC) for change of use if money will be spent on seismic retrofit.					
Lead Agency: Bureau of Planning and Sustainability (BPS)		**Partner Agencies:** PBEM			
Action Source: Steering Committee		**Performance Metric:** Completed studies; enactment of new fee waiver program			
Earthquake	New	Staff time	Near-term	1, 4, 8, 11, 12	No
BPS-5 — Adopt Portland's Comprehensive Plan to address Citywide policies, land use improvements and mapping changes related to natural hazards. This action needs high-level support from City Council.					
Lead Agency: Bureau of Planning and Sustainability (BPS)		**Partner Agencies:** City Council; all City bureaus			
Action Source: 2010 NHMP		**Performance Metric:** Progress made towards adoption of natural hazard elements in Comprehensive Plan			
All hazards	Both	Staff time	Near-term	1, 3, 8, 12, 15	Yes (LT MH #1)
BPS-6 — Support Comprehensive Plan policies and projects that relate to resilience, climate change and natural hazard mitigation, response, adaptation and recovery. This action needs high-level support from City Council.					
Lead Agency: Bureau of Planning and Sustainability (BPS)		**Partner Agencies:** All City bureaus; City Council			
Action Source: 2010 NHMP		**Performance Metric:** # Successful projects or implementation of policies related to resilience, climate change & natural hazard mitigation.			
All hazards	Existing	Staff time	Mid-term	1, 3, 8, 12, 15	Yes (LT MH #1)

Hazards Addressed	New or Existing Assets	Funding Options	Timeframe	Objectives Met	In Previous Plan? (# from previous plan)
BPS-7 — Support 2015 Climate Action Plan and Climate Change Preparedness Strategy actions that relate to adaptation planning and natural hazard mitigation actions.					
Lead Agency: Bureau of Planning and Sustainability (BPS)		**Partner Agencies:** City bureaus; County			
Action Source: 2010 NHMP		**Performance Metric:** # Successful projects or implementation of policies related to resilience, climate change & natural hazard mitigation.			
All hazards	Existing	Staff time	Mid-term	3, 8, 9, 15	Yes (New MH #6)
BPS-8 — Consider natural hazard mitigation in the development of the River Plan/North Reach.					
Lead Agency: Bureau of Planning and Sustainability (BPS)		**Partner Agencies:** BES, PP&R, private sector			
Action Source: BPS Strategic Plan		**Performance Metric:** # of natural hazard and resilience-related elements included in the River Plan/North Reach			
All hazards / Flood	Both	Staff time	Mid-term	3, 8, 12	No
BPS-9 — Develop an emergency resumption of service plan for solid waste removal after a disaster event.					
Lead Agency: Bureau of Planning and Sustainability (BPS)		**Partner Agencies:** PBEM, Portland Housing Authority (PHA)			
Action Source: BPS Strategic Plan		**Performance Metric:** Progress made towards development of plan.			
All hazards / Earthquake	Both	Staff time	Near-term	4, 5, 8, 12. 14. 15	No
BPS-10 — Develop an emergency service plan for solid waste removal in multifamily properties after a disaster event.					
Lead Agency: Bureau of Planning and Sustainability (BPS)		**Partner Agencies:** PBEM, Portland Housing Authority (PHA)			
Action Source: BPS Strategic Plan		**Performance Metric:** Progress made towards development of plan.			
All hazards / Earthquake	Both	Staff time	Mid-term	2, 4, 5, 8, 12. 14. 15	No
BPS-11 — Develop recommended policies, regulations and/or landscape options for areas at risk from wildfires.					
Lead Agency: Bureau of Planning and Sustainability (BPS)		**Partner Agencies:** PBEM, BDS, PF&R, BES, PP&R			
Action Source: 2010 NHMP		**Performance Metric:** Progress made towards development of policies, recommendations and/or regulations.			
Wildfire	New	Staff time	Mid-term	3, 4, 5, 9, 10, 12	Yes (ST WF#7)
BPS-12 — When possible, build mitigation and resiliency education into bureau public events and outreach (e.g., neighborhood meetings, Fix-it Fairs).					
Lead Agency: Bureau of Planning and Sustainability (BPS)		**Partner Agencies:** PBEM, Neighborhood Emergency Team (NET)			
Action Source: BPS Strategic Plan		**Performance Metric:** # of resilience / mitigation outreach events completed			
All hazards	Existing	Staff time	Near-term	2, 6, 8, 12	No
BPS-13 — Develop incentives and regulations that promote, encourage and/or require seismic retrofits of private property (such as multi-family, masonry structures). This action needs high-level support from City Council and Office of Government Relations (OGR).					
Lead Agency: Bureau of Planning and Sustainability (BPS)		**Partner Agencies:** Portland Development Commission (PDC), BDS, PBEM, City Council, Office of Government Relations (OGR)			
Action Source: 2010 NHMP		**Performance Metric:** Progress made towards the development and implementation of incentive program.			
Earthquake	New	Staff time	Near-term	1, 4, 11, 12	Yes (LT EQ #8)

Hazards Addressed	New or Existing Assets	Funding Options	Timeframe	Objectives Met	In Previous Plan? (# from previous plan)
BPS-14 — Identify ways to encourage, promote or require U.S. Resiliency Council Certification for new public buildings. This action needs high-level support from City Council and Office of Government Relations (OGR).					
Lead Agency: Bureau of Planning and Sustainability (BPS)		**Partner Agencies:** PBEM, City Council, Office of Government Relations (OGR)			
Action Source: 2010 NHMP		**Performance Metric:** # of public buildings certified under the U.S. Resiliency Council Certification program			
Earthquake	New	Staff time	Mid-term	1, 4, 5, 15	Yes (LT EQ #8)
BPS-15 — Prioritize retrofitting of structures along emergency transportation routes.					
Lead Agency: Bureau of Planning and Sustainability (BPS)		**Partner Agencies:** PBOT, Multnomah County, Oregon Department of Transportation (ODOT), PF&R, Portland Police Bureau (PPB)			
Action Source: 2010 NHMP		**Performance Metric:** # or % Buildings retrofitted			
Earthquake	New	Staff time	Long-term / Ongoing	5, 8, 11, 13	Yes (LT EQ #8)
BPS-16 — Use updated floodplain data and maps, including potential climate change scenarios, to inform City and County land use, transportation, and other infrastructure planning processes.					
Lead Agency: Bureau of Planning and Sustainability (BPS)		**Partner Agencies:** Multnomah County, BES, PBOT, PBEM, Federal Emergency Management Agency (FEMA), Multnomah County Drainage District (MCDD)			
Action Source: BPS Strategic Plan		**Performance Metric:** Progress made towards full incorporation of new floodplain data into land use planning databases.			
Flood, Severe Weather	Both	Staff time	Near-term	1, 2, 4, 5, 9, 10, 12	No
BPS-17 — Encourage or require private property owners and developers to limit or reduce impervious area at citywide, watershed, site-specific and district scales.					
Lead Agency: Bureau of Planning and Sustainability (BPS)		**Partner Agencies:** BES, PBOT			
Action Source: 2010 NHMP		**Performance Metric:** # of successful outreach and/or communication programs completed.			
Flood / Severe weather	New	Staff time	Mid-term	1, 3, 5, 8, 12	Yes (LT FL #8)
BPS-18 — Provide safety training for day laborers, protect workers' rights, and collaborate with Voz to provide a safe place to locate day laborer services to encourage employment of local day laborers for post-disaster reconstruction and recovery. This action needs high-level support from City Council.					
Lead Agency: Bureau of Planning and Sustainability (BPS)		**Partner Agencies:** Portland Development Commission (PDC), Voz, City Council			
Action Source: 2010 NHMP		**Performance Metric:** worker center established, # safety trainings or certifications provided			
All Hazards	N/A	Staff time	Mid-term	2, 6, 7, 8, 14, 15, 16	No
BPS-19 — Update the environmental overlay zone, codes and maps to reflect best available science and the location and extent of risks associated with natural hazards in Portland					
Lead Agency: Bureau of Planning and Sustainability (BPS)		**Partner Agencies:** BES, BDS, PP&R			
Action Source: New		**Performance Metric:** Acres of natural resources included in the overlay zone			
All Hazards	Existing	Staff time	Near-term	1, 3, 4, 5, 6, 8, 10, 14	No
PWB-1 — Continue to assess the vulnerability of the water system to seismic events and work toward hardening the backbone system.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** N/A			
Action Source: 2010 NHMP		**Performance Metric:** Seismic hardening reduces risk by percent of total risk factors			
Earthquake	Both	Capital Improvement Plan (CIP)	Existing/ Ongoing	4, 7, 9, 10	Yes

Hazards Addressed	New or Existing Assets	Funding Options	Timeframe	Objectives Met	In Previous Plan? (# from previous plan)
PWB-2 — Install remote operating valves to isolate existing river crossings.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** N/A			
Action Source: Water System Seismic Study		**Performance Metric:** Valve isolation reduces risk of water loss following damage			
Earthquake	Both	Capital Improvement Plan (CIP)	Mid-Term	4, 11	No
PWB-3 — Install isolation valves where distribution system is tied in to backbone.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** N/A			
Action Source: Water System Seismic Study		**Performance Metric:** Valve isolation reduces risk of water loss following damage			
All Hazards	Both	Capital Improvement Plan (CIP)	Existing/ Ongoing	4, 11	No
PWB-4 — Seismically upgrade water pump stations.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** N/A			
Action Source: Water System Seismic Study		**Performance Metric:** Seismic upgrades reduce risk to water delivery system			
Earthquake	New	Capital Improvement Plan (CIP)	Existing/ Ongoing	4,10	No
PWB-5 — Continue to monitor dam safety at Mt. Tabor and Washington Park reservoirs.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** State Water Resources			
Action Source: Steering Committee		**Performance Metric:** Dam safety reduces flooding risk			
Dam Failure	Existing	Capital Improvement Plan (CIP)	Existing/ Ongoing	10, 9	No
PWB-6 — Seismically upgrade water storage tanks.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** N/A			
Action Source: Water System Seismic Study		**Performance Metric:** Seismic upgrades reduce vulnerability of water storage tanks			
Earthquake	New	Capital Improvement Plan (CIP)	Existing/ Ongoing	4, 11	No
PWB-7 — Plan, design and construct new Willamette River Crossing.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** Division of State Lands, Portland Harbor Master			
Action Source: Portland Water Bureau (PWB) Operations Group		**Performance Metric:** Redundancy of water delivery routes across Willamette River ensures adequate water supply to West side			
Earthquake	New	Capital Improvement Plan (CIP)	Mid-Term	4, 11, 2	No
PWB-8 — Plan, design and construct second new Willamette River Crossing.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** Division of State Lands, Portland Harbor Master			
Action Source: Water System Seismic Study		**Performance Metric:** Redundancy of water delivery routes across Willamette River ensures adequate water supply to West side			
Earthquake	New	Capital Improvement Plan (CIP)	Long-Term	4, 2	No

Hazards Addressed	New or Existing Assets	Funding Options	Timeframe	Objectives Met	In Previous Plan? (# from previous plan)
PWB-9 — Plan, design and construct replacement for St. John's River Crossing.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** Division of State Lands, Portland Harbor Master			
Action Source: Water System Seismic Study		**Performance Metric:** Redundancy of water delivery routes across Willamette River ensures adequate water supply to West side			
Earthquake	New	Capital Improvement Plan (CIP)	Long-Term	4, 11, 2	No
PWB-10 — Partner with University of Washington to participate in the testing of the Earthquake Early Warning System.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** University of WA			
Action Source: Portland Water Bureau (PWB) Engineering		**Performance Metric:** Enhancing early earthquake notification capability saves lives			
Earthquake	Both	Capital Improvement Plan (CIP)	Near-Term	6, 10, 13	No
PWB-11 — Coordinate with electrical utilities on tree fall mitigation measures to prevent impacts to Bull Run watershed supply.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** Portland General Electric (PGE), Local Electrical Utilities			
Action Source: Portland Water Bureau (PWB) Operations Group		**Performance Metric:** Water distribution is protected from power outages			
Severe Weather	Both	Capital Improvement Plan (CIP)	Near-Term	10, 11	No
PWB-12 — Continue to work in a co-management role with the Oregon Department of Forestry, US Forest Service and local fire departments to respond to and recover from fires in and near the Bull Run watershed.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** Oregon Department of Forestry, United States Forest Service (USFS), Local Fire Departments			
Action Source: Bull Run Watershed Group Recommendations		**Performance Metric:** Water supply and distribution is protected from wildfire damage			
Wildfire	Both	Capital Improvement Plan (CIP)	Existing/ Ongoing	10, 11	No
PWB-13 — Continue to assess the potential impacts of climate change on wildfire in the Bull Run watershed.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** National Oceanic and Atmospheric Administration (NOAA)			
Action Source: Bull Run Watershed Group Recommendations		**Performance Metric:** Ongoing assessment helps to address changes timely			
Wildfire	Both	Capital Improvement Plan (CIP)	Existing/ Ongoing	9, 10	No
PWB-14 — Continue to monitor forest health surveys completed by federal and state agency partners for the Bull Run watershed.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** United States Forest Service (USFS), Oregon Department of Forestry			
Action Source: Bull Run Watershed Group Recommendations		**Performance Metric:** Monitoring forest health surveys helps address issues timely			
Wildfire	Both	Capital Improvement Plan (CIP)	Existing/ Ongoing	9,10	No

Hazards Addressed	New or Existing Assets	Funding Options	Timeframe	Objectives Met	In Previous Plan? (# from previous plan)
PWB-15 — Update the Bull Run wildfire evacuation plan.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** United States Forest Service (USFS), Oregon Department of Forestry, Sandy Fire, Clackamas County Communications, Clackamas Emergency Management			
Action Source: Bull Run Watershed Group Recommendations		**Performance Metric:** Evacuation planning protects people and property			
Wildfire	Existing	Capital Improvement Plan (CIP)	Existing/ Ongoing	4, 16	No
PWB-16 — Identify and prioritize culvert improvements in the Bull Run watershed to manage streamflow and stormwater runoff and reduce risks to water quality and infrastructure.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** United States Forest Service (USFS)			
Action Source: Bull Run Watershed Group Recommendations		**Performance Metric:** Culvert improvements protect water supply by reducing runoff			
Flood	Both	Capital Improvement Plan (CIP)	Existing/ Ongoing	4, 11	No
PWB-17 — Continue to assess the potential impacts of climate change on flooding in the Bull Run watershed.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** United States Forest Service (USFS), National Oceanic and Atmospheric Administration (NOAA)			
Action Source: Bull Run Watershed Group Recommendations		**Performance Metric:** Ongoing assessment of climate change impacts allows for adjustments to protect water supply and prevent flooding			
Flood	Both	Capital Improvement Plan (CIP)	Existing/ Ongoing	9, 10	No
PWB-18 — Continue to assess the potential impacts of climate change associated with drought in the Bull Run watershed.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** United States Forest Service (USFS), National Oceanic and Atmospheric Administration (NOAA), Oregon Water Resources Department			
Action Source: Portland Water Bureau (PWB) Engineering		**Performance Metric:** Ongoing assessment of climate change impacts allows for adjustments to protect water supply from drought impacts			
Drought	Both	Capital Improvement Plan (CIP)	Existing/ Ongoing	9, 10	No
PWB-19 — Perform seismic/dynamic analysis of Bull Run watershed bridges.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** United States Forest Service (USFS)			
Action Source: Water System Seismic Study		**Performance Metric:** Seismic analysis helps to plan improvements to prevent damage to critical transportation routes			
Earthquake	New	Capital Improvement Plan (CIP)	Mid-Term	9, 10	No

Hazards Addressed	New or Existing Assets	Funding Options	Timeframe	Objectives Met	In Previous Plan? (# from previous plan)
PWB-20 — Continue to implement with the USFS the Portland Water Bureau (PWB) transportation system management plan for emergency and fire access in Bull Run Watershed.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** United States Forest Service (USFS)			
Action Source: Portland Water Bureau (PWB) Engineering		**Performance Metric:** Implementation of a management plan for emergency and fire access transportation routes protects water supply access			
Wildfire	Both	Capital Improvement Plan (CIP)	Existing/ Ongoing	5, 9, 11	No
PWB-21 — Continue to partner with electrical utilities to ensure continuity of electrical service to the City and the Columbia South Shore Well field during power outages					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** Portland General Electric (PGE), Local Electrical Utilities, Pacific Power & Light			
Action Source: 2010 NHMP		**Performance Metric:** Partnership with electrical utilities to ensure power to the City and South Shore Well field during power outages ensures uninterrupted water supply			
All Hazards	Both	Capital Improvement Plan (CIP)	Existing/ Ongoing	4, 5, 11	Yes (ST MH #8)
PWB-22 — Collaborate with Multnomah County Drainage District and Port of Portland to assess flooding impacts from levee failure, quantify risks, and identify potential mitigation strategies.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** Multnomah County Drainage District (MCDD), Port of Portland, Multnomah County Levee Ready Columbia, United States Army Corps of Engineers (USACE)			
Action Source: Steering Committee		**Performance Metric:** Prevent flood damage through assessment and mitigation planning			
Flood	Both	Capital Improvement Plan (CIP)	Mid-Term	4, 5	No
PWB-23 — Make seismic improvements to Columbia South Shore well field and groundwater pump station					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** N/A			
Action Source: Portland Water Bureau (PWB) Operations Group		**Performance Metric:** Seismic improvements protect water supply and distribution systems			
Earthquake	New	Capital Improvement Plan (CIP)	Existing/ Ongoing	4, 11	No
PWB-24 — Install backup transformer(s) at Groundwater Pump Stations to reduce vulnerability to power outage.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** Portland General Electric (PGE)			
Action Source: Portland Water Bureau (PWB) Operations Group		**Performance Metric:** Redundancy of power supply system ensures uninterrupted water distribution			
All Hazards	New	Capital Improvement Plan (CIP)	Mid-Term	4, 11	No

Hazards Addressed	New or Existing Assets	Funding Options	Timeframe	Objectives Met	In Previous Plan? (# from previous plan)
PWB-25 — Investigate well treatment options to increase existing well capacity.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** N/A			
Action Source: Portland Water Bureau (PWB) Operations Group		**Performance Metric:** Reducing well deposits increases well holding capacity			
All Hazards	Both	Capital Improvement Plan (CIP)	Long-Term	4, 10, 8	No
PWB-26 — Investigate hypochlorite generation at ground water pump station to reduce or eliminate the need for out of area deliveries.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** N/A			
Action Source: Portland Water Bureau (PWB) Operations Group		**Performance Metric:** Reducing dependence on out of area deliveries ensures uninterrupted water treatment when transportation network is damaged			
All Hazards	Both	Capital Improvement Plan (CIP)	Mid-Term	4, 8, 16	No
PWB-27 — Continue to research ways to balance the needs between fire flow requirements and water quality requirements.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** Portland Fire & Rescue (PF&R)			
Action Source: Steering Committee		**Performance Metric:** Ensures that water quality is maintained			
Wildfire	Both	Capital Improvement Plan (CIP)	Long-term	9,10	No
PWB-28 — Coordinate with Fleet and PBOT Maintenance Operations to ensure adequate reserves of diesel fuel and gasoline to support extended operations.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** Office of Management and Finance (OMF) - Fleet, PBOT Maintenance Operations			
Action Source: Portland Water Bureau (PWB) Operations Group		**Performance Metric:** Adequate fuel storage reserves ensures water distribution systems can continue to operate			
All Hazards	New	Capital Improvement Plan (CIP)	Near-Term	11, 16	No
PWB-29 — Work with other City bureaus to investigate potential for pre-disaster agreements to provide fuel, shelter, food, water, and sanitary facilities, materials, supplies, equipment, and specialty contractors for City response.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** City bureaus			
Action Source: Portland Water Bureau (PWB) Engineering		**Performance Metric:** Pre-disaster agreements to provide critical resources will allow for quicker emergency response in the event of a disaster			
All Hazards	Both	Capital Improvement Plan (CIP)	Near-Term	13, 14, 15	No
PWB-30 — Partner with Multnomah County, Metro, Portland Public Schools (PPS), adjacent school districts, and Portland Parks and Recreation (PP&R) to develop a sheltering plan for city responders and their families.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** Multnomah County, Metro, PPS, local school districts, PP&R			
Action Source: Portland Water Bureau (PWB) Engineering		**Performance Metric:** Development of a plan and identification of shelter locations for responders and their families allows quicker response in disasters			
All Hazards	Both	Capital Improvement Plan (CIP)	Near-Term	13, 14, 15	No

Hazards Addressed	New or Existing Assets	Funding Options	Timeframe	Objectives Met	In Previous Plan? (# from previous plan)
PWB-31 — Investigate availability, capacity, contracting and delivery of portable water treatment plants					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** Federal Emergency Management Agency (FEMA), Army National Guard, Regional Water Providers Consortium			
Action Source: Water System Seismic Study		**Performance Metric:** Ensures availability of potable water after an event			
All Hazards	New	Capital Improvement Plan (CIP)	Mid-Term	10, 14	No
PWB-32 — Investigate availability and use of food-grade quality tank trucks for distribution of water following emergencies.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** Federal Emergency Management Agency (FEMA)			
Action Source: Water System Seismic Study		**Performance Metric:** Benefit is potential for expanded water delivery system via tank trunks			
All Hazards	New	Capital Improvement Plan (CIP)	Mid-Term	14, 16	No
PWB-33 — Determine number, locations and types of Emergency Water Distribution Systems, and provide location information to the public.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** Federal Emergency Management Agency (FEMA), Regional Water Providers Consortium			
Action Source: Water System Seismic Study		**Performance Metric:** Water distribution planning and publication of locations improves critical access to potable water following disasters			
All Hazards	New	Capital Improvement Plan (CIP)	Mid-Term	14, 16	No
PWB-34 — Investigate and implement use of Integrated Public Alert and Warning System (IPAWS) / Wireless Emergency Alerts (WEA) systems to send alerts from specific cell towers to cell phones for those in specific locations affected by an event.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** PBEM; Federal Emergency Management Agency (FEMA); Multnomah, Clackamas, and Washington Counties			
Action Source: Steering Committee		**Performance Metric:** Emergency notifications save lives			
All Hazards	Both	Capital Improvement Plan (CIP)	Near-Term	6, 13	No
PWB-35 — Develop measures to rapidly isolate damaged portions of the water conveyance system (most of Vernon 270, Washington Park 229 and Tabor 270) to minimize water loss and preserve storage					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** Portland Fire & Rescue (PF&R)			
Action Source: Water System Seismic Study		**Performance Metric:** Minimizing water loss ensures adequate water supply			
All Hazards	New	Capital Improvement Plan (CIP)	Mid-Term	4, 16	No
PWB-36 — Further study the feasibility of seismic valve installation at strategic locations to protect water supply & storage.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** Portland Fire & Rescue (PF&R)			
Action Source: Portland Water Bureau (PWB) Engineering		**Performance Metric:** Protection of water storage and minimizing seismic impacts protects water supply			
Earthquake	Both	Capital Improvement Plan (CIP)	Mid-Term	4,10	No

Hazards Addressed	New or Existing Assets	Funding Options	Timeframe	Objectives Met	In Previous Plan? (# from previous plan)
PWB-37 — Participate with PBOT, Multnomah County, Oregon Department of Transportation (ODOT), Metro, Clackamas County and USFS in an in depth risk assessment of the bridges to develop and prioritize mitigation projects to ensure connectivity after an event.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** PBOT, Multnomah County, Oregon Department of Transportation (ODOT), Metro, Clackamas County, United States Forest Service (USFS)			
Action Source: Steering Committee		**Performance Metric:** Ensuring access to critical transportation, including bridges, ensures water delivery despite disaster damage			
Earthquake	Both	Capital Improvement Plan (CIP)	Mid-Term	4,10,14	No
PWB-38 — Coordinate with Multnomah County, Clackamas County, Metro, Oregon Department of Transportation (ODOT) and PBOT to ensure road system access to critical facilities including Interstate, Lusted Hill, Headworks, Sandy River Station, pump stations, and tank/reservoir sites.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** PBOT, Multnomah County, Oregon Department of Transportation (ODOT), Metro, Clackamas County, United States Forest Service (USFS)			
Action Source: Portland Water Bureau (PWB) Operations Group		**Performance Metric:** Access to critical facilities following disasters ensures water delivery			
All Hazards	Both	Capital Improvement Plan (CIP)	Near-Term	4,10,14	No
PWB-39 — Revise current emergency response plans based on recommendations from the Water Bureau Seismic Study.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** PBEM			
Action Source: Water System Seismic Study		**Performance Metric:** Including seismic risks in planning emergency response is critical to determine strategies to protect and provide water system maintenance, transportation, supply and delivery			
All Hazards	Existing	Capital Improvement Plan (CIP)	Near-Term	10, 13, 16	No
PWB-40 — Continue to support research of best available science and data for space weather and potential impacts to the City of Portland, and where possible take steps to increase resilience of city infrastructure to space weather events.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** National Oceanic and Atmospheric Administration (NOAA)			
Action Source: Steering Committee		**Performance Metric:** Consideration of potential impacts to communication and other systems protects water distribution			
Space Weather	Both	Capital Improvement Plan (CIP)	Existing/ Ongoing	10, 4	No

Hazards Addressed	New or Existing Assets	Funding Options	Timeframe	Objectives Met	In Previous Plan? (# from previous plan)
PWB-41 — Develop main replacement program with earthquake resistant pipe (Kubota ERDIP or US-Pipe TR-EXTREME) in areas of high permanent ground deformation					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** N/A			
Action Source: Water System Seismic Study		**Performance Metric:** Seismic resiliency for at-risk locations prevents catastrophic failure			
Earthquake	Both	Capital Improvement Plan (CIP)	Mid-Term	4, 11	No
PWB-42 — Support the creation of a City of Portland Seismic Resiliency Officer position under PBEM to drive citywide resiliency efforts. This action needs high-level support from City Council.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** City Council, PBEM			
Action Source: Steering Committee		**Performance Metric:** Seismic resiliency officer position would assist resiliency efforts			
Earthquake	Both	Capital Improvement Plan (CIP)	Near-Term	7, 16	No
PWB-43 — Coordinate with Commissioner's Office and Office of Government Relations (OGR) to elevate seismic retrofit funding for water infrastructure to a high priority on the City's legislative agenda. This action needs high-level support from City Council and Office of Government Relations (OGR).					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** Commissioner's Office, Office of Government Relations (OGR)			
Action Source: Portland Water Bureau (PWB) Engineering		**Performance Metric:** Provides a mechanism for requesting seismic improvement funding			
Earthquake	Both	Capital Improvement Plan (CIP)	Near-Term	4, 7	No
PWB-44 — Collaborate with other City bureaus to encourage and expand personal, family and business preparedness plans and programs.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** City bureaus, PBEM			
Action Source: Steering Committee		**Performance Metric:** Personal and family preparedness saves lives; business preparedness allows continuity. Responders are able to assist more readily if families are prepared.			
Earthquake	Both	Capital Improvement Plan (CIP)	Near-Term	6, 13	No
PWB-45 — Develop a West-side emergency operations and staging facility for field crews.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** N/A			
Action Source: Portland Water Bureau (PWB) Engineering		**Performance Metric:** Ensures access to materials and personnel to respond in emergencies.			
All Hazards	Both	Capital Improvement Plan (CIP)	Mid-Term	14, 15	No
PWB-46 — Develop a staging plan for stockpiling water system repair materials in strategic locations.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** N/A			
Action Source: Portland Water Bureau (PWB) Engineering		**Performance Metric:** Ensures repairs despite transportation system damage			
All Hazards	Both	Capital Improvement Plan (CIP)	Mid-Term	15, 16	No

Hazards Addressed	New or Existing Assets	Funding Options	Timeframe	Objectives Met	In Previous Plan? (# from previous plan)
PWB-47 — Continue to conduct ongoing emergency response training for all Portland Water Bureau (PWB) employees.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** PBEM			
Action Source: Water System Seismic Study		**Performance Metric:** Ensures organized and effective response to disasters			
All Hazards	Both	Capital Improvement Plan (CIP)	Long-term	15, 16	No
PWB-48 — Purchase additional vacuum excavator to facilitate access to water system for maintenance and repairs.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** N/A			
Action Source: Water System Seismic Study		**Performance Metric:** Protects assets			
All Hazards	Both	Capital Improvement Plan (CIP)	Mid-Term	4, 16	No
PWB-49 — Establish relationships with out-of-state utilities for future Emergency Management Assistance Compact (EMAC) agreements.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** National WARN, out-of-state utilities			
Action Source: Water System Seismic Study		**Performance Metric:** Ensures power supply in catastrophic outages			
All Hazards	Both	Capital Improvement Plan (CIP)	Near-Term	14, 16	No
PWB-50 — Establish and document PWB reporting standards for both temporary protective measures and permanent repairs in compliance with Federal Emergency Management Agency (FEMA) guidelines.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** Federal Emergency Management Agency (FEMA), PBEM, Oregon Emergency Management (OEM), Multnomah County			
Action Source: Water System Seismic Study		**Performance Metric:** Ensures FEMA reimbursement success			
All Hazards	Both	Capital Improvement Plan (CIP)	Near-Term	14, 16	No
PWB-51 — Train PWB responders to understand and follow protocols for Federal Emergency Management Agency (FEMA) reporting.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** Federal Emergency Management Agency (FEMA), PBEM			
Action Source: Water System Seismic Study		**Performance Metric:** Ensures FEMA reimbursement success			
All Hazards	Both	Capital Improvement Plan (CIP)	Near-Term	14, 16	No
PWB-52 — Upgrade trestles that carry Conduits 2 and 3 of the water delivery system.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** United States Forest Service (USFS), Clackamas County			
Action Source: 2010 NHMP		**Performance Metric:** Upgrade mitigates loss			
All Hazards	Both	Capital Improvement Plan (CIP)	Mid-Term	4, 11	Yes

Hazards Addressed	New or Existing Assets	Funding Options	Timeframe	Objectives Met	In Previous Plan? (# from previous plan)
PWB-53 — Create redundancy in the water delivery system by burying Conduit 3 under the Sandy River.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** Division of State Lands, Clackamas County			
Action Source: 2010 NHMP		**Performance Metric:** Ensures water delivery			
All Hazards	Both	Capital Improvement Plan (CIP)	Long-Term	4, 11	Yes
PWB-54 — Continue to mitigate Portland's water supply infrastructure and the Bull Run Watershed from landslide hazards; incorporate landslide hazard reduction techniques into infrastructure projects.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** N/A			
Action Source: 2010 NHMP		**Performance Metric:** Mitigates loss due to landslide			
Landslide	Both	Capital Improvement Plan (CIP)	Existing/ Ongoing	4, 10, 11	Yes
PWB-55 — Seismically harden Groundwater Transmission Main.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** PBOT			
Action Source: Water System Seismic Study		**Performance Metric:** Critical location requiring seismic stability – Protects water delivery system			
Earthquake	Both	Capital Improvement Plan (CIP)	Long-Term	4, 11	No
PWB-56 — Seismically harden conduits from Headworks to Powell Butte.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** United States Forest Service (USFS)			
Action Source: Water System Seismic Study		**Performance Metric:** Seismic resiliency critical to water delivery			
Earthquake	Both	Capital Improvement Plan (CIP)	Long-Term	4, 11	No
PWB-57 — Mitigate landslide hazards for the conduits within the Bull Run watershed.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** United States Forest Service (USFS)			
Action Source: Water System Seismic Study		**Performance Metric:** Mitigate loss due to landslide			
Landslide	Both	Capital Improvement Plan (CIP)	Long-Term	4, 11	No
PWB-58 — Make seismic improvements at Headworks.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** N/A			
Action Source: Portland Water Bureau (PWB) Operations Group		**Performance Metric:** Mitigates loss			
Earthquake	Both	Capital Improvement Plan (CIP)	Long-Term	4, 11	No
PWB-59 — Make seismic improvements at Lusted Hill Treatment Facility.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** Multnomah County			
Action Source: Portland Water Bureau (PWB) Operations Group		**Performance Metric:** Mitigates loss			
Earthquake	Both	Capital Improvement Plan (CIP)	Long-Term	4, 11	No

Hazards Addressed	New or Existing Assets	Funding Options	Timeframe	Objectives Met	In Previous Plan? (# from previous plan)
PWB-60 — Install remote monitoring sensors and alarms at Bull Run dams to provide an early detection of dam movement or change.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** United States Forest Service (USFS), Federal Energy Regulatory Commission (FERC)			
Action Source: Portland Water Bureau (PWB) Operations Group		**Performance Metric:** Mitigation and early warning would be possible with monitoring			
Dam Failure	Both	Capital Improvement Plan (CIP)	Mid-Term	4, 9, 13	No
PWB-61 — Continue to monitor Bull Run Dams 1 and 2 for seismic risk, floods and landslides					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** United States Forest Service (USFS), Federal Energy Regulatory Commission (FERC)			
Action Source: Portland Water Bureau (PWB) Engineering		**Performance Metric:** Monitoring allows for early warning and loss mitigation			
All Hazards	Both	Capital Improvement Plan (CIP)	Existing/ Ongoing	4, 9	No
PWB-62 — Replace Cast Iron piping with seismically resilient pipe material.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** N/A			
Action Source: Portland Water Bureau (PWB) Operations Group		**Performance Metric:** Seismic resilience reduces loss			
Earthquake	Both	Capital Improvement Plan (CIP)	Existing/ Ongoing	4, 11	No
PWB-63 — Establish a pre-disaster inter-bureau agreement with Office of Management and Finance (OMF) - Fleet and PBOT Maintenance Operations to assign personnel, equipment, and resources to work in coordination with Portland Water Bureau (PWB) response.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** OMF - Fleet, PBOT Maintenance Operations			
Action Source: Portland Water Bureau (PWB) Operations Group		**Performance Metric:** Continuity of operations is enhanced for all departments			
All Hazards	Both	Capital Improvement Plan (CIP)	Near-Term	6, 7, 13	No
PWB-64 — Coordinate with FEMA on results of updated flood-plain mapping on Willamette River for impacts to Portland Water Bureau (PWB) facilities.					
Lead Agency: Portland Water Bureau (PWB)		**Partner Agencies:** Federal Emergency Management Agency (FEMA), BES			
Action Source: Portland Water Bureau (PWB) Operations Group		**Performance Metric:** Flood plain mapping and planning for impacts to Portland Water Bureau (PWB) facilities would help with mitigation and alternative water delivery planning			
Flood	Both	Capital Improvement Plan (CIP)	Near-Term	6, 7, 13	No
OMF-1 — Participate in Oregon Solutions project to recertify Multnomah County Drainage District (MCDD) levees.					
Lead Agency: Office of Management and Finance (OMF)		**Partner Agencies:** BDS, Oregon Solutions			
Action Source: 2010 NHMP		**Performance Metric:** Staff time and funding for levee recertification.			
Flood	Existing	Staff Time/Budget Reallocation	Long-term	4, 5	Yes (LT MH #10)

Hazards Addressed	New or Existing Assets	Funding Options	Timeframe	Objectives Met	In Previous Plan? (# from previous plan)
OMF-2 — Partner with agencies to develop an emergency operations center on the west side of the Willamette River. This action needs high-level support from City Council.					
Lead Agency: Office of Management and Finance (OMF)		**Partner Agencies:** PBOT, City Budget Office (CBO), Bureau of Emergency Communications (BOEC), City Council			
Action Source: 2010 NHMP		**Performance Metric:** West side emergency operations center developed and operational.			
All Hazards	New	Staff Time/Budget Reallocation	Long-term	2, 4, 5, 15	Yes (New MH #5)
PBOT-1 — Perform risk assessment of bridges; use findings to develop and prioritize mitigation projects. Ensure equity tools are used in project prioritization.					
Lead Agency: PBOT		**Partner Agencies:** PWB			
Action Source: Steering Committee		**Performance Metric:** Risk assessment completed and Plan created. Project prioritization has equity criteria.			
Earthquake	New	Staff Time/ Hazard Mitigation Grant Program (HMGP) /Pre-Disaster Mitigation (PDM) grant	Long Term	4, 5, 7,10,11	No
PBOT-2 — Identify transportation routes likely to be impacted by landslides and identify potential alternate routes based on most likely scenarios. Communicate potential alternate routes with the public, highlighting the fact that routes may change during actual events. Ensure this information is available to those with limited English proficiency, as well as seniors and those with disabilities.					
Lead Agency: PBOT		**Partner Agencies:** PBEM, Oregon Department of Transportation (ODOT)			
Action Source: Steering Committee (Landslide 95)		**Performance Metric:** Routes identified, communication to disadvantaged communities.			
Landslide	New	Staff Time/ HMGP /PDM	Mid-term	4, 5, 6	No
PBOT-3 — Design and build facility for PBOT Maintenance Operations that can operate as a Bureau Incident Command Post following a large earthquake. Move existing road clearing equipment to a facility that is not subject to freeway ramp collapse. Engage local community groups, especially communities of color, in design phase and ensure Minority, Women Owned Emerging Small Business contracting meets or exceeds aspirational goals.					
Lead Agency: PBOT		**Partner Agencies:** Office of Management and Finance (OMF) – Fleet			
Action Source: Hazard Mitigation Catalog		**Performance Metric:** Facility designed, funded and built. Community engagement.			
Earthquake	New	Staff Time/ HMGP /PDM	Mid-term	4, 5, 11, 13	No
PBOT-4 — Perform drainage assessment and mitigate problem areas of right of way where frequent washouts occur during heavy rains.					
Lead Agency: PBOT		**Partner Agencies:** Parks, BES, Oregon Department of Transportation (ODOT)			
Action Source: Hazard Mitigation Catalog		**Performance Metric:** Assessment performed			
Severe weather	New	Staff Time/ HMGP/PDM	Mid-term	3, 4, 5, 7, 11	No
PBOT-5 — Continue to convene city landslide group after each major landslide occurrence (including large single landslides or multiple concurrent landslides) to evaluate the city's response and develop lessons learned.					
Lead Agency: PBOT		**Partner Agencies:** PBEM, BDS			
Action Source: 2010 NHMP		**Performance Metric:** Landslide group convenes after landslides.			
Landslide	N/A	Staff Time	Long-term	9, 14, 15	Yes (ST LS #1)
BES-1 — Continue to implement actions in the 2005 Portland Watershed Management Plan.					
Lead Agency: Bureau of Environmental Services (BES)		**Partner Agencies:** N/A			
Action Source: 2010 NHMP		**Performance Metric:** # of green infrastructure projects completed			
Erosion, Landslide, Flood	N/A	Staff Time	Long-term	3, 4	Yes (ST MH #11)

Hazards Addressed	New or Existing Assets	Funding Options	Timeframe	Objectives Met	In Previous Plan? (# from previous plan)
BES-2 — Engage with the electric utilities to negotiate prioritizing the return of power to treatment plants (Tryon Creek and Columbia Boulevard), collection system active controls and pump stations.					
Lead Agency: Bureau of Environmental Services (BES)		**Partner Agencies:** PBEM, Utilities			
Action Source: 2010 NHMP		**Performance Metric:** Agreement with electric utilities executed.			
Earthquake	N/A	Staff Time	Near-Term	4, 16	Yes (ST EQ #4)
BES-3 — Complete the BES Resiliency Plan to identify vulnerabilities in the sanitary and combined sewer collection system.					
Lead Agency: Bureau of Environmental Services (BES)		**Partner Agencies:** N/A			
Action Source: 2010 NHMP		**Performance Metric:** Completion of BES Resiliency Plan.			
Earthquake	N/A	Staff Time	Near-Term	4, 16	Yes (ST EQ #3)
BES-4 — Continue BES' land acquisition program to protect or enhance water quality, hydrology and habitat. Consider the presence of floodplain and steep slopes in the program's criteria. When properties are purchased, remove structures and place deed restrictions to limit to open space uses, to protect them as natural resource areas or other green infrastructure in perpetuity.					
Lead Agency: Bureau of Environmental Services (BES)		**Partner Agencies:** PP&R, Metro			
Action Source: 2010 NHMP		**Performance Metric:** # of acres acquired through the Watershed Land Acquisition Program.			
All Hazards	N/A	Staff Time, Budget Allocation	Long-term	11, 12	Yes (New Reworded MH)
BES-5 — Develop permitting and policy tools to offset impacts of floodplain development with mitigation on sites that increase flood storage and enhance ecological functions, consistent with new floodplain regulations.					
Lead Agency: Bureau of Environmental Services (BES)		**Partner Agencies:** BDS, Portland Development Commission (PDC)			
Action Source: BES Strategic Plan		**Performance Metric:** Adoption of policies and new permitting requirements.			
Flood	N/A	Staff Time	Mid-term	3, 4, 5, 7, 8, 12	No
BES-6 — Continue to fund the Johnson Creek Willing Seller Program to reduce the risks of flooding, while improving natural floodplain conditions in the watershed.					
Lead Agency: Bureau of Environmental Services (BES)		**Partner Agencies:** PP&R			
Action Source: 2010 NHMP		**Performance Metric:** # of acres acquired through the Johnson Creek Willing Seller Program.			
Flood	N/A	Staff Time, Budget Allocation	Long-term	3, 7, 11	Yes (LT FL #1)
BES-7 — Continue to partner with United States Geological Survey (USGS) to maintain and improve river and stream gauges in the Portland metropolitan area.					
Lead Agency: Bureau of Environmental Services (BES)		**Partner Agencies:** PBEM, PBOT			
Action Source: 2010 NHMP		**Performance Metric:** N/A			
Flood	N/A	Staff Time	Long-term	9, 10	Yes (ST FL #2)
BES-8 — Continue to provide publicly accessible information on landscaping techniques that reduce water run-off.					
Lead Agency: Bureau of Environmental Services (BES)		**Partner Agencies:** East Multnomah Soil and Water Conservation District, West Multnomah Soil and Water Conservation District, Watershed Councils			
Action Source: BES Strategic Plan		**Performance Metric:** N/A			
Flood	N/A	Staff Time	Long-term	3, 12	No

Hazards Addressed	New or Existing Assets	Funding Options	Timeframe	Objectives Met	In Previous Plan? (# from previous plan)
BES-9 — Design and conduct a study to determine the effectiveness of maintenance agreements that require homeowners associations to manage vegetation in open space tracts when new land divisions are approved.					
Lead Agency: Bureau of Environmental Services (BES)		**Partner Agencies:** BDS			
Action Source: 2010 NHMP		**Performance Metric:** Completion of study.			
Wildfire	N/A	Staff Time	Near-Term	3, 12	Yes (LT WF #3)
BES-10 — Update the Stormwater Management Manual on a regular basis to incorporate best management practices, address development-related issues and work effectively with natural hydrologic conditions.					
Lead Agency: Bureau of Environmental Services (BES)		**Partner Agencies:** BDS			
Action Source: 2010 NHMP		**Performance Metric:** Updates completed.			
Flood	N/A	Staff Time	Long-term	1, 3, 12	Yes (ST FL #10)
BES-11 — Investigate design approaches for effectively managing stormwater in landslide-prone areas.					
Lead Agency: Bureau of Environmental Services (BES)		**Partner Agencies:** PBOT			
Action Source: 2010 NHMP		**Performance Metric:** Design approaches developed.			
Landslide	N/A	Staff Time	Long-term	3, 4, 5, 12	Yes (LT LS #4)
BES-12 — Continue the City's vegetation management, public education programs, and partnerships with watershed councils and the soil and water conservation districts to prevent erosion along streams and rivers.					
Lead Agency: Bureau of Environmental Services (BES)		**Partner Agencies:** PP&R, Watershed Councils, Soil and Water Conservation Districts			
Action Source: 2010 NHMP		**Performance Metric:** # of projects completed.			
Flood, Landslide	N/A	Staff Time	Long-term	3, 6, 12	Yes (ER #1)
BES-13 — Continue to implement projects that retain native vegetation, increase vegetation diversity and increase the complexity of the vegetation strata (having at least three vegetation strata: herbs, shrubs, trees).					
Lead Agency: Bureau of Environmental Services (BES)		**Partner Agencies:** PP&R			
Action Source: 2010 NHMP		**Performance Metric:** Acres managed or restored.			
Flood, Landslide	N/A	Staff Time, Budget Allocation	Long-term	3, 8, 12	Yes (ER #2)
BES-14 — Continue to implement City restoration projects that increase large wood and root wads, which soften the effect of wave action on shorelines as well as provide habitat for migrating salmonids.					
Lead Agency: Bureau of Environmental Services (BES)		**Partner Agencies:** N/A			
Action Source: 2010 NHMP		**Performance Metric:** River or stream miles restored with large wood.			
Flood	N/A	Staff Time, Budget Allocation, Hazard Mitigation Assistance (HMA) (Floodplain & Stream Restoration, Flood Diversion & Storage)	Long-term	3, 8	Yes (ER #8)
BES-15 — Support Early Detection and Rapid Response to control invasive plant and insect populations that threaten forest infrastructure.					
Lead Agency: Bureau of Environmental Services (BES)		**Partner Agencies:** PP&R, United States Department of Agriculture (USDA), Oregon Department of Agriculture (ODA)			
Action Source: BES Strategic Plan		**Performance Metric:** N/A			
Landslide, Wildfire	N/A	Staff Time	Long-term	3, 12	No

Hazards Addressed	New or Existing Assets	Funding Options	Timeframe	Objectives Met	In Previous Plan? (# from previous plan)
BES-16 — Explore options to acquire rights of first refusal for properties that become non-conforming uses in the floodplain due to changing regulations. Right of first refusal would be exercised when properties are substantially damaged by a flood event. Consider establishing an acquisition fund for these properties that amortizes the cost of acquisition over decades.					
Lead Agency: Bureau of Environmental Services (BES)		**Partner Agencies:** PP&R, Metro			
Action Source: BES Strategic Plan		**Performance Metric:** White paper completed documenting the anticipated effectiveness of this tool.			
Flood	N/A	Staff Time, HMA	Long-term	7, 11, 12	No
BES-17 — Complete the Stormwater System Plan, including strategies to reduce risks related to runoff in areas at risk of natural hazards.					
Lead Agency: Bureau of Environmental Services (BES)		**Partner Agencies:** PP&R, PBOT			
Action Source: BES Strategic Plan		**Performance Metric:** Stormwater System Plan completed.			
Landslide, Flood	N/A	Staff Time	Near-Term	3, 4	No
BES-18 — Continue to implement green infrastructure projects and natural area restoration projects identified in BES' watershed management plans and system plans.					
Lead Agency: Bureau of Environmental Services (BES)		**Partner Agencies:** PP&R, PBOT			
Action Source: BES Strategic Plan		**Performance Metric:** # and type of projects completed.			
Landslide, Flood	N/A	Staff Time, HMA (Floodplain & Stream Restoration, Flood Diversion & Storage)	Long-term	3, 4	No
BES-19 — Partner with community groups and residents to plant trees and revegetate natural areas and open spaces to improve local hydrology and stormwater management and to promote resiliency of and equitable benefits provided by the urban forest.					
Lead Agency: Bureau of Environmental Services (BES)		**Partner Agencies:** PP&R, Watershed Councils, Friends of Trees			
Action Source: BES Strategic Plan		**Performance Metric:** # of trees planted; # of acres revegetated.			
Flood, Landslide	N/A	Staff Time	Long-term	2, 3, 15	No
BES-20 — Support Multnomah County Drainage District (MCDD) in their continued calibration and update of hydraulic models for conveyance and internal flood impacts to the four floodplains managed by MCDD #1.					
Lead Agency: Bureau of Environmental Services (BES)		**Partner Agencies:** MCDD			
Action Source: 2010 NHMP		**Performance Metric:** N/A			
Flood	N/A	Staff Time	Long-term	5, 9, 10	Yes (ST FL #6)
BES-21 — Provide technical assistance to support Multnomah County Drainage District in conducting flooding impact studies from levee failure and develop a risk assessment using the updated general building stock, critical facility and demographic information developed for the mitigation action plan.					
Lead Agency: Bureau of Environmental Services (BES)		**Partner Agencies:** BPS, MCDD			
Action Source: BES Strategic Plan		**Performance Metric:** N/A			
Flood, Dam Failure	N/A	Staff Time	Near-term	2, 4, 5, 10	No
BES-22 — Work with the Federal Emergency Management Agency (FEMA) to remap all City of Portland streams to identify changes in peak flows and flood extents due to climate change.					
Lead Agency: Bureau of Environmental Services (BES)		**Partner Agencies:** Federal Emergency Management Agency (FEMA), United States Army Corps of Engineers (USACE)			
Action Source: BES Strategic Plan		**Performance Metric:** N/A			
Flood	N/A	Staff Time	Near-term	3, 9, 10	No

Hazards Addressed	New or Existing Assets	Funding Options	Timeframe	Objectives Met	In Previous Plan? (# from previous plan)
BES-23 — Where feasible, cost effective and supported both publicly and politically, restore the natural and beneficial floodplain functions of appropriate floodplains within the City. For this action, appropriate means a floodplain that has been identified through a master plan or study certified by a qualified agency.					
Lead Agency: Bureau of Environmental Services (BES)		**Partner Agencies:** PP&R, BDS			
Action Source: Community Rating System (CRS)		**Performance Metric:** # of acres of restored floodplain			
Flood	Both	Flood Mitigation Assistance (FMA) grant, PDM, HMGP, Land and Water Conservation Fund, Johnson Creek Willing Seller Program	Long-term	1, 2, 3, 4, 11	No
BDS-1 — Increase the responsiveness of the emergency permitting procedures for post-hazard event periods through development of procedural plan that considers equity implications.					
Lead Agency: Bureau of Development Services (BDS)		**Partner Agencies:** N/A			
Action Source: 2010 NHMP		**Performance Metric:** N/A			
All Hazards	N/A	Staff Time	Near-Term	2, 15, 16	Yes (LT MH #3)
BDS-2 — Enforce codes relating to wildfire, earthquake, flood, and landslide, including Portland City Code (PCC) 24.51 (fire-safe materials), PCC 24.85 (seismic upgrades), PCC 24.50 (local flood hazard mitigation), and develop a publicly accessible landslide code guide in plain language to assist developers in complying with landslide-related building codes.					
Lead Agency: Bureau of Development Services (BDS)		**Partner Agencies:** BPS			
Action Source: 2010 NHMP		**Performance Metric:** N/A			
Wildfire, Earthquake, Flood, Landslide	N/A	Staff Time	Long-term	1, 6, 12	Yes (New MH #3)
BDS-3 — Develop an ordinance requiring a covenant to be recorded on the deed for new development in the FEMA special flood hazard area to ensure that space below the base flood elevation is not converted to habitable space.					
Lead Agency: Bureau of Development Services (BDS)		**Partner Agencies:** N/A			
Action Source: 2010 NHMP		**Performance Metric:** N/A			
Flood	N/A	Staff Time	Mid-term	1, 12	Yes (ST FL #1)
BDS-4 — Encourage and expand personal, family, and business preparedness plans and programs.					
Lead Agency: Bureau of Development Services (BDS)		**Partner Agencies:** All City bureaus			
Action Source: Steering Committee		**Performance Metric:** Preparedness fairs; citywide preparedness surveys			
All Hazards	N/A	Staff Time	Long-term	1, 4, 12	No
BDS-5 — Make information about floodplain zones available to residents when applying for permits.					
Lead Agency: Bureau of Development Services (BDS)		**Partner Agencies:** N/A			
Action Source: Steering Committee		**Performance Metric:** N/A			
Flood	N/A	Staff Time	Mid-term	3, 6, 12, 15	No

Hazards Addressed	New or Existing Assets	Funding Options	Timeframe	Objectives Met	In Previous Plan? (# from previous plan)
BDS-6 — Implement recommendations from the City's Unreinforced Masonry (URM) Work Group.					
Lead Agency: Bureau of Development Services (BDS)		**Partner Agencies:** PBEM			
Action Source: Steering Committee		**Performance Metric:** New codes developed.			
Earthquake	Existing	Staff Time, Budget Allocation, HMA	Long-term	1, 2, 3, 6, 7, 11, 12	No
BDS-7 — Continue to coordinate with Multnomah County Drainage District (MCDD) to review permit applications for development near levees; if a permit is requested for development within the "levee review area", submit the application to MCDD to review and if necessary work with developer to revise plans to meet United States Army Corps of Engineers (USACE) requirements for development on or near federal levees.					
Lead Agency: Bureau of Development Services (BDS)		**Partner Agencies:** Multnomah County Drainage District (MCDD), BPS			
Action Source: Stakeholder Input		**Performance Metric:** N/A			
Dam Failure, Flood	Existing	Staff Time	Long-term	1, 4	No
BDS-8 — Maintain good standing under the National Flood Insurance Program by implementing programs that meet or exceed the minimum NFIP requirements. Such programs include enforcing an adopted flood damage prevention ordinance, participating in floodplain mapping updates, and providing public assistance and information on floodplain requirements and impacts.					
Lead Agency: Bureau of Development Services (BDS)		**Partner Agencies:** Bureau of Environmental Services			
Action Source: NFIP Compliance		**Performance Metric:** Continued good standing under the NFIP			
Flood	New and Existing	Staff Time	Ongoing	1, 9, 10, 12	No
CAMG-1 — Advocate for bureaus to consider seismic and landslide risk when developing capital improvement plans, including plans to replace water and sewer infrastructure.					
Lead Agency: City Asset Managers Group (CAMG)		**Partner Agencies:** PBEM, BES			
Action Source: 2010 NHMP		**Performance Metric:** Criteria established in Capital Improvement Plan (CIP) prioritization process regarding seismic and landslide hazards.			
Earthquake, Landslide	Both	Staff Time	Long-term	1, 4, 5	Yes (LT EQ #3)
CAMG-2 — Consider what the critical assets are in determining mitigation priorities for City assets, incorporating critical facilities risk assessment data from the MAP where relevant.					
Lead Agency: City Asset Managers Group (CAMG)		**Partner Agencies:** PBEM, BES			
Action Source: 2010 NHMP		**Performance Metric:** N/A			
All Hazards	Existing	Staff Time	Long-term	2, 5, 7, 11	Yes (FL #2)
CAMG-3 — Encourage every bureau to inventory critical assets and review critical infrastructure vulnerability, and identify a 50-year plan to strengthen, retrofit, relocate or otherwise increase resiliency. Consider ways to promote city-wide collaboration					
Lead Agency: City Asset Managers Group (CAMG)		**Partner Agencies:** City bureaus, PBEM			
Action Source: Steering Committee		**Performance Metric:** Entire city infrastructure planning is critical to disaster recovery			
Earthquake	Both	Capital Improvement Plan (CIP)	Long-term	5, 7	No

Hazards Addressed	New or Existing Assets	Funding Options	Timeframe	Objectives Met	In Previous Plan? (# from previous plan)
OEHR-1 — Prior to and during implementation, review all actions for negative externalities and to ensure vulnerable populations are protected from displacement or other disproportionate burdens.					
Lead Agency: Office of Equity and Human Rights (OEHR)		**Partner Agencies:** PBEM, BES, BPS, PBOT, PWB			
Action Source: Steering Committee		**Performance Metric:** All actions are reviewed for equity considerations during implementation planning.			
All Hazards	N/A	Staff Time	Long-term	2, 8, 14, 15	No

19.3.3 Action Plan Benefit-Cost Review

The action plan must be prioritized according to a benefit/cost analysis of the proposed actions (44 CFR, Section 201.6(c)(3)(iii)). The benefits of proposed projects were weighed against estimated costs as part of the project prioritization process. The benefit/cost analysis was not as detailed as required by FEMA for eligibility under the Hazard Mitigation Grant Program (HMGP) and Pre-Disaster Mitigation (PDM) grant program. A less formal approach was used because some projects may not be implemented for up to 10 years, and associated costs and benefits could change in that time. Therefore, a review of apparent benefits versus apparent cost was performed by assigning subjective ratings (high, medium, and low) to project costs and benefits.

Benefit ratings were defined as follows:

- **High:** Action will support compliance with a legal mandate or, once completed, will have an immediate impact on the reduction of risk exposure to life and property.
- **Medium:** Once completed, action will have a long-term impact on the reduction of risk exposure to life and property, has a substantial life safety component, or project will provide an immediate reduction in the risk exposure to property.
- **Low:** Long-term benefits of the action are difficult to quantify in the short term.

Cost impact ratings were defined as follows:

- **High:** Would require an increase in revenue via an alternative source (i.e., bonds, grants, fee increases) to implement. Existing funding levels are not adequate to cover the costs of the proposed project.
- **Medium**: Could budget for under existing work-plan, but would require a reapportionment of the budget or a budget amendment, or the cost of the project would have to be spread over multiple years.
- **Low:** Possible to fund under existing budget. Project is or can be part of an existing ongoing program or would not require substantial effort to initiate or appropriate funds.

Using this approach, projects with positive benefit versus cost ratios (such as high over high, high over medium, medium over low, etc.) are considered cost-beneficial and are prioritized accordingly.

For many of the strategies identified in this action plan, the City may seek financial assistance under the HMGP or PDM programs, both of which require detailed benefit/cost analyses. These analyses will be performed on projects at the time of application using the FEMA benefit-cost model. For projects not seeking financial assistance from grant programs that require detailed analysis, the City reserves the right to define "benefits" according to parameters that meet the goals and objectives of this plan.

19.3.4 Action Plan Prioritization

Using the results of the benefit-cost analysis as well as the other information identified in the action development process, all identified actions were prioritized in two categories: implementation and grant pursuit.

Implementation priority was defined as follows:

- **High Priority—**An action that meets multiple objectives, has benefits that exceed cost, has funding secured or is an ongoing project. High priority actions can be completed in the short-term or mid-term (1 to 5 years) or are projects that are long-term projects that can be initiated in the short-term and will have large positive impacts once completed. The key factors for high priority actions are that they have funding secured and can be completed or initiated in the short- or mid-term.
- **Medium Priority**—An action that meets multiple objectives, that has benefits that exceed costs, and for which funding has not yet been secured, but is eligible for funding. Actions can be completed in the short- or mid-term, once funding is secured, or are projects that are long-term projects that can be initiated in the short-term and will have large positive impacts once completed. Medium priority actions will become high priority actions once funding is secured. The key factors for medium priority actions are that they are eligible for funding, but do not yet have funding secured, and they can be completed or initiated within the short- or mid-term.
- **Low Priority**—An action that will mitigate the risk of a hazard, that has benefits that do not exceed the costs or are difficult to quantify, for which funding has not been secured, that is not eligible for grant funding, and for which the time line for completion is long-term or uncertain. Low priority actions may be eligible for grant funding from other programs that have not yet been identified. Low priority projects are generally "blue-sky" or "wish-list." projects. Financing is unknown, and they can be completed over the long term.

Grant pursuit priority was defined as follows:

- **High Priority**—An action that has been identified as meeting grant eligibility requirements, assessed to have high benefits, is listed as high or medium priority, and where local funding options are unavailable or where dedicated funds could be utilized for projects that are not eligible for grant funding.
- **Medium Priority**—An action that has been identified as meeting grant eligibility requirements, assessed to have medium or low benefits, is listed as medium or low priority, and where local funding options are unavailable.
- **Low Priority**—An action that has not been identified as meeting grant eligibility requirements, or has low benefits. Additionally, projects that are already being funded and are likely to continue to be funded are identified as low grant pursuit priority.

In addition, each action was reviewed to determine if the target audience/beneficiary identified for the action is one of the groups of focus for the assessment (e.g. people with disabilities, communities of color, etc.). If so, the priority was noted with an E (e.g. High-E). Results are summarized in Table 19-5.

Table 19-5. Prioritization of Mitigation Actions

Action #	# of Objectives Met	Benefits	Costs	Do Benefits Equal or Exceed Costs?	Is project Grant Eligible?	Can Project be Funded under Existing Programs/ Budgets?	Implementation Priority (High, Med., Low)	Grant Pursuit Priority (High, Med., Low)

a. Action was identified as a plan integration action by the planning team. See Section 19.5.5 for more information.

19.3.5 Analysis of Mitigation Actions

Mitigation Types

Each recommended action was classified based on the hazard it addresses and the type of mitigation it involves. Table 19-6 shows the classification based on this analysis. Mitigation types are defined as follows:

- **Prevention**—Government, administrative or regulatory actions that influence the way land and buildings are developed to reduce hazard losses. Includes planning and zoning, floodplain laws, capital improvement programs, open space preservation, and storm water management regulations.
- **Property Protection**—Modification of buildings or structures to protect them from a hazard or removal of structures from a hazard area. Includes acquisition, elevation, relocation, structural retrofit, storm shutters, and shatter-resistant glass.
- **Public Education and Awareness**—Actions to inform citizens and elected officials about hazards and ways to mitigate them. Includes outreach projects, real estate disclosure, hazard information centers, and school-age and adult education.
- **Natural Resource Protection**—Actions that minimize hazard loss and preserve or restore the functions of natural systems. Includes sediment and erosion control, stream corridor restoration, watershed management, forest and vegetation management, and wetland restoration and preservation.
- **Emergency Services**—Actions that protect people and property during and immediately after a hazard event. Includes warning systems, emergency response services, and the protection of essential facilities.
- **Structural Projects**—Actions that involve the construction of structures to reduce the impact of a hazard. Includes dams, setback levees, floodwalls, retaining walls, and safe rooms.
- **Community Capacity Building**—Actions that identify, strengthen or link the community's tangible and intangible resources. Includes investing in food independence projects (ex. community gardens), promoting and supporting rain water collection systems, alternative energy sources (ex. solar power, wind power, micro-level hydro power), culturally appropriate community-level training for emergency and trauma response.

Objectives Met

Each recommended action also identifies the objectives that the action supports. Table 19-7 shows the recommended actions and the corresponding objectives.

19.4 PLAN ADOPTION

A hazard mitigation plan must document that it has been formally adopted by the governing body of the jurisdiction requesting federal approval of the plan (44 CFR Section 201.6(c)(5)). DMA compliance and its benefits cannot be achieved until the plan is adopted. This plan will be submitted for a pre-adoption review to the Oregon Office of Emergency Management, FEMA Region X, and the Insurance Services Office, Inc. prior to adoption. Once pre-adoption approval has been provided, the City of Portland will formally adopt the plan. A copy of the resolution is provided in Figure 19-1.

Insert Adoption Resolution

Figure 19-1. Resolution Adopting The Mitigation Action Plan

19.5 PLAN IMPLEMENTATION AND MAINTENANCE STRATEGY

A hazard mitigation plan must present a plan maintenance process that includes the following (44 CFR Section 201.6(c)(4)):

- A section describing the method and schedule of monitoring, evaluating, and updating the mitigation plan over a 5-year cycle.
- A process by which local governments incorporate the requirements of the mitigation plan into other planning mechanisms, such as comprehensive or capital improvement plans, when appropriate.
- A discussion on how the community will continue public participation in the plan maintenance process.

This section details the formal process that will ensure that *The Mitigation Action Plan* remains an active and relevant document and that the City maintains its eligibility for applicable funding sources. It includes the establishment of a Mitigation Action Plan Working Group and a schedule for monitoring and evaluating the plan annually and producing an updated plan every 5 years. The plan's format allows sections to be reviewed and updated when new data become available, resulting in a plan that will remain current and relevant.

19.5.1 Plan Implementation

The effectiveness of the MAP depends on its implementation and the incorporation of its actions into existing plans, policies and programs. Together, the action items in the plan provide a framework for activities that the City of Portland, with support from stakeholders, will work to implement over the next 5 years. The planning team and the steering committee have established a vision, a mission, goals and objectives and have prioritized mitigation actions that will be implemented through existing plans, policies, and programs. The plan will be evaluated based on how effectively the implementation of the mitigation actions have been at reducing risk in Portland and in meeting plan goals. Lead agencies for all selected mitigation actions have identified performance metrics to help evaluate the success of the MAP. The effectiveness of the MAP will also be assessed at the next update by the new working group through a review of the changes in risk that occurred over the performance period and by the degree to which mitigation goals and objectives were incorporated into existing plans, policies and programs.

The Portland Bureau of Emergency Management (PBEM) will have lead responsibility for coordinating and tracking the plan implementation and maintenance strategy. Plan implementation and evaluation will be a shared responsibility among all bureaus and offices identified as lead agencies in the mitigation action plan and all other jurisdictions that may link to this plan.

19.5.2 Mitigation Action Plan Working Group

The hazard mitigation steering committee was a volunteer body that oversaw this update of the plan. It was the steering committee's position that an oversight committee with representation similar to that of the steering committee should have an active role in the plan implementation and maintenance. Therefore, a Mitigation Action Plan Working Group will be formed to remain a viable body involved in key elements of the plan implementation and maintenance strategy. This working group should strive to include representation from stakeholders in Portland as well as Bureau representatives. The Mitigation Action Plan Working Group will work toward fulfilling the following responsibilities:

- Continuing to provide feedback and guidance on equity concerns;
- Coordinating action implementation;

- Providing feedback on possible avenues for continued public engagement;
- Coordinating with the Office of Governmental Relations annually to determine what hazard mitigation related items should be advocated for during their annual agenda setting;
- Reviewing and contributing to the annual progress report; and
- Providing input and recommendations on possible enhancements to be considered at the next plan update.

Future plan updates will be overseen by a steering committee similar to the one that participated in this update, so keeping an interim group intact will provide a head start on future updates. The Mitigation Action Plan Working Group will meet biannually to work toward the objectives outlined in this implementation and maintenance strategy. PBEM will coordinate the meetings, which likely will be held in March and September.

19.5.3 Equity Implementation Guide

The steering committee recommends that equity analysis and screening be carried forward as actions are implemented. The Mitigation Action Plan Working Group will provide suggestions, guidance and feedback in the development of a natural hazard mitigation equity implementation guide. It is expected that this guide will build upon or be adapted from previous best practices and recommendations such as those in the *Climate Action Plan Equity Implementation Guide* or the *East Portland Action Plan's Involuntary Displacement Prevention Recommendations for East Portland*. Special attention will be paid to best practices for collecting data, using information gathered to inform other processes and identifying and expanding accountability mechanisms.

19.5.4 Annual Progress Report

The lead agencies identified for action item implementation will participate in annual progress reporting, led by PBEM. This progress report will be presented to and reviewed by the Mitigation Action Plan Working Group. The intent of the progress report will be to evaluate the progress on the implementation of the action plan during a 12-month performance period. This review will include items such as the following:

- Summary of any hazard events that occurred during the performance period and the impact these events had on Portland;
- Review of the data utilized for this planning process as well as identified gaps and identification of any newly available or updated datasets;
- Listing of any newly published or updated reports or studies that should be incorporated into the next plan update process;
- Review of any upcoming local planning efforts that should be integrated with the MAP
- Review of any changes that would impact risk in Portland (e.g. decommissioning or reservoir or annexation)
- Review of mitigation success stories;
- Review of continuing public engagement;
- Brief discussion about why actions were not completed or have not been initiated;
- Reevaluation of the action plan to determine if the timeline for identified projects needs to be amended (such as changing a long-term project to a short-term project because of new funding);
- Review of data that was or should be collected for an equity identified actions (e.g. High-E)
- Changes in or potential for new funding options (grant opportunities);

- Review of the Steering Committee recommended actions (see Appendix I) and recommendations for new actions based on new or enhanced capabilities identified by lead agencies or next steps in actions identified in the 2016 action plan;
- Impacts of changes in other planning programs or projects that involve hazard mitigation; and
- Identification of training needs or additional guidance, such as benefit-cost analysis or E-grants training or additional equity guidance.

The planning team has created a template for preparing a progress report (see Appendix K). The Mitigation Action Plan Working Group and identified lead agencies will provide feedback to PBEM on items included in the template. PBEM staff will compile the information into a formal annual report on the progress of the plan, which will be presented to the mitigation action plan working group for their review and comment. This report will be disseminated as follows:

- Posted on the PBEM website dedicated to the MAP;
- Provided to the local media through a press release;
- Presented to the City of Portland City Council to inform them of the progress of mitigation actions implemented during the reporting period; and
- Provided as part of the CRS annual re-certification package.

The annual progress report should be compiled in August of each year, reviewed by the committee in September, and be finalized before October 1 each year.

19.5.5 Incorporation into Other Planning Mechanisms

The information on hazard, risk, vulnerability and mitigation contained in *The Mitigation Action Plan* and cited throughout is based on the best available science and technology. Plan integration is the incorporation of this information into other relevant planning mechanisms, such as general planning and capital facilities planning. It includes the integration of natural hazard information and mitigation policies, principles and actions into local planning mechanisms and vice versa, as well as the encouragement of collaborative planning and inter-agency coordination (FEMA, 2015c).

Plan Integration During the 2010 NHMP Performance Period

The 2010 NHMP identified three main activities to incorporate the NHMP requirements into other planning mechanisms as appropriate during the performance period of the plan (44 CFR Section 201.6(c)(4)(ii)):

- Conduct a review of community-specific regulatory tools to assess the integration of the mitigation strategy. These regulatory tools were identified in the capability assessment section.
- Track implemented mitigation actions to determine their success or failure, to determine road blocks to implementation, and identify potential corrective actions.
- Work with community members to increase awareness of the NHMP and provide assistance in integrating the mitigation strategy into relevant planning mechanisms. Implementation of these requirements may require updating or amending specific planning mechanisms.

Although the status of these specific activities was not tracked closely during the performance period, the City did make progress on integrating and incorporating the NHMP into locally relevant plans and programs. The planning team conducted a review of the 2010 NHMP mitigation actions and identified 51 actions that addressed integration into local planning mechanisms and/or collaborative planning. During the performance period of the plan, 19 (37 percent) of these actions were completed, 23 (45 percent) were carried over to the 2016 MAP, and 9 (18 percent) were removed due to a lack of

feasibility. More information on the status of these actions can be found in Table 19-1. The following plans and programs were specifically identified by participating bureaus to have integrated the goals, risk assessment or recommendations of the 2010 NHMP or vice versa:

- Portland Comprehensive Plan
- Climate Action Plan
- PBEM Strategic Plan
- Portland Parks & Recreation Master Plan
- BPS Strategic Plan
- BES Strategic Plan
- Portland Water Bureau (PWB) Water System Seismic Study
- Johnson Creek Restoration Plan
- Portland Watershed Management.

Plan Integration for the Mitigation Action Plan

Implementation of the MAP has and will continue to enhance and expand the integration efforts of the 2010 NHMP. During the update process, *The Portland Plan*, the draft *Comprehensive Plan*, *Capital Investment Plans*, the *Climate Action Plan,* and other plans were reviewed for relevant community goals, policies and actions. Inter-agency coordination occurred through involvement by local, regional, state and federal stakeholders involved in and consulted with during the planning process. This coordination is expected to continue through the Mitigation Action Plan working group activities, annual progress reporting, implementation coordination and the continued public engagement outlined below.

As the plan is implemented, all City bureaus will use information from this updated plan as the best available science and data on natural hazards impacting the City of Portland. Bureaus were asked to review the capability assessment and identify codes, plans and programs that provide opportunities for integration and include these as actions in the MAP. Seventy actions related to plan integration have been identified by the planning team and recommended for implementation in this plan. Progress will be reported annually through the progress reporting process described above. New opportunities for integration will be identified as part of the annual progress report.

19.5.6 Implementation Coordination

It is anticipated that upon completion of this plan, there will be interest among the lead agencies in pursuing grant funding under FEMA hazard mitigation grant programs and other relevant programs. In order to keep lead agencies informed of these opportunities and to coordinate grant pursuits, the PBEM staff person charged with coordinating the implementation of this plan will strive to:

- Coordinate with lead agencies and stakeholders through scheduling mitigation action plan working group meetings; and
- Monitor HMGP grant funding opportunities identified in this plan, maintain accountability of other lead agencies to monitor funding opportunities for their actions, and coordinate with other lead agencies to seek funding when such opportunities become available.

PBEM will strive to coordinate the working group sessions as needed and with enough lead time to plan for pursuing Hazard Mitigation Assistance funds, which typically open in March or April. At working group sessions, agenda topics will be devoted to the following:

- Identify and refine projects or actions that are recommendations of this plan so that eligible, well-planned, vetted projects can be submitted for consideration when funding opportunities arise;

- Identify and develop strategies for incorporating mitigation projects into existing budgets, schedules, and planning mechanisms;
- Identify additional opportunities for plan integration; and
- Provide input for the annual progress report.

Plan Update

The City of Portland intends to continue to update the MAP on a 5-year cycle from the date of final plan approval. This cycle may be accelerated to less than 5 years based on the following triggers:

- A federal disaster declaration that impacts Portland;
- A hazard event that causes loss of life; or
- A comprehensive update of the City's Comprehensive Plan.

It will not be the intent of future updates to develop a complete new natural hazard mitigation plan for Portland. The update will, at a minimum, include the following elements:

- The update process will be convened through a steering committee.
- The goals and objectives will be reviewed to evaluate the effectiveness of the plan.
- The hazard risk assessment will be reviewed and, if necessary, updated using best available information and technologies.
- The action plan will be reviewed and revised to account for any actions completed, dropped, or changed and to account for changes in the risk assessment or new policies identified under other planning mechanisms.
- The equity implementation strategy will be reviewed to see if adjustments are needed and if equity-flagged projects are meeting their equity objectives.
- The draft update will be sent to appropriate agencies and organizations for comment.
- The public will be given an opportunity to comment on the update prior to adoption.
- The City Council and governing boards of any planning partners will adopt the updated plan.

The plan update process will be led by the Portland Bureau of Emergency Management. All lead agencies and relevant stakeholders will be asked to participate in the plan update process.

19.5.7 Continued Public Engagement and Access

The public will continue to be apprised of the plan's progress through the hazard mitigation website and through the provision of copies of the annual progress reports to the media. The website will not only house the final plan, it will continue to be the one-stop shop for information regarding the plan and plan implementation. A mechanism for providing comments on the mitigation plan and on the implementation of actions will be available via the website. Additionally, PBEM will strive to include information on the website that clearly outlines available data on mitigation projects and hazard risk and mechanisms to evaluate progress.

Additional public engagement will be pursued as opportunities arise or as recommended by the Mitigation Action Plan Working Group. This may include activities such as utilizing existing networks and communication systems to distribute the annual progress report, speaking to groups upon request and as resources allow, and recorded webinars or other online engagement.

Upon initiation of future update processes, a new public engagement strategy will be initiated based on guidance from a new steering committee and the recommendations of the mitigation action plan

working group. This strategy will be based on the needs and capabilities of the City of Portland and any planning partners at the time of the update.

20. LINKAGE PROCEDURES

The federal Disaster Mitigation Act broadly defines local government to encompass more than city and county governments. The DMA's definition of local government also includes local jurisdictional authorities such as schools or special purpose districts. The benefits of the DMA extend to these governments if the planning requirements are met. Not all eligible local governments in the City of Portland are currently covered by approved, adopted local hazard mitigation plans. Some or all of these local governments may wish to develop and adopt DMA-compliant plans to gain eligibility for relevant grant programs.

In order to promote the wise use of resources, enhance communication and collaboration among local governments, and encourage regional consistency, the City of Portland has developed linkage procedures that define requirements for completing a DMA-compliant annex to this plan. This linkage procedure will substantially reduce the level of effort for linking jurisdictions in plan development, as many of the components of the MAP development process will be used to support annex development. No currently non-DMA compliant jurisdiction in Portland is obligated to link to this plan. These jurisdictions can choose to not seek compliance or to develop their own "complete" plan that addresses all required elements for such plans.

Eligible jurisdictions located in Portland may link to this plan at any point during the plan's performance period (5 years after final approval). Eligibility will be determined by the following factors:

- The linking jurisdiction is a local government as defined by the Disaster Mitigation Act.
- The boundaries or service area of the linking jurisdiction is completely contained within the boundaries of Portland established during the 2016 MAP development process.
- The linking jurisdiction's critical facilities were included in the critical facility and infrastructure risk assessment completed during the 2016 plan development process.

It is expected that linking jurisdictions will complete the following requirements and submit a completed annex to the lead agency (PBEM) for review within six months of submitting a letter of intent to link to the MAP:

- The eligible jurisdiction requests a "Linkage Package" by contacting the Point of Contact (POC) for the plan:

  Jonna Papaefthimiou
  Planning and Preparedness Manager, PBEM
  Phone: 503-823-3809
  Email: jonnap@portlandoregon.gov

- The POC will provide a linkage procedure package that includes linkage information and a linkage tool-kit:

  - Linkage Information

- Procedures for linking to the Mitigation Action Plan (MAP)
- Expectations for linking jurisdictions
- A sample "letter of intent" to link to the MAP
- A copy of Section 201.6 of 44 CFR, which defines the federal requirements for a local natural hazard mitigation plan.

➢ Linkage Tool-Kit

- Copy of the approved MAP
- A special purpose district template that will form the basis of the annex
- Instructions for completing the annex
- Facility-specific results of the critical facility risk assessment (for official use only)
- A catalog of mitigation best practices
- An annex review check-list
- A sample resolution for plan adoption
- ArcMap files and associated database for map production consistent with the MAP.

- The linking jurisdiction will be required to review the MAP, which includes the following key components:

  ➢ Vision, mission, goals and objectives
  ➢ Risk assessment
  ➢ Comprehensive review of alternatives
  ➢ Equity analysis screening process
  ➢ Action prioritization scheme
  ➢ Plan implementation and maintenance procedures.

  Once this review is complete, the linking jurisdiction will submit a letter of intent to link to the MAP and complete its annex using the template and instructions provided by the POC.

- The development of the new jurisdiction's annex must not be completed by one individual in isolation. The jurisdiction must develop, implement and describe a public engagement strategy and a methodology to identify and vet jurisdiction-specific actions. The original plan development involved extensive public outreach and engagement and is described in Part 1 of the MAP. Since linking jurisdictions were not explicitly covered by these strategies, they will have to initiate new strategies and describe them in their annex. Although linking jurisdictions will need to conduct their own public engagement, they are encouraged to use the results of the extensive public engagement conducted during development of the MAP to help inform their selection of actions (for example, the results of the public survey and Planning for Real Workshops). For consistency, linking jurisdictions are encouraged to develop and implement strategies similar to those described in this plan; however, the City of Portland recognizes that linking jurisdictions may have fewer staff and resources available to support such efforts. At a minimum, a linking jurisdiction must develop a strategy that meets the minimum requirements outlined in the DMA.
- The methodology to identify actions should include a comprehensive range of specific mitigation actions and projects being considered to reduce the effects of each hazard and a description of the process by which chosen actions were identified. As part of this process, linking jurisdictions should coordinate the selection of actions amongst the jurisdiction's various departments.
- Once its public engagement strategy and template are completed, the new jurisdiction will submit the completed package to the POC for a pre-adoption review to ensure conformance with the plan format and linkage procedure requirements.

- The POC will review for the following:
  - Documentation of public engagement and action plan development strategies
  - Conformance of template entries with guidelines outlined in instructions
  - Chosen actions are consistent with vision, mission, goals, objectives and mitigation catalog of the MAP.
  - A designated point of contact
  - A completed FEMA plan review crosswalk.

- Plans will be reviewed by the POC and submitted to Oregon Office of Emergency Management (OEM) for review and approval.
- OEM will review plans for state compliance. Non-compliant plans are returned to the lead agency for correction. Compliant plans are forwarded to FEMA for review with annotation as to the adoption status.
- FEMA reviews the linking jurisdiction's plan in association with the approved plan to ensure DMA compliance. FEMA notifies the new jurisdiction of the results of review with copies to OEM and the approved plan lead agency.
- Linking jurisdiction corrects plan shortfalls (if necessary) and resubmits to OEM through the approved plan lead agency.
- For plans with no shortfalls from the FEMA review that have not been adopted, the new jurisdiction governing authority adopts the plan and forwards adoption resolution to FEMA with copies to lead agency and OEM.
- FEMA regional director notifies the new jurisdiction's governing authority of the plan's approval.

The new jurisdiction plan is then included with the City plan, and the linking jurisdiction is committed to participate in the ongoing plan implementation and maintenance strategies and should have at least one regularly attending representative on the Mitigation Action Plan working group.

EMAC—Emergency Management Assistance Compact
ENSO— El Niño-Southern Oscillation
EPA—U.S. Environmental Protection Agency
EQ—Earthquake
ESA—Endangered Species Act
EWP—Emergency Watershed Protection
FEMA—Federal Emergency Management Agency
FERC—Federal Energy Regulatory Commission
FIRM—Flood Insurance Rate Map
GIS—Geographic Information System
GPS—Global Positioning System
Hazus-MH—Hazards, United States-Multi Hazard
HMA—Hazard Mitigation Assistance
HMGP—Hazard Mitigation Grant Program
HVAC—Heating, Ventilation and Air Conditioning
IBC—International Building Code
IPAWS—Integrated Public Alert and Warning System
IPCC—Intergovernmental Panel on Climate Change
IRC—International Residential Code
IRCO—Immigrant and Refugee Community of Oregon
LiDAR—Light Detection and Ranging
MAP—Mitigation Action Plan – refers to City of Portland 2016 plan
MCDD—Multnomah County Drainage District
ML—Local Magnitude or Richter Scale
MMI—Modified Mercalli Scale
M_W—Magnitude

NASA—National Aeronautics and Space Administration
NEHRP—National Earthquake Hazards Reduction Program
NET—Neighborhood Emergency Team
NHMP—Natural Hazard Mitigation Plan – refers to City of Portland 2004 or 2010 plan
NIDIS—National Integrated Drought Information System
NIMS—National Incident Management System
NFIP—National Flood Insurance Program
NOAA—National Oceanic and Atmospheric Administration
NRCS—Natural Resources Conservation Services
NWS—National Weather Service
ODA—Oregon Department of Agriculture
ODOT—Oregon Department of Transportation
OEHR—City of Portland Office of Equity and Human Rights
OEM—Oregon Office of Emergency Management
OGDC—Oregon Geologic Data Compilation
OGR—City of Portland Office of Governmental Relations
OHA—Oregon Health Authority
OHSU—Oregon Health and Science University
OMF—City of Portland Office of Management and Finance
ONI—City of Portland Office of Neighborhood Involvement
OS—Open Space Zone
PBEM—City of Portland Bureau of Emergency Management
PBOT—City of Portland Bureau of Transportation
PCC—City of Portland City Code
PDC—Portland Development Commission
PDM—Pre-Disaster Mitigation Grant Program
PGA—Peak Ground Acceleration
PGE—Portland General Electric
PHA—Portland Housing Authority
PHB—City of Portland Housing Bureau
POC—Point of Contact
PPB—City of Portland Police Bureau
PP&R—Portland Parks and Recreation
ppm—Parts per million

PPS—Portland Public Schools

PSU—Portland State University

PWB—City of Portland Water Bureau

RDPO—Regional Disaster Preparedness Organization

SDC—System Development Charge

SEAO—Structural Engineers Association of Oregon

SEC—Significant Environment Zone

SFHA—Special Flood Hazard Area

SLIDO—State Landslide Database of Oregon

TriMET—Tri-County Metropolitan Transportation District

USACE—U.S. Army Corp of Engineers

USDA—U.S. Department of Agriculture

USFS—U.S. Forest Service

USGS—U.S. Geological Survey

URM—Unreinforced Masonry

WEA—Wireless Emergency Alerts

WUI—Wildland Urban Interface

DEFINITIONS

1-Percent Annual Chance Flood (100-Year Flood): The flood magnitude that has a 1 percent chance of being equaled or exceeded in any given year. On a statistical average over a long term, this magnitude can be expected to occur once every 100 years; in fact though, such a flood can occur multiple times in a few years, or even in a single year.

1-Percent Annual Chance Flood Hazard Area (100 Year Floodplain or Special Flood Hazard Area): The area that is inundated during a 1-percent annual chance (100-year) flood.

Acre-Foot: An acre-foot is the amount of water it takes to cover 1 acre to a depth of 1 foot. This measure is used to describe the quantity of storage in a water reservoir. An acre-foot is a unit of volume. One acre foot equals 7,758 barrels; 325,829 gallons; or 43,560 cubic feet. An average household of four will use approximately 1 acre-foot of water per year.

Adaptation: The process of adjustment to actual or expected climate and its effects. In human systems, adaptation seeks to moderate or avoid harm or exploit beneficial opportunities, In some natural systems, human intervention may facilitate adjustment to expected climate and its effects.

Agricultural Drought: When there is not enough soil moisture to support crop needs at a particular time.

Air Pollution: the presence of contaminants or pollutant substances in the air that interfere with health or welfare, or produce other harmful environmental effects.

Air Toxics: Air pollutants known or suspected to cause cancer and come from a variety of sources.

Asset: An asset is any man-made or natural feature that has value, including, but not limited to, people; buildings; infrastructure, such as bridges, roads, sewers, and water systems; lifelines, such as electricity and communication resources; and environmental, cultural, or recreational features such as parks, wetlands, and landmarks.

Base Flood: The flood having a 1% chance of being equaled or exceeded in any given year, also known as the "100-year" or "1% chance" flood. The base flood is a statistical concept used to ensure that all properties subject to the National Flood Insurance Program (NFIP) are protected to the same degree against flooding.

Benefit/Cost Analysis: A benefit/cost analysis is a systematic, quantitative method of comparing projected benefits to projected costs of a project or policy. It is used as a measure of cost effectiveness.

Benefit: A benefit is a net project outcome and is usually defined in monetary terms. Benefits may include direct and indirect effects. For the purposes of benefit-cost analysis of proposed mitigation measures, benefits are limited to specific, measurable, risk reduction factors, including reduction in expected property losses (buildings, contents, and functions) and protection of human life.

Benioff Zone (Deep) Earthquakes: Benioff Zone earthquakes occur in the Juan De Fuca plate as moves below the North American plate. They are deep earthquakes, 20 miles or more in depth. Shaking from these earthquakes can last up to 60 seconds. Due to their depth, aftershocks are typically not felt.

Body Wave: A type of seismic wave that travels through the earth's interior.

Capability Assessment: A capability assessment provides a description and analysis of a community's current capacity to address threats associated with hazards. The assessment includes two components: an inventory of an agency's mission, programs, and policies, and an analysis of its capacity to carry them out. A capability assessment is an integral part of the planning process in which a community's actions to reduce losses are identified, reviewed, and analyzed, and the framework for implementation is identified.

Community Capacity Building: Actions that identify, strengthen or link the community's tangible and intangible resources. Includes investing in food independence projects (ex. community gardens), promoting and supporting rain water collection systems, alternative energy sources (ex. solar power, wind power, micro-level hydro power), culturally appropriate community-level training for emergency and trauma response.

Community Rating System (CRS): The CRS is a voluntary program under the NFIP that rewards participating communities (provides incentives) for exceeding the minimum requirements of the NFIP and completing activities that reduce flood hazard risk by providing flood insurance premium discounts.

Community: All residents of the City of Portland and those who work and play here.

Compounding Factor: Characteristics of a planning area that can contribute to the likelihood or severity of a hazard event's occurrence.

Coordinating stakeholders: Stakeholders who could not commit to the Steering Committee, but may have attended meetings and wanted to be informed of plan progress.

Critical Facility and Infrastructure: Publicly and privately controlled systems and assets, including the built and natural environments and human resources, essential to the sustained functioning of the Portland/Vancouver metropolitan area including Clackamas, Columbia, Multnomah and Washington Counties in Oregon and Clark County in Washington. Such systems and assets specifically include those necessary to ensure continuity of security, safety, health and sanitation services, support the area's economy, and/or maintain public confidence. Incapacitation or destruction of any of these systems or assets would have a debilitating impact on the area either directly, through interdependencies, and/or through cascading effects. For the MAP, these facilities were categorized as emergency services, schools, transportation systems, high potential loss facilities, utility systems and other assets.

Critical Habitat: specific geographical areas that are essential for the conservation and management of a listed species, whether occupied by the species or not.

Dam Failure: An uncontrolled release of impounded water due to structural deficiencies in dam.

Dam: A hydraulic structure built above the natural ground grade line that is used to impound water. Dams include all appurtenant structures, and together are sometimes referred to as "the works." Dams include wastewater lagoons and other hydraulic structures that store water, attenuate floods, and divert water into canals

Disaster Mitigation Act of 2000 (DMA); The DMA is Public Law 106-390 and is the latest federal legislation enacted to encourage and promote proactive, pre-disaster planning as a condition of receiving financial assistance under the Robert T. Stafford Act. The DMA emphasizes planning for disasters before they occur. Under the DMA, a pre-disaster hazard mitigation program and new requirements for the national post-disaster hazard mitigation grant program (HMGP) were established.

Distributive Equity: Ensuring that resources or benefits and burdens of a policy or program are distributed fairly, prioritizing those with highest need first.

Drought: The cumulative impacts of several dry years on water users. It can include deficiencies in surface and subsurface water supplies and generally impacts health, well-being, and quality of life.

Earthquake: An earthquake is defined as a sudden slip on a fault, volcanic or magmatic activity, and sudden stress changes in the earth that result in ground shaking and radiated seismic energy. Earthquakes can last from a few seconds to over 5 minutes, and have been known to occur as a series of tremors over a period of several days. The actual movement of the ground in an earthquake is seldom the direct cause of injury or death. Casualties may result from falling objects and debris as shocks shake, damage, or demolish buildings and other structures.

Emergency Action Plan: A formal document that identifies potential emergency conditions at a dam and specifies actions to be followed to minimize property damage and loss of life. The plan specifies actions the dam owner should take to alleviate problems at a dam. It contains procedures and information to assist the dam owner in issuing early warning and notification messages to responsible downstream emergency management authorities of the emergency situation. It also contains inundation maps to show emergency management authorities the critical areas for action in case of an emergency.

Emergency Services: Actions that protect people and property during and immediately after a hazard event. Includes warning systems, emergency response services, and the protection of essential facilities.

Endangered: a species of fish, animal or plant is "in danger of extinction throughout all or a significant portion of its range.

Engagement: A two-way communication between local government and stakeholders.

Equity Lens: A critical thinking approach to undoing institutional and structural biases, which evaluates burdens, benefits and outcomes to underserved communities.

Equity: When everyone has access to the opportunities necessary to satisfy their essential needs, advance their well-being and achieve their full potential. We have a shared fate as individuals within a community and communities within society. All communities need the ability to shape their own present and future. Equity is both the means to healthy communities and an end that benefits us all (The Portland Plan).

Excessive Heat Event: Summertime weather that is substantially hotter and/or more humid than average for a location at that time of year.

Exposure: Exposure is defined as the number and dollar value of assets considered to be at risk during the occurrence of a specific hazard.

Extent: The extent is the size of an area affected by a hazard.

Flash Flood: A flash flood occurs with little or no warning when water levels rise at an extremely fast rate

Flood Insurance Rate Map (FIRM): FIRMs are the official maps on which the Federal Emergency Management Agency (FEMA) has delineated the Special Flood Hazard Area (SFHA).

Flood Insurance Study: A report published by the Federal Insurance and Mitigation Administration for a community in conjunction with the community's Flood Insurance rate Map. The study contains such background data as the base flood discharges and water surface elevations that were used to prepare the FIRM. In most cases, a community FIRM with detailed mapping will have a corresponding flood insurance study.

Flood: The inundation of normally dry land resulting from the rising and overflowing of a body of water.

Floodplain: Any land area susceptible to being inundated by flood waters from any source. A flood insurance rate map identifies most, but not necessarily all, of a community's floodplain as the Special Flood Hazard Area (SFHA).

Floodplain: The land area along the sides of a river that becomes inundated with water during a flood.

Floodway Fringe: Floodway fringe areas are located in the floodplain but outside of the floodway. Some development is generally allowed in these areas, with a variety of restrictions. On maps that have identified and delineated a floodway, this would be the area beyond the floodway boundary that can be subject to different regulations.

Floodway: Floodways are areas within a floodplain that are reserved for the purpose of conveying flood discharge without increasing the base flood elevation more than 1 foot. Generally speaking, no development is allowed in floodways, as any structures located there would block the flow of floodwaters.

Freeboard: Freeboard is the margin of safety added to the base flood elevation.

Freezing Rain: The result of rain occurring when the temperature is below the freezing point. The rain freezes on impact, resulting in a layer of glaze ice up to an inch thick. In a severe ice storm, an evergreen tree 60 feet high and 30 feet wide can be burdened with up to six tons of ice, creating a threat to power and telephone lines and transportation routes.

Frequency: For the purposes of this plan, frequency refers to how often a hazard of specific magnitude, duration, and/or extent is expected to occur on average. Statistically, a hazard with a 100-year frequency is expected to occur about once every 100 years on average and has a 1 percent chance of occurring any given year. Frequency reliability varies depending on the type of hazard considered.

Fujita Scale of Tornado Intensity: Tornado wind speeds are sometimes estimated on the basis of wind speed and damage sustained using the Fujita Scale. The scale rates the intensity or severity of tornado events using numeric values from F0 to F5 based on tornado wind speed and damage. An F0 tornado (wind speed less than 73 miles per hour (mph)) indicates minimal damage (such as broken tree limbs), and an F5 tornado (wind speeds of 261 to 318 mph) indicates severe damage.

Geographic Information System (GIS): GIS is a computer software application that relates data regarding physical and other features on the earth to a database for mapping and analysis.

Goal: Explain what should be achieved.

Hail: showery precipitation in the form of irregular pellets or balls of ice more than 5 millimeters in diameter, falling from a cumulonimbus cloud.

Hazard Mitigation Grant Program (HMGP): Authorized under Section 202 of the Robert T. Stafford Disaster Relief and Emergency Assistance Act, the HMGP is administered by FEMA and provides grants to states, tribes, and local governments to implement hazard mitigation actions after a major disaster declaration. The purpose of the program is to reduce the loss of life and property due to disasters and to enable mitigation activities to be implemented as a community recovers from a disaster

Hazard of Concern: Hazards that present the greatest concern for a planning area. These hazards are profiled and risk to the planning area is assessed.

Hazard: A hazard is a source of potential danger or adverse condition that could harm people and/or cause property damage.

Hazards U.S. Multi-Hazard (Hazus-MH) Loss Estimation Program: Hazus-MH is a GIS-based program used to support the development of risk assessments as required under the DMA. The Hazus-MH software program assesses risk in a quantitative manner to estimate damage and losses associated with natural hazards. Hazus-MH is FEMA's nationally applicable, standardized methodology and software program and contains modules for estimating potential losses from earthquakes, floods, and wind hazards. Hazus-MH has also been used to assess vulnerability (exposure) for other hazards.

Heat Wave: Excessive heat events that typically last two or more days.

High Hazard Dam: Dams where failure or improper operation will probably cause loss of human life.

High Wind: Those that last longer than one hour at 40 mph or greater or wind gusts of 58 mph or greater.

Hydraulics: Hydraulics is the branch of science or engineering that addresses fluids (especially water) in motion in rivers or canals, works and machinery for conducting or raising water, the use of water as a prime mover, and other fluid-related areas.

Hydrological Drought: Deficiencies in surface and subsurface water supplies.

Hydrology: Hydrology is the analysis of waters of the earth. For example, a flood discharge estimate is developed by conducting a hydrologic study.

Ice Storm: A storm that results in the accumulation of at least 0.25 inches of ice on exposed surfaces.

Intensity: For the purposes of this plan, intensity refers to the measure of the effects of a hazard.

Invasive Plants: those species that spread at such a rate that they cause harm to human health and the environment. In general, most invasive plants are non-native species, however, not all non-native plants are invasive.

Inventory: The assets identified in a study region comprise an inventory. Inventories include assets that could be lost when a disaster occurs and community resources are at risk. Assets include people, buildings, transportation, and other valued community resources.

Lahar: A rapidly flowing mixture of water and rock debris that originates from a volcano. While lahars are most commonly associated with eruptions, heavy rains, and debris accumulation, earthquakes may also trigger them

Landslide: The movement of masses of loosened rock and soil down a hillside or slope. Slope failures occur when the strength of the soils forming the slope is exceeded by the pressure, such as weight or saturation, acting upon them.

Lava Flow: The least hazardous threat posed by volcanoes. Cascades volcanoes are normally associated with slow moving andesite or dacite lava.

Lightning: Lightning is an electrical discharge resulting from the buildup of positive and negative charges within a thunderstorm. When the buildup becomes strong enough, lightning appears as a "bolt," usually within or between clouds and the ground.

Liquefaction: Liquefaction is the complete failure of soils, occurring when soils lose shear strength and flow horizontally. It is most likely to occur in fine grain sands and silts, which behave like viscous fluids when liquefaction occurs. This situation is extremely hazardous to development on the soils that liquefy, and generally results in extreme property damage and threats to life and safety.

Local Government: Any county, municipality, city, town, township, public authority, school district, special district, intrastate district, council of governments (regardless of whether the council of governments is incorporated as a nonprofit corporation under State law), regional or interstate government entity, or agency or instrumentality of a local government; any Indian tribe or authorized tribal organization, or Alaska Native village or organization; and any rural community, unincorporated town or village, or other public entity.

Love Waves: A type of seismic surface wave that produces horizontal motion.

Magnitude: Magnitude is the measure of the strength of an earthquake, and is typically measured by the Richter scale. As an estimate of energy, each whole number step in the magnitude scale

corresponds to the release of about 31 times more energy than the amount associated with the preceding whole number value.

Mass movement: A collective term for landslides, debris flows, falls and sinkholes.

Meteorological Drought: An abnormally low level of precipitation over a period of time.

Mission: What the is to be achieved and how.

Mitigation Actions: Mitigation actions are specific actions to achieve goals and objectives that minimize the effects from a disaster and reduce the loss of life and property.

Mitigation Strategy: The long-term blueprint for reducing the potential losses identified in the risk assessment.

Mitigation: Advance actions to reduce potential hazard effects or risk. Protections are already in place at the time a hazard event occurs.

Mudslide (or Mudflow or Debris Flow): A river of rock, earth, organic matter and other materials saturated with water. Mudslides develop in the soil overlying bedrock on sloping surfaces when water rapidly accumulates in the ground, such as during heavy rainfall or rapid snowmelt. Water pressure in the pore spaces of the material increases to the point that the internal strength of the soil is drastically weakened. The soil's reduced resistance can then easily be overcome by gravity, changing the earth into a flowing river of mud or "slurry."

Natural Resource Protection: Actions that minimize hazard loss and preserve or restore the functions of natural systems. Includes sediment and erosion control, stream corridor restoration, watershed management, forest and vegetation management, and wetland restoration and preservation.

Objective: Broader than actions, but more specific than goals, objectives are specific enough to help determine whether a proposed project or program would advance the values expressed in the mission and vision. Objectives may also be thought of as 'policies.' In this planning process, objectives are used to define and prioritize actions.

Participatory Stakeholders: Stakeholders who committed to being members of the Steering Committee that oversaw the plan update process.

Peak Ground Acceleration: Peak Ground Acceleration (PGA) is a measure of the highest amplitude of ground shaking that accompanies an earthquake, based on a percentage of the force of gravity.

Planning Partners: City of Portland bureaus and offices which manage infrastructure and administer programs included or potentially included as part of the city's hazard mitigation strategy.

Planning Team: The Tetra Tech team and PBEM staff responsible for the facilitation of the planning process and the development of the plan document.

Preparedness: Advance actions that strengthen the capability of government, residents, and communities to respond to disasters.

Presidential Disaster Declaration: These declarations are typically made for events that cause more damage than state and local governments and resources can handle without federal government assistance. Generally, no specific dollar loss threshold has been established for such declarations. A

Presidential Disaster Declaration puts into motion long-term federal recovery programs, some of which are matched by state programs, designed to help disaster victims, businesses, and public entities.

Prevention (emergency management): Building capabilities to avoid, prevent or stop a threatened or actual act of terrorism.

Prevention (mitigation typology): Government, administrative or regulatory actions that influence the way land and buildings are developed to reduce hazard losses. Includes planning and zoning, floodplain laws, capital improvement programs, open space preservation, and storm water management regulations.

Primary waves (P waves): A type of seismic body wave that travels through both solids and fluids. These waves are the fastest travelling seismic waves.

Probability of Occurrence: The probability of occurrence is a statistical measure or estimate of the likelihood that a hazard will occur. This probability is generally based on past hazard events in the area and a forecast of events that could occur in the future.

Procedural Equity: Ensuring that processes are fair and inclusive in the development and implementation of any program or policy.

Property Protection: Modification of buildings or structures to protect them from a hazard or removal of structures from a hazard area. Includes acquisition, elevation, relocation, structural retrofit, storm shutters, and shatter-resistant glass.

Public Education and Awareness: Actions to inform citizens and elected officials about hazards and ways to mitigate them. Includes outreach projects, real estate disclosure, hazard information centers, and school-age and adult education.

Rayleigh Waves: A type of seismic surface wave that travels like ocean waves. Most of the shaking felt during an earthquake is the result of these waves.

Recovery: A phase of emergency management in which activities are carried out to restore essential services and repair damage caused by a hazard event.

Repetitive Loss Property: Any NFIP-insured property that, since 1978 and regardless of any changes of ownership during that period, has experienced:

- Four or more paid losses in excess of $1,000
- Two paid losses in excess of $1,000 within any rolling 10-year period
- Three or more paid losses that cumulatively equal or exceed the current value of the property.

Residual Risk: The risk that remains after safeguards have been implemented.

Resilience: The capability to anticipate, prepare for, respond to, and recover from significant multi-hazard threats with minimum damage to social well-being, the economy, and the environment.

Response: A phase of emergency management that consists of immediate actions to save lives, protect property and the environment and meet basic human needs.

Return Period (or Mean Return Period): This term refers to the average period of time in years between occurrences of a particular hazard (equal to the inverse of the annual frequency of occurrence).

Riparian Area: The area along the banks of a natural watercourse.

Risk Assessment: Risk assessment is the process of measuring potential loss of life, personal injury, economic injury, and property damage resulting from hazards. This process assesses the vulnerability of people, buildings, and infrastructure to hazards and focuses on (1) hazard identification; (2) impacts of hazards on physical, social, and economic assets; (3) vulnerability identification; and (4) estimates of the cost of damage or costs that could be avoided through mitigation.

Risk Ranking = Probability + Impact (people + property + economy)
