Risk Ranking: This ranking serves two purposes, first to describe the probability that a hazard will occur, and second to describe the impact a hazard will have on people, property, and the economy. Risk estimates are based on the methodology used to prepare the risk assessment for this plan. The following equation shows the risk ranking calculation:

Risk: Risk is the estimated impact that a hazard would have on people, services, facilities, and structures in a community. Risk measures the likelihood of a hazard occurring and resulting in an adverse condition that causes injury or damage. Risk is often expressed in relative terms such as a high, moderate, or low likelihood of sustaining damage above a particular threshold due to occurrence of a specific type of hazard. Risk also can be expressed in terms of potential monetary losses associated with the intensity of the hazard.

Riverine: Of or produced by a river. Riverine floodplains have readily identifiable channels. Floodway maps can only be prepared for riverine floodplains.

Robert T. Stafford Act: The Robert T. Stafford Disaster Relief and Emergency Assistance Act, Public Law 100-107, was signed into law on November 23, 1988. This law amended the Disaster Relief Act of 1974, Public Law 93-288. The Stafford Act is the statutory authority for most federal disaster response activities, especially as they pertain to FEMA and its programs.

Safe Harbor Languages: Those that are spoken as a primary language by at least 1,000 people in Portland with limited English proficiency.

Secondary Hazard: Impacts that result from a hazard event in a more indirect way than the immediate hazard effects.

Secondary Waves (S waves): A type of seismic body wave that travel through rock.

Severe Local Storm: Small atmospheric systems, including tornadoes, thunderstorms, windstorms, ice storms and snowstorms. Typically, major impacts from a severe storm are on transportation infrastructure and utilities. These storms may cause a great deal of destruction and even death, but their impact is generally confined to a small area.

Shallow Crustal Earthquake: Shallow crustal earthquakes occur within the North America plate at depths of 20 miles or less. These types of earthquakes occur frequently in the Pacific Northwest. Most are relatively small, but large, damaging events in the region have and will continue to occur. Generally, these earthquakes are expected to last from 20 to 60 seconds, with magnitudes less than 7.5. Aftershocks are likely.

Shallow Flood Hazard Area: Areas that are inundated only 1 to 3 feet deep by the 1-percent annual chance flood.

Significant Hazard Dam: Dams where failure or improper operation will result in no probable loss of human life but can cause economic loss, environmental damage or disruption of lifeline facilities, or can impact other concerns. Significant hazard dams are often located in rural or agricultural areas but could be located in areas with population and significant infrastructure.

Social Vulnerability (for hazard mitigation): The characteristics of a person or group in terms of their capacity to anticipate, cope with, resist and recover from the impacts of a natural hazard. It involves a combination of factors that determine the degree to which someone's life and livelihood are put at risk (Blaikie et al., 1994).

Socioeconomic Drought: Drought impacts on a population's health, well-being and quality of life.

Special Flood Hazard Area: The base floodplain delineated on a Flood Insurance Rate Map. The SFHA is mapped as a Zone A in riverine situations and zone V in coastal situations. The SFHA may or may not encompass all of a community's flood problems

Stakeholder: Persons and agencies with a vested interest in the recommendations and implementation of the MAP. Stakeholders include residents, community groups, business owners, local, state and federal agencies, elected officials, visitors, and neighboring communities.

Steering Committee: Representative members from the community and city bureaus and offices that serve as the oversight body. They are responsible for many of the planning milestones and decisions prescribed for this process.

Stratovolcano: Typically steep-sided, symmetrical cones of large dimension built of alternating layers of lava flows, volcanic ash, and cinders, rising as much as 8,000 feet above their bases.

Stream Bank Erosion: Stream bank erosion is common along rivers, streams and drains where banks have been eroded, sloughed or undercut. However, it is important to remember that a stream is a dynamic and constantly changing system. It is natural for a stream to want to meander, so not all eroding banks are "bad" and in need of repair.

Structural equity: A commitment and action to correct past harms and prevent future negative consequences by institutionalizing accountability and decision-making structures that aim to sustain positive outcomes.

Structural Projects: Actions that involve the construction of structures to reduce the impact of a hazard. Includes dams, setback levees, floodwalls, retaining walls, and safe rooms.

Subduction Zone Earthquakes: Subduction Zone earthquakes occur at the interface between tectonic plates. Such earthquakes typically have a minute or more of strong ground shaking, and are quickly followed by damaging tsunamis and numerous large aftershocks.

Surface Waves: A type of seismic wave that travels along the earth's surface.

Sustainable Hazard Mitigation: This concept includes the sound management of natural resources, local economic and social resiliency, and the recognition that hazards and mitigation must be understood in the largest possible social and economic context.

- **Tephra:** Ash and fragmented rock material ejected by a volcanic explosion

Threatened: a species "is likely to become endangered within the foreseeable future.

Thunderstorm: Any rain event that includes thunder and lightning. A typical thunderstorm is about 15 miles in diameter and lasts about 30 minutes.

Tornado: Tornadoes are funnel clouds of varying sizes that touch ground. Tornadoes are measured using the Fujita Scale ranging from F0 to F6.

Urban Heat Island Effect: the measureable increase in ambient urban air temperatures resulting primarily from the replacement of vegetation with buildings, roads, and other heat-absorbing infrastructure. The heat island effect can result in significant temperature differences between rural and urban areas.

Vision: A desired future state.

Volcano: A vent in the planetary crust from which magma (molten or hot rock) and gas from the earth's core erupts.

Vulnerability: Vulnerability describes how exposed or susceptible an asset is to damage. Vulnerability depends on an asset's construction, contents, and the economic value of its functions. Like indirect damage, the vulnerability of one element of the community is often related to the vulnerability of another. For example, many businesses depend on uninterrupted electrical power. Flooding of an electric substation would affect not only the substation itself but businesses as well. Often, indirect effects can be much more widespread and damaging than direct effects.

Watershed: A watershed is an area that drains downgradient from areas of higher land to areas of lower land to the lowest point, a common drainage basin.

Wildfire Hazard Zone: The portion of a local government jurisdiction that has been determined to be at risk of a catastrophic wildfire

Wildfire: These terms refer to any uncontrolled fire occurring on undeveloped land that requires fire suppression. The potential for wildfire is influenced by three factors: the presence of fuel, topography, and air mass. Fuel can include living and dead vegetation on the ground, along the surface as brush and small trees, and in the air such as tree canopies. Topography includes both slope and elevation. Air mass includes temperature, relative humidity, wind speed and direction, cloud cover, precipitation amount, duration, and the stability of the atmosphere at the time of the fire. Wildfires can be ignited by lightning and, most frequently, by human activity including smoking, campfires, equipment use, and arson.

Wildland-Urban Interface (WUI) Area: An area where structures are adjacent to or are intermingled with natural vegetative fuels which is prone to the occurrence of wildland fires

Windstorm: A storm featuring violent winds. Windstorms are generally short-duration events involving straight-line winds or gusts of over 50 mph, strong enough to cause property damage.

Winter Storm: The National Weather Service defines a winter storm as having significant snowfall, ice, and/or freezing rain; the quantity of precipitation varies by elevation. Heavy snowfall is 4 inches or more in a 12-hour period, or 6 inches or more in a 24-hour period in non-mountainous areas; and 12 inches or more in a 12-hour period or 18 inches or more in a 24-hour period in mountainous areas.

Zoning Ordinance: The zoning ordinance designates allowable land use and intensities for a local jurisdiction. Zoning ordinances consist of two components: a zoning text and a zoning map.

APPENDICES

The Mitigation Action Plan

Appendix A. 5-Year Progress Report

2010 City of Portland Natural Hazard Mitigation Plan

2016 Progress Report

REPORTING PERIOD

March 2010 through March 2016

BACKGROUND

The City of Portland has developed and maintained a hazard mitigation plan, most recently updated in 2010. The *City of Portland Natural Hazard Mitigation Plan* identifies resources, information, and strategies for reducing risk associated with natural hazards in the City. The plan was adopted in 2010 and approved by FEMA Region X on February 15, 2011.

By preparing the 2010 update, the City retained compliance with the federal Disaster Mitigation Act and remained eligible for hazard mitigation grant funding under the federal Robert T. Stafford Act. The plan and annexes are available to the public online at the following website:

https://www.portlandoregon.gov/pbem/53813

An update of the 2010 plan is underway. The new update will be adopted before the end of 2016.

Purpose

This progress report provides an update on implementation of the action plan identified in the 2010 *City of Portland Natural Hazard Mitigation Plan*. This report was prepared by the 2016 update planning team and reviewed by the 2016 update steering committee. The objective is to ensure that there is a continuous planning process that keeps the local hazard mitigation plan responsive to stakeholder needs and capabilities. The contents of this progress report are as follows:

- Summary overview of action plan progress
- Recent natural hazard events
- Changes in risk exposure in Portland
- Mitigation success stories
- Itemized review of the action plan
- Changes in capability in Portland that could impact plan implementation
- Recommendations for changes/enhancement.

The Steering Committee

The update steering committee plays an important role in plan development, and may remain involved during plan implementation. The steering committee has provided technical review and oversight on developing this implementation progress report. Table 1 lists steering committee membership as of March, 2016.

Table 1. 2015-2016 Steering Committee Members

	Agency	Primary Member	Alternate
1	Bureau of Environmental Services (BES)	Maggie Skenderian	Kate Carone
2	Bureau of Planning and Sustainability (BPS)	Kathryn Hartinger	Roberta Jortner / Sallie Edmunds
3	Office of Equity and Human Rights (OEHR)	Danielle Brooks	Judith Mowry
4	Parks & Recreation	Vicente Harrison	
5	Fire and Rescue (PF&R)	Laurent Picard	Leo Krick
6	OHSU Institute on Development and Disability/Oregon Office of Disability and Health	Jessica London	Justin E. Ross
7	Portland Audubon Society	Bob Sallinger	Micah Meskel
8	Oregon Food Bank	Dean Alby	
9	Filipino American Community	Simeon Mamaril	
10	Oregon Seismic Safety Policy Advisory Commission	Jeff Soulages	
11	Department of Homeland Security	Glen Collins	
12	NET/ARES/Local Emergency Planning Committee	John Steup	
13	Neighbors West/Northwest	Darlene Urban Garrett	
14	Portland African American Leadership Forum/Boy Scouts of America	Solamon Ibe	
15	Brummell Enterprises, SMILE Member, Sellwood/Moreland	Karen Tam	Bob Burkholder
16	Portland Water Bureau	Mary Ellen Collentine	Mike Saling
17	Simpson Strong-Tie	Jim Mattison	Shalini Prochazka, S.E.
18	Bureau of Development Services	Kathy Roth	Mark Fetters
19	East Portland Action Plan	Jeremy O'Leary	
20	Immigrant and Refugee Community Organization IRCO/ONI New Portlanders	Ronault (Polo) LS Catalani	Lisha Shrestha
21	Hayden Island Neighborhood Network	Jeff Geisler	Margaret Puckette
22	Linnton Neighborhood Association	Rob Lee	
23	St. Johns Neighborhood Association	Jennifer Levy	Emilie Saks-Webb
24	Portland Public Schools	Molly Emmons	
25	MRG/Coalition of Communities of Color	Ranfis Giannettino Villatoro	
26	Bureau of Emergency Management	Jonna Papaefthimiou	
27	Office of Neighborhood Involvement (ONI)	Brian Hoop	
28	OHSU Emergency Management	Sherrie Forsloff	Mike Nurre
29	Goose Hollow Foothills League	Casey Milne	
30	Volunteers of America	Dean Stearman	
31	Portland Bureau of Transportation (PBOT)	Rich Grant	
32	Portland Harbor Community Advisory Group	Darise Weller	

SUMMARY OVERVIEW OF ACTION PLAN PROGRESS

The 2010 *City of Portland Natural Hazard Mitigation Plan* includes an action plan that identifies specific mitigation actions and a performance period for implementation of those actions. Table 2 summarizes the actions and current progress as of the time of this progress report.

Table 2. Summary Overview of Action Plan Progress

Number of Mitigation Actions	**101**
Mitigation Actions Started or Completed	
Number of Actions	75
Percent of Total	75%
Mitigation Actions Not Started	
Number of Actions	26
Percent of Total	25%

RECENT NATURAL HAZARD EVENTS IN PORTLAND

- **January 2012 Winter Storm**—Heavy flooding, street closures.
- **July 2013 Government Island Wildfire**—Over 20 acres of wildlands on Government Island burned.
- February 2014 Winter Storm—Snow and freezing rain. City of Portland issued Emergency Alert advising residents to remain indoors due to ice.
- **July 2015 Excessive Heat**—County activated cooling centers.
- **August 2015 Smoke Event**—Wildfires across Oregon negatively impacted air quality in the Portland Metro region. County health departments issued warnings.
- **December 2015 Severe Weather**—Heavy flooding, landslides, and wind damage. State Disaster Declaration. Federal Disaster Declaration for December 6-23, 2015.
- **January 2016 Severe Weather**—Significant snow and ice throughout the City. Hazardous conditions due to icy roads and walkways. City offices closed and warming shelters opened.

CHANGES IN RISK EXPOSURE IN PORTLAND

Since 2010, there has been no tracking of risk exposure or changes to risk exposure in Portland.

MITIGATION SUCCESS STORIES

The City of Portland completed restoration on the Foster Floodplain Natural Area in 2012. The project began after a 15-year process to purchase the property from 60 willing sellers and move them out of the Johnson Creek 100-year floodplain. The project added 140 acre-feet of flood storage, which was put to the test in December 2015 during record floods on Johnson Creek. The additional flood storage created by removal of impervious surfaces, planting of native vegetation and wood debris substantially reduced the amount of flooding experienced at homes and businesses in the Foster area.

In 2014 the City of Portland conducted a pilot project for residential seismic strengthening, managed by Clean Energy Works, Inc. Using federal grant dollars from the hazard mitigation grant program (HMGP), the City of Portland helped to seismically strengthen 23 single-family homes in Portland. In 2015 the City of Portland applied for and received funding for a similar project under the pre-disaster mitigation (PDM) grant program to help 150 homeowners seismically strengthen their homes. Clean Energy Works, operating under the new name Enhabit, will be partnering with the City in the management of this project.

REVIEW OF THE ACTION PLAN

This section reviews the action plan and lists the status of each action from the hazard mitigation plan, grouped by the agency or department responsible for its completion. The action plan matrix in Table 3 provides the following information:

- Brief summary of action
- Lead agency responsible for implementation
- Indication of whether any action has been taken (Yes or No)
- Current timeline (Short Term or Long Term)
- Indication of whether the project priority has changed (Yes or No)
- Status (Complete, Ongoing or No Progress)
- Comments, including the following information:
  - Was any element of the action carried out during the reporting period?
  - If no action was completed, why?
  - Is the timeline for implementation for the action still appropriate?
  - If the action was completed, does it need to be changed or removed from the action plan?

PORTLAND CHANGES THAT MAY IMPACT PLAN IMPLEMENTATION

No changes that might impact plan implementation were reported since 2010.

RECOMMENDATIONS FOR CHANGES OR ENHANCEMENTS

Based on the review of this report by the steering committee, the recommendations described below will be noted for future updates or revisions to the plan. In future updates, identified action items should include a timeframe and should clearly indicate the bureau primarily responsible for implementation and progress reporting. Potential partners (community groups, other jurisdictions, etc.) should also be listed. Action items should be organized and prioritized by responsible bureau, and a statement should be included describing whether the action can be accomplished within existing budgets or if additional funds need to be pursued.

An online data-sharing method for tracking action item status should be explored (e.g. GoogleDocs, OneDrive, etc.), as should a method for tracking grants and funding opportunities to implement action items.

Public review notice: *The contents of this report are considered to be public knowledge and have been prepared for total public disclosure. Copies of the report have been provided to local media outlets. The report is also posted on the City of Portland Natural Hazard Mitigation Plan website. Any questions or comments regarding the contents of this report should be directed to:*

Natural Hazard Mitigation
Portland Bureau of Emergency Management

Table 3. Action Plan Matrix

Action Taken?	Timeline	Priority Changed?	Comment (Describe progress or changed priority)	Status
ST MH #1— Continue to involve the public in updating the Natural Hazard Mitigation Plan. (education & outreach)				
Lead Agency:				
Yes	Long Term	No	In progress. Outreach is recorded in Emergency Management Performance Grants grant reporting. PBEM does regular outreach and is supportive of MCDD's Levee Ready Columbia outreach efforts.	Ongoing
ST MH #2— Form a committee to identify and coordinate critical transportation (street and highway) networks. (mapping, asset management)				
Lead Agency:				
Yes	Long Term	Yes	There is no committee, but we have identified emergency transportation routes for key facilities. If new facilities are built, transportation routes would be re-evaluated.	Complete
ST MH #3— Coordinate emergency standard operating procedures and plans between disaster responder organizations in the Portland metro region, to coordinate and expedite decision making during emergencies. (planning)				
Lead Agency:				
Yes	Short Term	No	Regional Multi-Agency Coordination on operations. Internally de-conflicted the County Basic Emergency Operations Plan with the City Basic Emergency Operations Plan. PBEM reviews other bureaus' emergency procedures.	Complete
ST MH #4— Develop a multiple-agency multi-hazard evacuation plan (EQ, flood, fire and landslide at a minimum).				
Lead Agency:				
Yes	Short Term	No	Evacuation Plan developed. Certain areas of highest risk have individualized plans (Linnton).	Complete
ST MH #5— Acquire Light Detection and Ranging (LiDAR) images of the Portland Metro area to facilitate natural hazard area risk assessment and vulnerability analysis. (mapping) (NFIP Compliance)				
Lead Agency:				
Yes	Short Term	No	Acquisition complete. Analysis in progress.	Complete
ST MH #6— Use findings from Portland's Risk Assessment (HAZUS-MH) to enhance existing debris removal plan. HAZUS-MH will need to be updated. (existing GIS Mapping)				
Lead Agency:				
Yes	Short Term	No	The 2003 HAZUS analysis was used to update Metro's debris removal plan from the 1990's in 2013. Debris modeling is being updated regionally. A new HAZUS analysis is being completed as part of the 2016 plan update.	Complete
ST MH #7— Create a mitigation mapping committee to index and maintain GIS mapped inventory and develop prioritized list of critical facilities, residential and commercial buildings within known hazard areas such as earthquake, erosion, the 100-year and 500-year floodplains, invasive plant species, landslide and wildfire areas. (NFIP Compliance) Identify parameters and methods for new maps as needed to meet multi-hazard mitigation goals and to improve communication with the public.				
Lead Agency:				
Yes	Long Term	Yes	CGIS maintains inventory in Portland Maps. No such committee exists. Much of this will be accomplished through the MAP update. Parks, BES data, PBOT erosion data, and others are included. PBEM also promotes the Map Your Neighborhood initiative.	Complete
ST MH #8— Partner with utilities as they ensure continuity of service to the City and the Columbia South Shore Well field to provide for redundancy in case of primary power outage. (asset management)				
Lead Agency:				
Yes	Long Term	No	The Groundwater Electrical Improvements project, currently in design, will provide for upgrades and additional redundancy to the Groundwater Pump Station electrical system.	Ongoing

Action Taken?	Timeline	Priority Changed?	Comment (Describe progress or changed priority)	Status
ST MH #9— Develop a city employee emergency response plan to assure that city employees know what is expected of them to continue City operations. (education, outreach)				
Lead Agency:				
Yes	Short Term	No	All bureaus have submitted Continuity of Operations Plans (COOP), and recognize accountability requirements. PBEM is hiring a COOP planner. The mayor sends out emails informing employees what to do in an emergency.	Complete
ST MH #10— Develop educational materials (television and print media) for residents that identify and define their risk to multi hazards: define and offer mitigation measures that residents can take home or share, determine method of distribution of the educational materials and coordinate with the media to reduce conveyance of misinformation. (education, outreach)				
Lead Agency:				
Yes	Long Term	No	PBEM hired a communications outreach representative, supports preparedness campaigns, promotes preparedness materials, and has offered seismic strengthening programs. Public Information Officer works with local news (KOIN) on post-disaster collaboration.	Complete
ST MH #11— Implement actions in the 2005 Portland Watershed Management Plan (planning) (NFIP Compliance)				
Lead Agency:				
Yes	Short Term	No	Dozens of projects implemented since the Portland Watershed Management Plan was completed. BES is developing a Stormwater System Plan that will significantly increase our ability to address drainage and flooding problems. Analysis available Sept. 2016.	Ongoing
LT MH #1— Revise Portland's Comprehensive Plan to address and implement Citywide policies, land use improvements and mapping changes to natural hazards including, but not limited to, earthquakes, erosion, floods, invasive plants, landslides, volcano, severe weather and wildfires. (mapping, planning) (NFIP Compliance)				
Lead Agency:				
Yes	Long Term	No	The draft Comp. Plan includes policies to reduce natural hazard risks and impacts, proposes changes to reduce development in areas prone to natural hazards. City Council hearings started November 2015. Adoption and submittal in spring 2016.	Ongoing
LT MH #3— Increase the responsiveness of the emergency permitting procedures for post-hazard event periods through development of a procedural plan and the purchase of a mobile permitting van. (planning)				
Lead Agency:				
Yes	Short Term	Yes	BDS looked into purchasing a mobile permitting van, and learned that it was much more expensive than originally thought. There are not sufficient resources currently to implement this action.	Ongoing
LT MH #6— Promote the development of TriMet communications and dispatch capability to immediately implement changes to transit routes and service due to disruption of streets, roads, bridges, rail transit tracks and the information technology that provides connectivity. (planning)				
Lead Agency:				
No	Long Term	No	Not started, identified as a need.	No Progress
LT MH #8— Review and amend City Code and other compliance documentation to require that all facilities that store or handle hazardous materials (including large tanks) and which are located in the 500-year floodplain, landslide, or other hazard areas, develop a hazardous materials inventory statement. This statement will be made available for Fire Bureau review. Require that these storage tanks are either adequately protected or relocated outside of the 500 year floodplain, landslide, or other hazard areas. (asset management) (NFIP Compliance)				
Lead Agency:				
No	Long Term	No	City Resolution 36156 (Water Bureau) requires businesses in the Columbia South Shore Well Field Wellhead Protection Area that meet haz-mat thresholds to report a hazardous materials inventory every November 30. Not in Title 33, Title 24 or Fire Code.	No Progress

Action Taken?	Timeline	Priority Changed?	Comment (Describe progress or changed priority)	Status
LT MH #9— Identify and pursue funding opportunities from outside agencies to fund and implement identified mitigation projects and activities. (education, outreach)				
Lead Agency:				
Yes	Long Term	No	FHA grant funding for PBEM/PBOT transportation planner. PDM 13 grant for MAP update, Hazard Mitigation Program grant for seismic retrofitting of private residences, PDM 15 grant application for seismic retrofit of private residences. PBEM annually applies for and receives Emergency Management Performance Grants, Urban Areas Security Initiative grants, and others on a regular basis. *Note: PBEM did not receive the Urban Areas Security Initiative grant in 2013.	Complete
LT MH #10— Assess the stability of levees in the Columbia Corridor Area and develop appropriate emergency plans to address potential levee failure and associated hazards. (planning)				
Lead Agency:				
Yes	Long Term	No	Assessments are being conducted through the Levee Ready Columbia project, and some have already been completed. Emergency response plans have been and will be developed for specific areas of concern.	Ongoing
LT MH #11— Support development of a multiple-agency plan for Marine Drive closure coordination. (planning)				
Lead Agency:				
No	Short Term	No	No multi-agency plan exists between MCDD, Port of Portland, PBOT, and PPB. Plans are developed ad hoc or as needed basis. Associated with winter weather plan/annex.	No Progress
LT EQ #11— Work with local jurisdictions to assess the capacity of landfill to accommodate earthquake debris: develop coordination plans for disposal of debris in the aftermath of an earthquake. (planning)				
Lead Agency:				
Yes	Short Term	No	A debris management plan is under development. PBEM is working with Metro and the Regional Disaster Preparedness Organization.	Ongoing
New MH #1— Cross reference and incorporate mitigation planning provisions into all community planning processes such as comprehensive, capital improvement and land use plans, to demonstrate multiple bureau benefits and strengthen eligibility from multiple funding sources. This action is also identified in LTFL#8, IS#94 & SW#117. (planning)				
Lead Agency:				
Yes	Long Term	No	2010 Natural Hazard Mitigation Plan components incorporated into Climate Action Plan and Comp. Plan update. PBEM regularly provides comments on citywide planning efforts and requests comments or participation from other bureaus on PBEM planning activities	Complete
New MH #2— Identify and list repetitively flooded structures and infrastructures, analyze the threat to these facilities and prioritize mitigation actions to protect the threatened population. (NFIP Compliance)				
Lead Agency:				
Yes	Long Term	No	There are 11 repetitive loss properties throughout the city. Two of these no longer have structures on them.	Ongoing
New Reworded MH— Acquire (buy-out), demolish, or relocate structures from hazard prone area. Property deeds shall be restricted for open space uses in perpetuity to keep people from rebuilding in hazard areas. (planning) (NFIP Compliance)				
Lead Agency:				
Yes	Long Term	No	1-2 properties on the Repetitive Loss Properties list are in target areas for acquisition.	Ongoing
New MH #3— Develop and incorporate building ordinances commensurate with building codes to reflect survivability from all hazards to ensure occupant safety. (NFIP Compliance)				
Lead Agency:				
Yes	Short Term	No	BDS is currently evaluating state seismic building codes adopted in 2014. BDS is also reviewing retrofit triggers for commercial buildings.	Ongoing

Action Taken?	Timeline	Priority Changed?	Comment (Describe progress or changed priority)	Status
New MH #4— Update the Infrastructure Master Plan and System Vulnerability Assessment, Sewer Failure Response Plan. (asset management, planning)				
Lead Agency: City Asset Managers Group (CAMG)				
Yes	Short Term	No	Infrastructure Master Plan was updated in 2014 and renamed the Citywide Systems Plan. The Sewer Failure Response Plan was updated in 2012 to comply with National Pollutant Discharge Elimination System permit requirements and named the Sewer Release Response Plan.	Complete
New MH #5— Partner with agencies to develop a west side operations center to be used during an emergency if the east side Emergency Control Center and other City facilities become inoperable.				
Lead Agency:				
Yes	Long Term	No	The Jerome Sears Center is currently being retrofitted to ADA accessibility to be temporary homeless shelter (6 months). Additional upgrades could be made over time to convert it to a west side operations center.	Ongoing
New MH #6— Promote 09 Climate Action Plan action items with similarities to adaptation planning and mitigation actions. (planning)				
Lead Agency:				
Yes	Long Term	No	This is a multi-bureau effort. A Climate Action Plan Implementation Team with representatives from key implementing bureaus meets regularly to monitor progress on 2015 CAP and 2014 Climate Change Preparation Strategy.	Ongoing
ST EQ #2— Assess existing earthquake related mitigation plans and vulnerability studies to identify areas of conflict, duplication or gaps between studies & secondary hazards of earthquake. (planning)				
Lead Agency:				
Yes	Short Term	No	This is being completed as part of the 2016 natural hazard mitigation plan update.	Ongoing
ST EQ #3— Update the vulnerability analysis of Columbia Boulevard Wastewater Treatment Plant Tryon Creek Wastewater Treatment Plant and wastewater pump stations. (asset management, planning)				
Lead Agency:				
Yes	Long Term	No	This was in the Capital Improvement Plan for 2013, but Bureau of Environmental Services determined at that time that more study was needed and we delayed it, but other related projects have been completed. A resiliency plan will be developed in FY16-18.	Ongoing
ST EQ #4—Prioritize the return of power to treatment plants (Tryon Creek and Columbia Boulevard) and pump stations.				
Lead Agency:				
Yes	Long Term	No	Bureau of Environmental Services has done several things under this umbrella and is otherwise required to have a high priority on power reliability by federal standard for critical assets.	Ongoing
ST EQ #8—Study the feasibility of mandatory or voluntary installation of seismic shutoff valves on natural gas meters at commercial and residential buildings.				
Lead Agency:				
Yes	Short Term	Yes	PBEM pursued this, but it did not come to fruition. Valves are expensive, and take time to turn back on after being shut off. It may be pursued at a state level. BPS and BDS have advocated for disclosure of seismic information upon sale of homes.	Complete
LT EQ #3—Develop a plan to strengthen sewer infrastructure in areas where street overlays and sewers have potential to collapse in a seismic event. (asset management)				
Lead Agency: City Asset Managers Group (CAMG)				
Yes	Short Term	No	City Asset Managers Group is working on this. MAP risk assessment could identify projects and key risk areas.	Ongoing

Action Taken?	Timeline	Priority Changed?	Comment (Describe progress or changed priority)	Status
LT EQ #6—Assess the vulnerability of the water distribution system to seismic events: work toward hardening the system.				
Lead Agency:				
Yes	Long Term	No	The Water Bureau has completed a number of seismic evaluations and upgrades over the last several years. A comprehensive evaluation of the entire water system is planned to be completed in the Fall of 2016.	Ongoing
LT EQ #8—Study development regulations and policies to ascertain if regulations can be made to limit development of high risk facilities in known areas of earthquake hazards.				
Lead Agency:				
No	Long Term	No	Not begun. BPS is leading the Comprehensive Plan and Central City 2035 planning process, which could establish the policy framework to update regulatiions. There are other options too, e.g., changes to fire code.	No Progress
SW #2—Acquire an additional facility for storage of anti-icing materials and expand anti-icing vehicle inventory.				
Lead Agency:				
Yes	Long Term	No	The city has acquired two new anti-icing vehicles. There is one storage location now. This is being addressed in conjunction with other needs at the Jerome Sears facility.	Ongoing
ST SW #6—Insulate residential buildings that house at risk populations.				
Lead Agency: Bureau of Planning and Sustainability				
Yes	Long Term	Yes	This action is being accomplished through different means. BPS created Clean Energy Works, Oregon which is now a non-profit organization that conducts energy audits and provides homeowners with low-cost energy efficient upgrades.	Complete
ST SW #7—Prioritize existing building stock for active review of Title 29 (Dangerous Building Code) This needs to be updated with intern information or information sent from individuals that are on the team.				
Lead Agency:				
No	Short Term	No	No progress at this time.	No Progress
ST FL #1— A covenant is recorded with the deed of new development in the floodplain to ensure that space below the base flood elevation is not converted to habitable space. This should be codified to improve compliance. (NFIP Compliance)				
Lead Agency:				
No	Long Term	No	No progress at this time. Team responsible for these types of codes is not clear on what this action means.	No Progress
ST FL #2—Continue to co-fund improvements to river and stream gauges in the Portland metropolitan area with the United Geological Survey.				
Lead Agency:				
Yes	Long Term	No	BES continues to allocate funding for these important sources of hydrologic (and in some cases, water quality) data.	Ongoing
ST FL #4—Secure the agreements necessary to design and implement the redevelopment of Freeway Land Company site. (within the Lents Urban Renewal Area)				
Lead Agency:				
Yes	Short Term	No	Potential with a current manufacturing company interested in the site. Should know by June if it is a viable project.	Ongoing
ST FL #5—Acquire outside funding to hire a consultant to lead the application process to maintain a Class 5 rating when the City seeks Community Rating System re-certification.				
Lead Agency:				
Yes	Short Term	No	Recently completed reverification. Portland is likely to be a Class 6 Community follow an extrmemely rigorous reverification process. New, more robust guidelines in the 2013 CRS Coordinators' Manual made it impossible to retain Class 5 status.	Complete

Action Taken?	Timeline	Priority Changed?	Comment (Describe progress or changed priority)	Status
ST FL #6—Support Multnomah County Drainage District (MCDD) in the continued calibration and update of hydraulic models for conveyance and internal flood impacts to the four floodplains managed by MCDD #1.				
Lead Agency:				
Yes	Short Term	No	Participated in information sharing for update of the internal drainage study. In addition, developed and calibrated model to predict stormwater volumes from BES stormwater system to the Multnomah County Drainage District #1.	Ongoing
ST FL #8—Identify funding for the design and construction of the Springwater Wetlands Complex, a 30-acre floodplain wetland restoration project in the Lents area of Johnson Creek.				
Lead Agency:				
Yes	Long Term	Yes	Grant funding was identified, but became cost-prohibitive. BES is pursuing a way to self-fund the project. Capital Improvement Plan advisory committee meeting in January to seek funding.	Ongoing
ST FL #9—Secure funding to implement the passive flood management projects that are recommended in the Johnson Creek Restoration Plan & other watershed management plans. Coordinate with Portland Development Commission's urban renewal efforts in Lents and with other partners in other parts of the watershed.				
Lead Agency:				
Yes	Short Term	No	BES is currently working with Housing, PDC, and Mayor's office to submit an application to Oregon Solutions to implement a robust set of projects that will help mitigate 100-year flood impacts to 300+ residential properties and numerous businesses.	Ongoing
ST FL #10—Improve definitions and refine standards for stormwater retention in the Storm water Management Manual.				
Lead Agency:				
Yes	Short Term	No	New Stormwater Management guidelines have just been released, with clarifying definitions and standards.	Complete
LT FL #1—Increase funding for the Johnson Creek Willing Seller Program; establish willing seller programs in other watersheds where flood hazard and priority restoration areas coexist. (NFIP Compliance)				
Lead Agency:				
Yes	Long Term	No	In addition to the Johnson Creek Willing Seller Program, a Watershed Land Acquisition Program is in place that prioritizes properties with significant hydrologic function and/or value. Over 450 acres have been acquired City-wide in partnership with Portland Parks (and in some cases, Metro) under the Watershed Program. Willing Seller funding is available to purchase the additional properties needed to implement the JC Restoration Plan. Over 20 acres acquired through the Willing Seller Program since 2010.	Ongoing
LT FL #3—Develop a plan for addressing flooding in the Holgate Lake area. (planning) (NFIP Compliance)				
Lead Agency:				
Yes	Long Term	No	No progress to date. Anticipate looking at this area as part of the larger Lents Floodplain/Oregon Solutions project.	No Progress
LT FL #4—Improve hydraulic bottleneck that prevents discharge of chlorinated effluent to the Willamette River during high river levels. (NFIP Compliance)				
Lead Agency:				
Yes	Long Term	No	The recent Facilities Plan update anticipates a future improvement of installing a high river bankside outfall to provide access to flow to the Willamette River during the conditions outlined.	Ongoing

Action Taken?	Timeline	Priority Changed?	Comment (Describe progress or changed priority)	Status
LT FL #5—As Waterfront Park remodeling is designed, ensure that Portland's downtown property and critical facilities remain protected from floodwaters. (asset management)				
Lead Agency:				
Yes	Long Term	No	This was considered during the Central City 2035 plan. BPS has contracted with PSU to evaluate flood changes from climate change in the Lower Willamette. The report will be completed by early 2017.	Ongoing
LT FL #6/#7—Partner with Army Corps of Engineers to conduct modeling of the Willamette River upstream of Portland to identify areas that, if acquired or restored, would contribute to mitigate of peak flows in Portland or result in significant reduction of flood damage. (NFIP Compliance)				
Lead Agency:				
Yes	Long Term	No	BPS contracted with PSU for work with the Army Corps to model the Willamette River flood extent through Portland under Climate Change scanarios. Following this, areas will be identifed that may be used to reduce peak flows. Analysis complete in 2018.	Ongoing
LT FL #8—Develop goals, policies and implementation measures to manage the amount of new impervious surface and remove existing impervious surfaces where appropriate. These goals, policies and measures may be at the citywide, watershed, or sub-watershed level. (planning) (NFIP Compliance)				
Lead Agency:				
Yes	Long Term	No	Draft Comprehensive Plan contains goals and policies, and updated CAP and new Climate Change Preparation Strategy include objectives and actions to limit and reduce impervious area. BES would lead implementation measures to actually remove pavement.	Complete
LT FL #9—Upgrade trestles that carry the main conduits of the water delivery system. (Sandy River Crossing interties completed) (asset management)				
Lead Agency:				
Yes	Long Term	No	Several conduit trestles have been eliminated or upgraded over the last several years. Eight more are recommended to be completed over the next five years.	Ongoing
FL #10—Create redundancy in the water delivery system at the three Sandy River crossings by burying conduits under the river (in progress).				
Lead Agency:				
Yes	Long Term	No	Two of these crossings have been replaced as part of a construction project completed in 2010. The Conduit 3 Crossing of the Sandy River is scheduled for completion within the Water Bureau's five year Capital Improvement Plan.	Ongoing
LT FL #11—Provide funding for and participate in development of a flood inundation model for the managed floodplains and downtown sea wall. (mapping) (NFIP Compliance)				
Lead Agency:				
Yes	Long Term	No	BPS contracted with PSU to assess changes to Willamette River floodplains resulting from climate change. Report completion date is in 2017. Levee Ready Columbia is contracting with USGS and Corps of Engineers to conduct an assessment for the Columbia.	Ongoing
LT FL #12—Install a river gauge in the vicinity of the bridge over Johnson Creek at 108th. The gauge should be able to send data to remote monitoring sites.				
Lead Agency:				
Yes	Short Term	Yes	The bridge was removed as part of the Foster Floodplain Natural Area construction, which created an additional 120 acre feet of flood storage along SE Foster Rd. We have installed a crest gage however to determine flood levels during over-bank events.	Complete

1700

LUBA No. 2020-009
Page 1986

Action Taken?	Timeline	Priority Changed?	Comment (Describe progress or changed priority)	Status
LT FL #13—Install one-way valves on the outlet pipes of the storm inlets on SE Foster Road between 101st and 112th.				
Lead Agency:				
Yes	Long Term	No	These outlets now go to a stormwater facility that is part of the Foster Floodplain Natural Area.	Complete
FL #1—Complete update to the Johnson Creek Restoration Plan. Develop individual plans for each subwatershed to address the sources of excess stormwater runoff that exacerbates flooding. (NFIP Compliance)				
Lead Agency:				
Yes	Short Term	No	This work falls under the Stormwater System Plan. See ST-MH #11.	Ongoing
FL #2—Establish flood mitigation priorities for critical facilities and residential and commercial buildings located within the 100-year floodplain using survey elevation data. (NFIP Compliance)				
Lead Agency:				
Yes	Short Term	Yes	The City Asset Managers Group is working to define critical facilities, rather than prioritize, which is the first step. This will also be furthered by the MAP risk assessment and action item update.	Ongoing
ST-LS #1—Continue to maintain and Improve internal City communications to facilitate coordination of landslide mitigation activities. (education, outreach)				
Lead Agency: Portland Bureau of Emergency Management				
Yes	Long Term	No	PBEM continues working to improve internal coordination and communication. It is unclear what this action refers to specifically in terms of landslide mitigation.	Ongoing
ST-LS #3—Mitigate Portland's water supply infrastructure from landslide hazards. (asset management)				
Lead Agency:				
Yes	Long Term	No	Evaluation work continues on PWB facilities considered vulnerable to landslides.	Ongoing
ST-LS #4—Initiate more operations and maintenance pilot projects along roads that inform about the development of standards for managing stormwater in ditches in landslide prone areas. (education, outreach)				
Lead Agency: Bureau of Environmental Services				
No	Short Term	Yes	No progress has been made on this project to date. Project description is vague and does not identify specific actions.	No Progress
LT-LS #1—Develop a comprehensive landslide map for the City of Portland to identify hazard areas and to improve communications with the public. (mapping)				
Lead Agency:				
Yes	Short Term	No	BPS is coordinating with DOGAMI on a project to improve landslide related maps and data. This is currently between Corporate GIS and DOGAMI. CGIS will update landslide data based on DOGAMI work.	Ongoing
New LT LS #3—Evaluate the role of drainage systems in the West Hills, including pipes, streams and drainage ways and options for protecting and improving their functions and increasing their resiliency. (planning)				
Lead Agency:				
Yes	Short Term	No	This work falls under the Stormwater System Plan. See ST-MH #11.	Ongoing
LT LS #4—Review the effectiveness of existing regulations related to development in landslide hazard areas. (planning)				
Lead Agency: Bureau of Planning and Sustainability				
No	Short Term	No	Not started but could be a good Comprehensive Plan implementation project. It could be coupled with project to address impervious area and use new landslide data from DOGAMI.	No Progress
LT-LS #6—Employ alternative construction methods such as trenchless construction on City projects to reduce the impact that development can have in landslide prone areas.				
Lead Agency: Bureau of Environmental Services				
No	Long Term	No	No progress on this project to date. Specific action items are unclear.	No Progress

Action Taken?	Timeline	Priority Changed?	Comment (Describe progress or changed priority)	Status
LT LS #7—Continue development of standards for small pump stations as an alternative to gravity sewers in accessible or high risk areas.				
Lead Agency:				
No	Short Term	No	BES recognizes this as a desirable project but has not begun work yet.	No Progress
ER #1—Develop recommendations for high and low ranking streamside plants that provide more erosion control, such as reducing erosion from high water and wave actions.				
Lead Agency:				
No	Short Term	Yes	No progress has been made on this project to date. Project description is vague and does not identify specific actions.	No Progress
ER #2—Implement projects that retain native vegetation, increase vegetation diversity and increase the complexity of the vegetation strata (having three vegetation strata: herbs, shrubs, trees).				
Lead Agency:				
Yes	Long Term	No	Robust invasive plant removal/native plant installation implementation over the last 5 years.	Ongoing
ER #3—Implement policies to increase the extent of coverage of the Greenway zones along the rivers and further limit proposed activities within these areas.				
Lead Agency:				
Yes	Long Term	No	In progress. Central City 2035 plan anticipates proposing expanded river setback, updated regulations, and riverbank enhancement targets.	Ongoing
ER #4—Develop standards for soil backfill in vegetated areas, especially sloped areas. (planning)				
Lead Agency:				
No	Short Term	Yes	No progress has been made on this project to date. Project description is vague and does not identify specific actions.	No Progress
ER #5—Establish regulations that prevent installation of slopes steeper than 3:1 and prohibit development on slopes steeper than 3:1. (planning)				
Lead Agency:	Bureau of Development Services/Bureau of Planning and Sustainability			
No	Short Term	No	No such proposal yet.	No Progress
ER #6—Implement projects that layback and/or regrade riverbank slopes and secure wetland sod mats composed of native emergent/grasses, etc.				
Lead Agency:				
Yes	Long Term	No	These practices are used routinely in our restoration projects. Six projects, 98 acres completed since 2010.	Ongoing
ER #7—Construct and install bio-engineered slope protective measures to reduce or eliminate erosion				
Lead Agency:				
No	Short Term	No	No progress on this project to date. Specific action items are unclear.	No Progress
ER #8—Implement projects that increase large wood structures that act to soften the effect of wave action on shorelines as well as provide habitat for migrating salmonids.				
Lead Agency:				
Yes	Long Term	No	These practices are used routinely in our restoration projects. Six projects, 98 acres completed since 2010.	Ongoing
ER #9—Secure large wood [boles w/ attached root wads] or log rafts to reduce high wave action that can result in erosion.				
Lead Agency:				
Yes	Short Term	No	Large wood has been installed in all major tributaries to the Willamette, including Columbia Slough, Johnson, Tryon, Fanno, and Stephens Creeks. Proposals in progress for mainstream Willamette projects at Powers Marine, Sellwood, and Kelly Point Parks.	Ongoing

Action Taken?	Timeline	Priority Changed?	Comment (Describe progress or changed priority)	Status
ST WF #1—Consolidate unassigned and/or unmanaged vegetated areas owned by the City under a single land management umbrella. (asset management)				
Lead Agency:				
No	Long Term	No	No progress has been made on this project to date.	No Progress
ST WF #2—Procure funding for management of vegetated natural areas with high wildfire danger, including public and private properties.				
Lead Agency:				
Yes	Long Term	No	Parks does not seek funding from outside sources, but this is a typical management practice and is integral to Parks SOPs and management/planning documents.	Complete
ST WF #4—Provide wildfire management training to staff. (education, outreach)				
Lead Agency:				
Yes	Short Term	No	Each year PF&R provides seasonal wildland training to all line personnel by reviewing and exercising procedures. In 2016, PF&R will conduct a spring Training Block that all line staff will complete, with basic state level hands-on wildland training.	Complete
ST WF #5—Amend the Portland Plant List and other related City plant lists and landscaping guides to include/identify fire resistant native plants and planting strategies that could be encouraged or required in local landscaping. (planning)				
Lead Agency:				
Yes	Short Term	No	The Portland Plant List was updated to provide information about fire resistant native plants. Other landscaping and tree guides are maintained by BDS and PP&R.	Complete
ST WF #6—Integrate, as appropriate, fire prevention goals and provisions into City policies, plans and codes. Identify and address ambiguities or conflicts among city requirements. (planning)				
Lead Agency:				
Yes	Short Term	No	The draft Comprehensive Plan includes policies and map changes to reduce future risks and impacts from natural hazards, including wildfire. The draft plan also includes new urban forest related policies that recognize the need to manage for wildfire.	Complete
ST WF #7—Identify conditions of approval and mitigation strategies that could be applied to new development or redevelopment in high risk areas.				
Lead Agency:				
Yes	Long Term	No	The Comprehensive Plan could set the stage to address this in future code amendments (e.g., ezones, land division).	Ongoing
ST WF #9—Improve the system for identifying new construction in areas subject to wildfires and communicating this information to the affected land owners. (planning)				
Lead Agency:				
Yes	Short Term	No	It is not clear what exactly this strategy means. It seems to imply a new mapping tool or interface. BTS upgraded the online mapping platform at PortlandMaps.com, which shows fire risk by parcel.	Complete
ST WF #10—Conduct systematic reviews of Portland's large, publicly owned, wildland tracts regarding fire safety and ecological health to ensure informed land management decisions. (asset management)				
Lead Agency:				
Yes	Short Term	No	This is part of Parks' standard operating procedures and planning documents.	Complete
ST WF #11—Adopt the national "Fire Danger Rating System" and install the signs at key points in the City.				
Lead Agency:				
No	Short Term	No	Portland does not currently have a "Fire Danger Rating System", but this is a system that would be useful and could be maintained by the Parks Bureau.	No Progress

Action Taken?	Timeline	Priority Changed?	Comment (Describe progress or changed priority)	Status
ST WF #12—Implement a neighborhood wildland interface disaster planning program. (education, outreach)				
Lead Agency: Portland Parks and Recreation				
Yes	Short Term	No	"Ready, Set, Go!" was developed and managed by the International Association of Fire Chiefs. We adopted the program last year, and have information on our website and handouts for citizens to learn how to protect themselves.	Complete
ST WF #13—Review and potentially refine City contract specifications for machinery operations during "Red Flag" weather conditions. (asset management)				
Lead Agency:				
No	Short Term	No	No equipment use restrictions exist during Red Flag Warnings other than an advisory generated by the Natural Weather Service. Parks does have contract language that restricts construction and other work during Red Flag days.	No Progress
ST WF #14—Convene a standing wildland interface fire technical group. (planning)				
Lead Agency:				
Yes	Short Term	Yes	A standing wildland interface technical group currently meets to discuss wildland issues but budgets have limited current activity.	Ongoing
ST WF #15—Index City wildfire mitigation plans and activities. (asset management)				
Lead Agency:				
Yes	Short Term	No	The 2011 Multnomah County Community Wildfire Protection Plan indexes recommendations from the 2010 NHMP, the 2009 Wildfire Readiness Assessment Gap Analysis Report, and the Forested and the 2005 Wildland Interface Areas Protection Annex recommendations into one comprehensive list.	Complete
WF—Develop and implement protocol for defining and mapping Wildland Urban Interface Zones and develop recommended policies, regulations and landscape options for incorporation into City plans and programs. (planning)				
Lead Agency: Bureau of Planning and Sustainability				
No	Long Term	No	Not started. This could be a good Comprehensive Plan implementation project. It should be co-led with Portland Fire & Rescue.	No Progress
ST WF #16—Identify water grid engineering requirements for firefighting in wildfire areas. (asset management)				
Lead Agency:				
No	Short Term	No	Have not started, but this could be coordinated between PF&R and the Water Bureau.	No Progress
LT WF #2—Review the feasibility of adopting portions of nationally recognized wildfire interface codes to strengthen building standards in wildfire risk areas.				
Lead Agency:				
Yes	Short Term	Yes	PF&R have worked toward adopting nationally recognized codes, but with little success. Portland does have requirements for new structures built in wildland areas, such as non-combustible siding and roofing.	Ongoing
LT WF #3—Design and conduct a study to determine the effectiveness of maintenance agreements that are established when new land divisions are approved to manage vegetation in open space tracts.				
Lead Agency:				
No	Short Term	No	Not started.	No Progress
LT WF #4—Complete an assessment to characterize high priority wildfire risk areas and recommend specific mitigation strategies.				
Lead Agency:				
No	Short Term	Yes	Metro procured LiDAR data in 2014, and vegetation classification analysis was performed by BPS and PSU. The vegetation data could be used to produce a wildfire risk assessment, but that analysis has not been done.	No Progress

Action Taken?	Timeline	Priority Changed?	Comment (Describe progress or changed priority)	Status
LT WF #5—Explore avenues for funding wildfire interface home construction upgrades to low income homeowners.				
Lead Agency:				
No	Short Term	No	PF&R has not explored this due to the lack of funding for a dedicated wildland position through the Fire Marshall's Office.	No Progress
WF—Act upon all Mitigation Actions outlined in the Wildfire GAP Analysis Report				
Lead Agency:				
Yes	Long Term	No	See Attachment A.	Ongoing
IS #1—Update Invasive Species Plants List by consolidating nuisance and prohibited plant lists into one "Nuisance Plants List" and assigning priority ranks to the Nuisance Plants List.				
Lead Agency:				
Yes	Short Term	No	Completed in 2010.	Complete
IS #2—Clarify zoning regulations to require removal of plants on the Nuisance Plants List in the Environmental, Greenway and Pleasant Valley Natural Resources Overlay Zones and the Columbia South Shore and Johnson Creek Basin Plan Districts.				
Lead Agency:				
No	Short Term	Yes	There is no additional plan to require removal of all nuisance plants in the specific areas identified in the action. DROP.	No Progress
IS #3—Initiate a process to ensure the Erosion Control Manual be made consistent with City goals to control and eradicate invasive plants. (planning)				
Lead Agency:				
Yes	Short Term	No	The Erosion Control Manual was updated in 2010. In this update, invasive species were called out as specifically prohibited.	Complete
IS #4—Initiate a process to ensure the Tree and Landscaping Manual, the Recommended Street Tree List and the Stormwater Management Manual be made consistent with City goals to control and eradicate invasive plants. (planning)				
Lead Agency:				
No	Long Term	Yes	There is no coordination committee in place. Tree and Landscaping Manual maintained by BDS, Recommended Street Tree List maintained by PP&R/Urban Forestry, SWMM maintained by BES. Any such project should be led by the BES Invasive Species Mgmt. Program.	No Progress
IS #5—Coordinate with the Portland Plan project to help ensure that invasive species are addressed in the Comprehensive Plan update and Portland Plan work plan. (planning)				
Lead Agency:				
Yes	Short Term	No	The draft Comprehensive Plan contains policies to manage and prevent the spread of invasvie plants.	Complete
IS #6—Research the feasibility of establishing a local noxious or invasive weed law.				
Lead Agency:				
No	Short Term	No	Not started.	No Progress
LT V #1—Work with the state and other impacted jurisdictions to implement and update the various volcano Inter-Agency Coordination Plans.				
Lead Agency: Portland Bureau of Emergency Management				
Yes	Long Term	No	PBEM attends meetings regarding interagency volcano plans for Mt. St. Helens, Mt. Adams, and Mt. Hood	Ongoing
V—Work with the state and other impacted jurisdictions to implement and update the various volcano Inter-Agency Coordination Plans.				
Lead Agency:				
CHOOSE	CHOOSE	CHOOSE	Redundant.	CHOOSE

ATTACHMENT A – WILDFIRE GAP ANALYSIS REPORT ACTION ITEM STATUS

5. Convene a standing City of Portland wildfire technical working group. *Done*
6. Identify and map the wildland urban interface area within the City. *Done*
7. Modify existing regulations to improve the permitting process and allow an increase of the defensible space around structures. *Not Started.*
8. Integrate fire prevention goals and provisions into policies, plans, and codes. *Not Started.*
9. Secure funding for continued, long term vegetation management projects that maintain safe fuel levels in key locations. *PF&R conducted some vegetation management when grants were available, up to 2012, at which point funding expired.*
10. Conduct a wildland firefighter training assessment. *Done.*
11. Reaffirm wildland firefighting standards for Portland Fire & Rescue. *Done*
12. Analyze and prioritize emergency vehicle access routes. *Not Started.*
13. Conduct a periodic tri-county wildfire coordination meeting. *Done. PF&R regularly attends Fire Defense Board Meetings.*
14. Revisit mutual aid agreements to ensure they are current and applicable. *Done. Most agreements are reviewed periodically, even though they are perpetual in nature and extend from year to year.*
15. Establish an agreed upon fire danger rating system and develop agency protocols. *Not Started.*
16. Continue conduct annual wildland firefighter training for Portland Fire personnel. *Done.*
17. Improve enforcement of park rules in natural areas and open space tracts on approved land divisions. *Not Started.*
18. Improve emergency radio communications between PP&R Nature field staff and City first responders. *Done. Communications between Rangers has improved, but no documented improvements with Nature Field Staff.*
19. Design and conduct an effectiveness study of maintenance agreements that are established when new land divisions are approved to manage vegetation in open space tracts. *Not Started.*
20. Conduct wildfire training for City wildfire response stakeholders. *Not Started.*
21. Develop a comprehensive, long term vegetation treatment program. *Done. Portland Parks is working on a 10-year Restore Forest Park Plan for continued maintenance and removal of non-native trees and vegetation and other ladder fuels.*
22. Educate landowners within the Wildfire Hazard Zone about wildfire hazards. *Done.*
23. Establish a fire information network in Forest Park and Powell Butte. *Not Started.*
24. Create incentives to encourage fuel reduction and defensible space. *Done. Currently Portland Parks works with landowners and participates in outreach with our partner organizations.*
25. Design and install one or more demonstration areas to showcase wildfire resistant plantings. *Done. Station 27 is currently a "work-in-progress" to demonstrate wildfire resistance strategies.*
26. Initiate and maintain training opportunities with regional and City incident management teams. *Done.*
27. Develop a cross-bureau plan for evacuation of citizens in high fire risk areas. *Not Started.*
28. Develop critical GIS map layers for fire response and planning in natural areas. *Done.*
29. Review and update the Forested and Wildland Interface Areas Fire Protection Plan. *Not Started.*
30. Re-Invigorate Neighborhood Emergency Teams with concrete projects. *Done.*
31. Improve the system for identifying new construction in areas subject to wildfires. *Not Started.*
32. Assess and communicate the capacity of the water infrastructure (e.g. pipes, hydrants, water reservoirs). *Not Started.*
33. Review the feasibility of adopting portions of state or nationally recognized wildfire interface codes. *Not Started.*
34. Identify conditions of approval and mitigation strategies for new development or redevelopment in high risk areas. *Not Started.*

Appendix B. Steering Committee Ground Rules

B. Steering Committee Ground Rules

PURPOSE OF THE STEERING COMMITTEE

The role of the Steering Committee is to guide the planning process for the City of Portland Mitigation Action Plan (MAP), and to foster an equitable approach to building Portland's resilience to natural hazards. The Steering Committee will provide guidance and leadership, oversee the planning process, and act as a point of contact for local governments, neighborhoods, and community groups interested in this planning effort, working to ensure that all Portlanders have equal access to projects that reduce their risk from natural hazards. Members of the Steering Committee represent a cross-section of views and interests across Portland. Through this inclusion of diverse interests, the Steering Committee hopes to enhance the robustness of the planning effort and to build support for hazard mitigation activities across stakeholder groups. A successful planning effort will result in the adoption and approval of a plan that sets the stage for equitably reducing the adverse impacts of natural hazards within the City through activities and strategies embraced by both elected officials and the people of Portland.

DEFINITION OF STAKEHOLDER

Stakeholders for this planning process are persons and agencies that have a vested interest in the recommendations and implementation of the MAP. Stakeholders include residents; community groups; business owners; local, state and federal agencies; elected officials; visitors; neighboring communities; and others.

CHARGE STATEMENT

During the course of developing the MAP, the Steering Committee will:

- guide the planning process,
- develop strategies for public involvement that foster mutual information exchange during plan development and implementation,
- promote and advocate for equity in hazard mitigation, and
- support the develop of mitigation strategies that promote a decrease in loss of life, property damage, and long-term impacts to social, environmental and economic systems from natural hazards.

CHAIRPERSON AND VICE CHAIRPERSON

Solamon Ibe, Jessica London, and Jeremy O'Leary have been selected as the co-chairpersons of the Steering Committee. The Co-chairpersons will rotate acting Chairperson and Chairperson Support roles. The role of the acting Chairperson for each meeting is to:

- lead meetings so that agendas are followed and meetings adjourn on-time;

- allow all members to be heard during discussions;
- moderate discussions between members with differing points of view; and
- be a sounding board for staff in the preparation of agendas and on how to best involve the full Committee in work plan tasks.

The role of the Chairperson Support person will be to assist in timekeeping and to assist in tracking the order in which members have indicated they would like to comment, particularly when agenda items are contentious.

QUORUM

A quorum for the Steering Committee will be 17 members. When less than 17 members are present at a meeting, items listed on the agenda may still be reviewed and discussed; however, any committee action as to those items will be postponed until a quorum is present.

ALTERNATES

Committee members were selected for the Steering Committee based on their specific backgrounds and perspectives on matters related to hazard mitigation. Regular attendance by members is needed to understand the issues presented, identify and reflect on various stakeholder perspectives, and reach agreements on plan recommendations. However, there may be circumstances when regular members cannot attend. To address these circumstances, alternates may be designated for each Steering Committee member. An alternate attending on behalf of a Steering Committee member shall have the same rights and responsibilities as the Steering Committee member during that meeting. Alternates will be included on all Steering Committee emails and should remain apprised of the business of the Steering Committee.

DECISION-MAKING

The Steering Committee will strive for consensus in its decision-making process. If consensus cannot be reached as to a particular item or issue, the Steering Committee's decision will be determined by a majority vote of the Committee members in attendance at the meeting, and the meeting summary will reflect the number of votes in favor, opposed, and in abstention. Any Steering Committee member may request that dissenting opinions be included in the meeting summary.

In the event that an issue brought to a vote results in a tie, 20 additional minutes of discussion time will be allotted for the topic. A re-vote will be conducted at the end of the allotted time. If the vote still results in a tie, decision-making authority will be handed over to the lead agency, Portland Bureau of Emergency Management (PBEM). PBEM may choose to decide on the issue, extend the time allotted for discussion or carry the item over to the next agenda.

RECOMMENDATIONS

The Committee's recommendations will be recorded in the meeting summaries and reflected in the MAP, as appropriate. The Committee may also be asked to assist in public outreach efforts and public presentations of the MAP and its recommendations.

STAFFING

The Planning Team for this project includes appropriate personnel from the City of Portland Department of Emergency Management, along with contract consultant assistance provided by Tetra Tech, Inc. The Planning Team will schedule meetings, distribute agendas, prepare information/presentations for Committee meetings, write meeting summaries, and generally seek to facilitate the Committee's activities.

A City designated Public Information Officer, **Dan Douthit 503-823-3928**, will be the designated spokesperson for this planning effort.

MEETING DATES

Meetings generally will be conducted on the third Wednesday of each month from 4:00 PM to 6:30 PM at the Wyeast Conference Room, Level L1, 501 N Dixon St. Portland, OR 97227. A teleconference number will also be provided for those wishing to join the meeting, but who are unable to attend in person. The planning team requests that steering committee members be given first priority for spaces on the conference line in the event those who choose to utilize the call-in option exceeds the line capacity. Meetings that conflict with religious, state or federal holidays will be rescheduled at the Steering Committee's discretion. Such scheduling changes will be noted on the hazard mitigation website. Meetings will be open to the public and will be advertised as such.

ATTENDANCE

Participation of all Committee members in meetings is important and members should make every effort to attend each meeting. If Committee members and their designated alternates are unable to attend a meeting, they should provide as much advance notice as reasonably possible to the Planning Team before the meeting is conducted. If neither a Steering Committee member nor his or her alternate attends 2 consecutive meetings or 3 cumulative meetings, the Steering Committee chairperson will reach out to the member to determine if participation will still be possible. The Steering Committee will strive to maintain the Steering Committee membership at 33 members with a representative makeup similar to the initial committee makeup.

PUBLIC INVOLVEMENT

All Steering Committee meetings will be open to the public. Members of the public wishing to address the Steering Committee at a meeting may do so based on the following protocol:

- While the agenda is reviewed at the beginning of each Steering Committee meeting, the chairperson will ask if anyone wishes to be heard. Anyone wishing to speak will be given three minutes and Steering Committee members may then ask questions. This allotted time cannot be aggregated or passed on to another individual.
- The time allocation for public comment at each meeting will be determined by the chairperson.
- When many people are expected to testify, sign-up lists will be provided. Written materials may also be submitted to the Steering Committee for distribution to members either prior to or at the meeting. Written material for distribution to members may also be submitted by those unable to attend in person.
- Those wishing to make video or PowerPoint presentations should check with the Planning Team prior to the meeting (danielle.butsick@portlandoregon.gov).

- All comments must have relevance to the MAP and Portland. Relevance will be determined by the chairperson.

A member of the public may request clarification from the Steering Committee by raising his or her hand during the normal course of the meeting; permission to speak will be granted at the discretion of the chairperson.

The meeting agendas for all Steering Committee meetings will be posted on the hazard mitigation website a minimum of 72 hours prior to all scheduled meetings (https://www.portlandoregon.gov/pbem/67578).

COURTESY

Committee members will treat each other with respect, listen to each other, work cooperatively, and allow all members to voice their opinions.

STEERING COMMITTEE MEMBERSHIP

Agency	Primary Member	Alternate

GROUND RULES ATTACHMENT A: MEETING FACILITATION

Committee Co-Chairs

- Solamon Ibe – Portland African American Leadership Forum
- Jessica London – Oregon Health and Science University/Oregon Office of Disability and Health
- Jeremy O'Leary – East Portland Action Plan

One Chair and one Vice-Chair will serve at each steering committee meeting. Each Co-Chair will be off-duty approximately once every three months, depending upon scheduling needs. The Co-Chairs will determine scheduling in advance of each meeting. If a substitute is needed, Co-Chairs will work with the other Co-Chairs and the Planning Team to designate an alternate.

Responsibilities

Chair

The Chair will be responsible for facilitating discussion during meetings. During normal discussion, the Chair will manage committee comments and questions, calling on members in the order they requested to speak. The Chair will also receive comments and questions from non-committee members at her or his discretion. If the topic becomes contentious or several members wish to provide comment, the Chair may request assistance from the Vice-Chair.

Vice-Chair

The Vice-Chair will manage committee and public comments when requested by the Chair, or when the topic becomes contentious or several members wish to provide comment. While managing comments, the Vice-Chair may also call on members of the public at her or his discretion. The Vice-Chair will track time spent on agenda items and will alert the Chair when time allotted to an agenda topic is nearing or have been reached.

Self-Representation

While acting as Chair or Vice-Chair, the Co-Chairs may represent their own interests, thoughts, and opinions so long as they do not use their position to overstep others. Comments from the acting Chair or Vice-Chair will be received in the same manner as comments from other members.

Meeting Management

Seating

Whenever possible, the meeting room will have a U-shaped conference table large enough for the entire steering committee. To facilitate accurate consensus and voting representation, conference table seating will be reserved for voting steering committee members and planning team members. In situations where a bureau or organization has both a primary member and a designated alternate present, only the primary member will be seated at the conference table. Additional seating for non-voting stakeholders and members of the public will be provided. The bottom of the U-shape (head of

the table) will be reserved for the Co-Chairs and Planning Team members. Committee members are free to choose any other seat at the table that will meet their needs.

Comment/Question Queue

At the discretion of the Chair and Vice-Chair, a whiteboard may be used to keep a running list of names of committee members and members of the public who wish to provide comments or questions. The Vice-Chair is responsible for managing the queue and ensuring committee members are called upon for comment. Members of the public may be added to the list at the Vice-Chair's discretion. Normal conversation is preferred, and this method will be employed only when deemed necessary by the Chair and/or Vice-Chair.

Voting Cards

Each steering committee member will be provided with a set of three colored cards to be used in committee discussions or voting activities. Committee members will use these colored cards to indicate their needs or voting preferences during discussion.

- **Red** indicates a "no" answer during a vote. During discussion, a red card indicates that a committee member wishes to express a dissenting opinion or is uncomfortable with the present discussion. Red cards will be addressed in the order they are received.
- **Yellow** indicates an "undecided" or "abstaining" vote. During discussion, a yellow card indicates that a committee member requires clarification before the conversation can continue. For example, a member might use a yellow card to request a definition when an acronym is used. Yellow cards will be addressed immediately, and should be used judiciously.
- **Green** indicates a "yes" answer during a vote. During discussion, a green card indicates that a member has a supporting comment or question. Green cards will be addressed in the order they are received.

A set of cards will be provided for each committee member at every meeting. Each card will have its color name printed in text, and will include the above definition for its purpose. Cards will be collected from committee members after each meeting.

Handouts

All handouts will be printed and provided for committee members at each meeting.

Committee Membership

The Planning Team will maintain a roster for the steering committee. Committee members are free to designate alternates at their discretion. New voting members will be added at the committee's discretion. If a stakeholder or member of the public wishes to join the committee as a new voting member, she or he will be presented to the committee for confirmation.

EXECUTIVE SUMMARY

This community engagement plan outlines the Community Engagement Strategy for the City of Portland's 2016 Mitigation Action Plan (MAP) development process. The City has invested significant resources in facilitating public participation to ensure that the MAP reflects the relevant needs of the community. This document proposes a number of activities to be undertaken over the next few months as part of the MAP development process. A number of recommendations are also made to ensure continued community engagement following the adoption of the MAP. These recommendations include creation of an E-portal and an online risk atlas, multi-lingual support for planning documents and surveys, hazard mitigation exhibits, increased coordination with other bureaus and civic organizations, and the hazard mitigation ambassador program.

1. INTRODUCTION

This community engagement plan provides a framework for public participation in the 2016 Mitigation Action Plan (MAP) development process. The City of Portland believes in the importance of public participation, and has invested significant resources to ensure that this process benefits from a wide range of perspectives from all stakeholders.

BOX–1: COMMUNITY ENGAGEMENT STRATEGY GOALS

1. Reach out to all stakeholders, specifically those that live in higher risk areas.
2. Create authentic opportunities for stakeholders to influence the planning process
3. Make use of existing community outreach capacities and networks.
4. Partner with local organizations
5. Promote activities that meet the Disaster Mitigation Act (DMA) and Community Rating System (CRS) outreach requirements;
6. Propose activities that can be included in the MAP

2. PUBLIC INVOLVEMENT PRINCIPLES

BOX–2: NEED FOR PUBLIC PARTICIPATION

Effective public involvement in local planning and policy development:

1. Results in City decisions that effectively respond to the needs and priorities of the community.
2. Makes community members and community resources as part of the solution.
3. Involves the whole community – especially those that have not participated in the past.
4. Spreads knowledge of and support for public policies and programs.
5. Keeps government accountable.

The City of Portland has a history of promoting community engagement and participation in all areas of local policy making. It is one of the handful of cities in the United States that have intentionally adopted a programs to consult and partner with communities in all aspects of local policy making. The Office of Equity and Human Rights was established within the City Government "to promote equity and reduce disparities based on race and disability within City Government." Also, a number of other departments and agencies have developed numerous programs to promote stakeholder engagement.

All city departments and local agencies in Portland strive to incorporate the Portland City Council's 2010 Public Involvement Principals in their policy making efforts.

3. Stakeholder Involvement in Hazard Mitigation Planning Process

The Planning team listed and prioritized key stakeholders at the beginning of the planning process. The Portland Bureau of Emergency Management reached out to each of these stakeholders through emails and phone calls with invitation to participate as a steering committee member.

BOX–3: KEY TERMS

Community, refers to all residents of the City of Portland or those who work and play here.

Stakeholders, refer to people, groups, or businesses with an interest in findings and projects in the MAP. Stakeholders include residents; community groups; business owners; local, state and federal agencies; elected officials; visitors; neighboring communities; and others.

Engagement, is any two-way communication between the local government and stakeholders.

The Steering Committee guides the planning process for the MAP and promotes equity in building Portland's resilience to natural hazards. Members of the Steering Committee represent a cross-section of views and interests across Portland. By including diverse interests, the Steering Committee hopes to strengthen the planning effort and to build support for hazard mitigation activities across stakeholder groups. The Steering Committee provides guidance and leadership, oversees the planning process, and is the point of contact for local governments, neighborhoods, and community groups interested in the plan update. The Steering Committee members work with the planning team and other city officials to ensure that all Portlanders have equal access to projects that reduce their risk from natural hazards.

The Portland Bureau of Emergency Management coordinated two equity training sessions for the members of the Steering Committee and other stakeholders during the beginning of the plan update process. These sessions introduced attendees to key issues of equity in local policy making, especially in hazard mitigation planning.

4. CHALLENGES TO EFFECTIVE STAKEHOLDER INVOLVEMENT

To identify challenges to community engagement in the MAP process, the planning team conducted in person and phone interviews with 41 stakeholders. Ten members of Portland Neighborhood Associations were interviewed, 22 people representing community groups, and random visitors to local cafes in the city. Information about interviewees is kept private. It is not shared with city staff or in this report. The planning team conducted semi-structured interviews with a few questions, which allowed for free flow of conversation. Comments were recorded and grouped to show patterns. These interviews happened before the December 2015 floods in Portland. The floods may have changed some responses.

BOX–4: INTERVIEW QUESTIONS

1. How involved is the organization in the hazard mitigation planning process?
2. What do they think a Hazard Mitigation Plan is?
3. What groups do they think should be involved and why?
4. What constituency/ groups can they speak about or know about?
5. Do they think these groups are aware of the hazard risks they face?
6. What are the major concerns of these groups?
7. How do they think, we can involve these groups?
8. What are existing social network mechanisms are they aware of?
9. What role can their organization, or groups they know of, play?
10. Are you involved in any other community outreach program of the city? If so, which ones?

Interview responses were recorded and analyzed for patterns. The results are summarized below:

- Some communities of color and immigrant groups distrust the government.
- Respondents expressed the need to have multilingual notifications and other public outreach material. Interviewees want notifications and outreach materials in multiple languages. Many community members do not understand English very well and do not receive notifications in time. This results in more confusion and distrust.
- Most interviewees from community groups said they were burnt out on participation in city programs. Over the past few years, time commitment to local government public outreach programs has increased significantly for community groups. Each of the respondents said they participated in at least two ongoing outreach programs or committees.
- Members of the neighborhood associations wanted to participate in the MAP process, but were unsure how much influence they could have. They felt the process of hazard mitigation planning required technical expertise beyond their skills. They worried that getting involved in this process would take away time from other initiatives that they had already committed to.
- Most respondents from café interviews said they appreciated that the city started community engagement programs to promote public participation.
- Most respondents felt that there were other important issues that needed to be addressed, and hazard mitigation was low in their order of priority.
- Most respondents see earthquakes as the greatest risk, and said they do not feel prepared. They would like the City to provide more information and resources to help residents prepare for an earthquake.

5. RECOMMENDATIONS

Community engagement and outreach strategies in this section are designed to achieve the following three objectives:

1. Encourage public participation during the MAP development process (Section 5.1).
2. Facilitate continued engagement with local residents after adoption of the MAP (Section 5.2).
3. Promote effective cooperation and coordination between the local government and civil society organizations to promote an integrated framework for community engagement (Section 5.3).

5.1 COMMUNITY ENGAGEMENT AND OUTREACH ACTIVITIES

Community Engagement and Outreach Activity – 1: Stakeholder Participation Review	
Suggested Timeframe:	February 2016
Format:	Self-Evaluation by the Planning Team
Duration:	2 hrs.
Rationale:	After a few months of involvement in the same way (steering committee in this case), the stakeholder interest can start to wane. Attendance at the meetings decreases, and discussions tend to divert without contributing to the MAP development process. By doing a mid-course self-check, the planning team may re-activate participation, and if needed, reach out to more stakeholders who have yet not been involved.
Description of the Activity:	Planning team reassess participation in the steering committee and identify any stakeholders that may have dropped out or not yet participated in the update process.
Outcomes:	This activity will reveal the gaps in stakeholder representation that may cause problems or delay in formal adoption of the plan.
Follow-up Activities:	The project coordinator to reach out to the unrepresented stakeholders and encourage them to participate in the steering committee meetings.
Measures of Performance:	Number of unrepresented stakeholders contacted.

Community Engagement and Outreach Activity – 2: Community Hazard Mitigation Survey	
Suggested Timeframe:	February- April 2016
Format:	Mailed, Online, and Targeted
Duration:	3 months
Rationale:	The planning team should create opportunities for general public to be involved in the planning process. While many members of the public may not be technical experts, they can be a useful resource in identifying critical assets, problem areas, describe past events and provide ideas for continued community engagement. A Natural Hazard Mitigation Survey can help share information about the plan update and assess public awareness of risks.
Description of the Activity:	A Public Hazard Mitigation Survey should be conducted by the planning team. The survey should seek to collect information on how informed the public is about local hazard risks, their perception of their own risks, and how important they think hazard mitigation is. This survey should be multilingual and widely distributed in the community. Suggestions for survey distribution include: • Permanent online link to be displayed on local government website, and partner community organization web pages. • Paper surveys and collection boxes at neighborhood coalition office, and important local government offices. • Distribution of survey at local community events. • Survey kiosks at local popular grocery stores, and cafes.
Outcomes:	This activity will increase transparency of the planning process, build trust, and provide information about public preferences and attitudes towards hazard mitigation.
Follow-up Activities:	The collected data should be formatted and organized in an easily usable format (spreadsheets). Planning team should analyze data to find level of public awareness about local hazards, suggestions for public engagement, perceived risk from natural hazards, and their experiences with hazards. This dataset should be maintained by the local government to be a baseline for later surveys.
Measures of Performance:	Number of surveys conducted.

Community Engagement and Outreach Activity – 3: Planning for Real – Risk Assessment & Policy Development Focus Groups	
Suggested Timeframe:	Mar-April 2016
Format:	Focus Groups (10, in 8 neighborhood coalitions, and 2 special interest groups)
Duration:	3-4 hrs. for each event depending on participation and venue availability (Open House)
Rationale:	The planning team should risk assessment findings and encourage the community to help develop hazard mitigation policies that match community priorities.
Description of the Activity:	Planning for real is a hands-on focus group method that allows for participation by all attendees. Large format maps depicting risk areas are mounted on a horizontal table. The map station shows participants the extent and degree of hazard risks the community faces. The planning team introduces the risk assessment, and provides a brief overview of possible hazard mitigation activities (often based on FEMA and CRS guidance documents). Participants are then asked to place suggestions for the community on cards or flags placed on the map. Each exercise can have 5- 15 people per map station. Hazard risk computer workstations manned by local technical experts can be used instead of maps. The planning team should partner with the Portland's neighborhood coalitions to implement these exercises. Partnering with the neighborhood coalitions will add legitimacy to the process, build trust, and strengthen existing networks between the local government and the community. The Planning team should also partner with local community organizations to do similar workshops with two special interest groups – immigrant and refugee community or coalition of communities of color. The planning team may explore options for partnering with IRCO (Immigrant and Refugee Community Organization) and Communities of Color for implementation of these exercises.
Outcomes:	This activity will help communicate hazards risks to the community and increase public awareness of risk. It will also help collect information on community preferences for specific hazard mitigation actions to be included in the MAP.
Follow-up Activities:	The planning team should use the information collected from these workshops for updating risk analysis and generating hazard mitigation priorities.
Measures of Performance:	Number of attendees in each 'Planning for Real' activity.

Community Engagement and Outreach Activity – 4: Draft MAP Review & Feedback	
Suggested Timeframe:	Jul 2016
Format:	Online Public Brochures (distributed through local government agencies, partner organizations, and neighborhood associations) Hazard Mitigation Displays (at City Hall, and Neighborhood Coalition Centers) MAP Town Hall Meetings (5 Town Hall Meetings)
Duration:	30 days (based on FEMA guidelines)
Rationale:	The preceding engagement and outreach activities will significantly contribute to plan development, there should also be a way for the public to give feedback on the whole draft plan document. This will help identify omissions or inappropriate policies that may place disproportionate burden on specific community groups or neighborhoods.
Description of the Activity:	The planning team should collect feedback from communities on the draft plan. These four types of activities should be conducted during the 30-day comment period. • Online: The City should post the full draft report, an executive summary, and a slide deck of key points online for reviewing and download. There should be a place on the website for comments. • Public Brochures: These should include a summary of outcomes of local risk assessments, summary of public engagement activities, and key hazard mitigation polices in the plan. The brochure should also refers to the webpage where the plan documents are available, and give a location where people can submit and comment on the draft plan. These could be distributed through government agencies, neighborhood associations, and local community organizations. • Hazard Mitigation Displays: The planning team should create Hazard Mitigation displays at key places in the community. The displays could be placed at the City Hall and at the neighborhood coalition offices. The displays could be in form of free standing 3D displays showing hazard risks through photos and text. They should show the benefits of the proposed hazard mitigation policies. • MAP Town Hall Meetings: It is proposed that the City officials and the planning team should partner with Neighborhood coalitions and community organizations to host hazard mitigation town hall meetings where local residents can ask questions about the MAP. This forum gives residents a chance for direct responses to their questions. Venues should match "Planning for Real" sites if possible. There should be 5 town hall meetings
Outcomes:	This activity will help collect feedback on the draft MAP and give residents a chance to influence the final plan.
Follow-up Activities:	The planning team should collect the feedback and respond to the comments as quickly as possible.
Measures of Performance:	Number of activities completed. Number of attendees. Quality of feedback received.

Community Engagement and Outreach Activity – 5: Draft MAP Review & Feedback	
Suggested Timeframe:	Post Adoption Plan Rollout. Annual Review thereafter.
Format:	Online (continuous) Hazard Mitigation Annual Review Town Hall Meeting (in partnership with Neighborhood Coalitions, and communities)
Duration:	60-90 mins each.
Rationale:	Community engagement and outreach activities should continue after the plan is adopted to keep the public informed about hazards risks, continue to build support for implementation of mitigation projects, and prepare for the next plan update. These activities will also help build on the good will and public interest created the planning phase.
Description of the Activity:	These activities should be continued after the plan adoptions. • Online: Maintain a permanent webpage that hosts the digital copy of the MAP and document future planning activities. The webpage should also provide contact information for local agencies and departments involved in implementation of hazard mitigation activities. • Hazard Mitigation Annual Review Town Hall Meeting: City staff should partner with local neighborhood coalitions and civic organizations to host annual plan review town hall meetings. Rollout event should be planned within a month of formal plan adoption. At least one annual event should be planned in the following years. In these meeting the planning team should discuss the following: o Update historical events record with any events in the past year. o Review community profile and individual community assessments for each hazard and note any major changes or mitigation projects that have changed vulnerability. o Note accomplishments and current mitigation projects. o Record status of all action items in the MAP as projects are completed and as new needs or issues are identified. o Address updated Comprehensive Plans and other city plans - how can the two plans be coordinated to make them work for each other? o Incorporate additional hazard risk assessments as funding allows.
Outcomes:	This activity improves transparency in the MAP implementation process. It will also help maintain interest for engagement and outreach in the next update.
Follow-up Activities:	The planning team should prepare annual progress reports and make them available on the permanent website.
Measures of Performance:	Number of activities completed. Number of attendees.

Figure 1. Community Engagement and Outreach Strategy

5.2 COORDINATED AND COOPERATIVE ENGAGEMENT

The city of Portland has an established history of effective community engagement and stakeholder participation in local policy making through its bureaus, and offices. Each of these administrative units continually undertakes programs and outreach activities. At the same time, Portland is home to a large number of civic organizations that have taken on the leadership role in advancing interests of their stakeholders in local policy making. A list of these stakeholders as identified through stakeholder mapping exercise is included in Attachment 1.

The MAP development process can take advantage of these partnerships by directly engaging with these stakeholder networks in the plan making process. Specifically, it is recommended that existing groups and networks be engaged to solicit their views on the following:

- Identification of specific vulnerable groups within the community.
- Assessment of risk awareness among the various communities.
- Identification of preferred means of capacity building and outreach to enhance risk awareness and participation in the planning process.
- Identification and prioritization of hazard mitigation activities to be included in the MAP.
- Identification and training of Hazard Mitigation Ambassadors

In order to leverage existing community linkages and partnerships during the MAP development process, a brief survey of local bureaus and community organizations was conducted to identify ongoing programs and initiatives. The original survey responses are included in Attachment 1. Table 1 summarizes the various programs/activities/evens identified by respondents as possible avenues for outreach as well as continued engagement following the adoption of the MAP.

5.3 BROADER COMMUNITY ENGAGEMENT AND OUTREACH

Community engagement is a continuous process, and requires multiple means of facilitating two-way communication with the citizens. This section highlights a number of important ways to facilitate meaningful community engagements.

5.3.1 E-engagement: Online Risk Atlas & E-Portal

It is recommended that an online spatial risk atlas be hosted on the hazard mitigation website. The atlas will contain socio-economic data along with risk overlays to inform public about the likely hazard risks they face in their neighborhoods. Additional resources for specific mitigation actions, and opportunities for participation in the planning process can also be made available through this website. The interactive web based platform should also an interactive annotation tool for users to post flags, highlight and comment on specific locations on the map. This mapping interface can be developed in partnership with existing low cost mapping initiative underway in the other departments/bureaus at the

city. A screenshot of a similar application developed by Institute for Hazard Mitigation and Planning at University of Washington in partnership with Texas A &M University, Galveston is shown in Figure 2.

Figure 2. Screenshot of Sample Online Mapping Interface

Presently, the city does have a number of online mapping platforms to share spatial and census data. These include:

- MetroMap (https://gis.oregonmetro.gov/ metromap/)
- Racial equity atlas (http://regionalequityatlas.org/ programs/regional-equity-atlas/equity-atlas-20-mapping-tool)
- Portland Maps (https://www.portlandmaps.com).

While each of these online interface does provide significant data, the ability for users to download and analyze spatial datasets is very limited. Further, none of the online mapping platform accessed at the time of the writing of this report provided hazard risk information at the neighborhood level or linked to possible hazard mitigation information. It is therefore recommended that additional hazard mitigation related information and data be made available either through existing or a new online mapping interface.

The E-portal that will host the online risk atlas can also be designed to include hazard mitigation, and other hazard risk awareness resources for the local stakeholders. Presently, there are a number of hazard mitigation, risk awareness, and disaster preparation documents available online from the city website as well as federal website such as ready.gov. Given the diversity of stakeholders (and associated languages) in Portland, it is recommended that the city actively consider making these resources available online in multi-lingual format.

In addition to the online atlas there a number of other opportunities for engaging with the community using online platforms. The following updates are recommended to the existing Portland Bureau of Emergency Management hazard mitigation homepage:

- To provide updated information about all meetings and events proposed to be conducted as part of the planning process.
- Online questionnaires and surveys can be posted on this website to allow users to access and responds.
- Live Chat Events can be scheduled on this website to allow stakeholders who are unable to participate in steering committee meeting to interact with the planning team to provide feedback and comments.
- A feedback and comments tool can be created specifically to allow people to respond to the issues and concerns specifically for hazard mitigation planning.
- Facebook, twitter and other social media outlets can be utilized to connect with people and stakeholders.

5.3.2 Multilingual Support for Planning Documents and Surveys

A number of participants in the surveys conducted during the preparation of this engaging strategy indicated that a significant number of the residents did not understand English that well. It is therefore recommended that the planning team partner with local civic organizations that represent these minority groups and seek their assistance in conversion of planning documents and surveys into other formats. This will enable a boarder range of stakeholders to access, understand and participate in the planning process. Past experiences reveal that multi-language support is critical in diverse communities that are undergoing significant demographic changes. Lack of access to understandable documents and other outreach material is likely to further alienate communities that have traditionally been excluded from earlier public consultation process.

5.3.3 Hazard Mitigation Exhibits

Exhibits and displays are an effective way of making relevant information accessible to the public at a relatively lower cost. These locations can also serve as the nodes for further distribution of documents, surveys and materials. Over time stakeholders start to visit these locations regularly to seek out specific information regarding new projects and outreach activities. It is therefore strongly recommended that the planning team and the city consider installation of such displays at prominent locations such as the city hall and the neighborhood coalition offices. These displays can be used to provide regular updates on the hazard mitigation planning process, planned activities, and can also serve as nodes for conducting smaller public meetings events as needed. These displays will be particularly useful for public review of the draft plan, and continued engagement following the plan adoption.

5.3.4 Increased participation of Other Bureaus and Offices in Stakeholder Meetings

As highlighted earlier it is often not possible for the stakeholders to distinguish between hazard mitigation priorities and general development concerns. Stakeholders often tend to bring up a variety of concerns (often not necessarily connected to hazard mitigation planning) during steering committee meetings and the other events. It is possible that if these concerns are ignored citing lack of direct connection with hazard mitigation planning, it is likely to result in increased community distrust. It is therefore recommended that representatives from other bureaus, specifically Development services, Environmental services, Office of Equity and Human rights, Planning and Sustainability, and Housing Bureau be invited to these meetings and be allowed to respond to concerns related to their department. At a minimum, a procedure for recording all concerns be established, and forwarded to relevant bureaus for response. These responses could then be shared through email or directly with the stakeholders.

5.3.5 Hazard Mitigation Ambassador Program

The city of Portland is home to a large number of diverse stakeholder civil society organizations that are actively involved and embedded within their respective communities. These existing networks provide an effective means for the continued engagement with the local stakeholders not only during the MAP development process but also after the adoption of the plan. It is therefore recommended that the city consider establishment of a Hazard Mitigation Ambassador program. The primary goal of this program will be to identify and train individuals from diverse community groups about risk awareness, and minimization through effective mitigation actions. These individuals can also be trained to assist community members in preparation of household level emergency response plans, and other disaster mitigation activities, as well as resources to help community members become prepared for other hazard threats. These hazard mitigation ambassadors would serve as the vital link between the city and the community in case of any hazard event, and assist citizens in undertaking appropriate response actions as advocated by the city. Overtime it is expected that the role of these community ambassadors can be diversified to include organization and coordination of other community outreach activities in their community.

Community Engagement Plan

Attachment 1. Copy of Survey Responses

Survey of City Bureaus and Offices

Dear Respondent,

As you may know, Portland Bureau of Emergency Management is in the process of updating the city's Natural Hazard Mitigation Plan (NHMP). The plan outlines a strategy for reducing Portland's risk from natural hazards. Having a FEMA-approved plan also makes the City of Portland eligible for federal grants that can help strengthen city assets and improve community resilience before and after a disaster. Information about the project can be found at the project website here:

https://www.portlandoregon.gov/pbem/naturalhazard

We are asking for information about programs and outreach activities at your bureau or office to find opportunities for resource sharing and collaborative community engagement. We think it's important to team up whenever possible, and we want to find ways we can support each other in our outreach efforts. By working together, we think we can reach more people in more meaningful ways.

Feel free to share this with your colleagues who may also be able to provide relevant information.

Question 1: Which city bureau or office are you associated with?

BPS- Sustainability Education and Assistance

Question 2: Prior to receiving this survey, had you heard about the Natural Hazard Mitigation Plan (NHMP) update process?

○ Yes ◉ No

Question 3: Would you like to receive more information about the NHMP plan update?

○ Yes ◉ No

Please provide your contact information:

Preferred Email:

Telephone:

Question 4: Please list any community outreach and engagement programs at your bureau or office that we might be able to work together on. If known, please provide the contact information of the key person to contact for each of these programs.

#	Name of the program/activity/event	Contact Person	Email	Tel.

Survey of City Bureaus and Offices

Dear Respondent,

As you may know, Portland Bureau of Emergency Management is in the process of updating the city's Natural Hazard Mitigation Plan (NHMP). The plan outlines a strategy for reducing Portland's risk from natural hazards. Having a FEMA-approved plan also makes the City of Portland eligible for federal grants that can help strengthen city assets and improve community resilience before and after a disaster. Information about the project can be found at the project website here:

https://www.portlandoregon.gov/pbem/naturalhazard

We are asking for information about programs and outreach activities at your bureau or office to find opportunities for resource sharing and collaborative community engagement. We think it's important to team up whenever possible, and we want to find ways we can support each other in our outreach efforts. By working together, we think we can reach more people in more meaningful ways.

Feel free to share this with your colleagues who may also be able to provide relevant information.

Question 1: Which city bureau or office are you associated with?

Portland Housing Bureau

Question 2: Prior to receiving this survey, had you heard about the Natural Hazard Mitigation Plan (NHMP) update process?

(•) Yes ( ) No

Question 3: Would you like to receive more information about the NHMP plan update?

(•) Yes ( ) No

Please provide your contact information:

Preferred Email: michelle.depass@portlandoregon.gov

Telephone: 503 823-6291 or (503) 823-3606

Question 4: Please list any community outreach and engagement programs at your bureau or office that we might be able to work together on. If known, please provide the contact information of the key person to contact for each of these programs.

#	Name of the program/activity/event	Contact Person	Email	Tel.

Community Engagement Plan

Attachment 2. Key Stakeholders & Networks

KEY STAKEHOLDERS & NETWORKS

Within the City of Portland, there are service (non-profit) organizations affiliated with different ethnic, racial, economic and other sub-populations that have historically lacked a voice in development and implementation of government policy and programs. Many of these organizations have experience conducting public engagement with their constituencies to develop and implement their own programs. There likely are opportunities for the PBEM to collaborate with and learn from these organizations for how best to engage their constituents. The following information identifies organizations that may provide collaboration and describes each organizations mission, constituency and organization partners. We also identify program areas that may lend themselves to collaboration with PBEM hazard mitigation planning.

Organization: African American Chamber of Commerce of Oregon[1]

Mission: To enhance, educate and empower the African American business and professional community in the Oregon and Southwestern Washington district. To identify and provide avenues for mentoring, professional growth and business development for small business owners and entrepreneurs. To develop and enhance outreach and assistance programs to youth in the areas of business, law, and personal responsibility.

Community Served: The African American Chamber serves the African American business and professional community in the Oregon and Southwestern Washington district.

Programs: The Chamber offers assistance, mentoring and referrals, through a vast network of associates and members, to assistance interested parties in starting, developing or expanding businesses. The Chamber also provides education scholarships, job postings and contract bid postings.

Partners: The Chamber's members are involved and committed volunteers who serve on a diverse range of commissions, boards, and committees connecting all socio-economic levels and racial communities. Whether it is business, education, legal, economic development, arts, social justice, housing, or health issue.

Potential Opportunities for Collaboration: Potential opportunity for communication with the African American business community. Hazard mitigation themes of community and business resilience may be of interest to members of the organization.

---

[1] African American Chamber, 2015. Web site accessed Dec. 7, 2015. http://blackchamber.info/.

Organization: African American Health Coalition, Inc. [2]

Mission: To promote health and improve wellness among Oregon's African American community through health education, advocacy and research.

Community Served: Oregon's African American community

Programs: Chronic Disease Self-Management Program elderly 60+ years of age, National Diabetes Prevention Program for high risk individuals, Educational Program to Increase Colorectal Cancer Screening, Cover Oregon Insurance Enrollment Assistance, Diabetes Self-Management Program, Racial and Ethnic Approaches to Health, Spice it Up Healthy Eating Program and the Wellness within Reach that is focused on physical activity.

Partners: The African American Health Coalition, Inc. is sponsored by Moda Health, United Way, new Seasons Market, Providence Health & Services, Spirit Mountain Casino, Legacy Health, Family Care Health Plans, Novo Nordisk, M.J.M. Murdock Charitable Trust, Oregon Health & Science University, Safeway, Fred Meyer, the Collins Foundation, Multnomah County Health Department and MacDonalds.

Potential Opportunities for Collaboration: Potential opportunity to communicate with African American adults. The hazard mitigation theme of safety may be of interest to members of the organization.

Organization: Asian Pacific American Network of Oregon (APANO) [3]

Mission: The Asian Pacific American Network of Oregon is a statewide, grassroots organization, uniting Asians and Pacific Islanders to achieve social justice. We use our collective strengths to advance equity through empowering, organizing and advocating with our communities.

Community Served: Asians and Pacific Islanders

Programs: APANO program work is focused on community organizing, leadership development and training, policy advocacy, Civic Engagement, cultural Work and the jade district.

Partners: Partners of APANO in Oregon include The Asian Council of Eugene & Springfield, Chinese American Citizens Alliance, Chinese Consolidated Benevolent Association, COFA Alliance National Network, DisOrient Film Festival, Korean American Coalition of Oregon, Living Islands, Micronesian Islander Community, Mien Professionals Network, Oregon Marshallese Community, Philippine American Chamber of Commerce and Zomi Association of US.

Potential Opportunities for Collaboration: Potential opportunity to collaborate on outreach to Asian and Pacific Islander communities (Primarily younger adult population). Civic engagement, resilience, leadership development/training are APANO work areas that may have synergy with hazard mitigation.

[2] African American Health Coalition, Inc., 2015. Website accessed Dec. 7, 2015. http://aahc-portland.org/.
[3] APANO, 2015. Web site accessed Dec. 3, 2015. http://www.apano.org/.

Organization: Asian Health & Service Center[4]

Mission: To be the bridge between Asian and American cultures and build a harmonious community. Vision: To reduce health inequity and improve health care quality for all Asians.

Community Served: Asian Americans (demographic dominant client base 40 to 80 years of age)

Programs: Arts and cultural community engagement, health education and support, healthcare services, research and studies related to health in Asian American community and Chinese immersion preschool.

Partners: American Association of Retired Persons, American Cancer Society, Avon Breast Health Outreach Program, City of Beaverton, Coalition of Community Health Clinics, Children's Community Clinic, Gilead Sciences, Mercy & Wisdom Healing Center, Multnomah County Health Department, National College of Natural Medicine (NCNM), Native American Rehabilitation Association of the Northwest (NARA), North By Northeast Clinic, National Institutes of Health (NIH), Northwest Health Foundation, Novartis Pharmaceuticals, OHSU Richmond Clinic, Old Town Clinic: with Central City Concern Health Services, Orange County Asian and Pacific Islander Community Alliance, Oregon Health Authority (OHA), Oregon Health & Science University (OHSU), OHSU Family Center at Richmond, Outside In Medical Clinic, PACS Family Health Center, Portland State University, Providence Health & Services, Rosewood Family Health Center, Susan G. Komen for the Cure, SW Community Health Center, The Wallace Medical Concern, United Way of the Columbia-Willamette, Washington County Health & Human Services and West Burnside Chiropractic Clinic.

Potential Opportunities for Collaboration: Potential opportunity to reach older Asian American population. The hazard mitigation theme of safety may be of interest to members of the organization.

Organization: Audubon, Portland[5]

Mission: Audubon Society of Portland promotes the understanding, enjoyment, and protection of native birds, other wildlife, and their habitats.

Community Served: Local environmental community and the Pacific Northwest

Programs: Birding publications and information, education classes and camps, Wildlife Care Center, sanctuaries, and habitat and species conservation and restoration.

Potential Opportunities for Collaboration: Could potentially collaborate with outreach to environmental community. Members may be interested in impact mitigation strategies may have on wildlife or mitigation strategies that could also benefit wildlife and environmental education.

Organization: Black Parent Initiative[6]

Mission: The Black Parent Initiative (BPI) educates and mobilizes the parents and caregivers of Black and multi-ethnic children to ensure they achieve success.

Community Served: Families of Black and multi-ethnic children

[4] Asian Health & Service Center, 2015. Web site accessed Dec. 4, 2015. http://www.ahscpdx.org/.
[5] Audubon Portland, 2015. Web site accessed Dec. 4, 2015. http://audubonportland.org/.
[6] BPI, 2015. Web site accessed Dec. 4, 2015. http://thebpi.org/.

Programs: Parent University focuses on:

- Literacy: home-based support for improved child reading and comprehension
- Culturally Specific Parenting: home-based discipline; home based/school advocacy
- Advocacy: cultivating parent advocates
- And, the Together We Can program provides:
- Intensive Home Visiting: relationship-based; focus on safety, stability, and personal growth
- Group Services: personal growth, consciousness, and connection

Potential Opportunities for Collaboration: Potential opportunity for outreach to African American and mixed race families with children. The hazard mitigation theme of safety may be of interest to members of the organization.

Organization: Center for Intercultural Organizing[7]

Mission: The Center for Intercultural Organizing is a diverse, grassroots organization working to build a multi-racial, multicultural movement for immigrant and refugee rights.

Community Served: Multi-racial, multicultural immigrants and refugees

Programs: The Center for Intercultural Organizing has four focus areas.

Community Education-The Center educates immigrants, refugees and U.S.-born allies on pressing community issues and strengthens and supports existing efforts to bring visibility to immigrant and refugee struggles.

Civic Engagement and Policy Advocacy-Our civic engagement program provides a pathway for immigrants and refugees to participate in democratic processes through training programs, hands-on projects and collective action that produce concrete improvements in their lives.

Organizing and Mobilization-CIO assists immigrant and refugee community members in building the organizing skills necessary to impact policies that affect them and to work collaboratively, mobilizing diverse constituencies.

Intergenerational Leadership Development-CIO develops new leaders through a signature yearlong leadership development program, through strategic trainings, and through on-the-ground leadership positions within our campaigns.

Potential Opportunities for Collaboration: Potential opportunity to collaborate with Community Engagement and Civic Engagement programs.

Organization: Coalition of Communities of Color[8]

Mission: The Coalition of Communities of Color (CCC) addresses the socioeconomic disparities, institutional racism and inequity of services experienced by our families, children and communities; and to organize our communities for collective action resulting in social change to obtain self-determination, wellness, justice and prosperity.

---

[7] CIO, 2015. Web site accessed Dec. 4, 2015. http://www.interculturalorganizing.org/.
[8] CCC, 2015. Web site accessed Dec. 4, 2015. http://www.coalitioncommunitiescolor.org/.

Community Served: Coalition of Communities of Color (CCC) is an alliance of culturally-specific community based organizations with representation from the following communities of color: African, African American, Asian, Latino, Native American, Pacific Islander, and Slavic.

Programs: The CCC implements culturally-responsive data and research projects to build an important knowledge base from which to educate and to advocate. Bridges is a leadership development initiative with houses six culturally-specific leadership development programs led by CCC member organizations. Bridges' programs provide ongoing support through leadership placements, mentorship and community networking. The CCC also conducts policy analysis and advocacy to advance policies in Oregon that have the best potential to improve outcomes for communities of color. This program area includes the Education Justice Initiative that creates better outcomes for all students by removing barriers facing students of color, and Community & Economic Development work that focuses on anti-displacement and environmental justice.

Partners: IRCO Africa House, IRCO Asian Family Center, Asian and Pacific American Network of Oregon, Center for Intercultural Organizing, El Centro Milagro, Hacienda Community Development Corporation, Immigrant and Refugee Community Organization (IRCO), Latino Network, KairosPDX, Native American Youth and Family Center (NAYA Family Center), Portland African American Leadership Forum, Portland Community Reinvestment Initiatives, Inc., Portland Youth and Elders Council, Self Enhancement, Inc., Slavic Community Center, Slavic Network of Oregon, Urban League of Portland, Verde and VOZ Workers' Rights Education Project.

Potential Opportunities for Collaboration: The staff could provide insight on how best coordinate with partner organizations.

Organization: Disability Rights Oregon[9]

Disability Rights Oregon (DRO) is a non-profit law office that provides advocacy and legal services to people with disabilities who have an issue related to their disability and that falls within DRO's goals and priorities.

Mission: To promote and defend the rights of individuals with disabilities.

Community Served: People with disabilities who have an issue related to their disability and that falls within DRO's goals and priorities.

- Goals:
  - Stopping Abuse and Neglect,
  - Providing Full Access to Community Participation,
  - Removing significant access barriers in public places with emphasis on barriers in education, transportation and the courts
  - Monitoring the increase in the supply of accessible housing through policy work
  - Providing information about reasonable accommodations for tenants to prevent homelessness and isolation.
  - Enforcing anti-discrimination laws
  - Working to achieve full participation in the electoral process including registering to vote and casting a ballot
  - Getting and Maintaining Quality Community Support Services

[9] Disability Rights Oregon, 2015. Web site accessed Dec. 4, 2015. https://droregon.org/.

- Getting a Free & Appropriate Education for Children
- Other Very Important Issues That Promote the Mission of DRO & That Are Approved by the Executive Director

Potential Opportunities for Collaboration: DRO may be able to provide insight on how best engage individuals with disabilities in HMP update process. They may also be able to provide inputs in development of appropriate hazard mitigation strategies

---

Organization: East Portland Neighborhood Office (East Portland Action Plan)[10]

The East Portland Neighborhood Office (EPNO) is part of the City of Portland's Office of Neighborhood Involvement.

EPNO acts as a hub for these independent organizations in their work; providing organizing assistance, support in navigating the city's processes, funding opportunities, material resources (meeting space, event equipment, copies, etc), and more.

The East Portland Action Plan (EPAP), a group affiliated with the EPNO, was convened for the specific task of providing leadership and guidance to public agencies and other entities on how to strategically address community-identified issues and allocate resources to improve livability and prevent displacement in East Portland. East Portland is defined by the East Portland Neighborhood Office (EPNO) coalition area.

Goals: To enhance community involvement in efforts to improve neighborhood livability, a sense of community, public safety, organizational and self-empowerment at the neighborhood level, and to implement the goals of The Five Year Plan to Strengthen Community Involvement in Portland.

Community Served: EPNO serves about 25% of the City's population, spread across about 20% of the City's landmass. EPNO exists to support community organizations, community members, and the thirteen neighborhood associations of East Portland as they strengthen their communities and work with local government and other organizations.

Programs: The EPAP has identified strategies and action items for each of the following subject areas:

Housing and Development Policies, Commercial and Mixed Use, Transportation, Public Infrastructure and Utilities, Parks and Open Space. Natural Areas and Environment, Economic Development and Workforce Training, Education Infrastructure and Programs, Public Safety, Housing Assistance and Safety-net Services, Community Building, and Equity. There are working committees staffed by volunteers for several of these subject areas.

Potential Opportunities for Collaboration: With PEMB resource/staff support, EPAP/EPNO staff could provide guidance for effectively engaging community members. In addition, may be able to partner with EPAP members to engage the community through EPAP's monthly general meetings and through digital and print media. Other Portland District Coalitions may be able to provide similar access to their communities.

---

[10] EPNO, 2015. Web site accessed Dec. 3, 2015. http://eastportland.org/.

Organization: Ecumenical Ministries of Oregon's Russian Oregon Social Services[11]

Mission: To successfully integrate Russian-speaking immigrants and refugees into Oregon and southwest Washington communities by providing services that increase independence, enable economic self-sufficiency, and improve mental and physical well-being.

Community Served: Russian Oregon Social Services (ROSS) was established by Ecumenical Ministries of Oregon (EMO) in 1994 to serve the needs of Russian-speaking refugees and immigrants. More than 100,000 Russian-speaking refugees and immigrants from the former Soviet Union currently reside in the Portland metro area, and the numbers are expected to increase.

Programs: ROSS provides the following services:

- 24-hour crisis response.
- Individual and family crisis counseling.
- One-on-one advocacy, crisis intervention, support safety planning.
- Assistance obtaining stalking orders and restraining orders and filing out other forms and documents.
- Accompaniment to hospitals for forensic medical exams (for clients).
- Accompaniment to court and assistance communicating with police and District Attorney's Office.
- Assistance accessing immigration legal services.
- Domestic violence and sexual assault victims' support groups.
- Assistance applying for crime victims compensation.
- Assistance applying for public benefits.
- Assistance with temporary and transitional housing.
- Mentorship program for survivors of domestic violence and sexual assault.
- Information and referrals.
- Community orientation.
- Assistance obtaining dental services.
- Translation and interpretation services (for clients).
- Cross-cultural education (for other service providers).

Potential Opportunities for Collaboration: May be able to provide guidance on how to effectively conduct outreach to the Russian speaking population, recommendations on translation services and access to the community network.

Organization: El Programa Hispano-Catholic Charities[12]

Mission: El Programa Hispano's mission is threefold: to increase self-sufficiency within the Latino community, to empower individuals to achieve a better quality of life and to promote mutual understanding and respect among cultures.

Community Served: low-income Latinos in the Portland metro area

[11] ROSS, 2015. Web site accessed Dec. 3, 2015. http://www.emoregon.org/ross.php.
[12] El Programa Hispanico, 2015. Web site accessed Dec. 3, 2015. http://www.catholiccharitiesoregon.org/services_latino_services.asp.

Programs: El Programa Hispano offers a wide variety of services for low-income Latino families, including a low-income taxpayer clinic, food stamp assistance, anti-poverty services, skill building classes and outreach to the elderly. Project UNICA assists Spanish-speaking women, men and adolescents affected by domestic violence and sexual assault. El Programa Hispano also offers case management, educational activities, and support groups to Latino parents with children ages birth to five years. El Programa Hispano provides academic support, advocacy, skill building, mentoring, tutoring and recreation to Latino students; as well as family engagement services to Latino parents in Multnomah County school districts.

Potential Opportunities for Collaboration: May be able to provide guidance for outreach to the low income Latino community and access to their network. Safety

---

Organization: Hacienda Community Development Corporation (CDC) [13]

Mission: Hacienda CDC is a Latino Community Development Corporation that strengthens families by providing affordable housing, homeownership support, economic advancement and educational opportunities.

Community Served: Low income Latino community

Programs: The Community Economic Development Department provides culturally-specific education and skill-building programs for adult Latinos. Through a variety of programs, including micro-enterprise development, small business training, adult financial education, and workforce development programs, the department makes a long-term impact by increasing the income and assets of Hacienda residents and the broader Latino community.

The Asset Management department seeks to strengthen the performance of the organization's existing housing assets, strengthen the health of our communities through robust on-site services for residents and anticipate and plan for the asset management needs of existing and future properties.

The Housing Development department oversees the construction of new housing, office and commercial space.

Hacienda CDC serves approximately 300 members of the youth resident population through three major **Programs:** Portland Niños, Expresiones, and Avanzamos. The programs offer a variety of important academic and social support services to children from birth to 9th Grade. Hacienda CDC also provides home ownership counseling through its Homeownership Support Program. Services are provided to families and individuals buying their first homes as well as to those who are at risk of losing their homes to foreclosure.

Potential Opportunities for Collaboration: Hacienda CDC may be able to provide guidance on outreach to the Latino community and access to it network. The organization may also be interested as a stakeholder of housing infrastructure in the community.

---

[13] Hacienda CDC, 2015. Web site accessed Dec. 3, 2015. http://www.haciendacdc.org/.

Organization: Home Forward[14]

Home Forward promotes, operates and develops affordable housing that engenders stability, self-sufficiency, self-respect and pride in its residents and represents a long-term community asset. Home Forward strives to be a community leader to create public commitment, policy and funding to preserve and develop affordable housing.

Mission: The mission of Home Forward is to assure that the people of the community are sheltered, with a special responsibility to those who encounter barriers to housing because of income, disability or special need.

Community Served: those who encounter barriers to housing because of income, disability or special need. Home Forward is a public corporation serving all of Multnomah County, including the cities of Gresham, Fairview, Portland, and Troutdale, and other East County communities.

Programs: Home Forward programs are divided into three major areas: apartment communities, rent assistance and support services. As the largest provider of affordable housing in Oregon, Home Forward offers a variety of housing options to low-income individuals and families: more than 6,000 apartments to rent, including approximately 1,980 units of public housing, and approximately 9,390 Section 8 rent assistance vouchers. Home Forward services include the GOALS (Greater Opportunities to Advance, Learn and Succeed) program that provides Home Forward participants with ways to set and reach their goal of becoming self-sufficient through five years of dynamic supportive services, and partners with programs such as the Portland YouthBuilders where low income youth aged 17-24 are paid to finish school, learn a trade, and plan for their future and the NAYA Family Center offers services relating to health, housing, nutrition, education, transportation and other services.

Partners: Home Forward partners with more than 100 community agencies in the public, nonprofit and private sectors. The services provided by our community partners include financial services, education, substance abuse and youth programs, job training and life skills.

Potential Opportunities for Collaboration: Home Forward could provide guidance and or assistance with outreach to low-income residents of Portland. In addition, as a manager of facilities in the area, the organization may be interested in direct engagement as a stakeholder in the HMP update process.

Organization: Immigrant & Refugee Community Organization (IRCO) [15]

Mission: IRCO's mission is to promote the integration of refugees, immigrants and the community at large into a self-sufficient, healthy and inclusive multi-ethnic society.

Community Served: Immigrant and refugee communities

Programs: IRCO focuses on removing barriers to self-sufficiency and helping individuals and families thrive, by providing more than 100 culturally and linguistically specific social services, from employment, vocational training and English language learning, to community development, early childhood and parenting education, youth academic support and gang prevention. To better provide these services IRCO established the IRCO Asian Family Center in 1994 and the IRCO Africa House in 2006.

[14] Home Forward, 2015. Web site accessed Dec. 4, 2015. http://www.homeforward.org/.
[15] IRCO, 2015. Web page accessed Dec. 4, 2015. http://www.irco.org/.

Potential Opportunities for Collaboration: IRCO could provide guidance and or collaborate with outreach to refugee and immigrant communities. There may be an opportunity to conduct community engagement activities at or collaborate with their established community centers.

Organization: Impact NW -Southeast Multicultural Services Center[16]

Impact NW's Seniors and Adults with Disabilities services and Energy Assistance program are offered through its Southeast Multicultural Services Center.

Mission: Impact NW's mission is to help people prosper through a community of support.

Community Served: Annually, more than 1,500 individuals are supported by Impact NW's Seniors and Adults with Disabilities Services programs.

Programs: Impact NW's Seniors & Adults with Disabilities Services program gives clients the tools and support they need to be healthy, happy, and active, and to live at home safely. Programs include connecting community volunteers to isolated seniors, in-home care coordination, transportation to shopping and medical appointments, money management and legal services, and on-site meal services. The Southeast Multicultural Senior Center provides an activity hub where seniors gather for meals, games, celebrations and friendship.

Potential Opportunities for Collaboration: Impact NW could provide outreach guidance and potentially could collaborate with outreach to seniors through the Southeast Multicultural Services Center.

Organization: JOIN[17]

Mission: JOIN exists to support the efforts of homeless individuals and families to transition out of homelessness into permanent housing.

Community Served: JOIN efforts are directed at individuals sleeping outside or in their car in the Portland Metro area. Service provision is not dependent on age, gender, ethnicity, sexual identity, specific diagnosis or identifiable issues.

Programs: JOIN's outreach program engages homeless individuals to identify and overcome their barriers to housing. The retentions program works with newly placed households to get the support they need to succeed in their housing long-term. The JOIN Day Center provides critical basic day services such as hygiene facilities, laundromat vouchers, referral information, clothing, conversation and a refuge from the weather. And the Immersion program helps people for the greater community learn about homelessness.

Potential Opportunities for Collaboration: JOIN could provide could provide insight on how to serve the homeless during and after a disaster.

[16] Impact NW, 2015. Web page accessed Dec. 4, 2015. http://impactnw.org/.
[17] JOIN, 2015. Web page accessed on December 7, 2015. http://joinpdx.org/.

Organization: Latino Network[18]

Mission: Latino Network provides transformative opportunities, services, and advocacy for the education, leadership and civic engagement of our youth, families and communities.

Community Served: Latino children and families

Programs: The Latino Network focus on early childhood education, family and youth engagement, transformative youth opportunities and civic leadership.

Potential Opportunities for Collaboration: The Latino Network could provide guidance for outreach to the Latino community. Also, there may be opportunities for collaborative public engagement.

Organization: Native American Youth & Family Center (NAYA) [19]

Mission: To enhance the diverse strengths of our youth and families in partnership with the community through cultural identity and education.

Community Served: Self-identified Native Americans, infant to Elder, from across the Portland, Oregon, metropolitan area

Programs: NAYA provide educational services, cultural arts programming, and direct support to reduce poverty to the Portland Metropolitan Area Native American community. In addition, NAYA supports civic engagement and advocacy by convening the Portland Indian Leaders Roundtable, fostering leadership through the Oregon LEAD cohort, hosting the Portland Youth and Elders Council and holding forums to engage the community and gather input on programming. NAYA also registers voters and educates their community about the importance of being civically engaged.

Partners: Member of the Coalition of Communities of Color

Potential Opportunities for Collaboration: NAYA could provide guidance for conducting outreach to Portland's Native American population. And, they may be willing to collaborate with community engagement.

Organization: Oregon Food Bank[20]

Mission: Oregon Food Bank works to eliminate hunger and its root causes.

Community Served: People in Oregon lacking the resources to reliably secure food for a healthy life.

Programs: OFB works with a cooperative, statewide network of partner agencies to distribute emergency food to hungry families. We fight hunger's root causes through public policy advocacy, nutrition and garden education and work to strengthen community food systems.

Partners: 953 partner organizations in Oregon and SW Washington

Potential Opportunities for Collaboration: The Oregon Food Bank may be able to provide guidance for working with partner organizations and outreach to the low income population. They may also be

[18] Latino Network, 2015. Web page accessed on December 7, 2015. http://www.latnet.org/.
[19] NAYA, 2015. Web page accessed on December 6, 2015. http://www.oregonfoodbank.org.
[20] Oregon Food Bank, 2015. Web page accessed on December 6, 2015. http://www.oregonfoodbank.org.

willing to provide access to their network. The Oregon Food Bank likely is interested in risks to food supply and access, and mitigation actions that help secure food supply and access.

Organization: Oregon Health and Science University, Oregon Office of Disability and Health (OODH) [21]

Mission: To prevent secondary conditions and improve the health and quality of life of Oregonians with disabilities through improved access to health care facilities, public health programs, and effective health promotion and wellness programs.

Community Served: Oregonians with disabilities

Programs: OODH provides healthy lifestyle, breast cancer awareness, emergency preparedness and health care access education and outreach to people with disabilities and service providers. In addition, OOHD conducts research on the health, wellbeing and risk factors of adolescents and adults with disabilities in Oregon.

Potential Opportunities for Collaboration: OODH can provide guidance on how to make public engagement accessible to people with disabilities, and may be willing to collaborate with outreach to these individuals. OODH likely is also interested in potential risks from natural hazards to people with disabilities and mitigation action items that would reduce these risks.

Organization: Portland African American Leadership Forum[22]

Mission: The Portland African American Leadership Forum (PAALF) leverages the power of our community's combined resources to advance the vision of a connected thriving, resilient Black Community.

Community Served: African Americans

Programs: PAALF convenes African American leaders around a public policy agenda that impacts the community in the areas of housing & economic development, education, health, and civic engagement/leadership.

Potential Opportunities for Collaboration: PAALF could provide guidance for outreach to the African American community and may be willing to collaborate with public engagement.

Organization: Portland Community Reinvestment Initiatives (PCRI) [23]

Mission: Preserve, expand and manage affordable housing in the City of Portland and provide access to, and advocacy for, services for residents.

Community Served: Low income families and adults

[21] OODH, 2015. Web page accessed on December 6, 2015. http://www.ohsu.edu/xd/research/centers-institutes/institute-on-development-and-disability/public-health-programs/oodh/oodh.cfm.
[22] Portland African American Leadership Forum, 2015. Web page accessed December 10, 2015. http://aalfnw.org/portland/
[23] PCRI, 2015. Web page accessed December 10, 2015. http://www.pcrihome.org/

Programs: PCRI focuses on preserving and managing affordable, high quality, scattered site, single family homes; expanding and managing their portfolio of small multiplexes; and acquiring/developing multi-family housing to preserve affordable housing choices in the community.

Potential Opportunities for Collaboration: PCRI could provide guidance and or assistance with outreach to low-income residents of Portland. In addition, as a manager of facilities in the area, the organization may be interested in direct engagement as a stakeholder in the HMP update process.

Organization: REACH CDC[24]

REACH is a nonprofit affordable housing development and property management company

Mission: REACH's mission is to provide quality, affordable housing for individuals, families and communities to thrive.

Community Served: Low income community.

Programs: REACH owns and manages a portfolio of 2,073 units of affordable housing located across the metropolitan region, including properties in Multnomah, Washington, and Clark Counties (state of Washington). The portfolio includes new and renovated plexes, apartment buildings and mixed-use developments.

REACH provide a range of programs focused on housing success and financial stability such as eviction prevention, financial education, employment and career support, and access to emergency food and clothing. In addition, REACH's Community Builders Program provides free volunteer-powered home repairs for low income elderly and disabled homeowners, as well as families with children living in the home experiencing some type of home health hazard (i.e. lead poisoning, radon, mold, etc.).

Potential Opportunities for Collaboration: REACH could provide guidance and or assistance with outreach to low-income residents of Portland. In addition, as a manager of facilities in the area, the organization may be interested in direct engagement as a stakeholder in the HMP update process.

Organization: Slavic Community Center of NW[25] (information in Russian on Web site)

Community Served: Slavic community in Portland

Potential Opportunities for Collaboration: The Slavic Community Center of NW could provide guidance and or collaborate with outreach to Slavic community in Portland.

---

[24] REACH CDC, 2015. Web page accessed December 10, 2015. http://reachcdc.org/

Organization: Urban League of Portland[26]

Mission: The Urban League of Portland's mission is to empower African Americans and others to achieve equality in education, employment, health, economic security and quality of life.

Community Served: African Americans and other people of color in the region.

Programs: The Urban League of Portland's programs include a distinctive blend of direct services, organizing, outreach, and advocacy. They offer workforce services, community health services, summer youth programming, senior services, meaningful civic engagement opportunities, and powerful advocacy.

Potential Opportunities for Collaboration: The Urban League Portland could provide guidance on outreach to African Americans and communities of color. In addition, there may be the opportunity to collaborate with their Diversity and Civic Leadership V.O.I.C.E. (Voice Our Importance through Community Engagement) Project, which is a series of forums to provide information, raise awareness and to provide the community with a voice on issues and decision-making in the city and region.

Organization: Verde[27]

Mission: Verde serves communities by building environmental wealth through social enterprise, outreach and advocacy.

Community Served: Low income communities of Portland

Programs: Verde's Social Enterprise work employs and trains low-income adults, creates contracting opportunities for minority-owned and woman-owned businesses and brings environmental assets to low-income neighborhoods.

Verde Outreach works to address the divide that exists between sustainability and low-income communities. Verde and partners bring new environmental investments to the Cully Neighborhood by creating an EcoDistrict. Through Policy Advocacy, Verde and partners create a policy framework that empowers low-income people and people of color to drive environmental resources into their neighborhoods, in response to existing community needs. Other policy focused work includes Clean Energy Works Oregon and Portland Bike Share.

Partners: Hacienda CDC and NAYA

Potential Opportunities for Collaboration: Verde will likely be interested in the potential impacts of natural hazards in the communities that they work and interested in how their projects could help build resilient communities.

PUBLIC SURVEY

Portland Natural Hazard Mitigation Plan (NHMP)

Survey Distribution Plan

Introduction and Purpose

As part of Portland's 2016 Natural Hazard Mitigation Plan update, a public survey will be used to inform action item development and prioritization, as well as inform the planning team how best to communicate with the public about natural hazard risks and risk reduction. The survey will help meet FEMA requirements for public involvement, earn points for the National Flood Insurance Program (NFIP) Community Rating System (CRS), as well as advance the City of Portland's equity objectives. It will reach a broad cross-section of the Portland population, with an emphasis on the populations most vulnerable to natural hazard risks – economically disadvantaged populations, communities of color, those with limited English proficiency, immigrants or refugees, and others who are historically underrepresented in government activities or experience greater likelihood of negative consequences from natural hazard events.

The NHMP survey will be launched Monday February 1st, 2016 and will remain open at a minimum through the close of the 2016 NHMP plan update. Initial results will be compiled April 3rd, 2016 to inform action item development, plan content, and outreach strategies. It will be distributed online in English, Spanish, Chinese, Russian, Ukrainian, and Vietnamese, through translation provided by Oregon Translation, LLC. It includes questions intended to gather information about how Portlanders think about preparedness and reducing risk from natural hazards; questions to collect demographic information, such as income level, ethnic identification, household structure; and questions to identify the respondents' country of birth and language spoken at home. Data is also collected related to how the respondent learned about the survey and whether he or she would like to be contacted with additional related information.

Web Survey

The web survey will be provided through Survey Gizmo at the following link.

http://sgiz.mobi/s3/Portland-Preparedness-Survey

The QR Code below will also be used to direct people to the survey.

The public will be directed to PBEM's website at http://www.portlandoregon.gov/pbem through a variety of outreach methods, to be discussed below. PBEM's main webpage will host the link to the web survey.

Social Media –

The web survey will be distributed via a variety of online social media. PBEM's social media networks to be used include:

- Facebook
- Twitter
- NextDoor

PBEM will also request that its bureau partners share the survey link through their social media networks as well. PBEM will work with Public Information Officers at Portland Fire & Rescue, Portland Police, Portland Water Bureau, and Portland Parks and Recreation.

Survey Cards –

The following will be printed on quarter-sheet postcards to be distributed in strategic locations throughout Portland.

Cards will be placed at computer terminals in all Multnomah County libraries in Portland. Libraries at which the survey cards will be distributed include:

- St. Johns Library
- Kenton Library
- North Portland Library
- Capitol Hill Library
- Northwest Library
- Albina Library
- Central Library
- Hillsdale Library
- Sellwood-Moreland Library
- Woodstock Library
- Belmont Library
- Hollywood Library

- Gregory Heights Library
- Holgate Library
- Rockwood Library
- Midland Library

Cards will also be placed at computer terminals in Portland State University Library and Portland Community College Library.

Other locations throughout Portland to distribute survey cards will be identified as time and resources allow. Possible locations include schools, grocery stores, and the Lloyd Center Mall. If practical and cost-effective, cards may be distributed in water bills through coordination with the Portland Water Bureau.

Flyers –

Flyers with information about the survey will be displayed at strategic locations, where survey cards are not cost-effective or practical. Locations where flyers may be displayed include schools, grocery stores, and major employers in Portland. See flyer in Appendix A.

Email Distribution –

A link to access the survey via PBEM's website will be distributed via email to the following groups:

- NHMP steering committee
- NHMP stakeholders distribution list
- NET distribution list
- All Neighborhood Coalition Offices

Along with the survey link, a flyer in PDF format will be attached to emails for printing and distribution. Steering committee members, NHMP stakeholders, NETs, and Neighborhood Coalition Offices will be asked to share the survey within their networks. If possible, the link and flyer will also be emailed out via the Portland Parks survey distribution list.

Newsletters and Print Media –

To the extent publication deadlines align with the timing of the NHMP Preparedness Survey, notices will be published in the Northwest Examiner and Southwest News via Portland's Crime Prevention Communications Program.

Notices may be placed in city newsletters including the Portland Water Bureau newsletter and Office of Equity and Human Rights newsletters, as possible.

News Media –

During the week of February 1st, 2016 through February 5th, 2016, local news stations will be contacted regarding the survey through a brief press release. Interviews and information will be provided to support news coverage of the survey. The public will be encouraged to participate and will be offered the opportunity to be entered in a prize drawing for preparedness kits and emergency gear. Possible networks include:

- KBOO
- KOIN
- OPB
- Univision/Spanish Radio
- Slavic Family Media

In-Person Outreach –

NHMP Steering Committee members will be encouraged to hold focus groups to discuss the NHMP survey, in order to give an opportunity for constituents to ask questions and provide real-time feedback. PBEM staff will be available to support these efforts as scheduling and resources allow.

PBEM staff will promote the survey at meetings and events, including Parents for Preparedness, Public Involvement Advisory Committee (PIAC), and other community events as possible.

PBEM staff will participate as a vendor at the Portland Fix-It-Fair on February 20th, 2016. Three to five PBEM iPads will be available at the PBEM booth, with which attendees will be encouraged to take the survey. At least 50 paper copies of the survey will be printed and made available at the event. Paper copies will have the information links written out.

Paper Survey

Paper surveys will be printed in English and in all five translated languages. The number of printed copies will depend on opportunities to distribute. Printed surveys will include PBEM contact information in a highly visible place so that participants know who to call with questions or to arrange for the completed survey to be collected. Paper surveys will be distributed at the events/groups below, as well as others as opportunities allow.

- East Portland Action Plan (EPAP) General Meeting – March 23rd, 2016 6:30pm – 8:30pm
  (Spanish)
- Portland Fix-it-Fair – February 20th, 2016 (All Day)
  (All languages available)
- APANO
  (Vietnamese, Chinese)
- IRCO Russian/Slavic Coalition – Civic Engagement Steering Committee every 3rd Monday from 7:00pm-9:00pm. March 15th, 2016. Contact: Oleg Kubrakov, olegk@mail.irco.org
  (Russian, Ukrainian)
- IRCO Asian Family Services
  (Vietnamese, Chinese)
- Fubonn Supermarket, SE 82nd Avenue (Monday – Sunday 9am to 8pm), Contact: 503-517-8899
- Slavic Church Emmanuel
  (Russian, Ukrainian)
- St. John the Baptist Ukrainian Orthodox Church
  (Russian, Ukrainian)
- Vietnamese Community of Oregon

(Vietnamese)

Where paper surveys are left on site to be distributed over a period of time, a locking drop box placarded with PBEM contact information will be provided for returned surveys. During events or meetings where PBEM staff remain on site, paper surveys will be collected real-time if possible. Participants who do not complete their survey at the time of distribution will be encouraged to make arrangements with PBEM staff via phone or email to have the completed survey collected at a public location.

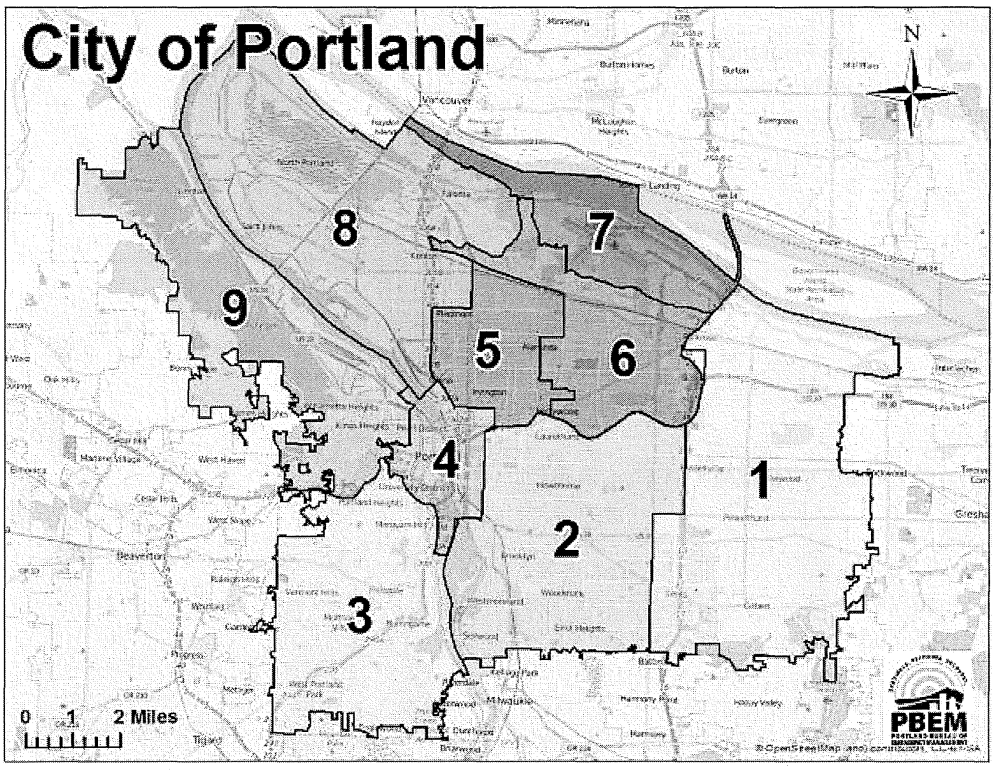
PBEM staff will manually input data received via paper survey into the web-based survey. If comments are received in languages other than English, Oregon Translation Services, LLC will be contracted to translate the surveys. Intervals at which surveys are translated will depend upon the number of surveys requiring translation.

Appendix A – Survey Flyer

How do you prepare?

Help us make Portland ready. Win prizes. Tell us how you prepare here:

www.portlandoregon.gov/pbem



By taking 10 minutes to complete the Portland Preparedness Survey, you'll help City of Portland offices prioritize projects aimed at reducing our risk from natural hazards. You can also be entered to win prizes, including a $150 emergency kit, and other cool preparedness gear!

Natural Hazards and the City of Portland

11. What are the three (3) most important things the City of Portland government offices should do to reduce the risk from natural hazards?

- [ ] Provide more information to the public about natural hazards.
- [ ] Strengthen public buildings.
- [ ] Reduce development in known hazardous areas.
- [ ] Restore natural floodplains and open space.
- [ ] Build or improve man-made protections (levees for example).
- [ ] Strengthen infrastructure such as bridges, sewer lines, and water pipes.
- [ ] Increase safety requirements for building permits.
- [ ] Collect more data and information about hazard areas.
- [ ] Help citizens reduce their individual natural hazard risks.
- [ ] Other

About You

12. How many people are in your household?

13. Do you own or rent your home?

- ○ Own
- ○ Rent
- ○ Other

14. Were you born in another country?

Yes
No

15. Where were you born?

16. Do you speak English at home?

- Yes
- No

17. What language do you prefer?

- Spanish
- Vietnamese
- Russian
- Chinese
- Romanian
- Ukrainian
- Japanese
- Somali
- Arabic
- Laotian
- Other

18. What is your age?

19. Do you have a physical or mental disability?

- No
- Yes

20. How many people in your home work to provide for the family?

21. Would you consider your household income low, middle, or high?

- Low
- Middle
- High

22. How do you identify yourself by race or ethnicity?

23. Are you a trained Community Emergency Response Team/Neighborhood Emergency Team member?

- Yes
- No

24. How did you find out about this survey?

- Library
- Social Media (Facebook, Twitter, NextDoor)
- Neighborhood Association
- City Website
- Radio/News Coverage
- Friend, Family Member, or Colleague
- Email
- Other

Prizes!

25. What is your email address or phone number?
This survey is completely anonymous, but if you want to be entered in our prize drawing to win free preparedness kits and emergency gear, we need to be able to contact you. The raffle drawing will be held on April 11, 2016.

26. Would you like us to contact you with related information and training opportunities?

- Yes
- No

Thank You!

Thank you for telling us about how you think about preparedness! The information you provided will help us prioritize projects, and lets us know how best to share information with you. *Visit our website here: www.portlandoregon.gov/pbem for more information.*

Report for Portland Preparedness Survey

There were 2,970 responses to the public survey between February and April of 2016. Key results are summarized below.

Geographic Representation and Residency Tenure

Survey responses were received from all risk reporting areas and from individuals who live outside of Portland. 75.5 percent of all respondents indicated that they live within Portland.

When non-residents are excluded, the percent of responses from risk reporting areas is representative of the estimated population in some cases; however, there are some areas with under- and over-representation. Over-represented areas included: Northeast, Southeast and Southwest. Under-represented areas include: Central City/Downtown and East Portland. The remaining reporting areas were within 1 percent of the estimated population. See the table below for more information.

Risk Reporting Area	Estimated Population	Estimated Percent of Population	Percent of Survey Responses (excluding outside of Portland)
Airport	2,674	0.4%	0.2%
Central City/Downtown	37,987	**6.2%**	**3.6%**
Central Northeast	47,644	7.8%	7.1%
East Portland	148,712	**24.2%**	**9.6%**
West/Northwest	26,875	4.4%	4.9%
North Portland	68,047	11.1%	12.1%
Northeast	57,842	**9.4%**	**15.9%**
Southeast	153,952	**25.1%**	**32.6%**
Southwest	70,262	**11.4%**	**13.8%**

The majority of respondents who live in Portland have lived in the City for 11 or more years (62 percent). 26 percent of respondents indicated that they have lived in the City for more than 25 years.

The top three areas where all survey respondents indicated that they and their families spend the most time include: Central City/Downtown (42 percent), Southeast (34 percent) and Southwest (25 percent). When non-Portland residents are excluded the top three areas indicated include Central City/Downtown (43 percent), Southeast (40 percent), Southwest and Northeast (about 25 percent each).

Demographics

72 percent of Portland resident respondents self-identified as middle income and 13 percent identified their household as low income. According to American Community Survey (ACS) estimates, approximately 12 percent of Portland families are surviving on incomes below the federal poverty line.

When non-Portland residents are excluded 99 percent of respondents indicated that they speak English at home. Only 9 respondents indicated that they preferred languages other than English. The ACS estimates that limited English speaking households make up approximately 4 percent of Portland households.

72 percent of Portland respondents indicated that they own their home, while 27 percent indicated that they rent their home. The ACS estimates that 43 percent of the housing units in the City are renter occupied.

Approximately 9 percent of respondents indicated that they have physical or mental disability. According to U.S census estimates 8.5 percent of Portland residents under age 65 have a disability. 13 (about 7 percent) of respondents indicating that they had a disability also indicated that they were 65 years of age or older.

Respondents were able to enter their own racial identity rather than choosing from pre-determined options. Approximately 79 percent of respondents indicated that they identified as white/Caucasian or Anglo. According to ACS estimates, 78 percent of the Portland population is white.

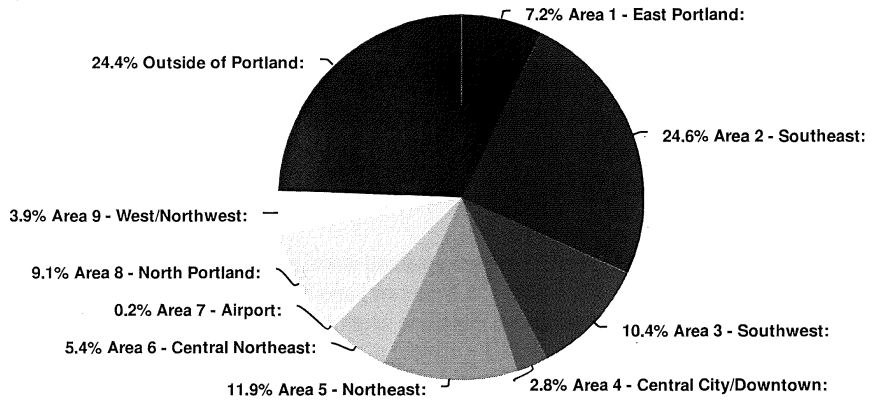
Hazards of Concern

For Portland residents, the top three hazard of concern selected were: earthquake (96 percent), severe weather (51 percent) and drought (34 percent). Dam failure (3.9 percent) and space weather (8 percent) were the least likely to be selected. The top three hazards remain the same when non-Portland residents are included.

53 percent of Portlanders indicated that they had experienced one of the hazard of concern.

Thoughts on Preparedness and Mitigation

Portlanders indicated that they have made efforts to reduce risk to their families. Portlanders clear storm drains (50 percent), have made non-structural retrofits, such as securing a water heaters (42 percent), and have planted drought-resistant plants (33 percent). Only 6 percent of Portlanders indicated that they have purchased flood insurance, while 27 percent indicated that they have purchased earthquake insurance. 17 percent of Portlanders indicated that they had not done any of the options indicated. There were a large number of respondents who indicated that they had not taken these measures because they rent or live in apartment buildings or condominiums.



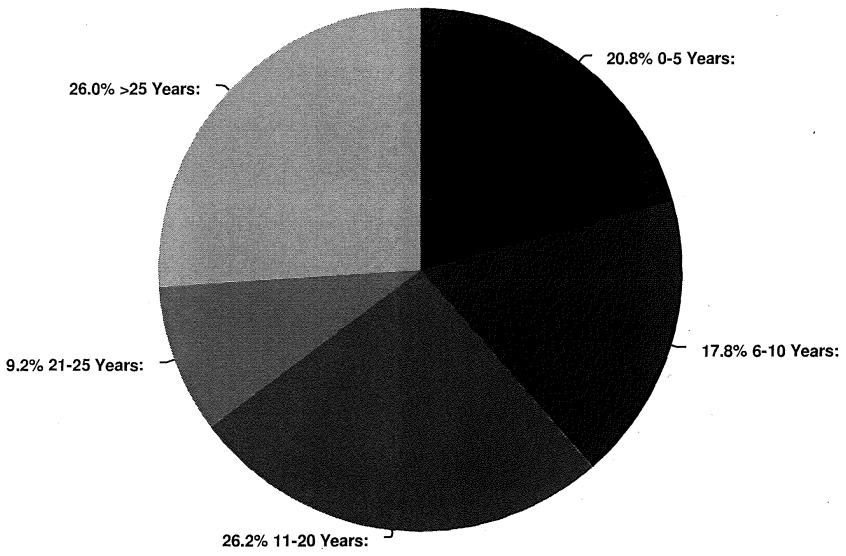
The top three things Portlanders have done to prepare for a natural hazard event include: obtained emergency food and water (58 percent), have an emergency kit at home (54 percent) and registered for public alerts (46 percent). Only 10 percent of respondents indicated that they had done nothing to prepare. When non-Portland residents are included, the results are similar.

Portlanders indicated the top three reasons for not preparing for emergencies included: lack of money (40 percent), being too busy (34 percent) and preparing being too overwhelming (32 percent).

Portlanders indicated that power outage (67 percent), water system damage (65 percent) and bridge closures (43 percent) would impact them the most. Responses were similar when all survey respondents are included.

Portlanders selected strengthen infrastructure such as bridges, sewer lines and water pipes (85 percent), strengthen public buildings (44 percent), and help citizens reduce their individual natural hazard risks (36 percent) as the three most important things that the City of Portland government could do to reduce risk from natural hazards. Strengthening schools was also commonly mentioned.

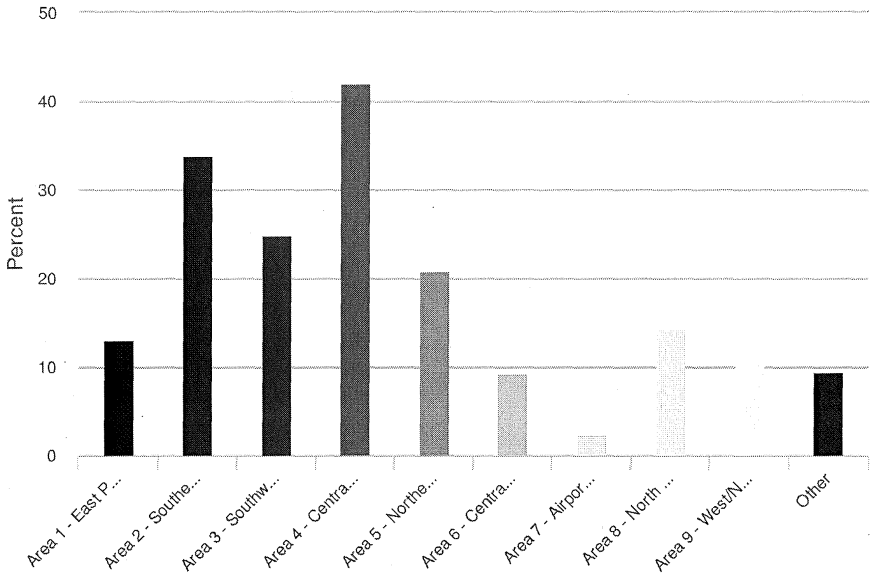
1. Where do you live?



Value	Percent	Count
Area 1 - East Portland	7.2%	215
Area 2 - Southeast	24.6%	730
Area 3 - Southwest	10.4%	309
Area 4 - Central City/Downtown	2.8%	83
Area 5 - Northeast	11.9%	354
Area 6 - Central Northeast	5.4%	161
Area 7 - Airport	0.2%	5
Area 8 - North Portland	9.1%	270
Area 9 - West/Northwest	3.9%	116
Outside of Portland	24.4%	723
	Total	**2,966**

2. Where outside of Portland do you live?

Areas outside of Portland commonly mentioned include:

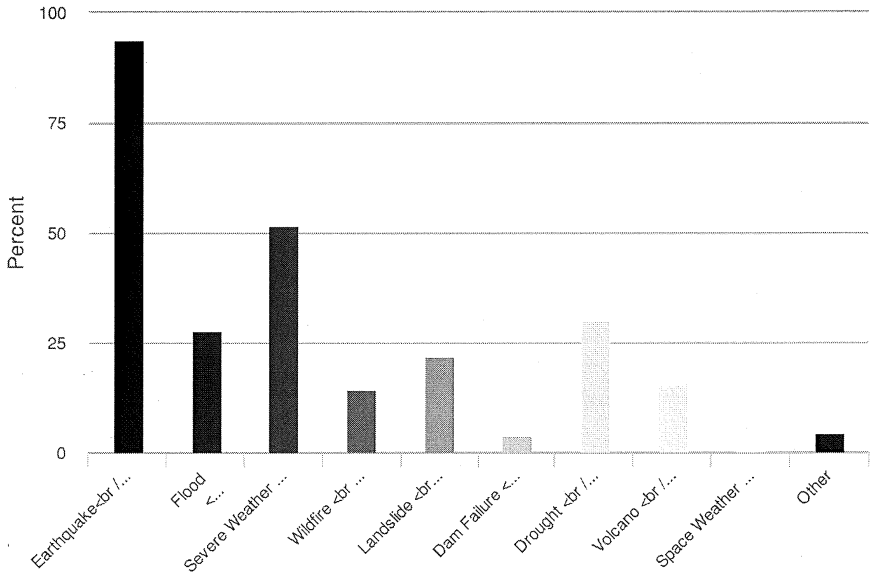


- Beaverton,
- Hillsboro,
- Tigard,
- Gresham,
- Milwaukie,
- Vancouver,
- Oregon City,
- Happy Valley,
- Lake Oswego,
- West Linn,
- Aloha,
- Tualatin,
- Sherwood,
- Troutdale,
- Fairview,
- Clackamas County,
- Gladstone,
- Newberg,
- Washington County,
- Camas,
- Cedar Hills,
- Forest Grove,
- Sandy, and
- Wilsonville.

3. How long have you lived in Portland?

Value	Percent	Count
0-5 Years	20.8%	436
6-10 Years	17.8%	374
11-20 Years	26.2%	550
21-25 Years	9.2%	192
>25 Years	26.0%	544
	Total	**2,096**

4. Where in Portland do you and your family spend most of your time (school or work)? Select all that apply.



Value	Percent	Count
Area 1 - East Portland	13.1%	404
Area 2 - Southeast	33.9%	1,044
Area 3 - Southwest	25.0%	769
Area 4 - Central City/Downtown	42.0%	1,294
Area 5 - Northeast	20.8%	639
Area 6 - Central Northeast	9.3%	286
Area 7 - Airport	2.4%	75
Area 8 - North Portland	14.4%	442
Area 9 - West/Northwest	10.3%	317
Other	9.5%	291

Other areas commonly mentioned include:

- Beaverton,
- Vancouver,
- Hillsboro,
- Tigard,
- Milwaukie,
- Gresham,
- Oregon City,
- Lake Oswego,
- Hillsboro, and
- Clackamas County.

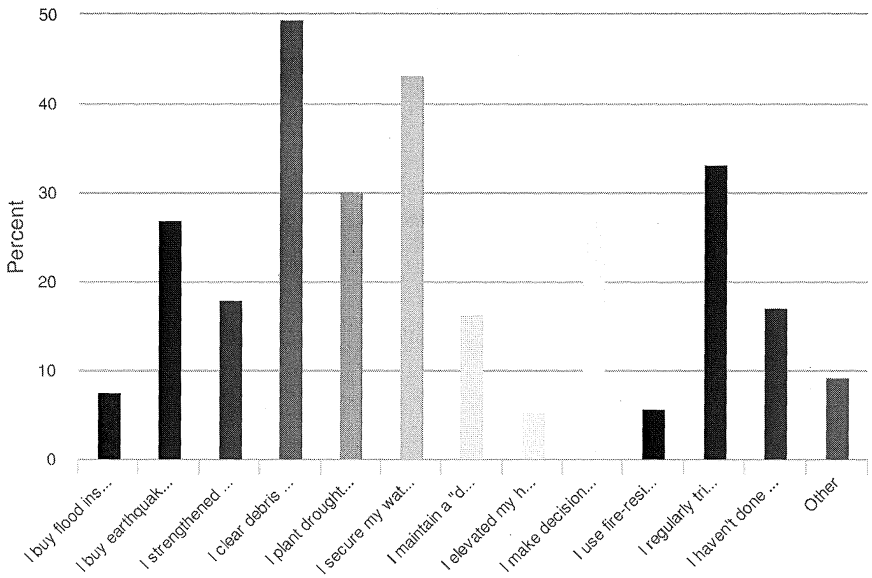
6. What other natural hazards do you worry about?

Other hazards commonly mentioned include:

- climate change,
- tsunami,
- falling trees,
- hazardous material spill/industrial accident,
- loss of electricity,
- economic collapse,
- pandemics,
- radon,
- sinkholes,
- poor air quality, and
- man-made disasters.

7. Have you experienced any of the hazards above?



Value	Percent	Count
Yes	54.5%	1,660
No	45.5%	1,386
	Total	**3,046**

8. Can you tell us about your experience?

The vast majority of responses included hazards experienced living, working or vacationing elsewhere. For Portland experienced hazards, respondents most commonly referenced severe weather, earthquakes and flooding. Power outages, difficulty driving/commuting in severe weather, basement flooding and falling trees were commonly mentioned impacts. Many respondents mentioned the following:

- Earthquakes in California or elsewhere
- Portland "Spring Break Quake"
- Minor earthquakes in Portland
- 1996 Floods in Portland
- Eruption of Mt. St. Helens
- Ice storms
- Basement flooding due to severe weather/storms
- Columbus Day storms
- Small-scale nuisance flooding
- Water use restrictions from drought
- Power outages from severe weather/winter weather
- Difficulty driving/commuting in winter weather
- Landslides during the 1996 flood
- Tornadoes, mostly experienced elsewhere
- Hurricanes in other locations
- Wildfire, mostly experienced elsewhere
- Extreme temperatures (heat)
- Downed trees
- High winds
- Flooding in general or experienced elsewhere
- Small landslides in Portland
- Flooding in Johnson Creek, and
- Extreme cold.

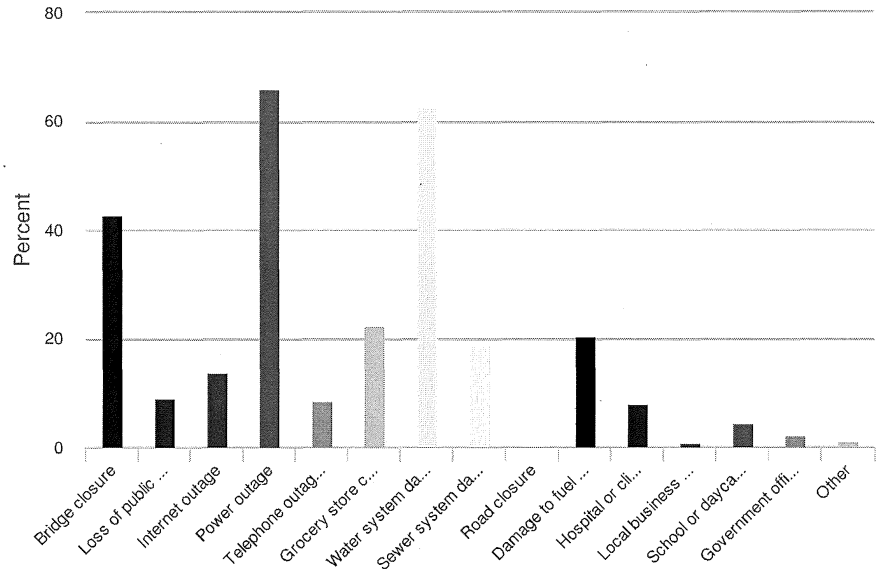
Other common responses included:

- Emergency kit at work
- NET/CERT volunteer
- Emergency communication system (e.g. ham radio), and
- Participate in drills.

11. Do any of these things make it hard for you to prepare your family for emergencies?

1802

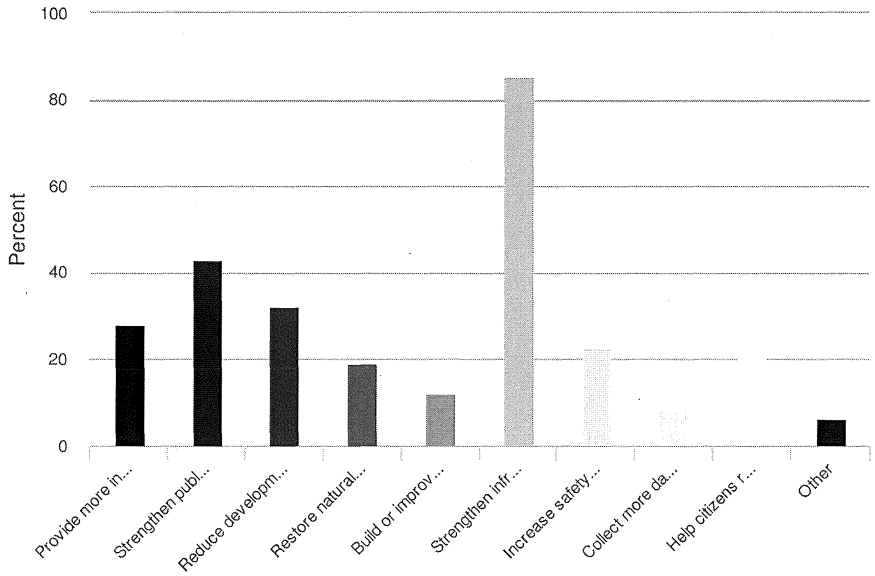


Value	Percent	Count
I don't have the money.	40.3%	997
I have more important things to worry about.	11.8%	293
Thinking about preparedness is just too overwhelming.	29.8%	739
I'm too busy.	34.6%	857
I don't know what I need to do.	25.9%	641
I'm not sure what my risks are.	27.2%	674
Other	13.4%	332

Other common responses included:

- Procrastination
- Laziness
- Denial
- Disability/elderly
- Don't have room or a secure place to store items
- Don't own home or live in an apartment building
- Difficulty retrofitting older homes
- Lack of people taking it seriously (friends/family/neighbors)
- Have started preparations, but have not completed them
- Have not prioritized it
- Lack of urgency
- Issues regarding rotation of food/medicine/water etc.
- Unsure how to address some issues related to planning/preparing
- Issues regarding preparations for pets
- Uncertainty/unknowns

12. Natural hazards can cause damage that makes it hard to carry out our daily lives. Select three (3) things that would impact you most.

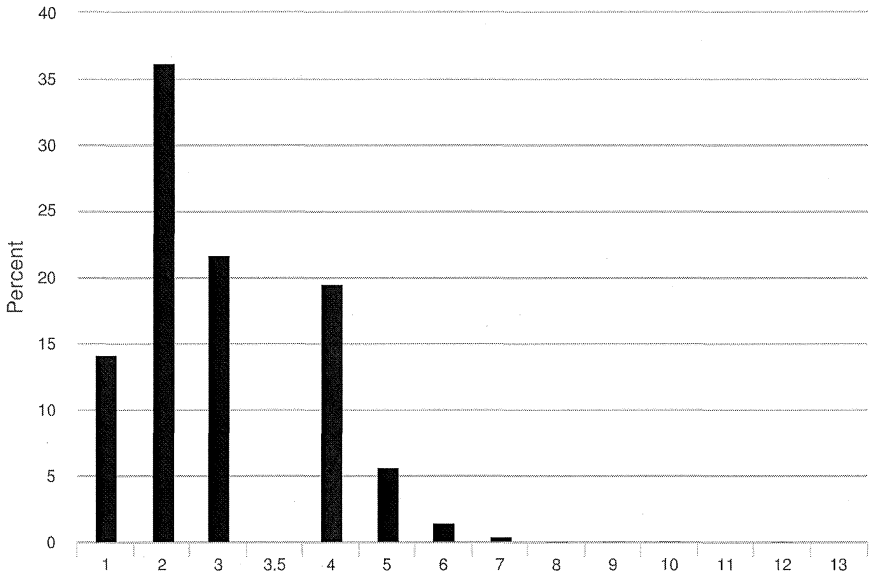


Value	Percent	Count
Bridge closure	42.8%	1,321
Loss of public transportation	9.1%	281
Internet outage	13.7%	423
Power outage	66.0%	2,036
Telephone outage	8.5%	261
Grocery store closure	22.3%	688
Water system damage	62.5%	1,929
Sewer system damage	19.1%	588
Road closure	15.7%	483
Damage to fuel and natural gas infrastructure	20.4%	630
Hospital or clinic closure	7.9%	244
Local business closure	0.7%	21
School or daycare closure	4.5%	138
Government office closure	2.3%	71
Other	1.2%	36

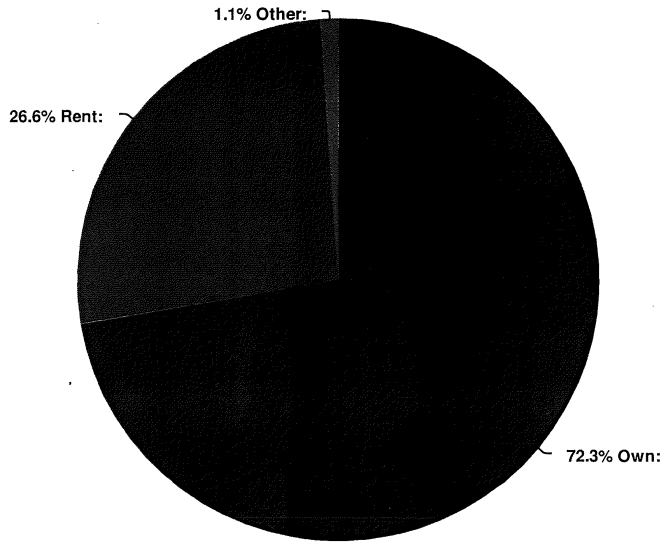
Other common responses included:

- Getting medicine
- Damage to home
- All options listed
- Damage to public schools, and
- Cell phone outages.

13. What are the three (3) most important things the City of Portland government offices should do to reduce the risk from natural hazards?



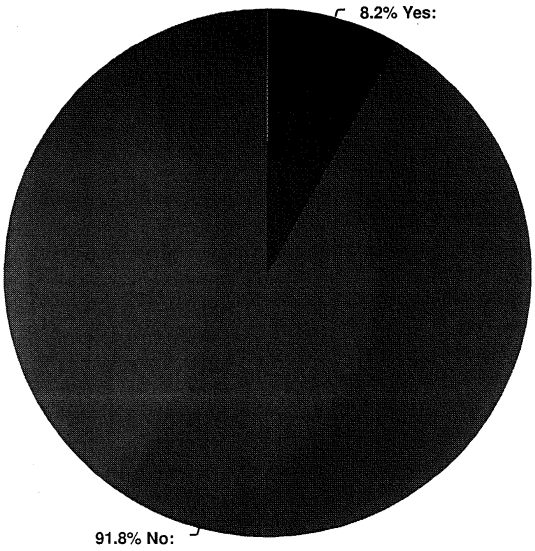
Value	Percent	Count
Provide more information to the public about natural hazards.	28.1%	847
Strengthen public buildings.	43.2%	1,302
Reduce development in known hazardous areas.	32.3%	974
Restore natural floodplains and open space.	19.0%	573
Build or improve man-made protections (levees for example).	12.1%	363
Strengthen infrastructure such as bridges, sewer lines, and water pipes.	85.4%	2,572
Increase safety requirements for building permits.	22.4%	675
Collect more data and information about hazard areas.	8.2%	246
Help citizens reduce their individual natural hazard risks.	35.3%	1,062
Other	6.4%	194



Other common responses included:

- Strengthen schools
- Road infrastructure improvement/address traffic issues
- Subsidize retrofits/preparedness
- Underground utilities
- Tax breaks
- Increase funding/wise use of public resources
- Address oil/gas infrastructure and shutoffs
- Strengthen bridges
- Require upgrades/retrofits
- Provide more information/guidance on planning and preparedness
- Offer more training/classes
- Help make it easier for residents to prepare, especially vulnerable populations.

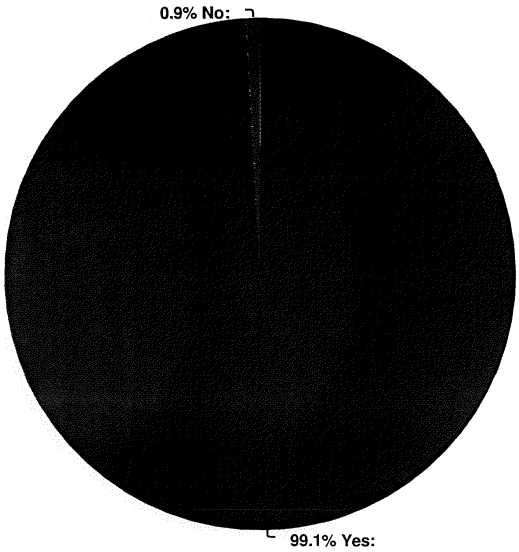
14. How many people are in your household?



15. Do you own or rent your home?

Value	Percent	Count
Own	72.3%	2,141
Rent	26.6%	789
Other	1.1%	32
	Total	**2,962**

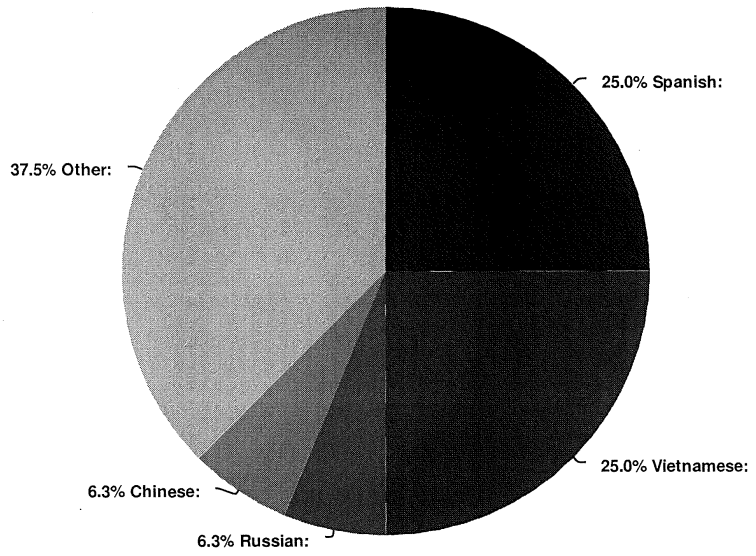
16. Were you born in another country?



Value	Percent	Count
Yes	8.2%	233
No	91.8%	2,625
	Total	**2,858**

17. Where were you born?

Other common responses included:



- Germany
- Canada
- Japan
- Philippines
- England
- Mexico
- Ukraine
- Vietnam

18. Do you speak English at home?

Value	Percent	Count
Yes	99.1%	2,941
No	0.9%	27
	Total	**2,968**

	Total	**2,891**

PLANNING FOR REAL WORKSHOPS

Planning for Real Workshop Report

INTRODUCTION

This report summarizes the public feedback gathered in support of Portland's 2016 update to its natural hazard mitigation plan (NHMP). It is intended to be used by city bureaus and offices to identify and prioritize action items to be included in the NHMP.

As part of the planning process, the planning team, with guidance from the steering committee, developed a public engagement strategy to outline the ways in which the planning team would engage the public in the development of the plan. The public engagement strategy recommended that the planning team hold 10 "Planning for Real" workshops throughout Portland. Eight of these workshops would be open to the public and focused geographically in eight of the nine risk reporting areas used for the plan. The risk reporting areas are roughly aligned with Portland's neighborhood coalitions with the addition of a Central City area. The remaining two workshops would be held with community organizations that work with Portland's communities of color and immigrant and refugee communities.

The NHMP planning team ultimately held 7 geographically-based workshops in the following locations:

- Northeast and Central Northeast Portland (joint workshop), April 18th, 2016
- Northeast Portland, April 23rd, 2016
- North Portland, April 30th, 2016
- Southeast Portland, April 24th, 2016
- Southwest Portland, May 3rd, 2016
- North/Northwest Portland and Central City (joint workshop), April 23rd, 2016
- East Portland, May 10th, 2016

The workshops were promoted through and organized with the support of the following neighborhood coalitions and groups:

- Northeast Coalition of Neighbors
- Central Northeast Neighbors
- North Portland Neighborhood Services
- Southeast Uplift
- Southwest Neighborhoods, Inc.
- Neighbors North/Northwest
- East Portland Action Plan

Two workshops were held with community organizations with the following groups:

- Coalition of Communities of Color, Native American Youth and Family Center, Portland Voz, Asian Pacific American Network of Oregon (APANO) and Latino Network, May 7th, 2016
- Community Engagement Liaisons (CELs) representing Chinese, Zomi, Lao, Butanese, Somali, Latino, Iraqi, and Khmer immigrant and refugee communities, May 14th, 2016

Individuals in the Community Engagement Liaisons group are leaders in their communities and are contracted with the City of Portland to act as a bridge between city government and immigrant and refugee communities. Following the CELs workshop, each participant was asked to schedule a meeting with at least 10 members of his or her community to share information about hazards in Portland and to provide any feedback received to the planning team by June 15th. This work is still in progress.

WORKSHOP CONTENT

The content of each workshop varied based on lessons learned from previous workshops. The planning team recognized that this was an entirely new process and was open to adapting the workshop content to community needs throughout the process. Earlier workshops focused on the NHMP planning process and the local physical exposure to hazards of concern (primarily flood, earthquake, landslide, wildfire, and severe weather, with some discussion of drought, space weather, and volcano) in the geographic area in which the workshop was held.

Based on feedback received during the process (detailed below), the content of later workshops was adapted to align with the PBEM's long-term outreach goals and to establish partnerships with local community groups in building resilience and community capacity. Workshop participants urged the planning team to deemphasize the planning process itself, and provide more information about what projects and programs the city is currently doing to reduce vulnerability, and how the city might partner with community organizations to enhance social and economic benefits to the community. Later workshops took this feedback into account. These workshops were broader in focus, briefly covering natural hazard risks, highlighting current citywide activities to reduce risk and vulnerability, and working to identify potential partnerships and collaborations between the city and community organizations.

For workshops with fewer attendees, discussion sessions involved the whole group, while larger groups were divided into discussion groups focused on specific hazards (wildfire, flood, earthquake, etc.). The following are questions discussed during the discussion sessions:

1) Is your neighborhood in a hazard risk zone? Are there buildings or services you use on a daily basis that are in a hazard risk zone? What would the consequences be if they were impacted by a natural hazard?
2) What are some ways that you could reduce the risk impacts and negative consequences at your home, at work, and in your neighborhood?
3) What kinds of programs or projects can city offices do to support you and your neighbors in preparing for natural hazards?
4) Are there potentially vulnerable populations in your neighborhood that could experience disproportionate impacts from natural hazard events? Can you think of ways to build capacity for these groups now, so that they are better positioned to absorb and recover from a hazard event?

COMMUNITY FEEDBACK

This section describes the feedback received from the Planning for Real workshops, summarized by topic. Topics include planning process, communications, and outreach; all-hazards; landslide; flood; earthquake; wildfire; severe weather; and drought.

Planning Process, Communications, and Outreach

This topic is the broadest in scope and includes feedback related to how the NHMP planning process is implemented, how to communicate messages about natural hazards and other emergencies, and how education and outreach efforts are managed across the city. This topic was the one most frequently discussed during workshops, indicating that activities that fall within this category are high priority for workshop participants.

Participants were generally in support of using the Neighborhood Emergency Team (NET) program to connect neighbors and prepare as a community. Many neighborhoods lack NETs, and the need to expand the program was highlighted. Several outreach tools were also mentioned, including using NextDoor (social media website) to promote preparedness messages, and City of Seattle's Structured Neighborhood Assessment Program (SNAP) was mentioned as an example model for community organizing.
Emergency messaging was also a prevalent topic, particularly communication of emergency messages using a variety of media and in languages other than English. A cohort of Portland residents with hearing impairments attended the East Portland workshop, and emphasized the need to communicate emergency messages using visual means including signs and graphics or flashing lights as emergency signals. Communication through graphics would also help to reach children, people who are unable to read, and people with limited English proficiency. Participants advocated for a registry of addresses with people with special needs that could be shared with emergency responders.

There was a strong emphasis on culturally appropriate and multi-language outreach and preparedness training, as well as safety training for post-disaster reconstruction and recovery. Nearly all of the workshops included a discussion of the need for additional training and education opportunities at the community level. In terms of outreach, workshop participants expressed that outreach about the plan should focus on information about social and economic benefits and investing in community capacity through partnerships. Community members are not likely to emotionally engage with specific plans; they see all of PBEM's work, and often the whole city, as one effort. To the community, there is no difference between each of PBEM's plans and the plans developed by other bureaus; the city's outreach efforts should align with one another rather than operating in "silos". Community members care most about how the city's work will directly impact them.

Some key recommendations in this category were:

- Include full social and economic recovery after a disaster as a goal of the plan.
- Provide culturally and community-specific training for community leaders on home safety, hazard mitigation (e.g. non-structural seismic strengthening), food and supply storage, response considerations for people with special needs, and household and neighborhood preparedness.
- Develop post-disaster safety messages based on 2013 "Day Labor, Worker Centers & Disaster Relief Work in the Aftermath of Hurricane Sandy" report.
- Provide education for rental property owners and property managers on hazard communication and mitigation actions.
- Provide training on evacuation and sheltering for retirement home staff and all licensed nursing homes and assisted living care providers.
- Increase PBEM's capacity to provide community trainings and partner with the Office of Neighborhood Involvement, Diversity in Civic Leadership program, and Community Engagement Liaisons program to connect underserved communities with training opportunities.

- Expand the NET program into every neighborhood in Portland and expand beyond the neighborhood structure to non-geographic communities (e.g. immigrant and refugee communities).
- Update Portland Maps to be more user-friendly and visually map hazards.
- Cultural and language-appropriate webpage for New Portlanders to access emergency information, videos, and events in their preferred language.
- Postcard mailers to every household in Portland to share natural hazard risks and how to be prepared. Include this information in neighborhood newsletters.
- Hold a storytelling event to share disaster survivor stories and share information about hazards in an emotionally compelling way.
- Citywide "Preparedness Tours" to highlight exemplary projects.
- Do outreach for ATC-20 damage assessment trainings at neighborhood land use and transportation meetings. Provide ATC-20 training to NET members to support ATC-20 certified engineers and architects.

All-Hazards

Much of the feedback received during the workshops relates to reducing overall vulnerability and can be applied across multiple hazards. This category includes ideas that address multiple hazards but are not directly related to the hazard mitigation planning process or communication and outreach.

There was widespread interest among workshop participants in identifying a funding mechanism for assisting low-income families, particularly those with elderly or very young members, in the purchase and installation of air conditioners to address the risks posed by severe heat, as well as the diminished air quality during wildfire season and during a potential volcanic eruption. Participants were concerned about the rising summer temperatures over the past few years, and felt that the city should provide assistance for potentially vulnerable residents who don't have access to air conditioning. Participants recognized that most areas in the city are not at direct risk from volcanic lava or debris flows, but there was concern that ashfall after an eruption would pose a significant risk to the elderly and those who suffer from asthma and other respiratory problems. Another option discussed by workshop participants was to place permit requirements on new multi-family and rental housing to include air conditioning systems.

Food, water, and energy independence was another common thread in many workshop discussions. Workshop participants expressed concern about access to food and water in the case of any major natural hazard event in Portland; power outages and fuel shortages were also major concerns. Investments in community gardens and local food production, rainwater collection systems, and solar power systems were suggested as important steps to improving community resilience while simultaneously contributing to the city's sustainability and climate change adaptation goals.

Recognizing the important role day laborers can have in disaster response and recovery, as well as their increased risk of suffering negative consequences after a disaster, workshop participants expressed the desire to see the city take an active role in protecting this group's safety during post-disaster response, reconstruction, and recovery, and preventing post-disaster displacement. Guidelines were developed based on lessons learned from Hurricane Sandy (*Day Labor, Worker Centers & Disaster Relief Work in the Aftermath of Hurricane Sandy*, by Cordero-Guzman et al., 2013) to include these groups in planning activities, protecting workers' rights during reconstruction, provide preparedness and safety trainings,

provide access to personal protective equipment, and allocate funds for day labor centers to be established as community resources prior to a major natural hazard event.

Many community-based projects would rely on partnerships with community organizations for implementation. Participants expressed interest in finding ways for the city to financially support community organizations that promote activities related to preparedness and increasing community resilience.

Some key recommendations in this category were:

- Financial assistance and/or regulatory support for low-income residents and renters who are vulnerable to extreme heat or diminished air quality to install air conditioning systems.
- Training and support for day laborers consistent with guidance in "Day Labor, Worker Centers & Disaster Relief Work in the Aftermath of Hurricane Sandy" report from 2013.
- Funding for community organizations outside of formal neighborhood structure whose projects focus on preparedness and community resilience.
- Invest in and promote community gardens and local food production.
- Invest in and promote rainwater collection systems in public, residential, and commercial properties.
- Require new development to include onsite rainwater storage and/or emergency drinking water storage tanks. Include water storage solutions in seismic retrofit projects for schools and other public buildings.
- Update city policies to include energy and water purification solutions promoted internationally by Green Empowerment.
- Invest in and promote solar and other alternative energy in public, residential, and commercial properties.
- Prioritize clearing bike paths so that non-automobile traffic can flow safely and develop plans to locate aid stations along these routes.
- Prioritize road access to grocery stores, medical offices, and hospitals. Consider isolated communities in establishing road-clearing priorities.
- Partner with community groups and critical social service organizations to ensure that they have continuity of operations plans.
- Develop hazard-specific evacuation plans that consider likely impacts to bridges and other transportation infrastructure.
- Develop a recovery plan to promote hazard-informed decision-making for post-disaster redevelopment and to take advantage of the opportunity to move critical assets to safer locations.
- Provide neighborhood tool libraries for mitigation projects and post-disaster reconstruction. Partner with home improvement stores to build tool collections.
- Require Portland's emergency responders to live within the city. Provide financial support to purchase or rent a home within the city limits.

Landslide

Landslides were a major concern for many workshop participants, especially those who live in or near the West Hills in Portland; many were worried about the closure of key access roads and life safety hazards from collapse of bridges and tunnels. Participants were also worried about the dramatic increase in infill development over the past few years and the addition of large multi-family developments in known

landslide hazard areas. There was strong interest in preventing any additional development within the city's regulatory landslide hazard zone.
Some key recommendations in this category were:

- Financial support and education for property owners wishing to remediate their properties for erosion.
- Emergency moratorium on all development in high landslide risk areas.
- Enhanced communication with adjacent property owners and neighbors about how landslide risk is being minimized if development is permitted in landslide risk areas.
- Erosion control projects using bio-swales and beneficial drainage systems.
- Pre-established detour routes for access in and out of known landslide risk areas.

Flood

Flood risks were of particular concern to workshop participants who live in East Portland. Clear communication about safe alternative routes through highly flood-prone areas emerged as a top priority.
Some key recommendations in this category were:

- Replace unsafe or structurally compromised bridges and rebuild to more flood-resistant standards.
- Identify high-traffic bridges and flood-prone routes and establish alternative routes to be used in case they are flooded.
- Require construction of bio-swales for large construction projects where appropriate.
- Promote the use of French drains and other on-site stormwater management systems.

Earthquake

Because of the potential for long-term citywide and regional impact, earthquake is the "model hazard" for many participants in the Planning for Real workshops. Many of the recommendations in the all-hazards category above were discussed in the context of earthquake hazards, but were described in this report as all-hazards recommendations because of their broader applicability to other hazards of concern. It is also important to note that earthquakes may cause or contribute to incidences of other hazard events such as landslides or floods. For that reason, many concerns and recommendations from workshop participants that fall under other categories discussed in this report would also be applicable to earthquake hazards.
The need for enhanced communication about seismic risks and the seismic stability of structures throughout the city was highlighted as a priority during workshop discussions. Participants expressed the need for information about whether public buildings such as schools or office buildings have been seismically strengthened. It was also important to workshop participants that unreinforced masonry buildings be clearly marked so that people who live and work in these buildings are aware of the risks they face.
Participants were also generally unsure about whether current seismic codes were sufficient for a Cascadia Subduction Zone earthquake, and many strongly advocated for higher seismic standards for new buildings and infrastructure. Failure of bridges and overpasses, disrupted communications, and damage to key energy infrastructure and potential hazardous materials in liquefaction zones were major concerns for workshop participants. Many were also concerned about fires caused by broken gas lines and other ignition sources during and after an earthquake.

Some key recommendations in this category were:

- Retrofit and/or move fuel infrastructure in Linnton. Maintain fuel reserves in safe locations for use in disaster recovery.
- Strengthen levees to seismic standards.
- Develop an inventory of and distribute information about which shelter facilities have been retrofitted.
- Provide property owners with financial assistance for seismic strengthening, especially owners of multi-family and low-income housing.
- Reinforce and fire-proof the Linnton Community Center as a place of refuge for residents who cannot evacuate.
- Require automatic shutoff valves for gas lines in all new development.
- Evaluate whether current seismic codes are sufficient for a 9.0 subduction zone earthquake. If not, adopt higher standards.
- Assess seismic stability of large water towers throughout the city to determine whether they pose a risk or could be used as an emergency water source.
- Communicate information about hazardous materials and potential plume areas prior to major event. Ensure firefighters and NET members know hazard types and response considerations.
- Label unreinforced masonry buildings to notify occupants of their risks.
- Require signage about risks and evacuation routes in hotels.
- Retrofit and reinforce schools beyond life-safety standards so that they can be used as neighborhood shelters and storage locations for emergency supplies.
- Stage emergency resources on the west side of the river in case bridges fail and east-west access is blocked.
- Continually update water and sewer pipe systems, and continue with the project to build a seismically reinforced water pipe that crosses under the Willamette River.

Wildfire

Wildfire was primarily a concern for workshop participants who live in or near the West Hills, although participants from other areas in the city recognized the air quality risks associated with wildfire outside of their immediate neighborhoods. Recommendations to address air quality issues are discussed in the all-hazards topic above.

Many participants expressed concerns about hotter, drier summers leading to increased wildfire risk. There was also some concern about invasive or non-native species contributing to wildfire risk, as well as certain diseases affecting trees that can cause massive tree die-outs including Swiss-Cass Needle Disease, which is currently affecting Portland's Douglas Fir tree population.

Workshop participants provided a number of zoning and building code solutions to reduce fire risk in urban-wildland interface zones, such as requiring non-combustible roofing materials in wildfire risk zones. There was also interest in the city providing training to community members and NET members to use firefighting equipment and hoses.

Some key recommendations in this category were:

- Require metal or composition roofing materials when replacing greater than 50% of a roof in a wildfire risk zone.
- Provide NET members with training on fire response, especially how to use fire hydrants and hoses.
- Provide clear information to the public on burn restrictions.

Severe Weather

Primary concerns from workshop participants about severe weather were related to extreme heat and emergency shelters for all extreme weather conditions. All recommendations for severe weather are included under the all-hazards topic above.

Drought

Although drought was not a major concern for most workshop participants, some did provide recommendations for reducing Portland's drought risk. These recommendations were primarily focused on water conservation and planting native and drought-resistant plants that require less water.
Some key recommendations in this category were:

- Promote homeowners planting native and drought-resistant plants that require less water during drier months.
- Provide water conservation education to kids in schools.

NEXT STEPS - INSTRUCTIONS GIVEN TO BUREAUS

This report is intended to inform the development and prioritization of action items for the NHMP. City bureaus and offices should use this feedback from community members to supplement the list of recommended action items from other sources in this planning process. Bureaus and offices should consider which of the recommendations might fit under their portfolios. Those actions that are selected should be included in the final list of actions submitted to the NHMP planning team. They should also be refined using the equity screening process and prioritized using the prioritization tables provided in the bureau toolkit.

TOWN HALL MEETINGS

TOWN HALL MEETING SUMMARY

During the public review and comment period, five town hall events were held throughout Portland to give residents an opportunity to ask questions about and provide feedback on the draft Mitigation Action Plan (MAP) (See Table 1). These events were advertised as Summer Socials (See Figure 1). At the Summer Socials, the public was invited to come and view the maps, review the draft plan, and ask questions of city staff and neighborhood emergency team volunteers. Approximately 60 people attended the events, some even came to multiple events. Attendees learned about liquefaction, talked about natural hazard risks and how to get prepared. The Summer Socials led to several individuals being interested in becoming trained Neighborhood Emergency Team members, and several people registered for PublicAlerts after talking to staff about the voluntary registration program. Planning team staff shared information about city bureau projects currently underway to reduce risks from natural hazards, as well as those listed in the plan that bureaus hope to implement over the next five years.

LNG—Liquid natural gas

NEHRP—National Earthquake Hazards Reduction Program

PBEM—Portland of Bureau of Emergency Management

PUC—Public Utility Commission of Oregon

USGS—U.S. Geological Survey

EXECUTIVE SUMMARY

The stability and reliability of local energy importation systems are of paramount importance to the City of Portland and the surrounding region. A significant portion of the energy distribution infrastructure is located along a 6-mile stretch of the lower Willamette River in Northwest Portland, between the I-405 Fremont Bridge and Sauvie Island, commonly referred to as the Critical Energy Infrastructure Hub (the CEI Hub). The energy sector facilities in the CEI Hub receive and distribute 90% of the fuel that powers the State of Oregon (PBEM, 2012). The CEI Hub includes the following types of facilities:

- All of Oregon's major liquid fuel port terminals
- Liquid fuel transmission pipelines and transfer stations
- Natural gas transmission pipelines
- Liquefied natural gas storage facility
- High-voltage electric substations and transmission lines
- Electrical substations for local distribution.

The CEI Hub is strategically located to provide access to navigable waters, rail infrastructure, petroleum pipelines, and highways, all important for both the supply and the distribution of energy products. While the location is vital for its functions, it is also a significant source of risk for the CEI Hub assets and personnel as well as residents who live adjacent to the CEI Hub. The CEI Hub area is especially susceptible to earthquake, flood, landslide, severe weather, volcanic ash fall, and wildfire.

This CEI Hub study was conducted by the Portland Bureau of Emergency Management in coordination with the 2016 update of the City of Portland Hazard Mitigation Plan. The purpose of the study was to develop a stand-alone report that includes a risk assessment and a list of key recommendations, and to incorporate the findings into the update of the city's hazard mitigation plan.

The study also included a comprehensive literature review on five previous studies related to the CEI Hub to pull together key findings and recommendations.

STAKEHOLDER ENGAGEMENT

Stakeholders for this study are local, state and federal agencies, as well as owners and operators of CEI Hub facilities, local residents, and environmental groups, all of whom have a stake in the disaster resiliency of the CEI Hub. In all, over 135 stakeholders were invited to participate in this study. Fewer than 10 percent of the stakeholders invited to participate in this study actually participated. This low level of participation was not surprising, as it tracks with the level of participation in other studies reviewed for this project; but it does have a direct effect on the quality of the risk assessment results.

RISK ASSESSMENT

A comprehensive risk assessment was performed on the CEI Hub facilities using the same tools that are being used to update the City's hazard mitigation plan. Risk assessment software was used to model potential impacts

from earthquake and flood. Comprehensive Data Management System software was used to capture property-specific attributes of 323 user-defined facilities.

The CEI Hub risk assessment for each hazard of concern includes an overview of the hazard, an analysis of people, property and environment exposed to the hazard, an analysis of the vulnerability of exposed people, property and environment, and a summary of key findings. The 2016 update to the City of Portland Hazard Mitigation Plan includes a more detailed profile for each hazard of concern for the entire city.

SELECTED KEY FINDINGS

- It is assumed that the modeling results of this analysis are understated due to incomplete data sets. There is a heavy reliance on default level data in the modeling for this study in lieu of the data that was not available from CEI Hub stakeholders. The accuracy of the modeling would be significantly enhanced if key data attributes that help estimate damage in the Hazus-MH models could be provided. Further, the Hazus-MH model employed a "lower bound" analysis, intended to demonstrate cost-effectiveness at the lowest level of expected impact.
- The vast majority of the facilities in the study area are constructed on soft, liquefiable soils that are typically associated with increased seismic vulnerability. The soils and liquefaction data provided by DOGAMI significantly enhanced the results of this study.
- The facilities and infrastructure within the study area range from over 100 years old to new or recent construction. The new construction has been built to heightened code standards, while the older construction was built to little or no code standards. The majority of the facilities were constructed to low, or no code standards. Code construction standards are an important parameter in the modeling of seismic events.
- Models of the Cascadia Subduction Zone event show less damage than the Portland Hills Fault event due to proximity to the source. The CSZ event has an epicenter 67 miles west of the study area, while the Portland Hills fault scenario has an epicenter less than 5 miles west of the study area. The CSZ event would be considered the true worst-case scenario due to its higher probability of occurrence and likelihood of regional impact. USGS has assigned a 15 percent probability in 50 years for a CSZ event, versus a 1 percent probability in 50 years for the Portland Hills event. Additionally, seismologists estimate a CSZ event to last longer than 3 minutes, while estimates for a Portland Hills event are 60 seconds or less. Event duration can play a significant role in the amount of damage associated with seismic events.

RECOMMENDATIONS

This study includes nine recommendations:

- Recommendation 1: CEI Hub Disaster Resiliency Workgroup —Form a workgroup made up of CEI Hub stakeholders that would be recognized by federal, state and local agencies as an authoritative body with a vested interest in the resiliency of the CEI Hub. This workgroup would help guide policy, initiate dialogue, and have some level of funding capability to seed resilience initiatives in the study area.
- Recommendation 2: Update/Enhance CEI Hub Risk Assessment—Address data gaps in the risk assessment performed for this study and update the risk assessment as new data and science become available.
- Recommendation 3: Fossil Fuel Resolution—Apply Fossil Fuel Resolution #37168 to allow expansion of existing infrastructure or installation of new infrastructure only after adjacent infrastructure on the same facility have been retrofitted to address seismic risks, including liquefaction.

- Recommendation 4: Emergency Response/Recovery Regulatory Waivers—Pursue a process for allowing waivers from federal and state regulatory agencies in order to make disaster response and recovery in the CEI Hub more efficient, for example allowing gravity-fed transfers that bypass electricity-dependent overfill alarms during an electrical outage.
- Recommendation 5: Planning—The CEI Hub Disaster Resiliency Workgroup would establish a planning curriculum by assessing the level of planning that currently exists and establishing procedures to improve coordination on planning efforts.
- Recommendation 6: Backup Power—Identify and prioritize backup power needs following local energy assurance planning protocols, and consider the use of microgrids or other alternative energy sources.
- Recommendation 7: Training and Exercise—Commit to periodic, scenario-based City trainings and exercises in the CEI Hub, coordinating between CEI Hub stakeholders and local responders.
- Recommendation 8: Facility retrofits—Via a comprehensive, site-specific risk assessment, identify and prioritize for retrofit or replacement all vulnerable CEI Hub facilities.
- Recommendation 9: Land Use Repurposing—Create regionally acceptable means to repurpose land use within an identified buffer area adjacent to the CEI Hub.

1. PURPOSE OF THIS STUDY

1.1 BACKGROUND

1.1.1 Local and Regional Energy Resources

The City of Portland, like all jurisdictions in Oregon, relies on the importation of energy resources from adjacent states (DOGAMI, 2013). The stability and reliability of local energy importation systems are of paramount importance to the City and to the entire region. A significant portion of the local, regional and state energy distribution infrastructure is located along a 6-mile stretch of the lower Willamette River in Northwest Portland, between the I-405 Fremont Bridge and Sauvie Island (see Figure 1-1). This area is commonly referred to as the Critical Energy Infrastructure Hub (the CEI Hub).

The CEI Hub lies on soils that are highly susceptible to the impacts of earthquakes and other hazards. The importance of the CEI Hub to the people and economy of the City of Portland and the State of Oregon warrant a detailed look at the exposure and vulnerability of facilities in the CEI Hub to natural hazards. The 2016 Critical Energy Infrastructure Hub Study was conducted as part of the 2016 update to the *City of Portland Hazard Mitigation Plan*. This report of the study's findings is a companion document to that updated plan.

1.1.2 Hazard Mitigation Planning

Hazard mitigation is defined as any action taken to reduce or alleviate the loss of life, personal injury, and property damage that can result from a disaster. It involves long- and short-term actions implemented before, during and after disasters. Hazard mitigation activities include planning efforts, policy changes, programs, studies, improvement projects, and other steps to reduce the impacts of hazards. The federal Disaster Mitigation Act (Public Law 106 390) emphasizes planning for disasters before they occur by requiring state and local governments to develop hazard mitigation plans as a condition for some federal disaster grant assistance.

The study recommendations presented in Chapter 5 of this report were presented for review and comment at the April 2016 meeting of the City of Portland Hazard Mitigation Plan Steering Committee. Final study recommendations will be included as actions in the updated 2016 Hazard Mitigation Plan.

1.2 OBJECTIVES

The mission of the Portland Bureau of Emergency Management (PBEM) is to build a resilient City through coordinated planning, mitigation, response and recovery. PBEM's objectives for this study are as follows:

- Conduct a study in conjunction with the update to the City's hazard mitigation plan.
- Perform a risk assessment for the CEI Hub.
- Identify CEI Hub mitigation strategies for the City of Portland and possible funding mechanisms.
- Provide the findings in a stand-alone, companion document.
- Deliver a public presentation on the study for the City Council.
- Incorporate the CEI Hub mitigation recommendations into the final, updated Hazard Mitigation Plan.

1.3 STUDY SCOPE OF WORK

PBEM selected Tetra Tech, Inc. to facilitate the update to the City's Hazard Mitigation Plan, including the development of the CEI Hub study. A planning team composed of PBEM and Tetra Tech staff guided and facilitated the CEI Hub study. The scope of work for the CEI Hub study included the following tasks:

- **Task A: CEI Stakeholder Engagement**—CEI Hub stakeholders were identified and engaged by the planning team to support the development of the study. These stakeholders included owners/operators of CEI Hub facilities; state and federal agencies with relevant data, studies or plans about the facilities; residents of the surrounding Linnton neighborhood; members of the Hazard Mitigation Plan Steering Committee; and relevant staff from City of Portland bureaus. Stakeholders were invited to participate in two meetings:
  - At the first meeting, the planning team explained the purpose of the study, sought committed participation from stakeholders and requested relevant data.
  - At the second meeting, the planning team presented the findings of the risk assessment and identified recommendations for actions to be considered in the City's updated Hazard Mitigation Plan.
- **Task B: CEI Data Analysis**:
  - The planning team reviewed relevant plans, studies and programs to identify data that would augment the a risk assessment for the CEI Hub.
  - Following the literature review, a risk assessment was performed using the Federal Emergency Management Agency's (FEMA's) Hazus-MH risk assessment platform (Version 2.1). The risk assessment was conducted solely on facilities for which information was provided by participating stakeholders identified under Task A. Risk assessment results were generated by facility and by hazard type. Direct damage, indirect damage, and loss-of-function estimates were derived from the Hazus-MH platform.
- **Task C: CEI Facility Report**—The planning team prepared this CEI Hub study report, which provides an overview of the risk and vulnerability of the CEI Hub for each hazard of concern, identifies possible mitigation actions, and identifies possible sources of funding for recommendations that require an alternative source of funding. The report is a companion document to the 2016 update to the City's Hazard Mitigation Plan.
- **Task D: Final CEI Report to City Council**—The planning team will present the findings and recommendations of this report to the Portland City Council.

1.4 STUDY AREA DEFINED

The study area for this assessment was defined as a 6-mile-long area centered on US Highway 30 along the lower Willamette River between the south tip of Sauvie Island and the I-405 Fremont Bridge. Figure 1-1 shows the study area. A significant portion of Oregon's electricity, natural gas, and fuel oil infrastructure is concentrated in this area. The energy sector facilities in the CEI Hub include the following:

- All of Oregon's major liquid fuel port terminals
- Liquid fuel transmission pipelines and transfer terminals
- Natural gas transmission and distribution pipelines
- Liquefied natural gas (LNG) storage facility
- High-voltage electric substations and transmission lines
- Electrical substations for local distribution.

2. STAKEHOLDER ENGAGEMENT

This chapter summarizes the outreach and engagement efforts to CEI Hub stakeholders that the planning team undertook to gather the best available data for this study.

2.1 IDENTIFIED CEI HUB STAKEHOLDERS

A stakeholder is any person or group with an investment, share, or vested interest in something. For this study, stakeholders are all persons and agencies with a vested interest in the disaster resiliency of the CEI Hub, including, but not limited to facility owners and operators, environmental groups, adjacent property owners or residents, and major regional energy customers such as PDX airport. The planning team assembled a list of two key types of stakeholders to engage in the effort:

- Owners, operators and other data providers, such as state regulatory agencies
- Communities or interests that would likely be indirectly impacted by a major hazard event at the CEI Hub, such as neighborhoods adjacent to the CEI Hub and groups representing environmental interests.

Over 135 stakeholders representing these interests were contacted and invited to participate in the development of this study.

2.2 CEI HUB STAKEHOLDER OUTREACH

2.2.1 CEI Hub Stakeholder Meeting #1

A study kickoff meeting was held on October 21, 2015 at the Clean Rivers Cooperative Training Center, located in the study area. Seventeen CEI Hub stakeholders attended, along with five members of the planning team. Stakeholder interests that were represented included: CEI Hub owner/operators, representatives from the Linnton Neighborhood Association, the Oregon Department of Geology and Mineral Industries (DOGAMI), the Federal Emergency Management Agency (FEMA), and the Oregon Department of Environmental Quality. The meeting began with a presentation to introduce the planning team, project goals and expected outcomes as well as the following meeting objectives:

- Ensure that relevant stakeholders have been identified and are participating
- Determine information needs, data availability, and possible sources
- Identify and address data confidentiality and other concerns
- Outline the project timeline
- Determine next steps in the process.

After the presentation, there was discussion among the planning team and stakeholders on project understanding, concerns, information security and data capture and transmission. Most stakeholders in attendance indicated that they were likely to participate in the study.

2.2.2 Data Solicitation

On November 9, 2015 the planning team sent a data capture form to all identified CEI Hub owner and operator stakeholders, along with a set of instructions on how to complete the form. The form was designed to capture necessary information for each facility for input to the Comprehensive Data Management System (CDMS), an extension to FEMA's Hazus-MH risk assessment software (see Chapter 4). CDMS captures facility-specific attributes to establish curves for estimating damage to facilities. Completion of the CDMS form, which was voluntary, indicated each stakeholder's support for the study. Stakeholders were asked to submit completed forms by December 18, 2015.

2.2.3 CEI Hub Stakeholder Meeting #2

A second CEI stakeholder meeting was held at the Clean Rivers Cooperative Training Center on February 25, 2016 to present the results of the risk assessment and to identify recommendations for action. This meeting was attended by 11 CEI Hub stakeholders and three members of the planning team. The agenda was as follows:

- Welcome and introductions
  - Round-table introductions
- Project review
  - Project overview
  - Project status
  - Summary of the literature review
  - Next steps
- Model results
  - Description of the computer model
  - Hazard scenarios analyzed
  - Outputs defined
  - Review of the results
- Alternatives analysis
  - Strengths
  - Weaknesses
  - Obstacles
  - Opportunities to use strengths to address weaknesses and obstacles
  - Possible actions.

Evaluation of Strengths, Weaknesses, Obstacles and Opportunities

Recommended actions for possible inclusion in the City's Hazard Mitigation Plan were identified through consideration of the study area's hazard-related strengths, weaknesses, obstacles and opportunities. Key points discussed included the following:

- Strengths
  - Practical experience—CEI Hub owner/operators have not had to respond to a major disaster, but they do have practical experience in dealing with business interruption from impacts outside the CEI Hub.

- Established relationships—There are strong relationships among CEI Hub owner/operations that have been expanded to other stakeholders, such as the City of Portland, DOGAMI and the Oregon Department of Environmental Quality.
- The City of Portland Local Energy Assurance Plan (LEAP)—The LEAP, developed by the City in coordination with CEI Hub owner/operators, has helped to establish a dialogue among CEI Hub stakeholders on energy resilience that could be applied to disaster resilience.
- Product distribution alternatives—Petroleum/gas stakeholders have the ability to deliver product without power. This is not the ideal method, but it is an option that could be deployed to support continuity of operations.
- Example for disaster resilience—Portland General Electric, the principle energy supplier to the study area, has incorporated disaster resilience into its business plan and is proactively mitigating its vulnerable facilities. This provides a practical example for all CEI Hub stakeholders on embracing disaster resilience.

- Weaknesses
  - Access—The study area has the potential to be isolated in a disaster scenario due to limited points of ingress and egress.
  - Plan awareness—Numerous plans and studies have conducted in-depth assessments of the CEI Hub and its facilities. There is a lack of awareness by CEI Hub owner/operators about these plans.
  - Planning coordination—There is a lack of coordination of all the relevant planning efforts currently underway. This lack of coordination leads to a lack of consistency in data analyzed and plan findings and conclusions.
  - Lack of data—There seems to be a good understanding about potential hazard events and their impacts; however, understanding of how CEI Hub facilities might perform in these events is lacking due to information gaps for the CEI Hub facilities. Needed information probably exists, but is not readily available.
  - Understanding of functional downtime—CEI Hub stakeholders do not have a good understanding of how long after a hazard event their facilities would be unable to operate at their normal level.

- Obstacles
  - Environmental restrictions/regulations and safety restrictions/regulations—CEI Hub stakeholders indicated that existing environmental and safety regulations may impede response and recovery efforts at the CEI Hub after a major disaster.
  - Local regulations—The City of Portland recently adopted regulations that would restrict the expansion of petroleum facilities within the study area (Resolution No. 37168). This could be an obstacle to any incentive to retrofit vulnerable facilities in the CEI Hub. It would also be an obstacle for petroleum facilities to keep up with State of Oregon growth demand.
  - Security—The need for security of sensitive data can create an obstacle to sharing data and requires steps to ensure sure that shared data is secure.

- Opportunities
  - Continuity of operations planning—Determine if all CEI Hub owners and operators have prepared continuity of operations plans and whether existing plans address post-disaster operations and provide consistency in strategies.
  - State of Oregon Energy Plan update—Update the State Energy Plan and incorporate existing data, studies, and plans on the CEI Hub.
  - Work group—Build on the momentum from this study and others by creating a work group for data sharing, analysis, security and policy-making related to the overall resilience of the CEI Hub.

- Regulatory waiver—Consider a waiver to City Resolution No. 37168 that would allow a CEI Hub owner/operator to expand a petroleum facility if it is done as a retrofit to an identified vulnerable facility.
- Legislative strategies—Pursue state legislative strategies to address environmental and safety restrictions related to achieving disaster resilience through preparedness, response or mitigation actions by CEI Hub stakeholders.
- Backup generators—Ensure that all CEI Hub owner/operators own or have access to backup generators. Further analysis is necessary to determine how many generators are needed, the type, capacity, switching capabilities, etc.
- Training and exercises—Build on existing successes, such as LEAP, to provide disaster scenario training that includes and involves CEI Hub stakeholders.
- Ongoing risk assessment updates and enhancements—Continue to update and enhance the risk assessment for the CEI Hub using the best facility data and best available science as they become available.
- Planning—Make a concerted effort among public and private-sector CEI Hub stakeholders to identify existing plans related to CEI Hub disaster resiliency, the level of consistency among them, and needs for additional planning.

Review of Risk Assessment Results

Following the evaluation of strengths, weaknesses, obstacles and opportunities, stakeholders engaged in additional discussion on the risk assessment results. There was a general consensus that the model results were likely understating risk, especially in regard to earthquake risk. Stakeholders suggested several methods by which the data and models could be refined to more accurately portray risk, including greater participation from owners/operators at the CEI Hub and accounting for an increase in severity resulting from shaking duration lasting longer than one minute. Although risk may be understated in this study, the risk assessment results represent a valuable starting point toward understanding the vulnerabilities of the CEI Hub.

2.3 CEI HUB STAKEHOLDER PARTICIPATION

All stakeholder participation was valuable for this study, and participation from owners and operators of CEI Hub facilities was of particular importance. Because all CEI Hub facilities are privately owned, a detailed assessment of the CEI Hub could not be conducted without the participation of facility owners and operators. The risk and vulnerability assessment (described in Chapter 4) was built upon FEMA's Hazus-MH modeling program, which requires detailed, accurate data about existing conditions. The accuracy and reliability of the results depend upon the quality of the input data. When current, detailed data is not provided, the model supplements missing data with default entries and assumptions.

Modeled results presented in this report (see Chapter 4) are based only on the facilities for which data was provided. The total number of owners and operators of facilities in the CEI Hub has not been established, but is substantially more than those who provided full participation. Full participation in this study—defined as attending meetings and providing data to be used in the study—was given by the following stakeholders:

- Kinder Morgan
- Pacific Terminal Services
- Port of Portland
- DOGAMI
- Department of Homeland Security, Region X
- Portland Bureau of Emergency Management
- Portland Bureau of Environmental Services
- Oregon Department of Environmental Quality

- Oregon Public Broadcasting
- Concerned citizen from Sauvie Island
- Public representatives from the 2016 City of Portland Hazard Mitigation Plan Update Steering Committee, including those representing the Linnton Neighborhood Association, the Audubon Society and the Local Emergency Planning Committee.

This rate of participation is consistent with what was observed in the review of previous studies and plans (see Chapter 3). Many of the stakeholders who participated in other plans and studies also participated in this study, and stakeholders who did not participate in this study have generally not participated in other efforts. Early in the process, the planning team determined that success would be defined as any level of participation from CEI Hub stakeholders, because this study marks the beginning of the City's engagement of CEI Hub stakeholders in planning for disaster resiliency. The dialogue and engagement initiated through this study provides a metric on which to improve.

Participation from stakeholders subject to indirect impacts from a hazard event at the CEI Hub also was critical to the findings and recommendations of this study. Representatives from the Linnton Neighborhood Association, Sauvie Island and the Audubon Society all provided insights that had a direct impact on the recommendations of this study. Their engagement and commitment to understanding the risks expanded the perspectives of the study, thus enhancing the creditability of the final report.

3. LITERATURE REVIEW

The importance of the CEI Hub to Portland, the state of Oregon and the Pacific Northwest region has prompted numerous, detailed studies of the area by local, state and federal agencies. Many of these studies have focused on the CEI Hub's exposure and vulnerability to earthquake hazards. The planning team identified five key documents that examined the vulnerability of the CEI Hub to a Cascadia Subduction Zone (CSZ) earthquake or to prolonged loss of power:

- Earthquake Risk Study for Oregon's Critical Energy Infrastructure Hub (DOGAMI, 2013)
- Protected Critical Infrastructure Information, Columbia Basin Resiliency Assessment (U.S. Department of Homeland Security, 2015)
- City of Portland Local Energy Assurance Plan (PBEM, 2012)
- The Energy Cluster in Linnton (Grillo, 2005)
- Port of Portland, Corporate Seismic Risk Assessment Study (Berger ABAM, 2015).

This chapter provides extracts of these documents, providing a brief synopsis of each, along with a summary of key findings and recommendations.

3.1 EARTHQUAKE RISK STUDY FOR OREGON'S CRITICAL ENERGY INFRASTRUCTURE HUB

3.1.1 Synopsis

The Oregon Department of Geology and Mineral Industries conducted an earthquake risk study of the CEI Hub as part of a larger Energy Assurance Project by the Oregon Department of Energy, Public Utility Commission of Oregon (PUC) and DOGAMI (funded by the U.S. Department of Energy). The purpose of this study was to provide a better understanding of the vulnerabilities of the energy sector when confronted with a magnitude 8 or larger Cascadia earthquake. Study goals were as follows:

- Characterize Oregon's natural hazards using qualitative risk scores to estimate the scale of potential disasters.
- Better understand CEI Hub facility operations and learn about site conditions, structures, components, systems and interdependencies.
- Describe potential critical seismic vulnerabilities in the energy sector, and offer recommendations to improve energy sector resiliency to minimize earthquake impacts.

This study did not entail site-specific vulnerability and risk studies and provided only estimates of seismic vulnerability based on visual reconnaissance inspections, site-independent analyses and studies and existing site specific information provided by CEI Hub facilities.

3.1.2 Key Findings

The following are the key findings of the DOGAMI report that are relevant for this study:

- Some infrastructure in the CEI Hub was built 100 years ago, to very antiquated standards. Other infrastructure is new and built to current standards. Because of the wide range of ages and construction practices, the seismic vulnerability of the facilities also spans a wide range.
- Energy companies have operational interdependencies with the transportation and telecommunication sectors. The three energy sources—electricity, natural gas, and liquid fuel—depend upon each other; if one system is inoperable, it impacts another. For example, all sources rely on electricity to operate their systems. Electricity is needed to power the control rooms for natural gas and liquid fuel transmission.
- There are few regulations that require existing structures to be upgraded to today's seismic standards.
- Older building codes and practices did not adequately address many non-building structures that exist in the CEI Hub, such as tanks, pipes, and piers.
- Each energy source has a different level of redundancy in its transmission system. Redundancy influences the level of seismic resilience, with more redundant systems providing higher resilience.
- The following findings were made regarding liquid fuel facilities:

  - **Liquid fuel pipeline**—CEI Hub petroleum facilities receive liquid fuel from a liquid fuel transmission pipeline and from marine vessels. The liquid fuel pipeline was largely constructed in the 1960s when construction techniques had no seismic standards. The pipeline design did not consider ground movements from lateral spreading at river crossings or stresses induced by earthquakes that may cause pipe breaks. A pipe break would have a significant impact on all petrochemical facilities in the CEI Hub and could result in a statewide fuel shortage.
  - **Shipping channel**—Marine vessels use the navigation channel from the Columbia River mouth to the lower Willamette River to transport fuel. A preliminary investigation found that the shipping channel would likely be closed for river navigation after an earthquake until it is cleared for use by the U.S. Coast Guard. Closure of the shipping channel would prevent marine vessels from delivering liquid fuel and limit transport of emergency recovery equipment.
  - **Marine terminals**—Port facilities in the CEI Hub have significant seismic risks. Some older piers constructed without any seismic design may be damaged even in a moderate earthquake. If oil products are released and contaminate the navigable waterway, the waterway may be closed to river traffic, impeding emergency response and the supply chain. Local capacity to fight fires and clean hazardous material spills is limited.
  - **Fuel Tank Farms**—All fuel tank farms in the CEI Hub have significant seismic risk due to unmitigated liquefaction hazards. Most tanks were constructed on potentially liquefiable soils, with little or no seismic design criteria.
  - **Fuel supply**—Fuel terminals in the CEI Hub have a three- to five-day average supply of regular unleaded gasoline and diesel fuel. Premium gasoline is subject to daily delivery. If the supply chain is disrupted, fuel would quickly become scarce. Airlines operating at Portland International Airport receive 100 percent of their liquid fuels from a terminal in the CEI Hub. There is limited on-site fuel supply at the airport. If the transmission pipe between the CEI Hub and the airport fails, then the airport would likely experience a shortfall and operations would be impacted.

- The following findings were made regarding natural gas facilities:

  - **Natural gas pipelines**—Oregon's largest natural gas service provider receives most of its natural gas from pipelines that cross under the Columbia River. Most of these pipelines are 1960s vintage and were constructed without seismic design provisions. The soils at major river crossings are subject to liquefaction and lateral spreading. Pipe breaks could lead to a natural gas shortfall in the state as well as explosions or fires.
  - **LNG storage facility**—The LNG storage facility in the CEI Hub was constructed in the late 1960s on what is suspected to be highly liquefiable soils. As of February 2012, the natural gas operator with facilities in the CEI Hub had not performed seismic vulnerability assessments.

3.1.3 Recommendations

The most critical conclusion from this report is that energy sector companies must pro-actively integrate seismic mitigation into their business practices for Oregon's energy sector to adequately recover from a Magnitude 8.5 to 9 Cascadia earthquake in a reasonable time period. DOGAMI made these recommendations to private and public energy sector stakeholders:

- Energy sector companies should work with local, state tribal and federal government agencies and stakeholders to conduct seismic vulnerability assessments on all systems or facilities.
- Energy sector companies should work with local, state, tribal and federal government agencies and stakeholders to institutionalize long-term seismic mitigation programs to ensure facility resilience and operational reliability.
- The State of Oregon's Homeland Security Council should review the vulnerability and resilience of the energy sector to earthquakes and other natural disasters. This could involve the Energy Assurance Project partners (Oregon Department of Energy, PUC, and DOGAMI) as well as the Oregon Department of Transportation, Building Codes Division, and the Oregon Seismic Safety Policy Advisory Commission. Under Oregon Revised Statute (ORS) 401.109, no outside individual or group has previously been involved in the Homeland Security Council's roles and responsibilities.
- Energy sector companies and the State of Oregon should build Oregon's seismic resilience to a Cascadia earthquake. Adopting pro-active practices and a risk management approach will help achieve seismic resilience. A culture of awareness and preparedness about energy sector seismic vulnerability should be encouraged, including long-range energy planning. Emergency batteries, generators and communication devices should be braced or anchored to withstand a Cascadia earthquake.
- The length of time to resume services after a Cascadia earthquake should be evaluated by each energy company to establish a baseline understanding, and improvements should be made to achieve a satisfactory service level.

3.2 COLUMBIA BASIN REGIONAL RESILIENCY ASSESSMENT PROGRAM

3.2.1 Synopsis

The Regional Resiliency Assessment Program is a cooperative, non-regulatory, assessment of critical infrastructure, led by the federal Office of Infrastructure Protection. The program focuses on infrastructure systems within designated geographic areas, addressing hazards that could have regionally and nationally significant consequences. The goal is to mitigate the risk of loss of life and physical and economic damage from natural and manmade hazards.

The Columbia Basin Regional Resiliency Assessment Program established a working relationship between the Department of Homeland Security and key partners in Washington, Oregon, and Idaho. These included the Washington Military Department, the Oregon Military Department, and the Idaho Bureau of Homeland Security. Other public and private sector organizations contributed to the assessment of hazards and vulnerabilities associated with Columbia Basin transportation, agriculture, and energy infrastructure, and regional infrastructure systems that depend on the river transport system.

Data were gathered from public and private sector organizations to determine the hazards, vulnerabilities, and interdependencies among transportation, energy, and agriculture infrastructure along the Columbia, Willamette, and Snake Rivers. The Office of Infrastructure Protection conducted site assistance visits and enhanced critical infrastructure protection security surveys in all three states. The study included a detailed look at the CEI Hub because of its importance to the assessment area.

Because the document contains protected critical infrastructure information, it is exempt from release under the Freedom of Information Act (5 United States Code 552) and similar state and local disclosure laws (in accordance with Title 6 Code of Federal Regulations (CFR) Part 29). It is to be safeguarded and disseminated in accordance with the Critical Infrastructure Information Act of 2002 (6 United States Code §§ 131 et seq.), the implementing regulation (6 CFR Part 29), and protected critical infrastructure information program requirements.

3.2.2 Key Findings

The following are the key findings of the Columbia Basin Resiliency Assessment that are relevant for this study:

- **Finding # 1**—Planning related to the reopening of river navigation after a CSZ earthquake is insufficient. After a CSZ earthquake, sections of the lower Columbia and Willamette Rivers are likely to be closed to shipping. Reopening of navigation channels will be important to support critical functions in the immediate post-disaster situation, and to reduce economic impacts on the region over the long term.
- **Finding # 2**—Regional, state, local, and private sector disaster plans do not reflect the impacts on and integration necessary for recovery of petroleum infrastructure from a CSZ earthquake.
- **Finding # 5**—Most refined petroleum products destined for the Columbia Basin are received via the Olympic Pipeline and/or Columbia and Willamette River transportation systems, all of which would be significantly disrupted by a CSZ earthquake. East-to-west routes for refined petroleum products from Salt Lake City refineries and other sources may be necessary. Rail could play a pivotal role in emergency transportation. The ability to ship grain and petroleum fuels via rail would be critical until Columbia Basin river transportation systems are restored. It is assumed that rail traffic east of the Interstate 5 (I-5) corridor could be reestablished or rerouted fairly rapidly, providing transportation options. However, greater planning and preparation are needed to allow rail to play this role.
- **Finding # 6**—Reliability and rapid recovery of electricity are critical to recovery of petroleum fuel supply and grain export operations. The electrical grid serving Oregon, Washington, and Idaho is part of a highly interconnected system that will experience short- and long-term outages throughout the Pacific Northwest following a CSZ earthquake.

3.2.3 Recommendations

Finding-Specific Recommendations

The Columbia Basin Resiliency Assessment identified "resiliency options" for each of the identified key findings. The resiliency options for the key findings associated with the CEI Hub are as follows:

- Finding # 1 Resilience Options:
  - Emergency agencies should incorporate information about types and volumes of river commerce into existing recovery planning as an appendix to existing state recovery plans for Oregon and Washington.
  - Washington and Oregon State agencies should work with the U.S. Army Corps of Engineers and the Coast Guard to identify federal, state, local, and private sector resources to assist with waterway recovery (dredging, salvage, and transport vessels).
  - Restoration of channel navigation may be gradual and initially not sufficient to support all demands for passage. The Coast Guard and private industry should institute a study to develop specific guides for priority of service.
  - Mitigation measures such as seismic reinforcement of bridges and soil stabilization at port facilities might prevent CSZ earthquake damage that would otherwise take a long time to repair. Federal, state, and local agencies should build mitigation priorities into long-range planning, budgeting, and funding

requests. These agencies can encourage private terminal owners to install mitigation measures by providing information, scientific analysis, and grants or tax incentives.

- Finding # 2 Resilience Options
  - Emergency management and energy agencies should coordinate with industry associations to assist private sector owners and operators of petroleum and transportation assets to incorporate industry-specific resilience guidance and analysis into business continuity plans.
  - Government emergency planners in Idaho, Oregon, and Washington should use existing cross-jurisdictional planning coalitions, such as the Cascadia Region Earthquake Workgroup, in developing regional CSZ earthquake response plans that address petroleum fuel supply.
  - State energy planning agencies should facilitate collaboration between private petroleum supply chain components and regional, state, and local agencies to help facility owners understand the need for seismic vulnerability assessments and amend their contingency plans to address both infrastructure hardening and alternate supply chain pathways.
  - Emergency management, energy, and regulatory agencies should coordinate with federal authorities and private sector petroleum and transportation infrastructure owners and operators to develop a comprehensive listing of waivers from regulatory requirements that may be necessary so that private sector fuel supply contingency plans can be implemented successfully. Agencies should develop a process to facilitate securing the waivers.
  - State emergency management agencies, FEMA, and the private sector should investigate mitigation actions for regional petroleum supply chain choke points, including identifying alternative transportation modes and paths and alternate storage and dispensing facilities. Potential impacts related to those alternate supply chain strategies should be assessed, including alternative energy supplies and communication modes.

- Finding # 5 Resilience Options
  - The Great Northern Corridor Coalition promotes regional cooperation, planning, and shared project implementation for moving freight in a multistate rail and road freight corridor. Idaho, Oregon and Washington emergency management agencies should join the coalition to help ensure that emergency planning for a CSZ earthquake is considered for improvements being proposed.
  - The Transportation Security Administration, the Federal Railroad Administration, the Association of American Railroads, and the American Short Line and Regional Railroad Association should investigate the availability of railcars, including confirming the number of covered hoppers and tank cars that could be made available from major carriers and smaller railroads.
  - State rail programs could incorporate the impacts of congestion and resilience into future infrastructure planning for a CSZ earthquake.

- Finding #6 Resilience Option
  - State public utility agencies and electric providers need to coordinate restoration of electricity in less earthquake-damaged areas where otherwise unaffected infrastructure critical to alternative transportation options for fuel and grain products have been identified.
  - State public utility agencies and energy planners should collaborate with electric utilities to determine how established best practices could strengthen the regional grid to help mitigate the impacts of a CSZ earthquake. State energy planners should consider changes to response and recovery plans that can facilitate a utility's recovery and review energy assurance plans and emergency operation plans to ensure they address wide-scale electric outages and actions to mitigate impacts and restore the grid.
  - State public utility agencies, electric providers work and the Western Electricity Coordinating Council should study how to gauge recovery and restoration needs after a CSZ earthquake and

develop a regional strategy that inventories electric infrastructure resilience and hardening mitigation projects for all at-risk electrical equipment.

Overall Recommendations

The following overall resilience options are recommended:

- Community infrastructure improvement planning—Resilience measures can be incorporated into community land use or transportation planning.
- Structured approach to risk management—Effective risk management employs approaches to prevent or mitigate the effects of hazards that are likely to cause harm. Many government and industry partners use risk management models that can be applied to critical infrastructure.
- Emergency preparedness plans and exercises—The inclusion of infrastructure restoration activities in plans and exercises can enhance infrastructure resilience.
- Vulnerability identification—Analyzing the vulnerabilities of critical infrastructure enables critical infrastructure partners to take action to mitigate risks.

3.3 CITY OF PORTLAND LOCAL ENERGY ASSURANCE PLAN

3.3.1 Synopsis

The City of Portland Local Energy Assurance Plan was developed to prepare for energy disruptions. Participating stakeholders looked at Portland's reliance on energy and the vulnerability of the energy supply, and developed recommendations to address future energy disruptions. The Portland LEAP links to the Oregon State Energy Assurance Plan, Portland's Hazard Mitigation Plan, the Portland Urban Area's Critical Infrastructure Protection Plan, the city's Climate Action Plan and the recommendations of the Portland Peak Oil Task Force. Two documents were produced:

- An energy emergency plan for the City of Portland (the Energy Annex) describing the roles of emergency response agencies, energy providers and distributors, and the community. The Energy Annex provides a framework to guide the City's response during an energy disruption. The City's response priorities are life safety, incident stabilization, environmental protection and property conservation. Priority is given to provide emergency assistance to vulnerable populations. When the energy supply is disrupted, the City will work collaboratively with critical infrastructure owners and operators to help get facilities back online as quickly as possible. The City's efforts may include helping utilities access and secure their sites, facilitating damage assessments, debris removal, and reopening roads.
- An improvement plan with recommendations to guide next steps.

The Portland LEAP used the following earthquake scenario for planning purposes:

- **What**: Cascadia Subduction Zone earthquake with a magnitude of 8.0 in Portland.
- **Where:** The earthquake occurs 90 miles west of Portland.
- **When**: Noon on a Wednesday in November 2011.
- **Timeline:** 72 hours after the earthquake it is now Saturday.

3.3.2 Key Findings

The following are the key findings of the Portland LEAP process that are relevant for this study:

- **The importance of coordination between the public and private sectors**—Coordination between the City of Portland, energy utilities and industries will be paramount during an energy emergency. During a

major energy disruption, utilities will need help from emergency responders to gain access to their sites. Site access, transportation and debris removal for utility crews and emergency response workers will be critical to restoring power in a timely manner.

- **Coordination between local jurisdictions and state agencies can be improved**—There is little understanding in the Portland area of the Oregon Department of Energy's Oregon Petroleum Contingency Plan and minimal awareness of the Fuel Allocation Program. Priority groups identified in the Oregon Department of Energy's plan may not correspond to local government, business and industry priorities.

3.3.3 Recommendations

Recommendations were identified to help the region better prepare for a major energy disruption and build a resilient community. The following are most relevant to the CEI Hub study:

- **Formalize the relationship between the public and private sectors**—A formal public and private sector partnership of energy providers, distributors, energy users and state agencies, including the Public Utility Commission, is needed to strengthen preparations for a major energy disruption. This could better define roles, responsibilities, priorities, technology and protocols for communication between the City of Portland, energy utilities and industries in Portland's Northwest Industrial Area.

  - **Objective**—Work with the PUC and private sector energy providers to formalize a liaison position to the City's Emergency Coordination Center by December 2013.

- **Ensure that the energy assurance plan is used in development of bureau-specific and citywide continuity of operations plans and utility asset management plans**—Align findings from the energy assurance plan with energy profiles of essential facilities to ensure they are adequate to meet emergency needs.

  - **Objective**— By December 2014, ensure that all city bureaus have updated their continuity of operations plans to take into account their energy profile, internal and external interdependencies, necessary service restoration resources, and contingency plans. Work with private sector utilities to evaluate expected lengths of time to resume utility service after a Cascadia earthquake.

- **Certify more damage assessment teams**—The City should work with utilities to coordinate and train more post-earthquake damage assessment teams. This will give utilities the ability to assess their own facilities without relying on city damage assessment teams.

  - **Objective**—Conduct at least two Applied Technology Council post-earthquake damage assessment trainings (ATC-20) for 80 structural engineers, architects and inspectors to serve on damage assessment teams by September 2013.

- **Improve the process for emergency notifications**—Continue to improve the communication process between utilities, government and emergency response agencies and the public.

  - **Objective**—Work with utilities to formalize a process to communicate the impacts of planned and unanticipated outages and restoration actions with potentially affected customers, government and emergency response agencies and the public via a centralized website, by June 2013.

- **Conduct drills**—A regional practice drill should be performed with public and private partners. The exercise should focus on several possible disruptions to the energy system and demonstrate the need for energy resource options (i.e. renewable, petroleum, natural gas and electricity).

  - ➢ **Objective**—Plan a series of table top and functional exercises that test elements of the Energy Annex by September 2014 and use lessons learned to update the Energy Annex.

- **Recommend changes to the Oregon Department of Energy's Fuel Allocation Program**—When the Oregon Department of Energy implements its Fuel Allocation Program, end users are prioritized into three tiers. Tier 1 includes emergency services sectors (law enforcement, fire, EMS) and Tier 2 includes essential services (public works, transit, telecommunications, utilities). Because emergency vehicles cannot use roads heavily strewn with debris, debris removal operations should be performed early.

  - ➢ **Objective**—Work with the Oregon Department of Energy to consider accommodating certain essential functions, including debris management, as part of the Tier 1 Fuel Allocation Program.

3.4 THE ENERGY CLUSTER IN LINNTON

3.4.1 Synopsis

This 2005 report investigated the importance of the CEI Hub (referred to in the report as the Linnton Energy Cluster) to the Northwest region as a whole. It evaluated conditions that contribute to a healthy climate for the energy cluster and how potential land use changes could negatively impact those conditions. The report was prepared by Phillip E. Grillo of Miller Nash LLP for the Olympic Pipeline Company, BP West Coast Products LLC, and Kinder-Morgan Energy Partners, L.P. A principle source document was the City of Portland 2004 Industrial District Atlas.

3.4.2 Key Findings

The following are the key findings of the Linnton Energy Cluster report that are relevant for this study:

- Three property owners own 78.5 percent of the 69.3-acre study area.
- The convergence of freight infrastructure and all the logistical investments that support it have led to a highly efficient and highly regulated petroleum transportation and distribution network.
- The area has the characteristics of an "industry cluster"—a group of firms that are geographically close and share common markets and technologies and draw on similar worker skills and facilities. These clusters can draw competitive advantages from the investment of labor, facilities and other assets that accumulate in certain places, forming a concentration of employees, facilities and service. This can create strong buyer-supplier relationships.
- The zoning in the study area as of 2004 was ideally suited for energy cluster use.
- As a matter of policy, the study area has been preserved for all kinds of industry, especially heavy industries that cannot be located in other portions of the City.
- Protection of the study area for conflicting uses is important to Oregon's economy.
- The study area is subject to earthquakes, landslides, flooding and wildfire.
- There is only one way in and out of the study area—Highway 30—and there is a lack of alternate access.
- Increasing the population in the study area could lead to increased security concerns within the cluster.
- The potential impacts from a tank fire are significant. Studies estimate significant injury would be experienced within 60 seconds at a distance of 695 feet from the fire source.

3.4.3 Conclusions

The report concluded that the energy cluster is vital to the economy of the state and the region and should not be compromised by placing new residential uses nearby. It found that, over time, industries came to be located in the energy cluster because of the convergence of freight infrastructure and other favorable site conditions. The

introduction of new residential uses in the area would make it significantly more difficult and risky for the energy cluster to operate and would make it virtually impossible for the cluster to grow.

3.5 PORT OF PORTLAND CORPORATE SEISMIC RISK ASSESSMENT

3.5.1 Synopsis

The Port of Portland conducted a seismic risk assessment of high-value Port assets with the following goals:

- Evaluate the performance of the assets under the effects of an earthquake.
- Identify improvements that would enhance the ability to avoid damage from an earthquake.
- Estimate benefits of such improvements in comparison to cost of implementation.

The seismic risk assessment included the following elements:

- Identify a list of key Port aviation and marine assets to consider.
- Assess the seismic fragility of the identified assets, considering several earthquake magnitudes.
- Estimate duration of service loss or downtime.
- Estimate costs of repair or replacement.
- Estimate economic losses to the Port and to the region resulting from business interruptions.
- Identify potential mitigation actions for selected assets.
- Develop order-of-magnitude estimates of cost for the actions.
- Conduct benefit-cost analyses of potential mitigation actions.
- Identify specific mitigation projects for further study and analysis, potentially leading to incorporation into the Port's capital improvement program.

The only Port facility assessed in this report within the CEI Hub was Marine Terminal # 4, the Kinder-Morgan Berths 410 and 411. The following discussion pertains only to facilities within the CEI Hub.

3.5.2 Key Findings

The following are the key findings of the Port of Portland report that are relevant for this study:

- Berth 410 was constructed in 1962; Berth 411 was constructed in 1959.
- Design capacity for the lateral systems is approximately 30 percent of current code design forces.
- Berth 410 is constructed primarily of timber elements, and Berth 411 is constructed of concrete elements. However, the performance of the two berths is expected to be similar.
- The structures would likely survive a 72-year return period seismic event with repairable damage.
- A 475-year return period seismic event would induce significant soil liquefaction, causing large lateral soil displacements that would result in excessive forces on structural elements. The facilities would not survive the 475-year event.

3.5.3 Recommendations

Benefit-cost ratios for mitigation actions are shown in Table 3-1. The benefit-cost analysis for the potential retrofit mitigation actions at all of the marine facilities evaluated, except Terminal 4 (Berths 410/411), shows benefit-cost ratios greater than 1 considering Port and regional economic impacts.

Table 3-1. Terminal Mitigation Action Benefit/Cost Ratios

Marine Terminal#	Estimated Cost of Mitigation	Benefit/Cost Ratio
#4 (Berths 410 and 411)	$42 million	0.77
#5 (Berth 501)	$20 million	3.47
#5 (Berth 503)	$13 million	1.77
#6 (Berth 601)	$5 million	2.85
#6 (Berths 604/605)	$15 million	2.24

For Terminal 4 (Berths 410/411), the cost of facility replacement and the time out of service take the benefit/cost ratio of retrofit mitigation below 1. The report concluded that, given the age of these facilities and the cost of improvements that would be needed to achieve survivability for the 475-year earthquake, the only mitigation action that would be economically feasible is to replace the berths with a modern facility. It is expected that replacing the two berths with a single combined facility would be the preferred approach. The report's order-of-magnitude estimate of cost for a combined replacement facility was $42 million.

The following are additional general recommendations from the report:

- Evaluate the benefit of designing each new project for greater seismic resilience than required by building code. Considering that code requirements for seismic design forces are based on life safety and collapse prevention, not on property preservation or operational continuity, structures designed to code cannot be expected to maintain uninterrupted functionality after a major earthquake.
- Identify and evaluate mitigations for other key Port assets. This study identified and evaluated potential mitigation actions for only a limited number of the Port's key assets. A similar effort should be undertaken for other assets considered critical for the Port's functions.
- Broaden future seismic risk assessment efforts to include non-Port critical assets and lifelines, in coordination with other agencies and with utility owners.
- Confirm the plan for Port emergency operations and recovery. Immediate occupancy after a significant ground motion should not be expected for any Port facility, as it currently exists. The Port should assess the current emergency response plan to ensure there is an allowance for the probable temporary unavailability of existing Port facilities.

4. RISK ASSESSMENT

Risk assessment is the process of measuring the potential loss of life, personal injury, economic injury, and property damage resulting from natural hazards. It allows emergency management personnel to establish response priorities by identifying potential hazards and vulnerable assets. The process focuses on the following elements:

- Vulnerability identification—Determine the impact of natural hazard events on the people, property, environment, economy and lands of the region.
- Cost evaluation—Estimate the cost of potential damage or cost that can be avoided by mitigation.

4.1 HAZARDS OF CONCERN

For this study, the study area was assessed for the hazards of concern identified by the oversight Steering Committee for the update of the City of Portland Hazard Mitigation Plan. The following hazards of concern are relevant in particular to the CEI Hub:

- Earthquake
- Flood
- Landslide
- Severe weather
- Volcanic activity
- Wildfire.

Detailed citywide assessments of all of these hazards of concern, as well as the dam failure hazard, which is not relevant for the CEI Hub, can be found in the 2016 City of Portland Hazard Mitigation Plan.

4.2 RISK ASSESSMENT METHODOLOGY

Risk assessments generally include exposure and vulnerability information for people, property, the environment and the economy. These factors are addressed in more detail for each hazard of concern in the 2016 City of Portland Hazard Mitigation Plan. For this study, the focus is on property; specifically, the facilities operating in the CEI Hub. The exposure and vulnerability of people, the environment and the economy are discussed only if impacts on CEI Hub facilities would result in secondary impacts on people, the environment or the economy. This is a high-level study based on the best available data, technology and industry best management practices available at the time of the study.

Sections 4.3 to 4.10 of this report provide summaries of each hazard, the scenarios assessed, and exposure and vulnerability evaluations for all CEI Hub facilities for which data was available. Not all CEI Hub stakeholders participated in this study. For facilities for which data was not available, the planning team made modeling assumptions that may understate the risk.

4.2.1 Mapping

A review of national, state and local databases was performed to locate spatially based data relevant to this planning effort. Maps were produced using geographic information system (GIS) software to show the extent and location of identified hazards when such data was available.

4.2.2 Earthquake and Flood—Hazus-MH

Overview

In 1997, FEMA developed the Hazards U.S., or Hazus, model to estimate losses caused by earthquakes. Hazus was later expanded into a multi-hazard model, Hazus-MH, able to estimate potential losses from hurricanes and floods. Hazus-MH is a GIS-based program used to support risk assessments, mitigation planning, and emergency planning and response. It provides a wide range of inventory data, such as demographics, building stock, and transportation and utility facilities. The program maps and displays hazard data and estimates damage and economic loss for buildings and infrastructure. Its advantages include the following:

- It provides a consistent methodology for assessing risk across geographic and political entities.
- It provides a way to save data so that it can readily be updated as population, inventory, and other factors change and as mitigation-planning efforts evolve.
- It facilitates the review of mitigation plans because it incorporates FEMA methodologies.
- It supports grant applications by calculating benefits using FEMA definitions and terminology.
- It produces hazard data and loss estimates that can be used in communication with local stakeholders.
- It is administered by the local government and can be used to manage and update a hazard mitigation plan throughout its implementation.

Levels of Detail for Evaluation

Hazus-MH provides default data for building and infrastructure inventory, vulnerability and hazards; this default data can be supplemented with local data to provide a more refined analysis. The model can carry out three levels of analysis, depending on the format and level of detail of information about the study area:

- **Level 1**—All of the information needed to produce an estimate of losses is included in the software's default data. This data is derived from national databases and describes in general terms the characteristic parameters of the study area.
- **Level 2**—More accurate estimates of losses require more detailed information about the study area. To produce Level 2 estimates of losses, detailed information is required about local geology, hydrology, hydraulics and building inventory, as well as data about utilities and critical facilities. This information is needed in a GIS format.
- **Level 3**—This level of analysis generates the most accurate estimate of losses. It requires detailed engineering and geotechnical information to customize it for the study area.

Comprehensive Data Management System

The Comprehensive Data Management System is a complementary tool to Hazus-MH that provides users with the ability to update and manage statewide datasets, which are currently used to support analysis in Hazus-MH. Currently, Hazus-MH users are required to undertake a large amount of manual effort to incorporate new data into the statewide datasets according to their pre-defined formats. To reduce this effort, CDMS streamlines and automates raw data processing, the conversion of external data sources into Hazus-MH compliant data and the transfer of data into and out of the statewide datasets.

Application for This Study

Hazus-MH (Version 2.1) was used to assess risk for the earthquake and flood hazards for this study. The following methods were used:

- **CDMS essential facility update**—The CDMS extension to Hazus-MH was used to update the inventory of assets analyzed for this study. Data provided by the participating CEI Hub stakeholders was formatted for importation into the CDMS platform for analysis. The planning team developed a CDMS data-capture form and accompanying instructions that were distributed to all participating stakeholders. The data-capture form was set up to collect up to 24 attributes on each facility in the CEI Hub to support the earthquake and flood analyses. For attributes not provided by CEI Hub stakeholders, Hazus default values were used. Each facility inventoried was assigned one of eight Hazus occupancy class designations, defined as shown in Table-4-1.
- **Earthquake**—A Level 2 analysis was conducted. Earthquake shake maps and probabilistic data prepared by the U.S. Geological Survey (USGS) were used for the analysis of this hazard. This data was augmented by National Earthquake Hazard Reduction Program soils, liquefaction susceptibility, and landslide susceptibility data provided by DOGAMI. An updated inventory of essential facilities, transportation and utility features was used in place of the Hazus-MH defaults.
- **Flood**—A Level 2 analysis was conducted. An updated inventory was used in place of the Hazus-MH defaults for essential facilities, transportation and utilities. Current study area digital Flood Insurance Rate Map information from FEMA was used to delineate flood hazard areas and estimate potential losses from the 10-year, 100-year, and 500-year flood events. Using the FEMA floodplain boundaries and the City of Portland 3-foot digital elevation model, flood depth grids were generated and integrated into the Hazus model.

Table-4-1. Hazus Occupancy Class Definitions

Facility Categories	Facility Types
Emergency Services	Emergency operation centers, fire, police, medical
Transportation Systems	Ports, airports, bridges, tunnels, rail, bus
High Potential Loss Facilities	Dams, hazardous materials, military, nuclear
Electric Power Facilities	Sub-stations, major power lines
Natural Gas Facilities	Major gas lines
Petroleum Facilities	Tank farms
Potable Water	Pump stations, wells, tanks, reservoirs, essential pipelines
Wastewater	Pump stations, treatment plants, pipelines

4.2.3 Landslide, Severe Weather, Volcanic Activity and Wildfire

For landslide, severe weather, volcano and wildfire, historical data was not adequate to model future losses. However, geospatial analysis can be used to map hazard areas and calculate exposures if geographic information is available on the locations of the hazards and inventory data. Areas and inventory susceptible to some of the hazards of concern were mapped and exposure was evaluated. For other hazards, a qualitative analysis was conducted using the best available data and professional judgment. Locally relevant information was gathered from a variety of sources. The primary data source was the City of Portland GIS database, augmented with state and federal data sets. Additional data sources for specific hazards were as follows:

- **Landslide**—Two data sets were used to support the landslide risk assessment:
  - City of Portland regulatory landslide hazard areas—This dataset was created from three sources: Areas mapped as earthquake hazard areas by Metro, areas delineated as zones of high landslide

potential by Portland State University based on study of hundreds of landslides during storms in February 1996, and areas in the City with slopes of 15 percent or greater.
  - DOGAMI historical landslide deposits.

- **Volcano**—Volcanic hazard data was obtained from the USGS Cascade Volcano Observatory.
- **Wildfire**—Wildland fire hazard data was provided by the City of Portland.

4.2.4 Sources of Data Used in Hazus Modeling

Table-4-2 summarizes the Hazus-MH model data sources for this study.

4.2.5 Limitations

Uncertainties are inherent in loss estimation, partly due to incomplete scientific knowledge concerning natural hazards and their effects on the built environment. Uncertainties for this study also result from the following:

- Approximations and simplifications necessary to conduct a study.
- Incomplete or outdated inventory, demographic or economic parameter data.
- The unique nature, geographic extent and severity of each hazard. For example, in the current Hazus-MH model, the maximum duration of shaking during an earthquake event is 1 minute. It is anticipated that shaking may last for 3 minutes or longer during a Magnitude-9.0 Cascadia event.
- Mitigation measures already employed.
- The amount of advance notice residents have to prepare for a specific hazard event.
- The fact that not all hazards of concern have readily available modeling platforms.

These factors can affect loss estimates by a factor of two or more. Therefore, potential exposure and loss estimates are approximate and should be used only to understand relative risk.

Hazus-MH currently represents the industry best management practice for assessing risk in support of hazard mitigation planning. However, Hazus and other models used for this risk assessment are limited by the availability of data to support their working components. Such models must make assumptions where firm data are not available. Assumptions are used, for example, to estimate ground deformation caused by liquefaction. These model limitations can lead to an understatement or overstatement of risk. Further, the Hazus-MH model employs a "lower bound" analysis, intended to demonstrate cost-effectiveness at the lowest level of expected impact.

Despite their limitations, risk assessment techniques are able to indicate the possible extremes of hazard events. Their findings should be recognized as identification of potential hazard occurrences rather than as predictions of probable hazard events.

4.3 EARTHQUAKE RISK ASSESSMENT

4.3.1 Hazard Profile

This report provides a summary profile of the earthquake hazard in the City of Portland. The 2016 City of Portland Hazard Mitigation Plan and the following additional resources provide discussions that are more detailed:

- Earthquake Risk Study for Oregon's Critical Energy Infrastructure Hub (DOGAMI, 2013)
- Cascadia Subduction Zone Earthquakes: A Magnitude 9.0 Earthquake Scenario (Cascadia Region Earthquake Workgroup, 2013).

Faults Affecting the Study Area

Many earthquake faults capable of producing damaging earthquakes exist in the area of the CEI Hub. The most threatening fault is the Cascadia Subduction Zone fault, which lies just offshore of the Oregon coast. The CSZ fault has produced over 40 large magnitude earthquakes during the past 10,000 years, most recently on January 26, 1700. Based on the 10,000-year record of past Cascadia earthquakes, Oregon will certainly experience another Magnitude 8 – 9 earthquake (Goldfinger et al. 2012). A Magnitude 9 CSZ earthquake has a likelihood as high as 14 percent in the next 50 years (USGS, 2008), although probabilities are likely higher for smaller segments along the fault to break (Goldfinger et al. 2012). A large earthquake on this fault, which has the same type of subduction zone process as the 2011 Magnitude 9 earthquake in Japan, will be accompanied by a coastal tsunami.

The Portland Hills fault is located in the CEI Hub area and can produce a Magnitude 7 earthquake (USGS, 2008). The likelihood of this earthquake occurring is approximately 1 percent in the next 50 years (USGS, 2016).

Earthquake Damage

Earthquakes can last from a few seconds to over 5 minutes. They may occur as a single event or a series of tremors over several days. The actual movement of the ground in an earthquake is seldom the direct cause of injury or death. Casualties generally result from falling objects and debris because the shocks damage or demolish structures. Disruption of communications, electrical power supplies and gas, sewer and water lines should be expected. Earthquakes may trigger fires, landslides or releases of hazardous material, compounding their disastrous effects. Hazardous materials releases can occur during an earthquake from fixed facilities or transportation-related incidents. During an earthquake, structures storing these materials could rupture and leak into the surrounding area or an adjacent waterway, having a disastrous effect on the environment.

The following are the primary seismic characteristics that would impact the CEI Hub area:

- Ground shaking
- Liquefaction (soil behavior phenomenon in which a saturated sand softens and loses strength during strong earthquake ground shaking)
- Lateral spreading (where surficial soil permanently moves laterally due to earthquake shaking)
- Landslides
- Co-seismic settlement (where the ground surface is permanently lowered due to seismic shaking)
- Bearing capacity failures (when the foundation soil cannot support the structure it is intended to support).

Liquefaction and lateral spreading hazards are of primary concern to the waterfront fuel supply facilities. The impact of an earthquake is based on its magnitude as well as its distance from a community. Local faults can produce lower magnitude quakes that result in strong ground shaking and extensive damage because they are nearby. In contrast, large regional faults can generate earthquakes of great magnitudes that, because of their distance and depth, may result in only moderate shaking in an area.

Seismic Mapping

Shake Maps

A shake map is a map of ground shaking produced by an earthquake. The information it presents is different from the earthquake magnitude and epicenter that are released after an earthquake; shake maps focus on the ground shaking resulting from the earthquake, rather than the parameters describing the earthquake source. An earthquake has only one magnitude and one epicenter, but it produces a range of ground shaking at sites throughout the region, depending on the distance from the earthquake, the rock and soil conditions at sites, and variations in the propagation of seismic waves from the earthquake due to complexities in the structure of the earth's crust. A shake map shows the extent and variation of ground shaking immediately after significant earthquakes.

Ground motion and intensity maps are derived from peak ground motion amplitudes recorded on seismic sensors (accelerometers), with interpolation based on estimated amplitudes where data are lacking, and site amplification corrections. Two types of shake map are typically generated from the data:

- A probabilistic seismic hazard map shows the hazard from earthquakes that geologists and seismologists agree could occur. The maps are expressed in terms of probability of exceeding a certain ground motion, such as the 10-percent probability of exceedance in 50 years. This level of ground shaking has been used for designing buildings in high seismic areas. The standard Hazus analysis for the 100- and 500-year probabilistic events were modeled for this study.
- Earthquake scenario maps describe the expected ground motions and effects of hypothetical large earthquakes for a region. Two scenarios were chosen for this plan:
  - Scenario Earthquake 1—A Magnitude-9.0 event on the Cascadia Subduction Zone Fault with an epicenter at 45.7329° N, 125.125° W (67 miles west of Tillamook) and a focal depth of 20 km.
  - Scenario Earthquake 2—A Magnitude-6.5 event on the Portland Hills Fault with an epicenter at 45.5544° N, 122.798° W (Forest Park, Portland, OR) and a focal depth of 0 km.

National Earthquake Hazards Reduction Program Soil Maps

Soil classifications under the National Earthquake Hazards Reduction Program (NEHRP) help to identify locations that will be significantly impacted by an earthquake. NEHRP Soils B and C typically can sustain low-magnitude ground shaking without much effect. The areas that are most commonly affected by ground shaking have NEHRP Soils D, E and F. Mapped NEHRP Soils in the CEI Hub Study Area are shown on Figure 4-1.

Liquefaction

Figure 4-2 shows the mapped liquefaction hazard areas within the study area.

4.3.2 Exposure

Population

The entire population of the study area is exposed to direct and indirect impacts from earthquakes. This includes people who live in Linnton Neighborhood within the CEI Hub study area and people who work in the CEI Hub.

Property

All facilities in the study area are exposed to the earthquake hazard.

Environment

Secondary hazards associated with earthquakes will likely have impacts on the environment in the study area.

4.3.3 Vulnerability

Population

The vulnerability of people in the study area depends on factors such as the age and construction type of the structures people live and work in, the soil type these facilities are constructed on, their proximity to the fault, etc. Whether directly impacted or indirectly impact, the entire population will have to deal with the consequences of earthquakes to some degree. Business interruption could keep people from working, road closures could isolate populations, and loss of functions of utilities could impact populations that suffered no direct damage from an event itself. These impacts would not be unique to the CEI Hub, but would be felt city-wide.

It is logical to assume, but difficult to model, secondary impacts from the CEI Hub facilities on population centers in the City after a major earthquake. The secondary impacts could include but are not limited to: reduction in air quality from fires and fume emissions from CEI Hub containment facilities that experience failures from seismic activity, environmental impacts from product entering the Willamette River, and isolation due to road and bridge failure. These impacts could be significant and would tax the response capability of the City.

Property

Level of Damage

Hazus-MH classifies the vulnerability of critical facilities to earthquake damage in five categories: no damage, slight damage, moderate damage, extensive damage, or complete damage. The definitions for each of these damage categories varies based upon the occupancy class of the facility, as shown in Table-4-3. The model was used to assign a vulnerability category to each defined facility in the study area.

The damage analysis was performed for the 100- and 500-year probabilistic events, the Magnitude 9.0 Cascadia Subduction Zone scenario event, and the Magnitude 6.5 Portland Hills fault scenario event. The results are summarized in Table-4-4 through Table-4-7.

Time to Return to Functionality

Hazus-MH estimates the time to restore critical facilities to fully functional use. Results are presented as probability of being functional at specified time increments: 1, 3, 7, 14, 30 and 90 days after the event. For example, Hazus-MH may estimate that a facility has 5 percent chance of being fully functional at Day 3, and a 95-percent chance of being fully functional at Day 90. In this methodology, loss of function is defined as the time that a facility is not capable of conducting business. This, in general, will be shorter than repair time, because businesses will rent alternative space while repairs and construction are being completed.

The functionality analysis of CEI Hub facilities was performed for the 100- and 500-year probabilistic events, the Magnitude 9.0 Cascadia Subduction Zone scenario event, and the Magnitude 6.5 Portland Hills fault scenario event. The results are summarized in Table-4-8 through Table-4-11.

Environment

The environment vulnerable to earthquake hazard is the same as the environment exposed to the hazard. Groundwater supplies and adjacent water courses could be contaminated by spillage from storage tanks. Air quality could be significantly compromised by fires started due to secondary impacts from seismic events. Earthquake-induced landslides can significantly impact surrounding habitat. It is also possible for streams to be rerouted after an earthquake. This can change the water quality, possibly damaging habitat and feeding areas. There is a possibility of streams fed by groundwater drying up because of changes in underlying geology.

Table-4-3. Damage State Definitions by Occupancy Class

Classification	Description
Emergency Services and High Potential Loss	
Slight	Small cracks at corners of door and window openings and wall-ceiling intersections; small cracks on stucco and plaster walls. Some slippage may be observed at bolted connections.
Moderate	Larger cracks at corners of door and window openings; small diagonal cracks across shear wall panels exhibited by cracks in stucco and gypsum wall panels; minor slack (less than 1/8" extension) in diagonal rod bracing requiring re-tightening; minor lateral set at store fronts and other large openings; small cracks or wood splitting may be observed at bolted connections.
Extensive	Large diagonal cracks across shear wall panels; large slack in diagonal rod braces and/or broken braces; permanent lateral movement of floors and roof; cracks in foundations; splitting of wood sill plates and/or slippage of structure over foundations; partial collapse of "soft-story" configurations; bolt slippage and wood splitting at bolted connections.
Complete	Structure may have large permanent lateral displacement, may collapse or be in imminent danger of collapse due to failed shear walls, broken brace rods or failed framing connections; it may fall its foundations; large cracks in the foundations. Approximately 3% of the total area of W2 buildings with complete damage is expected to be collapsed.
Transportation Systems	
Slight	Slight settlement (few inches) or offset of the ground. Minor cracking and spalling.
Moderate	Moderate settlement (several inches) or offset of the ground. Support features experiencing moderate (shear cracks) cracking and spalling (column structurally still sound), moderate movement of the abutment (<2"), extensive cracking and spalling of shear keys, any connection having cracked shear keys or bent bolts, keeper bar failure without unseating, rocker bearing failure or moderate settlement of the approach.
Extensive	Major settlement of the ground (few feet). Support features degrading without collapse—shear failure - (column structurally unsafe), significant residual movement at connections, or major settlement approach, vertical offset of the abutment, differential settlement at connections, shear key failure at abutments.
Complete	Major settlement of the ground. Support features collapsing and connection losing all bearing support, which may lead to imminent deck collapse, tilting of substructure due to foundation failure.
Electric Power	
Slight	Failure of 5% of the disconnect switches (i.e., misalignment), or the failure of 5 % of the circuit breakers (i.e., circuit breaker phase sliding off its pad, circuit breaker tipping over, or interrupter-head falling to the ground), or by the building being in minor damage state. Turbine tripping, or light damage to diesel generator, or by the building being in minor damage state.
Moderate	Failure of 40% of disconnect switches (e.g., misalignment), or 40% of circuit breakers (e.g., circuit breaker phase sliding off its pad, circuit breaker tipping over, or interrupter-head falling to the ground), or failure of 40% of current transformers (e.g., oil leaking from transformers, porcelain cracked), or by the building being in moderate damage state. chattering of instrument panels and racks, considerable damage to boilers and pressure vessels, or by the building being in moderate damage state
Extensive	Failure of 70% of disconnect switches (e.g., misalignment), 70% of circuit breakers, 70% of current transformers (e.g., oil leaking from transformers, porcelain cracked), or by failure of 70% of transformers (e.g., leakage of transformer radiators), or by the building being in extensive damage state. Considerable damage to motor driven pumps, or considerable damage to large vertical pumps, or by the building being in extensive damage state.
Complete	Failure of all disconnect switches, all circuit breakers, all transformers, or all current transformers, or by the building being in complete damage state. Extensive damage to large horizontal vessels beyond repair, extensive damage to large motor operated valves, or by the building being in complete damage state.
Natural Gas	
Slight	Slight damage to building.
Moderate	Considerable damage to mechanical and electrical equipment, or considerable damage to building
Extensive	Building being extensively damaged, or the pumps badly damaged beyond repair.
Complete	Building in complete damage state.
Petroleum	
Slight	Malfunction of plant for a short time (less than three days) due to loss of backup power or light damage to tanks.
Moderate	Malfunction of tank farm for a week or so due to loss of backup power, extensive damage to various equipment, or considerable damage to tanks.

Classification	Description
Extensive	Tanks extensively damaged, or extensive damage to elevated pipes.
Complete	Complete failure of all elevated pipes, or collapse of tanks.
Potable Water	
Slight	Malfunction of facility for a short time (less than three days) due to loss of electric power and backup power if any, considerable damage to various equipment, light damage to sedimentation basins, light damage to chlorination tanks, or light damage to chemical tanks. Loss of water quality may occur. Tanks suffering minor damage without loss of its contents or functionality. Minor damage to the tank roof due to water sloshing,
Moderate	Malfunction of facility for about a week due to loss of electric power and backup power if any, extensive damage to various equipment, considerable damage to sedimentation basins, considerable damage to chlorination tanks with no loss of contents, or considerable damage to chemical tanks. Loss of water quality is imminent. Storage tanks being considerably damaged, but only minor loss of content. Elephant foot buckling for steel tanks without loss of content, or moderate cracking of concrete tanks with minor loss of contents.
Extensive	Damage will likely result in the shutdown of the facility. Buildings extensively damaged, or the pumps being badly damaged beyond repair. Storage tanks being severely damaged and going out of service. Elephant foot buckling for steel tanks with loss of content, stretching of bars for wood tanks, or shearing of wall for concrete tanks fits the description of this damage state.
Complete	Complete failure of all piping, or extensive damage to the filter gallery. Total building collapse. Storage tanks collapsing and losing all of its content.
Wastewater	
Slight	Malfunction of facility for a short time (less than three days) due to loss of electric power and backup power if any, considerable damage to various equipment, light damage to sedimentation basins, light damage to chemical tanks. Loss of water quality may occur.
Moderate	Malfunction of facility for about a week due to loss of electric power and backup power if any, extensive damage to various equipment, considerable damage to sedimentation basins, considerable damage to chemical tanks with no loss of contents. Loss of water quality is imminent.
Extensive	Damage will likely result in the shutdown of the facility. Buildings extensively damaged, or the pumps being badly damaged beyond repair.
Complete	Complete failure of all piping's, or extensive damage to the filter gallery. Total building collapse.

4.3.4 Key Findings

Important findings associated with an earthquake include to the following:

- It is assumed that the modeling results of this analysis are understated due to incomplete data sets. There is a heavy reliance on default level data in the modeling for this study in lieu of the data that was not available from CEI Hub stakeholders. The accuracy of the modeling would be significantly enhanced if key data attributes that help estimate damage in the Hazus-MH models could be provided. Further, the Hazus-MH model employed a "lower bound" analysis, intended to demonstrate cost-effectiveness at the lowest level of expected impact.
- The vast majority of the facilities in the study area are constructed on soft, liquefiable soils that are typically associated with increased seismic vulnerability. The soils and liquefaction data provided by DOGAMI significantly enhanced the results of this study.
- The facilities and infrastructure within the study area range from over 100 years old to new or recent construction. The new construction has been built to heightened code standards, while the older construction was built to little or no code standards. The majority of the facilities were constructed to low, or no code standards. Code construction standards are an important parameter in the modeling of seismic events.
- Models of the Cascadia Subduction Zone event show less damage than the Portland Hills Fault event due to proximity to the source. The CSZ event has an epicenter 67 miles west of the study area, while the Portland Hills fault scenario had an epicenter less than 5 miles west of the study area. The CSZ event would be considered the true worst-case scenario due to its higher probability of occurrence and likelihood of regional impact. For the model, USGS has assigned a 15 percent probability in 50 years for a CSZ event, versus a 1 percent probability in 50 years for the Portland Hills event. Additionally, seismologists estimate a CSZ event to last longer than 3 minutes, while estimates for a Portland Hills event are 60 seconds or less. Event duration can play a significant role in the amount of damage associated with seismic events.
- For a CSZ event, the Hazus-MH model estimated that a 42.6 percent chance that all facilities analyzed would experience "slight" damage. For a Portland Hills event, there is a 32.3 percent chance that all facilities would experience "moderate" damage. Both scenario events approximate at least a 500-year probabilistic event, based on a comparison of the Hazus-MH results.
- For the CSZ event, the Hazus-MH model estimated that the facilities analyzed would be 88.6-percent functional at Day 7 following the event, and that it would take more than 90 days to restore 100-percent functionality. For a Portland Hills Fault scenario, facilities would be 62.89-percent functional at Day 7, and only 88.3-percent functional at Day 90. These results correlate with the 500-year probabilistic model results.

- The focus of the Hazus-MH modeling for this study was the direct impact on facilities in the study area. The modeling does not take into account significant secondary impacts from a CSZ event, such as the loss of use of port facilities due to the impacts from a likely tsunami on the Columbia River, or the loss of transportation corridor access due to road and bridge failures outside the study area. These secondary impacts could be substantial, considering the reliance of the CEI Hub on port access for receipt of its inventory, and the road and bridge network. These are key points identified in other studies reviewed for this study.

4.4 FLOOD RISK ASSESSMENT

4.4.1 Hazard Profile

A floodplain is the area adjacent to a river, creek or lake that becomes inundated during a flood. Floodplains may be broad, as when a river crosses an extensive flat landscape, or narrow, as when a river is confined in a canyon. These areas form a complex physical and biological system that not only supports a variety of natural resources but also provides natural flood and erosion control. When a river is separated from its floodplain with levees and other flood control facilities, natural benefits can be lost, altered or significantly reduced.

The principle flooding sources for the study area are the Willamette River and any localized flooding associated with a lack of drainage infrastructure. The Willamette River drains 11,200 square miles in northwestern Oregon upstream of Portland. Intensive commercial and industrial development borders the Willamette River in Portland, with some residential development near the upstream corporate limits. Major facilities within the 100-year floodplain include terminal and warehouse facilities on the west bank downstream of the Broadway Bridge (including the CEI Hub), portions of the Union Pacific Railroad at the Albina Yard, and industries on the west bank near Ross Island Bridge.

The Willamette River typically floods during the spring, primarily as the result of backwater from the Columbia River. FEMA has established the following flood depths on the Willamette River at the Morrison Bridge:

- 25.5 feet (North American Vertical Datum) for the 10-year flood
- 30.2 feet for the 50-year flood
- 32.3 feet for the 100-year flood
- 37.2 feet for the 500-year flood event.

The peak recorded discharge on the Willamette River at USGS Gage # 14211720 was 283,000 cubic feet per second on January 18, 1974.

A detailed flood hazard profile for all of the City of Portland is provided in the 2016 City of Portland Hazard Mitigation Plan. While there are FEMA-mapped floodplains within the study area, they do not significantly impact the CEI Hub facilities.

4.4.2 Exposure

Property

Facilities in the Floodplain

Table-4-12 shows the number of facilities in the 10-, 100- and 500-year floodplains. All these facilities are in the emergency services, transportation, petroleum or electric power occupancy category. This analysis does not reflect the total exposure within the study area; it only reflects the exposure of facilities for which information was provided to the planning team by participating CEI Hub stakeholders.

Table-4-12. CEI Hub Facilities in the Floodplain

Category	Number of Facilities Exposed		
	10-Year Flood	100-Year Flood	500-Year Flood
Emergency Services	1	1	1
Transportation	0	0	1
High Potential Loss	0	0	0
Electric Power	0	0	1
Natural Gas	0	0	0
Petroleum	2	2	40
Potable Water	0	0	0
Wastewater	0	0	0
Total	**3**	**3**	**43**

Land Use in the Floodplain

All land in the study area is zoned for industrial uses under the City of Portland Comprehensive Plan and zoning ordinance. While residential land uses exist adjacent to the study area, there are no residential land uses within the study area or the identified floodplains. There are no identified open space uses within the identified floodplains of the study area. While industrial occupancy is not an ideal land use for floodplains because of the potential secondary hazard of hazardous material releases, industrial facilities tend to be less vulnerable due to typical industrial construction classes. For example, petroleum storage tanks are typically constructed of steel or concrete that is flood resistant. Based on the available information, it does not appear that any of the exposed facilities are subject to regulations under the City's Flood Damage Prevention Ordinance (Section 24.50.050 of the Portland Municipal Code) because they were constructed prior to adoption of that ordinance.

Environment

Flooding is a natural event, and floodplains provide many natural and beneficial functions. Nonetheless, flooding can impact the environment in negative ways. At the CEI Hub, secondary hazards include the risk of oil or gas entering floodwaters due to spilling or leakage. Any flooding in the study area could result in surface water or groundwater contamination due to the liquid nature of the products handled in the CEI Hub.

4.4.3 Vulnerability

Property

Hazus-MH calculates losses to structures from flooding by looking at depth of flooding and type of structure and using historical flood insurance claim data to estimate the resulting percentage of damage to structures and their contents. For this analysis, local data on facilities was used instead of the Hazus-MH default inventory data. Modeling results are summarized in Table 4-13 for the 10-, 100- and 500-year flood events.

Environment

Loss estimation platforms such as Hazus-MH are not currently equipped to measure environmental impacts of flood hazards. The environment vulnerable to flood hazard is the same as the environment exposed to the hazard. The best gauge of vulnerability of the environment would be a review of damage from past flood events. Loss data that segregates damage to the environment was not available at the time of this plan. Capturing this data from future events could be beneficial in measuring the vulnerability of the environment for future updates.

Table 4-13. Flood Damage Estimates for Flood Scenario Events

	10-Year			100-Year			500-Year		
	# Facilities	% Damage		# Facilities	% Damage		# Facilities	% Damage	
Category	Impacted	Structure	Contents	Impacted	Structure	Contents	Impacted	Structure	Contents
Emergency Services	1	58.2	100	1	84.86	100	1	88	100
Transportation	0	0	0	0	0	0	1	14	0
High Potential Loss	0	0	0	0	0	0	0	0	0
Electric Power	0	0	0	0	0	0	1	0.66	0
Natural Gas	0	0	0	0	0	0	0	0	0
Petroleum	2	0	0	2	0	0	41	0	0
Potable Water	0	0	0	0	0	0	0	0	0
Wastewater	0	0	0	0	0	0	0	0	0

4.4.4 Key Findings

Important findings associated with the flood hazard in the study area include the following:

- It is assumed that the modeling results of this analysis are understated due to incomplete data sets. There is a heavy reliance on default level data in the modeling for this study in lieu of the data that was not available from CEI Hub stakeholders. The accuracy of the modeling would be significantly enhanced if key data attributes that help estimate damage in the Hazus-MH models could be provided. Further, the Hazus-MH model employed a "lower bound" analysis, intended to demonstrate cost-effectiveness at the lowest level of expected impact. It is evident from review of aerial photography of the study area that the net exposure and possible vulnerability are greater than reflected in these model results.
- Due to construction classes and operations of CEI Hub facilities, floods are more likely to have an indirect impact on these facilities than a direct impact. Issues such as road closures and power interruptions associated with flooding would impact the functions of the CEI Hub.
- Future development or re-development within the floodplains of the study area would trigger regulation under the City's Flood Damage Prevention Ordinance.
- There is a high probability that a flood in the study area would have significant environmental impact due to effects on water quality.

4.5 LANDSLIDE RISK ASSESSMENT

4.5.1 Hazard Profile

A landslide is a mass of rock, earth or debris moving down a slope. Landslides may be small or large, and can move slow or fast. They can be initiated by storms, earthquakes, fires, volcanic eruptions or human modification of the land. Mudslides develop in the soil overlying bedrock on sloping surfaces when water rapidly accumulates in the ground, such as during heavy rainfall or rapid snowmelt. Water pressure in the pore spaces of the material increases to the point that the internal strength of the soil is drastically weakened. The soil's reduced resistance can then easily be overcome by gravity, changing the earth into a flowing river of mud. A mudflow can move rapidly down slopes or through channels and can strike with little or no warning. The material can travel miles from its source, growing as it descends, picking up trees, boulders, cars and anything else in its path.

The site where landslide material initially breaks free is called the failure location; the movement of material away from the failure location to locations downslope is called runout. With these two components, landslides pose a serious hazard to properties on and below hillsides. When landslides deform and tilt the ground surface,

they can destroy building foundations, offset roads or break underground pipes at the failure location, and the runout can override downslope properties and structures.

Recent events such as the Oso landslide in Washington in March 2014 have changed the thinking of the assessment of risk from landslide hazards. The Oso landslide was the deadliest single landslide event in U.S. history (43 fatalities, 49 homes destroyed, damage in excess of $10 million). The damage extended over 2.6 kilometers, although the failure location of the slide was less than a half-kilometer. Most of the area impacted was damaged by the slide runout. This indicates the importance of considering possible runout scenarios to accurately reflect the risk from landslide hazards. The science and technology to do this is evolving. Runout studies are costly, and the science to do them is still to be validated. The driver to doing these types of studies is typically historical occurrence.

In general, landslide hazard areas are where the land has characteristics that contribute to the risk of the downhill movement of material, such as the following:

- Steep slopes
- A history of landslide activity or movement
- Stream or wave activity, which has caused erosion, undercut a bank or cut into a bank to cause the surrounding land to be unstable
- The presence of an alluvial fan, indicating vulnerability to the flow of debris or sediments
- The presence of impermeable soils, such as silt or clay, which are mixed with granular soils such as sand and gravel

Two data sets were used for the risk assessment of the landslide hazard:

- DOGAMI historical landslide deposits.
- City of Portland regulatory landslide hazard area—This dataset is currently used for permitting purposes and was created from three sources:
  - Areas identified and mapped by Metro as earthquake hazard areas
  - Areas delineated as zones of high landslide potential in a study conducted by Portland State University based on the mapping of 676 landslide events that occurred as a result of the February 1996 storms
  - All land within the City that has a slope of 15 percent or greater.

A detailed landslide hazard profile for all of the City of Portland is provided in the 2016 City of Portland Hazard Mitigation Plan. While there are landslide susceptible areas identified in the CEI Hub study area, they do not significantly impact the CEI Hub facilities.

4.5.2 Exposure

Table-4-14 summarizes the CEI Hub facilities exposed to the landslide hazard. This analysis does not reflect the total exposure within the study area; it only reflects the exposure of facilities for which information was provided to the planning team by participating CEI Hub stakeholders.

Any landslide exposure for the study area lies in the hillsides to the west. The direct exposure to landslide failure locations on steep slopes with soft soils is very low (on 2 out of 323 facilities analyzed). However, what is not known is the exposure of the study area to landslide runout, as landslide materials move downhill from the initial failure location. Runout maps currently do not exist for the study area. If an event like the Oso slide were to happen in the hillside to the west of the study area, most of the facilities in the CEI Hub would be impacted by runout.

Table-4-14. CEI Hub Facilities in Landslide Risk Areas

Category	Number of Exposed CEI Hub Facilities in Risk Area
Emergency Services	0
Transportation	0
High Potential Loss	0
Electric Power	0
Natural Gas	0
Petroleum	1
Potable Water	1
Wastewater	0
Total	**2**

The following infrastructure components also can be exposed to mass movements:

- **Roads**—Landslides can block egress and ingress on roads, causing isolation for neighborhoods, traffic problems and delays for public and private transportation. This can result in economic losses for businesses.
- **Bridges**—Landslides can knock out bridge abutments or significantly weaken the soil supporting them, making them hazardous for use.
- **Power Lines**—Landslides can trigger failure of the soil underneath a power line tower, causing it to collapse and ripping down the lines.

4.5.3 Vulnerability

Currently, there are no nationally accepted formulas for modeling the damage resulting from landslides in applications such as Hazus-MH. At this time, all CEI Hub facilities, infrastructure and transportation corridors identified as exposed to the landslide hazard are considered vulnerable until more information becomes available.

4.5.4 Key Findings

Important findings associated with the landslide hazard in the study area include the following:

- It is assumed that the modeling results of this analysis are understated due to incomplete data sets. There is a heavy reliance on default level data in the modeling for this study in lieu of the data that was not available from CEI Hub stakeholders. The accuracy of the modeling would be significantly enhanced if key data attributes that help estimate damage in the Hazus-MH models could be provided. Further, the Hazus-MH model employed a "lower bound" analysis, intended to demonstrate cost-effectiveness at the lowest level of expected impact.
- As the science and technology for landslide risk analysis continues to evolve, risk managers within the study area should consider revisiting the risk assessment for this hazard, especially with the development risk assessment tools that can account for landslide runout.
- The risk associated with the landslide hazard overlaps the risk associated with other hazards such as earthquake, flood and wildfire. This provides an opportunity to seek mitigation alternatives with multiple objectives that can reduce risk for multiple hazards.

4.6 SEVERE WEATHER RISK ASSESSMENT

4.6.1 Hazard Profile

Severe weather refers to any dangerous meteorological phenomena with the potential to cause damage, serious social disruption, or loss of human life. It includes thunderstorms, hail storms, damaging winds, tornadoes, excessive heat, snowstorms, ice storms, blizzards, and extreme cold. The most common severe weather events that impact the study area are winter weather and windstorms.

Severe weather events have the potential to happen anywhere in the study area. Low-lying areas adjacent to the Willamette River are more susceptible to flooding. Wind events are most damaging to areas that rely on elevated utilities such as above-ground power lines.

4.6.2 Exposure

Population

The entire population of the study area is exposed to direct and indirect impacts from severe weather. This includes people who live in the Linnton District and people who work in the CEI Hub.

Property

All 323 facilities for analyzed in this study are considered to be exposed to the severe weather hazard. This reflects only the exposure of facilities for which information was provided to the planning team.

4.6.3 Vulnerability

Population

The degree of vulnerability of population in the study area is dependent on many factors, including the age and construction type of the structures/facilities people live and work in. Whether directly or indirectly impacted, the entire population will have to deal with the consequences of severe weather to some degree. Business interruption could keep people from working, road closures could isolate populations, and loss of functions of utilities could impact populations that suffer no direct damage from an event itself.

Property

The range and diversity of severe weather hazards makes it difficult to establish standard estimates of damage to support risk assessment modeling for severe weather. Therefore, severe weather vulnerability assessments are typically qualitative in nature.

All facilities are vulnerable to a degree during severe weather events, but facilities in poor condition or in vulnerable locations may risk the most damage. Those in higher elevations and on ridges may be more prone to wind damage. Those that are located under or near overhead lines or near large trees may be vulnerable to falling ice or may be damaged in the event of a collapse.

Incapacity and loss of roads are the primary transportation failures resulting from severe weather, mostly associated with secondary hazards such as landslides or debris or power lines knocked down by high winds. Large storms can have negative economic impacts for an entire region as prolonged obstruction of major routes can disrupt the shipment of goods and other commerce.

Severe windstorms, downed trees, and ice can create serious impacts on power and above-ground communication lines. Freezing of power and communication lines can cause them to break, disrupting electricity and

communication. Loss of electricity and phone connection can leave populations isolated if residents are unable to call for assistance.

The biggest impact to the CEI Hub from severe weather events would be the prolonged loss of power. Power is a vital commodity for the CEI Hub for both the receipt and distribution of product, mostly through electricity-powered pumping. While it would be possible for product to be distributed via gravity methods, it is significantly less efficient and requires different operating procedures that would require some down time for conversion. While backup power is available, it is not consistent through all facilities in the CEI Hub.

4.6.4 Key Findings

Important findings associated with severe weather in the study area include the following:

- It is assumed that the modeling results of this analysis are understated due to incomplete data sets. There is a heavy reliance on default level data in the modeling for this study in lieu of the data that was not available from CEI Hub stakeholders. The accuracy of the modeling would be significantly enhanced if key data attributes that help estimate damage in the Hazus-MH models could be provided. Further, the Hazus-MH model employed a "lower bound" analysis, intended to demonstrate cost-effectiveness at the lowest level of expected impact.
- Coordinated continuity of operations planning between CEI Hub stakeholders would significantly aid the operations of CEI Hub facilities during and after severe weather events.

4.7 VOLCANIC ACTIVITY RISK ASSESSMENT

4.7.1 Hazard Profile

A volcano is a vent in the earth's crust through which magma, rock fragments, gases, and ash are ejected from the earth's interior. There are 20 volcanoes in the Cascade Range, five of which have been active in historical times: Mount Baker, Glacier Peak, Mount Rainier, Mount St. Helens, Mount Adams and Mount Hood.

Volcanoes can lie dormant for centuries between eruptions, and the risk they pose is not always apparent. When Cascade volcanoes erupt, high-speed avalanches of hot ash and rock called pyroclastic flows, lava flows, and landslides can devastate areas 10 or more miles away. Huge mudflows of volcanic ash and debris called lahars can inundate valleys more than 50 miles downstream. Falling ash from explosive eruptions can disrupt human activities hundreds of miles downwind, and drifting clouds of fine ash can cause severe damage to the engines of jet aircraft hundreds or thousands of miles away.

Any impacts on the study area from the volcano hazard would be considered to be secondary, indirect impacts associated mainly with ash fall from volcanic activity outside the study area. A detailed volcano hazard profile for all of the City of Portland is provided in the 2016 City of Portland Hazard Mitigation Plan.

Location

Based on currently best available data, there is no lahar exposure to the study area from volcanic activity. There could be ash fall exposure from volcanic activity at any of the Cascade Range volcanos near the study area. As a point of reference to this assertion; during the 9 hours of vigorous eruptive activity of Mt. St. Helens in 1980, about 540 million tons of ash fell over an area of more than 22,000 square miles. Total volume of the ash before its compaction by rainfall was about 0.3 cubic miles (USGS, 2016a). Much of this ash fall affected the City of Portland and the study area. Impacts from volcanic ash fall are dependent on prevailing wind directions at the time of the eruption. Figure 4-3 shows the annual probability of ash fall accumulation across the Pacific Northwest as projected by USGS Cascade Volcano Observatory. The study area is highlighted in the graphic.

Source: Hoblitt and Scott 2011

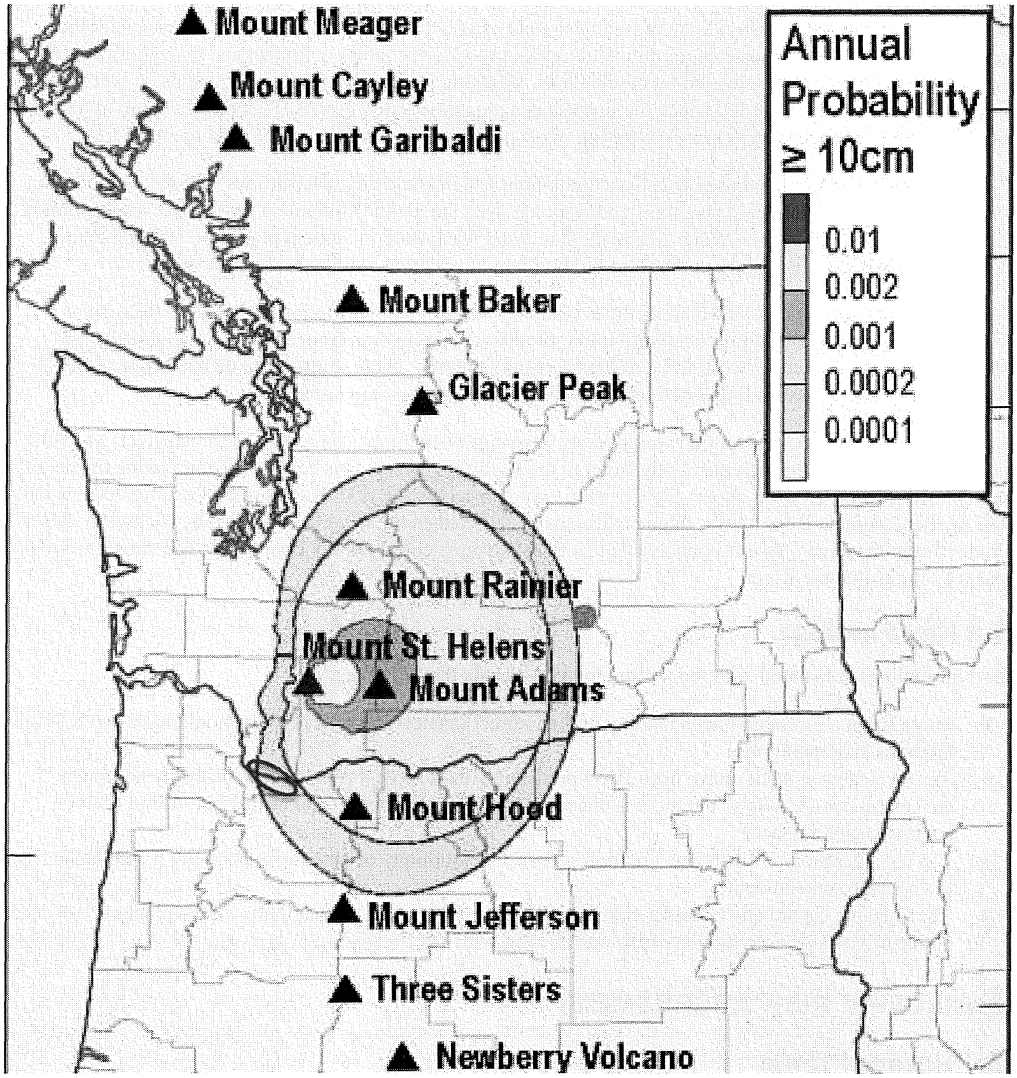

Figure 4-3. Probability of Ash Fall Accumulation in Pacific Northwest

4.7.2 Exposure

The entire study area would be exposed to ash fall accumulation from any of the nearby Cascade Range volcanoes.

4.7.3 Vulnerability

Facilities most vulnerable to ash fall are those that are not as structurally sound and may collapse under the excessive weight of ash and possible rainfall. Vulnerable property includes equipment and machinery out in the open whose parts can become clogged by the fine dust. Infrastructure, such as drainage systems, is potentially vulnerable to the effects of ash fall, since the fine ash can clog pipes and culverts. This may be more of a problem if an eruption occurs during winter or early spring when precipitation is highest and floods are most likely.

All transportation routes are exposed to ash accumulation, which could create hazardous driving conditions on roads and highways and hinder evacuations and response. Machinery and equipment using these transportation routes would also be vulnerable. Water treatment plants and wastewater treatment plants are vulnerable to contamination from ash. Visibility in the short aftermath of an eruption would also be problematic.

Indirect/secondary impacts on CEI Hub facilities could include power interruption, transportation corridor interruption that would impact product distribution, product contamination from ash fall, and public health concerns that could impact the work force of the CEI Hub facilities. These impacts are difficult to quantify by modeling, but could be assessed qualitatively by looking at relevant past occurrences.

Lahar flows from a Mt. Hood eruption would likely have significant impacts on the Columbia River. Mt. Hood lahars are likely to flow through the Sandy River to the Columbia River. This could interrupt marine traffic on the Columbia River, which would impact the CEI Hub, which receives and distributes some of its products via barge traffic up the Columbia River. Also, flood conditions on the Willamette River are dictated by backwater effects from the Columbia River. So it is conceivable that the study area could see flooding on the Willamette from lahar impacts on the Columbia River.

4.7.4 Key Findings

Important findings associated with the volcano hazard include the following:

- There is not a thorough understanding of the indirect impacts volcanic activity would have on CEI Hub facilities and operations.
- Since volcanic episodes have been fairly predictable in the recent past, there is probably not much concern about life safety, but there is concern about loss of property and infrastructure and severe environmental impacts.
- The consideration of a volcanic eruption scenario in continuity of operations planning would be beneficial to CEI Hub stakeholders.
- The volcanic hazard can be underestimated based on the perception that there will be plenty of advance notice of volcanic activity, like there was in 1980 with Mt. St. Helens.

4.8 WILDFIRE RISK ASSESSMENT

4.8.1 Hazard Profile

A wildfire is any uncontrolled fire on undeveloped land that requires fire suppression. Wildfires can be ignited by lightning or by human activity such as smoking, campfires, equipment use, or arson. Oregon's Building Code encourages local governments to designate portions of their jurisdictions subject to catastrophic fire as Wildfire Hazard Zones. The purpose of these zones is to define areas where buildings need to be made more survivable from fires spreading through adjacent wildlands. Three factors vital to wildfire risk are included in the methodology for mapping these zones: weather, topography, and vegetative fuel factor. Fire hazard maps used for this risk assessment were provided by the City of Portland. While there are wildfire severity zones within the

study area, they do not significantly impact the CEI Hub facilities. A detailed wildfire hazard profile for all of the City of Portland is provided in the 2016 City of Portland Hazard Mitigation Plan.

Fuels

Fuels are classified by weight or volume and by type, including living and dead vegetation on the ground, brush and small trees on the surface, and tree canopies above the ground. Fuel loading, often expressed in tons per acre, indicates the amount of vegetative material available. Some fuels burn more easily or release more energy than others. Lighter fuels such as grasses, leaves and needles quickly expel moisture and burn rapidly, while heavier fuels such as tree branches, logs and trunks take longer to warm and ignite.

Topography

The movement of air over the terrain tends to direct a fire's course. Gulches and canyons can funnel air and act as a chimney, intensifying fire behavior and inducing faster rates of spread. Saddles on ridge tops offer lower resistance to the passage of air and will draw fires. Solar heating of drier, south-facing slopes produces upslope thermal winds that can complicate fire behavior. On steep slopes, fuels on the uphill side of a fire are closer to the source of heat. Fire travels downslope much more slowly than it does upslope, and ridge tops often mark the end of wildfire's rapid spread.

Weather

Extreme weather leads to extreme fire events, and it is often a moderation of the weather that marks the end of a wildfire's growth. High temperatures and low humidity can produce vigorous fire activity. Winds may play a dominant role in directing the course of a fire. Strong, dry winds produce extreme fire conditions. The most damaging firestorms are usually marked by high winds.

4.8.2 Exposure

Any wildfire exposure for the study area lies in the hillsides to the west. Table 4-15 summarizes the CEI Hub facilities exposed to the wildfire hazard. This analysis does not reflect the total exposure within the study area; it only reflects the exposure of facilities for which information was provided to the planning team by participating CEI Hub stakeholders.

Table 4-15. CEI Hub Facilities in Wildfire Risk Areas

Category	Number of Exposed CEI Hub Facilities in Risk Area
Emergency Services	0
Transportation	0
High Potential Loss	0
Electric Power	1
Natural Gas	0
Petroleum	0
Potable Water	0
Wastewater	0
Total	**1**

4.8.3 Vulnerability

Structures, above-ground infrastructure, critical facilities and natural environments are all vulnerable to the wildfire hazard. Currently, there are no nationally accepted formulas for modeling the damage resulting from wildfire in applications such as Hazus-MH. Therefore, the vulnerability assessment for this hazard is qualitative.

CEI Hub facilities of wood frame construction are especially vulnerable during wildfire events. Power lines are at risk to wildfire if their support poles are made of wood and susceptible to burning.

The combustible nature of the materials on hand within the CEI Hub could increase the degree of risk within the study area. In the event of a wildfire, pipelines could provide a source of fuel and lead to a catastrophic explosion. However, the fact that most if not all of these materials are contained within fire resistant containers, and that there is a fairly significant fire break (Highway 30) between the risk area and those containers, significantly reduces that risk.

In the event of wildfire, there would likely be little damage to the majority of infrastructure in the study area. Most road and railroads would be without damage except in the worst scenarios. Fires can create conditions that block or prevent access and can isolate residents and emergency service providers. Wildfire typically does not have a major direct impact on bridges, but it can create conditions in which bridges are obstructed. Many bridges in areas of high to moderate fire risk are important because they provide the only ingress and egress to large areas and in some cases to isolated neighborhoods.

Most measurable impacts from the wildfire hazard would be indirect/secondary impacts. These impacts would be predominantly business interruption impacts associated with power loss and transportation corridor closures due to the response to wildfire events outside the study area.

4.8.4 Key Findings

Important findings associated with the wildfire hazard in the study area include the following:

- It is assumed that the modeling results of this analysis are understated due to incomplete data sets. There is a heavy reliance on default level data in the modeling for this study in lieu of the data that was not available from CEI Hub stakeholders. The accuracy of the modeling would be significantly enhanced if key data attributes that help estimate damage in the Hazus-MH models could be provided. Further, the Hazus-MH model employed a "lower bound" analysis, intended to demonstrate cost-effectiveness at the lowest level of expected impact.
- Coordinated continuity of operations planning between CEI Hub stakeholders would significantly aid the operations of CEI Hub facilities during and after wildfire events.

5. DISASTER RESILIENCE RECOMMENDATIONS

This chapter presents disaster resilience recommendations that will be considered for inclusion as actions in the 2016 update to the City of Portland Hazard Mitigation Plan. These recommendations are specific to the CEI Hub and were identified through a facilitated process that involved the identification and engagement of stakeholders, collection of data, assessment of risk, and identification of recommendations based on the study area's strengths, weaknesses, obstacles and opportunities (see Chapter 4 for more information on the risk assessment).

5.1 RECOMMENDATION 1—CEI HUB DISASTER RESILIENCY WORKGROUP

The CEI Hub is of paramount importance to the City of Portland, the State of Oregon and the larger region. The literature review and stakeholder engagement undertaken as part of this study highlighted the need for continued and enhanced focus on the development of disaster resilience for the CEI Hub to protect this critical resource and the surrounding areas. This study represents a high-level starting point for a collaborative approach to building resilience in the CEI Hub. To continue this work, it is recommended that a CEI Hub Disaster Resiliency Workgroup be formed and be officially recognized by all CEI Hub stakeholders. The success of the workgroup will depend on the following:

- Support from all CEI Hub stakeholders that were identified for this study
- Recognition by federal, state, local and private-sector entities as a body that can initiate change
- Public support garnered by the authentic involvement of public stakeholders, such as the Linnton Neighborhood Association.

The issues identified by this study and those that preceded it cross multiple public and private sectors and go beyond questions of hazard intensity and the resilience of facilities. The importance of the CEI Hub to the Pacific Northwest warrants a workgroup with strong commitment and recognition from all stakeholders. Because this workgroup would be recognized across multiple sectors, it would become the voice of disaster resilience for the CEI Hub. Goals for the workgroup would include the following:

- Meet regularly to work toward an established mission, vision, goals and objectives, and possible strategic plan.
- Build upon the strong buyer-supplier relationships established by the industry cluster (Grillo, 2005).
- Have dedicated resources to support disaster resilient initiatives for the CEI Hub.
- Provide recommendations on policy, best management practices, interagency coordination, public outreach and education, preparedness, response and recovery—all with regard to disaster resilience for the CEI Hub.

The Cascadia Region Earthquake Workgroup provides an example of the effectiveness of this level of focus on a regionally important subject. That workgroup is a coalition of private and public representatives, funded with a grant through the NEHRP, working together to improve the ability of Cascadia region communities, businesses and homeowners to proactively reduce impacts from earthquakes.

It is assumed that the CEI Hub Disaster Resiliency Workgroup would be established as a private non-profit entity similar to the Cascadia Region Earthquake Workgroup. The workgroup would need access to funding to be effective. Potential funding sources may include the following:

- Federal grants from the NEHRP, similar to those used by the Cascadia Region Earthquake Workgroup
- Sponsorship fees from supporting stakeholders such as the City of Portland, the State of Oregon, FEMA, and CEI Hub owner/operators

The importance of this recommendation to the overall resilience of the CEI Hub is indicated by the fact that all of the following recommendations incorporate a role for this workgroup. Implementation of the recommendations below is not contingent upon this recommendation, but their effectiveness will be enhanced by the existence of a CEI Hub Disaster Resiliency Workgroup.

5.2 RECOMMENDATION 2—UPDATE/ENHANCE CEI HUB RISK ASSESSMENT

The Hazus-MH model that was constructed to support this study and the update of the larger mitigation plan is a tool that can be used to support the implementation of hazard mitigation actions. The ability to look at risk associated with natural hazards at a property-specific level can be leveraged to support all phases of emergency management (preparedness, response, recovery and mitigation); however, model results are only as accurate as the data on which they rely.

As noted several times in this report, the results of the risk assessment for this study are likely to be understated in part due to the incomplete facility data resulting from less than full participation by all CEI Hub owner/operators and limitations of the Hazus model. The magnitude and severity of the hazard events that may impact the CEI Hub are believed to be well understood; however, the fragility of facilities at risk during these hazard events is less clear. This recommendation aims to improve model results and close this data gap by continuing to work with relevant stakeholders to gather data and update the model as new information becomes available from stakeholders as well as new data on event intensity, severity and magnitude of hazard events.

The groundwork for this recommendation was established during the course of this study. Hazard scenarios were identified, mapped and quantified, models were constructed, data capture tools and instructions were created, and data were captured for 323 facilities. The success of this recommendation will require a greater rate of participation by CEI Hub stakeholders than was achieved for this study. The formation of a CEI Hub Disaster Resiliency Workgroup (Recommendation 1) would contribute to the success of this recommendation because of the increased buy-in from CEI Hub stakeholders.

5.3 RECOMMENDATION 3—REGULATORY AMENDMENT

The City of Portland City Council Resolution No. 37168, passed on November 12, 2015, adopted a policy opposing projects that would increase the amount of crude oil being transported by rail through the City of Portland as well as expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways. Through the stakeholder engagement process for this study, CEI Hub owner/operators stated that this resolution provides no incentive for retrofitting vulnerable facilities and may provide a disincentive. For example, an owner/operator may be more likely to retrofit a vulnerable tank if capacity could be expanded at the same time that retrofitting occurred.

It is recommended that the City consider amending this resolution to allow for the expansion of an existing facility that has been identified as vulnerable to an identified hazard of concern and targeted for retrofit. The facility would have to have be identified as vulnerable based on the risk assessment model (Recommendation 2),

and the owner would have to include the retrofit in a resilience-related plan (Recommendation 4). The degree of allowable expansion would be capped (e.g. no more than 20 percent of current capacity). Proposals for retrofits/expansions would be screened by the CEI Hub Disaster Resiliency Workgroup (Recommendation 1). Implementation protocol for the amendment would need to be clearly vetted by stakeholder groups.

5.4 RECOMMENDATION 4—EMERGENCY RESPONSE/RECOVERY REGULATORY WAIVERS

CEI Hub stakeholders participating in this study stressed that federal and state environmental regulations regarding obtaining and transferring fuel are obstacles to effective disaster resilience, especially in disaster response and recovery. This recommendation proposes that parameters or best management practices be identified for waivers from federal and state regulatory agencies to improve ease of response and recovery efforts, with adequate assurances for environmental protection. The CEI Hub Resilience Workgroup would facilitate the development of these waivers and provide approval prior to submittal to the regulatory agency. Although this recommendation calls for waivers, a well-established protocol may achieve the same objective as a waiver under certain circumstances. The principle objective of this recommendation is to increase efficiency in disaster response and recovery by whatever means is most effective. This recommendation is specific to disaster response and recovery. It is not the intent of the recommendation to circumvent effective regulation outside of a disaster response and recovery scenario.

5.5 RECOMMENDATION 5—PLANNING

The current level of disaster-resilience planning by CEI Hub owner/operators is not well known. Some plans may exist, but their scope and degree of consistency have not been evaluated. Therefore, it is recommended that the CEI Hub Disaster Resiliency Workgroup (Recommendation 1) establish a suite of best management practices for a range of resilience-related planning efforts, such as continuity of operations plans, response plans, recovery plans, facility vulnerability assessments, etc. The first step in this process would be to assess existing planning efforts and establish minimum baselines for the promotion of disaster resilience. The assessment and development of the guidelines would seek answers to questions such as the following:

- Does each facility owner/ operator have a continuity of operations plan? A response plan? A recovery plan? A capital facility plan?
- Do these plans acknowledge or address disaster resilience?
- What should a continuity of operations plan for the CEI Hub include?

The establishment of these baselines and best management practices would help to promote consistency within the CEI Hub and promote the wise use of resources through the provision of templates and/or best practices that were vetted through a forum of peers who understand the importance and operations of the CEI Hub. The success of this recommendation would be predicated on stakeholder buy-in on the benefits of the planning curriculum and commitment in the use of the curriculum to develop plans. This would be facilitated through the CEI Hub Disaster Resiliency Workgroup.

5.6 RECOMMENDATION 6—BACKUP POWER

Power is mission-critical for the CEI Hub. Maintaining power supply to the CEI Hub will have a large impact on the region's ability to recover from a disaster. The Portland General Electric (power supplier for the CEI Hub) has built disaster resilience into its business plan, but maintaining consistent power during and after major disaster events cannot be guaranteed. As a result, backup power capability is a necessity for the CEI Hub. Needs should be identified through a systematic look at all facilities that determines the following:

- The current level of backup power capability at the CEI Hub
- How long that capability can be sustained
- The reliability of the capability
- Anticipated functional downtimes of facilities following hazard events
- The size and types of backup power systems that would meet the facility's needs, possibly including solar microgrids and other alternative energy sources.

FEMA has revised its policy on funding emergency generators through hazard mitigation grant programs. By including this recommendation in the Hazard Mitigation Plan, funding for these projects may be able to be secured through these grant programs.

5.7 RECOMMENDATION 7—TRAINING AND EXERCISE

Preparedness is a key element of disaster resilience. This includes training and exercises on multiple scenarios of likely events, so that when a hazard occurs, participants have already practiced responses and improved them based on lessons learned from the practices. Led by PBEM, the City of Portland has a well-established training and exercise program for disaster preparedness and response. This program is bolstered by multiple tabletop and full-scale exercises that examine disaster scenarios likely to occur in the City of Portland.

Through the implementation of this recommendation, the City would commit to periodic, scenario-based trainings and exercises within the CEI Hub, coordinated with CEI Hub stakeholders. This recommendation seeks to build on the existing PBEM training and exercise program. It assumes that implementation of Recommendations 1, 2 and 4 will provide the information and coordination to enhance the program for the CEI Hub. Under this recommendation, PBEM would make a commitment to a CEI Hub-specific training or exercise on a periodic basis (e.g. every 2 years). This recommendation would be coordinated through the CEI Hub Resiliency Workgroup.

5.8 RECOMMENDATION 8—FACILITY RETROFITS

Vulnerable facilities in the CEI Hub should be identified and retrofitted. A comprehensive, site-specific risk assessment should be conducted to identify and prioritize facilities for retrofit and/or replacement. Completion of this recommendation is dependent on the development of a facility vulnerability assessment protocol established by the CEI Hub Resiliency Workgroup. Once facilities have been identified, funding options (capital improvement plans, grants, etc.) and a timeline for completion would be identified for each facility. Additionally, facility retrofit projects potentially impacted by Portland City Council Resolution No. 37168 (Recommendation 3) would be identified.

This recommendation assumes that vulnerability assessment best practices would be performed by the CEI Hub facility owner/operator following the best management practices established in Recommendation 4. The identification of funding alternatives would be a coordinated effort between the facility owner/operator and the CEI Hub Resiliency Workgroup. If facilities are identified as potentially eligible for grant funding, the owner/operator would inform PBEM for incorporation as an action into the City's hazard mitigation plan through the plan implementation and maintenance protocol included in the plan document.

5.9 RECOMMENDATION 9—LAND USE REPURPOSING

Accessibility to the CEI Hub by land and water is necessary for both supply and distribution. The effectiveness of its location to marine, highway, petroleum pipeline, and rail access is a principle reason the CEI Hub is so important to the Pacific Northwest region. Relocating the CEI Hub to mitigate its natural hazard risks would negate the advantages of its current location. Given that it is not feasible to relocate the CEI Hub facilities, the City of Portland needs to consider whether it should continue to support residential land uses in this area, which is

likely to experience severe direct and indirect consequences from natural hazard events. The City recognizes the personal connection and long-term investment that Linnton residents have in their community. However, due to increasing evidence of substantial risk, the City has begun taking steps to slow the growth of residential use in the area (City of Portland, 2016). This recommendation for land use repurposing includes the development of regionally acceptable means to repurpose land within an identified buffer area, or hazard zone, adjacent to the CEI Hub.

The first step would be to identify an appropriate buffer zone for which land use repurposing would take place. The CEI Hub Resilience Workgroup should engage all stakeholders who would be directly impacted by land repurposing in a two-step facilitated process: 1) determine factors for consideration in establishing a buffer; 2) use those factors to define the size of buffer needed to ensure safety in the event of a hazard event affecting the CEI Hub.

Once the hazard zone buffer has been established, options for repurposing land use within that region would be identified. These options could include, but would not be limited to, further down-zoning (decreasing allowed density for new development) in addition to zoning changes in the city's 2035 Comprehensive Plan, or a voluntary buy-out program to convert existing properties to open space. These, and other land-use repurposing alternatives should be thoroughly evaluated by the CEI Hub Resilience Workgroup and members of the surrounding community.

The Mitigation Action Plan

Appendix F. Data Sources and Methods Used for Mapping

2028

F. Data Sources and Methods Used for Mapping

EARTHQUAKE MAPPING

Liquefaction Susceptibility

Liquefaction data was provided by the Oregon Department of Geology and Mineral Industries (DOGAMI). This database accompanies DOGAMI Open-File Report O-13-06 (Madin and Burns, 2013). The liquefaction mapping uses the methods of Hazus-MH MR4 to create new liquefaction susceptibility data for Oregon. Hazus assigns susceptibility classes based on geology. For this map, the geology was primarily taken from the Oregon Geologic Data Compilation (OGDC 5) and Statewide Landslide Information Layer for Oregon (SLIDO-2), with some coming from published liquefaction studies. The methods and data used to make this map are described in detail in Madin and Burns, 2013.

National Earthquake Hazard Reduction Program Soils

National Earthquake Hazard Reduction Program (NEHRP) site class data was provided by DOGAMI. This database accompanies DOGAMI Open-File Report O-13-06 (Madin and Burns, 2013). The NEHRP soils mapping uses measured shear wave velocity data, estimated shear wave velocity data from the literature, and geologic data primarily taken from OGDC 5 and SLIDO-2, with some coming from published earthquake hazard studies. The methods and data used to make this map are described in detail in Madin and Burns, 2013.

Landslide Susceptibility

Landslide susceptibility data was provided by DOGAMI. This database accompanies DOGAMI Open-File Report O-13-06 (Madin and Burns, 2013). This map uses the methods of Hazus-MH MR4 to create a new landslide susceptibility map for Oregon. Hazus assigns susceptibility classes based on the combination of three geologic material classes and six slope classes. The geologic material classes were derived from the OGDC 5, SLIDO-2, and several other published geologic maps. Slope data was derived from a mosaic of all Oregon Lidar Consortium Lidar topography available at the time and the USGS 30-meter digital elevation model. The methods and data used to make this map are described in detail in Madin and Burns, 2013.

Probabilistic Peak Ground Acceleration Maps

Probabilistic peak ground acceleration data are generated by Hazus-MH 2.2. In Hazus' probabilistic analysis procedure, the ground shaking demand is characterized by spectral contour maps developed by the U.S. Geological Survey (USGS) as part of a 2008 update of the National Seismic Hazard Maps. USGS probabilistic seismic hazard maps are revised about every six years to reflect newly published or thoroughly reviewed earthquake science and to keep pace with regular updates of the building code. Hazus includes maps for eight probabilistic hazard levels: ranging from ground shaking with a 39-percent probability of being exceeded in 50 years (100-year return period) to the ground shaking

with a 2-percent probability of being exceeded in 50 years (2,500-year return period). Earthquake mapping for this plan used the 100-year and 500-year probabilistic events.

Shake Maps

A shake map is designed as a rapid response tool to portray the extent and variation of ground shaking throughout the affected region immediately following significant earthquakes. Ground motion and intensity maps are derived from peak ground motion amplitudes recorded on seismic sensors (accelerometers), with interpolation based on estimated amplitudes where data are lacking, and site amplification corrections. Color-coded instrumental intensity maps are derived from empirical relations between peak ground motions and Modified Mercalli intensity. For this plan, shake maps were prepared for two earthquake scenarios:

- An earthquake on the Cascadia Subduction Zone with the following characteristics:
  - Magnitude: 9.0
  - Epicenter: N 45.73 W 125.13
  - Depth: 20 km
- An earthquake on the Portland Hills Fault with the following characteristics:
  - Magnitude: 6.5
  - Epicenter: N 45.55 W 122.8
  - Depth: 0 km

FLOOD MAPPING

Flood hazard areas are mapped as depicted on effective FEMA Digital Flood Insurance Rate Maps dated December 2014. Repetitive flood loss and active NFIP policy data was provided by FEMA as of November 30, 2014. Property addresses were geocoded and then mapped at a citywide scale.

LANDSLIDE MAPPING

The landslide hazard exposure analysis used combination of areas drawn from two sources: regulatory landslide hazard area and historical landslide deposits.

Landslide Hazard Area

Landslide hazard area data was provided by the City of Portland. The regulatory landslide hazard area map was created from three sources:

- Areas identified and mapped by Oregon Metro as earthquake hazard areas
- Areas delineated as zones of high landslide potential in a study conducted by Portland State University based on the mapping of more than 676 landslide events that occurred as a result of the February 1996 storms
- All land within the City that has a slope of 15 percent or greater.

Historical Landslide Deposits

Historical landslide deposit data was provided by the City of Portland and created by DOGAMI as part of the SLIDO Release 3.2 (December 29, 2014). The database is an inventory of existing landslides

and includes supplemental photos taken by staff geologists while performing landslide related field work.

The landslide inventory is one of the essential data layers used to delineate regional landslide susceptibility. This inventory is not regulatory, and revisions can happen when new information regarding landslides is found or when future new landslides occur. Therefore, it is possible that landslides within the mapped area were not identified or occurred after the data was prepared.

This data was prepared by following the *Protocol for Inventory Mapping of Landslide Deposits from Light Detection and Ranging (Lidar) Imagery* developed by Burns and Madin (DOGAMI Special Paper 42, 2009). The three primary tasks include compilation of previously mapped landslides, Lidar-based morphologic mapping of landslide features, and review of aerial photographs. Landslides identified by these methods are digitally compiled into this database at varying scales. The recommended map/use scale for these data is 1:8,000.

Each landslide is also attributed with classifications for activity, depth of failure, movement type, and confidence of interpretation. The landslide inventory is intended to provide users with basic information regarding landslides. The geologic, terrain, and climatic conditions that led to landslides in the past may provide clues to the locations and conditions of future landslides, and it is intended that this data will provide useful information to develop regional landslide susceptibility maps, to guide site-specific investigations for future developments, and to assist in regional planning and mitigation of existing landslides.

WILDFIRE MAPPING

Wildfire hazard data created in 2002 by Metro Data Resource Center was provided by the City of Portland. ORS 93.270(4) changed the Oregon Building Code to encourage local governments to voluntarily designate portions of their jurisdictions subject to catastrophic fire as wildfire hazard zones. The purpose of these zones is to define areas where buildings need to be made more survivable from fires spreading through adjacent wildlands. This analysis and map identify wildfire hazard zones within the City of Portland. The methodology used to identify wildfire hazard zones data is described in detail on the Wildfire Hazard Zone Map created by the Metro Data Resource Center for Portland Fire & Rescue, dated October 11, 2002.

DAM FAILURE MAPPING

Inundation area data for Mt. Tabor Reservoirs Nos. 1, 5 and 6 and Washington Park Reservoirs Nos. 3 and 4, provided by the City of Portland Water Bureau, identifies areas where warnings or evacuations may be required due to a failure of the reservoirs. The original inundation area maps were created for the reservoirs' Emergency Action Plans. The DAMBRK model for the Mt. Tabor reservoirs was created and run in March 1999 to develop the original data, using a peak flow of 5,630 cubic feet per second from Reservoir No. 1, 25,400 cubic feet per second from Reservoir No 5, and 23,940 cubic feet per second from Reservoir No. 6.

VOLCANO HAZARD MAPPING

Digital Data for Volcano Hazards in the Mount Hood Region, Oregon was downloaded from the USGS Cascades Volcano Observatory (CVO) website. Scientists at the CVO created the volcanic hazards data to delineate proximal and distal hazard zones that could be affected by lahars in the event of an eruption. This dataset was generated with a combination of computer modeling and geologic evidence

of past events at Mt. Hood as recorded in deposits. These volcanic hazard zones are intended for use by public and private agencies to view, overlay with other GIS datasets, and make maps of volcanic hazards from potential future eruptions of Mount Hood.

The hazard zones delineated in this data set portray volcanic events believed most likely from future activity at Mount Hood. Areas outside the hazard zones, especially those having low relief, should not be regarded as hazard-free. Too many uncertainties exist in source, size, and mobility of future events to locate boundaries of zero-hazard zones with confidence. The degree of hazard does not change abruptly at the hazard zone boundaries. Rather, a volcanic hazard decreases gradually with increased distance from the volcano and above the valley floor. Volcanic hazards also span a range of size and recurrence.

Appendix G. Risk Assessment Data Gaps and Limitations

G. Risk Assessment Data Gaps and Limitations

HAZARD DATA GAPS

Data Layer	Data Gaps	Effect on Risk Assessment
Flood		
Finished floor elevations	This information is only available as individual elevation certificates. In order to incorporate this information into the Hazus analysis, the elevation values would need to be extracted from the certificates into a database that can be linked to the buildings data.	The first floor elevation, in conjunction with the flood depth grid value, is used to determine the depth of flooding at a particular building. The extent of damage to the building and its contents is then estimated from the depth of flooding by the application of a depth-damage curve associated with the Hazus occupancy class for the building. If the building-specific finish floor elevation is not available, a default value is used. This default value is based on the year the structure was built and the foundation type. Using default first floor elevation values results in less accurate damage estimates.
Earthquake		
Liquefaction susceptibility	Portland Water Bureau recently completed a liquefaction susceptibility dataset. This dataset will need to be vetted by other City bureaus. The next MAP update should incorporate this data in the earthquake analysis.	The current DOGAMI data has been produced at a state-level scale. The new Water Bureau data should be at a scale more appropriate for a city-level analysis.
Landslide susceptibility	DOGAMI is currently working on a new landslide susceptibility dataset that will be completed by the end of 2016. The next MAP update should incorporate this data in the earthquake analysis.	The current DOGAMI data has been produced at a state-level scale. The new DOGAMI data is being produced at a county-level scale and should provide more detail for a city-level analysis. The new DOGAMI data is also being produced using LiDAR data and the latest methodology.
Landslide		
Regulatory landslide hazard area	DOGAMI is currently working on a new landslide susceptibility dataset that will be completed by the end of 2016. The next MAP update should incorporate this data in the landslide analysis.	The current DOGAMI data has been produced at a state-level scale. The new DOGAMI data is being produced at a county-level scale and should provide more detail for a city-level analysis. The new DOGAMI data is also being produced using LiDAR data and the latest methodology.
Historic landslide deposits	DOGAMI is currently working on a new landslide susceptibility dataset that will be completed by the end of 2016. The next MAP update should incorporate this data in the landslide analysis.	The current DOGAMI data has been produced at a state-level scale. The new DOGAMI data is being produced at a county-level scale and should provide more detail for a city-level analysis. The new DOGAMI data is also being produced using LiDAR data and the latest methodology.
Wildfire		
Wildfire hazard	This dataset was created in 2002, the City may update this data. The next MAP update should incorporate the updated data in the wildfire analysis.	An updated version of this data will most likely be created from current LiDAR data and include updated vegetation data. Any increase in the level of accuracy and level of detail will improve the exposure analysis.
Climate Change		
N/A	No data available for scenario-based future modeling.	

BUILDING DATA GAPS

Data Layer	Data Gaps	Effect on Risk Assessment
Building footprints with added tax assessor data	The use description attribute was incomplete. Secondary descriptions and zoning attributes were used when the primary use description was not available.	The use description information is critical to assigning the correct Hazus occupancy classes to the buildings. The occupancy class is used in a number of ways including determining replacement costs and assigning damage curves for the flood and earthquake analyses.
	For residential buildings with both finished and unfinished basement square footage there was not information on how the square footage was divided between finished and unfinished. In this situation, it was assumed that the square footage was divided 50/50 between finished and unfinished.	Finished and unfinished square footage are used in the replacement cost calculation. Accurate square footage values result in more accurate replacement cost values.
	Attached garage square footage was not included so only detached garage information was used in the replacement cost calculation.	Garage square footage is used in the replacement cost calculation. Attached garage square footage values would result in more accurate replacement cost values.
	Construction class information (economy, average, luxury) was not available. This information is stored in the permitting system, but it is not possible to extract and associate it with the building data.	Construction class information for single-family residential buildings is used to determine the appropriate cost per square foot values used in the replacement cost calculation. For this risk assessment, all buildings were considered to have an average construction class. Using the actual construction class would result in more accurate replacement cost values.
	Construction material information was not available except for unreinforced masonry buildings.	Construction material information is used to assign damage curves for the earthquake analysis. For this risk assessment, default construction material values based on the Hazus occupancy class and year built were assigned. Using the actual construction material would result in the use of the most appropriate damage curves and more accurate damage estimates.
	Foundation type information was incomplete.	Foundation type information is used to assign damage curves for the flood analysis. For this risk assessment, default foundation type values based on the Hazus occupancy class were assigned when actual values were not available. Using the actual foundation type would result in the use of the most appropriate damage curves and more accurate damage estimates.
Low income URM buildings	Data not available.	

CRITICAL FACILITIES DATA GAPS

Data Layer	Data Gaps	Effect on Risk Assessment
Emergency Operation Centers		
Emergency Operation Centers	Replacement cost values not available.	Damage estimates in dollars not available when ranking risk and determining mitigation actions.
Fire Stations		
Fire stations	Owner and replacement cost values not available.	Damage estimates in dollars not available when ranking risk and determining mitigation actions.
Fireboat facilities	Replacement cost values not available.	Damage estimates in dollars not available when ranking risk and determining mitigation actions.
Medical Care Facilities		
Hospitals	An attribute with the numbers of beds would have been useful when assigning the Hazus analysis class. Replacement cost values not available.	Using the correct Hazus analysis class provides the most accurate estimate of damage. Damage estimates in dollars not available when ranking risk and determining mitigation actions.

2035

LUBA No. 2020-009
Page 2321

Data Layer	Data Gaps	Effect on Risk Assessment
Police Stations		
Police Bureau facilities	Replacement cost values not available.	Damage estimates in dollars not available when ranking risk and determining mitigation actions.
Non-Police Bureau facilities	Replacement cost values not available.	Damage estimates in dollars not available when ranking risk and determining mitigation actions.
Schools		
Schools	Replacement cost values not available.	Damage estimates in dollars not available when ranking risk and determining mitigation actions.
Dams		
Dams	Construction information was incomplete, this information is useful for assigning Hazus analysis class. Replacement cost values not available.	Using the correct Hazus analysis class provides the most accurate estimate of damage. Damage estimates in dollars not available when ranking risk and determining mitigation actions.
Hazardous Materials		
Hazardous material facilities	Replacement cost values not available.	Damage estimates in dollars not available when ranking risk and determining mitigation actions.
Military Facilities		
Armories	Replacement cost values not available.	Damage estimates in dollars not available when ranking risk and determining mitigation actions.
Military installations	Replacement cost values not available.	Damage estimates in dollars not available when ranking risk and determining mitigation actions.
Nuclear Power Plants		
Nuclear reactors	Replacement cost values not available.	Damage estimates in dollars not available when ranking risk and determining mitigation actions.
Air Transportation Facilities		
Airports	Hazus has analysis classes for many of the individual buildings/terminals at an airport. The available data did not have this level of detail.	Building-level information could help refine any mitigation actions specific to the airport.
Helipads	Replacement cost values not available.	Damage estimates in dollars not available when ranking risk and determining mitigation actions.
Bus Facilities		
Transit centers	Information that distinguishes between transit centers that are enclosed structures versus park and ride lots would have been useful when assigning the Hazus analysis class. Replacement cost values not available.	Using the correct Hazus analysis class provides the most accurate estimate of damage. Damage estimates in dollars not available when ranking risk and determining mitigation actions.
Bus facilities	Replacement cost values not available.	Damage estimates in dollars not available when ranking risk and determining mitigation actions.
Highway Facilities		
Highway bridges	City of Portland data provided spatial locations of bridges and HITRAC data provided descriptive information, including the Hazus analysis class, scour index and replacement cost. Unknown if replacement cost values are accurate.	Damage estimates in dollars may not be accurate.
Highway tunnels	Information on type of tunnel - bored or cut and cover - would have been useful when assigning Hazus analysis class. Replacement cost values not available.	Using the correct Hazus analysis class provides the most accurate estimate of damage. Damage estimates in dollars not available when ranking risk and determining mitigation actions.

Data Layer	Data Gaps	Effect on Risk Assessment
Light Rail Facilities		
Light rail bridges	Information about the bridge construction would have been useful when assigning Hazus analysis class. Replacement cost values not available.	Using the correct Hazus analysis class provides the most accurate estimate of damage. Damage estimates in dollars not available when ranking risk and determining mitigation actions.
Light rail facilities	Replacement cost values not available.	Damage estimates in dollars not available when ranking risk and determining mitigation actions.
Light rail tunnel	Replacement cost values not available.	Damage estimates in dollars not available when ranking risk and determining mitigation actions.
Port Facilities		
Port facilities	Data was not provided in a GIS format. Used information in Seismic Risk Assessment report and orthoimagery to locate facilities.	Increased level of effort to analyze these facilities.
Rail Facilities		
Rail bridges	City of Portland data provided spatial locations of bridges and HITRAC data provided descriptive information, including the Hazus analysis class, scour index and replacement cost. Unknown if replacement cost values are accurate.	Damage estimates in dollars may not be accurate.
Rail facilities	Replacement cost values not available.	Damage estimates in dollars not available when ranking risk and determining mitigation actions.
Rail tunnel	Replacement cost values not available.	Damage estimates in dollars not available when ranking risk and determining mitigation actions.
Communications Facilities		
Transmitters 800MHz	Replacement cost values not available.	Damage estimates in dollars not available when ranking risk and determining mitigation actions.
CenturyLink offices	This data only includes CenturyLink offices, offices for other companies are not included. Replacement cost values not available.	Potentially missing facilities that could affect the determination of mitigation actions. Damage estimates in dollars not available when ranking risk and determining mitigation actions.
Communication facilities	Default data is likely out of date and doesn't cover all radio and TV broadcasting facilities in the City. Replacement cost values are not available.	Potentially missing facilities that could affect the determination of mitigation actions. Damage estimates in dollars not available when ranking risk and determining mitigation actions.
Other communications facilities	Data is not available for other internet facilities or switching hubs.	Potentially missing facilities that could affect the determination of mitigation actions.
Electric Power Facilities		
Electric substations	Replacement cost values not available.	Damage estimates in dollars not available when ranking risk and determining mitigation actions.
Electric facilities	Default data is likely out of date and doesn't cover all radio and TV broadcasting facilities in the City. Replacement cost values are not available.	Potentially missing facilities that could affect the determination of mitigation actions. Damage estimates in dollars not available when ranking risk and determining mitigation actions.
Natural Gas Facilities		
Natural gas facilities	This data may be missing natural gas compressor sites. Replacement cost values are not available.	Potentially missing facilities that could affect the determination of mitigation actions. Damage estimates in dollars not available when ranking risk and determining mitigation actions.
Petroleum Facilities		
Petrol tank farms	Data is missing for several tank farms but majority are included. Replacement cost values are not available.	Potentially missing facilities that could affect the determination of mitigation actions. Damage estimates in dollars not available when ranking risk and determining mitigation actions.

2037

LUBA No. 2020-009
Page 2323

Data Layer	Data Gaps	Effect on Risk Assessment
Potable Water Facilities		
Well sites	Replacement cost values not available.	Damage estimates in dollars not available when ranking risk and determining mitigation actions.
Reservoirs	Replacement cost values not available.	Damage estimates in dollars not available when ranking risk and determining mitigation actions.
Pump stations	Replacement cost values not available.	Damage estimates in dollars not available when ranking risk and determining mitigation actions.
Potable water facilities	Replacement cost values not available.	Damage estimates in dollars not available when ranking risk and determining mitigation actions.
Wastewater Facilities		
Wastewater facilities	Pump/lift station data did not include capacity information, which would have been useful when assigning Hazus analysis class. Replacement cost values not available.	Using the correct Hazus analysis class provides the most accurate estimate of damage. Damage estimates in dollars not available when ranking risk and determining mitigation actions.
Other Facilities		
Prisons	Replacement cost values not available.	Damage estimates in dollars not available when ranking risk and determining mitigation actions.
City-owned essential facilities	Replacement cost values not available.	Damage estimates in dollars not available when ranking risk and determining mitigation actions.
Oregon Zoo	Replacement cost values not available.	Damage estimates in dollars not available when ranking risk and determining mitigation actions.
Nursing homes/ assisted living facilities	Replacement cost values not available.	Damage estimates in dollars not available when ranking risk and determining mitigation actions.

Appendix H. Prior Plan Goals

H. Prior Plan Goals

For the 2004 NHMP, the Planning Team used the exposure analysis results as a basis for developing the mitigation goals and actions. The City selected the five goals in 2004 to reduce or avoid long-term vulnerabilities to the identified hazards for the five-year planning period.

- Identify risk level and evaluate Portland's vulnerability to natural hazards
- Implement activities to protect human life, property and natural systems
- Promote public awareness, engage public participation and enhance partnerships through education, outreach and coordination of a diverse and representative group of the City's population
- Establish a disaster resilient economy
- Build and support the capacity and commitment to continuously become less vulnerable to hazards

For the 2010 NHMP update, the Planning Team evaluated the 2004 NHMP's goals and determined they needed to modify them to better meet the city's changing needs. The City determined the seven goals to more clearly focus their long-term efforts to reducing risk and vulnerabilities to the identified hazards.

- Update the Risk Assessment and Vulnerability Analysis every five years
- Implement actions to prepare, protect, preserve and restore life, property and natural systems
- Promote public outreach to a variety of City populations
- Improve City of Portland's economic resilience through inclusion of the private sector into mitigation action implementation
- Commit to continuously reducing the City's natural hazards vulnerability
- Maximize mitigation effectiveness by taking a comprehensive approach to natural resource management via city plans, codes and programs that increase mitigation efforts
- Coordinate mitigation activities with regional communities and agencies

Appendix I. Mitigation Best Practices Catalog

I. MITIGATION BEST PRACTICES CATALOG

BACKGROUND INFORMATION

Risk is defined as being a function of the:

- Hazard
- Exposure
- Vulnerability
- Capability.

Risk can be reduced through mitigation by manipulating the hazard, reducing exposure to the hazard, reducing the vulnerability and/or increasing capability. And, where mitigation is not yet possible, the risk can be reduced through preparation, response or/and recovery.

Over the course of developing *The Mitigation Action Plan* (MAP), the following catalogs were developed from best practices, steering committee recommendations and stakeholder input. These catalogs are not meant to be exhaustive, but to inspire thought. It is expected that the City of Portland, in collaboration with stakeholders, will take these ideas and concepts and look for specific ways to apply them for their own particular needs/situation. These actions should be refined to add additional specificity and clarity as needed.

The City of Portland, its residents and its businesses are already engaged in many of these activities. In addition to identifying new actions, Bureaus may want to select actions that continue existing plans and programs. In general in selecting actions, the City of Portland and its stakeholders should capitalize on strengths and look for opportunities to overcome obstacles and weaknesses.

STEERING COMMITTEE TOP-RATED ACTIONS AND CEI HUB REPORT RECOMMENDATIONS

The following actions were selected as top-rated actions by the steering committee and/or were recommendations developed from the Critical Energy Infrastructure (CEI) Hub report.

Hazard (source)	Refined Action	Total Votes
All Hazards (SC-1)	For each hazard of concern, develop a simple report card that identifies the risk in each category and the progress made on identified performance metrics. Include a sheet with "plain talk" language explaining any references to government reports and emergency codes. Include this information in the annual progress report. Share the results annually in several very public ways (e.g. press release, community group networks, posted on website). Develop a system to ensure that members of the public have received the information.	11
All Hazards (SC-3)	Fund disability community-based organization to build resiliency skills and capacity of people with disabilities to be engaged as a part of a resilient community response	5
All Hazards (SC-4)	Develop an inventory of critical facilities that includes those facilities critical to underserved populations and other community groups. Once developed, keep this inventory up to date.	5
All Hazards (SC-210)	Prior to and during implementation, review all actions for negative externalities and to ensure vulnerable populations are protected from displacement or other disproportionate burdens.	Note – not included in voting
Dam Failure (SC-5)	Collaborate with Multnomah County Drainage District to get flooding impact studies from levy failure and develop a risk assessment using the updated general building stock, critical facility and demographic information developed for the mitigation action plan.	4
Dam Failure (SC-8)	Continue to monitor risk from Mt. Tabor reservoirs. Re-evaluate the proposal to retain 85% capacity, and consider reflecting pools instead.	3
Dam Failure (SC-10)	Collaborate with Clackamas County to get dam inundation areas from upstream dams that might affect Portland and develop a risk assessment using the updated general building stock, critical facility and demographic information developed for the mitigation action plan.	2
Drought (SC-12)	Promote drought-resistant landscaping and planting that supports native fauna including pollinator insects and migratory birds.	5
Earthquake (SC-13)	Expand ATC-20 trainings and certifications to increase pool of damage assessment team members.	6
Earthquake (SC-14)	Lobby for increased funding for seismic retrofits and the creation of a statewide committee on CEI hub partial or complete relocation. (Office of Government Relations)	16
Earthquake (SC-16)	Ensure that every Bureau has inventoried critical assets and reviewed critical infrastructure vulnerability and has identified a 50-year plan to strengthen, retrofit, relocate or otherwise increase resiliency. Consider ways to promote citywide collaboration and prioritization of resiliency efforts.	16
Earthquake (SC-18)	Collaborate with PSU to identify buildings (public and other institutions) that exceed life safety standards and are likely to be useable for government functions and other purposes after various earthquake events.	6
Earthquake (SC-23)	Appoint and fund a City of Portland Seismic Resiliency Officer	9
Earthquake (SC-24)	Develop incentives and regulations that promote, encourage and/or require seismic retrofits of private property (such as multi-family, masonry structures). Potential partner: Home Depot	16
Earthquake (SC-27)	Perform an in depth risk assessment of the transportation network to develop and prioritize mitigation projects to ensure connectivity after an event. Potential partners: PBOT, TSA, Tri-Met and Boat owners/organizations	16
Earthquake (SC-35)	Develop a program with a steady source of funding to provide grants for home retrofits. Devote a certain percentage of available funding to low income homeowners.	6
Earthquake (SC-40)	Encourage and expand personal, family and business preparedness plans and programs.	6

Hazard (source)	Refined Action	Total Votes
Earthquake (SC-42)	Retrofit the water conveyance system.	11
Earthquake (SC-49)	Increase taxes on businesses in high risk areas (Linnton) that are not working to reduce the risk to neighbors and the environment.	7
Earthquake (SC-50)	Appoint a CEI Hub Disaster Resiliency Workgroup to include citizens, business leaders that contribute to the high risk, elected officials and experts. White Paper Report to be made public and to include timelines and plans for change that goes into the "Report Card" and is managed, measured and reported annually.	6
Earthquake (SC-51)	Adopt higher standards for all buildings and reduce height limits.	7
Earthquake (SC-54)	Review alternatives to increase the resilience of the CEI hub and other energy infrastructure. Alternatives may include an update of zoning or building codes, relocation of tank farms out of vulnerable areas, seismic strengthening requirements etc.	12
Earthquake (SC-55)	Develop a study to evaluate how capped sediments behave in major earthquakes and whether there is the potential for toxic sediments below to be released. If such potential exists, promote full removal of sediments.	10
Earthquake (SC-62)	Require seismic upgrading of emergency operations center, fire, police stations by XX date.	7
Earthquake (SC-64)	Incorporate the recommendations of the Unreinforced Masonry Work Group into the mitigation action plan. Ensure work group recommendations are screened using the equity review tool.	12
Earthquake (SC-66)	Require seismic upgrading of public and private soft first story buildings by XX date.	6
Earthquake (SC-67)	Review construction plans for all bridges to determine their susceptibility to collapse and retrofit problem bridges. Work with bridge owners to secure funding and prioritize retrofits/upgrades. Potential Partners: PBOT, ODOT, County	11
Earthquake (SC-71)	Require all new schools and other government buildings to meet OC IV so they can be used as an earthquake emergency shelter. Require strategic strengthening of portions of existing schools. Develop a prioritization strategy for these improvements using an equity assessment.	18
Earthquake (SC-79)	Identify ways to encourage, promote or require U.S. Resiliency Council Certification (e.g. tax incentives, minimum standards, requirement for new public buildings).	7
Flood (SC-81)	Make information available about floodplains (10, 25, 50 and 500) when applying for permits (BDS and BES partnership).	4
Flood (SC-85)	Develop and implement a flood emergency warning text alert system that sends notice to cell phones in identified flood evacuation areas.	4
Flood (SC-87)	Clarify rules and responsibilities within Bureaus during a flood and partner with all Portland Bureaus to identify nonessential staff that can be trained to become dispatch operators so that essential "boots on the ground" personnel can be free to perform recovery actions. (Strengthen cross-training programs)	6
Flood (SC-91)	Expand holistic stormwater management program requiring green infrastructure such as eco-roofs where needed to improve hydraulic system capacity.	12
Landslide (SC-95)	Identify transportation routes likely to be impacted by landslides and identify alternate routes. Communicate this information to the public. Lead Agencies: PBOT, BES and PBEM	7
Landslide (SC-99)	Update landslide chapter in 2017 when new DOGAMI data can be included.	3
Landslide (SC-100)	Provide notice to property owners and other residents, including renters and transient populations) of location in high landslide risk areas. Consider mandatory renter disclosure. Consider posting signage. Potential Partners: DOGAMI and PSU	3
Landslide (SC-102)	Encourage property owners and developers to actively manage hillsides and landslide hazard areas to reduce risk from landslides. Develop a brochure describing risk and potential mitigation techniques. Incorporate landslide risk into invasive species management plans. Lead Agencies: BDS and BES	7
Landslide (SC-103)	Perform an assessment of drainage and erosion conditions in identified risk areas.	3

Hazard (source)	Refined Action	Total Votes
Landslide (SC-105)	Examine zoning and building codes and provide recommendations for increasing or decreasing permeable surfaces in landslide risk areas.	4
Landslide (SC-106)	Investigate the feasibility of expanding requirements for eco-roofs to include high landslide risk areas.	6
Landslide (SC-107)	Incorporate the retrofitting of existing infrastructure into the stormwater management plan.	3
Landslide (SC-112)	Adopt higher regulatory standards or rezone for new development within unstable slope areas.	5
Landslide (SC-123)	Consider adding a liability or risk clause to agreements with developers that develop in high risk areas and areas that would be impacted by landslides. Ensure that any actions are reviewed for equity considerations.	8
Severe Weather (SC-126)	Improve public warning and information systems for severe weather events. Ensure that communication is easy to understand, gives clear direction, timely, is available in multiple languages and reaches all populations. Potential Partners: County, disabled population, families and organizations that serve them.	7
Severe Weather (SC-127)	Coordinate and clarify pre- and post-severe weather event responsibilities within and among the Bureaus.	2
Severe Weather (SC-130)	Support redundant public transit systems that are reliable and prepared for severe weather.	2
Severe Weather (SC-134)	Overlay tree database with soils that area likely to saturate. Inform property owners/residents of risk and warning signs and provide information on possible mitigation measures.	3
Severe Weather (SC-137)	Identify ways to increase ice storm/snow response capabilities.	3
Severe Weather (SC-141)	Continue to fund and utilize the LENST text based warning system for severe weather notifications.	2
Severe Weather (SC-147)	Partner with Multnomah County to develop a more robust sheltering plan. Develop an established protocol for partnering with schools that includes a reunification plan. Provide more public outreach and information on cooling and heating shelters and when they are open. Ensure plans and program meet the needs for all populations. Potential Partners: County, disabled population, families and organizations that serve them	8
Space Weather (SC-151)	Continue to research best available science and data for space weather and potential impacts to the City of Portland.	2
Volcanic Hazards (SC-154)	Develop a partnership to use Wireless Emergency Alerts, Emergency Alert System or Community Emergency Notification System on volcano/ash fall alerts and awareness of evacuation procedures (PBEM and OEM)	1
Wildfire (SC-160)	Identify facilities with volatile/hazardous materials from high risk wildfire areas (e.g., hazardous chemicals that can spread the fire, cause additional serious health and environment concerns, trigger a chain reaction with other facilities due to the spread of the chemicals and/or the spreading fire resulting from the chemical release) and consider transfer, relocation or other mitigation efforts.	8
Wildfire (SC-161)	Identify invasive species that are fire hazards (e.g., scotch broom). Educate the public on these species and work to eradicate/greatly reduce them, especially in high risk areas	4
Wildfire (SC-163)	Require defensible spaces and water turrets around structures in wildfire risk areas.	6
Wildfire (SC-165)	Identify and publish a list of plants that are severe fire hazards.	3
Wildfire (SC-173)	Increase funding for Rangers outreach, surveys, patrols in general to let people know about smoking/campfire risk (especially in forest park)	6
Wildfire (SC-180)	Continue to research ways to balance the needs between fire safety flow requirements and water quality requirements.	3
Wildfire (SC-181)	Strengthen site and building design standards in wildfire risk areas.	6
Wildfire (SC-191)	Partner with the Forest Park Conservancy and individual land owners to develop a fire risk reduction plan for Forest Park.	3
Wildfire (SC-206)	Provide funding to better maintain fire access roads in Forest Park for response and evacuation needs as well as increased daily access for disabled/mobility challenged populations	4

BEST PRACTICES AND PLANNING PROCESS ACTIONS

The following actions were developed from best practices and other stakeholder input. Actions shown include general mitigation best practices as well as actions identified through the steering committee planning process.

All Hazards

General Mitigation Best Practice—All Hazards			
Manipulate Hazard	Reduce Exposure	Reduce Vulnerability	Increase Capability
Public (Individual) Scale			
• None	• None	• Apply for permits as required and follow established building codes • Perform a vulnerability check on personal property	• Educate yourself on risk reductions methods • Educate yourself on early warning procedures • Purchase insurance for your home and valuables • Volunteer on community mitigation projects. • Develop household mitigation plan, such as creating a retrofit savings account, communication capability with outside, 2 week self-sufficiency during an event • Prepare a family post-disaster action plan • Get to know your neighbors • Participate in perishable data capture programs
Private (Business) Scale			
• None	• None	• Establish/participate in a business-to-business mitigation mentoring program. • Perform a vulnerability check on property	• Educate your employees on the probable impacts from hazard events • Develop a Continuity of Operations Plan • Participate in perishable data capture programs

General Mitigation Best Practice—All Hazards			
Manipulate Hazard	Reduce Exposure	Reduce Vulnerability	Increase Capability
Government Scale			
• None	• Relocate critical facilities out of known hazard areas • Prohibit or limit public expenditures for capital improvements in known hazard areas • Acquire safe sites for public facilities (e.g., schools, police/fire stations, etc.) • Prohibit new facilities for persons with special needs/mobility concerns in hazard areas. • Prohibit animal shelters in known hazard areas	• Retrofit critical facilities within known hazard areas. • Organize a managed retreat from very high-risk areas. • Promote open space uses in identified high hazard areas via techniques such as: PUD's, easements, setbacks, greenways, sensitive area tracks • Acquire property in high hazard areas for use as open space • Offer expanded development rights to developers/businesses for performing mitigation retrofits • Incorporate mitigation retrofits for public facilities into the annual capital improvements program. • Installing quick-connect emergency generator hook-ups for critical facilities	• Develop an all hazards public education campaign and resource center • Promote the purchase of insurance in known hazard areas • Designate high-risk zones as special assessment districts (to fund necessary hazard mitigation projects) • Incorporate a stand-alone element for hazard mitigation into the local comprehensive (land use) plan. • Develop a post-disaster reconstruction plan to facilitate decision making following a hazard event. • Involve citizens in comprehensive planning activities that identify and mitigate hazards • Adopt a post-disaster recovery ordinance based on a plan to regulate repair activity, generally depending on property location. • Adopt the International Building Code (IBC) and International Residential Code (IRC) • Increase the local Building Code Effectiveness Grading Schedule classification through higher building code standards and enforcement practices. • Identify a funding mechanism for a local match to Federal funds that can fund private mitigation practices. • Identify and strengthen facilities so that they can function as public shelters • Provide hazard vulnerability checklists for homeowners to conduct their own inspections • Establish a technical assistance program for residents to access data or resources for mitigation purposes • Develop mutual aid agreements with other local governments/organizations • Warehouse critical infrastructure components such as pipe, power line, and road repair material • Develop a Continuity of Government Plan • Provide technical information and guidance during permitting and development process • Form a citizen plan implementation steering committee to monitor progress of local mitigation actions. Include a mix of representatives from neighborhoods, local businesses, and local government.

Reduce Vulnerability	Increase Capability
Government Scale	
• Continue mitigation programs started by some bureaus (water/BES) and incorporate those programs into the mitigation action plan • Replicate mitigation best practices developed by some bureaus in bureaus that do not have a strategy for incorporating mitigation into standard operating procedures • Follow through with new/stronger Comprehensive Plan policies that set the stage for updating regulations and enhancing investments (implement these policies) • Continue to develop and institutionalize an asset management approach to budgeting and prioritizing infrastructure upgrades • Incorporate all hazard risk information into codes and policies and ensure that permits meet regulations for risk aversion and update as needed (especially environmental overlay zones)	• Continue to collect and update data on population, building stock, etc. and look for opportunities to capture and incorporate missing hazard-related data • Continue to utilize subject matter expertise (e.g. keep certified floodplain managers on staff, partner with Cascade Volcano Observatory) in order to inform residents, businesses and other city staff of hazard risk and mitigation opportunities and gaps • Continue to work on engaging the public in hazard mitigation. Capitalize on civic, city and neighborhood pride. Use this messaging in framing mitigation. • Continue to seek/develop unique funding opportunities for mitigation projects and to seek grant opportunities whenever they are available. • Partner with creative industries that excel at education and marketing ideas and concepts to the general public • Continue to retain and hire City staff that is competent and cares about mitigation • Establish a program to systematically review and update regulations that address hazard risk • Establish a process to coordinate/ partner with local, state and federal agencies to maintain up-to-date hazard data, maps, and assessments. • Continue to build on strong community engagement standards • Continue to develop and expand the NET program and engage NET volunteers • Integrate the mitigation action plan with existing plans and programs such as CRS, climate action plan, Comprehensive Plan etc.) • Develop a bureau-wide mitigation working group for greater collaboration and information sharing • Develop and implement successful, effective, institutionalized systems, especially for equitable mitigation • Continue to seek ways to meaningfully engage non-English speaking and other underserved populations • Seek ways to promote the mitigation of private property. • Incorporate mitigation priorities into goals/missions of applicable bureaus • Seek novel ways to influence traditional processes • Maintain existing hazard databases and establish a program for collection of perishable data after hazard events • Seek opportunities to incorporate psychological preparedness and education into preparedness and mitigation related programs • Emphasize the need for endurance in post-disaster planning (e.g. more than 72 hours preparation) • Develop strategy to overcome risk from existing development patterns and seek opportunities to incentivize mitigation of private property • Utilize the natural features and resources of Portland in planning for and mitigation from natural hazards • Focus on developing strategies that capture opportunities associated with the growing population and growth in the region • Perform an extensive literature and internal review of mitigation processes and practices that have provided beneficial results. Look to other communities such as LA, New Zealand, Japan. • Develop a bumper stick that says "keep" Portland Prepared • Ensure each action is measureable, tracked and shared publicly • Utilize informed, local media to increase publicity about mitigation • Engage local celebrities in sharing the mitigation message (Portlandia's Fred Armisen and Carrie Brownstein, actors from Grimm, the Blazers, the Timbers!) • Establish equitable criteria for action development and prioritization of actions. • Give the City the "right of refusal" after a major event • Develop games/fun activities about preparing ahead and surviving a disasters • Develop a recovery plan for the City of Portland. • Develop one "elevator speech" item per bureau. One action item that cannot be accomplished without additional resources • Ensure all actions have an estimated timeframe for completion that is reviewed and updated during the progress reporting process

Actions Identified by Steering Committee—All Hazards	
Reduce Vulnerability	Increase Capability
• Continue to support, incorporate and participate in projects that increase regional and local understanding of climate change and its impacts • Seek input from emergency responders on land use and development codes and regulation • Ensure that relocation programs are implemented equitably.	• Institute a climate change education program for the public that discusses how climate change will impact risk and vulnerability to hazard events • Work with CIRC to educate bureaus and create standard assumptions and models, internal consistency in application of data • Develop a phone tree with local community organizations, such as IRCO. • Identify a list of pre-approved Minority, Women-Owned, and Emerging Small Business contractors for response/recovery efforts • Align budgeting cycle with hazard mitigation priorities – when new funding is requested, require review of MAP priorities • Provide authority for use of the Resilience Bond Model • Build resiliency of city/county information to bounce back/respond to increased customer service demands such as staffing and increased call/email volume. • Fund vulnerable immigrant/refugee organizations • Incorporation of making all action items accessible for safe harbor languages and disability community. • Search and rescue specific for disability community. • Shelter program specifically meeting needs of disability • Convene a working group to provide recommendations on a citywide requirement for full disclosure of known natural hazard risk at time of property sale or transfer. Ensure the committee reviews and provides recommendations on unintended consequences such as lowering of property values in high risk areas and displacement of low income residents to these areas. • Provide notice to property owners and residents in identified dam inundation areas. • Develop an earthquake scenario and perform a risk assessment that assumes dam failure as a secondary hazard.

Dam Failure

General Mitigation Best Practice—Dam Failure			
Manipulate Hazard	Reduce Exposure	Reduce Vulnerability	Increase Capability
Public (Individual) Scale			
• **None**	• Relocate out of Dam Failure Inundation areas.	• Elevate your home to appropriate levels • Flood-proof your home to appropriate levels	• Learn the evacuation routes for a dam failure event • Educate yourself on early warning procedures. • Purchase flood insurance
Private (Business) Scale			
• **Remove privately owned Dams** • **Strengthen privately owned Dams**	• Replace earthen dams with hardened structures	• Flood proof facilities within Dam Failure Inundation areas • Continue/ensure regularly scheduled engineering assessments of privately owned dams	• Develop and update Emergency Action Plans • Educate employees on dam failure evacuation routes • Educate employees on early warning procedures
Government Scale			
• **Remove government owned Dams** • **Strengthen government owned Dams**	• Replace earthen dams with hardened structures	• Adopt higher regulatory floodplain standards in mapped Dam Failure/Inundation areas. • Consider low density land uses within identified Dam Failure/Inundation areas. • Continue/ensure regularly scheduled engineering assessments • Create easements in impoundment and downstream inundation areas • Study and evaluate impacts from climate change on dam operations	• Enhance Emergency Operations Plan to include a dam failure component. • Institute monthly communications checks with dam operators. Maintain up to date communications list. • Inform the public on risk reduction techniques and develop a communication plan • Adopt real-estate disclosure requirements for the re-sale of property located within Dam Inundation areas. • Establish early warning systems downstream of high hazard dams. • Update evacuation routes and educate the public on those routes • Promote the purchase of flood insurance in inundation areas

Actions Identified by Steering Committee—Dam Failure
Increase Capability
Government Scale
• Update scenario based Dam Failure/Inundation area maps.
• Develop an earthquake scenario and perform a risk assessment that assumes dam failure as a secondary hazard.
• Provide notice to property owners and residents in identified dam inundation areas.

2051

LUBA No. 2020-009
Page 2337

Drought

General Mitigation Best Practice—Drought			
Manipulate Hazard	Reduce Exposure	Reduce Vulnerability	Increase Capability
Public (Individual) Scale			
• **None**	• Install stored water/captured water techniques, such as rain barrels or down spout gardens • Use permeable paving techniques whenever feasible	• Plant drought resistant landscapes • Reduce water system losses (e.g. fix drips) • Modify plumbing systems, i.e. water saving kits or grey water systems	• Practice active water conservation techniques
Private (Business) Scale			
• **None**	• Install stored water/captured water techniques, such as rain barrels or down spout gardens • Use permeable paving techniques whenever feasible.	• Plant drought resistant landscapes • Reduce private water system losses • Identify alternate water supply sources • Plant drought-resistant crop varieties • Develop and implement grey water systems	• Practice active water conservation techniques • Develop a water conservation plan
Government Scale			
• **Promote groundwater recharge through stormwater management** • **Implement cloud seeding techniques during dry season**	• Identify and create ground water back up sources • Create/identify new impounded water supply points • Use permeable paving techniques whenever feasible	• Plant drought resistant landscapes on community owned facilities • Distribute water saving kits to community members • Implement storm water retention in regions ideally suited for groundwater recharges • Reduce water system losses through regular maintenance • Design water delivery systems to accommodate drought events	• Identify alternative water supplies for time of drought • Develop a drought contingency plan • Develop criteria triggers for drought related actions • Improve accuracy of water supply forecasts • Modify rate structures to influence active water conservation techniques • Consider providing incentives to property owners that utilize drought resistant landscapes in the design of their home • Develop/Implement drought education/notification systems and communication plan • Emphasize droughts relationship to other hazards in hazard awareness messaging • Increase capability to enforce water restrictions when such restrictions are in place.

Actions Identified by Steering Committee—Drought	
Reduce Vulnerability	Increase Capability
Government Scale	
• **Integrate water conservation and green infrastructure into all applicable regulations/programs**	• Update/establish requirements on impervious surfaces • Expand green stormwater infrastructure program and integrate water conservation into messaging – partner with Willamette Week Hydro Hogs lists to increase awareness.

Earthquake

General Mitigation Best Practice—Earthquake			
Manipulate Hazard	Reduce Exposure	Reduce Vulnerability	Increase Capability
Public (Individual) Scale			
• **None**	• Locate outside of hazard area (off soft soils and other seismically induced ground failure areas)	• Retrofit structure (e.g. anchor house structure to foundation) • Secure household items that can cause injury or damage such as water heaters, bookcases, and other appliances • Build to higher design standards	• Practice "drop, cover and hold" • Participate in drills such as the Great Shakeout • Purchase earthquake insurance
Private (Business) Scale			
• **None**	• Locate/relocate mission critical functions outside hazard area where possible (off soft soils and other seismically induced ground failure areas)	• Build redundancy for critical functions/facilities • Retrofit critical buildings/areas housing mission critical functions • Perform non-structural assessments and mitigation activities (e.g. anchor bookcases to the wall) • Anchor rooftop-mounted equipment (i.e., HVAC units, satellite dishes, etc.).	• Adopt higher standard for new construction -- Consider "performance based design' when building new structures • Increase capability by having cash reserves for reconstruction • Inform your employees on the possible impacts of earthquake and how to deal with them at your work facility • Participate in drills such as the Great Shakeout

General Mitigation Best Practice—Earthquake			
Manipulate Hazard	Reduce Exposure	Reduce Vulnerability	Increase Capability
Government Scale			
• **None**	• Locate critical facilities or functions outside of hazard area where possible (off soft soils and other seismically induced ground failure areas)	• Harden infrastructure • Provide redundancy for critical functions • Encourage mitigation of private property • Perform non-structural assessments and mitigation activities (e.g. anchor bookcases to the wall) • Require bracing of generators, elevators, and other vital equipment in hospitals. • Use flexible piping (earthquake resistant) when extending water, sewer, or natural gas service. • Install shutoff valves and emergency connector hoses where water mains cross fault lines. • Anchor rooftop-mounted equipment (i.e., HVAC units, satellite dishes, etc.). • Include retrofitting/replacement of critical system elements in Capital Improvements Plan (CIP)	• Produce more accurate hazard maps (e.g. liquefaction and soils maps) • Further enhance seismic risk assessment to target high hazard buildings for mitigation opportunities (e.g. older structures, unreinforced masonry) • Develop a debris management plan • Participate in drills such as the Great Shakeout • Communicate earthquake secondary hazards to public (e.g. landslides, dam failure, fires, hazardous material spills) • Assess emergency response routes and determine back-up options in case of damage or disruption • Educate K-12, residents, developers and businesses on earthquake safety and building codes. • Require/encourage rapid damage assessment training for City staff • Develop and distribute guidelines or pass ordinances that require developers and building owners to locate lifelines, buildings, critical facilities, and hazardous materials out of areas subject to significant seismic hazards. • Support financial incentives, such as low interest loans or tax breaks, for home and business owners who seismically retrofit their structures. • Use Hazus to quantitatively estimate potential losses from an earthquake • Establish a school survey procedure and guidance document to inventory structural and non-structural hazards in and around school buildings • Use rapid visual screening to quickly inspect a building and identify disaster damage or potential seismic structural and non-structural weaknesses to prioritize retrofit efforts, inventory high-risk structures and critical facilities, or assess post-disaster risk to determine if buildings are safe to re-occupy • Develop a technical assistance information program for homeowners. • Create a seismic safety committee to provide policy recommendations, evaluate and recommend changes in seismic safety standards, and give an annual assessment of local and statewide implementation of seismic safety improvements • Develop an inventory of public and commercial buildings that may be particularly vulnerable to earthquake damage.

Actions Identified by Steering Committee—Earthquake		
Reduce Exposure	Reduce Vulnerability	Increase Capability
Public (Individual) Scale		
• Remove buildings and do not build new buildings within 100 yards of an active fault (slip rate > 2 mm a year).	• Install automatic earthquake gas shutoffs	• None
Private (Business) Scale		
• Remove buildings and do not build new buildings within 100 yards of an active fault (slip rate > 2 mm a year). • Do not build critical facilities (Occupancy Class III and IV) on soft soil sites (SE and SF sites). • Do not build critical facilities (Occupancy Class III and IV) on sites with potential for seismic induced ground failure (lateral spreading, liquefaction, landslide).	• Install automatic earthquake gas shutoffs • Retrofit older office buildings to at least life-safety standards • Perform non-structural assessments of building contents • Pursue other non-structural mitigation including ceilings, troffer light fixtures, partition bracing, elevator rails, brick veneer, hollow clay tile around stairwells, etc.	• Purchase earthquake insurance
Government Scale		
• Remove buildings and do not build new buildings within 100 yards of an active fault (slip rate > 2 mm a year). • Do not build critical facilities (Occupancy Class III and IV) on soft soil sites (SE and SF sites) or on sites with potential for seismic induced ground failure (lateral spreading, liquefaction, landslide).	• Review construction plans for all bridges to determine their susceptibility to collapse and retrofit problem bridges. Work with bridge owners to secure funding and prioritize retrofits/upgrades. • Ensure that best available data and science is used in the siting and development of City buildings. • Require all newly built City buildings to exceed life safety standards. • Incentivize or require retrofitting of infrastructure in the CEI hub until complete or partial relocation can be obtained. • Partner with identified high potential loss facilities to encourage individual assessments of seismic risk. Identify and share risk with nearby residential communities. • Update residential building code so that it includes higher seismic standards for new or substantially improved buildings. • Perform non-structural assessments of building contents. Pursue other non-structural mitigation including ceilings, troffer light fixtures, partition bracing, elevator rails, brick veneer, hollow clay tile around stairwells, etc. • Develop a non-structural, technical assistance information program and tool kit.	• Research, develop and implement innovative approaches to implement the recent fossil fuel legislation using established jurisdictional authority (e.g. zoning) • Incorporate the updated liquefaction, lateral spreading and landslide data developed by the Portland Water Bureau into BDS development and design standards. • Develop and maintain a rapid damage assessment program that creates a tiered system of certification so that there can be two trained but uncertified assistants for each certified staff member. • Expand the BDS tie down training program and include information/training on other retrofit activities. • Develop and implement a plan for a system of fuel hubs and stockpiles. Involve public and private stakeholders that provide essential services in this planning process. • Research and develop a plan to ensure adequate sanitation if sewer systems are knocked offline by an event. • Develop a post-event communication plan. • Develop a post-disaster recovery plan based on a seismic event. • Develop method for communities to report mitigation priorities directly to the City. • Ensure that response plans have identified adequate food resources. Partner with food producers and distributors to develop memorandums of understanding and/or responsibilities. • Develop a phased sheltering plan. • Provide resources for businesses to help them identify ways to mitigate for natural hazards.

2055

LUBA No. 2020-009
Page 2341

Actions Identified by Steering Committee—Earthquake		
Reduce Exposure	Reduce Vulnerability	Increase Capability
	• Support financial incentives, such as low interest loans or tax breaks, for home and business owners who seismically retrofit their structures. • Install automatic earthquake gas shutoffs in public buildings and require automatic shutoffs in public buildings. • Retrofit older office buildings to at least life-safety standards • Require seismic upgrading of hospitals including phased nonstructural mitigation by XX date. • Require seismic upgrading of school buildings by XX date. • Require seismic upgrading of public and private non-ductile concrete buildings by XX date. • Seismically retrofit housing bureau buildings on the Unreinforced Masonry (URM) list or constructed prior to 1994 • Update residential building code so that it includes higher seismic standards for new or substantially improved buildings. Initiate triggers guiding improvements such as: < 50% substantial damage/improvements or passive trigger programs for mandatory seismic strengthening • Require higher standards for new construction of Occupancy Category II (and certain I?) buildings. • Perform a sediment seismic stability analysis for Hayden Island and develop appropriate mitigation items	• Assess opportunities for "alternative" evacuation routes, e.g. foot and bicycle paths, helicopter pads • Identify post-earthquake evacuation routes and prioritize retrofitting of structures along those routes. • Develop a response plan for fire boats. • Explore utilizing the waterways as a post event transportation system. • Assess potential fire risks from Cascadia quake if it were to happen during dry months. • Establish a basic needs check-list for all households and survey residents to determine the percent of households with sufficient supplies. • Adopt the mitigation plan and seek pledges from elected officials to implement and provide funding for identified actions. • Develop an instructional video for non-structural mitigation. • Explore capability to have portable temporary bridge to cross Willamette. • Perform geotechnical assessment of subsurface • Capitalize on recent publicity regarding earthquake risk in the Pacific Northwest • Determine a practical method to track buildings that are brought up to current seismic codes due to retrofit or permit requirement • Institute legislation that allows for rent controls after a certain percentage of housing stock is lost (e.g. post disaster) • Appoint an earthquake administrator – similar to a flood administrator • Institute bridge tolls to fund seismic retrofits

2056

LUBA No. 2020-009
Page 2342

Flood

General Mitigation Best Practice—Flood			
Manipulate Hazard	Reduce Exposure	Reduce Vulnerability	Increase Capability
Public (Individual) Scale			
• **Clear stormwater drains and culverts**	• Locate outside of hazard area • Elevate utilities above base flood elevation • Institute low impact development techniques on property	• Retrofit structure (elevate house above base flood elevation) • Elevate items within house above base flood elevation • Build new homes above base flood elevation • Floodproof non-residential structures	• Comply with National Flood Insurance Program (NFIP) • Purchase flood insurance
Private (Business) Scale			
• **Clear stormwater drains and culverts**	• Locate business critical facilities or functions outside hazard area • Institute low impact development techniques on property	• Build redundancy for critical functions/ retrofit critical buildings • Provide flood-proofing measures when new critical infrastructure must be located in floodplains	• Increase capability by having cash reserves for reconstruction • Support and implement hazard disclosure for the sale/re-sale of property in identified risk zones • Solicit 'cost-sharing" through partnerships with public sector stake holders on projects with multiple benefits
Government Scale			
• **Develop an adopt a "storm drain" program** • **Dredge, construct levees, provide retention areas** • **Invest in structural flood control: levees, dams, channelization, revetments** • **Construct regional stormwater control facilities** • **Harden areas with significant erosion concerns** • **Promote/retain natural vegetation in areas with significant erosion concerns**	• Acquire or relocate identified repetitive loss properties • Adopt land development techniques such as density transfers or clustering • Institute low impact development techniques on property • Adopt sediment and erosion control regulations • Adopt zoning and erosion overlay districts • Prohibit any fill in floodplain areas • Encourage the use of porous pavement, vegetative buffers, and islands in large parking areas. • Use stream restoration to ensure adequate drainage and diversion of stormwater.	• Adopt appropriate regulatory standards such as cumulative substantial improvement/damage, freeboard, lower substantial damage threshold, compensatory storage • Develop and implement stormwater management regulations and master planning • Adopt "no-adverse impact" floodplain management policies that strive to not increase the flood risk on down-stream communities • Perform regular inspections/assessments of locally owned or maintained flood control infrastructure • Replace undersized culverts • Provide permanent protection for pump stations at risk of flooding • Identify/mitigate drainage issues resulting in ponding • Enhance road drainage programs or elevate/relocate roads subject to frequent flooding • Ensure permitting process is consistent with the adopted floodplain management ordinance • Develop an erosion protection program for high hazard areas • Construct open foundation systems on buildings to minimize scour	• Join Community Rating System (CRS) program or maintain/improve class • Provide training for staff and decision-makers in floodplain management (e.g. maintain certified floodplain managers on staff) • Create a building and elevation inventory of structures in the floodplain • Develop a Flood Task Force • Pre-stage flood response equipment before events • Integrate floodplain management policies into other planning mechanisms within Portland • Develop framework/continue efforts for cooperation between agencies/districts in flood mitigation activities (e.g. sand and sand bag deployment) • Retain good standing in National Flood Insurance Program • Participate in information sharing with other agencies (e.g. U.S. Army Corps of Engineers, NWS) • Identify and mitigate sources of nuisance flooding • Review and update floodplain damage prevention ordinances • Identify debris collection sites

2057

LUBA No. 2020-009
Page 2343

General Mitigation Best Practice—Flood			
Manipulate Hazard	Reduce Exposure	Reduce Vulnerability	Increase Capability
		• Construct deep foundations in erosion hazard areas • Establish a green infrastructure program • Use subdivision design standards to require elevation data collection during platting and to have buildable space on lots above the base flood elevation • Require tie downs of propane tanks • Require a drainage study with new development • Design a "natural runoff" or "zero discharge" policy for stormwater in subdivision design • Require and maintaining FEMA elevation certificates for all new and improved buildings located in floodplains • Extend the freeboard requirement past the mapped floodplain to include an equivalent land elevation • Include requirements in the local floodplain ordinance for homeowners to sign non-conversion agreements for areas below base flood elevation. • Offer incentives for building above the required freeboard minimum (code plus). • Inspect bridges and identify if any repairs or retrofits are needed to prevent scour • Floodproof critical facilities and infrastructure located in flood hazard areas • Require all critical facilities to meet requirements of Executive Order 11988 and be built 1 foot above the 500-year flood elevation	• Require/encourage rapid damage assessment training for staff • Map locations of storm drains, catch basins and dry wells so that they may be located and cleared • Identify and map erosion hazard areas • Develop a tracking program for erosion hazards and their impacts on the community • Pass and enforce an ordinance that regulates dumping in streams and ditches • Develop a stormwater committee • Form a regional watershed council • Incorporate digital floodplain and topographic data into GIS systems, in conjunction with Hazus, to assess risk • Conduct NFIP community workshops to provide information and incentives for property owners to acquire flood insurance. • Increase drainage or absorption capacities with detention and retention basins, relief drains, spillways, drain widening/dredging or rerouting, logjam and debris removal, extra culverts, bridge modification, dike setbacks, flood gates and pumps, or channel redirection

2058

LUBA No. 2020-009
Page 2344

Actions Identified by Steering Committee—Flood		
Reduce Exposure	Reduce Vulnerability	Increase Capability
Government Scale		
• Relocate (through willing seller) existing development in floodplain	• Continue to improve and expand floodplain development regulations to meet higher standards • Develop maps that include information on climate change risk • Designate flood storage/conveyance areas • Expand the willing-seller program to a citywide program • Consider implementing/providing information on flood-resilient building design (allowing and designing for first floors to flood) • Promote and provide publicly accessible information on landscaping techniques that reduce water run-off. • Continue to develop and implement a public education campaign regarding low impact development. Reach out to community leaders and faith based organizations (possibly as pilot projects, signage about projects etc.) • Continue to improve and publicize the stormwater retention program. • Improve effectiveness of development restrictions in the floodplain • Fix Foster Rd flooding problem	• Produce more accurate flood hazard maps or identify areas for further study. Incorporate updated information from FEMA when available. • Convert hard copy first finished floor elevations for structures located in the floodplain into a digital database • Identify potential risk from flooding/channel migration downstream on Johnson Creek toward city boundary • Review and revise current approach to fill relocation projects to include an area specific "mitigation bank" so that the area is expanded beyond the tax lot (BDS and BES partnership) • Develop a system to communicate safe areas for traffic during a flood, and set up easy systems for citizens to report areas of standing water and dangerous roads (BES, PBEM and PBOT partnership) • Develop standard operating procedures that increase communication between PBOT and other agencies to report on flooded road status. • Develop a system to warn underground garages when a flood event is likely so that cars can be moved. Work with owners and operators to identify flood proofing strategies to reduce contaminated runoff from flooded garages. • Implement flood training exercises for pertinent Bureaus. Include exercises for high frequency, low impact events, such as the 10 year flood. • Enhance the flood risk assessment by incorporating waterfront planning exercises and climate change models (BES and BPS) • Reevaluate the willing seller program using an equity lens. Ensure that the program benefits both homeowners and renters.

Landslide

General Mitigation Best Practice—Landslide			
Manipulate Hazard	Reduce Exposure	Reduce Vulnerability	Increase Capability
Public (Individual) Scale			
• **Stabilize slope (de-water, armor toe)** • **Reduce weight on top of slope** • **Minimize vegetation removal and the addition** • **Install rip rap boulders of geotextile fabric** • **Using bioengineered bank stabilization techniques.** • **Use a rock splash pad to direct run off and minimize the potential for erosion**	• Locate structures outside of hazard area (off unstable land and away from slide-run out area)	• Retrofit homes on steep slopes	• Sign up for warning systems • Learn the warning signs that indicate a landslide may occur • Educate yourself on risk reduction techniques for landslide hazards
Private (Business) Scale			
• **Stabilize slope (de-water, armor toe)** • **Reduce weight on top of slope** • **Minimize vegetation removal and the addition of impervious surfaces** • **Using bioengineered bank stabilization techniques.** • **Use a rock splash pad to direct run off and minimize the potential fort erosion**	• Locate structures outside of hazard area (off unstable land and away from slide-run out area)	• Retrofit at risk facilities	• Sign up for warning system and develop evacuation plan • Increase capability by having cash reserves for reconstruction • Educate your employees on the potential exposure to landslide hazards and your emergency response protocol
Government Scale			
• **Monitor/review accumulated effects from piecemeal development on steep slopes** • **Implement post-fire vegetation management plans** • **Coordinate with resource management agencies to identify potential issues from resource extraction activities** • **Using bioengineered bank stabilization techniques.** • **Use a rock splash pad to direct run off an minimize the potential fort erosion**	• Acquire properties located in high risk landslide areas • Adopt land use policies that prohibit the placement of habitable structures in high risk landslide areas • Adopt land use policies that limit accumulated effects in landslide risk areas	• Adopt higher regulatory standards for new development within unstable slope areas • Armor/retrofit critical infrastructure from the impact of landslides • Post signage in landslide hazard areas • Prohibit removal of natural vegetation from slopes • Assess vegetation in wildfire-prone areas to prevent landslides after fires (e.g., encourage plants with strong root systems).	• Produce landslide hazard risk maps • Enact tools to help manage development in hazard areas: better land controls, tax incentives, information, limit new impervious/pervious surfaces • Collect and compile landslide event history database • Develop plan/strategy for communicating risk to property owners/communities recently affected by wildfires • Increase regulatory authority for post-fire mitigation enforcement • Establish and communicate post-event repair responsibilities (e.g. roads that are impacted) • Conduct geological/engineering studies of potential slide areas • Notify property owners in high-risk areas • Develop a brochure describing risk and potential mitigation techniques

Actions Identified by Steering Committee—Landslide	
Reduce Vulnerability	Increase Capability
Government Scale	
• Prohibit onsite infiltration of collected stormwater (offsite drainage) in landslide hazard areas • Require geotechnical study for building/grading in landslide hazard area • Incorporate landslide risk areas in comprehensive plan and increase regulations for risk reduction (see above) • Evaluate disconnect downspouts program/stormwater disconnect program. Do not promote in landside areas. • Develop new stormwater systems to redirect drainage away from landslide hazard. • Utilize landslide data in maintenance plans – roads, utilities, etc., For example, you can build a trench as a drain if used correctly – add as a standard evaluation. • Revisit density, vegetation, stormwater control in zoning. • Establish post-landslide disaster protocol. Geoengineers on retainer for immediate assessment/safety evaluation. Determine level of hazard – 1, 2, 3? Is it time to evacuate? • Develop regulations regarding building and excavation in landslide hazard areas. • Create acquisition program for land/property in high risk areas	• Perform geotechnical assessment of subsurface • Update/establish requirements on impervious surfaces • Re-run HAZUS with new landslide areas (after DOGAMI study is completed) • Appoint a landslide administrator – similar to a flood administrator • Update landslide chapter in 2017 when new DOGAMI data can be included • Correlate historical data on rainfall and landslide events to develop landslide warning thresholds. • Develop an evacuation plan for the Linnton neighborhood that takes landslide risk into consideration. • Explore the feasibility of providing a disaster response facility (not sure if this means police/fire) in Linnton. • Explore the development of post-slide ordinances that regulate redevelopment. • Strengthen land use regulations on landslide risk areas. • Charge an additional permitting fee for construction in high risk areas and set aside these monies for an acquisition program. • Expand the landslide related policies in the St. Johns neighborhood to be applicable citywide. • Compile and update a landslide event history database. • Partner with DOGAMI to ensure city regulations have incorporated the best available data and science. • Perform an in-depth social vulnerability analysis of landslide risk. • Develop and implement a public outreach campaign that educates property owners about landslide risk and possible mitigation measures. • Modify the City Storm Water Manual to include specific guidance based on localized risks (e.g. reporting districts). • Assess fees or taxes for new development in known high-risk areas to offset costs of additional safety and response-oriented infrastructure. • Develop a landslide risk resource center. • Require landslide risk and history in property disclosure forms, transfer of deeds, and renters agreements • Seek funding to assist homeowners in mitigating risk from landslides. Develop quantitative risk ranking system to prioritize projects and report progress. • Implement tax breaks for land owners that implement mitigation strategies in areas at risk for landslides. • Send a letter to each property owner identified on the water hog list to fix leaky water systems.

Severe Weather

General Mitigation Best Practice—Severe Weather			
Manipulate Hazard	Reduce Exposure	Reduce Vulnerability	Increase Capability
Public (Individual) Scale			
• **Increase tree plantings around buildings to shade parking lots and along public rights-of-way**	• None	• Insulate house • Provide redundant heat and power • Plant appropriate trees near home and power lines ("Right tree, right place" National Arbor Day Foundation Program) • Incorporate passive ventilation in the site design. • Secure loose items (i.e., patio furniture)	• Trim or remove trees that could affect power lines • Obtain a NOAA weather radio • Obtain an emergency generator • Identify locations of emergency shelters • Participate in amateur radio groups • Sign up for reverse 911 systems/other notification options • Post address so as to be visible to first responders • Teach school children about the dangers of lightning and how to take safety precautions.
Private (Business) Scale			
• **Increase tree plantings around buildings to shade parking lots and along public rights-of-way.**	• None	• Relocate critical infrastructure, such as power lines, underground • Install tree wire • Install lightning protection devices and methods, such as lightning rods and grounding, on communications infrastructure and other critical facilities • Install and maintain surge protection on critical electronic equipment. • Avoid placing flag poles or antennas near buildings	• Trim or remove trees that could affect power lines • Create redundancy in critical systems • Equip facilities with a NOAA weather radio • Equip vital facilities with emergency power sources

General Mitigation Best Practice—Severe Weather			
Manipulate Hazard	Reduce Exposure	Reduce Vulnerability	Increase Capability
Government Scale			
• **Increase tree plantings around buildings to shade parking lots and along public rights-of-way.**	• None	• Trim trees back from power lines • Designate snow routes and strengthen critical road sections and bridges • Continue/expand participation in Storm Ready programs • Continue to support/maintain/improve notification and warning systems • Support/continue/formalize shelter agreements • Ensure critical facilities have back-up power generation capabilities • Install lightning protection devices on critical facilities and communications equipment • Inspect/ensure facilities can withstand high winds • Encourage construction of guard rails where appropriate • Ensure critical facilities/shelters can easily transition to generator produced power • Stockpile response/preparedness supplies • Install and maintain surge protection on critical electronic equipment • Review building codes and structural policies to ensure they are adequate to protect older structures from wind damage • Use natural environmental features as wind buffers in site design • Incorporate inspection and management of hazardous trees into the drainage system maintenance process. • Preemptively test power line holes to determine if they are rotting • Use designed-failure mode for power line design to allow lines to fall or fail in small sections rather than as a complete system to enable faster restoration • Avoid placing flag poles or antennas near buildings • Convert traffic lights to mast arms	• Support/continue programs such as "Tree Watch" that proactively manage problem areas by use of selective removal of hazardous trees, tree replacement, etc. • Establish and enforce building codes that require all roofs to withstand snow loads and wind speeds • Improve communication alternatives/redundancy • Modify landscape and other ordinances to encourage appropriate planting near overhead power, cable, and phone lines • Provide NOAA weather radios to the public • Encourage coordination with amateur radio groups • Identify/ear mark funding opportunities for generator purchases • Develop evacuation/ emergency road plans and prioritize roads for response efforts • Encourage residents to sign-up for reverse 911 services or other notification services • Encourage/require residents to post addresses where they are visible to first responders • Include safety strategies for severe weather in driver education classes and materials. • Organize outreach to vulnerable populations, including establishing and promoting accessible heating centers in the community

Actions Identified by Steering Committee—Severe Weather Increase Capability
Government Scale
• Develop and implement land use codes and policies to reduce the creation of and impacts from urban heat island effect
• Update/establish requirements on impervious surfaces
• Use current enthusiasm for earthquake preparedness to also encourage preparedness for severe weather.
• Support transit providers by quickly communicating schedule changes and cancellations to the public.
• Support and promote the development of continuity of operations plans for community groups. Include information on scaling based on the incident and certify those businesses meeting certain requirements.
• Develop a resource center for severe weather information and tools.
• Identify mechanisms to fund/administer tree maintenance programs.
• Partner with appropriate agencies to identify mitigation strategies for Route 30.
• Identify ways to address areas of the community where freezing fog and ice are more likely.
• Develop on-call contracts for road and sidewalk sanding support.
• Develop standard operating procedures to increase communication between schools and city emergency management, especially as it pertains to school closures.
• Develop standard operating procedures for coordinating warning and response activities for severe weather events (e.g. moving transient populations away from floodplains and simultaneously opening shelters).
• Enhance outreach to populations more likely to be vulnerable to heat events. Provide information on locally available tools and resources.
• Continue to research new technologies for urban heat island abatement (e.g. glazing).
• Consider implementing/providing information on flood-resilient building design (allowing and designing for first floors to flood)
• Develop a public outreach campaign focused on the nexus between heat waves, wildfires, stagnant air and poor air quality. Provide resources for mitigation.
• Establish a certification program for shelter leaders and managers.
• Partner with local businesses to explore opportunities for increasing access to air conditioned spaces during extreme heat or poor air quality events (e.g. free movie theatre admission).
• Identify suitable locations for cooling shelters that can also be used in the event of poor air quality.
• Partner with neighborhood organizations to improve Community Emergency Response Team (or equivalent program) awareness and membership in all languages and underserved areas.

Space Weather

General Mitigation Best Practice—Space Weather

Volcanic Hazards

General Mitigation Best Practice—Volcano			
Manipulate Hazard	Reduce Exposure	Reduce Vulnerability	Increase Capability
Public (Individual) Scale			
• **None**	• Identify equipment/resources that may be negatively impacted by ash fall and develop plan to move indoors/protect	• None	• Sign up for early warning systems and notifications
Private (Business) Scale			
• **None**	• Identify equipment/resources that may be negatively impacted by ash fall and develop plan to move indoors/protect	• Build redundancy for critical facilities and functions	• Educate employees on impacts and emergency plans
Government Scale			
• **None**	• Identify equipment/resources that may be negatively impacted by ash fall and develop plan to move indoors/protect	• Retrofit older building stock to be able to support accumulated ash fall loads	• Develop post-event cleanup plan

Actions Identified by Steering Committee—Volcano
Increase Capability
Government Scale
• Identify innovative ways to seek funding for private air conditioners.
• Continue to participate in and support updates of regional ash management plan.
• Research and develop lessons learned from Mt. St. Helens ash management response.

Wildfire

General Mitigation Best Practice—Wildfire			
Manipulate Hazard	Reduce Exposure	Reduce Vulnerability	Increase Capability
Public (Individual) Scale			
• **Clear potential fuels on property: dry, overgrown underbrush, diseased trees**	• Create and maintain defensible space around structures • Reduce exposure -- Locate outside of hazard area • Mow regularly • Stay clear of hazard areas during a wildfire event	• Create and maintain defensible space around structures, provide water on site. • Use fire-retardant building materials • Create defensible spaces around your home	• Employ "Firewise" techniques to safeguard your home • Identify alternative water supplies for fire fighting • Install/replace roofing material with non-combustible roofing materials • Ensure that all fuel-burning equipment should be vented to the outside • Install carbon monoxide monitors and alarms.
Private (Business) Scale			
• **Clear potential fuels on property: dry underbrush, diseased trees**	• Create and maintain defensible space around structures and infrastructure • Reduce exposure -- Locate outside of hazard area	• Create and maintain defensible space around structures and infrastructure, provide water on site • Use fire-retardant building materials	• Support "Firewise" community initiatives • Create /establish stored water supplies to be utilized for fire fighting
Government Scale			
• **Clear fuels (dry underbrush, diseased trees) on land that can trigger and maintain wildfires** • **Implement "Best Management Practices" on public lands** • **Partner with local communities to create fire breaks**	• Create and maintain defensible space around structures and infrastructure • Enhance building code to include use of fire resistant materials in high hazard areas • Reduce exposure -- Locate outside of hazard area	• Create and maintain defensible space around structures and infrastructure • Use fire-retardant building materials • Develop/implement higher regulatory standards in wildfire hazard areas • Develop/support biomass reclamation initiatives • Increase regulatory requirements/code enforcement for fire risk reduction or incentivize higher standards • Develop fire smart building code regulations • Implement road side vegetation management best practices • Conduct pre-construction building inspections that include fire prevention requirements and provide emphasis on a fire resistant structure • Develop programs to identify/install wildland fire water supply systems such as cisterns, ponds and dry hydrants • Involve fire protection agencies in determining guidelines and standards and in development and site plan review procedures • Enclose the foundations of homes and other buildings in wildfire-prone areas, rather than leaving them open and potentially exposing undersides to blown embers or other materials. • Prohibit wooden shingles/wood shake roofs on any new development in areas prone to wildfires. • Routinely inspect the functionality of fire hydrants • Use prescribed burning to reduce fuel loads that threaten public safety and property.	• Seek alternative water supplies in urban wildland interface areas • Become a "Firewise" community • Utilize academia to study impacts/solutions to wildfire risk • Create/implement/update wildfire protection plans • Develop evacuation/ emergency road plans and prioritize roads for response efforts • Provide public outreach to increase understanding of forest management practices • Enhance/provide redundant communication infrastructure • Require/encourage rapid damage assessment training • Pre-plan responses to wildland urban interface areas • Use zoning and/or a special wildfire overlay district to designate high-risk areas and specify the conditions for the use and development of specific areas • Develop a vegetation management plan • Work with insurance companies, utility providers, and others to include wildfire safety information in materials provided to area residents

Actions Identified by Steering Committee—Wildfire	
Reduce Vulnerability	Increase Capability
Government Scale	
• Develop and implement invasive species management plans. Research best management practices and partner with local, regional organizations (e.g. colleges, fire districts, State) • Take advantage of allowances for City-specific building codes that restrict building materials (more stringent than State) • Partner with regional stakeholders to identify critical facilities that are in hazard risk areas. Review and prioritize mitigation activities, such as the creation of defensible space. • Develop guidelines regarding the construction of critical facilities in wildfire risk areas (disclose the risk, educate the company interested, regulate the land) • Analyze and identify wildfire evacuation routes in different neighborhoods and areas. Take into account bridges, transportation routes and disability access. • Retrofit fire and police stations in order to strengthen their current capabilities and ensure the safety of these emergency responders during a disaster. Where possible, strengthen facilities to higher than life safety standards. • Promote drought tolerant, fire resistant plants and the backyard habitat program.	• Develop regulations that specifically address urban wildfire interface zones • Update hazard maps using the newly developed LiDAR and vegetation class data • Plan for integration of defensible space and natural resource habitat management • Educate the public on wildfire risk and promote wildfire risk reduction measures. • Expand and improve public education and information programs about fire prevention, especially fireworks. • Educate the public and disseminate information about the evacuation routes. • Create wildfire evacuation route signs • Analyze and identify the locations of fire stations/boats and response times of firefighters in communities. See where there are major gaps and lack of fire support-take in to account the use of bridges and other transit routes that may be compromised. • Explore the feasibility of establishing a fire station and/or hazmat response team in or near Linnton. • Identify ways to enhance fire prevention and incorporate forest health (e.g. prescribed burns). • Promote and support the FireWise program in appropriate neighborhoods. • Continue increased patrols in watersheds and continue to help fund water towers. • Continue to identify and seek solutions for problem areas along the Pacifica Crest Trail. • Continue to require water bureau staff in the watershed to carry small fire fighting capabilities when risk level is at 3 or above. • Develop a secondary improved access from Lolo Pass for wildfire fighting Bull Run Watershed. • Develop a protocol for the use of in town reservoir water for emergency water supplies in the event of an urban fire. • Evaluate urban and wildfire risk from Cascadia Subduction Zone event and develop strategy to reduce risks. • Use Mt. Tabor reservoir for firefighting after earthquake • Fill Mt. Tabor reservoir with petroleum

The Mitigation Action Plan

Appendix J. Expectations for Participating Bureaus

J. EXPECTATIONS FOR PARTICIPATING BUREAUS

PLANNING PARTNER EXPECTATIONS

ACHIEVING CITYWIDE RESILIENCE TO NATURAL HAZARDS

City of Portland bureaus manage city infrastructure, plan for long-term capital improvement and community-level investments, and administer a wide variety of programs. These activities play a role in the city's resilience to natural hazards. There are many things that bureaus can do now as part of their normal activities – or add to their portfolios when opportunities arise – to reduce Portland's risk from natural hazards over time and improve the city's ability to bounce back when natural hazard events do happen. These projects and programs together contribute to Portland's *Mitigation Action Plan* (MAP), the city's overall strategy for reducing its risk from natural hazards. They also help achieve compliance with the Disaster Mitigation Act of 2000 (DMA 2000), a federal law that requires local jurisdictions to have a federally-approved hazard mitigation plan to ensure eligibility for pre- and post-disaster grant funding. As stewards of the city's assets and services, bureaus share responsibility for mitigating natural hazard risks and maintaining the city's compliance with DMA 2000. Portland Bureau of Emergency Management (PBEM) oversees the update process for the MAP, but the MAP is not "PBEM's plan". It belongs to the City of Portland as a whole, and each bureau has a stake in the development of the plan and implementation of mitigation actions.

GROUPS INVOLVED IN THE PLANNING PROCESS

Because of Portland's commission form of government, bureaus operate relatively independently of one another. This independence has led the MAP planning team to adopt the approach typically used for multi-jurisdictional plans. One of the goals of the multi-jurisdictional approach to hazard mitigation planning is to efficiently achieve compliance with the Disaster Mitigation Act (DMA) for all participating members in the planning effort, citywide compliance in this case. There are several groups who will be involved in this process at different levels, which include:

- **Planning Team—**the Tetra Tech team and PBEM staff responsible for the facilitation of the planning process and the development of the plan document.
- **Steering Committee—**representative members from the community and city bureaus and offices that serve as the oversight body. They are responsible for many of the planning milestones and decisions prescribed for this process.
- **Planning Partners—**City of Portland bureaus and offices which manage infrastructure and administer programs included or potentially included as part of the city's hazard mitigation strategy
- **Planning Stakeholders—**the individuals, groups, businesses, academia, etc., from which the planning team gains information to support the various elements of the plan. This group may also be referred to as coordinating stakeholders.

ESTIMATED TIME COMMITMENT

The total time required of planning partners is dependent upon the number of mitigation action items each bureau commits to implementing or pursuing funding to implement. At a minimum, bureau representatives should expect to participate in an all-bureau workshop in mid-May, 2016 and an annual reporting and update meeting.

DEFINITION OF PARTICIPATION

For this planning process, planning partners must meet the following participation requirements:

- **Complete a letter of intent.** Provide a "Letter of Intent to participate" (see exhibit A).
- **Designate points of contact.** Designate a primary and secondary point of contact for this effort. These designees will be listed as the hazard mitigation points of contact for your bureau in the plan. Points of contact will be responsible for gathering progress reporting information for the planning team.
- **Attend bureau workshop.** In mid-May, the planning team will hold a workshop for all City of Portland bureaus and offices that manage city assets or administer programs that are included or potentially included in the hazard mitigation strategy. All such bureaus and offices should plan to attend this workshop. At the workshop, bureau representatives will be expected to provide information on existing programs and capabilities, review the 2010 mitigation strategy and recommend actions to roll over, and pledge support for the final mitigation recommendations that fall under their portfolio. Each approved action item must have commitment from one bureau to act as lead implementing bureau.
- **Apply an equity lens to project selection, development, and prioritization.** An equity worksheet has been provided for bureaus to be used in action item selection, development, and prioritization. Bureau representatives have a deep understanding of the work they do and the communities that are affected by their work. Bureaus should use this knowledge to work through the prioritization worksheet provided by the planning team to select action items that provide the most benefit possible to underserved and potentially vulnerable populations, while minimizing any disproportionate burden or adverse effects on these groups. Project implementation should also be carried out with these considerations.
- **Pursue mitigation implementation opportunities.** When opportunities arise to implement actions identified as priorities in the hazard mitigation plan, bureaus should pursue these opportunities to the extent they are able. This may include pursing grant funding, reallocating available resources to mitigation actions, or incorporating mitigation actions into existing or planned projects or programs.
- **Attend annual reporting and update meeting.** Over the five-year implementation period, bureaus will meet on an annual basis to report progress and make updates to the MAP as necessary.

If possible, bureau representatives are also encouraged to:

- **Support the steering committee.** A steering committee is already in place for this planning process, with representation from PBOT, PBEM, OEHR, ONI, BES, BPS, BDS, BPS, PF&R, and PP&R. The committee is tasked with overseeing the development of the plan and will become an oversight body throughout implementation. Steering committee meetings are not mandatory meetings for all planning partners, but all bureaus and offices are encouraged to remain engaged with this process and attend meetings as possible.

- **Support the public involvement strategy.** The planning team will also request support from bureau partners during the implementation of the public involvement strategy developed by the steering committee. Support could be in the form of providing venues for public meetings, attending these meetings as meeting participants, providing technical support, providing access to mailing lists, providing existing public information materials, etc.

Via email at: TheMAP@portlandoregon.gov

City of Portland Mitigation Action Plan Planning Team,

Please be advised that the _____ (***insert bureau or office name***) is committed to participating in the development and implementation of the City of Portland Natural Hazard Mitigation Plan. As the _____ (title, e.g., Chief Administrative Official) for this bureau/office, I certify that I will commit all necessary resources in order to meet expectations as outlined in the "Planning Partners expectations" document provided by the planning team, in order to obtain citywide Disaster Mitigation Act (DMA) compliance and meet citywide equity goals outlined in the 2012 Portland Plan and this hazard mitigation plan process.

Mr./Ms. _____ will be our bureau/office's primary point of contact for this process and they can be reached at ***(insert: address, phone number and e-mail address)***. Mr./Ms. _____ will be our bureau/office's secondary point of contact for this process and they can be reached at ***(insert: address, phone number and e-mail address)***.

Sincerely,

_____

Appendix K. Progress Report Template

The Mitigation Action Plan

20XX Progress Report

REPORTING PERIOD

MONTH 20XX through MONTH 20XX

BACKGROUND

The City of Portland has developed and maintained a natural hazard mitigation plan, most recently updated in 2016. *The Mitigation Action Plan* (MAP) identifies resources, information, and strategies for reducing risk associated with natural hazards in the city. The plan was adopted in 2016 and approved by FEMA Region X on __DATE__.

By preparing the 2016 update, the City maintained compliance with the federal Disaster Mitigation Act (DMA) and retained eligibility for hazard mitigation grant funding under the federal Robert T. Stafford Act. The plan is available to the public online at the following website:

https://www.portlandoregon.gov/pbem/53813

As part of the 2016 plan update process, a linkage procedure was established whereby eligible special purpose districts and other local governments within Portland could link to the base plan by creating jurisdictional annexes that assess risk to jurisdiction-specific facilities and develop mitigation actions to reduce these risks. During the reporting period X jurisdictions submitted a letter of intent to follow the linkage procedure and gain DMA compliance. *Provide a status update of any linked jurisdictions (e.g. in plan development, submitted to the state for review, etc.). If any eligible jurisdictions have completed linkage, the status their actions should also be included in the progress report.*

Purpose

This progress report provides an update on implementation of the MAP. It was prepared by the MAP planning team and reviewed by the 20XX mitigation action plan working group. The objective is to ensure that there is a continuous planning process that keeps the MAP plan responsive to stakeholder needs and capabilities. This progress reports includes the following:

- Summary overview of action plan progress
- Summary of any hazard events that occurred during the reporting period and the impact these events had on Portland;
- Review of the data utilized for this planning process as well as identified gaps and identification of any newly available or updated datasets;

- Listing of any newly published or updated reports or studies that should be incorporated into the next plan update process;
- Review of mitigation success stories;
- Review of continuing public engagement;
- Brief discussion about why actions were not completed or have not been initiated;
- Reevaluation of the action plan to determine if the timeline for identified projects needs to be amended (such as changing a long-term project to a short-term project because of new funding);
- Review of data that was or should be collected for any equity identified actions (e.g. High-E).
- Review of the Steering Committee recommended actions (see Appendix I of the MAP) and recommendations for new actions based on new or enhanced capabilities identified by lead agencies or next steps in actions identified in the 2016 action plan;
- Changes in or potential for new funding options (grant opportunities);
- Impacts of changes in other planning programs or projects that involve hazard mitigation; and
- Identification of training needs or additional guidance, such as benefit-cost analysis or E-grants training or additional equity guidance.

The Natural Hazard Mitigation Plan Working Group

The natural hazard mitigation plan working group holds an evolving role in plan implementation, based on the hazard mitigation needs of the City. The working group meets on a quarterly basis to discuss issues related to the MAP implementation. There were X meetings held during the reporting period. Issues discussed by the committee included:

- Date—Agenda items, issues or objectives
- Date—Agenda items, issues or objectives
- Date—Agenda items, issues or objectives

Table 1 lists current Mitigation Action Plan Working Group membership.

REVIEW OF THE ACTION PLAN

This section reviews the action plan and lists the status of each action from the MAP, grouped by the bureau or jurisdiction responsible for its completion. The action plan matrix in Table 4 provides the following information:

- Brief summary of action
- Indication of whether any action has been taken
- Current timeline
- Indication of whether the project priority has changed
- Status (complete, ongoing or no progress)
- Comments, including the following information:
  - Was any element of the action carried out during the reporting period?
  - If no action was completed, why?
  - Is the timeline for implementation for the action still appropriate?
  - Has a new funding source been identified?
  - If the action was completed, does it need to be changed or removed from the action plan or should the action be revised to reflect the next step in action implementation?
  - If the action was identified as an equity action, what data is or should be collected to assess performance?

PORTLAND CHANGES THAT MAY IMPACT PLAN IMPLEMENTATION

To Be Completed

With these changes in mind, lead agencies have reviewed the steering committee recommended actions developed during the 2016 plan update. Because of newly acquired capabilities (e.g. staff, funding, technical assistance, etc.) the following actions shown in Table 4 will be added to the action plan as they are now feasible.

Table-4. Newly Selected Actions for Implementation

Appendix L. FEMA Local Mitigation Plan Review Tool

L. FEMA Local Mitigation Plan Review Tool

The *Local Mitigation Plan Review Tool* demonstrates how the Local Mitigation Plan meets the regulation in 44 CFR §201.6 and offers States and FEMA Mitigation Planners an opportunity to provide feedback to the community.

- The Regulation Checklist provides a summary of FEMA's evaluation of whether the Plan has addressed all requirements.
- The Plan Assessment identifies the plan's strengths as well as documents areas for future improvement.
- The Multi-jurisdiction Summary Sheet is an optional worksheet that can be used to document how each jurisdiction met the requirements of the each Element of the Plan (Planning Process; Hazard Identification and Risk Assessment; Mitigation Strategy; Plan Review, Evaluation, and Implementation; and Plan Adoption).

The FEMA Mitigation Planner must reference this *Local Mitigation Plan Review Guide* when completing the *Local Mitigation Plan Review Tool*.

SECTION 1:

REGULATION CHECKLIST

INSTRUCTIONS: The Regulation Checklist must be completed by FEMA. The purpose of the Checklist is to identify the location of relevant or applicable content in the Plan by Element/sub-element and to determine if each requirement has been 'Met' or 'Not Met.' The 'Required Revisions' summary at the bottom of each Element must be completed by FEMA to provide a clear explanation of the revisions that are required for plan approval. Required revisions must be explained for each plan sub-element that is 'Not Met.' Sub-elements should be referenced in each summary by using the appropriate numbers (A1, B3, etc.), where applicable. Requirements for each Element and sub-element are described in detail in this *Plan Review Guide* in Section 4, Regulation Checklist.

1. REGULATION CHECKLIST **Regulation** (44 CFR 201.6 Local Mitigation Plans)	**Location in Plan** (section and/or page number)	**Met**	**Not Met**
ELEMENT A. PLANNING PROCESS			
A1. Does the Plan document the planning process, including how it was prepared and who was involved in the process for each jurisdiction? (Requirement §201.6(c)(1))	Part 1, Chapter 3 (Plan Update Approach) and Section 3.8 (Plan Development Chronology/Milestones) and Section 3.2 (Formation of the Planning Team) and Section 3.5 (the Steering Committee) and Section 3.6 (Coordination with Other Agencies) Part 1, Chapter 2 (Plan Update – What Has Changed)		
A2. Does the Plan document an opportunity for neighboring communities, local and regional agencies involved in hazard mitigation activities, agencies that have the authority to regulate development as well as other interests to be involved in the planning process? (Requirement §201.6(b)(2))	Part 1, Chapter 3, Section 3.4 (Plan Kick-off); Section 3.5 (The Steering Committee); Section 3.6 (Coordination with Other Agencies); Section 3.7.3 (Critical Energy Infrastructure Hub Stakeholder Outreach)		
A3. Does the Plan document how the public was involved in the planning process during the drafting stage? (Requirement §201.6(b)(1))	Part 1, Chapter 3, Section 3.7 (Public Engagement Strategy) and Appendix C (Public Engagement Materials)		

1. REGULATION CHECKLIST **Regulation** (44 CFR 201.6 Local Mitigation Plans)	Location in Plan (section and/or page number)	Met	Not Met
A4. Does the Plan describe the review and incorporation of existing plans, studies, reports, and technical information? (Requirement §201.6(b)(3))	Part 1, Chapter 4, Section 4.9 (Laws, Ordinances and Programs) Part 2, Chapter 6, Section 6.1 (Overall Risk Assessment Methodology); Table 6-1 (Summary of Data Used for Spatial analysis); Section 6.8 (Data sources, limitations and gaps) Part 3, Chapter 17 (Vision, Mission, Goals and Objectives) Part 3, Chapter 19, Section 19.3 (Actions Selected for Implementation in the 2016 Plan) and Section 19.5.5, Subsection (Plan Integration for the Mitigation Action Plan) References cited throughout (see References section)		
A5. Is there discussion of how the community(ies) will continue public participation in the plan maintenance process? (Requirement §201.6(c)(4)(iii))	Part 3, Chapter 19, Section 19.5.7 (Continued Public Engagement and Access)		
A6. Is there a description of the method and schedule for keeping the plan current (monitoring, evaluating and updating the mitigation plan within a 5-year cycle)? (Requirement §201.6(c)(4)(i))	Part 3, Chapter 19, Section 19.5.4 (Annual Progress Report); Section 19.5.6, Subsection (Plan Update); Section 19.5.1 Plan Implementation		
ELEMENT A: REQUIRED REVISIONS			
ELEMENT B. HAZARD IDENTIFICATION AND RISK ASSESSMENT			
B1. Does the Plan include a description of the type, location, and extent of all natural hazards that can affect each jurisdiction(s)? (Requirement §201.6(c)(2)(i))	Part 2, Chapter 5 (Hazards and Compounding Factors) Part 2, Chapters 7 through 14, Section X.1 General Background, Section X.2 (Hazard Profile) and X.4 (Exposure)		
B2. Does the Plan include information on previous occurrences of hazard events and on the probability of future hazard events for each jurisdiction? (Requirement §201.6(c)(2)(i))	Part 2, Chapters 7 through 14, Section X.2.1 (Past Events); X.2.4 (Frequency) Part 2, Chapter 16, Section 16.1 (Probability of Occurrence)		

1. REGULATION CHECKLIST **Regulation** (44 CFR 201.6 Local Mitigation Plans)	Location in Plan (section and/or page number)	Met	Not Met
B3. Is there a description of each identified hazard's impact on the community as well as an overall summary of the community's vulnerability for each jurisdiction? (Requirement §201.6(c)(2)(ii))	Part 2, Chapter 7 through 14, Section X.4 (Exposure) and X.5 (Vulnerability); , Sections X.8 (Issues) Part 2, Chapter 16 (Risk Ranking)		
B4. Does the Plan address NFIP insured structures within the jurisdiction that have been repetitively damaged by floods? (Requirement §201.6(c)(2)(ii))	Part 2, Chapter 11, Section 11.5.2, Sub-section (Repetitive Loss)		
ELEMENT B: REQUIRED REVISIONS			
ELEMENT C. MITIGATION STRATEGY			
C1. Does the plan document each jurisdiction's existing authorities, policies, programs and resources and its ability to expand on and improve these existing policies and programs? (Requirement §201.6(c)(3))	Part 1, Chapter 4, Section 4.9.3 (Local)		
C2. Does the Plan address each jurisdiction's participation in the NFIP and continued compliance with NFIP requirements, as appropriate? (Requirement §201.6(c)(3)(ii))	Part 2, Chapter 11, Section 11.2.7 (Flood Management Programs and Projects)		
C3. Does the Plan include goals to reduce/avoid long-term vulnerabilities to the identified hazards? (Requirement §201.6(c)(3)(i))	Part 3, chapter 17 (Vision, Mission, Goals and Objectives)		
C4. Does the Plan identify and analyze a comprehensive range of specific mitigation actions and projects for each jurisdiction being considered to reduce the effects of hazards, with emphasis on new and existing buildings and infrastructure? (Requirement §201.6(c)(3)(ii))	Part 3, Chapter 18 (Mitigation Alternatives) Appendix I Mitigation Best Practices Catalog Chapter 19, Section 19.3 (Actions Selected for Implementation in the 2016 Plan); Section 19.3.2 (Selected Actions)		
C5. Does the Plan contain an action plan that describes how the actions identified will be prioritized (including cost benefit review), implemented, and administered by each jurisdiction? (Requirement §201.6(c)(3)(iv)); (Requirement §201.6(c)(3)(iii))	Part 3, Chapter 19, Section 19.3.4 (Action Plan Prioritization); Section 19.3.3 (Action Plan Benefit-Cost Review); Section 19.3.2 (Selected Actions); and Table 19-4 (Actions Selected for Implementation)		

1. REGULATION CHECKLIST **Regulation** (44 CFR 201.6 Local Mitigation Plans)	Location in Plan (section and/or page number)	Met	Not Met
C6. Does the Plan describe a process by which local governments will integrate the requirements of the mitigation plan into other planning mechanisms, such as comprehensive or capital improvement plans, when appropriate? (Requirement §201.6(c)(4)(ii))	Part 3, Chapter 19, Section 19.5.5, Subsection (Plan Integration for the Mitigation Action Plan) Part 1, Chapter 4, Section 4.9.3 (Local); Part 3, Chapter 19, Section 19.3.2, Table 19-4 (Actions Selected for Implementation); and Section 19.3.4, Table 19-5 (Prioritization of Mitigation Actions) Part 3, Chapter 19, Section 19.5.5, Subsection (Plan Integration During the 2010 NHMP Performance Period)		
ELEMENT C: REQUIRED REVISIONS			
ELEMENT D. PLAN REVIEW, EVALUATION, AND IMPLEMENTATION (applicable to plan updates only)			
D1. Was the plan revised to reflect changes in development? (Requirement §201.6(d)(3))	Part 1, Chapter 2, Section 2.2.2 (Changes in Development) Chapters 7 through 14, Sections X.5 (Future Trends in Development)		
D2. Was the plan revised to reflect progress in local mitigation efforts? (Requirement §201.6(d)(3))	Part 3, Chapter 19, Section 19.2 (Status of Previous Plan Actions)		
D3. Was the plan revised to reflect changes in priorities? (Requirement §201.6(d)(3))	This plan update utilized a different prioritization scheme from original plan. Therefore, all actions were reprioritized. In general, Portland has increased its focus and attention on public engagement and equity and the entire plan and planning process was revised to address this shift in priorities. Part 1, Chapter 2, Section 2.2.3 (Focus on Public Engagement and Equity) Part 3, Chapter 19, Section 19.3.1 (Equity Analysis Screening) and Section 19.3.4 (Action Plan Prioritization)		
ELEMENT D: REQUIRED REVISIONS			

1. REGULATION CHECKLIST **Regulation** (44 CFR 201.6 Local Mitigation Plans)	Location in Plan (section and/or page number)	Met	Not Met
ELEMENT E. PLAN ADOPTION			
E1. Does the Plan include documentation that the plan has been formally adopted by the governing body of the jurisdiction requesting approval? (Requirement §201.6(c)(5))	Pre-adoption review request – Adoption scheduled for October 19		
E2. For multi-jurisdictional plans, has each jurisdiction requesting approval of the plan documented formal plan adoption? (Requirement §201.6(c)(5))	N/A		
ELEMENT E: REQUIRED REVISIONS			
ELEMENT F. ADDITIONAL STATE REQUIREMENTS (OPTIONAL FOR STATE REVIEWERS ONLY; NOT TO BE COMPLETED BY FEMA)			
F1.			
F2.			
ELEMENT F: REQUIRED REVISIONS			

SECTION 2:

PLAN ASSESSMENT

INSTRUCTIONS: The purpose of the Plan Assessment is to offer the local community more comprehensive feedback to the community on the quality and utility of the plan in a narrative format. The audience for the Plan Assessment is not only the plan developer/local community planner, but also elected officials, local departments and agencies, and others involved in implementing the Local Mitigation Plan. The Plan Assessment must be completed by FEMA. The Assessment is an opportunity for FEMA to provide feedback and information to the community on: 1) suggested improvements to the Plan; 2) specific sections in the Plan where the community has gone above and beyond minimum requirements; 3) recommendations for plan implementation; and 4) ongoing partnership(s) and information on other FEMA programs, specifically RiskMAP and Hazard Mitigation Assistance programs. The Plan Assessment is divided into two sections:

1. Plan Strengths and Opportunities for Improvement
2. Resources for Implementing Your Approved Plan

Plan Strengths and Opportunities for Improvement is organized according to the plan Elements listed in the Regulation Checklist. Each Element includes a series of italicized bulleted items that are suggested topics for consideration while evaluating plans, but it is not intended to be a comprehensive list. FEMA Mitigation Planners are not required to answer each bullet item, and should use them as a guide to paraphrase their own written assessment (2-3 sentences) of each Element.

The Plan Assessment must not reiterate the required revisions from the Regulation Checklist or be regulatory in nature, and should be open-ended and to provide the community with suggestions for improvements or recommended revisions. The recommended revisions are suggestions for improvement and are not required to be made for the Plan to meet Federal regulatory requirements. The italicized text should be deleted once FEMA has added comments regarding strengths of the plan and potential improvements for future plan revisions. It is recommended that the Plan Assessment be a short synopsis of the overall strengths and weaknesses of the Plan (no longer than two pages), rather than a complete recap section by section.

Resources for Implementing Your Approved Plan provides a place for FEMA to offer information, data sources and general suggestions on the overall plan implementation and maintenance process. Information on other possible sources of assistance including, but not limited to, existing publications, grant funding or training opportunities, can be provided. States may add state and local resources, if available.

A. Plan Strengths and Opportunities for Improvement

This section provides a discussion of the strengths of the plan document and identifies areas where these could be improved beyond minimum requirements.

Element A: Planning Process

How does the Plan go above and beyond minimum requirements to document the planning process with respect to:

- *Involvement of stakeholders (elected officials/decision makers, plan implementers, business owners, academic institutions, utility companies, water/sanitation districts, etc.);*
- *Involvement of Planning, Emergency Management, Public Works Departments or other planning agencies (i.e., regional planning councils);*
- *Diverse methods of participation (meetings, surveys, online, etc.); and*
- *Reflective of an open and inclusive public involvement process.*

Element B: Hazard Identification and Risk Assessment

In addition to the requirements listed in the Regulation Checklist, 44 CFR 201.6 Local Mitigation Plans identifies additional elements that should be included as part of a plan's risk assessment. The plan should describe vulnerability in terms of:

1) *A general description of land uses and future development trends within the community so that mitigation options can be considered in future land use decisions;*
2) *The types and numbers of existing and future buildings, infrastructure, and critical facilities located in the identified hazard areas; and*
3) *A description of potential dollar losses to vulnerable structures, and a description of the methodology used to prepare the estimate.*

How does the Plan go above and beyond minimum requirements to document the Hazard Identification and Risk Assessment with respect to:

- *Use of best available data (flood maps, HAZUS, flood studies) to describe significant hazards;*
- *Communication of risk on people, property, and infrastructure to the public (through tables, charts, maps, photos, etc.);*
- *Incorporation of techniques and methodologies to estimate dollar losses to vulnerable structures;*
- *Incorporation of Risk MAP products (i.e., depth grids, Flood Risk Report, Changes Since Last FIRM, Areas of Mitigation Interest, etc.); and*
- *Identification of any data gaps that can be filled as new data became available.*

Element C: Mitigation Strategy

How does the Plan go above and beyond minimum requirements to document the Mitigation Strategy with respect to:

- *Key problems identified in, and linkages to, the vulnerability assessment;*
- *Serving as a blueprint for reducing potential losses identified in the Hazard Identification and Risk Assessment;*
- *Plan content flow from the risk assessment (problem identification) to goal setting to mitigation action development;*
- *An understanding of mitigation principles (diversity of actions that include structural projects, preventative measures, outreach activities, property protection measures, post-disaster actions, etc.);*
- *Specific mitigation actions for each participating jurisdictions that reflects their unique risks and capabilities;*
- *Integration of mitigation actions with existing local authorities, policies, programs, and resources; and*
- *Discussion of existing programs (including the NFIP), plans, and policies that could be used to implement mitigation, as well as document past projects.*

Element D: Plan Update, Evaluation, and Implementation (*Plan Updates Only*)

How does the Plan go above and beyond minimum requirements to document the 5-year Evaluation and Implementation measures with respect to:

- *Status of previously recommended mitigation actions;*
- *Identification of barriers or obstacles to successful implementation or completion of mitigation actions, along with possible solutions for overcoming risk;*
- *Documentation of annual reviews and committee involvement;*
- *Identification of a lead person to take ownership of, and champion the Plan;*
- *Reducing risks from natural hazards and serving as a guide for decisions makers as they commit resources to reducing the effects of natural hazards;*
- *An approach to evaluating future conditions (i.e. socio-economic, environmental, demographic, change in built environment etc.);*
- *Discussion of how changing conditions and opportunities could impact community resilience in the long term; and*
- *Discussion of how the mitigation goals and actions support the long-term community vision for increased resilience.*

B. Resources for Implementing Your Approved Plan

Ideas may be offered on moving the mitigation plan forward and continuing the relationship with key mitigation stakeholders such as the following:

- *What FEMA assistance (funding) programs are available (for example, Hazard Mitigation Assistance (HMA)) to the jurisdiction(s) to assist with implementing the mitigation actions?*
- *What other Federal programs (National Flood Insurance Program (NFIP), Community Rating System (CRS), Risk MAP, etc.) may provide assistance for mitigation activities?*
- *What publications, technical guidance or other resources are available to the jurisdiction(s) relevant to the identified mitigation actions?*
- *Are there upcoming trainings/workshops (Benefit-Cost Analysis (BCA), HMA, etc.) to assist the jurisdictions(s)?*
- *What mitigation actions can be funded by other Federal agencies (for example, U.S. Forest Service, National Oceanic and Atmospheric Administration (NOAA), Environmental Protection Agency (EPA) Smart Growth, Housing and Urban Development (HUD) Sustainable Communities, etc.) and/or state and local agencies?*

SECTION 3:

MULTI-JURISDICTION SUMMARY SHEET (OPTIONAL)

INSTRUCTIONS: For multi-jurisdictional plans, a Multi-jurisdiction Summary Spreadsheet may be completed by listing each participating jurisdiction, which required Elements for each jurisdiction were 'Met' or 'Not Met,' and when the adoption resolutions were received. This Summary Sheet does not imply that a mini-plan be developed for each jurisdiction; it should be used as an optional worksheet to ensure that each jurisdiction participating in the Plan has been documented and has met the requirements for those Elements (A through E).

MULTI-JURISDICTION SUMMARY SHEET													
							Requirements Met (Y/N)						
#	Jurisdiction Name	Jurisdiction Type (city/ borough/ township/ village, etc.)	Plan POC	Mailing Address	Email	Phone	A. Planning Process	B. Hazard Identification & Risk Assessment	C. Mitigation Strategy	D. Plan Review, Evaluation & Implementation	E. Plan Adoption	F. State Require-ments

Fossil Fuel Terminal Zoning Amendments: Proposed Draft

PSC Work Session
October 11, 2016

Bureau of Planning and Sustainability
Innovation. Collaboration. Practical Solutions.

New policy direction on fossil fuel infrastructure

Fossil Fuel Infrastructure Resolution, November 2015:

1. Actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways.
2. But do not restrict. . .
   - improvements in the safety, efficiency, seismic resilience, or operations of existing infrastructure
   - service directly to end users
   - infrastructure that will accelerate the transition to non-fossil fuel energy sources

2035 Comprehensive Plan

Policy 6.48 Fossil fuel distribution. Limit fossil fuel distribution and storage facilities to those necessary to serve the regional market.

Proposed zoning code amendments

- **Define** Bulk Fossil Fuel Terminals as a regulated land use.
- **Prohibit** Bulk Fossil Fuel Terminals in all base zones.
- Existing Bulk Fossil Fuel Terminals would become legal, non-conforming uses that can continue to operate.

Code Issues

- Storage capacity threshold and aggregation of small facilities
- Regulating existing terminals
- Exemption for regulated utilities
- Other issues

New land use category:
Bulk Fossil Fuel Terminals

Bulk Fossil Fuel Terminals:

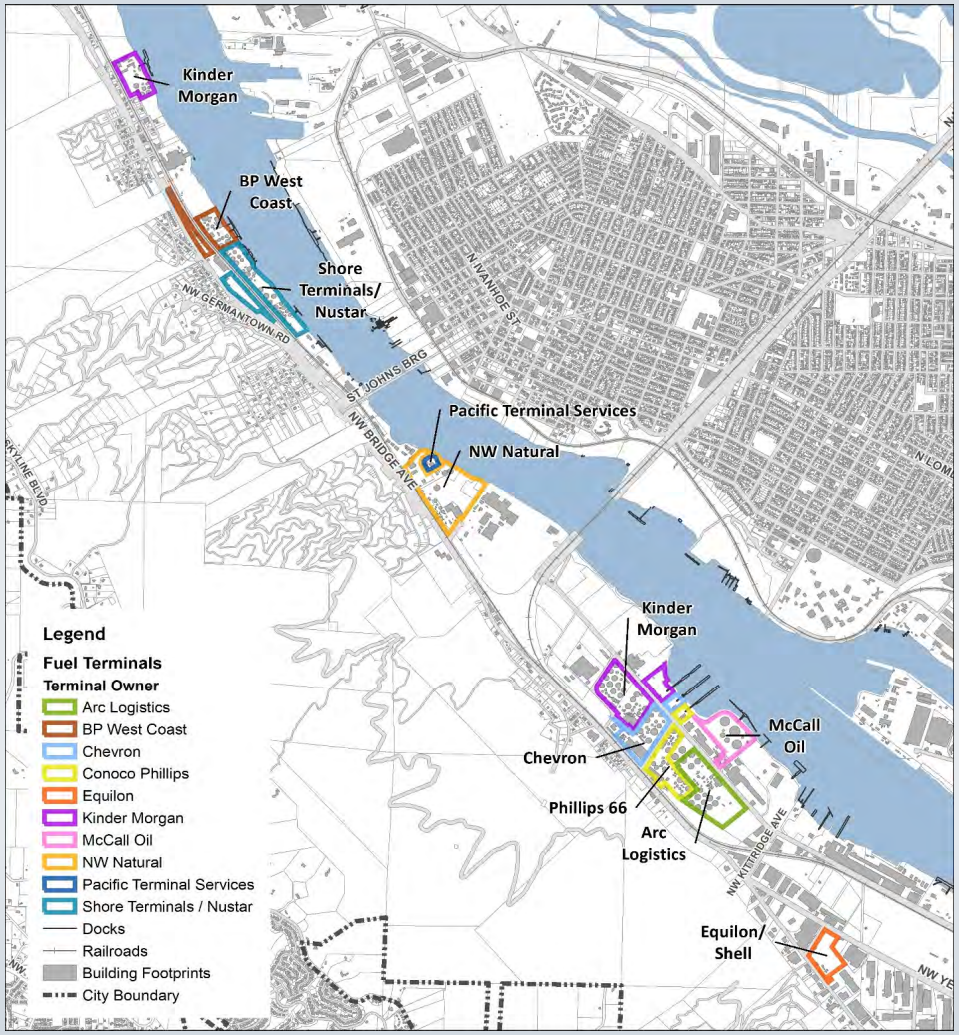
- Marine, railroad, or pipeline transport access; and
- Transloading facilities (such as train-to-ship) or storage capacity exceeding 5 million gallons.

Exclusions:

- Distributors with access exclusively by truck;
- End-user facilities, including filling stations and firms that store fossil fuels for use as an input;
- Recovery or reprocessing used petroleum

Storage Capacity Threshold

- Proposed draft: threshold is 5 million gallons
- Possible amendments:
  1. Reduce threshold
  2. Add language to prevent aggregation of small facilities
  3. Add language to clarify status of rail yards and pipelines



Aggregation of Small Facilities

- Zoning Code (33.910.030) definition of "ownership":

  An ownership is one or more contiguous lots that are owned by the same person, partnership, association, or corporation. Ownership also includes lots that are in common ownership but are separated by a shared right-of-way.

- Possible amendment: aggregation of separate parcels will be classified as a Bulk Fossil Fuel Terminal when two or more factors are present:
  a. Located on adjacent parcels, including separated by a right-of-way;
  b. Facilities share or will share operating facilities such as driveways, parking, piping, or storage tanks; or
  c. Facilities are owned or operated by a single parent partnership or corporation.

Status of existing terminals

Regulating Existing Terminals

- Proposed draft: Non-conforming use.
- Limited use:
  - No discretionary land use review.
  - Replacement or expansion for seismic upgrades or clean fuel standards allowed up to 10% increase in storage capacity.
- Conditional use:
  - Discretionary land use review for seismic upgrades or clean fuel standards allowed up to 10% increase.

2103
LUBA No. 2020-009
Page 2389

Exemption for regulated utilities

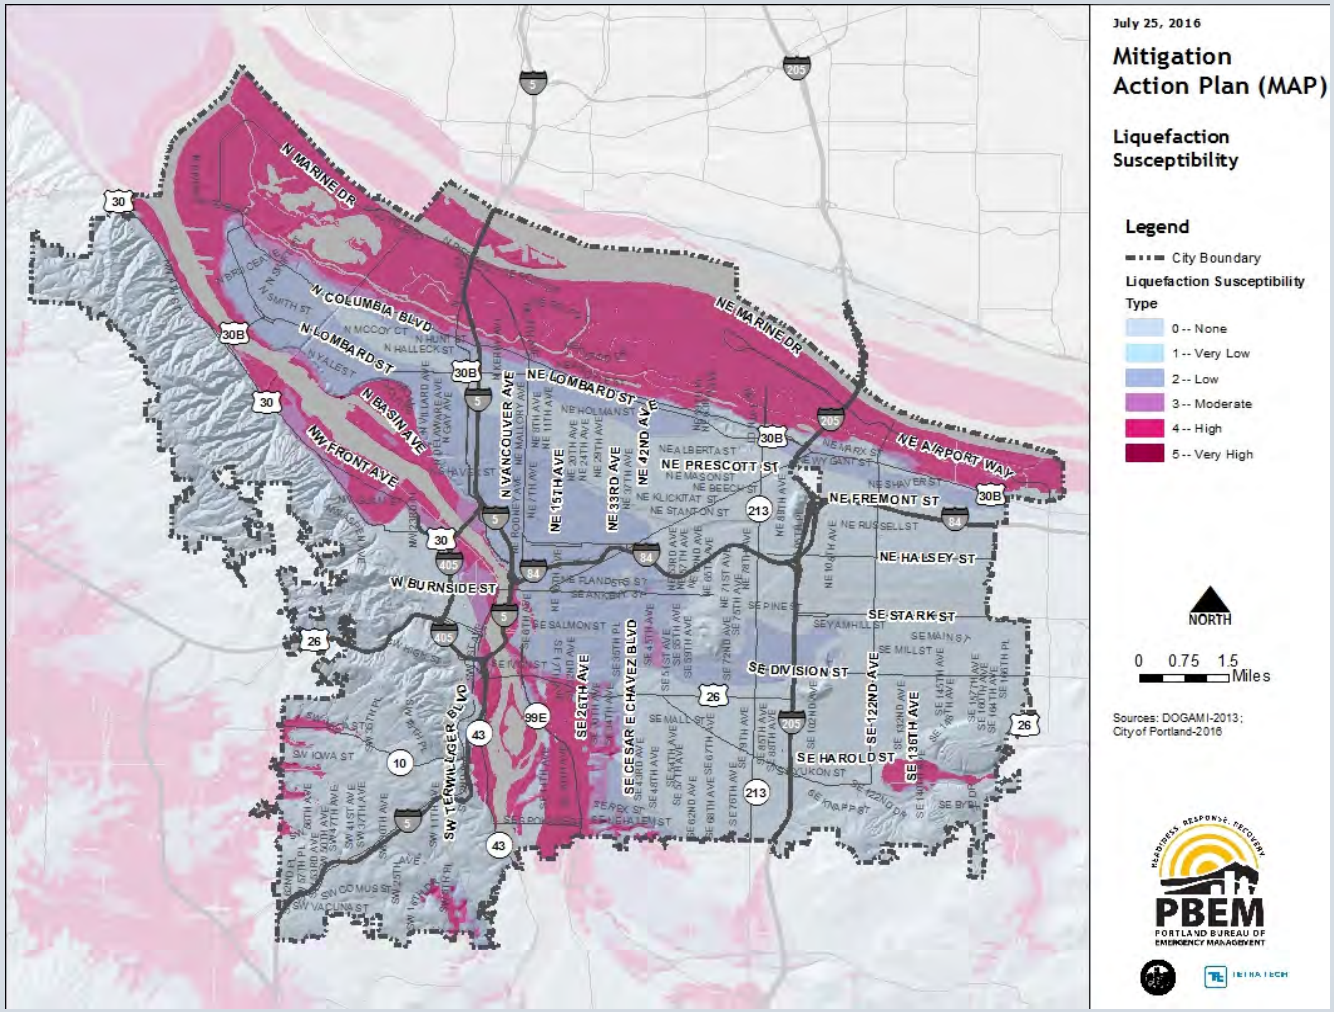
- Exceptions to Bulk Fossil Fuel Terminals:
- Possible amendment:

  Facilities operated by a public utility and regulated by the Oregon Public Utility Commission under ORS Chapters 756 and 757 for the purposes of ensuring fuel reliability to direct users through an interconnected system are not Bulk Fossil Fuel Terminals.

LUBA No. 2020-009
Page 2390
2104

Other Issues

- Regulating throughput
- Seismic upgrades



2105
LUBA No. 2020-009
Page 2391

Defining fossil fuel

Fossil fuels are petroleum products (such as crude oil and gasoline), coal, and gaseous fuels (such as natural gas, methanol, and propane) that are made from decayed plants and animals that lived millions of years ago and are used as a source of energy.

Exclusions: Denatured ethanol and similar fuel additives and biodiesel/renewable diesel with less than 5% fossil fuel content are not fossil fuels.

Public safety and environmental risks

Portland Planning and Sustainability Commission
October 11, 2016
12:30 p.m.
Meeting Minutes

Commissioners Present: Jeff Bachrach, Katie Larsell, Gary Oxman, Michelle Rudd, Katherine Schultz, Chris Smith, Eli Spevak, Teresa St Martin, Maggie Tallmadge (left at 3:15 p.m.)

Commissioners Absent: Andre' Baugh, Mike Houck

City Staff Presenting: Joe Zehnder, Michael Armstrong, Andria Jacob, Kyle Diesner, Tyler Bump, Matt Tschabold, Tom Armstrong

Other Presenters: Lorelei Juntunen (ECONorthwest)

Chair Schultz called the meeting to order at 12:30 p.m. and gave an overview of the agenda.

Documents and Presentations for today's meeting

Items of Interest from Commissioners

- *Commissioner Smith* and *Commissioner Spevak* attended Strong Towns, hosted by 1,000 Friends, an urban policy fiscal meeting, last week.

Director's Report

Joe Zehnder

- Residential Infill Project — BPS' recommendation to Council on the concepts are being published on October 17. The PSC's next meeting (October 25) will include a briefing on staff's recommendations.
- The first Task 5 Comp Plan hearing at Council was last Thursday; this Thursday is the continuation. Big topics people raised (pretty balanced testimony on both sides of these issues) included parking minimums, drive-throughs, the 4:1 versus 2:1 FAR issue in northwest, the Hayden Island bike path and individual property requests.

Consent Agenda

- RWA #7940: SW Moody south of the Ross Island Bridge
- Consideration of Minutes from the September 27, 2016 PSC meeting

Chair Schultz (at the request of *Commissioner Baugh*) pulled the Street Vacation RWA #7940 off the Consent Agenda. This item will return to the PSC for a hearing in the upcoming months.

Commissioner Smith moved to approve the Consent Agenda. *Commissioner Oxman* seconded.

The Consent Agenda was approved with an aye vote.
(Y9 — Bachrach, Larsell, Oxman, Rudd, Schultz, Smith, Spevak, St Martin, Tallmadge)

Home Energy Scoring

Briefing: Michael Armstrong, Andria Jacob, Kyle Diesner

Michael introduced the policy proposal. City Council will likely have their hearing on this at the end of November.

The intent of the policy is to reduce carbon emissions and respond to the urgency of climate change. Some people think this policy goes too far too fast, but staff feels the proposed policy is an appropriate

step to address climate change. The policy is also intended to make it easier for prospective homebuyers to see the full cost of home-ownership.

This action is part of the 2015 Climate Action Plan (CAP) to reduce energy use in existing buildings and was first proposed in the 2009 CAP. Action 1B in the 2015 CAP reads: "Require energy performance ratings for all homes so that owners, tenants and prospective buyers can make informed decisions about energy costs and carbon emissions." Residential buildings make up about 20 percent of carbon emissions. About three-quarters of existing houses were built before energy codes were in place and have not been retrofit.

It's also important for a prospective buyer to know their potential energy costs for housing they're considering to buy. Over time, a more efficient home can save a homeowner on the order of $10,000 over 10 years.

Benefits of the policy to Portlanders

- Better insight into the full costs of owning a home.
- Ability to compare energy costs and performance between homes.
- Knowledge of home improvements in advance of purchase.
- Access to specialized mortgage products
- Long-term operational savings from purchase of an energy-efficient home.

Staff is proposing that sellers of single-family homes obtain a home energy performance report, which includes:

- A home energy score and explanation of the score,
- An estimate of the total annual energy used in the home, by fuel type
- An estimate of the total monthly (or annual) cost of energy purchased for use in the home, in dollars by fuel type.
- The current average annual utility retail energy price by fuel type.

Staff have worked closely with the Oregon Department of Energy to stay aligned with existing statute and rules around home energy scoring systems and practices. The home energy score is based on how a home is built, not how the home is used. This type of score is called an asset rating and is considered best practice in the field because it allows buyers to compare homes on an apples-to-apples basis, which is not possible when you are just looking at past occupants' utility bills. This is similar to a MPG rating on cars, which enables comparison between vehicles even though actual mileage may vary. Asset ratings are based on a relatively brief inspection of the home by a certified home energy assessor.

Under the proposed policy, a seller must disclose the information from this report to the City of Portland and to prospective buyers who visit the home while it is on the market.
The requirement would apply to sellers or, in the case of newly constructed homes, homebuilders. However, sellers may have a designated representative, like a real estate professional, disclose the report and the score on their behalf.

Staff are proposing to use the US Department of Energy's Home Energy Score rating tool. The reports are customizable to make it consumer-friendly. The report also provides a roadmap for either the seller or the buyer about what to do to get that higher score.

As a result of stakeholder engagement and public comments, staff identified a number of exemptions that would be necessary. Since the policy is triggered by the public listing of a home for sale, the proposal exempts those transactions that never hit the market or that present examples of hardship, like foreclosures and short sales.

The proposed policy also recognizes that the new construction market is different than the existing homes market. Currently, other scoring products are in use in new construction, and stakeholders

indicated a need for time to transition to the new scoring tool. For that reason, staff propose to provide a waiver for new homes that are using other scoring products.

Also in response to public comment about equity concerns and potential harm to vulnerable residents, staff have proposed a new element to the policy, a deferral for "Low Income Qualified Sellers" — household income at or below 60 percent of median household income. Sellers would be able to qualify for this exemption by showing participation in one of a number of income-qualified services or who can demonstrate hardship.

Commissioner TaIlmadge suggested we may want to up this to include households at the 80 percent MFI threshold.

Rental homes are not included in the current proposal. However, staff noted that there are important equity benefits for renters since energy costs can burden lower-income households. However, equity stakeholder discussions suggested that though those equity benefits are understood, now is not the right time for this policy. Staff are therefore proposing to study this market, establish metrics to monitor that will identify when conditions are more favorable for a policy like this. BPS may recommend that Council establish a stakeholder committee to work on this, and staff welcome your thoughts on this piece.

Commissioner Spevak asked if this would apply to any single-home being sold.

- Any house that is sold, regardless of how it's being used. But when houses are leased, we are not proposing to require disclosure to the tenant.

Staff heard a number of comments from the public in their outreach:

- Equity: how does the policy affect low-income and vulnerable people (e.g., elders on fixed incomes?)
- Housing: concern that this will increase cost of homes, and worsen the housing crisis. Staff share concerns about affordability and believe that the proposed policy will enable homebuyers to understand the full cost of homeownership, including energy bills, which will improve affordability in the long run.
- Voluntary: Commenters suggested that a requirement was too aggressive and preferred a voluntary program. Staff noted that a voluntary approach has been in in place since 2009. Incentives for energy efficiency come from the utility sector, offered and promoted by Energy Trust of Oregon. These too are in effect. However, less than 2 percent of homes have gotten a score in Portland over the last 7 years.
- Many Portlanders recognize that home energy scores make the full cost of owning a home transparent in a way that they are not currently. Some argue that consumers (in this case, homebuyers) can find out what past occupants have paid for their utility bills and that it's obvious if a house has insulation or bad windows.
- Support for consumer protection and climate protection benefits.

Discussion
For PSC consideration:

1. What is the appropriate frequency for renewing the score?
2. Should Council establish a committee to identify appropriate market conditions for a policy addressing single-family rental housing?

This is tentatively scheduled to be at Council on November 23, which is a public hearing. This is an ordinance, so the second reading, likely December 7, is when Council will discuss and vote.
Commissioner Smith noted his experience is that you get what you measure. I understand the impetus for this, and I did read the letters with objections: there would be pressure on the assessors to give false-positive scores; economic burden to lower-income homeowners; and the idea that a bad score could reduce the marketability for a home, which could be a detriment particularly for low-income sellers.

- If a house gets a relatively low score and people can't invest in improvements, we have been talking to Enhabit about a customized loan product to meet the need. There are a number of home equity lines of credit opportunities as well. The flip side is: is it better to know or not to know?
- The "bad actors" questions: would home energy assessors have an incentive to rate homes poorly in order to generate business for energy-retrofit providers? Assessors must be certified, and there is QC for this if there are systematically biased results. The US Department of Energy requires entities that use the Home Energy Score tool to have an evaluation process in place. Currently, the Oregon Department of Energy is positioned to provide this role statewide; the City will also have to have someone to fill this QC role. Staff acknowledged the concern about assessors having a motivation to score houses low but also noted a countervailing pressure to score houses high in order to be view favorably for future assessments. For both reasons, quality control is essential.

Commissioner TaIlmadge: What are the concerns about expanding to the rental market?

- There is a fear of cost of the assessment being pushed onto renters. This is part of a larger conversation, not that it's a bad idea.

Commissioner Oxman: The commercial building program… does it cover any residential homes?

- Only commercial buildings 20,000 square feet and larger. No residential properties are included.
- Attached single-family homes are included in this proposal, but not stacked condos.

What's encompassed by being a green-certified home?

- The green building ratings (e.g., Earth Advantage and LEED for homes) include energy scoring but also other criteria, such as indoor air quality, water efficiency, and waste. Energy use is one component of these other ratings.

On effectiveness, how much of a decrease in energy consumption could we expect via this program?

- In Austin, this program has been going for 7 years. Of the houses that went through the process, about 6 percent followed through with improvements. So this is an essential first step in a market transformation effort, but this alone won't get to our carbon-reduction goals.

What's the turn-over rate for housing in Portland? How long will it take us to report on a number of houses?

- There were 11,000 homes transacted last year. We expect this over time, likely in the 20-year range.

Commissioner Rudd: Did we provide incentives with the voluntary program? What level of publicity was included in the voluntary program?

- There were incentives initially but not anymore.

Commissioner Bachrach: Is this going to apply to new homes?

- Yes. In the spirit of level playing field, we want those homes to get a score. Scores do vary with size as well as type of construction.

There are lots of energy-oriented programs. Utility customers already fund the Energy Trust of Oregon. It doesn't take long as a home owner to know what your utility bills are. So I don't know how much more incentive it will be to score versus when the homeowner gets a few bills. The point is to encourage retrofitting, correct? How will we measure the success of getting retrofits? What should we expect for people to act on having this information?

- We work closely with other participants in the energy field. We would evaluate impacts of this on understanding how the residential retrofit

Commissioner Spevak noted this is a good proposal. Information disclosure prompts people to address energy efficiency issues through the real estate sale process, and the City has an interest in this. Did the other cities have voluntary programs before requiring disclosure? I think one of the things that's important is that we're providing buyers information before they make their decisions.

- Some jurisdictions had voluntary, and some had mandatory retrofit requirements initially but then changed from required upgrades to a required score.

Commissioner St Martin: I support energy efficiency improvements. What are the costs of implementation for the City?

- We expect we would reassign existing City staff to work on this. We may need to pull from our larger green building and climate team.

This is a mandatory program with no penalties, so isn't that really voluntary?

- The BPS Director is proposed to have the authority to issue a penalty for non-compliance.

I get a report and it gives me options of how I can save and things to do. If the things to do cost lots more than my ownership time (energy use) will cost, why would I choose invest in upgrades? The timing may make the scoring less effective. There are obvious things you can see in older houses we can point out. It's the things you can't see that becomes important. If someone gets a score and makes improvements, their house still has the old score attached.

- They could redo the score audit.
- We are proposing to make the information available in the home for prospective buyers, so it's beneficial for either the buyer or seller.

Commissioner Larsell is also interested in experiences from other cities. I was noticing the exceptions, and I don't know how many that would include. Has there been thought about having the banks cover the cost of the assessment? This is the first part of a market transformation program; what happens next? And is this public, and is there history of contractors getting this information that in turn they make pitches to homeowners about?

- On the number of expected annual exceptions: we can follow up.
- Market transformation: information is a start, but will be much more effective when paired with a program to actually get someone and motivated to invest. Training, education and new tools can help, so that's why we're considering the score a first step to increase the changes for a new programmatic effort to succeed.
- Scores will be public. So someone who is looking at houses can see them, and others will have access to them as well.

Chair Schultz: In terms of frequency for renewing the score, my gut reaction is that a study on the metrics would be important so we could evaluate it at that time. I would completely support this scoring for the rental market would be good, too. If you're giving an exemption to sellers at a certain financial threshold, but what about on the buyer end?

Chair Schultz asked about having the PSC write a letter to Council.

Commissioner St Martin thinks the use of a mandate without a sure impact is something we should be careful about. I'm only questioning if this is the right first step.

Commissioner Spevak recommends supporting this because we already have a voluntary program. *Commissioner Smith* seconded.

Commissioner Rudd has some concern because we have a big turnout of people in the audience concerned about the proposal, but we don't have a hearing scheduled here. I understand we have CAP goals, but I'm not comfortable at this point to send a letter. I also know the voluntary program was not very successful at reaching lower-income people to assist with retrofits though there was some job creation.

- *Commissioner Bachrach* seconds this idea that it's inappropriate to give a recommendation to Council and we have outstanding questions on the Commission.

Commissioner St Martin asked for a pilot to pay for the work and see what people would do and if behaviors would change.

Commissioner Oxman has mixed feelings as well. The program may not make big changes in terms of the number of properties that will actually do change.

Commissioner Larsell asked if we note how many people showed up today against the proposal, and this is a first step to more work, if that would be a valuable letter to Council.

Chair Schultz noted we may not have support for a letter. I am personally supportive of the proposal and the work.

Michael clarified the question about a pilot: ETO has run repeated pilots over the past 7 years. The results are that voluntary programs have resulted in fewer than 2 percent of homes in Portland have energy scores.

Commissioner Smith asked to call the vote.

(Y5 — Larsell, Schultz, Smith, Spevak, Tallmadge; N4 — Bachrach, Oxman, Rudd, St Martin)

Staff will work with Commission officers to draft a letter for PSC to share with Council.

Inclusionary Housing
Briefing: Tyler Bump, Matt Tschabold; Lorelei Juntunen (ECONorthwest)

Tyler introduced the project and today's briefing. He acknowledged Shannon Buono's great work on the code (Title 33) component of the proposal. The state passed the bill last March that allows inclusionary housing. Since then, the Portland Housing Bureau (PHB) has led a process including a panel of experts to see how we can make inclusionary housing work in Portland. Portland is not unique; there are many other cites having similar conversations at this time.

Lorelei discussed The Economics of Inclusionary Development report. The numbers are not Portland-specific since this is a national report. The increase in one-bedroom rents have risen much higher than incomes. The challenge is that average rents can be only barely feasible even for people making 100 percent MFI.

Most cities with inclusionary housing programs target affordability at 60-80 percent MFI. The percentage of units in a development to be affordable range from very low up to 20 percent.

The new state legislation allows cities to have a mandatory program. Opt outs are required in the policy (e.g. fee-in-lieu). And there are lots of incentives to consider.

The policy can only work in places where development is occurring because it applies only to new buildings.

Market feasibility when sufficient rent income can cover costs. Another factor is capital is mobile. These are things builders don't have much control over. The only place there is "squish" is on the land value. If a policy reduces the residual land value below expectations, then development will no longer move forward.

With higher-density development, there is higher per-square-foot costs to the developer. Assuming the land value is zero and no policy in place, we see lots of growth only in the Central City.

With IH without incentives, at a 20 percent set aside, 80% of MFI and assumed $0 land price, big portions of the Central City are still feasible. We see a reduction in density in other areas because the rent that's achievable is not sufficient to support the higher construction costs in the higher-density development.

The Portland policy proposed does have incentives included. Incentives are necessary to make sure development is financially feasible and moves forward.

Ultimately:

- Well-calibrated IH programs can result in mixed income buildings in areas where new development is occurring.
- Poorly-calibrated IH programs create market disruptions and reduce development outcomes.
- Flexible programs are better:
    - Incentives
    - One size fits all vs. sub-market approach
    - Revisiting policy as market changes
    - Opt-out or fee-in-lieu

Commissioner St Martin: On the opt-out strategy, are incentives still provided?

- This changes from jurisdiction to jurisdiction

Commissioner Spevak: Do you see areas where IH have increased or decreased land value?

- Since every policy is different and many other variables, a pre/post assessment is almost impossible. Over time, you see land values going down, but since land owners have their own ideas of their property value, this doesn't always happen.

Commissioner Bachrach: The incentive package has been a big conversation with the work group. What difference does it make if we don't calibrate it right?

- A developer doesn't always know how much they'll be making. Returns are speculative and may not be known at the time the deal is financed, so if you can't show you can cover expenses, the project won't get financed, so it won't move forward.

In order to have a well-calibrated program, is it essential to have 100 percent incentive to compensate for the land value?

- There is a policy trade-off embedded here. Trade-offs and time periods are key.

Commissioner Smith: There is a calibration around not reducing multi-development. What about public dollars used in incentives versus using those dollars being used in other ways? You've described how there are different levels of returns… banks, then bank/developers, then everyone. has anyone crafted a public policy program that grabs from where everyone is making money versus just going for the lower tranches?

Chair Schultz: On the importance of calibration… is there a rule of thumb that says when calibration needs to happen?

- No, it ties into market situations. Ideally you would do this project-by-project, but that's not practical.

You talked about inclusionary policies work when the housing market is building units. With the incentive packages, would these affect the market as offered today?

- We helped to develop the policies at the early stages but haven't been involved with the policies, which are still evolving.
- We expect lots of people to testify about this question.

Matthew walked through the program recommendations. Citywide, 20 percent of units are affordable at 80 percent MFI. Or only 10 percent at 60 percent MFI, which is the voluntary option. Requirements and incentives vary:

- Mixed Use zones
- Central city
- Zones with base FAR above 5.0
- Build off-site options
    - Build new units off-site
    - Off-site dedication of existing units
- Fee-in-lieu calibration is a two-step process

- Calculate maximum justifiable fee-in-lieu
- Calculate Portland fee-in-lieu recommendation (slide 10)

Tyler highlighted the 2035 Comp Plan policies that are applicable to the discussion and issues about IZ. He shared the proposed amendments to Title 33 (Zoning Code) and Title 30 (Housing Code) and Administrative Rules. (slide 12)

February 1, 2017 is the target date for this to be implemented, so we need to update the existing zoning code as well as the new codes for mixed use zones and the Central City. Base zones' density bonuses are a key first part.

In 2010-2035 we are looking at 123,000 new housing units. About 30,000 units in Central City and 50,000 in Mixed Use Zones, all of which would be subject to the IH policies.
Timeline

- October 25: PSC Hearing
- November 8: PSC Work Session & Recommendation
- December TBD: City Council
- Anticipated Effective Date: Feb 1, 2017

Commissioner Smith: If we calibrate right, then we should be holding feasibility the same before and after the program.

- In the calibration, it was not a dollar-for-dollar off-set. The market will change, but just the inclusionary requirement is what we looked at. In some cases we are marginally below, some slightly above. Effectively we are mitigating as much as possible.
- Public dollars going to incentives are being used as efficiently as possible.

Parking minimums: We have minimums in the mixed-use zones, but we are suggesting waiving for affordable units. What about getting rid of parking minimums altogether?

- Regarding waiving minimums, the increased cost of parking hurts the IH program so we'd have to provide much higher levels of subsidy.

Commissioner Oxman noted the current City subsidy for $100,000 for each developed unit.

- This is a direct financial subsidy from PHB. It's sourced from Federal, URA or direct City general funds.

For the off-site development, I saw the criteria, which I assume are used to maintain equity. Was there discussion about if this is sufficient to maintain family support and integration with other average-income families?

- There was a question about the ½-mile. This aligns nicely with the radius around mass transit (light-rail), which can take advantage of comparable indicators.

In terms of the City's cost to build, the Willamette Week article showed that the City's costs were substantially higher.

- There may have been errors in that article, and I can look into that.

Commissioner Rudd: When we say "marginally" above and below, or "negligible", what's the scale?

- Depends on measure of analysis. We will look more closely at the numbers. We looked at various analyses, and we can make this work for our existing return requirements.
- We'll summarize the findings prior to the PSC work session.

Receiving sites have to be under construction or have a certificate of occupancy. If we can't work out the deal, what happens? Is there a risk to funding the projects with greater affordability if there is that time delay?

- We are looking into loosening this requirement that they are under construction and having some flexibility in having the units come online in a specific time.

With the transfer of affordability, do we think City sites will be receiving sites?

- Potentially. But a parameter of the off-site is that the City is not secondarily subsidizing the receiving site. So we'd have a rental development team to look at if the supplemental units aren't also receiving financing.

Commissioner Bachrach has been sitting in on some of the Task Force meetings. It's complicated, and staff has done a great job wading through everything. As the PSC, I think it's important not to risk our planning goals. We are designing the program for 80,000 units over the next 20 years in the Central City and MUZ. We should be protective of this and meeting our housing goals. If we err in the early years and we do lose housing, it's a detriment for many more years into the future. We heard that as we do this calibration, it's not quite working in MUZ. So we already have a program where the calibration analysis isn't quite working yet. So I'd have a concern signing off on this at this point. Will see that back again?

- There are concerns in the MUZ, but that second look will be complete before your October 25 hearing.

Are we spending the money effectively in the IZ program versus elsewhere? We've calculated the in-lieu fee based on a $100,000 subsidy to non-profit developers. All the incentives we give to non-profits building affordable units and the $100k direct subsidy, but the private developers with the same incentives don't get the financial bonus. What about subsidizing the private developers some amount as well? We would get a more cost-effective unit.

- It's not apples-to-apples. PHB is often financing 80-100 percent units being affordable. The financial structure is very different.
- If you look at the incentive packages, for those that only have an affordable property tax exemption, there is $2000-3000 per unit. The full property tax exemption $11,000-12,000 per unit.

There was discussion at the task force about needing to move this project quickly. Is there consideration of a phased approach?

- Commissioner Saltzman has requested to bring the full program to Council on December 8.

Commissioner Spevak: There is a big difference on property tax exemptions if they apply to all units or just the affordable units. The current proposal makes property tax abatements on all units available at the higher densities (generally in the Central City), but only for the affordable units in the mixed use zones. Is there anything magical about a 10-year tax abatement period (e.g. could it be tuned to a different number of years to create incentive bundles that achieve geographic parity between Central City and mixed use zone areas?

- We'll look into that.

Commissioner St Martin: When we talk about off-site units and dedicating existing, have you calibrated these choices to be neutral?

- We have calibrated so that should you choose a new construction off-site we will have more 60 percent MFI units off-site than we would on-site. This is equal with the 60-30 percent MFI as well.
- IH programs tend to be focused at 60-80 percent MFI. But knowing a build off-site option can build to 30 percent, so we wanted to be sure that's a good option.

Is the fee-in-lieu is structured so that's the last resort?

- Yes.

Commissioner Larsell: What's the variability in terms of your ability to predict and calibrate initially?

- We've had many people review and analyze our recommendations. With a full tax exemption program, we see this could work. We are again looking at the mixed use zones as we noted.

Chair Schultz: For the effective date of February 1, 2017… can you say it won't happen prior to that?

- We can't predict what Council will do, but functionally it will be very difficult to implement prior to then. I am fairly confident of this date. We don't know if Council would back-date this.

Prior to the work session, I'd like to understand the analysis of the effect of family housing units. What about a voucher program? I've met with Locust as well, and I've heard a slightly different take. "Negligible" is a question as *Commissioner Rudd* highlighted. As is defining parody.

Commissioner Smith asked about the MUZ bonuses. So for the existing Zoning Code, residential FAR is uncapped in zones. How do you calibrate based on uncapped?

- We are bringing those code changes forward in order to start counting residential floor space in the overall FAR limits.

Fossil Fuel Infrastructure Code Changes

Work Session / Recommendation: Tom Armstrong, Michael Armstrong

Commissioner Rudd recused herself from this topic.

Tom commented on balancing the direction of the fossil fuel infrastructure resolution about opposing expansion yet at the same time encouraging safety and transition to non-fossil fuels.

There are three components to the amendments we're discussing:

- Define Bulk Fossil Fuel Terminals as a regulated land use.
- Prohibit Bulk Fossil Fuel Terminals in all base zones.
- Existing Bulk Fossil Fuel Terminals would become legal, non-conforming uses that can continue to operate.

In the staff memo, there are four big issues for the PSC's consideration:

- Storage capacity threshold and aggregation of small facilities
- Regulating existing terminals
- Exemption for regulated utilities
- Other issues

Defining Bulk Fossil Fuel Terminal:

- Marine, railroad, or pipeline transport access; and
- Transloading facilities (such as train-to-ship) or storage capacity exceeding 5 million gallons.

Exclusions:

- Distributors with access exclusively by truck.
- End-user facilities, including filling stations and firms that store fossil fuels for use as an input.
- Recovery or reprocessing used petroleum.

Commissioner Smith asked if it's transloading OR 5 million gallons or AND 5 million gallons?

- It's an "or". So any facility with transloading is prohibited.

Storage Capacity Threshold

Proposed draft: Threshold of 5 million gallons

Possible amendments:

1. Reduce the threshold
2. Add language to prevent aggregation of small facilities
3. Add language to clarify status of rail yards and pipelines

BPS Recommendation: Retain the 5-million-gallon threshold.

Commissioner Oxman: Could someone permit a new transfer facility (e.g. coal from a train)? Or does this block that option?

- This would be blocked in Portland.

Commissioner Tallmadge: We're looking at the threshold for new facilities, yes?

- We're talking about 5 million gallons for existing and new facilities and if they'd fall under the fossil fuel terminal. The lower the 5-million-gallon threshold goes, if you say it's 0 (any amount of storage capacity), if you have a firm that has both fossil and bio tanks, they can no longer have the fossil tanks, so that has implications for their ability to blend fuels like biodiesel.

Can we lower the threshold for fuels we consider cleaner?

- We'd have to go back and redefine what a fossil fuel is in terms of the content. We are probably at a time where it would be difficult to come up with a new definition to set the mark. It could be something in your letter to Council to look at this in the future.

Commissioner Oxman: It seems like the primary policy focus is to limit expansion of fossil fuels going through the community. When we look at the other 24 listed, do we have a sense of what the aggregate volume of these is?

- We don't have data on what each individual business' capacity is. If we went with the 5-million-gallon threshold, we know they could expand up to that level, so the 24 businesses on the list could represent up to 125 million gallons of storage capacity. For comparison the 11 large facilities on our list have about 400 million gallons of storage capacity.

Commissioner Smith noted it seemed we had "OR" in some places and "AND" elsewhere.

- The intent is that they are regional facilities. Either they have large-scale storage or they could be a transload facility.

I am assuming the 5 million number is still relevant. So the logic was proposed that 5 million gallons is two unit trains. So if we lower the threshold to 2 million, that would prohibit any unit trains, so I'd suggest that to get to the intent of the policy.

Commissioner Spevak noted that at Port of Tacoma, there is a proposal for 87 million gallons of throughput at a proposed 8-million-gallon facility. It is possible that a relatively small tank can have lots of throughput. Let's decrease the size of allowable tanks. I concur with *Commissioner Smith*'s proposal.

Chair Schultz noted that *Commissioner Tallmadge* is in favor of reducing the 5-million-gallon threshold. Tom noted this is something we don't know: how much some of the biodiesel and other firms have and the impact that would be.

Commissioner Smith: I move to reduce the threshold from 5 to 2 million gallons. *St Martin* seconded.

(Y6 — Larsell, Oxman, Schultz, Smith, Spevak, St Martin; N1 — Bachrach)

Aggregation of Small Facilities

Aggregating a bunch of 2 million gallon facilities would require them to do a land division and other provisions.

Zoning Code (33.910.030) definition of "ownership":
An ownership is one or more contiguous lots that are owned by the same person, partnership, association, or corporation. Ownership also includes lots that are in common ownership but are separated by a shared right-of-way.

Commissioner Spevak moved to add the proposed language concerning aggregation of separate parcels will be classified as a Bulk Fossil Fuel Terminal when two or more factors are present:

a. Located on adjacent parcels, including separated by a right-of-way;
b. Facilities share or will share operating facilities such as driveways, parking, piping, or storage tanks; or
c. Facilities are owned or operated by a single parent partnership or corporation.

Commissioner Smith seconded.

(Y6 — Larsell, Oxman, Schultz, Smith, Spevak, St Martin; Abstain 1 — Bachrach)

Exemption for Regulated Utilities
During the comment process NW Natural suggested that almost by definition its services are direct-service to end users, which is identified in the November 2015 City Council resolution as one of the exceptions. Their argument is that their services are already regulated to serve customers. So it would be redundant and potentially conflicting if they had to satisfy both the PUC integrated resources plan process and this new regulation.

Commissioner Smith: We want to close off what you could do outside the intent of Council's resolution. Could someone load a truck with LNG from NW Natural's storage tank and deliver it to another utility or large user?

Shawna Brownstein, NWN: You can back a truck up and fill it with LNG to take it to places where we have low pressure on certain high-demand days. This facility is for peaking purposes, and the PUC wouldn't let us put this into rates if it were serving another purpose. We'd have to get PUC approval to use the facility to sell to others. The volume of the tank is part of our resource plan. We can't expand the facility unless it's to directly meet the demands of our customers and the growth of the region.

Commissioner Spevak: Lots of people don't use natural gas. PUC regulation doesn't cover everything (e.g. the plants themselves).

Commissioner Oxman supports the exemption. BDS has already told us they have concerns about assessing and regulating fossil fuels. The PUC is already an existing body, and it sounds like there are restrictions built in.

Chair Schultz noted *Commissioner Tallmadge*'s comment to not exempt for regulated utilities.

Commissioner Spevak moved to not provide an exception for regulated utilities. *Commissioner Smith* noted inaction is sufficient in this case. Without a motion to adopt new language to exempt a public utility, the code will stay as-is.

Regulating Existing Terminals
Proposed draft: Any facility with more than a 2-million-gallon capacity would be considered a non-conforming use.

Alternatives to consider:

- Limited use
    - No discretionary land use review.
    - Replacement or expansion for seismic upgrades or clean fuel standards allowed up to 10 percent increase in storage capacity.
- Conditional use
    - Discretionary land use review for seismic upgrades or clean fuel standards allowed up to 10 percent increase.

Staff proposes the Limited Use option: you can only expand if you're doing a seismic upgrade when you're adding a tank. They have to state in the development application what the purposed/use of the tank is to reduce the risk of bait-and-switch, which may be difficult to enforce going forward.

Commissioner St Martin asked about seismic upgrades. Are there specific upgrades to the tanks that are useful to upgrade their safety?

- The major benefit is replacing the tank. We've mainly seen companies demolish the existing tank, upgrade the foundation and then put the new tank in to replace the old one… not a retrofit.

Commissioner Smith: We have direction to stop being a fossil fuel export location. We have a Comp Plan seismic policy. But clean fuels is a state-level issue. Does the Council resolution include a clean fuels statement?

- It referenced not restricting infrastructure that accelerates transition to non-fossil fuel energy source, and we're suggesting these are a transitional fuel.

I'd come down on the conditional use option with clear criteria. I understand the current non-conforming use probably locks us into bad infrastructure.

Commissioner Oxman asked if there are requirements to meet seismic upgrades required in both the limited use and conditional use options.

- It depends on if you want to allow an expansion of fossil fuel capacity that will result in a seismic upgrade with a larger fossil fuel tank. It goes back to the AND versus OR question *Commissioner Spevak* raised.

What is the potential added value for using conditional use?

- There is a public review process and an opportunity to comment. BDS cautions what the discretionary judgement is: how will they determine the facility meets clean fuel standards or what's contained in the tank. The seismic upgrade and safety benefit from doing that is more straight-forward.

Commissioner Smith: What's the process difference for BDS between limited use versus conditional?

- Limited would be similar to a mixed-use building coming in… clear and objective standards. A company would come in with their demo plan, replacement plans, and if we want to go to the 10 percent increase, they would document where they are today in terms of capacity and what their next 10 percent would be.
- The staff memo includes code language in the back of the memo – code option #2.

And versus or: I would be ok with a seismic-only improvement if you're rehabbing a tank to do clean fuels.

Commissioner Spevak asked if under current regulations tanks are getting replaced to get them up to seismic.

- In theory, yes. But it's been very slow-going despite the fact that they can increase capacity.

I thought the expansion option was to sweeten the deal.

- It's part of the uncertainty of what the demand for what type of fuel we'll have in the future. depending on how we phrase this, whether or not a clean fuel tank is included in a bulk fossil fuel terminal or not, and then if you need an incentive to do a seismic upgrade, is the question.

I am unconvinced allowing a 10 percent increase in capacity will motivate tank replacements with seismic upgrades since they haven't been doing these under current regulations that allow major increases in capacity.

Commissioner St Martin: If you had ten 5-million gallon tanks, could you wipe them and increase to one big 55-gallon tank?

- If we have the 10 percent included, yes. It would be marginally better because of the required seismic upgrade.

Commissioner Oxman: In limited use language, it talks about at least one fossil fuel tank. Would you be allowed the 10 percent increase if you take down the small tank versus the larger one?

- 10 percent is a cap for the full site, not individual tanks on the site, as it is currently written.

Chair Schultz shared *Commissioner Tallmadge*'s option: non-conforming use is her first option. But if we opt for conditional use, certain safety criteria should be included.

Chair Schultz asked about the 10 percent addition: Do we know if economically this makes a dent in the cost of the required upgrade?

- We based this on the metric of the clean fuels standard and moving to 15 percent bio/ethanol fuel.

I am supportive of leaving this as a limited use because if we're not seismically upgrading now, I don't think we will in the future without encouraging the upgrade.

Commissioner Smith moved to adopt Option 2 (on page 11 in the staff report): Current facilities are limited use and an allowed 10 percent size upgrade. *Commissioner Larsell* seconded with the addition of notification requirement.

Commissioner Oxman proposed to include language about up to the amount specified in Table 140-8 to replace comparable capacity by 10 percent.

Commissioner Spevak suggested the limited use option but no not allow expansion of volume. This makes for a swift development process without increasing capacity. *Commissioner St Martin* seconded.

Commissioner Smith withdrew his motion. *Commissioner Larsell* withdrew her second.
Commissioner Smith Moved Option 2 as stated. *Commissioner Larsell* seconded.

Commissioner Oxman re-proposed to include language about the expansion would be up to 10 percent of a specific unit/tank on the site. *Commissioner Smith* seconded.

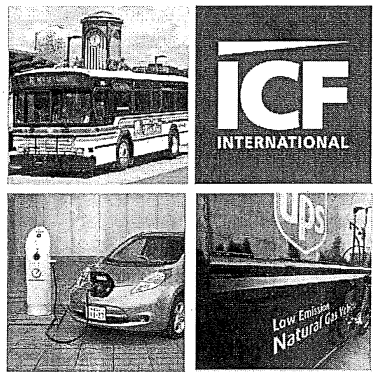
- (Y6 — Larsell, Oxman, Schultz, Smith, Spevak, St Martin; N1 — Bachrach)

Commissioner Larsell moved to include notification in the limited use proposal. *Commissioner Smith* seconded.

- (Y4 — Larsell, Oxman, Smith, Spevak; N3 — Bachrach, St Martin, Schultz)

Commissioner Spevak proposed an amendment to say the current facilities are limited use but expansion is prohibited. *St Martin* seconded.

- (Y3 — Smith, Spevak, St Martin; N4 — Bachrach, Larsell, Oxman, Schultz)



The Commission voted on the overall proposal: Existing terminals are designated as a limited use. There is no discretionary land use review. Expansions are allowed up to 10 percent capacity for a tank/unit that is being seismically upgraded. And a notification to stakeholders is required.

(Y7 — Bachrach, Larsell, Oxman, Schultz, Smith, Spevak, St Martin)

Adjourn

Chair Schultz adjourned the meeting at 4:34 p.m.

Submitted by Julie Ocken

Task 3 – Updated Compliance Scenarios

Final Report

August 2014

Prepared for
Oregon Department of Environmental Quality
811 SW 6th Avenue
Portland, OR 97204-1390

Prepared by
ICF International
75 E. Santa Clara St. Suite 300
San Jose, CA 95113
408.216.2800

ICF conducted this work under contract with the Oregon Department of Environmental Quality. The fuel volumes presented in this document are meant to be illustrative of compliance with a proposed Clean Fuels Program in Oregon. ICF developed the compliance scenarios in a manner consistent with our scope of work with Oregon DEQ, and as we do in all of our work, we strive to provide information and projections consistent with standard practices in a professional manner. These compliance scenarios, however, should not be confused with ICF market forecasts. These compliance scenarios reflect the fuel volumes that could be delivered to Oregon to comply with a Clean Fuels Program based on our understanding of transportation fuel availability today and projected transportation fuel availability. ICF makes no warranties express or implied (including without limitation any warranties or merchantability or fitness for a particular purpose), as to this material. Specifically but without limitation, ICF makes no warranty or guarantee regarding the accuracy of these scenarios or that such work products will be accepted by any legal or regulatory body.

Executive Summary

The clean fuel standard in Oregon, implemented by the Clean Fuels Program, requires a 10% reduction in carbon intensity from the gasoline and diesel baselines over a ten year period. In addition to carbon intensity reduction, the Clean Fuels Program helps Oregon reduce its consumption of traditional petroleum fuels. Potential fuels that could be used to achieve the standard are ethanol, biodiesel, hydrogen, electricity, natural gas, propane, and biogas. The Clean Fuels Program is designed as a performance-based standard using flexible market-based mechanisms that allow regulated parties to select the most cost-effective pathways to achieve compliance. In general, fuels that have a lower carbon intensity than gasoline or diesel generate credits. Regulated parties, such as refiners, have the option of producing or blending low carbon fuels, or purchasing credits from other fuel providers, including, but not limited to biofuel producers, natural gas infrastructure providers, electric utilities, and hydrogen producers.

As part of Oregon Department of Environmental Quality's (DEQ) original rulemaking and advisory committee process in 2010, technical analysis was performed by TIAX LLC to develop an Oregon specific business-as-usual (BAU) and compliance scenarios for a Clean Fuels Standard. As part of the previous analysis, assumptions were made around the composition of the vehicle fleet, carbon intensities, and availability of low carbon fuels for compliance both in Oregon and out-of-state. Four years later there is a greater understanding of the vehicles and fuels that could be available and new regulations and developments that will affect Oregon's fleet composition and fuel consumption.

This report is the final phase of the process to update the Clean Fuels Program compliance scenarios. The previous report detailed the updated BAU case and this report describes in detail the methodology used to develop the four compliance scenarios, available fuels and technologies and the resulting compliance scenarios. Compliance scenarios for the Clean Fuels Standard are compared against the updated BAU to determine incremental fuels required to achieve the scenarios.

ICF, in consultation with Oregon DEQ, developed four compliance scenarios based on two fuel scenarios (alternative vehicle technologies vs biofuel blending) and two different diesel baselines (B2 vs B5). Table 1 below shows the compliance scenario matrix.

Table 1. Compliance Scenarios

Compliance Scenarios	Scenario 1 – Advanced Vehicle Technology	Scenario 2 – Higher Biofuel Blending
B2 Diesel Baseline (2010)	1 – B2	2 – B2
B5 Diesel Baseline (2015)	1 – B5	2 – B5

The key highlights of the CFP compliance scenarios include:

- **Over-compliance in the early years of the program (2016-2021) is critical.** Credits can be banked and traded later and do not lose their value. Banking credits when the standard is lower reduces compliance costs and eases compliance in later years.
- **The Clean Fuels Standard can be achieved through a diverse fuel supply.** All of the scenarios required a combination of ethanol, biodiesel and renewable diesel from various feedstocks, electricity, natural gas, renewable natural gas, and propane for compliance. In addition, none of the analyzed compliance scenarios required the use of cellulosic ethanol.
- **Eight (8) years of overlap between the post-2017 Zero Emission Vehicle (ZEV) Program eases the burden of compliance.** The ZEV Program generates almost 15% of the cumulative credits needed over the compliance period. California only overlaps three (3) years with the post-2017 ZEV Program which limits the contribution electric and fuel cell vehicles can have towards compliance in their LCFS.
- **A B5 baseline compared to a B2 baseline results in greater greenhouse gas (GHG) emission reductions.** The B5 baseline scenarios generate more deficits than the B2 baseline scenarios and therefore require more credits for compliance. This results in an increased consumption of biodiesel and renewable diesel and lower cumulative GHG emissions over the compliance period.
- **Renewable natural gas is a key fuel for Clean Fuels Standard compliance.** In the advanced technology scenarios, renewable natural gas generated just as many credits as electricity and about one-third the amount credits generated from ethanol or biodiesel. In addition, Oregon has significant in-state potential for renewable natural gas production.
- **Renewable Diesel, even only in small volumes, is needed for compliance.** Renewable diesel does not require additional distribution or refueling infrastructure and there are no blend limitations.

1 Introduction

The clean fuel standard in Oregon, implemented by the Clean Fuels Program (CFP), requires a 10% reduction in carbon intensity from the gasoline and diesel baselines over a ten year period. In addition to carbon intensity reduction, the Clean Fuels Program helps Oregon reduce its consumption of traditional petroleum fuels. Potential fuels that could be used to achieve the standards are ethanol, biodiesel, hydrogen, electricity, natural gas, propane, and biogas. Task 3 developed updated compliance scenarios. Compliance scenarios for the Clean Fuels Standard are being compared against the updated BAU to determine incremental fuels required to achieve the scenarios.

As part of Oregon DEQ's original rulemaking and advisory committee process in 2010, technical analysis was performed by TIAX LLC to develop an Oregon specific BAU and compliance scenarios for a Clean Fuels Standard. The VISION model was used to quantify the amount of fuels, infrastructure, and investment required for the BAU scenario. VISION is a fleet sales and turnover model developed by Argonne National Laboratory that can be used to quantify future energy consumption and GHG emissions based on overall fleet characteristics and composition. It is important to understand the fleet composition when considering alternative fuel consumption. Many alternative fuels including E85 (blended ethanol and gasoline with 85% by volume ethanol), electricity and natural gas require new vehicles to be purchased or converted and maximum consumption of these fuels is constrained by the population of these vehicles within the fleet.

As part of the previous analysis, assumptions were made around the composition of the vehicle fleet, carbon intensities, and availability of low carbon fuels for compliance both in Oregon and out-of-state. Four years later there is a greater understanding of the vehicles and fuels that could be available and new regulations and developments that will affect Oregon's fleet composition and fuel consumption. The latest available version of the VISION model, "VISION 2013 AEO Base Case,"[1] was used to develop the updated BAU scenario and the compliance scenarios. After completing BAU case, ICF and DEQ agreed on the assumptions to update the compliance scenarios. The following document details the methodology for developing the compliance scenarios.

[1] http://www.transportation.anl.gov/modeling_simulation/VISION/

2 Methodology: Scenario Development

ICF developed four (4) Clean Fuels Program compliance scenarios based upon input and discussion with Oregon DEQ. The following subsections review the methodology for developing the compliance scenarios and compliance schedules.

2.1 Compliance Scenarios and Clean Fuels Compliance Schedules

Compliance Scenarios

From a broad perspective, there are two ways to deploy alternative fuels that will help comply with a Clean Fuels Program. Firstly, biofuels can be blended into conventional gasoline or diesel for consumption in the existing vehicle fleet. Secondly, advanced vehicle technologies can be deployed, which consume alternative fuels such as natural gas, electricity, or hydrogen. Compliance with a Clean Fuels Program will require a diverse mix of all of these alternative fuels. Due to constraints on how quickly the vehicle fleet can be turned over, biofuel blending will likely be a major form of compliance until advanced vehicle technologies are deployed in significant numbers.

ICF developed two fuel scenarios – Scenario 1 and Scenario 2 – to capture the potential market responses to achieve compliance with a Clean Fuels Program. Scenario 1 reflects a market that is more dependent on advanced vehicle technologies than Scenario 2 and puts less pressure on advanced biofuels and biofuel blending for compliance. ICF will account for a variety of market developments in the compliance scenarios including the immediate availability of lower carbon biofuels such as biodiesel from waste greases, and animal fats; renewable diesel from tallow; and ethanol from sorghum and lower carbon intensity corn. Although cellulosic biofuels have been produced at a slower-than-expected rate, these lower carbon biofuels are available to California in significant quantities today and supply is forecasted to increase dramatically over the next several years.

Apart from biofuels, increasing natural gas supplies and lower fuel pricing than diesel have renewed interest in natural gas in the transportation sector. The use of low carbon biomethane (also referred to biogas and renewable natural gas) from waste sources including landfills and wastewater treatment plants in natural gas vehicles is projected to be a major compliance pathway. Biomethane is currently consumed in large volumes in California for LCFS compliance and EPA has qualified biomethane from landfills and other sources to generate cellulosic renewable identification numbers (RINs).

The Oregon Renewable Fuel Standard biodiesel blend mandate was 2% by volume (B2) in 2010 and increased to 5% (B5) in April 2011. The previous Clean Fuels Program analysis included a B2 diesel baseline. ICF will analyze the effects of compliance with a B2 compared to a B5 diesel baseline for both Scenarios as shown in the table below. Before DEQ selects a baseline and compliance schedule for the regulation, it is important to understand the implications. A B2 diesel is consistent with when the regulation was conceived in 2009 and analysis was performed in 2010 and allows for built-in credit generation from the B2 to B5 blend levels that are currently mandated. A B5 diesel baseline is consistent with the regulatory landscape in 2015 when the compliance schedule would begin in 2016.

Table 2. Compliance Scenarios

Compliance Scenarios	Scenario 1 – Advanced Vehicle Technology	Scenario 2 – Higher Biofuel Blending
B2 Diesel Baseline (2010)	1 – B2	2 – B2
B5 Diesel Baseline (2015)	1 – B5	2 – B5

Development of Compliance Schedules

The Oregon Clean Fuels Program is proposing using a similar percent reduction compliance schedule for the 10 year period as the California LCFS. To develop the actual numerical compliance schedule carbon intensities, ICF needed to develop baseline carbon intensity values for gasoline containing 10% by volume ethanol (E10), B2 and B5. Table 3 below shows the development of the baseline carbon intensities for E10, B2 and B5. Table 4 and Figure 1 show the compliance schedule for E10, B2 and B5 using the baseline carbon intensities in Table 3.

Table 3. Baseline Carbon Intensity Calculation

Baseline Fuels	Carbon Intensities (gCO2e/MJ)	Biofuel by Volume (%)	Biofuel by Energy (%)	Baseline Carbon Intensity (gCO2e/MJ)
Gasoline Pool – E10	Gasoline Blendstock – 89.40 Midwest Corn Ethanol – 88.02	10%	6.7%	89.31
Diesel Pool – B2	ULSD – 89.00 Biodiesel – 47.70[2]	2.27%	2.1%	88.13
Diesel Pool – B5	ULSD – 89.00 Biodiesel – 47.70[2]	5%	4.6%	87.09

[2] Weighted average of soybean, canola and used oil biodiesel based on individual carbon intensities of 50.19, 68.91 and 10.28 gCO2e/MJ and 2013 reported consumption volumes for the first six months of 13.66 million gallons, 4.37 million gallons and 3.39 million gallons for soybean, canola and used oil biodiesel, respectively.

Table 4. Gasoline and Diesel Compliance Schedules

Compliance Year	Percent Reductions	Gasoline Compliance Schedule	B2 Baseline Diesel Compliance Schedule	B5 Baseline Diesel Compliance Schedule
2015	-	89.31	88.13	87.09
2016	0.25%	89.08	87.91	86.87
2017	0.50%	88.86	87.69	86.65
2018	1.0%	88.41	87.25	86.22
2019	1.50%	87.97	86.81	85.78
2020	2.50%	87.08	85.93	84.91
2021	3.50%	86.18	85.05	84.04
2022	5.00%	84.84	83.73	82.73
2023	6.50%	83.50	82.40	81.43
2024	8.0%	82.16	81.08	80.12
2025	10.0%	80.38	79.32	78.38

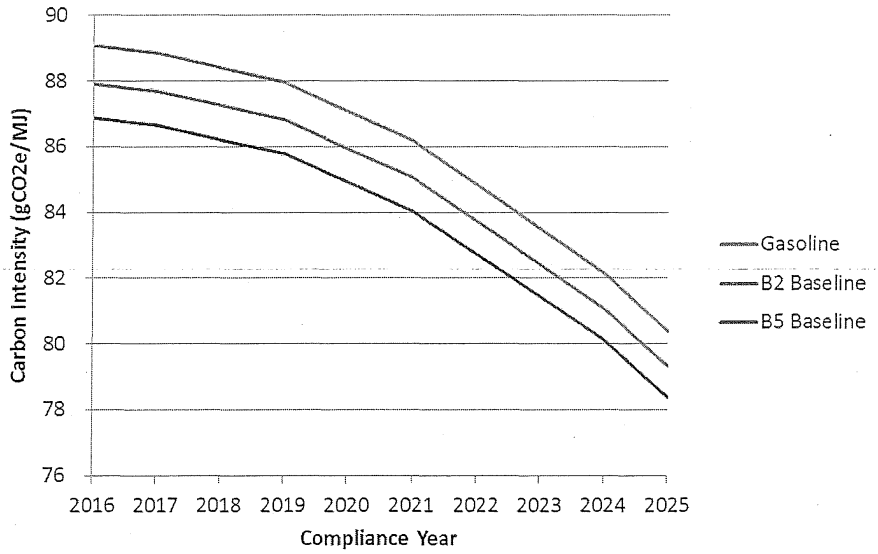

Figure 1. Gasoline and Diesel Compliance Schedules

2.2 Compliance Options Considered

ICF considered a variety of low carbon fuels to develop representative CFP compliance scenarios. Furthermore, to determine the balance of deficits and credits in each compliance scenario, ICF made various assumptions regarding how vehicles and fuels will be used in the near-term future towards CFP compliance. These are distinguished between fuels that substitute for gasoline (the gasoline pool) and fuels that substitute for diesel (the diesel pool).

Fuels that Substitute for Gasoline

ICF assumed that ethanol would continue to be blended into gasoline at a rate of 10 percent by volume, consistent with today's reformulated gasoline requirements. ICF limited the blending of ethanol with gasoline at a maximum of 15 percent by volume based on EPA's recently issued waiver for E15 in vehicle model years (MY) 2001 or newer. In addition, ICF included the potential of E85 consumption in flex-fuel vehicles (FFVs) if significant low carbon ethanol consumption is required for compliance. Although there is no E15 consumed in Oregon today – and very little generally in the United States – E15 could be consumed in meaningful quantities in Oregon as a result of drivers such as LCFS and the RFS2.

ICF considered the following pathways for ethanol production:

- **Corn, MW**: Corn from conventional processes is typically sourced from the Midwest. Corn has been and continues to be the most common feedstock for ethanol consumed in Oregon. Nearly 200 million gallons of corn ethanol are currently consumed in Oregon to meet the state's E10 requirement.
- **Corn, Boardman, OR**: The Boardman, OR ethanol facility currently produces 26 million gallons of corn ethanol per year. We assumed the same pathway carbon intensity from the 2010 plus the proposed CARB indirect land use change (ILUC) values.
- **Corn, low carbon intensity**: There is significant potential to lower the carbon intensity of corn ethanol through a variety of measures. For the purposes of this report, ICF assumed a lower limit of 46 g/MJ for what we term low carbon intensity corn ethanol (not including ILUC). There has already been a shift towards more efficient corn ethanol production as a result of the California LCFS, with many new lower carbon pathways submitted to and approved by CARB. The MW corn carbon intensity will exceed the gasoline standard in 2019 and ICF assumes by 2019 only ethanol meeting the standard will be consumed within Oregon with low carbon intensity corn will make up the balance of ethanol consumed in Oregon to meet the state's E10 requirement.
- **Corn, Sorghum**: There is a shift occurring towards lower carbon intensity feedstocks for ethanol production including grain and sweet sorghum as a result of the California LCFS. Based on the volumes of current applications submitted to CARB, ICF assumes that upwards of 100 million gallons per year of sorghum or other low carbon intensity feedstock ethanol will be available to Oregon by 2019 when the MW corn carbon intensity exceeds the gasoline standard.
- **Sugarcane**: Most sugarcane ethanol is produced in Brazil and shipped via tanker to the United States. In some cases, hydrous ethanol is shipped to a country in the Caribbean Basin Initiative (CBI); the excess water is subsequently removed and the anhydrous ethanol is shipped to the US. This step was more common when the US had a tariff on sugarcane ethanol imported directly from Brazil; the interim step allowed importers to avoid paying the tariff. For the sake of reference, the United

States imported 500 million gallons of sugarcane ethanol in 2012. ICF assumes that up to 50 million gallons per year of sugarcane ethanol could be consumed in Oregon.

- **Cellulosic**: Cellulosic ethanol refers generally to ethanol produced from wood, grasses, or other lignocelluosic materials.

Although ethanol from various feedstocks is the primary substitute for gasoline today, ICF also considered the following fuels that substitute for gasoline:

- **Electricity** used in plug -in electric vehicles (PEVs), including plug-in hybrid electric vehicles (PHEVs) and battery electric vehicles (BEVs), stands to play an important role towards compliance, particularly in later years of the regulation as the Zero Emission Vehicle (ZEV) Program takes full effect. In each of the compliance scenarios, a minimum number of PEVs was deployed to be consistent with business as usual case. For Scenario 1, ICF also considered the potential for all PHEVs in the BAU to be PHEV40s and not a split between PHEV10 and PHEV40.
- **Natural gas** has significant potential to displace gasoline consumption in medium-duty and light heavy-duty vehicles.
- **Biogas** has the potential to displace natural gas consumption and create significant reductions in carbon intensity. It is assumed that up to 47 million diesel gallon equivalents of biogas, comparable to Oregon in-state feedstock potential, could be consumed.

The table below shows the carbon intensity values used for fuels that substitute for gasoline. Unless otherwise noted, the carbon intensity values were taken directly from 2010 analysis with updates for CARB proposed ILUC values tables.

Table 5. Carbon Intensity Values for Fuels that Substitute for Gasoline

Fuel / Feedstock	Pathway Carbon Intensity (gCO2e/MJ)	ILUC (gCO2e/MJ)[a]	Updated CI (gCO2e/MJ)
Ethanol, MW Corn	64.82	23.20	88.02
Ethanol, Boardman	56.99	23.20	80.19
Ethanol, Low CI Corn	46.00	23.20	69.20
Ethanol, Sorghum	46.00	23.20	69.20
Ethanol, Sugarcane	26.44	26.50	52.94
Ethanol, Cellulosic[b]	18.22	2.5	20.72
Natural Gas (CNG/LNG) and Propane[c]	71.41	-	71.41
Biogas, multiple sources[d]	25.00	-	25.00
Electricity, marginal [e]	45.58	-	45.58

[a] ILUC values are proposed CARB values presented on March 11, 2014

[b] The average of previous Oregon pathways for ethanol from farmed trees and wheatstraw

[c] Assumes propane is mainly from natural gas liquids

[d] Representative of California LCFS applications for biogas used as CNG or LNG

[e] Includes the energy economy ratio (EER) of 3.4 for electric vehicles

Fuels that Substitute for Diesel

The fuel volumes in the compliance scenarios represent a combination of ICF research and previous project experience which includes input provided by the National Biodiesel Board (NBB). In the development of the compliance scenarios, we considered the following feedstocks for biodiesel:

- **Soybean oil**: Soybean oil is the largest single feedstock for biodiesel production in the United States. It is a well-established crop with a robust commodity market. While most soybeans are grown in the Midwest and a significant amount of biodiesel production capacity exists in the Midwest, Oregon biodiesel capacity can also utilize soybean oil. Soybean oil biodiesel is used as the balance biodiesel to make up necessary volumes to achieve desired blend levels.
- **Waste Grease/Used Oil**: Waste grease is a significant feedstock at Oregon production facilities. As a waste feedstock, waste grease has a low carbon intensity. The production process for biodiesel from waste grease is generally more energy intensive than for vegetable oils because there is generally a higher free fatty acid content. This requires an additional acid-catalyzed esterification reaction, thereby increasing the energy inputs. For the compliance scenarios, waste grease is assumed to remain constant at 15.8% of all biodiesel consumed based on the first 6 months of data from 2013.
- **Canola oil**: Canola oil is similar to soybean oil as a feedstock; it is more prominent feedstock in the European Union (referred to there as rapeseed). In North America, canola production historically exists primarily in Canada and northern states of the US and is a significant feedstock for Oregon

based biodiesel production. For the compliance scenarios, canola oil is assumed to remain constant at 20.4% of all biodiesel consumed based on the first 6 months of data from 2013.

- **Corn oil**: Corn oil is a byproduct of corn ethanol production and generally requires retrofitting an ethanol plant. It is a feedstock with significant growth potential for the biodiesel industry. Corn oil extraction is a relatively new commodity for the majority of ethanol production facilities, but represents another high-value co-product. Anecdotal evidence indicates that the majority of corn ethanol facilities in the US will have installed equipment to extract corn oil by the end of 2013. Corn oil biodiesel will be used as needed for the compliance scenarios.

ICF also considered the following alternative fuels:

- **Renewable diesel**: Like biodiesel, there are multiple feedstocks that can be used to produce renewable diesel, including palm oil, canola (or rapeseed) oil, jatropha oil, camelina oil, soy oil, waste greases, and animal fats (i.e., tallow). ICF considered renewable diesel produced from tallow and waste oil; this pathway is largely based on the availability of renewable diesel produced by Neste Oil in its Singapore production plant using its renewable diesel production process. A conservative assumption was made that maximum renewable diesel would be an average statewide 2% blend with a maximum of 10 million gallons per year from tallow and the balance from waste oil.
- **Natural gas**: ICF considered the potential for natural gas – compressed, liquefied, and biogas – in heavy-duty applications such as short-, medium-, and long-haul trucks, refuse haulers, and transit buses. It is assumed that up to 47 million diesel gallon equivalents of biogas, comparable to Oregon in-state feedstock potential, could be consumed. For Scenario 1, it is assumed that medium and heavy duty CNG vehicle sales increase to the point where 10% of diesel pool fuel consumption in 2025 is a combination of natural gas, biogas and LPG.
- **Propane** has potential to displace diesel consumption in medium-duty and light heavy-duty vehicles in niche applications. It is assumed that propane consumption will reach a maximum of 1% of total natural gas consumption. Since it is assumed that fossil fuel natural gas and propane have the same carbon intensity, the quantities of each fuel summing to the total are fungible.
- **Hybrid-Electric Vehicles (HEVs)**: HEVs do not consume alternative fuels; they do reduce the quantity of diesel consumed. In Scenario 1, the assumption is made that HEVs achieve 10% sales penetration in the medium- and heavy-duty markets. The BAU case and Scenario 2 do not included medium- and heavy-duty HEVs.

The table below includes the carbon intensity values used to determine the balance of deficits and credits in each scenario. Unless otherwise noted, the carbon intensity values were taken directly from 2010 analysis with updates for CARB proposed ILUC values tables.

Table 6. Carbon Intensity Values for Fuels that Substitute for Diesel

Fuel / Feedstock	Pathway Carbon Intensity (gCO_2e/MJ)	ILUC (gCO_2e/MJ)[a]	Updated CI (gCO_2e/MJ)
Biodiesel, soy oil	19.99	30.20	50.19
Biodiesel, waste grease	10.28	-	10.28
Biodiesel, corn oil	4.00	-	4.00
Biodiesel, canola oil	27.31	41.60	68.91
Renewable diesel, tallow	16.85	-	16.85
Renewable diesel, waste oil	10.28	-	10.28
Natural Gas and Propane [b]	79.34	-	79.34
Biogas, landfill [c]	27.78	-	27.78

[a] ILUC values are proposed CARB values presented on March 11, 2014

[b] Assumes propane is mainly from natural gas liquids; includes the EER of 0.9 for spark ignition CNG vehicles

[c] Representative of California LCFS applications for biogas used as CNG or LNG; includes the EER of 0.9 for spark ignition CNG vehicles

3 Overview of Compliance Scenarios

Based on the alternative fuels available for each compliance scenario and two diesel baselines described in Section 2, ICF developed four (4) different scenarios that achieve compliance with the Clean Fuels Program by balancing the cumulative deficits and credits over the 10 year compliance period.

Table 7. Overview of Clean Fuels Program Compliance Scenarios

Scenario	Ethanol	Biodiesel (BD) / Renewable Diesel (RD)	Natural Gas	Advanced Vehicles (PEVs / MD-HD HEVs)
Scenario 1-B2	Maintained E10 blend rate 50 million gallons per year (MGPY) of sugarcane ethanol for all years 100 MGPY of sorghum and balance ethanol required from low CI corn in 2019 when MW corn greater than standard	Maintained BD blend at 5% and canola/soy/used oil ratios RD at 1% in 2021 and increases to 2% by 2025; between 5-10 MGPY from tallow, balance waste oil	Natural gas vehicle market share increased till 10% diesel pool consumption is natural gas (18% market share in 2025) By 2019, 50% of natural gas from biogas (46 MGPY in 2025)	All PHEVs are PHEV40 MD-HD HEV sales increased to 10% market share by 2025
Scenario 1-B5	Same as Scenario 1-B2	BD blend to 6% in 2023 and 7% in 2025; maintained canola/soy/used oil RD 2% from 2016-2025 with 10 MGPY from tallow and balance waste oil	Same as Scenario 1-B2	Same as Scenario 1-B2
Scenario 2-B2	Same as Scenario 1-B2	Biodiesel blend to 6% in 2021 up to 8.9% in 2025; maintained canola/soy/used oil RD 2% from 2016-2025 with 10 MGPY from tallow and balance waste oil	By 2019, 100% of natural gas from biogas (12 MGPY in 2025)	Same as BAU
Scenario 2-B5	Same as Scenario 1-B2	BD blend to 6% in 2019 up to 10% in 2021; maintained canola/soy/used oil till 2020, capped canola at 10 MGPY and (2020) and waste oil at 30 MGPY (2023) RD 2% from 2016-2025 with 10 MGPY from tallow and balance waste oil	Same as Scenario 2-B2	Same as BAU
Assumptions for All Scenarios	Maximum ethanol blend is E15 FFVs 85% of miles on E85 Maximums for ethanol: Sorghum-100 MGPY; Low CI Corn-150 MGPY; Sugarcane- 50 MGPY			Achieves ZEV compliance BAU vehicle populations: 90,000 BEVs in 2025; 61,000 PHEV10 in 2025; 62,000 PHEV40 in 2025

3.1 Compliance Scenarios 1-B2 and 1-B5

Summary Overview of Compliance Scenarios 1-B2 and 1-B5

Figure 2 and Figure 3 on the following page show the annual credits and deficits generated for Scenarios 1-B2 and 1-B5. Each colored stacked bar represents credits generated from low carbon fuels; the blue line represents the deficits from forecasted gasoline blendstock and ultra-low sulfur diesel (ULSD) consumption. When the bars in years 2016-2021 exceed the blue line, annual credits exceed annual deficits and banked credits are generated for future compliance. When the bars fall short of the blue line in years 2022-2025, banked credits are required to meet annual compliance. The stacked bars are grouped by biofuels for blending at the bottom and advanced vehicle technologies at the top. Table 8 and Table 9 below show the annual deficits and credits generated and cumulative (banked) credits.

Table 8. Credits and Deficits: Banking in Scenario 1-B2

Fuel		2016	2017	2018	2019	2020	2021	2022	2023	2024	2025
Deficits (Millions)	Gasoline	-0.05	-0.08	-0.14	-0.20	-0.32	-0.43	-0.59	-0.75	-0.89	-1.08
	Diesel	-0.11	-0.13	-0.18	-0.22	-0.31	-0.40	-0.53	-0.65	-0.78	-0.93
Credits (Millions)	Gasoline Subs	0.22	0.23	0.25	0.57	0.60	0.63	0.64	0.66	0.68	0.68
	Diesel Subs	0.21	0.22	0.24	0.29	0.32	0.41	0.43	0.48	0.49	0.53
Balance		0.28	0.24	0.17	0.44	0.28	0.20	-0.05	-0.26	-0.49	-0.79
Banked (Net)		0.28	0.51	0.68	1.12	1.40	1.60	1.55	1.29	0.80	0.00

Table 9. Credits and Deficits: Banking in Scenario 1-B5

Fuel		2016	2017	2018	2019	2020	2021	2022	2023	2024	2025
Deficits (Millions)	Gasoline	-0.05	-0.08	-0.14	-0.20	-0.32	-0.43	-0.59	-0.75	-0.89	-1.08
	Diesel	-0.21	-0.23	-0.28	-0.32	-0.41	-0.50	-0.62	-0.74	-0.85	-1.00
Credits (Millions)	Gasoline Subs	0.22	0.23	0.25	0.57	0.60	0.63	0.64	0.66	0.68	0.68
	Diesel Subs	0.33	0.34	0.36	0.42	0.44	0.46	0.49	0.54	0.56	0.59
Balance		0.30	0.26	0.19	0.46	0.31	0.16	-0.09	-0.29	-0.50	-0.81
Banked (Net)		0.30	0.56	0.75	1.22	1.53	1.69	1.60	1.31	0.81	0.00

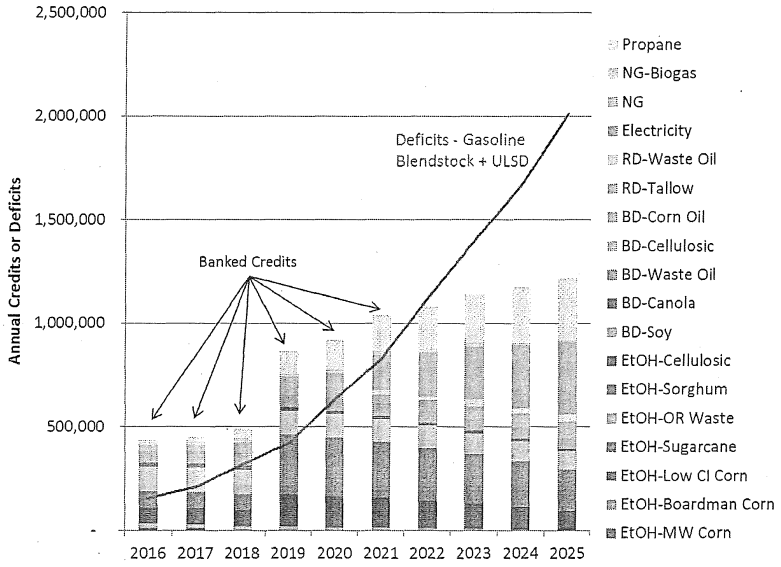

Figure 2. Balance of Credits and Deficits in Scenario 1-B2

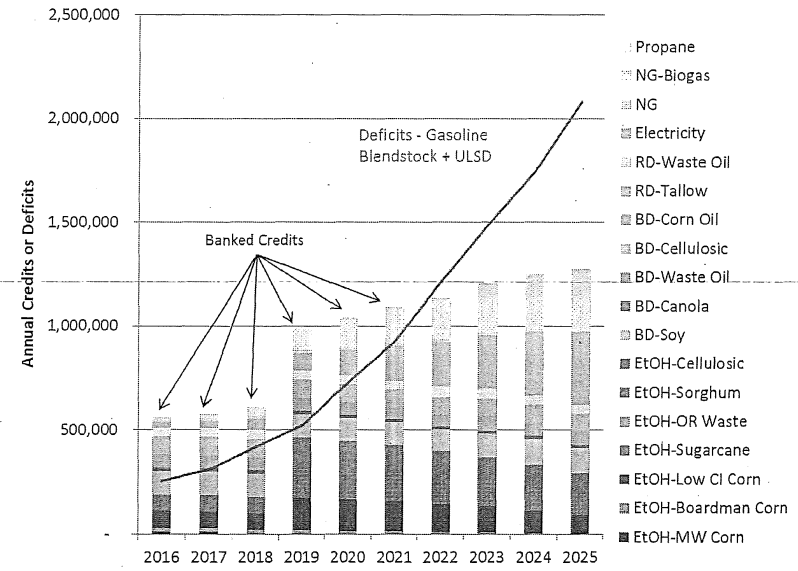

Figure 3. Balance of Credits and Deficits in Scenario 1-B5

In Scenario 1-B2, gasoline and diesel generate a similar number of deficits while in Scenario 1-B5 diesel generates almost 1 million more deficits than gasoline.

Fleet Changes from the BAU

Two fleet changes occurred between the BAU and Scenario 1 (both 1-B2 and 1-B5). In the light-duty fleet, all PHEVs are PHEV40s compare to the 50/50 split between PHEV10 and PHEV40 in the BAU. Figure 4 below shows the Scenario 1 light-duty vehicle fleet.

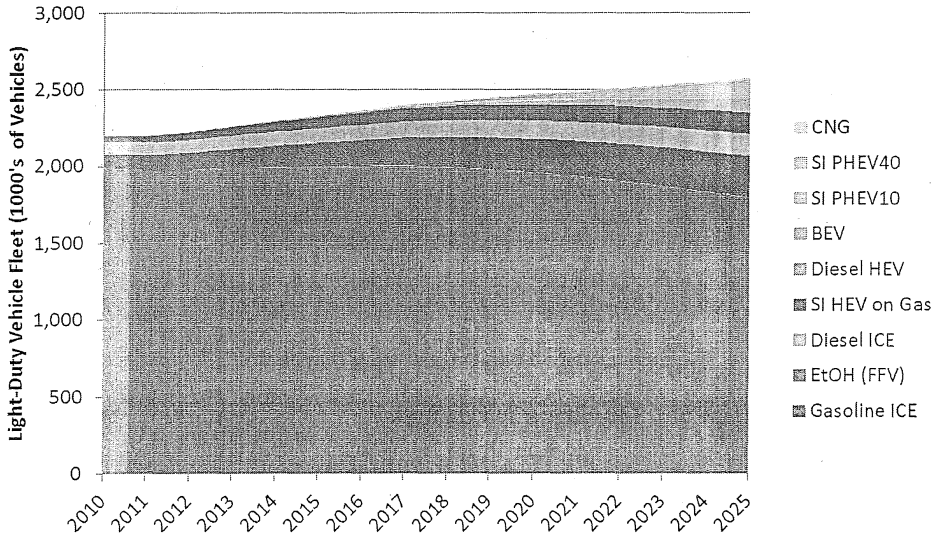

Figure 4. Scenario 1 Light-Duty Vehicle Fleet

The medium- and heavy-duty market shares for HEVs and natural gas/LPG vehicles were increased in Scenario 1 over the BAU case. The natural gas vehicle market shares were increased to achieve 10% diesel pool fuel consumption from natural gas/LPG. This assumption resulted in 18% market share of natural gas/LPG vehicles in 2025. The medium- and heavy-duty market shares for HEVs were increased to 10% by 2025. Figure 5 below shows the resulting Scenario 1 medium- and heavy-duty vehicle fleet.

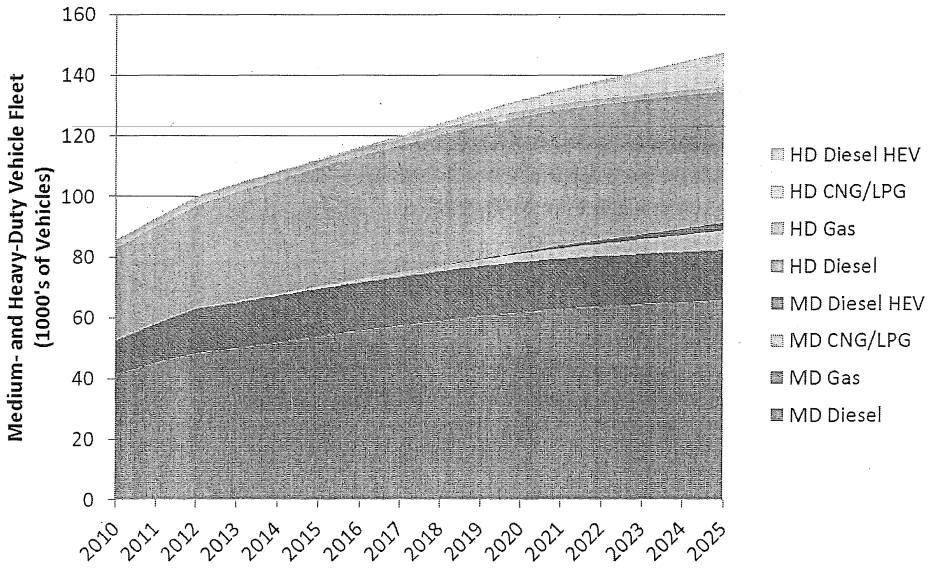

Figure 5. Scenario 1 Medium- and Heavy-Duty Fleet

Ethanol and Biofuels that Substitute for Gasoline

Table 10 below identifies the volumes of ethanol, broken down by feedstock, for both Scenarios 1-B2 and 1-B5. The ethanol volumes and feedstocks between 1-B2 and 1-B5 are identical.

Table 10. Ethanol Volumes (in million gallons) in Scenario 1

Feedstocks	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025
Corn, MW	135.14	142.19	147.62	0	0	0	0	0	0	0
Corn, Boardman	26	26	26	26	26	26	26	26	26	26
Low CI Corn	50	50	50	102.18	104.72	106.05	106.86	106.38	104.56	102.26
Sugarcane	0	0	0	50	50	50	50	50	50	50
Sorghum	50	50	50	100	100	100	100	100	100	100
Total	261.14	268.19	273.62	278.18	280.72	282.05	282.86	282.38	280.56	278.26
% EtOH in Gasoline	10%	10%	10%	10%	10%	10%	10%	10%	10%	10%

Scenarios 1-B2 and 1-B5 consume very similar volumes of ethanol to the BAU case since all cases maintain a 10% ethanol blend. Scenarios 1-B2 and 1-B5 cease to consume MW corn ethanol by 2019 since the carbon intensity of MW Corn exceeds the standard in that year and every subsequent year.

Biodiesel

Table 11 and Table 12 below show the volumes of biodiesel, by feedstock, consumed in Scenarios 1-B2 and 1-B5.

Table 11. Biodiesel Volumes (in million gallons) in Scenario 1-B2

Feedstocks	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025
Soy	24.48	24.77	24.98	25.09	25.05	24.98	24.91	24.71	24.42	24.13
Canola	7.83	7.93	7.99	8.02	8.01	7.99	7.97	7.90	7.81	7.72
Waste Oil	6.07	6.14	6.20	6.22	6.21	6.20	6.18	6.13	6.06	5.98
Total	38.38	38.84	39.17	39.33	39.27	39.16	39.06	38.74	38.28	37.83
% BD in ULSD	5%	5%	5%	5%	5%	5%	5%	5%	5%	5%

Table 12. Biodiesel Volumes (in million gallons) in Scenario 1-B5

Feedstocks	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025
Soy	24.50	24.80	25.01	25.12	25.08	24.99	24.92	29.68	31.79	33.83
Canola	7.84	7.93	8.00	8.03	8.02	8.00	7.97	9.49	10.17	10.82
Waste Oil	6.08	6.15	6.20	6.23	6.22	6.20	6.18	7.36	7.88	8.39
Total	38.42	38.89	39.21	39.38	39.32	39.19	39.08	46.54	49.84	53.04
% BD in ULSD	5%	5%	5%	5%	5%	5%	5%	6%	6.5%	7%

Scenario 1-B5 requires an increase from statewide average B5 to 6% biodiesel in 2023 and up to 7% in 2020. This results in a cumulative increase of over 35 million gallons of biodiesel between 2023 and 2025.

Renewable Diesel

Table 13 and Table 14 below show the volumes of renewable diesel, by feedstock, consumed in Scenarios 1-B2 and 1-B5.

Table 13. Renewable Diesel Volumes (in million gallons) in Scenario 1-B2

Feedstocks	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025
Tallow	0	0	0	0	0	5	6	7	8	10
Waste Oil	0	0	0	0	0	2.19	1.89	3.67	2.54	3.89
Total	0	0	0	0	0	7.19	7.89	10.67	10.54	13.89
% RD in ULSD	0%	0%	0%	0%	0%	1%	1.1%	1.5%	1.5%	2%

Table 14. Renewable Diesel Volumes (in million gallons) in Scenario 1-B5

Feedstocks	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025
Tallow	10	10	10	10	10	10	10	10	10	10
Waste Oil	4.11	4.28	4.40	4.46	4.44	4.39	5.48	5.36	5.18	5.01
Total	14.11	14.28	14.40	14.46	14.44	14.39	15.48	15.36	15.18	15.01
% RD in ULSD	2%	2%	2%	2%	2%	2%	2%	2%	2%	2%

Scenario 1-B5 requires an increase to 2% renewable diesel throughout the program while Scenario 1-B2 only requires small volumes in the later years. This results in a cumulative increase of almost 100 million gallons of renewable diesel during the 10 year compliance period of the program.

Natural Gas/LPG

Table 15 below shows the natural gas/LPG and biogas consumption in million DGE where market share was increased to achieve 10% diesel pool consumption of natural gas/LPG/biogas in 2025. The vehicle penetrations and assumptions were the same for natural gas/LPG/biogas in Scenarios 1-B2 and 1-B5.

Table 15. Natural Gas/LGP Consumption (in million DGE) in Scenarios 1-B2 and 1-B5

	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025
Natural Gas/LPG	8.11	11.79	15.25	14.11	18.52	23.26	28.28	33.80	39.94	46.62
Biogas	0.90	2.08	5.08	14.11	18.52	23.26	28.28	33.80	39.94	46.62
Total	9.01	13.87	20.34	28.22	37.04	46.53	56.55	67.61	79.87	93.24

Electricity

Table 16 below shows the electricity consumption from BEVs and PHEVs in million GGE.

Table 16. Electricity Consumption (in million GGE) in Scenarios 1-B2 and 1-B5

	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025
Total	1.51	1.85	3.17	4.99	7.39	10.24	13.40	16.87	20.76	25.12

3.2 Compliance Scenarios 2-B2 and 2-B5

Summary Overview of Compliance Scenarios 2-B2 and 2-B5

Figure 6 and Figure 7 on the following page show the annual credits and deficits generated for Scenarios 2-B2 and 2-B5. Each colored stacked bar represents credits generated from low carbon fuels; the blue line represents the deficits from forecasted gasoline blendstock and ultra-low sulfur diesel (ULSD) consumption. When the bars in years 2016-2021 exceed the blue line, annual credits exceed annual deficits and banked credits are generated for future compliance. When the bars fall short of the blue line in years 2022-2025, banked credits are required to meet annual compliance. The stacked bars are grouped by biofuels for blending at the bottom and advanced vehicle technologies at the top. Table 17 and Table 18 below show the annual deficits and credits generated and cumulative (banked) credits.

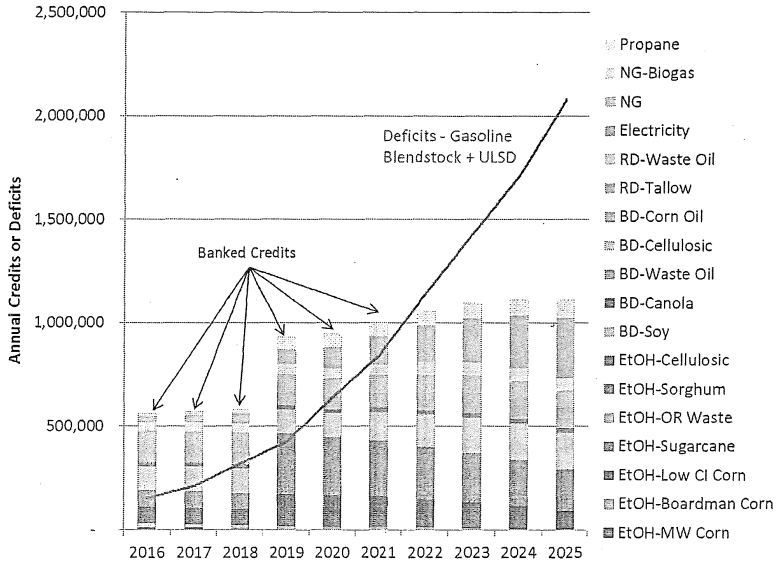

Figure 6. Balance of Credits and Deficits in Scenario 2-B2

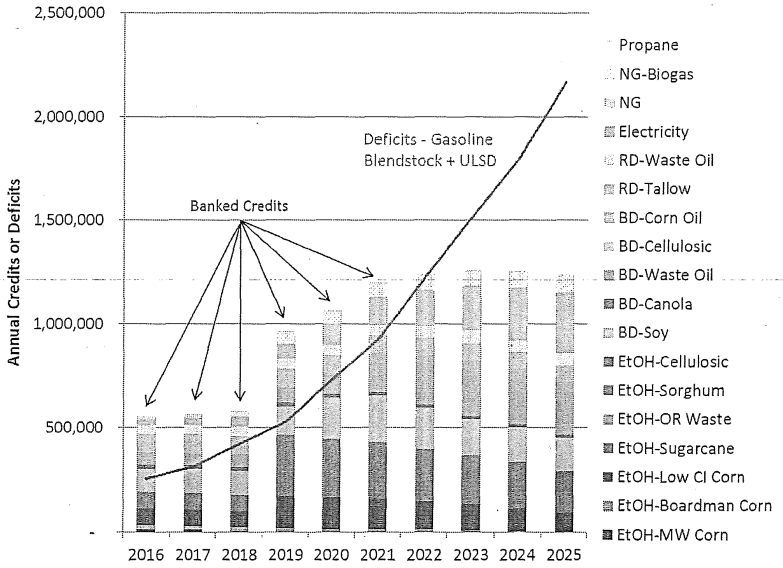

Figure 7. Balance of Credits and Deficits in Scenario 2-B5

Table 17. Credits and Deficits: Banking in Scenario 2-B2

Fuel		2016	2017	2018	2019	2020	2021	2022	2023	2024	2025
Deficits (Millions)	Gasoline	-0.05	-0.08	-0.14	-0.20	-0.32	-0.43	-0.60	-0.75	-0.90	-1.09

Banked (Net)		0.40	0.76	1.03	1.53	1.83	1.99	1.91	1.57	0.97	0.00

Table 18. Credits and Deficits: Banking in Scenario 2-B5

Fuel		2016	2017	2018	2019	2020	2021	2022	2023	2024	2025
Deficits (Millions)	Gasoline	-0.05	-0.08	-0.14	-0.20	-0.32	-0.43	-0.60	-0.75	-0.90	-1.09
	Diesel	-0.21	-0.24	-0.28	-0.33	-0.41	-0.49	-0.63	-0.76	-0.90	-1.08
Credits (Millions)	Gasoline Subs	0.22	0.23	0.24	0.56	0.58	0.60	0.61	0.62	0.63	0.63
	Diesel Subs	0.33	0.33	0.34	0.39	0.48	0.59	0.62	0.63	0.62	0.61
Balance		0.29	0.25	0.15	0.43	0.33	0.27	0.01	-0.26	-0.54	-0.93
Banked (Net)		0.29	0.54	0.69	1.12	1.45	1.72	1.73	1.47	0.93	0.00

In Scenario 2-B2, gasoline and diesel generate similar numbers of deficits while in Scenario 2-B5, diesel generates almost 1 million more deficits than gasoline.

Fleet Changes from the BAU

There are no fleet changes between Scenarios 2-B2 and 2-B5 and the BAU.

Ethanol and Biofuels that Substitute for Gasoline

Table 19 below identifies the volumes of ethanol, broken down by feedstock, for both Scenarios 2-B2 and 2-B5. The ethanol volumes and feedstocks between 2-B2 and 2-B5 are identical.

Table 19. Ethanol Volumes (in million gallons) in Scenario 2

Feedstocks	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025
Corn, MW	135.15	142.21	147.72	0	0	0	0	0	0	0
Corn, Boardman	26	26	26	26	26	26	26	26	26	26
Low CI Corn	50	50	50	102.36	104.99	106.44	107.36	107.02	105.34	103.18
Sugarcane	0	0	0	50	50	50	50	50	50	50
Sorghum	50	50	50	100	100	100	100	100	100	100
Total	261.15	268.21	273.72	278.36	280.99	282.44	283.36	283.02	281.34	279.18
% EtOH in Gasoline	10%	10%	10%	10%	10%	10%	10%	10%	10%	10%

Scenarios 2-B2 and 2-B5 consume the same volumes of ethanol to the BAU case since all cases maintain a 10% ethanol blend. Scenarios 2-B2 and 2-B5 cease to consume MW corn ethanol by 2019 since the carbon intensity of MW Corn exceeds the compliance in that year and every subsequent year. By 2025, there is a slight increase in ethanol consumption over Scenarios 1-B2 and 1-B5 since they include only PHEV40s and not PHEV10s which results in a slight increase in E10 consumption.

Biodiesel

Table 20 and Table 21 below show the volumes of biodiesel, by feedstock, consumed in Scenarios 2-B2 and 2-B5.

Table 20. Biodiesel Volumes (in million gallons) in Scenario 2-B2

Feedstocks	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025
Soy	24.64	25.06	25.43	25.75	25.96	31.41	37.01	42.55	45.39	48.30
Canola	7.88	8.01	8.13	8.24	8.30	10.05	11.84	13.61	14.52	15.45
Waste Oil	6.11	6.21	6.31	6.39	6.44	7.79	9.18	10.55	11.26	11.98
Total	38.63	39.28	39.87	40.37	40.70	49.25	58.02	66.71	71.17	75.73
% BD in ULSD	5%	5%	5%	5%	5%	6%	7%	8%	8.5%	9%

Table 21. Biodiesel Volumes (in million gallons) in Scenario 2-B5

Feedstocks	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025
Soy	24.64	25.06	25.43	30.92	44.94	52.33	47.47	43.51	43.83	44.21
Canola	7.88	8.01	8.13	9.89	10	10	10	10	10	10
Waste Oil	6.11	6.21	6.31	7.67	10.32	20	25.6	30	30	30
Total	38.63	39.28	39.87	48.48	65.27	82.33	83.07	83.51	83.83	84.21
% BD in ULSD	5%	5%	5%	6%	8%	10%	10%	10%	10%	10%

Scenario 2-B2 requires an increase from statewide average B5 to 6% biodiesel in 2021 and up to 9% in 2020 and Scenario 2-B5 requires an increase from B5 to B6 in 2019 and up to 10% in 2021. This results in a cumulative increase of almost 130 million gallons of biodiesel between Scenarios 2-B5 and 2-B2.

Renewable Diesel

Table 22 below shows the volumes of renewable diesel, by feedstock, consumed in Scenarios 2-B2 and 2-B5.

Table 22. Renewable Diesel Volumes (in million gallons) in Scenario 2-B2 and 2-B5

Feedstocks	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025
Tallow	10	10	10	10	10	10	10	10	10	10
Waste Oil	4.18	4.42	4.64	4.82	4.94	5.07	6.41	6.51	6.58	6.66
Total	14.18	14.42	14.64	14.82	14.94	15.07	16.41	16.51	16.58	16.66
% RD in ULSD	2%	2%	2%	2%	2%	2%	2%	2%	2%	2%

Scenarios 2-B2 and 2-B5 increase to 2% renewable diesel throughout the program resulting in 154 million gallons of renewable diesel consumption throughout the program.

Natural Gas/LPG

Table 23 below shows the natural gas/LPG and biogas consumption in million DGE where market share was increased to achieve 10% diesel pool consumption of natural gas/LPG/biogas in 2025. The vehicle penetrations and assumptions were the same for natural gas/LPG/biogas in Scenarios 2-B2 and 2-B5.

Table 23. Natural Gas/LGP Consumption (in million DGE) in Scenarios 2-B2 and 2-B5

	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025
Natural Gas/LPG	4.51	5.38	6.20	6.99	7.77	8.52	9.36	10.13	10.94	12.22
Biogas	4.06	4.57	4.65	0.07	0.08	0.09	0.09	0.10	0.11	0.12
Total	0.45	0.81	1.55	6.92	7.70	8.43	9.27	10.03	10.83	12.10

Electricity

Table 24 below shows the electricity consumption from BEVs and PHEVs in million GGE.

Table 24. Electricity Consumption (in million GGE) in Scenarios 2-B2 and 2-B5

	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025
Total	1.51	1.85	2.80	4.20	6.12	8.44	11.07	13.97	17.24	20.93

The fleet change between Scenario 1 and 2 where all PHEVs are PEHV40 resulted in 4.2 million GGE of increased electricity consumption in 2025 in Scenario 1.

3.3 Greenhouse Gas Reductions

Table 25 shows the annual GHG emissions in million metric tons from transportation fuels from 2015 to 2025. Table 26 shows the percent GHG reductions annually from 2016 to 2025 and cumulatively over the compliance period from 2016 to 2025.

Table 25. Annual GHG Emissions (million metric tons)

Scenario	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025
BAU	23.93	24.12	24.22	24.24	24.22	24.10	23.96	23.81	23.62	23.39	23.19
1-B2	23.92	23.95	24.04	24.03	23.64	23.48	23.21	23.00	22.71	22.41	22.09
1-B5	23.92	23.82	23.90	23.90	23.50	23.34	23.14	22.94	22.63	22.32	22.01
2-B2	23.92	23.83	23.92	23.94	23.58	23.45	23.26	23.06	22.81	22.56	22.32
2-B5	23.92	23.83	23.92	23.94	23.53	23.31	23.03	22.85	22.62	22.39	22.18

Table 26. GHG Emissions Reductions from the BAU (Percent)

Scenario	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025	2016-2015
1-B2	0.7%	0.7%	0.9%	2.4%	2.6%	3.1%	3.4%	3.8%	4.2%	4.7%	**2.6%**
1-B5	1.3%	1.3%	1.4%	2.9%	3.2%	3.4%	3.7%	4.2%	4.6%	5.1%	**3.1%**
2-B2	1.2%	1.2%	1.3%	2.6%	2.7%	2.9%	3.2%	3.4%	3.6%	3.7%	**2.6%**
2-B5	1.2%	1.2%	1.3%	2.8%	3.3%	3.9%	4.1%	4.2%	4.3%	4.4%	**3.0%**

The reductions in Table 26 are compared to the BAU (which includes the ZEV Program and increased light-duty fuel economy standards) and only represent those reductions that would be directly attributed to the Clean Fuels Program. As expected, the scenarios with the B5 baseline achieved more cumulative reductions than the B2 scenarios. Additionally, both of the B2 baseline scenarios and the B5 baseline scenarios achieved similar cumulative reductions which were expected since the compliance period was looking to achieve the same carbon intensity reductions. The advanced vehicle technology scenarios are reducing more emissions annually at the end of the program compared to the blending scenarios due to displacing diesel with natural gas and biogas and reducing consumption of diesel from medium- and heavy-duty hybrids.

MEMO

DATE: October 5, 2016

TO: Planning and Sustainability Commission

FROM: Tom Armstrong, Steve Kountz, Shannon Buono

CC: Michael Armstrong, Susan Anderson, Zach Klonoski

SUBJECT: Fossil Fuel Terminal Zoning Amendments

This memo is a response to major issues raised at the September 13, 2016 PSC public hearing and includes possible amendments to the Proposed Draft for consideration at the October 11 PSC work session.

Summary of issues:

- Storage capacity size threshold and aggregation of small facilities. The 5-million-gallon terminal size threshold determines which facilities will be subject to these restrictions. Public testimony raised concern that companies would use subsidiaries to aggregate or link smaller facilities as a means to circumvent the threshold limits.
- Regulating existing terminals. Designating existing terminals as non-conforming, limited or conditional uses has different implications for replacement of existing tanks, including seismic upgrades.
- Exemption for regulated utilities. NW Natural has requested that facilities required to serve end users be exempt from the regulations.
- Regulating throughput. Public testimony raised concerns that terminals would increase activity as a response to limited capacity and that the amount of product moving through a facility should be regulated.
- Seismic safety as a building code issue.

Balancing Competing Goals

The Portland Fossil Fuel Resolution (#37168) provides direction to actively oppose expansion of fossil fuel infrastructure, but do not restrict improvements in the safety, efficiency, seismic resilience, or operations of existing infrastructure and infrastructure that will accelerate the transition to non-fossil fuel energy sources.

BPS staff recommendations are based on three major points:

1. Even though these existing terminals are located in a moderate to high liquefaction susceptibility zone; it is impratical to assume that these facilities will move to another location in the region or Oregon. The focus should be on improving seismic resilience, which requires reinvestment and replacement of old tanks.

2. If the regulations are too restrictive, then the existing fossil fuel terminals will not make the necessary improvements to improve seismic safety. If there is a future program that requires replacement of old tanks through the building code, the zoning code should provide a clear path, without a discretionary land use review, to making these improvements.

3. Compliance with the State of Oregon's Clean Fuel Standards may generate the need for additional storage capacity for fuel additives such as ethanol. The zoning code should have a clear path, without a discretionary land use review, to provide flexibility for limited expansions to comply with the Clean Fuel Standards,

Zoning Code Options

1. Storage capacity size threshold and aggregation of sites

The Bulk Fossil Fuel Terminal use category is intended to apply to large regional gateway facilities where fossil fuels are brought into the region. The 5-million gallon capacity threshold is small compared to the existing petroleum terminals, which range from 11.6 million to 67.2 million gallons, with most facilities having more than 25 million gallons of storage capacity. Also, the recent proposals for export terminals in the Pacific Northwest are many times larger than the proposed 5-million gallon threshold. For example, the recent crude oil terminal proposal in Vancouver (Washington) was for 91 million gallons of storage capacity and the Pembina propane terminal proposal in Portland was for 34 million gallons of storage capacity.

The size threshold would apply to both new and existing terminals. BPS has identified 11 existing facilities that fit the description of a Bulk Fossil Fuel Terminal use. BPS involved representatives of these 11 terminals in early outreach activities for this project since May 2016, along with environmental organizations, neighborhood and equity organizations, and state and regional business associations. Smaller fossil fuel distributors that could be affected by these proposed regulations have not been involved in this process. Preliminary research to identify potential fossil fuel distributors based on NAIC codes has identified an additional 24 businesses that could be affected if the threshold is reduced below 5 million gallons (see table below).

A change to effectively eliminate the bulk fossil fuel storage aspect of the use description may also inadvertently expand the use category to include general freight transportation facilities, such as rail yards and barge lines that handle fossil fuels and other commodities. A clarification in the use description should be added to clarify that railroad yards and pipelines without transloading or storage facilities are not Bulk Fossil Fuel Terminals.

The September 16 written testimony from 350PDX, prepared by Mia Reback and Nick Caleb, indicates that the 5-million gallon threshold *probably* will be adequately restrictive on all new fossil fuel terminals, but are concerned about the potential for small terminal aggregation. Their concern is a larger parent corporation would set up different subsidiaries, each having a small lot with 5-million gallons of storage capacity, on contiguous lots as a way to circumvent the 5-million gallon limit on new facilities.

The Zoning Code (33.910.030) defines "ownership"as:

> An ownership is one or more contiguous lots that are owned by the same person, partnership, association, or corporation. Ownership also includes lots that are in common ownership but are separated by a shared right-of-way.

The reference to partnerships and corporations is an inclusive term that includes subsidiaries of a larger corporation, which would prevent a larger parent corporation from using different subsidiaries on contiguous lots.

A possible amendment to the definition of Bulk Fossil Fuel Terminals could clarify that multiple fossil fuel facilities, each with less than 5 million gallons of fossil fuel storage capacity located on separate parcels of land will be classified as a Bulk Fossil Fuel Terminal when two or more of the following factors are present:

a. The facilities are located or will be located on one or more adjacent parcels of land. Adjacent includes separated by a shared right-of-way;

b. The facilities share or will share operating facilities such as driveways, parking, piping, or storage tanks; or

c. The facilities are owned or operated by a single parent partnership or corporation.

Options:

A. No change. Retain the storage capacity threshold at 5 million gallons.

B. Reduce the storage capacity threshold.

C. Add language to clarify common ownership includes subsidiaries of corporations.

D. Add language to clarify the use status of railroad yards and pipelines.

- Regional gas and oil pipelines are classified as Rail Line and Utility Corridor uses.

City of Portland, Oregon | Bureau of Planning and Sustainability | www.portlandonline.com/bps
1900 SW 4th Avenue, Suite 7100, Portland, OR 97201 | phone: 503-823-7700 | fax: 503-823-7800 | tty: 503-823-6868

Printed on 100% post-consumer waste recycled paper.

- Railroad yards are classified as Railroad Yard uses.

BPS Recommendation: Retain the 5-million gallon threshold. Add clarifying language to prevent aggregation of small facilities. Add clarifying language for railyards and pipelines.

2. Regulating existing terminal expansion

To be consistent with Resolution 37168, there should be an opportunity for replacement and limited expansion of existing terminal storage capacity to allow for new tanks to meet clean fuel standards and seismic safety improvements through the replacement of existing tanks.

The Proposed Draft establishes the existing terminals as legal non-conforming uses that will require all improvements to go through a non-conforming situation review. Comments from BDS clarify that even one-for-one replacement of existing tanks (without expansion) would be difficult to approve through a non-conforming situation review. In addition, the terminal operators raised concerns about being designated as a non-conforming use in terms of financing improvements and the uncertainty created by the land use review process. At the same time, 350PDX and many others expressed support for designating terminals as a non-conforming use and requiring improvements to go through a land use review.

Other options are to make the existing terminals a limited use or conditional use with land use review approval criteria to ensure that the expanded capacity will improve safety (replace old tanks) and is need for compliance with clean renewable fuel standards (reduce GHG emissions).

BDS recommends designating the existing terminals as a limited use with a limit on expansions to be no more than 10 percent of the existing total storage capacity on the site. Alterations, replacement of existing tanks, and expansions within the limit would be allowed without a land use review. Expansion of storage capacity would need to be done in conjunction with the seismic upgrade of at least one existing tank, so that there is an increase in the overall seismic safety of the terminal. New or replacement tanks would automatically be required to meet current building code standards for seismic safety.

Another approach would be to allow for expansion up to the 10 percent limit through a conditional use review. Approval criteria could to ensure that the added capacity will improve safety (replace old tanks) and is needed for compliance with clean renewable fuel standards (reduce GHG emissions). Alterations to the terminal that do not increase the fossil fuel storage capacity would not be subject to a conditional use review.

There was a lot of public testimony on whether or not to require a discretionary land use review as part of a limited expansion. Land use reviews require public notice and opportunities for public comment and appeals. Land use reviews also introduce an element of uncertainty and time delay that could be a deterrent to undertaking an improvement project that would otherwise help meet seismic resilience or clean fuel goals. BDS has expressed concerns that they do not have the expertise to implement discretionary land use

City of Portland, Oregon | Bureau of Planning and Sustainability | www.portlandonline.com/bps
1900 SW 4th Avenue, Suite 7100, Portland, OR 97201 | phone: 503-823-7700 | fax: 503-823-7800 | tty: 503-823-6868

Printed on 100% post-consumer waste recycled paper.

review criteria addressing greenhouse gas emissions or safety impacts of hazardous material storage and transportation. If new conditional use criteria are added to limit or require no net increase of greenhouse gas emissions or safety impacts of hazardous material storage and transportation facilities, applicants would be required to hire specialized consultants to show compliance of the particular criterion, which would affect the complexity, predictability, and cost of land use reviews in new ways.

An alternative to a land use review is a public notice and meeting requirement, similar to the requirement for multi-dwelling residential development. The terminal operators would be required to send notice to the adjacent neighborhood association and hold a public meeting to explain the elements of the project prior to filing a development permit application. This notice and meeting would create public awareness about the project and serve to discuss a proposal in an informal basis.

BPS recommends designating the existing terminals as a limited use, capping the amount of expansion to 10 percent of the current storage capacity in order to provide flexibility to comply with clean fuel standards and as an incentive to make seismic upgrades. With a strict cap a land use review would not be necessary because all new improvements are required to comply with current building codes, so by their nature will be safer than the existing facilities. Also, given the past trends of flat gasoline consumption and other policy initiatives (increasing fuel efficiency standards, electric vehicles) that are expected to reduce the demand for fossil fuels, the most likely need for additional storage capacity is to comply with the clean fuel standards, which further helps reduce our GHG emissions.

Options:

A. No change. Existing terminals become non-conforming uses and any expansion must go through a non-conforming situation review. Variation: create review criteria that is specific to Bulk Fossil Fuel Terminals that addresses the need to comply with Clean Fuel Program and seismic safety standards.

B. Limited use. Existing terminals are designated as a limited use and expansion of storage capacity is not to exceed 10 percent of the current terminal capacity. No land use review required. Variation: require a public meeting prior to filing development application.

C. Conditional use. Replacement of storage tanks is allowed. Expansion of storage capacity is allowed (up to a 10 percent limit) through a conditional use review process with approval criteria for seismic upgrades and compliance with clean fuel standard.

BPS recommendation: Option B – a clear and simple approach.

3. Exemption for regulated utilities.

NW Natural, the natural gas utility that serves western Oregon and parts of southwest Washington, has suggested that its facilities should not be subject to new zoning restrictions because its distribution facilities provide service to end users. The November 2015 City Council resolution included a provision that the resolution "does not restrict. . .the provision of service directly to end users."

NW Natural's service to end users in Oregon is regulated by the Oregon Public Utility Commission. The company periodically prepares an integrated resources plan (IRP) to document its forecast for natural gas use by its customers that takes into consideration changes in number of customers, gas usage per customer, and anticipated economic trends. The IRP also details how NW Natural proposes to meet changes in natural gas demand and is statutorily obligated to do so in ways that result in the "least cost" to customers, while managing risk and complying with all applicable environmental and workplace regulations. The PUC conducts a public review process of the IRP and ultimately either "acknowledges" the IRP or identifies shortcomings the company must address in a revised IRP.

NW Natural has suggested that, because of the regulatory authority of the PUC and existing review process, any proposed facilities would be thoroughly vetted as necessary to meet the needs of end users.

This approach would apply only to facilities NW Natural constructs that fall within its PUC-regulated operations. If NW Natural established an unregulated subsidiary to supply wholesale liquefied natural gas (LNG), for example, any infrastructure associated with these operations would still be subject to the Fossil Fuel Code.

Option: Add the following under "Exceptions that are not Bulk Fossil Fuel Terminals."

Proposed Language	*Facility operated by a public utility and regulated by the Oregon Public Utility Commission under ORS Chapters 756 and 757 for the purposes of ensuring fuel reliability to direct users through an interconnected system are not Bulk Fossil Fuel Terminals.*

5. Regulating throughput.

Public testimony raised concerns that terminals would ramp up activity as a response to limited capacity and that the amount of product moving through a facility should be regulated.

Regulating throughput of a specific use is not something that the City of Portland does, especially through the Zoning Code. This type of regulation represents a new direction with a set of issues regarding reporting, monitoring, enforcement, and staffing that are beyond the scope of this project.

City of Portland, Oregon | Bureau of Planning and Sustainability | www.portlandonline.com/bps
1900 SW 4th Avenue, Suite 7100, Portland, OR 97201 | phone: 503-823-7700 | fax: 503-823-7800 | tty: 503-823-6868

Printed on 100% post-consumer waste recycled paper.

6. Seismic safety as a building code issue.

Improving seismic safety is a major issue. It also is a building code issue that is beyond the scope of the zoning code. As a future step, the City of Portland should explore options to require seismic safety upgrades through a program similar to un-reinforced masonry buildings (URMs) program that is in process or a property maintenance code.

1. Draft code for regulating existing terminals as a limited use (2 options—no expansion; 10% expansion):

33.140.100 Primary Uses

A. No change

B. Limited uses. Uses allowed that are subject to limitations are listed in Table 140-1 with an "L". These uses are allowed if they comply with the limitations listed below and the development standards and other regulations of this Title. In addition, a use or development listed in the 200s series of chapters is also subject to the regulations of those chapters. The paragraphs listed below contain the limitations and correspond with the footnote numbers from Table 140-1.

1. – 16. No change

17. Bulk Fossil Fuel Terminals. This regulation applies to all parts of Table 140-1 that have a [17].

a. Bulk Fossil Fuel Terminals that existed on [*insert effective date*] and are shown on Map 140-1 are allowed but the total amount of fossil fuel that can be stored within the boundaries of each terminal is limited to the amount shown in Table 140-7. Fossil fuel storage capacity in excess of the amount specified in Table 140-7 is prohibited.;

b. New Bulk Fossil Fuel Terminals are prohibited.

Table 140-7 for Option 1—Base (company names will not appear in the Zoning Code)

Table 140-7
Total Allowed Fossil Fuel Storage Capacity

Terminal	Total allowed fossil fuel storage capacity
Terminal #1 *(Kinder Morgan Linnton)*	17,640,000 gallons
Terminal #2 *(BP West Coast)*	25,263,000 gallons
Terminal #3 *(Shore Terminals/Nustar)*	50,022,000 gallons
Terminal #4 *(Pacific Terminal Services)*	11,678,000 gallons
Terminal #5 *(NW Natural)*	7,500,000 gallons
Terminal #6 *(Kinder Morgan Willbridge)*	65,142,000 gallons
Terminal #7 *(Chevron)*	67,200,000 gallons
Terminal #8 *(Phillips 66)*	31,920,000 gallons
Terminal #9 *(Arc Terminals)*	66,524,200 gallons
Terminal #10 *(McCall Oil)*	39,060,000 gallons
Terminal #11 *(Equilion Shell)*	16,800,000 gallons

Table 140-7 for Option 2—Base plus 10% (company names will not appear in the Zoning Code)

Table 140-8
Total Allowed Fossil Fuel Storage Capacity

Terminal	Total allowed fossil fuel storage capacity
Terminal #1 *(Kinder Morgan Linnton)*	19,404,000 gallons
Terminal #2 *(BP West Coast)*	27,789,300 gallons
Terminal #3 *(Shore Terminals/Nustar)*	55,024,200 gallons
Terminal #4 *(Pacific Terminal Services)*	12,845,800 gallons
Terminal #5 *(NW Natural)*	8,250,000 gallons

Terminal #6 *(Kinder Morgan Willbridge)*	71,656,200 gallons
Terminal #7 *(Chevron)*	73,920,000 gallons
Terminal #8 *(Phillips 66)*	35,112,000 gallons
Terminal #9 *(Arc Logistics)*	73,176,600 gallons
Terminal #10 *(McCall Oil)*	42,966,000 gallons
Terminal #11 *(Equilion Shell)*	18,480,000 gallons

Waste-Related	N	N	N	L/CU [8]	L/CU [8]	L/CU [8]

33.815.320 Bulk Fossil Fuel Terminals.

These approval criteria apply to Bulk Fossil Fuel Terminals. The approval criteria are:

A. The proposed development meets all *applicable seismic standards*; and

B. The proposed development is necessary to comply with *the clean fuel standards*.

4. Draft code for adding Neighborhood Contact:

33.140.050 Neighborhood Contact

A. Purpose. Neighborhood contact is required for changes to the storage capacity of Bulk Fossil Fuel Terminals in the IH zone because of the impacts that fossil fuel projects can have on the surrounding community. The neighborhood contact requirement provides an opportunity for community input on the design of the project by providing a setting for the applicant and neighborhood residents to discuss a proposal in an informal manner. By sharing information and concerns early, all involved have the opportunity to identify ways to improve a proposal and to resolve conflicts.

B. Neighborhood contact requirement. Proposals meeting the following conditions are subject to the neighborhood contact requirement as specified in Section 33.700.025, Neighborhood Contact. All of the steps in 33.700.025 must be completed before a building permit is requested.

1. The proposed development has not been subject to a land use review; and

2. Development for the storage of fossil fuels is proposed.

5. Draft Code to Ensure that the Olympic Pipeline and Rail Yards are not considered a Bulk Fossil Fuel Terminal, and ensure that the NW Natural LNG site is not a Bulk Fossil Fuel Terminal, plus a few changes for clarity purposes:

33.920.300 Bulk Fossil Fuel Terminal

A. Characteristics. Bulk Fossil Fuel Terminals are establishments primarily engaged in the transport and bulk storage of fossil fuels. Terminal activities may also include fuel blending, regional distribution, and wholesaling. The firms rely on access by marine, railroad or regional pipeline to transport fuels to or from the site, and either have transloading facilities for transferring fossil fuel between transport modes, or have fossil fuel storage capacity on the site exceeding 5 million gallons. There is minimal on-site sales activity with the customer present.

B. Accessory uses. Accessory uses may include retail sales of petroleum products, offices, food membership distribution, parking, storage, truck fleet parking and maintenance areas, rail spur or lead lines, and docks.

C. Examples. Examples include crude oil terminals, petroleum products terminals, natural gas terminals, propane terminals, and coal terminals.

D. Exceptions.

1. Truck or marine freight terminals that do not store, transport or distribute fossil fuels are classified as Warehouse and Freight Movement uses.
2. Truck or marine freight terminals that do not have fossil fuel transloading facilities and do not have fossil fuel storage capacity in excess of 5 million gallons are classified as Warehouse and Freight Movement uses.
3. Gasoline stations and other retail sales of fossil fuels are not Bulk Fossil Fuel Terminals.
4. Distributors and wholesalers that receive and deliver fossil fuels exclusively by truck are classified as Warehouse and Freight Movement uses.
5. Industrial, commercial, institutional, and agricultural firms that exclusively store fossil fuels for use as an input are not Bulk Fossil Fuel Terminals.
6. Uses that involve the transfer or storage of solid or liquid wastes are classified as Waste-Related uses.
7. The storage of fossil fuels for exclusive use at an airport, surface passenger terminal, marine, truck or air freight terminal, rail yard, or as part of a fleet vehicle servicing facility are accessory to their use.
8. Uses that recover or reprocess used petroleum products are not Bulk Fossil Fuel Terminals.
9. Regional gas and oil pipelines are classified as Rail Line and Utility Corridor uses.
10 Railroad yards are classified as Railroad Yard uses.
11. Facilities operated by a public utility and regulated by the Oregon Public Utility Commission under ORS Chapter 756 and 757 for the purposes of ensuring fuel reliability to direct users through an interconnected system are not Bulk Fossil Fuel Terminals.

6. Additional code language to address the potential for small site aggregation:

33.920.300 Bulk Fossil Fuel Terminal

A. Characteristics. Bulk Fossil Fuel Terminals are establishments primarily engaged in the transport and bulk storage of fossil fuels. Terminal activities may also include fuel blending, regional distribution, and wholesaling. The firms rely on access by marine, railroad or regional pipeline to transport fuels to or from the site, and either have transloading facilities for transferring fossil fuel between transport modes, or have fossil fuel storage capacity on the site exceeding 5 million gallons (or equivalent volume). There is minimal on-site sales activity with the customer present.

B. Accessory uses. Accessory uses may include retail sales of petroleum products, offices, food membership distribution, parking, storage, truck fleet parking and maintenance areas, rail spur or lead lines, and docks.

C. Examples. Examples include crude oil terminals, petroleum products terminals, natural gas terminals, propane terminals, and coal terminals.

D. Exceptions.

1. Truck or marine freight terminals that do not store, transport or distribute fossil fuels are classified as Warehouse and Freight Movement uses.

2. Truck or marine freight terminals that do not have fossil fuel transloading facilities and do not have fossil fuel storage capacity in excess of 5 million gallons are classified as Warehouse and Freight Movement uses. However, multiple fossil fuel facilities, each with less than 5 million gallons of fossil fuel storage capacity but cumulatively having a fossil fuel storage capacity in excess of 5 million gallons, located on separate parcels of land will be classified as a Bulk Fossil Fuel Terminal when two or more of the following factors are present:

   a. The facilities are located or will be located on one or more adjacent parcels of land. Adjacent includes separated by a shared right-of-way;

   b. The facilities share or will share operating facilities such as driveways, parking, piping, or storage tanks; or

   c. The facilities are owned or operated by a single parent partnership or corporation.

3. Gasoline stations and other retail sales of fossil fuels are not Bulk Fossil Fuel Terminals.

4. Distributors and wholesalers that receive and deliver fossil fuels exclusively by truck are classified as Warehouse and Freight Movement uses.

5. Industrial, commercial, institutional, and agricultural firms that exclusively store fossil fuels for use as an input are not Bulk Fossil Fuel Terminals.

6. Uses that involve the transfer or storage of solid or liquid wastes are classified as Waste-Related uses.

7. The storage of fossil fuels for exclusive use at an airport, surface passenger terminal, marine, truck or air freight terminal, rail yard, or as part of a fleet vehicle servicing facility are accessory to their use.

8. Uses that recover or reprocess used petroleum products are not Bulk Fossil Fuel Terminals.

Dear Portland PSC Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing implementation of its November 2015 Fossil Fuel Policy.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to:

-Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

-An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the fight against climate change. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland can remain at the forefront of

addressing the most pressing concern of our time.

Sincerely,
Rayne MacGeorge

Subject: PSC Fossil Fuel Zoning Testimony

Dear Planning and Sustainability Commissioners:

Knife River Corporation provides construction materials and contracting services in Portland and around the northwest. They own property within the city of Portland and operate an asphalt terminal on that property. As such, we have concerns regarding the proposed Fossil Fuels ordinance. Specifically we have the following concerns that we are hoping we can work with you to address.

1. Under proposed section 33.920.030 and the attached commentary regarding the definition of fossil fuels, there is reference to products that are excluded from the definition of fossil fuels. However, those exclusions are not specifically in the proposed language of the code. We request that these exclusions be specifically stated in the code and that "asphalt" be included as one of those exemptions. It is unclear to us what legal authority the "commentary" has and as such request this language be placed into the code. We think this is the simplest way to address our concerns and align them with what we believe to be the city's intent relating to fossil fuels.
2. Proposed section 33.920.300 (D) states "industrial, commercial, institutional and agricultural firms that *exclusively* store fossil fuels for use as an input are not Bulk Fossil Fuel Terminals." Assuming fuel used in asphalt is an "input", we read the word "exclusive" as preventing Knife River from selling asphalt to a third party. We request the term "exclusive" be changed to "primarily".

3. Additionally, we believe proposed section 33.920.300 (A) entitled "Characteristics" is vague and confusing. If asphalt was somehow determined to be deemed a "fuel" it appears that Knife River could only "store" up to 5 million gallons. However, we would not be allowed to "trans-load" the asphalt at all. Knife River does not manufacture the asphalt, so by definition we assume we would be considered to "trans-load" the asphalt and as such be in violation of the proposed code. Again we assume that is not the city's intent and as such believe our first recommendation is the best alternative.

Thank you very much for your consideration.

Sincerely,

Greg Peden on Behalf of Knife River Corp.

Subject: [User Approved] PSC Fossil Fuel Zoning Testimony

Dear Portland PSC Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing implementation of its November 2015 Fossil Fuel Policy.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to:

-Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

-An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the fight against climate change. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland can remain at the forefront of

addressing the most pressing concern of our time.

Sincerely,
David Powell

Re: PSC Fossil Fuel Zoning Testimony

350PDX comments on the Fossil Fuel Code Changes Discussion Draft & recommended changes to the proposed draft submitted by BPS Staff to the Planning and Sustainability Commission on September 9th.

Prepared by Mia Reback and Nick Caleb.

Esteemed Members of the Portland Planning and Sustainability Commission,

Thank you for taking the time for in-depth consideration of this important issue. 350PDX believes the fossil fuel terminal zoning code changes should implement the clear language of Resolution #37168 which states that the City of Portland will "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways," and prohibit all new fossil fuel terminals and expansions and existing facilities.

Below, please find our feedback on several amendments currently under consideration.

Fossil Fuel Terminal Size Threshold:

350PDX supports Resolution #37168 being implemented in the clearest way possible to fully prohibit new fossil fuel terminals and terminals expansions. 350PDX encourages the Planning and Sustainability Commission to amend proposed proposed zoning code changes by reducing or eliminating the storage capacity threshold, with preference for eliminating the threshold and prohibiting all new fossil fuel terminals.

With this in mind, we understand and appreciate BPS's strategy in creating the 5 million gallon threshold and believe that this approach in combination with the transloading restriction *probably* will be adequately restrictive on all new fossil fuel terminals in line with the Resolution, but are concerned about the potential for small terminal aggregation that would create a fossil fuel footprint well above what now seems like an aggressive limit (see below). Adding a terminal aggregation restriction will make the 5 million gallon threshold far more palatable to our members.

In the event that PSC decides upon a terminal threshold of 5 million gallons or less, we will strongly urge BPS to conduct a follow up review and plan for these facilities in the near future, and at the latest, in the 2020 Climate Action Plan.

Appendix A and B present two alternative code changes prepared in consultation with Trish Weber, Land Use Consultant for the Center for Sustainable Economy.

Regulating Existing Terminal Expansion:

350PDX supports existing Bulk Fossil Fuel Facilities being designated as legal, non-conforming uses and requiring any expansion go through a Type II review process. Any costs associated with the review process should be borne by the applicant. This is consistent with the spirit and plain language of the Resolution, our new Comprehensive Plan, and Portland's commitments to the health and safety of its residents

350PDX supports no change to the current proposal that designates existing terminals as a non-conforming use and requires any expansion to go through a legal non-conforming situation review.

Additional Review Criteria for Terminal Expansions:

350PDX supports the PSC amending the proposed draft to strengthen restrictions on expansion allowed at existing terminals and add additional review criteria to the the non-conforming use process for Bulk Fossil Fuel Terminals to to include the criteria that are the basis for prohibiting new bulk fossil fuel terminals in the first place - health, safety, and climate.

At the hearing, there was a discussion around the potential for re-locating the capacity of an existing storage tank out of liquefaction zone for the purposes of increasing safety, and whether this would be prohibited by strict review criteria for terminal expansions. We believe this concern to be a moot point as we are unaware of any industrial land suitable for such a re-location that isn't in a liquefaction zone. Additionally, even if it were possible, new infrastructure would be unacceptable because it would lock us into dirty fuels and their carbon emissions for decades to come and contravene the plain language and intent of the Resolution.

We also ask the PSC to take a close look at the history of seismic upgrades in the NW Industrial Area when considering the argument that new regulations would disincentivize future seismic upgrades. Put plainly, facilities in the NW Industrial area have not been investing in seismic upgrades without restrictions on expansion so this argument seems particularly disingenuous. Rather than disincentivizing seismic upgrades, we believe that the non-conforming use designation will inspire even more conversation about how to incentivize or require existing facilities to invest in seismic upgrades. We are communicating several strategies to city staff and expect future reform efforts in line with BPS's recommendation for further Resolution implementation and seismic safety policy.

Appendix C presents a potential code change to support these additional criteria, prepared by Trish Weber, Land Use Consultant for the Center for Sustainable Economy.

Small Terminal Aggregation:

350PDX is concerned about the trend of terminal aggregation in fossil fuel projects, of which we have some examples in the Pacific Northwest. In British Columbia, where nearly two-dozen liquefied natural gas (LNG) export projects are in the proposal stage, the annual production of several LNG proposals would be three to four times larger than the annual production of the largest existing LNG terminal in the world. The way in which the projects would achieve these production volumes is through the aggregation of several terminals of equal size, each with its own liquefaction equipment, storage and other structures. The terminals would be geographic neighbors. Through the benefits of the project umbrella they would be greenlit under the same permits with respect to land use, pipelines, etc. Examples include ExxonMobil's WCC LNG project at Prince Rupert, BC (which would consist of five aggregated facilities), Woodside Energy Holdings Party's Grassy Point LNG project, and Petronas' Pacific Northwest LNG project at Port Edward.

These proposals are a part of a trend to be aware of when limiting bulk fossil fuel terminals. What we have traditionally defined as a "terminal" may in the near future be commonly treated a part of a larger "project" or "network", and the definition of the word terminal may change as the distinction between terminals dissolves and a terminal is no longer a distinct entity.

To prevent this loophole, code language should be added to limit "projects" or "networks" whose aggregate volume is greater than or equal to a Bulk Fossil Fuel Terminal.

Through amendments in the zoning code, the City of Portland can prevent the fossil fuel industry from using subsidiaries and partnerships to build small terminals that in aggregate function like a Bulk Fossil Fuel Terminal.

Appendix D presents potential code language to address terminal aggregation, prepared by Trish Weber, Land Use Consultant for the Center for Sustainable Economy.

Stakeholder & Public Involvement - The Role of Industry

In addition to our feedback on the above amendments, we question the role the fossil fuel industry (terminal operators and utilities) has had in this process. As recent Pulitzer Prize-winning articles have revealed, the fossil fuel industry has been a master of denial of climate change, and delay of action on the science. The fossil fuel industry has known since the 1960s that we must shift away from our reliance on fossil fuels if we are to avoid the dangers of runaway climate change. In the face of this evidence, the City of Portland should analyze its stakeholder involvement with a view to whether the fossil fuel industry -- especially national and

international corporations -- should be given the same ethical and legal weight of "stakeholder input" as local environmental, health, neighborhood and equity organizations when it comes to providing comments that shape the future of their industry.

In the original stakeholder process, it is our understanding that 30 organizations represented Port and industry interests while only 10 represented community, public health, or environmental interests. This distorted engagement by the industry that we are trying to constrain, combined with a reliance on industry-friendly forecasts -- without consideration of our City's climate commitments, the state of the renewable energy industry as a whole, and the prospects for clean energy in our city and immediate region -- is deeply troubling.

In particular, we are concerned with the role industry played in forecasting future demand for fossil fuels - which was instrumental in setting the 5,000,000 gallon terminal size threshold.

Final Comments

The plain language and spirit of the Resolution clearly recognize that fossil fuels are inherently dangerous throughout their entire life cycle and that Portland's seismic instability creates abnormally high risks for infrastructure that is already demonstrably dangerous. Fossil fuel terminal zoning code changes need to reflect the scientific realities of climate change and lower the exposure of Portland residents to the unacceptably high risks inherent in dangerous fossil fuel infrastructure.

Last November, at the end of a year of enormous community participation in local policymaking, the Portland City Council voted 5-0 to say no to new fossil fuel infrastructure because of the inherent dangers it poses to the health and safety of Portland residents. Community organizations overwhelmingly supported the measure over a the objections of a small and vocal group of industry representatives. Since November, the Comprehensive Plan update has clarified Portland's long-term policy goals for climate and seismic safety. Specifically, the plan encourages us to limit fossil fuel infrastructure in line with "regional demand" (Policy 6.48) -- which is currently stagnant and must continually decrease if we are to meet our binding climate commitments and goals -- and contains general proscriptions to regulate industrial areas to protect public health (Policy 6.38c) and ensure seismic safety (Policies 4.14, 4.62, 4.79, 4.80, 4.81, and 4.82). A strong fossil fuel terminal zoning code implementation also follows the city's and state's carbon reduction goals as stated in the 2015 Portland Climate Action Plan and Oregon House Bill 3543. Furthermore, Mayor-elect Ted Wheeler has promised to facilitate the design and implementation of a 100% renewable energy Portland strategy. We have collectively set a path forward and it is up to the Planning and Sustainability Commission to make sure our stated policy becomes law so we can protect the health and safety of Portland residents and begin the just transition to a clean and renewable economy.

Fossil fuels are inherently unsafe when we extract them, transport them, store them, and ultimately burn them. For Portlanders who hadn't previously taken notice of the issue, the recent oil train derailment in Mosier, OR brought full attention to the risks posed to our community every day. There have been too many small spills and close calls in Portland and the surrounding areas. Given the risk of a 9.0 earthquake in the next 30-50 years, Portland must address the current risks from our existing infrastructure in a scientifically sound manner, while simultaneously disallowing new fossil fuel facilities to be built or expanded upon.

Since the Resolution was passed in November 2015, global understanding of the severity of climate change has only increased. We now know that in order to meet the goal of limiting global warming to 1.5C, as laid out in the Paris Climate Agreement, we must begin an immediate transition away from fossil fuels to 100% renewable energy, with greenhouse gas emissions declining to zero far more rapidly than previously thought. We also now have the technology to transition off of fossil fuels to an economy based on energy efficiency and 100% renewable energy[1]. And we now have studies that show that, for the same amount of investment, an investment in energy efficiency and renewable energy will result in far more jobs. In July 2016, the Labor Network for Sustainability released a report called "THE ECONOMIC IMPACT OF CLEAN ENERGY INVESTMENTS IN THE PACIFIC NORTHWEST: ALTERNATIVES TO FOSSIL FUEL EXPORTS" which concluded that "investments in the Pacific Northwest in renewable energy and energy efficiency can generate more jobs in construction, transportation, supply chains, and operations and maintenance than a similar dollar investment in oil, coal, and natural gas infrastructure[2]." This and similar studies are extremely important to consider as we create a "just transition" policy framework that will both provide jobs for people in our community and more safely address our energy future. Given the availability of alternatives to fossil fuels, Portland should prohibit new infrastructure projects whose multi-decade investments would lock us into the fossil fuel economy for another 40 years instead of facilitating the transition to safer alternatives.

We don't need new fossil fuel infrastructure in Portland and industry's own projections confirm it. As city staff accurately pointed out in the Sept. 13 hearing, demand for petroleum and gas in the State of Oregon and natural gas use in the City of Portland has been constant or decreasing consistently. Even Northwest Natural's 2014 Integrated Resource Plan (IRP) does not indicate that Northwest Natural anticipates any increase in storage demand at its Portland LNG facility. On the contrary, NW Natural's projections show capacity remaining constant at its Portland LNG facility throughout the planning period for the report. The City of Portland should not facilitate expansions that aren't needed to meet local demand and not even predicted by the industry. Any short term increases in local demand as we transition to a renewable energy economy can be met by small increases in throughput at existing facilities.

[1] http://web.stanford.edu/group/efmh/jacobson/Articles/I/USStatesWWS.pdf
[2] http://www.labor4sustainability.org/files/NorthPacific_final_03032016_.pdf

Further, other jurisdictions on the west coast are following Portland's work and are beginning to pass related bans on fossil fuel terminals, including Vancouver, WA (Oil Terminal Ban[3]), Hoquiam, WA (Oil Terminal Ban) and Oakland, CA (Coal Terminal Ban). A straight prohibition of new fossil fuel terminals will be consistent with other jurisdictions that are passing full bans, not size restrictions.

There is no negotiating with the physics of climate change. If we don't say "no" to fossil fuels and immediately begin our justice-based transition to a green energy economy, we'll quickly be cooked.

The City of Portland should stay true to the intent and intended impact of the Resolution and comprehensively prohibit new fossil fuel terminals and terminal expansions of any fuel type, of any size, anywhere in Portland.

Appendix A: Fossil Fuel Terminal

Industrial Use Categories

33.920.300 Fossil Fuel Terminal*

A. Characteristics. Fossil Fuel Terminals are establishments engaged in the transport and storage of fossil fuels. Terminal activities may also include fuel blending, regional distribution, and wholesaling. The firms rely on access by marine, railroad or regional pipeline to transport fuels to or from the site. There is minimal on-site sales activity with the customer present.

B. Accessory uses. Accessory uses may include retail sales of petroleum products, offices, food membership distribution, parking, storage, truck fleet parking and maintenance areas, rail spur or lead lines, and docks.

C. Examples. Examples include crude oil terminals, petroleum products terminals, natural gas terminals, propane terminals, and coal terminals.

D. Exceptions.

1. Truck or marine freight terminals that do not store, transport or distribute fossil fuels are classified as Warehouse and Freight Movement uses.

2. Gasoline stations and other retail sales of fossil fuels are not Fossil Fuel Terminals.

3. Distributors and wholesalers that receive and deliver fossil fuels exclusively by truck are classified as Warehouse and Freight Movement uses.

4. Industrial, commercial, institutional, and agricultural firms that exclusively store fossil fuels for use as an input are not Fossil Fuel Terminals.

5. Uses that involve the transfer or storage of solid or liquid wastes are classified as Waste- Related uses.

6. The storage of fossil fuels for exclusive use at an airport, surface passenger terminal, marine, truck or air freight terminal, rail yard, or as part of a fleet vehicle servicing facility are accessory to their use.

7. Uses that recover or reprocess used petroleum products are not Fossil Fuel Terminals.

** Additional locations in proposed amendment where "Bulk Fossil Fuel Terminal" would be revised to "Fossil Fuel Terminal" are not shown here. It is assumed that if this revision is adopted the necessary updates to other Code sections would be included as well.*

Appendix B: Bulk Fossil Fuel Terminal

Industrial Use Categories

33.920.300 Bulk Fossil Fuel Terminal

A. Characteristics. Bulk Fossil Fuel Terminals are establishments engaged in the transport and bulk storage of fossil fuels. Terminal activities may also include fuel blending, regional distribution, and wholesaling. The firms rely on access by marine, railroad or regional pipeline to transport fuels to or from the site and either have transloading facilities for transferring a shipment between transport modes, or have storage capacity exceeding 2 million gallons (or equivalent volume) of fossil fuels. There is minimal on-site sales activity with the customer present.

B. Accessory uses. Accessory uses may include retail sales of petroleum products, offices, food membership distribution, parking, storage, truck fleet parking and maintenance areas, rail spur or lead lines, and docks.

C. Examples. Examples include crude oil terminals, petroleum products terminals, natural gas terminals, propane terminals, and coal terminals.

D. Exceptions.

1. Truck or marine freight terminals that do not store, transport or distribute fossil fuels are classified as Warehouse and Freight Movement uses.

2. Truck or marine freight terminals that do not have transloading facilities and have storage capacity of less than 2 million gallons are classified as Warehouse and Freight Movement uses.

3. Gasoline stations and other retail sales of fossil fuels are not Bulk Fossil Fuel Terminals.

4. Distributors and wholesalers that receive and deliver fossil fuels exclusively by truck are classified as Warehouse and Freight Movement uses.

5. Industrial, commercial, institutional, and agricultural firms that exclusively store fossil fuels for use as an input are not Bulk Fossil Fuel Terminals.

6. Uses that involve the transfer or storage of solid or liquid wastes are classified as Waste- Related uses.

7. The storage of fossil fuels for exclusive use at an airport, surface passenger terminal, marine, truck or air freight terminal, rail yard, or as part of a fleet vehicle servicing facility are accessory to their use.

8. Uses that recover or reprocess used petroleum products are not Bulk Fossil Fuel Terminals.

Appendix C: Nonconforming Situation Review

33.258.80 Nonconforming Situation Review

A. Procedure. A nonconforming situation review is processed through a Type II procedure.

B. Approval criteria. The request will be approved if the review body finds that the applicant has shown that all of the following approval criteria are met:

1. All requests must comply with the following review criteria:

~~1.~~ a. With mitigation measures, there will be no net increase in overall detrimental impacts (over the impacts of the last legal use or development) on the surrounding area taking into account factors such as:

~~a.~~ (1) The hours of operation;

~~b.~~ (2) Vehicle trips to the site and impact on surrounding on-street parking;

~~c.~~ (3) Noise, vibration, dust, odor, fumes, glare, and smoke;

~~d.~~ (4) Potential for increased litter; and

~~e.~~ (5) The amount, location, and nature of any outside displays, storage, or activities; and

~~2.~~ b. If the nonconforming use is in an OS or R zone, and if any changes are proposed to the site, the appearance of the new use or development will not lessen the residential character of the OS or R zoned area. This is based on taking into account factors such as:

~~a.~~ (1) Building scale, placement, and facade;

~~b.~~ (2) Parking area placement;

~~c.~~ (3) Buffering and the potential loss of privacy to abutting residential uses; and Lighting and signs; and

~~d.~~ (4) Lighting and signs; and

~~3.~~ c. If the nonconforming use is in a C, E, or I zone, and if any changes are proposed to the site, the appearance of the new use or development will not detract from the desired function and character of the zone~~.~~; and

2. Because fossil fuels pose risks to safety, health, and livability, including mobility of people, other freight, and other commercial vehicles, because the extraction and combustion of fossil fuels are significant sources of greenhouse gas emissions and major contributors to climate change and pollution, and given the record of crude oil and coal or other fossil fuel transport accidents, Bulk Fossil Fuel Terminal are subject to these additional review criteria. With mitigation measures, there will be no net increase in overall detrimental impacts (over the impacts of the last legal use or development) on the surrounding area based on the following factors:

a. The effects of greenhouse gas (GHG) emissions and climate change, where:

(1) GHG is defined as the following:

- carbon dioxide,
- methane,
- nitrous oxide,
- hydrofluorocarbons,
- perfluorocarbons,
- nitrogen trifluoride,
- and sulfur hexafluoride,

(2) Both direct and indirect GHG emissions are to be considered, where

- Direct GHG emissions are emissions from the Bulk Fossil Fuel Terminal Use site, and
- Indirect GHG emissions are emissions that are a consequence of the activities of the Bulk Fossil Fuel Terminal Use site, but occur at sources located elsewhere, and

(3) Quantification tools and methodology employed is to be per the White House Council on Environmental Quality's publication *"2012 Guidance for Accounting and Reporting,"* as amended over time.

As the totality of climate change impacts is not attributable to any single action, but are exacerbated by a series of actions, a statement that emissions from a request involving a Bulk Fossil Fuel Terminal represent only a small fraction of global emissions is essentially a statement about the nature of the climate change challenge, and is not an appropriate basis for deciding the impact of climate change impacts on the surrounding area. Moreover, these comparisons are also not an appropriate method for characterizing the potential impacts associated with a request, because this approach does not reveal anything beyond the nature of the climate change challenge itself: the fact that diverse individual sources of emissions each make a relatively small addition to global atmospheric GHG concentrations that collectively have a large impact.

(b) The effects of a fire and/or explosion at either the Bulk Fossil Fuel Terminal Site or transportation equipment or infrastructure used to convey fossil fuels to or from the Bulk Fossil Fuel Terminal, and

(c)The effects of a breach and release of fossil fuels from either the Bulk Fossil Fuel Terminal Site or transportation equipment or infrastructure used to convey fossil fuels to or from the Bulk Fossil Fuel Terminal, into the Columbia River and/or contributory waterways.

(d) When considering the effects of (b), and (c), above, the likelihood of an event occurring should be evaluated in the context of the scale and severity of the deleterious impact on the surrounding area.

Appendix D: Small Terminal Aggregation

To prevent this loophole, code language should be added to limit "projects" whose aggregate volume is greater than or equal to a Bulk Fossil Fuel Terminal.

Under the City's current definitions of "Development," "Site," and "Ownership", if there is a proposal to build things like storage facilities or loading equipment that contribute to the function of the Bulk Fossil Fuel Terminal that are on contiguous lots owned by the same corporation, that is all one Bulk Fossil Fuel Terminal and therefore the maximum quantitative limits apply. However, there is a concern that subsidiary companies will be used to circumvent the proposed size restrictions on new fossil fuel terminals.

Proposal: add the following language to Section 33.910.030 Definitions under "Ownership":

> *"Contiguous lots that are owned by multiple corporations that are subsidiaries of a single corporation are considered to be a single ownership."*

Commentary:
This will prevent them from setting up a number (e.g. five) different subsidiaries, having each subsidiary own one lot of a set of five that are all contiguous, and submitting five different applications, each for 5M gallons, saying that they are five different site because each site is owned by a different entity. This change will say, basically, "No, this is not five different terminals with five different applications because they are on five different sites, because all five sites are owned by the same parent corporation and therefore comprise one site, so it is one development application and thus subject to the maximum limits.

PROPOSED CHANGES

33.910.030 Definitions

Development. All improvements on a site, including buildings, other structures, parking and loading areas, landscaping, paved or graveled areas, and areas devoted to exterior display, storage, or activities. Development includes improved open areas such as plazas and walkways, but does not include natural geologic forms or unimproved land. See also Exterior Improvements.

Site. <...> the site is an ownership except as follows:
• If a proposed development includes more than one ownership, then all the ownerships are included as the site.

• If a proposed development includes only a portion of an ownership, and the balance of the ownership is vacant, then the applicant may choose to define the site as the portion of the ownership that is proposed for development.
• If a proposed development includes only a portion of an ownership, and there is other development on the ownership, then the applicant may choose to define the site as the portion of the ownership that is currently developed plus the portion proposed for development.

Ownership. An ownership is one or more contiguous lots that are owned by the same person, partnership, association, or corporation. Ownership also includes lots that are in common ownership but are separated by a shared right-of-way. *Contiguous lots that are owned by multiple corporations that are subsidiaries of a single corporation are considered to be a single ownership.*

RE: PSC Fossil Fuel Zoning Testimony

Dear Members of the Planning and Sustainability Commission,

Please accept the comments of 40 individuals listed below. Thank you in advance for your efforts to implement Portland's historic November 2015 Fossil Fuel Policy.

Thank you to the Bureau of Planning and Sustainability (BPS) for its work to incorporate public input after releasing the initial draft of the Fossil Fuel Terminal Zoning Amendments.

However, the current Fossil Fuel Zoning Amendments proposal falls short of the bold resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while **this proposal should mark any bulk terminal as 'non-conforming'**, it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make City policy reflect the intent of the historic City Council Resolution, I request that the City of Portland and the Planning and Sustainability Commission do the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- Remove the exception for new facilities that are 5 million gallons or less. That exception could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With improvements to the Fossil Fuel Zoning Amendments, Portland can once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Subject: Fossil Fuel Terminal - Nonconforming Use Review additional criteria
Attachments: 258-ncu_PROPOSED AMENDMENT.pdf

Hi Tom, Hi Steve,

I wanted to double check and make sure you received a copy of the language that I brought to the meeting on 8/31. Please see attached, for your use. FYI, I also submitted this to the PSC as part of my comments.

Thanks, let me know if you have any questions or concerns!

-Trish Weber

APPENDIX "A"

NONCONFORMING SITUATION REVIEW – ADDITIONAL CRITERIA LANGUAGE

33.258.80 Nonconforming Situation Review

A. Procedure. A nonconforming situation review is processed through a Type II procedure.

B. Approval criteria. The request will be approved if the review body finds that the applicant has shown that all of the following approval criteria are met:

1. All requests must comply with the following review criteria:

~~1.~~ a. With mitigation measures, there will be no net increase in overall detrimental impacts (over the impacts of the last legal use or development) on the surrounding area taking into account factors such as:

~~a.~~ (1) The hours of operation;

~~b.~~ (2) Vehicle trips to the site and impact on surrounding on-street parking;

~~c.~~ (3) Noise, vibration, dust, odor, fumes, glare, and smoke;

~~d.~~ (4) Potential for increased litter; and

~~e.~~ (5) The amount, location, and nature of any outside displays, storage, or activities; and

~~2.~~ b. If the nonconforming use is in an OS or R zone, and if any changes are proposed to the site, the appearance of the new use or development will not lessen the residential character of the OS or R zoned area. This is based on taking into account factors such as:

~~a.~~ (1) Building scale, placement, and facade;

~~b.~~ (2) Parking area placement;

~~c.~~ (3) Buffering and the potential loss of privacy to abutting residential uses; and Lighting and signs; and

~~d.~~ (4) Lighting and signs; and

~~3.~~ c. If the nonconforming use is in a C, E, or I zone, and if any changes are proposed to the site, the appearance of the new use or development will not detract from the desired function and character of the zone.~~;~~ and

2. Because fossil fuels pose risks to safety, health, and livability, including mobility of people, other freight, and other commercial vehicles, because the extraction and combustion of fossil fuels are significant sources of greenhouse gas emissions and major contributors to climate change and pollution, and given the record of crude oil and coal or other fossil fuel transport accidents, Bulk Fossil Fuel Terminal are subject to these additional review criteria. With mitigation measures, there will be no net increase in overall detrimental impacts (over the impacts of the last legal use or development) on the surrounding area based on the following factors:

a. The effects of greenhouse gas (GHG) emissions and climate change, where:

(1) GHG is defined as the following:

- carbon dioxide,
- methane,
- nitrous oxide,
- hydrofluorocarbons,
- perfluorocarbons,
- nitrogen trifluoride,
- and sulfur hexafluoride,

(2) Both direct and indirect GHG emissions are to be considered, where

- Direct GHG emissions are emissions from the Bulk Fossil Fuel Terminal Use site, and
- Indirect GHG emissions are emissions that are a consequence of the activities of the Bulk Fossil Fuel Terminal Use site, but occur at sources located elsewhere, and

(3) Quantification tools and methodology employed is to be per the White House Council on Environmental Quality's publication *"2012 Guidance for Accounting and Reporting,"* as amended over time.

As the totality of climate change impacts is not attributable to any single action, but are exacerbated by a series of actions, a statement that emissions from a request involving a Bulk Fossil Fuel Terminal represent only a small fraction of global emissions is essentially a statement about the nature of the climate change challenge, and is not an appropriate basis for deciding the impact of climate change impacts on the surrounding area. Moreover, these comparisons are also not an appropriate method for characterizing the potential impacts associated with a request, because this approach does not reveal anything beyond the nature of the climate change challenge itself: the fact that diverse individual sources of emissions each make a relatively small addition to global atmospheric GHG concentrations that collectively have a large impact.

(b) The effects of a fire and/or explosion at either the Bulk Fossil Fuel Terminal Site or transportation equipment or infrastructure used to convey fossil fuels to or from the Bulk Fossil Fuel Terminal, and

(c) The effects of a breach and release of fossil fuels from either the Bulk Fossil Fuel Terminal Site or transportation equipment or infrastructure used to convey fossil fuels to or from the Bulk Fossil Fuel Terminal, into the Columbia River and/or tributary waterways.

(d) When considering the effects of (b), and (c), above, the likelihood of an event occurring should be evaluated in the context of the scale and severity of the deleterious impact on the surrounding area.

Date: 16 September 2016

To: City of Portland Planning & Sustainability Commission

Subject: Bulk Fossil Fuel Terminal Zoning Amendments – Additional Testimony

Esteemed Commissioners:

Thank you for the opportunity to submit testimony on the proposed Zoning Code amendments covering Bulk Fossil Fuel Terminal (BFFT) Zoning amendments submitted by the City of Portland Bureau of Planning and Sustainability (BPS) on 12 August 2016, with suggested revisions per Memorandum dated 9 September 2016.

This testimony is an addition to the testimony I submitted on 12 September, and is in response to concerns raised by several of you at the public hearing held on 13 September.

- **BPS's recommendation that the original Zoning amendment proposal be revised to "*allow limited expansion of existing terminals to not exceed 10 percent of the total terminal capacity*" should be rejected because it gives preferential treatment to a single class of Uses – Bulk Fossil Fuel Terminals.**

This assertion was part of my original testimony on the 12th, and is repeated for emphasis. The 10 percent expansion threshold is completely arbitrary on the part of the City and has no basis in any other legally adopted standard; it is based solely on the reluctance of BDS to see an increase in work load. Adoption of this revision could expose the City to a LUBA challenge.

- **Additional review criteria for BFFTs would incentivize seismic upgrades for existing facilities**

Included with my testimony on the 12th were suggested additional review criteria to which BFFT expansion applications should be subjected. These criteria include evaluations of climate change impacts, impacts of potential fire and/or explosion, and impacts of potential release of fossil fuels into the Columbia River. It is clear that the City of Portland takes very seriously the hazard posed by the existing location of fossil fuel storage facilities on liquefaction soils.

One way to address this existing risk is by the establishment of the proposed additional review criteria. Risk of fire and explosion and also risk of release of fossil fuels into the Columbia River could both be ameliorated by upgrading the facilities to higher seismic construction standards. If an Owner of a BFFT desires to expand a facility, under the additional criteria there would be a strong incentive to reduce these risks in order to compensate for the negative impacts on climate change by the increased GHG emissions. Approval of expansion proposals could be predicated upon reducing the risk of catastrophic fires, explosions, and spills that could occur in the event of a large earthquake. Under the existing review criteria, approval does not depend on decreasing these risks and thus there would be no incentive for the applicant to propose the additional work of seismic upgrades.

This concludes my written testimony. Please feel free to contact me with any questions or concerns. Thank you for your attention to this issue.

To: City of Portland Planning & Sustainability Commission

Subject: Bulk Fossil Fuel Terminal Zoning Amendments

Esteemed Commissioners:

Thank you for the opportunity to submit testimony on the proposed Zoning Code amendments covering Bulk Fossil Fuel Terminal (BFFT) Zoning amendments submitted by the City of Portland Bureau of Planning and Sustainability (BPS) on 12 August 2016, with suggested revisions per Memorandum dated 9 September 2016.

This testimony addresses Sections 2 and 3 of the 9 September 16 Memorandum which involve "Regulating existing terminal expansion" and "Additional review criteria" respectively. It also addresses the serious issue of terminal aggregation, wherein the fossil fuel industry submits a number of connected small facility proposals that individually meet size limitations but in aggregate exceed them.

- **Regulating existing terminal expansion**

The City of Portland Building and Development Services (BDS) Department reports that requiring expansion of existing terminals to undergo Non-conforming Situation Type II "would be difficult to approve." As a result of this feedback, BPS is recommending that the original Zoning amendment proposal be revised to *"allow limited expansion of existing terminals to not exceed 10 percent of the total terminal capacity"*.

This revision to the original zoning amendment should be rejected for two reasons:

1. **Expansion of existing fossil fuel infrastructure <u>should</u> be difficult to approve.** The City's Resolution #37618 was adopted for the express purpose to *"Oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways."* The recommendation to classify BFFT as Non-conforming Uses is a correct and appropriate method of achieving the goal stated in Resolution #37618. Any revisions to the Code which would facilitate - rather than inhibit -expansion of existing fossil fuel infrastructure would stand in direct contradiction to the City Resolution. Allowing limited expansion of facilities up to 10 percent of capacity without land use review would facilitate expansions and thus should not be adopted. Funding for any additional staff and/or consultant time required by BDS to process fossil fuel expansion applications should be borne solely by the applicant.

2. **Proposed revision gives BFFT preferential treatment.** No other Use category in Nonconforming Situations is allowed to expand up to 10 percent of existing capacity without Land Use Review. The proposed revision gives unwarranted preferential treatment to a category of Uses, specifically BFFT. Furthermore, the 10 percent expansion threshold is completely arbitrary on the part of the City and has no basis in any other legally adopted

standard; it is based solely on the reluctance of BDS to see an increase in work load. Adoption of this revision could expose the City to a LUBA challenge.

- **Additional review criteria**

The review criteria for Nonconforming Situation Review included in the current version of the Zoning Code were developed to evaluate primarily changes to Residential and/or Commercial Nonconforming Uses, especially Commercial Uses in Residential Zones. As a result they address the types of compatibility issues typically presented by these types of Uses, e.g. noise and traffic. Given the severity of impact that BFFT pose to surrounding properties, the current review criteria alone are inadequate to address the serious threats presented by BFFT. Resolution #37168 includes the following findings:

- *Fossil fuels pose risks to safety, health, and livability, including mobility of people, other freight, and other commercial vehicles;*
- *Fossil fuel infrastructure poses considerable risks in the event of a major earthquake;*
- *The extraction and combustion of fossil fuels are significant sources of greenhouse gas emissions and major contributors to climate change and pollution;*
- *Crude oil, including oil derived from the Bakken shale reservoir, is known to be volatile, highly flammable and to contain elevated levels of benzene, a potent carcinogen; and*
- *Given the record of crude oil and coal or other fossil fuel transport accidents, such as Lac Megantic in 2013, the 1999 Bellingham pipeline leak or a coal train derailment, an event could have catastrophic effects if it occurred in any of Oregon's populated areas.*

Thus it is not only appropriate and necessary, but legally justified to impose stricter review criteria on applications to expand the Nonconforming Situation review criteria only for BFFT. The additional review criteria that need to be taken into consideration are: (1) impact of increase in greenhouse gas (GHG) emissions and climate change, (2) impact of potential fire and/or explosion, and (3) impact of potential release of fossil fuels into the Columbia River and/or any tributary waterways.

The addition of these review criteria for BFFT would allow for proposed expansions that involve either facilities used for mixing of clean fuels and/or seismic upgrades to existing facilities, as net decreases in either GHG emissions and/or risk of explosion and fire in the event of an earthquake could justify approval of the request.

Lastly, BDS asserts that if additional review criteria are adopted, because "they do not have staff expertise to implement discretionary land use review criteria addressing greenhouse gas emissions or safety impacts of hazardous material storage and transportation," BFFT "applicants would be required to hire specialized consultants to show compliance of the particular criterion." This is both necessary and appropriate, as justified by the above listed findings from Resolution #37168. Furthermore, BDS notes that this would be inconsistent with Comprehensive Plan Policy 6.16 Regulatory Climate. The additional criteria would, however, be in compliance with the recently adopted Comprehensive Plan Policy on Fossil Fuel Distribution which *"Limit fossil fuels distribution and storage facilities to those necessary to serve the regional market."* Given the severity of the

impacts noted above in the City's resolution, adopting Zoning code language for BFFT that aligns with the applicable Comprehensive Plan Policy for fossil fuel distribution is of greater importance than reducing the regulatory burden on the fossil fuel industry.

Proposed language to enact these additional criteria is attached as Appendix "A".

- **Terminal Aggregation**

It is important to note a trend of terminal aggregation in fossil fuel projects, of which we have some examples in the Pacific Northwest. In BC, where nearly two dozen liquefied natural gas (LNG) export projects are in the proposal stage, the annual production of several LNG proposals would be three to four times larger than the annual production of the largest existing LNG terminal in the world. The way in which the projects would achieve these production volumes is through the aggregation of several terminals of equal size, each with its own liquefaction equipment, storage and other structures. The terminals would be geographic neighbors. Through the benefits of the project umbrella they would be greenlit under the same permits with respect to land use, pipelines, etc.

While the existing Zoning code definitions for "site", "ownership", and "development" do an excellent job of precluding this practice of small facility aggregation, there does exist opportunities for the fossil fuel industry to sidestep Zoning code prohibtions. One way would be by submitting separate applications for multiple projects, each owned by an entity that is a subsidiary of a single corporation. Another would be to separate contiguous lots by a lot or lots under different Ownership, but to connect facilities on the non-contiguous lots by easements containing pipelines, access roads, &c.

The existing Zoning code definition for "Ownership" should be revised to include the following language:

> *Contiguous lots that are owned by multiple entities that are subsidiaries of a single corporation are considered to be a single ownership. Non-contiguous lots that are Owned by the same entity and connected via an easement granted by the Owner(s) of the lot(s) located between the non-contiguous lots are considered to be a single ownership.*

This concludes my written testimony. Please feel free to contact me with any questions or concerns. Thank you for your attention to this issue.

APPENDIX "A"

NONCONFORMING SITUATION REVIEW – ADDITIONAL CRITERIA LANGUAGE

33.258.80 Nonconforming Situation Review

A. Procedure. A nonconforming situation review is processed through a Type II procedure.

B. Approval criteria. The request will be approved if the review body finds that the applicant has shown that all of the following approval criteria are met:

1. All requests must comply with the following review criteria:

~~1.~~ a. With mitigation measures, there will be no net increase in overall detrimental impacts (over the impacts of the last legal use or development) on the surrounding area taking into account factors such as:

~~a.~~ (1) The hours of operation;

~~b.~~ (2) Vehicle trips to the site and impact on surrounding on-street parking;

~~c.~~ (3) Noise, vibration, dust, odor, fumes, glare, and smoke;

~~d.~~ (4) Potential for increased litter; and

~~e.~~ (5) The amount, location, and nature of any outside displays, storage, or activities; and

~~2.~~ b. If the nonconforming use is in an OS or R zone, and if any changes are proposed to the site, the appearance of the new use or development will not lessen the residential character of the OS or R zoned area. This is based on taking into account factors such as:

~~a.~~ (1) Building scale, placement, and facade;

~~b.~~ (2) Parking area placement;

~~c.~~ (3) Buffering and the potential loss of privacy to abutting residential uses; and Lighting and signs; and

~~d.~~ (4) Lighting and signs; and

~~3.~~ c. If the nonconforming use is in a C, E, or I zone, and if any changes are proposed to the site, the appearance of the new use or development will not detract from the desired function and character of the zone~~.~~; and

2. Because fossil fuels pose risks to safety, health, and livability, including mobility of people, other freight, and other commercial vehicles, because the extraction and combustion of fossil fuels are significant sources of greenhouse gas emissions and major contributors to climate change and pollution, and given the record of crude oil and coal or other fossil fuel transport accidents, Bulk Fossil Fuel Terminal are subject to these additional review criteria. With mitigation measures, there will be no net increase in overall detrimental impacts (over the impacts of the last legal use or development) on the surrounding area based on the following factors:

a. The effects of greenhouse gas (GHG) emissions and climate change, where:

(1) GHG is defined as the following:

- carbon dioxide,
- methane,
- nitrous oxide,
- hydrofluorocarbons,
- perfluorocarbons,
- nitrogen trifluoride,
- and sulfur hexafluoride,

(2) Both direct and indirect GHG emissions are to be considered, where

- Direct GHG emissions are emissions from the Bulk Fossil Fuel Terminal Use site, and
- Indirect GHG emissions are emissions that are a consequence of the activities of the Bulk Fossil Fuel Terminal Use site, but occur at sources located elsewhere, and

(3) Quantification tools and methodology employed is to be per the White House Council on Environmental Quality's publication *"2012 Guidance for Accounting and Reporting,"* as amended over time.

As the totality of climate change impacts is not attributable to any single action, but are exacerbated by a series of actions, a statement that emissions from a request involving a Bulk Fossil Fuel Terminal represent only a small fraction of global emissions is essentially a statement about the nature of the climate change challenge, and is not an appropriate basis for deciding the impact of climate change impacts on the surrounding area. Moreover, these comparisons are also not an appropriate method for characterizing the potential impacts associated with a request, because this approach does not reveal anything beyond the nature of the climate change challenge itself: the fact that diverse individual sources of emissions each make a relatively small addition to global atmospheric GHG concentrations that collectively have a large impact.

(b) The effects of a fire and/or explosion at either the Bulk Fossil Fuel Terminal Site or transportation equipment or infrastructure used to convey fossil fuels to or from the Bulk Fossil Fuel Terminal, and

(c) The effects of a breach and release of fossil fuels from either the Bulk Fossil Fuel Terminal Site or transportation equipment or infrastructure used to convey fossil fuels to or from the Bulk Fossil Fuel Terminal, into the Columbia River and/or tributary waterways.

(d) When considering the effects of (b), and (c), above, the likelihood of an event occurring should be evaluated in the context of the scale and severity of the deleterious impact on the surrounding area.

Comments on Portland's Fossil Fuel Export Policy submitted to the Bureau of Planning and Sustainability
On behalf of Center for Sustainable Economy
September 16, 2016

Fossil fuels pose risks at every stage of their life cycle--from extraction, to transport, to storage to combustion. One risk that is of particular concern to the City of Portland is the risk of a catastrophic explosion in the event of a 9.0 magnitude earthquake. The entire industrial area of Portland, including the entire region where oil, gas and other chemicals are stored, is in a liquefaction zone. Should a quake hit, this region is particularly vulnerable to a catastrophic explosion, one that could set much of the city and the Willamette River on fire.

Northwest Natural and other fossil fuel industry representatives have submitted that the only way they will seismically upgrade their facilities is by way of expansion. The latest BPS code draft suggests a 10 percent increase of existing infrastructure may be acceptable. However, an expansion of existing facilities poses an additional and unacceptable risk to the Portland metropolitan area. Though we appreciate the concern of PSC over the possibility of disallowing seismic upgrades, we don't share the belief that the only way to incentivize upgrades is through allowing the expansion of fossil fuel infrastructure. In fact, this issue is more fit for subsequent city processes that should originate outside of the land use context. To this end, we are pleased to learn from BPS that they will recommend subsequent process of review of fossil fuel infrastructure policy and that additional studies and hearings will address the issues of seismic safety. We propose that, at the point in the review process when seismic safety is addressed, the City explore the option of imposing

fossil fuel, or more generally, dangerous infrastructure risk bonds. We are attaching, for your information, an outline of the concept of a fossil fuel risk bond. There is no reason that the City should accept that the only way we can protect health and safety by reducing catastrophic risk to the public is by allowing more of a dangerous activity.

Subject: [User Approved] PSC Fossil Fuel Zoning Testimony

Dear Portland PSC Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing implementation of its November 2015 Fossil Fuel Policy.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to:

-Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

-An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the fight against climate change. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland can remain at the forefront of

addressing the most pressing concern of our time.

Sincerely,
Sierra Ansley

To: Planning and Sustainability Commission <psc@portlandoregon.gov>
Subject: NW Natural's Regulatory Construct

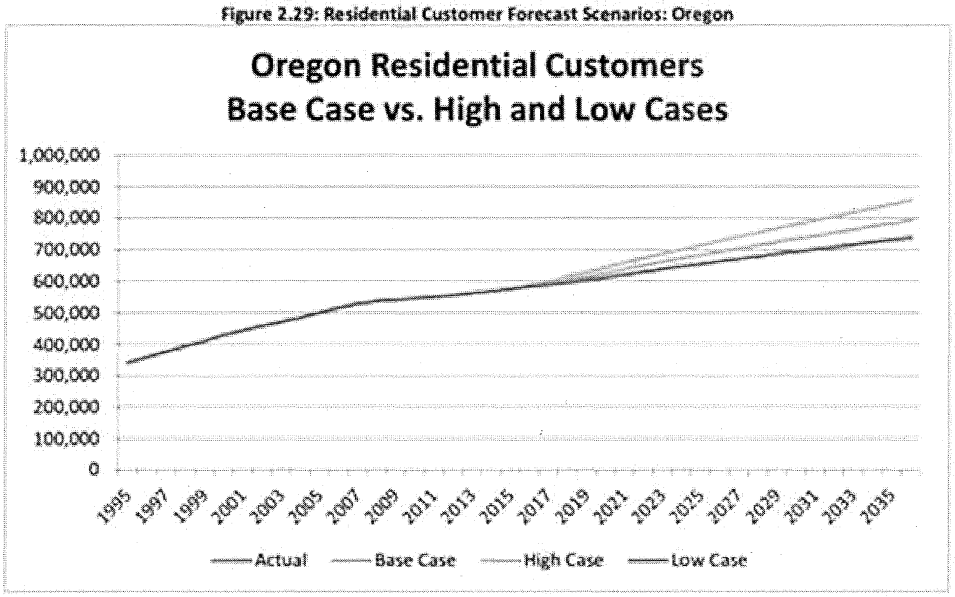
Members of the Planning & Sustainability Commission,

During my testimony, you asked a few specific questions regarding our integrated resource planning and rate-making for which I promised more thorough answers. I've tried to address your questions below.

- Our IRP is publicly available on our website here. I want to highlight a few pertinent points:
  - Assumptions for customer growth and demand were developed over many months and reviewed during an 8 hour technical working group meeting held on January 13, 2016.
    - The meeting was attended by staff from Oregon and Washington utility regulator offices, customer advocacy groups, members of industry, and energy efficiency advocates. They added their input and expertise that informed our growth projections.
    - These assumptions are at the very foundation of our IRP. Therefore, it is crucial they be robust and unassailable.
    - Appendix 10A.1 contains the sign-in sheet for participants at the January 13th meeting.
  - Chapter 2 contains our Gas Requirements Forecast. Table 2.3 (page 56) summarizes a Base, High and Low customer growth forecast, looking out to 2035.
    - I've included a screenshot of that page below for your convenience.
    - You'll see there is modest growth even in the low growth scenario. Even with this modest growth, there is no need to expand capacity at the LNG facility in Portland, nor are there any plans to do so at this time.
- Any investments made to the Company's distribution system facilities that are used to provide regulated utility service must meet a used -and-useful requirement in order to be recovered in a rate case. That is, in the case of our LNG facility, there must be sufficient demand to warrant investment in expansion; otherwise, the company will not be able to recover its investment.

- This requirement can be found in Chapter 757 of the Oregon Revised Statutes. It says:
    - *"757.355 Costs of property not presently providing utility service excluded from rate base; exception. (1) Except as provided in subsection (2) of this section, a public utility may not, directly or indirectly, by any device, charge, demand, collect or receive from any customer rates that include the costs of construction, building, installation or real or personal property not presently used for providing utility service to the customer."*

My hope is that this existing regulatory construct and transparent stakeholder involvement will give the PSC sufficient reason to exclude NW Natural's LNG facility from being designated a non-conforming use. Indeed, the Portland community already participates in our regulatory processes, expanding the LNG tank would only be based on proven regional demand, and the designation would create problems for seismic upgrades.



Of course, do not hesitate to contact me with any additional comments or concerns.

Best,
Shanna

To: Planning and Sustainability Commission <psc@portlandoregon.gov>
Subject: Written testimony regarding Planning and Sustainability Commission Meeting, Tuesday, September 13, 2016, Agenda item: Mass Shelters and Housing Zoning Code Update Hearing / Recommendation

I understand that the Planning and Sustainability Commission elected to leave open the record for further written testimony regarding its September 13, 2016, meeting and the agenda items therein. I am submitting this written testimony to reiterate and further clarify my invited oral testimony during the meeting.

The Joint Office of Homeless Services (JOHS) was formed through intergovernmental agreement between the City of Portland and Multnomah County in order to more directly coordinate the budgeting, contracting, and policy development roles of each government related to ending homelessness. Staff from the JOHS also coordinate A Home for Everyone, the community-wide effort to house people experiencing homelessness throughout Multnomah County by making smart investments in the areas of housing, income, survival, emergency services, health, access to services and systems coordination.

JOHS staff have worked closely with staff from the Bureau of Planning and Sustainability to describe the scope of challenges siting mass shelters within the City of Portland and to identify potential improvements to zoning code to address those challenges. The proposed draft Mass Shelters and Housing Zoning Code Update addresses the vast majority of the identified challenges and will make a significant difference in the ability of publicly funded nonprofit and volunteer-led shelter providers (including those hosted or operated by religious institutions) to site shelters effectively and efficiently. We genuinely appreciate the work of staff in developing the

proposed draft, particularly their outreach to various A Home for Everyone partners, as well as neighborhood coalitions and other community groups.

We recommend only one change to the current draft proposal:

1. Our nonprofit publicly-funded shelter providers are routinely able to successfully operate mass shelters with 75-100 beds, and are able to do so more efficiently and cost effectively than when they operate smaller facilities. In commercial zones where existing structures and/or allowable floor area ratios offer square footage sufficient to accommodate these larger shelters, we recommend that they be an allowed use. Specifically, we recommend that the Maximum Number of Shelter Beds for Mass Shelters as an allowed use (as described at 33.285.050.B.2 and related Table 285-1) in Storefront Commercial (CS), Mixed Commercial/Residential (CM), and Office Commercial 2 (CO2) zones be set at 100 beds, rather than at 50 beds as in the current proposed draft.

Please contact me with any questions.

Ryan.

Subject: [User Approved] PSC Fossil Fuel Zoning Testimony

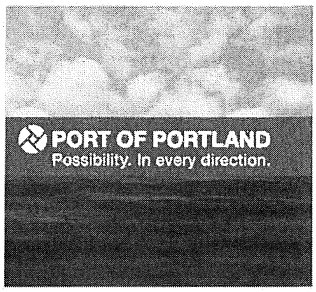
Dear Portland PSC Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing implementation of its November 2015 Fossil Fuel Policy.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to:

-Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

-An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.



-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the fight against climate change. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland can remain at the forefront of

addressing the most pressing concern of our time.

Sincerely,
Glenda Goldwater

Re: Fossil Fuel Terminal Zoning Amendments – August 2016 Proposed Draft

Dear Chair Schultz:

Thank you for the opportunity to comment on the Fossil Fuel Terminal Zoning Amendments – August 2016 Proposed Draft. Throughout this process, we have focused largely on how the City of Portland can move forward with this policy in a manner that avoids unintended consequences and strikes the right balance for where our region is in the evolution beyond fossil fuels.

Port of Portland (Port) facilities play a critical role in the economic vitality of Portland and our region as a whole. From Portland International Airport to our four marine terminals – the functions of these facilities, by their very nature, depend on a predictable supply of fuel. Therefore, our comments remain focused on ensuring that existing Port facilities and operations, as well those of tenants, are not unduly negatively impacted by the proposed zoning amendments.

Building on written comments provided to the Mayor's staff on May 12, 2016, as well as written comments provided to Bureau of Planning and Sustainability staff on July 27, 2016, (both attached for your reference) we offer the following perspective from the Port.

Supporting exemptions:

We appreciate that fuel storage for "end users", including Portland International Airport (PDX) and marine fuel suppliers, are specifically exempt from the provisions of the August 2016 Proposed Draft. We also appreciate that fossil fuels, as used for inputs into products at commercial and industrial facilities, are also exempt.

The code amendments in the August 2016 Proposed Draft could adversely affect the reliability of fuel delivery to PDX into the future as well as the supply of clean and sustainable aviation, marine and fleet vehicle fuels.

In the short term, fuel supply to PDX is probably not a concern. However, in the medium to long term, we are concerned about impacts to the PDX fuel supply. Fuel farm facilities at PDX are owned and operated by the Portland Fueling Facilities Corporation (PFFC), a consortium of the airlines operating at PDX. With growth in the aviation sector, fuel consumption is expected to increase by more than 50% by 2035 with a corresponding need for tank storage. PFFC has a system of three tanks, two at 840,000 gallon capacity and one at 1.68 million gallon capacity. In addition, PFFC is in discussions to construct one additional tank. Current operating requirements assume a three-day reserve supply for redundancy purposes. Any regulatory change that would adversely affect the reliability of fuel supply from NW Portland to PDX would likely increase the reserve supply requirement, dramatically increasing the need for tank storage.

Mission: To enhance the region's economy and quality of life by providing efficient cargo and air passenger access to national and global markets, and by promoting industrial development.

Box 3529 Portland OR 97208
503 415 6000

Printed on 100% recycled stock

Looking beyond supply and into the transition to clean and sustainable fuels – the issue really is capacity. Both the aviation and the marine industry are putting resources behind new fuel sources, the implementation of which we want to support. Fuels for facilities and operations defined as "end users" come from bulk facilities – now proposed to be non-conforming uses, with new facilities prohibited. Because existing bulk fuel facilities are the most likely location to store clean and sustainable fuels, we are concerned that these new fuels will inadvertently be "crowded out" due to limits on expansion imposed through these code amendments.

Code amendments should be cognizant of these efforts and support the infrastructure needed for this transition. Prohibiting bulk fuel facilities in the City of Portland and establishing such facilities as non-conforming uses will make it difficult or impossible for existing fuel terminal operators to modernize, upgrade and add capacity in order to serve the needs into the future.

Recommendations:

We encourage the city to take a different approach to review and designation of fuel terminals. In preparing the initial discussion draft (July 2016) of these amendments, bureau staff recognized that a Type II review would create uncertainty and a disincentive for needed investments. Further, bureau staff understood that the designation of a non-conforming use would significantly limit future investment. This position was consistent with Resolution 37168 in a way the current draft is not. It is incumbent on the Planning and Sustainability Commission and Portland City Council to tie code amendments back to the original legislative intent.

We encourage the City to take the time necessary to get this right. The implications of the proposed code amendments are far reaching with consequences that should be fully understood, balanced and appropriately vetted.

We look forward to being part of the ongoing discussion.

Sincerely,

Susie Lahsene

Re: Feedback on Fossil Fuel Policy Development

The Port of Portland appreciates the opportunity to provide information and feedback on the anticipated code amendments related to Resolution 37168. We hope this can be an ongoing conversation, and that we can be seen as a resource on issues pertaining to our public mission, and partner on areas where our missions align. The Portland waterfront serves a critical role in the delivery and transshipment of fuels used in the city, state, and wider region. This fact should not be overlooked as the City moves forward with a fossil fuel policy that is intended, in whole or in part, to achieve goals that extend beyond its borders.

We trust that the City will develop fossil fuel-related code amendments that that will reflect balance in community priorities – environmental, social and economic. Our feedback in this memorandum is mostly about avoiding unintended consequences and making sure the code amendments carefully consider the real world impacts to industry and the people who rely on it, as well as various environmental initiatives. In particular, we urge the City to take a careful approach to the scope of the fossil fuel definition and the concept of export versus local consumption.

Specifically:

Code amendments should not create disincentives for companies making needed investments in safety and seismic resiliency.

As noted in the 2012 DOGAMI study "Earthquake Risk Study for Oregon's Critical Energy Infrastructure Hub", oil terminals in Northwest Portland have significant seismic vulnerabilities and limited redundancy. (<http://www.oregongeology.org/sub/earthquakes/cei-hub-report.pdf>). Strictly limiting tank sizes individually or in aggregate may have the unintended consequence making it more difficult to replace multiple obsolete tanks with a single larger but modern tank that meets current seismic and environmental standards, as well making it more difficult to provide additional redundancy recommended in the report.

Code amendments should not create a disincentive for companies to take steps toward more environmentally friendly practices and commodities.

As such, regulated commodities should not include alternative fuels such as biodiesel or inputs to manufacture biodiesel, such as methanol. Nor should they include products derived from fossil fuels such as fertilizer, chemicals and steel. In addition, strict limitation of tank size may have an unintended consequence of limiting liquid bulk commodities that *are not* fuels, such as food-grade vegetable oil, as well as biofuels manufacturing and storage.

The following fuels are defined as alternative fuels by the Federal Energy Policy Act (EPAct) of 1992: pure methanol, ethanol, and other alcohols; blends of 85% or more of alcohol with gasoline; natural gas and liquid fuels domestically produced from natural gas; liquefied petroleum gas (propane); coal-derived liquid fuels; hydrogen; electricity; pure biodiesel (B100); fuels, other than alcohol, derived from biological materials; and P-Series fuels.

Code amendments should be consistent with the goals and definitions of the Oregon Clean Fuel Program.

The Clean Fuels Program [OAR 340-253-0000] is a critical component of Oregon's plan to reduce greenhouse gases in the transportation sector such as creating cleaner cars, using cleaner fuels and reducing the amount that Oregonians drive. In addition to reducing greenhouse gases, the program has many co-benefits including reductions in other air pollutants, improvements to public health and increased energy security.

Oregon Clean Fuel Program Oregon Administrative Rules [OAR 340-253-0200] define clean fuels as a transportation fuel with a carbon intensity lower than the clean fuel standard for gasoline and their substitutes listed in Table 1 under OAR 340-253-8010 or diesel fuel and their substitutes listed in Table 2 under OAR 340-253-8020, as applicable, for that calendar year, such as: (a) Bio-CNG; (b) Bio-L-CNG; (c) Bio-LNG; (d) Electricity; (e) Fossil CNG; (f) Fossil L-CNG; (g) Fossil LNG; (h) Hydrogen or a hydrogen blend; (i) LPG; and (j) Renewable diesel.

Code amendments should not frustrate international efforts to promote low-sulfur fuel in marine operations:

The International Convention for the Prevention of Pollution from Ships (MARPOL) Annex VI contains a program that applies stringent engine emission standards and fuel sulfur limits to ships that operate within 200 nm of the U.S. and in inland waterways. The 2015 fuel sulfur standard of 0.1 percent fuel sulfur (1,000 ppm) reduced diesel particulate matter by 74 percent. Marine Gas Oil distillate and LNG are the primary fuels that enable ships to meet the standards. Code amendments should be cognizant of this effort, and others that might arise in the future.

Code amendments should support sustainable aviation fuels:

In the Northwest, according to the Sustainable Aviation Fuels Northwest Project completed in 2013, approximately 800 million gallons of aviation fuel are used per year in the Pacific Northwest, with well over 90% of that allocated to commercial aviation. The airline industry has set a goal of capping industry-wide CO2 emissions by 2020 and cutting emissions in half by 2050. Individual airlines are setting goals of using sustainable aviation biofuel at one or more of their airport locations (given economic feasibility and adequate supply). The region can support these goals in many ways, including supporting state and federal clean fuels programs that incentivize the development of a stable commercial scale clean fuel supply chain and a

Northwest market, and by ensuring that fuel delivery infrastructure can accommodate the airlines' sustainable biofuels and biofuel/conventional fuel blends in aircraft fueling at PDX.

Code amendments should not adversely affect the reliability of fuel delivery to Portland International Airport:

Fuel farm facilities at PDX are owned and operated by the Portland Fueling Facilities Corporation (PFFC), a consortium of the airlines operating at PDX, not the Port. PFFC currently has a system of 3 tanks, two at 840,000 gallons capacity and one at 1.68 million gallons. PFFC is in discussions to construct another tank. These tanks operate together as a system. For purposes of redundancy as it relates to maintenance and safety, fuel can be pumped between these tanks. With growth in the aviation sector, fuel consumption is expected to increase by more than 50% by 2035 with a corresponding need for tank storage. Current operating requirements assume a 3-day reserve supply for redundancy purposes. Any regulatory change that would adversely affect the reliability of fuel supply from NW Portland to PDX could increase the reserve supply requirement. PFFC could move toward a 5, 7 or even 10 day reserve supply requirement if supply reliability is affected. Increasing the reserve supply requirement dramatically increases the need for tank storage at PDX.

Code Amendments should not impact the existing statewide and regional market.

The City of Portland supplies over 90% of the liquid fuel used in the State of Oregon and plays a similarly important role in the larger Pacific Northwest region including SW Washington, SE Washington and Northern Idaho. For purposes of these code amendments, fuel transshipped to other portions of Oregon or the Pacific Northwest region should clearly be exempt from the restricted "export" category.

Code amendments should not create additional regulatory processes that increase uncertainty in the market.

The code amendments should not create a new discretionary review process subject to appeal. Instead, the code amendments should create a clear and objective standard that is fair, equitable and can pass legal scrutiny.

The City should follow through on process commitments made in Resolution 37168.

Meaningful stakeholder engagement: *"BE IT FURTHER RESOLVED that the City shall consult with its Tribal Government Partners, the State of Oregon, local governments, and other key stakeholder including labor, business, environment, neighborhoods and communities of color in advancing this policy..."*

- This calls on the city to not just inform, but also engage representatives from these groups in the policy development.
- The feedback from these groups should be considered equally to those of other stakeholders whose opinions have been solicited to date.

Economic impact study: *"BE IT FURTHER RESOLVED that the Bureau of Planning & Sustainability shall undertake an analysis of the economic impacts of any proposed Code changes to advance the policies set forth in this resolution, with a particular focus on potential impacts to local blue-collar jobs..."*

- This study should seek to understand the impact of these code amendments not only on local jobs, but on the broader needs of our region. Given that over 90% of Oregon's liquid fuels move through Portland, its import to ensure that infrastructure to serve this regional market is not adversely impacted.

Re: Port of Portland Comments on the Fossil Fuel Terminal Zoning Amendments Discussion Draft

---

Thank you for the opportunity to comment on the Fossil Fuel Terminal Zoning Amendments Discussion Draft June 2016 (the draft document).

In addition to our previous comments provided in a memo dated May 12, 2016, we would like to emphasize our main areas of interest related to this topic.

Primarily, we want to ensure that existing Port facilities and operations are not unduly or unintentionally negatively impacted by any regulations that may stem from this initiative. Examples include the Aircraft Fuel Farm and the CNG powered vehicle fleet at Portland International Airport (PDX).

Secondarily, we want to ensure that current and future Port tenants are also not unduly or unintentionally impacted by any regulations that may stem from this initiative. Given these two primary areas of concern, we have a number of specific questions and comments:

Bulk Fossil Fuels Terminal Definition

> Bulk fossil fuel terminals are not well defined relative to other liquid bulk storage facilities. We believe that an existing liquid bulk storage facility that has handled in the past and/or has the capability of handling fossil fuels proposed to be regulated in this draft document should be considered an existing bulk fossil fuel terminal.

End Use Exemption

> While we appreciate efforts to clarify that end users are not subject to regulations contained in the draft document, we believe some of the specific examples could be clarified or refined to say:

- Aviation fuel facilities (rather than "jet fuel facilities at the PDX Airport")
- Marine vessel fuel facilities (rather than "vessel fuel facilities on Portland Harbor")
- Fleet vehicle fuel facilities
- Railroad fuel facilities
- Industrial and commercial uses (rather than simply "manufacturers")

We also remain concerned that "end user" is not well defined, leaving the potential for confusion and misunderstanding in the future. "End user" should also acknowledge the regional fuel market served by Portland, extending well beyond the metropolitan area and Oregon.

Site Definition

The draft document on page 23 suggests that off-site (non-contiguous) expansion of an existing terminal would be subject to limitations as if it were a new bulk fossil fuel terminal. Yet, the immediately following point notes that some existing bulk fossil fuel terminals are separated by public street rights-of-way and should be recognized as a single facility. These two contradictory statements need to be reconciled and clarified. In addition, the document should clarify that existing bulk fossil fuels terminals within an existing ground lease are allowed to expand their ground lease boundary and associated facility improvements.

Definition of Fossil Fuels

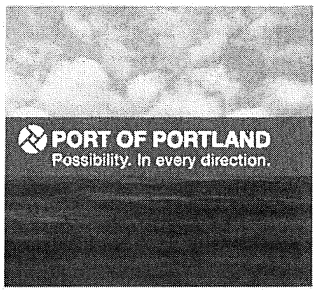
While we agree that petrochemicals used primarily for non-fuel products should be excluded from this code concept, we believe it is inconsistent that methanol would be regulated as a fossil fuel even when used as a petrochemical in a manufacturing process (such as refining biodiesel), as is proposed on page 21 of the draft document.

We are also concerned that the definition of regulated fossil fuels also includes some fuels defined under the Oregon Clean Fuel Program, including CNG and propane. Since these fuels are used extensively for vehicle fleets by the Port of Portland and many other government and commercial entities in Portland, we believe the draft document may unduly limit access to these important fuels.

Regulation of Tanks Suitable for Multiple Purposes

It is unclear if and how the tank size threshold described on page 24 of the draft document will be calculated for new liquid bulk storage facilities, when those tanks could be used to store a fossil fuel proposed for regulation, a non-regulated biofuel or other non-regulated liquid bulk commodity (such as vegetable oil) .

Ambiguity in how new tanks are regulated could undermine efforts of the Sustainable Aviation Fuels Northwest Project, described in more detail in our May 12, 2016 memo, as well as other efforts to meet the goals contained in the Oregon Clean Fuel Program.



Analysis concerns:

The analysis of economic impact only looks at jobs, rather than what the impact would be to the entire region if access to fuels is limited. The analysis does not take into account the forecasted demand for low carbon fuels – thereby undermining transition requirements. Also, the forecast of need is based on old data that was used to predict export driven growth specific to marine terminals, not overall demand.

The proposed size limits for new Bulk Fossil Fuel Facilities described on page 24 of the draft document seem unsubstantiated, and the size limit is confusing depending on the specific commodity. "Barrel" is typically only used as a volume measure for crude oil, whereas refined petroleum products are defined in gallons or liters. As an example, refining a barrel of crude oil may result in 20 gallons of gasoline, 4 gallons of jet fuel, or any number of other volume ratios depending on the refined petroleum product in question. (<http://aoghs.org/news/history-of-the-42-gallon-barrel/>)

Given that tanks may be used for a variety of fossil fuels (or other non-regulated liquid bulk commodities), expressing limits in barrels is confusing and may be unduly limiting depending on the commodity. As an example, we are concerned about limits this may place on the wholesale supply of jet and other aviation fuels to Port of Portland operated airports in Portland and the metropolitan region.

Thank you for the opportunity to comment on the discussion draft and we look forward to further discussion of this concept.

Re: Feedback on Fossil Fuel Policy Development

The Port of Portland appreciates the opportunity to provide information and feedback on the anticipated code amendments related to Resolution 37168. We hope this can be an ongoing conversation, and that we can be seen as a resource on issues pertaining to our public mission, and partner on areas where our missions align. The Portland waterfront serves a critical role in the delivery and transshipment of fuels used in the city, state, and wider region. This fact should not be overlooked as the City moves forward with a fossil fuel policy that is intended, in whole or in part, to achieve goals that extend beyond its borders.

We trust that the City will develop fossil fuel-related code amendments that that will reflect balance in community priorities – environmental, social and economic. Our feedback in this memorandum is mostly about avoiding unintended consequences and making sure the code amendments carefully consider the real world impacts to industry and the people who rely on it, as well as various environmental initiatives. In particular, we urge the City to take a careful approach to the scope of the fossil fuel definition and the concept of export versus local consumption.

Specifically:

Code amendments should not create disincentives for companies making needed investments in safety and seismic resiliency.

As noted in the 2012 DOGAMI study "Earthquake Risk Study for Oregon's Critical Energy Infrastructure Hub", oil terminals in Northwest Portland have significant seismic vulnerabilities and limited redundancy. (<http://www.oregongeology.org/sub/earthquakes/cei-hub-report.pdf>). Strictly limiting tank sizes individually or in aggregate may have the unintended consequence making it more difficult to replace multiple obsolete tanks with a single larger but modern tank that meets current seismic and environmental standards, as well making it more difficult to provide additional redundancy recommended in the report.

Code amendments should not create a disincentive for companies to take steps toward more environmentally friendly practices and commodities.

As such, regulated commodities should not include alternative fuels such as biodiesel or inputs to manufacture biodiesel, such as methanol. Nor should they include products derived from fossil fuels such as fertilizer, chemicals and steel. In addition, strict limitation of tank size may have an unintended consequence of limiting liquid bulk commodities that *are not* fuels, such as food-grade vegetable oil, as well as biofuels manufacturing and storage.

The following fuels are defined as alternative fuels by the Federal Energy Policy Act (EPAct) of 1992: pure methanol, ethanol, and other alcohols; blends of 85% or more of alcohol with gasoline; natural gas and liquid fuels domestically produced from natural gas; liquefied petroleum gas (propane); coal-derived liquid fuels; hydrogen; electricity; pure biodiesel (B100); fuels, other than alcohol, derived from biological materials; and P-Series fuels.

Code amendments should be consistent with the goals and definitions of the Oregon Clean Fuel Program.

The Clean Fuels Program [OAR 340-253-0000] is a critical component of Oregon's plan to reduce greenhouse gases in the transportation sector such as creating cleaner cars, using cleaner fuels and reducing the amount that Oregonians drive. In addition to reducing greenhouse gases, the program has many co-benefits including reductions in other air pollutants, improvements to public health and increased energy security.

Oregon Clean Fuel Program Oregon Administrative Rules [OAR 340-253-0200] define clean fuels as a transportation fuel with a carbon intensity lower than the clean fuel standard for gasoline and their substitutes listed in Table 1 under OAR 340-253-8010 or diesel fuel and their substitutes listed in Table 2 under OAR 340-253-8020, as applicable, for that calendar year, such as: (a) Bio-CNG; (b) Bio-L-CNG; (c) Bio-LNG; (d) Electricity; (e) Fossil CNG; (f) Fossil L-CNG; (g) Fossil LNG; (h) Hydrogen or a hydrogen blend; (i) LPG; and (j) Renewable diesel.

Code amendments should not frustrate international efforts to promote low-sulfur fuel in marine operations:

The International Convention for the Prevention of Pollution from Ships (MARPOL) Annex VI contains a program that applies stringent engine emission standards and fuel sulfur limits to ships that operate within 200 nm of the U.S. and in inland waterways. The 2015 fuel sulfur standard of 0.1 percent fuel sulfur (1,000 ppm) reduced diesel particulate matter by 74 percent. Marine Gas Oil distillate and LNG are the primary fuels that enable ships to meet the standards. Code amendments should be cognizant of this effort, and others that might arise in the future.

Code amendments should support sustainable aviation fuels:

In the Northwest, according to the Sustainable Aviation Fuels Northwest Project completed in 2013, approximately 800 million gallons of aviation fuel are used per year in the Pacific Northwest, with well over 90% of that allocated to commercial aviation. The airline industry has set a goal of capping industry-wide CO2 emissions by 2020 and cutting emissions in half by 2050. Individual airlines are setting goals of using sustainable aviation biofuel at one or more of their airport locations (given economic feasibility and adequate supply). The region can support these goals in many ways, including supporting state and federal clean fuels programs that incentivize the development of a stable commercial scale clean fuel supply chain and a

Northwest market, and by ensuring that fuel delivery infrastructure can accommodate the airlines' sustainable biofuels and biofuel/conventional fuel blends in aircraft fueling at PDX.

Code amendments should not adversely affect the reliability of fuel delivery to Portland International Airport:

Fuel farm facilities at PDX are owned and operated by the Portland Fueling Facilities Corporation (PFFC), a consortium of the airlines operating at PDX, not the Port. PFFC currently has a system of 3 tanks, two at 840,000 gallons capacity and one at 1.68 million gallons. PFFC is in discussions to construct another tank. These tanks operate together as a system. For purposes of redundancy as it relates to maintenance and safety, fuel can be pumped between these tanks. With growth in the aviation sector, fuel consumption is expected to increase by more than 50% by 2035 with a corresponding need for tank storage. Current operating requirements assume a 3-day reserve supply for redundancy purposes. Any regulatory change that would adversely affect the reliability of fuel supply from NW Portland to PDX could increase the reserve supply requirement. PFFC could move toward a 5, 7 or even 10 day reserve supply requirement if supply reliability is affected. Increasing the reserve supply requirement dramatically increases the need for tank storage at PDX.

Code Amendments should not impact the existing statewide and regional market.

The City of Portland supplies over 90% of the liquid fuel used in the State of Oregon and plays a similarly important role in the larger Pacific Northwest region including SW Washington, SE Washington and Northern Idaho. For purposes of these code amendments, fuel transshipped to other portions of Oregon or the Pacific Northwest region should clearly be exempt from the restricted "export" category.

Code amendments should not create additional regulatory processes that increase uncertainty in the market.

The code amendments should not create a new discretionary review process subject to appeal. Instead, the code amendments should create a clear and objective standard that is fair, equitable and can pass legal scrutiny.

The City should follow through on process commitments made in Resolution 37168.

Meaningful stakeholder engagement: *"BE IT FURTHER RESOLVED that the City shall consult with its Tribal Government Partners, the State of Oregon, local governments, and other key stakeholder including labor, business, environment, neighborhoods and communities of color in advancing this policy..."*

- This calls on the city to not just inform, but also engage representatives from these groups in the policy development.
- The feedback from these groups should be considered equally to those of other stakeholders whose opinions have been solicited to date.

Economic impact study: *"BE IT FURTHER RESOLVED that the Bureau of Planning & Sustainability shall undertake an analysis of the economic impacts of any proposed Code changes to advance the policies set forth in this resolution, with a particular focus on potential impacts to local blue-collar jobs..."*

- This study should seek to understand the impact of these code amendments not only on local jobs, but on the broader needs of our region. Given that over 90% of Oregon's liquid fuels move through Portland, its import to ensure that infrastructure to serve this regional market is not adversely impacted.

PORT OF PORTLAND

Memo

To: Steve Kountz, Bureau of Planning and Sustainability

From: Tom Bouillion, Port of Portland

Date: July 27, 2016

Re: Port of Portland Comments on the Fossil Fuel Terminal Zoning Amendments Discussion Draft

---

Thank you for the opportunity to comment on the Fossil Fuel Terminal Zoning Amendments Discussion Draft June 2016 (the draft document).

In addition to our previous comments provided in a memo dated May 12, 2016, we would like to emphasize our main areas of interest related to this topic.

Primarily, we want to ensure that existing Port facilities and operations are not unduly or unintentionally negatively impacted by any regulations that may stem from this initiative. Examples include the Aircraft Fuel Farm and the CNG powered vehicle fleet at Portland International Airport (PDX).

Secondarily, we want to ensure that current and future Port tenants are also not unduly or unintentionally impacted by any regulations that may stem from this initiative. Given these two primary areas of concern, we have a number of specific questions and comments:

Bulk Fossil Fuels Terminal Definition

> Bulk fossil fuel terminals are not well defined relative to other liquid bulk storage facilities. We believe that an existing liquid bulk storage facility that has handled in the past and/or has the capability of handling fossil fuels proposed to be regulated in this draft document should be considered an existing bulk fossil fuel terminal.

End Use Exemption

> While we appreciate efforts to clarify that end users are not subject to regulations contained in the draft document, we believe some of the specific examples could be clarified or refined to say:

- Aviation fuel facilities (rather than "jet fuel facilities at the PDX Airport")
- Marine vessel fuel facilities (rather than "vessel fuel facilities on Portland Harbor")
- Fleet vehicle fuel facilities
- Railroad fuel facilities
- Industrial and commercial uses (rather than simply "manufacturers")

We also remain concerned that "end user" is not well defined, leaving the potential for confusion and misunderstanding in the future. "End user" should also acknowledge the regional fuel market served by Portland, extending well beyond the metropolitan area and Oregon.

Site Definition

The draft document on page 23 suggests that off-site (non-contiguous) expansion of an existing terminal would be subject to limitations as if it were a new bulk fossil fuel terminal. Yet, the immediately following point notes that some existing bulk fossil fuel terminals are separated by public street rights-of-way and should be recognized as a single facility. These two contradictory statements need to be reconciled and clarified. In addition, the document should clarify that existing bulk fossil fuels terminals within an existing ground lease are allowed to expand their ground lease boundary and associated facility improvements.

Definition of Fossil Fuels

While we agree that petrochemicals used primarily for non-fuel products should be excluded from this code concept, we believe it is inconsistent that methanol would be regulated as a fossil fuel even when used as a petrochemical in a manufacturing process (such as refining biodiesel), as is proposed on page 21 of the draft document.

We are also concerned that the definition of regulated fossil fuels also includes some fuels defined under the Oregon Clean Fuel Program, including CNG and propane. Since these fuels are used extensively for vehicle fleets by the Port of Portland and many other government and commercial entities in Portland, we believe the draft document may unduly limit access to these important fuels.

Regulation of Tanks Suitable for Multiple Purposes

It is unclear if and how the tank size threshold described on page 24 of the draft document will be calculated for new liquid bulk storage facilities, when those tanks could be used to store a fossil fuel proposed for regulation, a non-regulated biofuel or other non-regulated liquid bulk commodity (such as vegetable oil) .

Ambiguity in how new tanks are regulated could undermine efforts of the Sustainable Aviation Fuels Northwest Project, described in more detail in our May 12, 2016 memo, as well as other efforts to meet the goals contained in the Oregon Clean Fuel Program.

Analysis concerns:

The analysis of economic impact only looks at jobs, rather than what the impact would be to the entire region if access to fuels is limited. The analysis does not take into account the forecasted demand for low carbon fuels – thereby undermining transition requirements. Also, the forecast of need is based on old data that was used to predict export driven growth specific to marine terminals, not overall demand.

The proposed size limits for new Bulk Fossil Fuel Facilities described on page 24 of the draft document seem unsubstantiated, and the size limit is confusing depending on the specific commodity. "Barrel" is typically only used as a volume measure for crude oil, whereas refined petroleum products are defined in gallons or liters. As an example, refining a barrel of crude oil may result in 20 gallons of gasoline, 4 gallons of jet fuel, or any number of other volume ratios depending on the refined petroleum product in question. (<http://aoghs.org/news/history-of-the-42-gallon-barrel/>)

Given that tanks may be used for a variety of fossil fuels (or other non-regulated liquid bulk commodities), expressing limits in barrels is confusing and may be unduly limiting depending on the commodity. As an example, we are concerned about limits this may place on the wholesale supply of jet and other aviation fuels to Port of Portland operated airports in Portland and the metropolitan region.

Thank you for the opportunity to comment on the discussion draft and we look forward to further discussion of this concept.

Dear Portland PSC Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing implementation of its November 2015 Fossil Fuel Policy.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to:

-Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

-An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the fight against climate change. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland can remain at the forefront of

addressing the most pressing concern of our time.

Subject: Public comment fossil fuel bulk terminal amendment

After looking at the 3 options, the non-conforming should still stand. If safety, unstable ground, fossil fuels are the issues, this will prevent any expansion. No increased storage of hazardous fuels should be allowed that includes bio diesel or other blended fuels. Companies that need to upgrade (seismic or otherwise) should do so to protect their investment not to gather incentives. Current trend is to combine small terminals. Therefore, allowing small terminals will lead to aggregation. Also, policy needs to be brought forward to eliminate the possibility of a company changing type of products, change import to export etc. Different products, different safety procedures, loading concerns, storage requirements, pollution controls. New permits and full evaluation need to be done for every change of products especially for bulk terminals. Chris turner 8 cedar gates rd longview wa 98632 360 270 2914

To: Planning and Sustainability Commission <psc@portlandoregon.gov>
Subject: PSC Fossil Fuel Zoning Testimony: I want a full ban!

Testimony:

Dear Portland City Council,

I am another signer of this letter composed by 350PDX. Portland must fulfill the intent of our 2015 Resolution to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels."

-- Kathy Austen

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes closer to the original intent of the 2015 Resolution.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland". Although this draft prohibits new larger bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine).

While this proposal will mark any bulk terminals as 'non-conforming', it still needs to strengthen the regulations on the size and type of expansion to pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the

use of lower-carbon fuels.

I want the City of Portland and the Planning and Sustainability Commission to:

1 - Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

2 - Remove the exception for new facilities that are 5 million gallons or less which would allow more unit trains of dangerous fossil fuels like Bakken crude oil.
Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

3 - Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.

4 - Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Subject: Comment regarding fossil fuel codes to implement City Council Resolution

Esteemed Portland Planning and Sustainability Commission:

Thank you for showing such interest in Portland's present and future as to serve on this commission. Thank you for listening to public comment on the code implementation of Portland City Council's measure to ban any new infrastructure whose purpose is to store or transport fossil fuels in or through Portland or its adjacent waterways. This ban is waiting on the laws necessary to enforce it.

We were present at the very-well attended meetings leading up to this City Council ordinance in November, very exciting!

We attended your commission meeting yesterday (up until 3:30). The proposal regarding codes before your commission neither fits the ordinance nor does it justice. These codes allow new infrastructure through expansion, and that is not the intent of the ordinance at all. The codes cannot change the intent of the ordinance, bending to suit others' purposes.

The time is now to move into the future. "Time and tide wait for no man'" and our future cannot wait for terminals that want to expand in Portland or for those of us who can't see exactly how life can work for us beyond fossil fuels. We as a nation are moving and must move with full intention toward a fossil fuel-free, sustainable energy future. San Diego, CA, a sprawling city, the country's eighth most populace at 1.4 million people, has set a goal to be

100 percent clean energy, and "its climate action plan is legally binding, not just a vaguely worded proclamation." ("Tomorrowland, Today; The Clean Energy Future is Here;" Gunther, Marc; *Sierra Magazine*, May/June 2016, 36-40)

Here in the Northwest, a consortium of cities, labor, environmentalists, firefighters and others have been working diligently for years to protect our area from fossil fuel contamination and threat --environmental devastation; threat to human, plant, and animal life; and devastating climate change that is on a trajectory to make Earth uninhabitable for our human species. We used to think we needed to move to fossil fuels because they are limited and running out, and we had ideas of using it all up, and then moving on somehow, but now we know we have to leave fossil fuels in the ground if we are even going to survive as a species. This is imperative, this ordinance by City Council, and we need codes that do in fact totally ban future fossil fuel infrastructure, as written.

Our city is not alone, though we lead in this area as a city. Other local jurisdictions have also voted against proposed oil, gas, and coal terminals, including Vancouver, Washougal, Hood River, The Dalles, Mosier, and Stevenson, but the Portland resolutions (including the one on trains) go much further, and we are proud of our city!

Be bold and be strong in requesting better, stricter codes that fully implement this ordinance banning new fossil fuel infrastructure. Why could a code not state that no expansion of existing (nonconforming) terminals and facilities is allowed, and no increase in capacity is allowed, though upgrades to meet seismic safety are encouraged? (And work with the state to get ordinances about seismic safety passed, if more are needed.)

The fossil fuel industry can move to clean, green energy, and leave fossil fuels --dirty, expensive, wasteful, and toxic --in the ground. More jobs, more creativity, and more responsibility are in this future of green and clean energy. We have loved our natural gas fires and cars with gasoline, but the time is over now, and we have new adventures ahead of us, long into the future, but only if we can stop climate change and that means drastic changes and courage right now. Life on Earth is worth it. We individuals need our cities to help us in this transition, and our cities need us. Working together, we will figure it out.

Thank you for listening.

Sincerely,
Adrienne Dickinson

Dear Portland PSC Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing implementation of its November 2015 Fossil Fuel Policy.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to:

-Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

-An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the fight against climate change. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland can remain at the forefront of

addressing the most pressing concern of our time.

Testimony:

In recent revelations of sexual misconduct on college campuses, a strong mantra has emerged: "No means no." Please apply that to the ban on fossil fuel infrastructure. When the City Council passed it's courageous, visionary, and historic ban, I don't think it meant a "little" hanky-panky is OK. Or that a slight pat on the butt is allowable. I think they meant what they said. "No means no." Period. Amen. Thank you for your hard and careful service.

Testimony:

Dear Commissioner:
Portland is seen around the world as a "sustainable city" a leader in green building, green energy, and green transportation. Please, let's ensure perception and reality align.

Please enact a full ban on all new fossil fuel terminals, large or small. An exception for new facilities that are 5 million gallons or less is unnecessary. The City's code changes should not allow more unit trains of dangerous fossil fuels like Bakken crude oil.

Please strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.

Please prevent any aggregate increase in fossil fuel infrastructure in Portland.

Finally, let's shore up our vulnerable fuel infrastructure prior to undertaking an expensive clean-up of the Harbor Superfund Site.

Thank you for your dedicated service to our city.

Hi, I'm Mukta Akter. Please forgive my speaking as English is not my first language. I am from Bangladesh which is one of the most climate vulnerable countries in the world.

The changing climate, driven by accumulating greenhouse gases, has in just 40 years doubled the number of category 4 & 5 storms in South Asia. The destructive force of storms striking my country has increased 50%. Bangladesh is mainly a low elevation country and the combination of sea level rise and powerful storms is already contaminating our drinking water with salinity. The affects are devastating.

Bangladesh has contributed less than 0.03% of global greenhouse gases. It is your country that has contributed the most yet you are taking only small actions while still adding a lot of carbon to the atmosphere. Though we produce almost no carbon emissions, climate change has the biggest impact in my country which directly hits the agriculture, environment & water sector and has become a severe threat to food security and livelihood. Climate disruption is not something coming in the future. It is already here.

A recent NOAA study estimates a potential sea level rise of 1 meter in the next 20 years which will displace 15-20 million people in Bangladesh. It has become a huge challenge for us how to resettle our climate refugees. Even though the policy you are working towards to ban new fossil fuel terminals is a good thing, much more needs to be done to secure the globe from the devastating climate calamities.

***

I work in my country on water and climate issues. I'm currently in the US on an exchange program through the U.S. government and working with 350pdx. If you want to know more about Bangladesh, our severe the climate impacts or would like links to the studies quoted above, please feel free to contact me.

Dear Planning and Sustainability Commission,

As a citizen of Portland and as a human being on planet earth I think it is extremely important to do everything possible to reduce fossil fuel consumption. With that in mind I strongly urge you to do the following:

Eliminate the Fossil Fuel Terminal Size Threshold
Regulate Expansion of Existing Terminals
Prevent Increase in Fossil Fuel Infrastructure
Strengthen Restrictions on Expansions at Existing Terminals

Thank you,

To: Planning and Sustainability Commission <psc@portlandoregon.gov>
Subject: PSC Fossil Fuel Zoning Testimony: I want a full ban!

Testimony:

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes closer to the original intent of the 2015 Resolution.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland". Although this draft prohibits new larger bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine).

While this proposal will mark any bulk terminals as 'non-conforming', it still needs to strengthen the regulations on the size and type of expansion to pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

I want the City of Portland and the Planning and Sustainability Commission to:

1 - Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

2 - Remove the exception for new facilities that are 5 million gallons or less which would

allow more unit trains of dangerous fossil fuels like Bakken crude oil.
Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

3 - Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.

4 - Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

To: Planning and Sustainability Commission <psc@portlandoregon.gov>
Subject: Fossil Fuel Zoning Testimony: Full Ban needed!

Dear Members of the Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the

regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Laura Berg

Dear Portland PSC Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing implementation of its November 2015 Fossil Fuel Policy.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to:

-Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

-An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the fight against climate change. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland can remain at the forefront of

addressing the most pressing concern of our time.

Sincerely,
Tom Blackburn

Subject: PSC Fossil Fuel Zoning Testimony: I want a full ban!

Testimony:

Thank you for considering what I have to say. As I'm sure PSC is coming to see, there is widespread popular opposition to continued investment in fossil fuel development, and this is because as an entire nation we are waking up to the reality of climate change, and we are afraid about the real possibility of not leaving a viable world for our children to inhabit. By 2050, when I am 63, the world's sea levels will have risen an average of no less than 9 ft above their current levels. Seeing the world respond to the current refugee crisis, I cannot imagine what will have transpired by the time many of the world's coastal cities are underwater. And we are already locked into this. The best we can hope for now is to mitigate even more catastrophic changes, and this is absolutely necessary, because it is entirely possible for us to raise the average global temperature well beyond what it has ever been while supporting life as we know it. This is what is at stake as you decide whether to set a bold and courageous precedent that will be felt around the country, and hence around the world. On the other side are people who act against not just my interest and yours, and your childrens', but inexplicably against their own. The time for accepting this has ended, by necessity, and you are in the rare and privileged position of actually playing a part in ending it. This is the moment of you to be heroic or cowardly; you have the heartfelt prayers of millions around the world behind you.

Thank you again.

Testimony:

Please, please don't lose this opportunity to ban an and all fossil fuel terminals and to prohibit oil trains from running through Portland. It is so important that we focus on other sources of energy instead of perpetuating the dangers of fossil fuels and the degradation of the earth as a result. As a resident of NW Portland, whose children and grandchildren also live here in NW, we are aware of the danger every day as we listen to the trains and drive past the storage facilities along Rt. 30. Knowing they are there, and being conscious about preparing for a possible Cascadia Fault major earthquake, I am pleading with you to not bring any more Bakken fuel or trains transporting it anywhere near Portland! Thank you!

September 13, 2016

Dear Planning & Sustainability Commission,

Dear Member of the Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways."

Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Sincerely,
Jonathan Brooks

Re: PSC Fossil Fuel Zoning Testimony: Create a full ban!

Dear PSC Commission members,
I'm writing you because I am extremely concerned about the connection between fossil fuels and the imminent danger posed to ALL people on our planet by Climate Change.
The Bureau of Planning and Sustainability did a great job of including public input in its initial draft of the Fossil Fuel Terminal Zoning Amendments. But the draft falls short in some important ways in reflecting the city's fossil fuel goals.
So I'm pleading with you to add language to the proposed draft to create a full ban on new fossil fuel infrastructure. Please hold the City to a high standard. It's up to you to protect us all!
I support amending the proposed draft so that it creates a full ban on all new fossil fuel terminals. I also don't think that new facilities that are 5 million gallons or less should be given an exception! So NO exceptions!
Also, please don't let the City make any code changes that would let more unit trains of fossil fuels -- like Bakken crude oil -- pass through our beautiful and vulnerable area.
In addition, please strengthen restrictions on expansions allowed at existing terminals, by making sure those expansions don't increase climate pollution or public safety risks.
Also, please add language to prevent terminals from building multiple small terminals together, allow them to avoid the 5 million gallon threshold.
Finally, please no new liquefied natural gas (LNG) or gaseous fuel storage near schools or neighborhoods. Too dangerous! Our current tank farms and LNG facility are enough.

Thank you,

Thanks Julie,
I will amend my first email here found a few typos too. :(

Hello my name is Josh Chernoff.

I was born at OHSU October 25th 1981. I was raised in Portland and I have raised my children in this city.
In hopes that my children are offered the same opportunities to raise their children in this city we must stop the destruction of our air, land and water.
I beg you to stop all new fossil fuel infrastructure development in and around our city.

Remember how clear you used to be able to see Mt. Hood from downtown?

- Josh Chernoff - 971-533-7446 - 4008 SE Mall St. Portland Oregon, 97202

Dear Portland PSC Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing implementation of its November 2015 Fossil Fuel Policy.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to:

-Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

-An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the fight against climate change. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland can remain at the forefront of

addressing the most pressing concern of our time.

Sincerely,
Jason Chin

Subject: Please enact bold, binding language for PSC Fossil Fuel Zoning

Rebecca Clark
5035 N Depauw St
Portland, OR 97203

September 13, 2016

Dear Planning & Sustainability Commission,

Dear Member of the Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways."

Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Sincerely,
Rebecca Clark

Subject: PSC Fossil Fuel Zoning Testimony: I want a full ban!

Testimony:

My name is Tori Cole, and I am a union organizer for SEIU 503 and an environmental activist. Like others who have followed this process, I've seen Portlanders demand meaningful action from their city on climate, and I hope that their conviction—which drove City Council to pass this as a resolution—informs the code changes made today. We need to reject the building of any new fossil fuel infrastructure in our city. Our climate movement sorely needs local leadership, and Portland should fulfill its rumored destiny as a climate leader today. Local action does matter.

Taking this action today will be the first drop in the bucket, step one of what we need to achieve a just transition away from fossil fuels and to 100% renewable energy by 2050, as reports from Greenpeace and others tell us we must. It's time for all of us to make deliberate choices in favor of our future. This year, SEIU 503's membership passed a resolution to prioritize acting against climate change,

and on Saturday the board voted unanimously to support solidarity with Standing Rock Sioux Tribe in their fight against the Dakota Access Pipeline. The time for us to stand together in this fight is long overdue.

Even those highest in the financial sector recognize that the era of fossil fuels is coming to a close, and that investments in the oil and gas industry are now risky and ill advised. To realize a successful transition to renewables, governments from local to federal must commit to invest in renewable infrastructure, and to create decent work opportunities and economic empowerment for workers who cannot be left behind in the oncoming economic restructuring. We must not allow ourselves to be divided into 'labor' and 'environmentalist' camps—the real choice is not jobs or environment. It is both, or neither.

So I urge you to take bold action, and listen to what the people are asking for. Vote in favor of our future, and reject any increase to fossil fuel infrastructure at the city level. No exceptions. And let's talk about how we are going to work together to ensure that the people who got the worst deal in the old economy will be the first in line to benefit in the new economy.

Portland, OR 97201
Sent via email to: psc@portlandoregon.gov

RE: PSC Fossil Fuel Zoning Testimony

Dear Commissioners,

Please accept these comments from Arc Terminals on the proposed Fossil Fuel Terminal Zoning Amendments under your consideration. Arc Terminals leases and operates a terminal, located at 5501 NW Front Avenue in Portland, that serves as a critical link between supply and demand for petroleum and petroleum products, including asphalt, aviation gas, and distillates. Businesses and individuals throughout Oregon and the region benefit from, and depend upon, the services provided by the existing terminals in Portland, including Arc's facility.

This facility has a long history of operating in the City of Portland since 1947. Arc was disappointed when the City Council decided to regulate fossil fuels under Resolution No. 37168 because of the uncertainty and unintended consequences the resolution places on the terminal investments and operating plans.

We have participated in several stakeholder meetings with the Bureau of Planning and Sustainability staff, including a site visit to our terminal during the development of the draft currently before the Commission. We also provided comments on the staff discussion draft released on June 30th. We were shocked and disappointed at the dramatic policy changes between that staff discussion draft and the current draft before the Commission. Specifically, the latest draft makes Arc's facility and other terminals a non-conforming use, an alternative which the staff discussion draft expressly rejected to avoid creating a "disincentive for seismic, efficiency, and clean fuel investments on existing facilities, consistent with policy direction in Resolution 37168 and the Comprehensive Plan" (Page 23).

Yesterday staff released a memorandum summarizing potential "major changes" to the current draft before the Commission. Of particular note, the Bureau of Development Services has concluded that "expansions of existing terminals may not be possible through a non-conforming situation review." This is further evidence that the current draft unavoidably conflicts with the policies set forth in Resolution No. 37168.

5501 NW Front Ave | Portland, Oregon | Phone: (503) 273-4705

Arc Terminals

Arc offers the following comments to identify both the intended and unintended consequences of the proposed zoning amendments:

- Prevents and discourages replacing infrastructure and equipment that has reached end of life;
- Prevents and discourages upgrades necessary to meet national and regional market demand, Arc customer needs or complies with federal and state law;
- Prevents and discourages safety and efficiency upgrades;
- Restricts infrastructure that serves the rest of Oregon and the region;
- Creates a highly discretionary and uncertain process for altering terminal facilities and/or expanding on-site to meet demand, comply with federal and state law, and improve safety, efficiency, seismic resilience and operations;
- Introduces ambiguities and uncertainties to Arc and our customers business plans;
- Fails to adequately engage Oregon and Metro residents and business outside Portland who will be impacted by the bottleneck in energy distribution created by the proposal.
- The proposal fails to provide for the economic assessment called for by the resolution, including the potential impacts to blue-collar jobs; and
- The timeline for implementing the proposed amendments is too aggressive and does not allow for thoughtful discussion to address the many concerns.

Thank you for the opportunity to comment on the Fossil Fuel Terminal Zoning Amendments Draft. We sincerely hope the Commission seriously reconsiders these proposed amendments to the zoning code that single out a narrow but important business sector.

Thank you for considering these comments from Arc Terminals. If you have any questions, please contact me at (503) 273-4705.

Sincerely yours,

Nathan Eggers

Dear Portland PSC Planning and Sustainability Commission,

Now more than ever the City of Portland has the opportunity to be a leader in the fight against climate change. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland can remain at the forefront of addressing the most pressing concern of our time.

Thank you for the diligent effort and transparency with which the City is pursuing implementation of its November 2015 Fossil Fuel Policy but more needs to done to ensure our city's example in fighting climate change.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to:

-Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

-An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel

shipments through Portland.

Sincerely,
Linda Engels

Subject: PSC Fossil Fuel Zoning Testimony: I want a full ban!

Testimony:

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes closer to the original intent of the 2015 Resolution.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland". Although this draft prohibits new larger bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine).

While this proposal will mark any bulk terminals as 'non-conforming', it still needs to strengthen the regulations on the size and type of expansion to pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

I want the City of Portland and the Planning and Sustainability Commission to:

1 - Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

2 - Remove the exception for new facilities that are 5 million gallons or less which would

allow more unit trains of dangerous fossil fuels like Bakken crude oil.
Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

3 - Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.

4 - Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

TESTIMONY to the PORTLAND PLANNING & SUSTAINABILITY COMMISSION:

ZONING PROPOSALS FOR FOSSIL FUEL EXPORT & STORAGE INFRASTRUCTURE

Implementation of City Council Resolution No. 37168

September 13, 2016

To the Members of the Planning & Sustainability Commission:

Thank you for this public hearing, and for your volunteer service to our city. Thank you also for two important aspects of the lead-up to this hearing:

- The staff work by the expert team at the Bureau of Planning & Sustainability (BPS) has been remarkable in its depth and thoroughness. We appreciate it.
- The decision by the Planning & Sustainability Commission (PSC) to delay until October 11 the public discussion of the options and recommendations that you may choose to forward to the City Council is very wise.

  This change allows time for deeper review and consideration of the oral and written testimony received in this process by everyone concerned about this massive set of proposals, including comprehensive staff evaluation by multiple agencies.

  This process was revised in response to the fallacy of receiving testimony and making decisions without due consideration, which occurred with your final hearing on the Pembina propane export terminal zoning amendment proposal, and which Oregon Sierra Club called out publicly as a flaw at the conclusion of that hearing. We appreciate that process correction.

However, regarding process, we are obligated to express our concerns about the continuing problem of slow and/or partial transparency in the City's consideration.

As a specific example, the new proposals promoted through the Bureau of Development Services (BDS), which we comment on below, were completed Friday and yet not released until Monday (yesterday), only one day before this hearing.

For organizations like ours working to respond in healthy ways to complex issues quickly, even a weekend delay makes our work more difficult. Going forward, quick distribution to all stakeholders of plans and proposals should be incorporated into Portland's municipal DNA.

As a specific process recommendation, therefore, **we request that the comment deadline for these zoning proposals be extended beyond the close of business today**, for additional input to you and BPS.

For the substantive issues embodied in the BPS and BDS staff work, and the proposals before you now, we have three major concerns to share today, and a new proposal:

1. The Fallacy of "Business as Almost Usual"
2. The Intersection of the Two Crises, Climate & Seismic
3. The Critical Importance of "Non-Conforming Uses" for Economic & Safety Transition

Proposal: Consider an Additional Plan to Support First-Responders & the Public

1. The Fallacy of "Business as Almost Usual"

As part of the coalition testifying to the City Council last November, we vigorously supported the ground-breaking binding policies in Resolution No. 37168.

Unfortunately, the initial BPS zoning proposal Discussion Draft, despite some virtues, had a "split the baby" flavor (please see our July 27 comments, and the text of our August 8 blog post, both attached and incorporated herein by reference). The final proposal showed significant improvement, but still included dangerous loopholes (please see the text of our September 7 blog post, also attached and incorporated herein).

The core fallacy to this process is that we cannot:

- on the one hand, fulfill the policy goals of the Resolution with carbon mitigation and adaptation strategies implemented by law, and
- on the other hand, continue to allow the fossil fuel industries to assert their control and to change behavior only on the margins.

We spoke to this fundamental contradiction in our July 13 Open Letter to the City Council (also attached and incorporated herein). The four components of this challenge are:

Keep It In the Ground
Do No More Harm
Reduce the Need
Build the Just Transition

Please be sure to read this two-page Open Letter. This framework is important for breaking the box of business-as-usual.

It is also important for you to understand that the fossil fuel industries are <u>not</u> climate deniers. They understand the science and they know that they cannot fight chemistry and physics. Instead of choosing to mitigate, however, they have chosen to compete more intensely with each other.

This is especially destructive in the export arena: those companies know that the projects that will be stopped first as the climate crisis grows are those that have not yet started construction. Hence the massive effort to push through the Pacific Northwest with every possible fossil fuel.

Because roughly half the stock value for the major multi-tiered fossil fuel companies is based on proven reserves, the call to keep at least four-fifths of existing reserves in the ground is equivalent to defining that part of their reserves as stranded assets, and accepting a deep slash in their share price. This understanding has been a key part of the recent financial collapse of coal companies, but it is coming to the oil and gas arena too.

For the distribution and retail companies (including the majors), changing behavior in this emergency is very difficult, and unacceptable to senior management in no small part because of this inherent financial hit. It is for that reason that these companies must be forced into the new realities of the climate crisis by force of law.

<u>It is not possible to please both sides:</u>

To oversimplify, **we cannot both save the climate and destroy the climate.**

That is the fallacy of the BPS and BDS attempts to provide the industry with opportunities for growth within limits.

We must have massive, urgent decline in fossil fuel use. Our infrastructure planning must reflect that. However, the climate crisis is not the only one we face.

2. The Intersection of the Two Crises, Climate & Seismic

Every jurisdiction on the planet is dealing with the climate crisis – many explicitly, through the beginnings of new public policy, and many (especially in the United States) only through the traumas of extreme weather, insect impact, sea-level rise, and the other ills of the growing heat load of the earth. But we all know it is here, now.

We do not need to repeat specifics; many commenters will detail those, and you all understand. ("Sustainability" is already in your name.) The key point for these zoning proposals, though, is the unique intersection with our impending earthquake.

Unlike the universality of the climate crisis, there is nothing 'daily' about the seismic crisis we face with the inevitable next rupture of the Cascadia subduction zone.

It could be another 316 years before the catastrophic rupture of 1700 repeats itself (although the odds are against so long a gap), or it could be Saturday. The average for this massive fracture is about 250 years, but the intervals vary widely.

When it happens, though, it will be the greatest catastrophe since the formation of the United States.

As you know, Portland shares this inevitable disaster with the larger cities of Seattle and Vancouver, B.C. The three major cities and all the smaller jurisdictions from Northern California through British Columbia share many challenges in preparing for this pending emergency. So we are not alone, but every locale has specific unique challenges.

One of ours is the insanity of having virtually all of our fossil fuel resources in archaic tanks on dredged soils in the Northwest Portland industrial zones on the Willamette River. These soils will inevitably liquefy when the earthquake strikes. (The chemical and other hazardous material tanks share the same problem.)

The overwhelming majority of the hundreds of tanks will sink and rupture; many will burn; many will explode; the destruction, toxic fumes, poisonous fluids, and fireballs will be carried downstream on the Willamette and Columbia rivers.

For practical purposes, there is no way to make our current tank farms seismically safe and usable, no matter how much is spent per ancient tank. The transportation fractures and bridge falls that will occur simultaneously will be especially damaging to any effort to use the rare tank that survives. The only solution is to eliminate the problem, as soon as possible.

Fossil fuel and poisonous chemical tanks must be removed from the Northwest seismic liquefaction zone, urgently.

At the same time, however, we must have fossil fuels available for the short- and medium-term – especially because of the intersection of these two crises. This is a difficult balance.

As you know, Sierra Club is a leader in Oregon and nationally in promoting the model laid out in our Open Letter, from **Keep It In the Ground** through **Build the Just Transition**. We fight for these values and the policies to implement them constantly.

But the Oregon Sierra Club leadership is clear that this transition is neither simple nor overnight. It

not possible to ban fossil fuel use tomorrow, but it is imperative to eliminate it urgently.

This contradictory challenge is exacerbated by our dual crises. When the earthquake hits, transportation and other resources that are currently available only with major inputs of fossil fuels will instantly become matters of life and death (just as the climate crisis already is during extreme weather catastrophes like floods, heat waves, and droughts).

As the tank farms disintegrate, First Responders and the general public will almost instantly be left with only the resources on hand. Those using fossil fuels will quickly deplete them, and be unable to get more. Day One of the earthquake will be horrific, but the next few months could well be even more deadly.

No matter how quickly we build the just transition, it is going to be a long time before we have fire trucks that are not dependent on fossil fuels.

It is imperative that Portland plan properly to protect the populace from this crisis intersection. That is not easy, but we have tools available.

3. The Critical Importance of "Non-Conforming Uses" for Economic & Safety Transition

We of course support the proposed ban on new Bulk Fossil Fuel Terminals, but we are also deeply concerned about leaving loopholes for expansion of existing tanks and tank farms, in our two-crisis situation.

The zoning code is an imperfect medium for dealing with these challenges, but it does offer important opportunities. One vital one is the Non-Conforming Use category.

We strongly support defining all the fossil fuel (and other hazardous materials) tanks in the seismic liquefaction zones as non-conforming, with the maximum feasible disincentive for expansion or same-site replacement.

There is no better possible example of a 'Titanic deck-chair' approach to ducking a problem than approve a building permit for an unstable tank that would make it less unstable but still unable to withstand the Cascadia rupture.

Frankly, that is exactly the kind of governmental failure in the face of bad corporate decision-making that has alienated so many voters for so long.

We understand that BDS has stated that they do not have the resources to properly consider non-conforming evaluation for tank farm expansions and replacements. There are simple answers to this concern, although they of course include difficulties in implementation:

First, there must be an acceptance that any expansion or replacement in the Northwest seismic zones is an impermissible mistake.

Second, BDS must work with the Council and the general public to increase the costs to industry for their evaluation and rejection of any proposals for expansion and replacement in these zones. Industry – especially the fossil fuels industries – must be forced to recognize legally and financially that business as usual is unacceptable.

We urge you to work diligently toward a structure that prohibits both new Bulk Fossil Fuel Terminals and eliminates the dangerous and obsolete tank farms on the Willamette with all deliberate speed.

It is imperative that you recommend that the Council define these tank farms as non-conforming uses.

You and the Council should in fact look at any other available options, in other parts of the

municipal code as well, to prohibit them more effectively than the non-conforming designation currently can.

At the same time, we urge you to ensure that the coming seismic disaster is properly incorporated into implementation of the Resolution.

We therefore request that you direct BPS staff (and ask that staff from other agencies) to engage in a new planning process that looks at more alternatives, after the current discussions are resolved and voted on.

Proposal: Consider an Additional Plan to Support First-Responders & the Public

After the determination is made on your current recommendations to the City Council, we request that you consider advocating for a broad stakeholder engagement effort, beginning early next year, to examine the full complexity of the fossil fuel infrastructure in the Portland metropolitan area.

Such an effort should have four major components.

First, it must recognize that fossil fuel use needs to be eliminated as quickly as possible. The climate crisis requires nothing less.

Second, it must recognize that industry can no longer use the Northwest industrial zones. These seismic, toxic, and flammable dangers must be eliminated.

Third, it must automatically incorporate quickly-scaled transition strategies to reduce fossil fuel use, urgently. This is an area where public policy must become much more assertive.

For example, there are many ways that electrical-use conversion to renewables and transportation-use conversion to electrical power can be strengthened and speeded up (in addition, of course, to pedestrian and bicycle improvements for the general public).

Smart-grid expansion is imperative for robust emergency response as well.

There are many other issues where the options are well-developed. The Portland-Multnomah County Climate Action Plan is an important leadership document, but it is not keeping up with the acceleration of the climate crisis, and it has not been adequately incorporated into municipal and public behavior. We must be much stronger on this.

Finally, it must include plans for new distributed fossil fuel infrastructure to support First Responders and the public. We need these new distributed fossil fuel reserves in smaller, seismically-immune facilities throughout the metropolitan area, planned specifically for life-safety support – and to be ultimately phased out as well, of course.

The building projects necessary to provide fossil fuels where they are extremely difficult to eliminate (again, think fire trucks – and, currently, most police vehicles) will raise fuel costs but would provide good jobs and make a dramatic difference in public protection over time.

Thank you for your consideration.

"No New Fossil Fuels Infrastructure": First, Do No More Harm

An Open Letter to the Portland City Council

Preamble Summary, Resolution 37168, November 12, 2015:
Oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways.

Portland is at imminent risk of squandering its prior leadership in dealing with the local response to our global climate crisis. The problem is serious bureaucratic back-sliding into a "business as usual" mentality in the implementation of Resolution 37168. Unless you deal promptly and firmly with signals of agency misunderstanding of both the letter and spirit of this resolution, this situation could too easily become a local crisis in its own right.

This binding policy resolution, which you approved unanimously on November 12, 2015, catapulted our city into the forefront of local, regional, national, and international efforts to confront one of the greatest sets of challenges our species has faced since the development of industrial technology.

It is vital that you remember the genesis of this effort, and re-commit to the specific – often difficult! – changes in municipal and stakeholder planning and behavior for your mission.

There is a straightforward but interlocking four-part schematic that outlines precisely where we are as a global and local political economy:

1. **Keep It in the Ground**
2. **Do No More Harm**
3. **Reduce the Need**
4. **Make the Just Transition**

1. Keep It in the Ground

We now know that our combustion of fossil fuels has moved our global atmosphere and temperature structure into such dangerous territory that civilization is genuinely at risk if we do not make radical reversals in behavior.

At least four-fifths of global fossil fuel reserves must be left completely intact, in the ground, and never exploited.

This requirement is completely contrary to modern corporate financial structure, because proven reserves constitute roughly half of the assets (and therefore a major component of share value) of the fossil fuels companies. This is one of the key reasons why business-as-usual policies and procedures are inevitably doomed to failure – for both corporate financial health and planetary social and environmental health. This has been one key factor in the current financial collapse of shareholder equity in coal corporations.

Acceptance of ***Keep It in the Ground*** is a mandatory first step for both the psychological and political economy revisions we must make for survival. This is the foundation for the other three intersecting components of this basic methodology. Resolution 37168 speaks eloquently to many of the issues inherent in our mandatory recognition of our new reality.

2. Do No More Harm

Understanding the compulsory physics and chemistry of ***Keep It in the Ground*** leads inevitably to this second principle: don't make things worse by continuing down the same destructive path. We must begin with our environmental version of the first line of the Hippocratic Oath: ***Do No More Harm***.

This is the required primary set of actions for directly confronting the climate crisis: to get out of this hole, first we have to stop digging. "No New Fossil Fuel Infrastructure" is the easiest way to proceed first. The core of Resolution 37168 – preventing new export and storage infrastructure – falls completely within this principle.

It is imperative that you maintain and defend your policy.

3. Reduce the Need

Simultaneously, demand reduction is vital to permit us to ***Do No More Harm***. Gradual complete elimination of coal for electrical production in Oregon is now state law. The same goal must be applied to oil and natural gas, urgently. As I noted in my testimony to you on November 12, there is no fossil fuel solution to the fossil fuels crisis.

You must align City procedures and economic governance with this need for both conservation and energy efficiency (which are overlapping but distinct sets of tools). Beyond direct City internal control and external economic governance, you must also push the Portland business communities – especially the fossil fuels companies – and the other governments that overlap with and impact your work to both ***Do No More Harm*** and ***Reduce the Need.***

4. Make the Just Transition

Finally, underpinning all these efforts must be the recognition that there is no substantive difference among environmental, economic, and social justice. We are engaged in a transition into a full-renewables energy economy, and that will be impossible unless it is done based on justice for all. The urgency of the effort means that coordination of ***Do No More Harm, Reduce the Need,*** and ***Make the Just Transition*** becomes the essence of this era.

Thank you for your consideration.

Email delivery: steve.kountz@portlandoregon.gov

Comments: Fossil Fuel Terminal Zoning Amendments – Discussion Draft

Dear Mr. Kountz:

To begin with, please accept our thanks to you and your colleagues at BPS for this thorough and useful Discussion Draft on this component of the implementation of Council Resolution No. 37168 and *2035 Comprehensive Plan* Policy 6.48. We see many virtues to the work your project team has done, and this document (and the follow-up and additional documents to come) will be useful not just to the policy makers, stakeholders, and populace of Portland, but also to many people working on these issues across the United States and around the world. We appreciate your efforts.

However, we request that you take a fresh look at three core aspects to the principles and major definitions underlying these draft zoning amendments. Here are areas where we believe that you have significant misunderstandings, apparently trying to:

- avoid the universality of the public intent, as defined by the Council approvals;
- add inappropriate definitions of applicable terminal size ("large"), which distorts Council intent; and
- most importantly, ignore the deep implications of the baseline policy framework necessary to avoid a "business as usual" approach to the most unexpected and most significant environmental, economic, and social crisis our planet has ever faced: the climate crisis – the fundamental reason for all of this work.

First, we spoke to the baseline policy framework in an open letter delivered to the City Council on July 13, entitled **"No New Fossil Fuels Infrastructure": First, Do No More Harm** (copy attached, and incorporated into these comments by reference). This letter speaks to a straightforward but interlocking four-part schematic that outlines precisely where we are as a global and local political economy: **Keep It in the Ground, Do No More Harm, Reduce the Need, Make the Just Transition.** Here are the outlines of these four components, as provided to the Council:

"1. Keep It in the Ground

We now know that our combustion of fossil fuels has moved our global atmosphere and temperature structure into such dangerous territory that civilization is genuinely at risk if we do not make radical reversals in behavior. At least four-fifths of global fossil fuel reserves must be left completely intact, in the ground, and never exploited.

This requirement is completely contrary to modern corporate financial structure, because proven reserves constitute roughly half of the assets (and therefore a major component of share value) of the fossil fuels companies. This is one of the key reasons why business-as-usual policies and procedures are inevitably doomed to failure – for both corporate financial health and planetary social and environmental

health. This has been one key factor in the current financial collapse of shareholder equity in coal corporations.

Acceptance of ***Keep It in the Ground*** is a mandatory first step for both the psychological and political economy revisions we must make for survival. This is the foundation for the other three intersecting components of this basic methodology. Resolution 37168 speaks eloquently to many of the issues inherent in our mandatory recognition of our new reality.

"2. Do No More Harm

Understanding the compulsory physics and chemistry of ***Keep It in the Ground*** leads inevitably to this second principle: don't make things worse by continuing down the same destructive path. We must begin with our environmental version of the first line of the Hippocratic Oath: ***Do No More Harm***.

This is the required primary set of actions for directly confronting the climate crisis: to get out of this hole, first we have to stop digging. "No New Fossil Fuel Infrastructure" is the easiest way to proceed first. The core of Resolution 37168 – preventing new export and storage infrastructure – falls completely within this principle.

It is imperative that you maintain and defend your policy.

"3. Reduce the Need

Simultaneously, demand reduction is vital to permit us to ***Do No More Harm***. Gradual complete elimination of coal for electrical production in Oregon is now state law. The same goal must be applied to oil and natural gas, urgently. As I noted in my testimony to you on November 12, there is no fossil fuel solution to the fossil fuels crisis.

You must align City procedures and economic governance with this need for both conservation and energy efficiency (which are overlapping but distinct sets of tools). Beyond direct City internal control and external economic governance, you must also push the Portland business communities – especially the fossil fuels companies – and the other governments that overlap with and impact your work to both ***Do No More Harm*** and ***Reduce the Need.***

"4. Make the Just Transition

Finally, underpinning all these efforts must be the recognition that there is no substantive difference among environmental, economic, and social justice. We are engaged in a transition into a full-renewables energy economy, and that will be impossible unless it is done based on justice for all. The urgency of the effort means that coordination of ***Do No More Harm, Reduce the Need,*** and ***Make the Just Transition*** becomes the essence of this era."

Second, we believe your project team has been persuaded to misread the plain language in both Council Resolution 37168 and *2035 Comprehensive Plan* Policy 6.48. These legally-binding components of Portland's overall legal framework were, we believe, intentionally crafted by the Council to be as broad as possible – while quite appropriately simultaneously allowing for adequate flexibility in implementation, so as to make implementation feasible.

This is clearly evident in the sensible balance within the first two *Be It Resolved* sections of Council Resolution 37168, and in the elegant simplicity of Policy 6.48:

> BE IT RESOLVED, that the City Council will actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways; and
>
> BE IT FURTHER RESOLVED, that this Resolution does not restrict:
> 1. improvements in the safety, or efficiency, seismic resilience, or operations of existing infrastructure;

2. the provision of service directly to end users;
3. development of emergency backup capacity;
4. infrastructure that enables recovery or re-processing of used petroleum products; or
5. infrastructure that will accelerate the transition to non-fossil fuel energy sources;

Policy 6.48 Fossil fuel distribution. Limit fossil fuel distribution and storage facilities to those necessary to serve the regional market.

Nowhere in these provisions does it say explicitly that any expansion of fossil fuels infrastructure is contemplated, encouraged, or desired. And it is clear from the entirety of Resolution 37168, including the carefully defined *Whereas* clauses in this binding policy resolution, that the Council did not in any way support or encourage any expansion of fossil fuel use in its unanimous approval.

Unfortunately, your draft language redefines "service directly to end users" and "necessary to serve the regional market" in ways that completely undercut the clear intent of the Council. This must be reconsidered and reversed for these zoning amendments to reflect the will of the people of Portland, expressed through the Council.

Finally, as a specific key example of the failure of the draft amendments to follow the universality implicit in both Resolution 37168 or Policy 6.48, your project team has consistently violated both the letter and spirit of our new Portland legal and policy framework by adding a term found nowhere in either: "large."

See, for example, this paragraph from Discussion Draft page 6 that attempts to explain these proposed amendments in the context of the first Be It Resolved section:

> The proposed zoning code changes are a key implementation action of Resolution 37168, adopted November 2015. Addressing the overall direction of the resolution to oppose expansion of fossil fuel distribution and storage infrastructure, this project proposes size standards that restrict development of **large** [emphasis added] new fossil fuel terminals.

This wholly-new concept, "large," appears nowhere in either the resolution or the policy. We presume that it has been added to the Discussion Draft at the behest of stakeholders who are not interested in the difficult, expensive, and vital work of actually moving Portland out of a "business as usual" model for fossil fuels use, so that we can properly work through our part of the climate crisis.

"Large," of course, is in the eye of the beholder. It is deceptively simple; a multitude of sins can be contained within it; and – in this crisis – exactly the sort of distortion that we must work to prevent.

The Council's wisdom in laying down clear guidelines, in great detail, was, we believe, intended to avoid exactly this sort of distortion of the ordinance changes we need.

Overall, therefore, we urge you to reconsider the Discussion Draft based on the three principles outlined above:

- incorporating the universality of the public intent;
- preventing distortion of the Council intent; and
- fully recognizing the core fallacy of a "business as usual" implementation.

Thank you for your consideration.

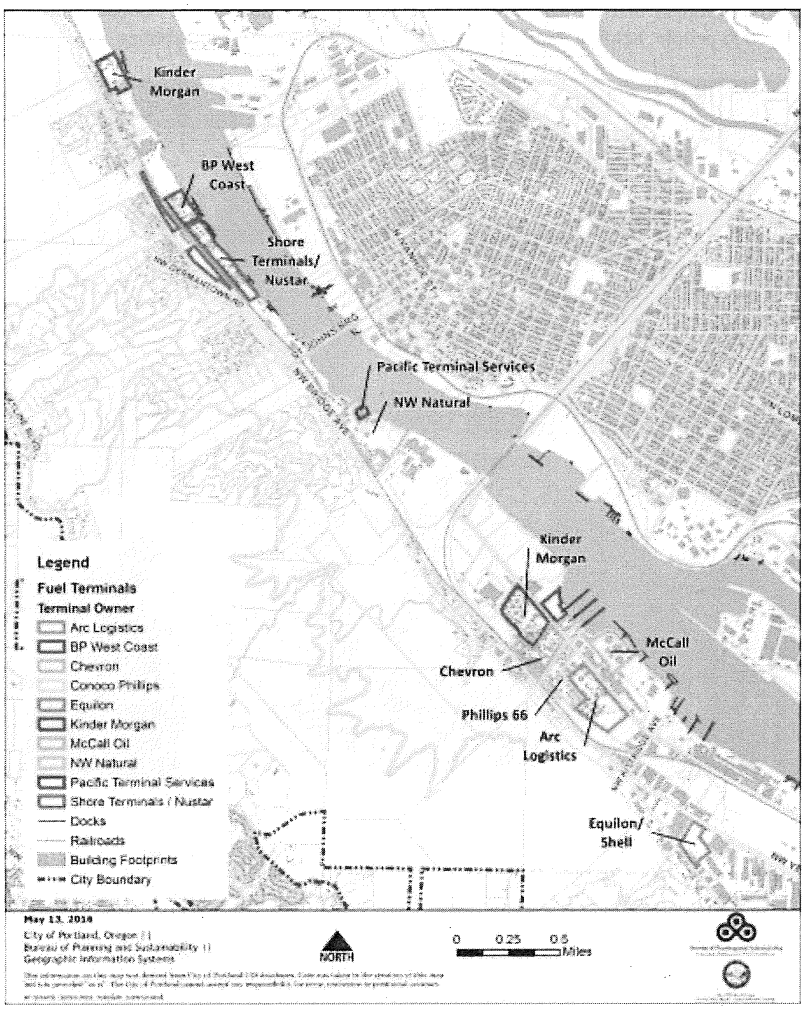
Ted Gleichman, on behalf of Oregon Sierra Club

Will Portland Abandon its Pledge Against New Fossil Fuel Infrastructure?

August 8, 2016

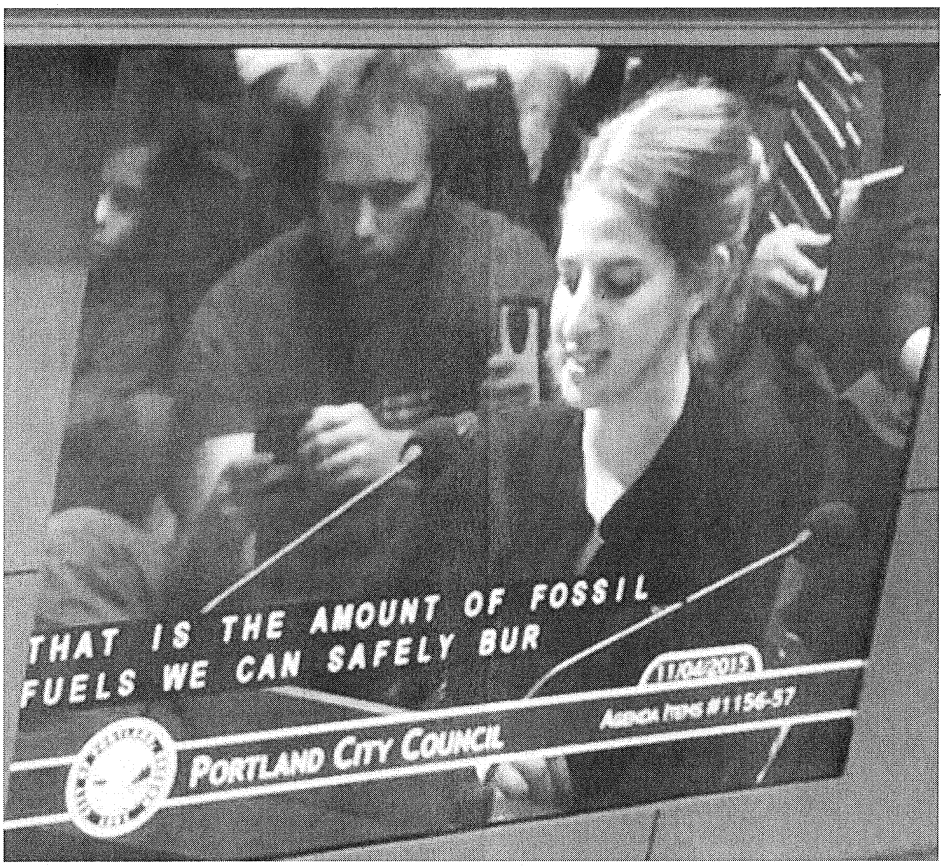
By Ted Gleichman, policy advisor, Oregon Sierra Club *Beyond Gas & Oil Team*

Last November, the Portland City Council voted unanimously for a binding policy resolution to stop any fossil fuel exports through Portland and to ban new fossil fuel infrastructure for exports or storage. This unprecedented measure put Portland on a state-of-the-art path for regional, national, and global leadership in fighting the climate crisis. Oregon Sierra Club was one of many leading groups* that worked hard for this. Together, we flooded the Council hearings with more than 500 people, helping to motivate our City Council for this bold action.



Activists pack City Hall in Portland

With leadership from Mayor Charlie Hales and Commissioner Amanda Fritz, the other Councilmembers – Commissioners Nick Fish, Dan Saltzman, and Steve Novick – joined in to make it unanimous. Next time you see any of them, **be sure to thank them! This fall, they will need to take this on again.**



The Council resolution directed city agencies to develop ordinance and regulatory changes to implement this unprecedented plan. First up to bat is the Bureau of Planning and Sustainability (BPS), and they are on the verge of fouling out. Fortunately, the Planning and Sustainability Commission (PSC) serves as the umpire on BPS work, with a public hearing set for **Tuesday, September 13: save the date** (time and place TBD). We fans are going to pack the stands to root for the home team: Planet Earth!

OK, I've beaten that seasonal metaphor into infield dust. But make no mistake: this is no game. The current BPS zoning ordinance plan completely guts the clear intent of the pioneering Council resolution by giving the fossil fuels industry all-but-unlimited opportunity for growth.

When I testified to the Council last November, this was my key point: "There is no fossil fuels solution to the fossil fuels crisis." The audacious Portland resolution is a great reflection of that shared understanding, and we can't let the City abandon it.

Two leading organizers, Mia Reback of 350PDX and attorney Nicholas Caleb, presented summaries of the BPS problem to the City Council on July 13, and Oregon Sierra Club joined in with an Open Letter to the Council.

350PDX lead organizer Mia Reback testifying to Portland City Council last November, while attorney Nicholas Caleb tweets

Please take a few minutes to read our two-page Open Letter. To support the Council resolution, we start with big picture, ***Keep It in the Ground***, and move through the next three steps: ***Do No More Harm***, ***Reduce the Need***, and ***Make the Just Transition.***

For more information, please see the formal comments we submitted to BPS on July 27. Great comments also went in from our regular allies 350PDX, Audubon Society of

Portland, Center for Sustainable Economy (CSE), and Columbia Riverkeeper, among others.

We are in this for the long haul, and Portland's leadership is vital to our metropolitan area, Oregon, the Pacific Northwest, the United States, and our long-suffering overheated earth.

If you want to help, please send me a note or give me a call; see below. We will update you regularly as this evolves through the rest of this year.

Thanks for all you do!

Ted Gleichman ted.gleichman@oregon.sierraclub.org 503-781-2498

* Great work for Oregon Sierra Club was done last year by *Beyond Gas & Oil Team* chair Gregory Monahan (who also testified, along with then Chapter Director Andy Maggi) and long-time ace National *Beyond Coal* organizer Laura Stevens.

Other key organizations included 350PDX, Audubon Society of Portland, Columbia Riverkeeper, Sustainable Energy & Economy Network (a project of CSE), Raging Grannies, Climate Action Coalition, Physicians for Social Responsibility, Friends of the Columbia Gorge, EcoFaith Recovery & Beyond Fossil Fuels, Climate Solutions, Oregon League of Conservation Voters, and others. It was a terrific team effort!

UPDATE: Portland Fossil Fuel Policy Work Moves from F to B-Minus

By Ted Gleichman, policy advisor, Oregon Sierra Club *Beyond Gas & Oil Team*

September 7, 2016

Portland's Bureau of Planning & Sustainability (BPS) has proposed zoning amendments for review by the Planning & Sustainability Commission (PSC) that are substantially less destructive than the agency's original plan. But "less bad" does not equal "good."

BPS was charged with implementing parts of the ban on new fossil fuel infrastructure for export and storage that the City Council approved unanimously last November. Their original draft zoning amendments were filled with loopholes, and basically gave the industry an open door to unlimited expansion.

BPS was flooded with more than 700 comments to the draft plan, the vast majority calling for a true ban on new fossil fuel infrastructure.

To their credit, agency staff reworked their zoning ordinance proposals with very thorough and diligent staff work. BPS has now proposed to narrow the opportunities for industry expansion in four important ways:

1. The new zoning would define "Bulk Fossil Fuel Terminal" as a tank with more than five million gallons of capacity – a tad smaller than the current 300+ tanks in Portland, but still huge.
2. New Bulk Fossil Fuel Terminals would be banned, but new tanks under five million gallons could still be built so long as they do not include the infrastructure necessary to transload the fuels for export.
3. Existing Bulk Fossil Fuel Terminals would be defined as "non-conforming uses" – a zoning designation that means 'they are already here but we don't want to let them in again.'
4. Changes and expansions to the non-conforming current Bulk Fossil Fuel Terminals would require approval by a hearings officer after a public hearing. Any approvals could be challenged in court under land use law (which does not include, for example, increased climate destruction). Almost all of these tanks are in the earthquake

liquefaction zones, on dredged soils along the Willamette River north of downtown Portland – a truly insane place to build or expand anything, but especially not dangerous flammable explosive fossil fuel infrastructure.

The basic problem now is that important parts of these proposals do not yet reflect the clear understanding in the City Council's binding policy in Resolution No. 37168 to move beyond fossil fuels as quickly as possible.

Activists pack City Hall in Portland

The new formal proposal will be reviewed by the Planning & Sustainability Commission on Tuesday, September 13, in an open public hearing at 1900 SW 4th Ave., scheduled to run from 12:30-4:30 pm. **You do not need to be a Portland resident to participate in this critically-important hearing!**

The PSC will then decide in early October, after an open meeting without additional testimony, whether to forward any zoning amendments to the City Council for review, possible amendment, and approval. If they do, the Council itself will hold public hearings and vote in late November or early December.

For more information, or to join in as part of the Oregon Sierra Club team in the September 13 PSC hearing, please contact Ted Gleichman, ted.gleichman@oregon.sierraclub.org, 503-781-2498. ***And please stay tuned!***

Dear Portland PSC Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing implementation of its November 2015 Fossil Fuel Policy.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to:

-Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

-An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the fight against climate change. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland can remain at the forefront of

addressing the most pressing concern of our time.

Sincerely,

Testimony:

I believe we're beyond the tipping point to control climate change; we have existing terminals for fossil fuels...an argument can and has been made to reduce/curtail the use of this type of fuel that is so detrimental, even fatal to our children and our planet. The bigger issue is this...reduce, curtail the use of fossil fuels; short of that, we need to make it difficult to provide containment of these fuels. Please consider banning all terminals; ALL Terminal, large and small. At the very least, increase safety issues surrounding the terminals, and decrease climate control impacts.

Testimony:

Like many Portlanders, I moved here in order to participate in a progressive city, and be able to enjoy the spectacular nature nearby. When I return home to my native Pittsburgh, I drive past billboard after billboard advertising "clean oil," "clean coal," and "safe fracking." Then I check the news and see another spill, another leak, another community devastated by the fossil fuel industry. And every time, the oil and gas companies are full of excuses as to why it's not their fault. It was the soil, the weather, a pipe, a well. It's always billed as a surprise, an unforeseeable circumstance. But pollution is not a surprise; it's a consequence of the fossil fuel industry. Don't allow any legal loopholes to endanger Portland's wildlife or its citizens.

Sent electronically to: psc@portlandoregon.gov

Dear Commissioners:

The following comments regard the Portland Planning and Sustainability Commission's (the "Commission's") proposal to adopt city policies restricting the development of terminal infrastructure that would support trade opportunities for new energy resources.

As you may know, freight rail is critical to economic activity and a high quality of life in the state of Oregon, around the Pacific Northwest, and across the nation. Today, in Oregon, freight railroads employ more than 2,000 citizens who receive an average annual compensation of more than $108,000 per year. When political leaders speak of attracting and retaining good-paying, family-wage jobs, these are the kinds of jobs they describe. Furthermore, freight rail is critical to supporting and expanding opportunities in numerous related industries including agriculture, manufacturing, forest products, and international shipping.

Freight rail is also critical to achieving the region's environmental goals. It is the most efficient method of moving freight over land. As an example, BNSF can move 1 ton of freight, 500 miles, on a single gallon of fuel. Moving cargo by rail is 4 times more efficient and 16 times safer than moving it by truck. Every unit train displaces several hundred trucks from Oregon's roads and highways. As a result, the state's citizens enjoy improved air quality, safer highways, reduced greenhouse gas emissions, and reduced gridlock.

Since freight rail infrastructure is built and maintained almost entirely using private funds, taxpayers in Portland and other communities receive all of these benefits without paying any additional taxes. In fact, since freight rail eases congestion and wear-and-tear on publically-funded roads and

highways by eliminating truck traffic, freight rail infrastructure actually eases tax pressures that would otherwise be paid by local citizens.

Regarding the measure currently before the Commission, we are specifically concerned with the chilling effect these arbitrary regulatory requirements could have on the development of new trade infrastructure in general. Consistent with federally mandated common carrier requirements, BNSF has a federal obligation to move all forms of hazardous materials, including energy resources. In discussing hazardous materials, it is important to understand that these include a wide variety of substances common to everyday life in cities such as Portland.

Specifically, the range of common materials deemed hazardous includes the following: chemicals used to purify municipal drinking water; substances used in industrial and manufacturing processes, such as the development of technical fabrics used by outdoor clothing manufacturers; fertilizers, commonly used by farmers to produce more robust, sustainable and verdant crops. In short, these materials include a vast array of substances and products used every day by citizens throughout Portland and across the region. They also include materials used in the development of products that sustain thousands of good-paying, family-wage jobs in the Pacific Northwest.

The energy products the Commission seeks to limit through zoning changes are perfectly legal. In fact, these products are used every day by millions of people in Portland and other communities across the region and around the world. Therefore, it seems arbitrary to enact new zoning requirements in this way. It also begs the question of whether other zoning restrictions – either in Portland, or other communities along the supply chain – might be initiated to limit substances deemed politically undesirable which are, nevertheless, perfectly legal and universally used every day by millions of citizens locally, regionally, and globally. These might include materials used to make running shoes, sports equipment, building materials, or agricultural products. The result of this kind of decision making could be extremely disruptive to local communities as well as national and international commerce.

Finally, the instability created by this approach to policy making would send a powerful message to companies and organizations responsible for developing large infrastructure such as transportation networks, shipping terminals, manufacturing operations, and other cornerstones of the trade economy. This kind of infrastructure tends to be very capital intensive, so regulatory certainty is critical. Arbitrary

measures that create regulatory unpredictability undermine investment and cast a chilling effect across multiple sectors of the trade economy. For these reasons, we urge you to not adopt the zoning restrictions on bulk energy projects currently before the Commission.

Thank you for your consideration.

Sincerely,

Johan Hellman

Any more fossil fuel infrastructure will degrade Portland's air, waters and land even more and prevent reducing risks from earthquakes and other natural and man made disasters

Drive fossil-fuel demand down → energy conservation, Non-fossil fuel economy. Not fossil fuel infra structure.
now carbon because any carbon burned would better be sequestered

Others have said it clearly repeatedly,
The City Council voted to stop expansion of fossil fuels, so many the public will know. Somehow, the staff who write the proposals have not been willing to get out of their habitual mode of supporting business expansion.
You must show them how to write your and our public intention - support sustainable, climate-restoring business infrastructure. We always need to support the changes needed for our healthy community - local through world-wide.
Get your staff into the change needed now for our present and future. Then, they can work directly on the new infrastructure needed for restoring our climate and phasing out fossil fuel infrastructure. Before a big earthquake comes soon. If
So tell your staff simply + clearly - no more fossil fuel infrastructure.
Then get on with what we do need - non-carbon!
Any more fossil fuel infrastructure will degrade Portland's air, waters and land even more and prevent reducing risks from earthquakes and other natural and man-made disasters

I wear thrifted, hemp and organic cotton clothing. Much better than my discarded nature-love

Decrease reliance on fossil fuels - transportation + energy

Dear Commissioners of the Portland Planning and Sustainability Commission,
Sept 13th, 2016

My name is Maya Jarrad, a staff Organizer with 350PDX, with a BA in Environmental Studies - Economics

Today I want to highlight the problem of allowing large expansions of fuel storage or transport through adding multiple small terminals -- which is called *terminal aggregation*, a trend happening here in the Pacific Northwest.

Take British Columbia, for example, where nearly two dozen Liquid Nat Gas export projects are in the proposal stage. The annual production of LNG added across these proposals would be 3-4 times larger than that of the largest existing LNG terminal in the world.

Large production volumes are achieved through the *aggregation of several "small" terminals*, each with its own liquefaction equipment, storage and other structures. Being geographic neighbors, these small terminals create a large project which the proposed zoning amendments here *hope* to prevent, but which would be allowed by this draft.

Examples in British Columbia include 5 ExxonMobil LNG facilities, Woodside Energy Holdings Party LNG facilities, and Petronas LNG facilities, to name a few.

To close this loophole, code language should be added to limit "projects" whose aggregate volume is greater than or equal to a Bulk Fossil Fuel Terminal per the amendments' definition.

Specifically, add to the definition of "Ownership":

"Contiguous lots that are owned by multiple corporations that are subsidiaries of a single corporation are considered to be a single ownership."

This will help prevent the situation we are observing in British Columbia and thus succeed the resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is storing or transporting fuels".

Thank you.

Subject: PSC Fossil Fuel Zoning Testimony

Dear Planning and Sustainability Commission

I am writing in regard to the proposed code changes relating to fossil fuel terminals. First let me state that there are three important issues that inform my opinions about fossil fuel terminals: risk of rail and other transport accidents in the Columbia River Gorge and in Portland, risk of damage to Portland and our local habitat in the event of a major earthquake, and finally climate consequences of encouraging consumption of fossil fuels.

First: The recent rail accident in Mosier is evidence that rail transport of fossil fuels is not without risk, indeed the risk appears substantial. We were simply lucky that many people did not die. In addition to the fire and visible oil spill, we now know there was serious groundwater contamination (see http://www.opb.org/news/series/oil-trains/mosier-groundwater-contaminated-oil-train-derailment/).
Increasing the number of trains transporting oil through the gorge can only increase the risk. Now imagine a similar derailment occuring within Portland...

Second: Existing oil terminals in Portland pose a major risk of spillage and fire in the event of a major earthquake. Since we are located in the vicinity of the Cascadia Subduction Zone, such an earthquake WILL occur at some point, maybe tomorrow, maybe in 50 years. Adding more terminals and more oil moving through Portland

simply magnifies the probable damage that will occur as a result.

Finally: Adding capacity to ship fossil fuels, and hence facilitating consumption of same, flies in the face of the evidence about global warming. Short term economic gain for a few is simply not worth the long term consequences for all. Those consequences include more frequent extreme weather events, sea level rise, reduced snowpack in the Cascades leading to drought, etc.

In light of these issues, I ask you to act to prevent the expansion of transport into and storage of fossil fuels in Portland: ban all new fossil fuel terminals, regardless of capacity; restrict expansion of existing terminals; and establish criteria for safety of existing facilities and fuels transport.

Thank you for your attention,

Albyn Jones

Subject: PSC Fossil Fuel Zoning Testimony

Full Name: Michael Karnosh, Ceded Lands Program Manager, Confederated Tribes of Grand Ronde
Mail Address: 9615 Grand Ronde Road
Grand Ronde, OR 97347

Dear Planning and Sustainability Commission,

On behalf of the Confederated Tribes of the Grand Ronde Community of Oregon ("Grand Ronde" or "Tribe"), thank you for this opportunity to comment on the City of Portland's Proposed Fossil Fuel Terminal Zoning Amendments ("Amendments"). Grand Ronde is made up of over 27 different antecedent tribes and bands, including the Multnomah, Clackamas and Cascades bands of Chinook people who originally inhabited the Portland area from time immemorial and signed the Willamette Valley Treaty of January 22, 1855, ceding their lands to the U.S. in exchange for certain rights and benefits. These antecedent tribes and bands were removed to the Grand Ronde Indian Reservation and later became the Confederated Tribes of Grand Ronde.

The lower Willamette River, which these Amendments affect, is an area of important Tribal cultural, natural, and treaty resources. Tribal members still fish for salmon and lamprey for cultural purposes in this section of the river. Grand Ronde still conducts traditional Tribal ceremonies here.

This reach of the Willamette River is plagued by water quality issues; much of it has been designated a Superfund site. One of the main contaminants of concern in the Superfund site is polycyclic aromatic hydrocarbons (PAHs), of which fossil fuels are a major source. The Tribe has been involved

as a government partner and Trustee at the Superfund site since its listing in 2000, and has consistently advocated for a cleanup that will be protective of human health and the environment. The Tribe's vision is for cleanup and source control such that Tribal members and the public may eat fish from the river without fear of contamination, and without the need for limits imposed by fish advisories.

In addition to its concerns over human health, the Tribe has concerns that the aquatic resources of the lower Willamette River will continue to suffer without a sufficiently protective remedy in place. PAHs in the water column and river sediments are known to have negative effects on Tribally important species such as Chinook salmon, Pacific lamprey, and other aquatic species with populations that have declined over the years.

Whether or not the Superfund remedy proves to be sufficiently protective of human health and the environment, additional development of fossil fuel terminals in the area introduces greater risk of contaminant discharge into the Willamette River, whether the discharge is intentional, neglectful, or the result of a natural disaster (e.g. subduction zone earthquake) or accident (e.g. oil train derailment). This equates to greater risk of harm to human health and the environment than currently exists, an outcome unacceptable to Grand Ronde.

Improvements to existing fossil fuel terminals that result in a higher degree of public safety and/or efficiency, and are not for the primary purpose of expansion, are exceptions that should be allowed, but in general fossil fuel terminal development in the Portland area should not be allowed to further jeopardize human health and the river's critical ecosystem. Again, thank you for this opportunity to be heard.

Sincerely,

Michael Karnosh

Testimony:

Dear Planning and Sustainability Commission,

I was drawn into Portland City politics by the proposed Pembina terminal. I thought it seemed terribly short-sighted and anti-Portland-values to put a new fossil fuel terminal in the city. I still think that, and I believe the City Commissioners agree.

The code as currently written does not ban fossil fuel terminals, however. Please strengthen the code so it forbids all new fossil terminals, and forbids expansion of the current existing terminals.

I think that doing that will be in the spirit of what the commissioners voted for last year.

Thank you,

Dear Portland PSC Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing implementation of its November 2015 Fossil Fuel Policy.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to:

-Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

-An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the fight against climate change. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland can remain at the forefront of

addressing the most pressing concern of our time.

Dear Members of the Planning and Sustainability Commission,

I am proud to see Portland City leaders pursuing a goal of opposing expansion of terminals supporting the fossil fuel industry. The leaders have shown themselves to be environmentally responsible and also open to citizen response.

Future expansion of terminals should be driven by public safety and seismic upgrades.
Portland should prohibit any new fossil fuel terminals of any size (eliminate exception for projects of 5 mil gallons or less), including LNG storage.
Oil train traffic should be reduced; no new crude oil unit train traffic.

Portland needs to continue to be at the front of the Climate Justice Movement.

Thank you,
Priscilla Lane,
Portland resident

Testimony:

Please ban ALL new fossil fuel infrastructure.
Portland already has a large fossil fuel handling and storage area.
The city's reputation as "green" apparently doesn't take this in to account. (Perhaps this should be publicized more.)
Portland is not only contributing in a significant way to climate change but also endangering the lives of all citizens in North Portland, along with the health of two rivers, with the present infrastructure.
Your time would be better spent making sure that the tank farms and tracks already in place are prepared for disasters (i.e. earthquake, fire, sabotage). From where I live and stand directly across from this storage area, and from Hwy 30, it's plain to see that we are woefully unprepared.
Please do the right thing, both for our city and the planet.

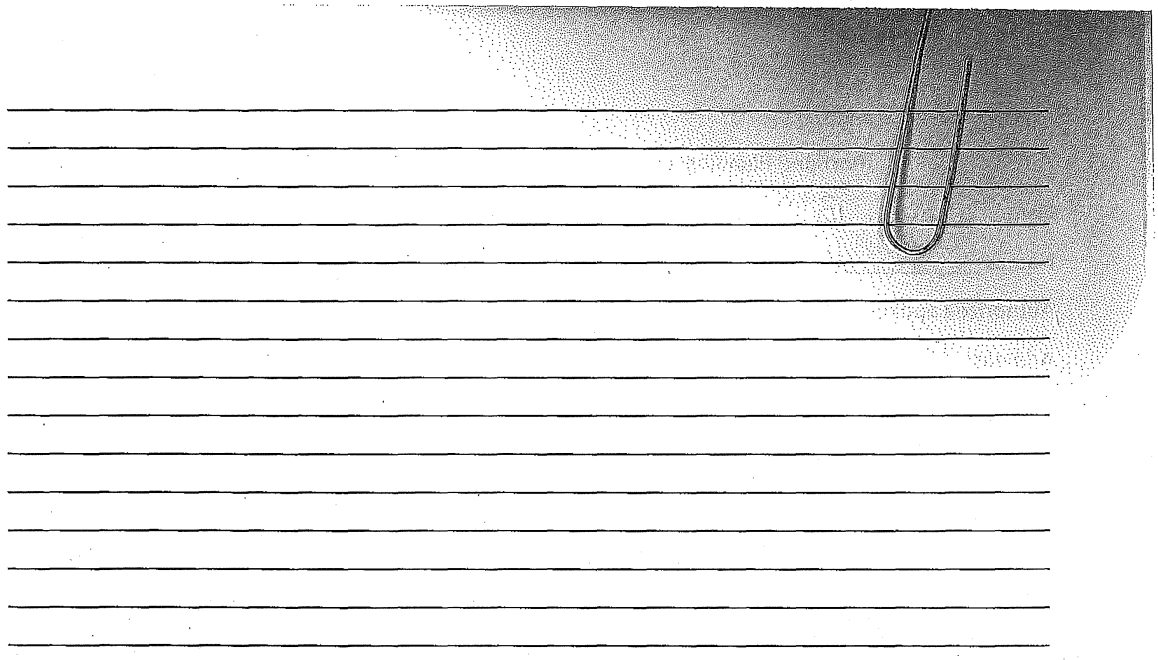
What agenda item do you wish to comment on? 5 million gallon limit on Fossil Fuel Facilities

Site Address, if different from above: _____



☒ (check if written comments are included on back)

2364

I have two reasons for opposing the 5 million gallon exemption proposed by the PJSC.

1) Allowing 5 million gallon oil infrastructure to be built would assist oil companies in increasing the number of oil trains passing through the Columbia Gorge. As the Mosier derailment and other oil-train derailments show, this would impose an unacceptable risk on the communities through which these trains pass.

2) Climate change, fueled by consumption of fossil fuels, poses ~~an~~ a terrifying threat to global civilization and to the very survival of the human species. Already, we are seeing the hottest year ever recorded and unprecedented increases in the number & intensity of severe weather events. We must transition to renewables (& possibly nuclear) as soon as possible. Discourage and development of fossil fuel infrastructure.

RE: Fossil Fuel Zoning Testimony

To the Portland Planning and Sustainability Commission:

The Columbia River Inter-Tribal Fish Commission (CRITFC) appreciates the City of Portland taking the responsible step to adopt Resolution 37168, opposing the expansion of fossil fuel transport projects, and taking the additional step in adopting 2035 Comprehensive Plan Policy section 6.48, limiting fossil fuel distribution and storage facilities. These are policies that move in the right direction to protecting our natural resources and preparing our region for an era of sustainable energy.

To continue that forward progression, zoning changes are appropriate. We agree with the definition of a "Bulk Fossil Fuel Terminal" and we urge the City to adopt the Zoning Amendments with these considerations:

- Maintain an appropriate definition of the terms: "region" and "regional" when referring to the "regional market" under § 6.48, such that this term is defined to be Oregon and Southwest Washington. Industrial stakeholders may prefer that you to consider defining "regional" as the entire PADD 5, which includes California, Hawaii and Alaska. However, Portland has not historically served the fossil fuel needs of California and these other areas. Notably, California consumes over two-thirds of the petroleum (roughly 80%) consumed in PADD V, while the entire states of Oregon and Washington consume less than 10%.

- Adopt building code recommendations related to seismic safety due to the dangerous location of many of these facilities. Currently, these projects are sited on a high-risk liquefaction zone and most are not built to appropriate seismic standards. The fuels stored in these facilities are upstream from the Columbia River estuary. The National Marine Fisheries Service's Recovery Planning Module for the Columbia River estuary emphasizes that protecting the estuary from hazardous chemicals is an important part of ESA-listed salmon recovery throughout the Columbia Basin.

We reviewed your Commission report and noticed that Figure 7 is incomplete. The figure does not account for additional proposed and operating crude by rail terminals, including two more in Grays Harbor and Columbia Pacific Bio-refinery operated by Global Partners. We realize that

each of these projects are in various stages of operation, but their applications are still "live". We are attaching a table to this letter with updated information.

Thank you for this opportunity to provide comments. Please feel free to contact us if you have any questions.

Sincerely,

Babtist Paul Lumley
Executive Director

Attachment

CRITFC – Pacific Northwest Fossil Fuel Transport Terminals – Rail/Ship Capacity Table

Type	Project	Crude Capacity (Barrels per day)	Coal Capacity (Million metric tons per annum)	Trains Per Week (1 way thru CR Gorge)	Vessels Round trips per week	Notes
Coal	Coyote Island Terminals (Port of Morrow, OR)	x	8.8 mmta	8-11	48 barge 10 ships	**Proposed, permit denied.** Trains to Port of Morrow, coal stored on site, transferred to barges. Barges down Columbia River to Port Westward, transfer directly to Panamax-sized ships. In legal proceedings.
Coal	Gateway Pacific (Cherry Pt, WA)	x	53 mmta	55-60	45+	**Proposed, permit denied.** Largest coal export terminal in U.S. All full trains travel through the CR Gorge, empty trains via interior WA state. Corps has denied permit based on treaty rights, probably will face appeal.
Coal	Millenium Bulk Terminals (Port of Longview, WA)	x	44 mmta	50-55	**30-35**	**Proposed.** In environmental review; DEIS released in April 2016.
Crude	Arc Terminals, Arc Logistics Partners (Portland, OR)	≤16,000 bpd	x	**≥2**	4	**Operating**. Former asphalt receiving terminal, receiving CBR and ethanol. Storage capacity 1,466,000.
Crude	Columbia Pacific Bio-Refinery/Global Partners (Port Westward, OR)	28,600 bpd (increase to 120,000)	x	**≤3-5** (increase to 10-12)	6	**Operating, financial problems.** Permitted to accept 24 – 50 trains/month, pending appeals and infrastructure upgrades. Rail line through Rainier needs major improvements. Ship dock condition extremely poor, received upgrade permit from Corps July 2015. Company in poor financial position, is currently accepting ethanol only. TBD.
Crude	Grays Harbor Rail Terminal U.S. Develop. (Grays Harbor, WA)	50,000 bpd	x	5	8	**Proposed.** Vacant industrial lot, lease was not renewed. Application is still active and project under environmental review.
Crude	Imperium Renewables (Grays Harbor, WA)	70,000 bpd	x	7-8	8	**Proposed Expansion**. DEIS released 2015, public comments filed Nov 2015. Company announced it will not accept crude on January 2016, but application not withdrawn.
Crude	NuStar Energy, L.P. (Port of Vancouver, WA)	50,000 bpd	x	2-4	**6**	**Proposed Conversion**. Former asphalt-receiving terminal with shipping capabilities. Under environmental review by City of Vancouver.
Crude	Targa Sound Terminals (Port of Tacoma)	30,000 bpd	x	2-3	4	**Proposed.** Capable of receiving CBR, ethanol, biodiesel.
Crude	Tesoro-Savage, Vancouver Energy (Port of Vancouver, WA)	360,000bpd	x	28	**14**	**Proposed.** Largest CBR terminal proposal in the U.S. Currently in EFSEC legal proceeding and environmental review. DEIS released 2015.
Crude	Westway Terminals (Grays Harbor, WA)	26,300-48,700 bpd	x	5	7	**Proposed Conversion.** Current storage-only, will be expanded to receive CBR. Application notes shipping by ships and barges. DEIS released 2015, public comments filed Nov 2015
Refinery	BP (Ferndale, WA)	*70,000 bpd	x	**6-7**	7-8	**Operating**. Largest refinery, receives crude by ships and CBR.
Refinery	Phillips 66 (Ferndale, WA)	(*35,000 bpd)	x	2-3	4	**Operating**. Receiving ships, but permits for CBR are pending
Refinery	Shell (Port of Anacortes)	(*60,000 bpd)	x	5-6	6	**Operating**. Receiving ships. Capacity reflects CBR **potential**. Currently in environmental review, strong opposition.
Refinery	Tesoro (Port of Anacortes)	*50,000 bpd	x	**5-6**	6	**Operating**. Receives by ship and CBR. Capacity reflects CBR only. Trains through Swinomish reservation challenged by tribe.
Refinery	U.S. Oil (Port of Tacoma)	*35,000 bpd	x	**3-4**	4	**Operating**. Refinery primarily receives by ship with limited CBR.
Propane/ LPG	Petrogas Ferndale LPG (Ferndale, WA)	30,000 (LPG)	x	1-2	2-3	**Operational.** Capability to handle exports & imports with rail, truck and pipeline; connected to 2 crude refineries

1x100 unit crude train = 2,900,000 gallons of crude ~ 42 gallons of crude = 1 barrel ~ CBR = "Crude by Rail" ~ Vessels – Panamax & Cape Class, barges in Gray's Harbor
All vessels in **RED** indicate vessels in the Lower Columbia River Estuary, all others through Puget Sound ~ All trains in **BLUE** reflect current rail traffic (one direction)in the Columbia River Gorge
*Refinery volume = amount of crude to receive by rail (CBR). Most refineries receive larger volume by ship delivery.

Subject: [User Approved] PSC Fossil Fuel Zoning Testimony

Dear Portland PSC Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing implementation of its November 2015 Fossil Fuel Policy.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to:

-Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

-An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the fight against climate change. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland can remain at the forefront of

addressing the most pressing concern of our time.

Sincerely,
Jan MacWilliams

Testimony:

Bakken crude oil may seem like a quick solution to our energy problems, but in reality they only create more dangerous consequences for our community and our planet in the long run. Portland is known for being a city with sustainability at it's core. We need to strengthen our resolve to protecting this planet and all of the life forms found on it. We need to think about our future generations. We need to enact a full ban on all new fossil fuel terminals, large or small. An exception for new facilities that are 5 million gallons or less is unnecessary. The City's code changes should not allow more unit trains of dangerous fossil fuels like Bakken crude oil. We need to Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. We need to Prevent any aggregate increase in fossil fuel infrastructure in Portland.

PORTLAND
BUSINESS ALLIANCE
Commerce · Community · Prosperity

September 13, 2016

Katherine Schultz, Chair
Portland Planning and Sustainability Commission
1900 SW 4th Avenue, Suite 1700
Portland, Oregon 97201

Re: Fossil Fuel Zoning Testimony

Dear Chair Schultz and Commission Members:

The Portland Business Alliance (Alliance) represents more than 1,850 member companies, small, medium and large, throughout the Portland metro region. The Alliance's mission is to promote and foster an environment in the Portland region that attracts, supports and retains private-sector jobs and spurs economic vitality.

From the outset, the Alliance opposed the city's resolution to restrict expansion of fossil fuel infrastructure. At the same time, we appreciated the amendments to Resolution 37168, adopted by City Council, making it clear the resolution does not restrict 1) improvements in the safety, or efficiency, seismic resilience, or operations of existing infrastructure, 2) provision of service directly to end users, 3) development of emergency backup capacity, 4) infrastructure that enables recovery or reprocessing of used petroleum products, or 5) infrastructure that accelerates the transition to non-fossil fuel energy sources.

Portland is a regional fossil fuel hub, located at the terminus of the Olympic pipeline. Fuels stored and distributed from northwest Portland serve the entire state of Oregon and parts of southwest Washington. Consumers and businesses throughout this broad market area rely on the fuels that are supplied from the energy hub in Portland. While we support the goal of reducing greenhouse gas emissions and improving public safety and resiliency, we are concerned with the approach taken in the Fossil Fuel Terminal Zoning Amendments Proposed Draft.

The resolution passed by City Council makes it clear that it **does not restrict** the exemptions noted above. Yet, that is exactly what the proposed draft contemplates by its very language because it prohibits development of new fossil fuel terminals and restricts the expansion of existing terminals, as well as makes the existing uses nonconforming. The report notes that the proposed code changes may be more restrictive than the exemptions in the resolution direct.

Furthermore, restricting expansion at existing fuel terminals and prohibiting new terminal development may impact industrial job growth and middle-income jobs. It may also constrain the supply of fossil fuels to serve anticipated population and employment growth, leading upward pressure on fuel costs which disproportionately affects lower-income households.

Greater Portland's Chamber of Commerce
200 SW Market Street, Ste. 150 | Portland, OR 97201 | 503-224-8684 | FAX 503-323-9186 | www.portlandalliance.com

The resolution adopted by City Council directs the Bureau of Planning & Sustainability to undertake an economic impact analysis of any proposed code changes yet no analysis has been undertaken and the proposed draft acknowledges that information is limited. Though the report does acknowledge that there may be impacts to job growth, tax revenue, and fuel costs, there is no quantitative analysis about those impacts. We urge that the proposed code changes not be implemented until a thorough economic analysis has been conducted to determine to what extent the proposed constraints will impact fuel supply or prices for users throughout Oregon and southwest Washington, which depend on the fuels in Portland's northwest energy hub.

Under the federal Renewable Fuel Standard and Oregon Clean Fuel Program, transportation fuels are required to contain renewable fuels. Fuels that are considered "clean fuels" by the state, such as natural gas and propane, are subject to restriction under these proposed changes. If companies are required to blend ever greater amounts of cleaner fuels into fossil fuels, but the proposed limits do not allow them adequate expansion opportunities to do so, there will be conflicts. It does not make sense for the city to potentially interfere with key policies of the federal and state government that seek to reduce greenhouse gas emissions in the transportation sector. The proposed draft also includes methanol, which under any definition is not a fossil fuel.

We appreciate the challenge staff faced in trying to develop code language to implement City Council's resolution. The fact is, at this point in time, consumers and businesses rely on fossil fuels to meet their everyday needs. That reliance is becoming less so as alternative energy sources are developed and cleaner fuels are used and/or blended into fossil fuels to reduce greenhouse gas emissions. The city should exercise extreme caution in adopting proposed code changes that unnecessarily restrict or drive up the supply of fuels, particularly when some of the very fuels the infrastructure limitations impact are needed to comply with existing laws designed to further environmental goals.

Thank you for the opportunity to comment.

Sincerely,

Sandra McDonough

Bonnie McKinlay
7112 SW 53rd Avenue
Portland 97219

Thank you for your meticulous work on evaluating and supplementing the City of Portland's Fossil Fuels Infrastructure Resolution.

Close to 50 years ago, on my 18th birthday, I left my parent's home to come to Portland. This is where I wanted to be---then---and now.

Our City Council took a historic move in unanimously passing the Resolution last fall. I fully support it.
I encourage you to withdraw the amendments that would allow terminals with five million gallon storage capacity, new liquefied natural gas storage facilities, and the construction of "mini terminal" clusters.

Please maintain the original intent of the resolution to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways."

To: Planning and Sustainability Commission <psc@portlandoregon.gov>
Subject: PSC Fossil Fuel Zoning Testimony: I want a full ban!

Testimony:

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes closer to the original intent of the 2015 Resolution.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland". Although this draft prohibits new larger bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine).

While this proposal will mark any bulk terminals as 'non-conforming', it still needs to strengthen the regulations on the size and type of expansion to pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

I want the City of Portland and the Planning and Sustainability Commission to:

1 - Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

2 - Remove the exception for new facilities that are 5 million gallons or less which would

allow more unit trains of dangerous fossil fuels like Bakken crude oil.
Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

3 - Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.

4 - Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,
Elizabeth Milner

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the fight against climate change. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland can remain at the forefront of

addressing the most pressing concern of our time.

Sincerely,
David Nez

Re: Fossil Fuel Zoning Testimony

Dear Members of the Planning and Sustainability Commission,

Thank you for the opportunity to comment on the proposed draft of the City of Portland's Fossil Fuel Terminal Zoning Amendments. Recognizing that the amendments are still in draft form, we appreciate any and all the revisions that you support through this process that will reconcile the proposed code changes with the City's November 2015 Fossil Fuel Policy Resolution 37168. We want policy and code to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways."

Along with Columbia Riverkeeper (CRK) and Friends of the Columbia Gorge, whose comments we in part incorporate by reference and repeat here, Oregon PSR supports the prohibition of bulk fossil fuel terminals and assigning existing fossil fuel terminals the status of a legal, nonconforming use. Portland's fossil fuel terminals should use a non-conforming use Type II process if code is to reflect the intention of the City's resolution.

The current proposal as reflected in the September 9, 2016 memo to the PSC does not achieve the City Council's intention to prohibit new major fossil fuel infrastructure, and we urge Planning and Sustainability Commission (PSC) members to make necessary changes to the proposed amendments.

I. The amendments should prohibit new bulk fossil fuel terminals.

Oregon PSR supports the proposed prohibition of bulk fossil fuel terminals. However, the language of the proposed zoning code carves out an exception for potential new terminals by allowing projects up to 5 million gallons of new storage. This volume represents almost 120,000 barrels of crude oil – approximately enough for two unit trains of oil. As noted by CRK, the City's proposed amendments would potentially allow new crude-by-rail deliveries to the Portland area, with each unit train of oil carrying 2.5 to 3 million gallons of crude oil. The City should eliminate the 5 million gallon threshold and prohibit new crude oil facilities, as the cities of Vancouver, Aberdeen, and Hoquiam have done already. To bring the amendments back into alignment with the resolution, the draft should also be revised to prohibit new LNG storage altogether.

II. The Amendments Should Limit Existing Fossil Fuel Facilities and Prevent Aggregation of Projects

Oregon PSR supports the City's proposal to identify existing fossil fuel facilities as legal nonconforming use facilities. By assigning existing facilities this status, the City preserves the ability for these facilities to address safety, seismic, and local market response issues while preserving the City's ability to achieve the larger goal of reducing reliance on fossil fuels.

We ask that the City add to the nonconforming use review the following factors:

- Expansion of existing terminals must be limited to allow operations only with those fuels described in the application. A letter describing those fuels must be submitted each year to the Director of BPS and the Mayor for review.
- Expansion shall not increase greenhouse gas emissions and climate change impacts;
- Expansion shall not increase the risk of fire and/or explosion at either the Bulk Fossil □Fuel Terminal Site, or the transportation route used to convey fossil fuels to or from the □Bulk Fossil Fuel Terminal, and
- Expansion shall not increase the risk of the release of fossil fuels from either the Bulk □Fossil Fuel Terminal Site or transportation equipment or infrastructure used to convey fossil fuels to or from the Bulk Fossil Fuel Terminal, into the environment, the Columbia River or other waterways.

□ Additionally, we ask that the City add language that prohibits the aggregation of smaller projects in order to avoid the 5 million gallon threshold that defines a "bulk fossil fuel terminal." By limiting aggregation and adding more stringent criteria to its nonconforming use review, consistent with the City's resolution, the proposed code changes would not inhibit □ improvements at these existing facilities that address seismic upgrades, safety improvements, or accelerate the transition to non-fossil energy.

III. Focus on Public Safety, Seismic Upgrades and Reducing Risks at Existing Facilities

We urge BPS staff to work with Portland's Bureau of Emergency Management to develop amendments or future code changes that protect the health and safety of Portland residents, consistent with the direction of the resolution.

Attached is a Position Statement from concerned health professionals that reminds us of the threats that oil-by-rail presents

to those who live, work and play in our great city. Please remember that crude oil is but one of many dangerous fossil fuels that threaten our community and our climate.

Thank you for the opportunity to comment on Portland's proposed draft of zoning code amendments to implement Portland's Fossil Fuel Policy Resolution 37168.

Sincerely,

Dr. Patrick O'Herron

Briefing: Oil-by-Rail Cargo Movement in Multnomah County

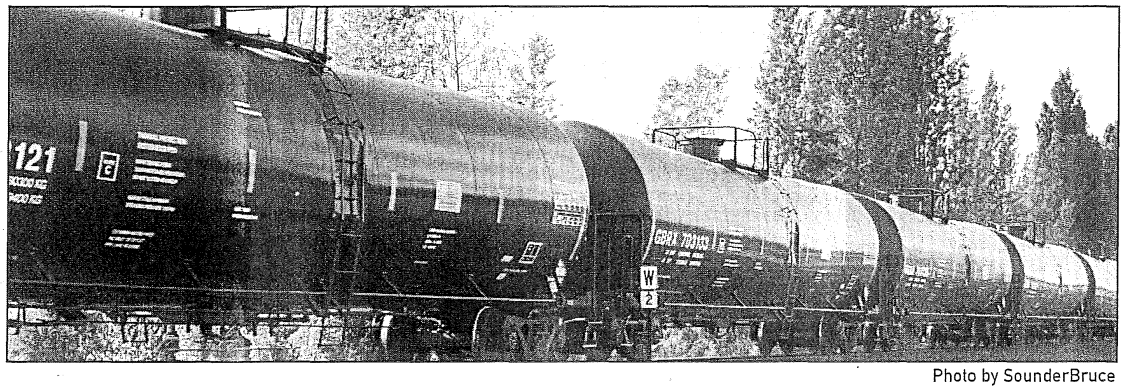

Photo by SounderBruce

PURPOSE

The purpose of this study is to:

1) Assess the potential negative impact of an accident involving train car(s) carrying crude oil traveling through populated areas in Multnomah County, and

2) Estimate whether the potential negative impact of an accident involving train car(s) carrying crude oil would be disproportionately experienced by environmental justice communities.

BASIS FOR ASSESSMENT

Oil-by-rail poses risks to the public because of the following factors:

- Transport by rail of hazardous materials such as crude oil and natural gas have increased 340 percent since 2012.[1]
- Most oil is currently carried in outdated tank cars prone to puncture, spills, and fires in train accidents.[2]
- Bakken crude is more volatile and flammable than most other crude oil.[3]
- Nine significant train derailments have occurred in North America since July 2013, one of which resulted in multiple fatalities and injuries.
- Impact from a major incident involving an oil train will extend beyond the immediately impacted area due to a toxic smoke plume, and stress and trauma to the population.
- The rapid increase of oil by rail has eclipsed the response capabilities of the local emergency responders and funding for those capabilities has not kept pace.[4]

January 2016

BACKGROUND

With the rapid development of the Bakken oil fields in North Dakota and Canada, and ongoing development of Canadian oil sands, shipments of crude oil-by-rail (OBR) have increased dramatically in the Northwest since 2012.[5] Due to this oil boom Oregon has become a throughway for crude oil traveling by rail destined for transfer terminals or refineries in Oregon, California, and Washington States. The total volume of OBR shipments transiting through the County is unknown. An emergency order issued by the U.S. Department of Transportation, however, requires that the carriers with a train containing more than 1,000,000 gallons of Bakken crude report to the State Emergency Response Commission. Currently, BNSF Railway and Portland and Western Railways both meet the criteria for Multnomah County. BNSF has 0 - 9 trains per week meeting the threshold while Portland and Western has 0 - 3 trains per week meeting the threshold.

Expansion of oil transfer and distribution terminals, if approved, will increase OBR shipments through Multnomah County. Currently, Port Westward, near Clatskanie, Oregon, is receiving 120,000 barrels of crude each day for reloading onto ocean going vessels. The proposed Vancouver Energy oil terminal at the Port of Vancouver, WA would ship up to 360,000 barrels of crude oil each day. If all of the 13 proposed or expanded oil facilities are built in Oregon and Washington, over one million barrels of oil will be shipped daily over Northwest rails lines.[6]

The dramatic increase in OBR shipments present safety concerns. Although overall incidents of rail cargo accidents is low, since 2010 there have been 11 fires, 6 explosions, and 9 evacuations in North America due to incidents involving ORB (Table 1 details several high profile OBR accidents). The number of reported OBR related incidents in the United States rose to 144 in 2014 from just one in 2009.[7] Several high profile derailments, spills, and explosions have raised widespread concern about the risks of moving crude by rail. An accident in Lac-Mégantic, a small town in Quebec, killed 47 people in the summer of 2013.[8] New federal rules, which take full effect in 2018, will require enhanced safety for rail cars carrying crude oil, including replacement or retrofit of outdated tanker cars, but those rules will not be fully implemented until May 1, 2025[9] and would not fully obviate the low probability but high impact potential of an accident.

DATE & LOCATION	DESCRIPTION
7/5/13 Lac-Mégantic, Quebec, Canada	An unattended freight train transporting petroleum crude oil rolled down a descending grade and subsequently 63 cars derailed. The subsequent fires, along with other effects of the accident, resulted in the confirmed deaths of 47 individuals. Extensive damage to the town center and the evacuation of approximately 2,000 people.
10/19/13 Gainford, Alberta, Canada	9 tank cars of propane and 4 tank cars of crude oil derailed. About 100 residents were evacuated. 3 propane cars burned, but the oil cars pushed away and did not burn.
11/7/13 Aliceville, Alabama	26 cars derailed, resulting in 11 cars impinged by a crude oil pool fire. An undetermined amount of petroleum crude oil escaped from derailed cars and found its way into wetlands area nearby the derailment site.
12/30/13 Castleton, North Dakota	A separation derailment resulted in the derailment of 21 cars of petroleum crude oil. 18 cars ruptured, and an estimated 400,000 gallons of petroleum crude oil was released. The ruptured tank cars ignited, causing a significant fire. Approxi mately 1,400 people were evacuated.
1/7/14 Plaster Rock, New Brunswick, Canada	17 cars of a mixed train hauling crude oil, propane, and other goods derailed. 5 cars carrying crude oil caught fire and exploded. 45 homes were evacuated but no injuries were reported.
4/30/14 Lynchburg, VA	105 tank cars loaded with petroleum crude oil derailed. Seventeen cars derailed, and one breached. A fire ensued. 350 evacuated from immediate area. Three cars came to rest in James River, spilling up to 30,000 gallons of oil into river.

Table 1: Recent oil train incidents in the United States and Canada[10]

Risks posed to Multnomah County residents from OBR include the potential for oil train explosions or spills as a result of derailment or rupture; increased particulate emissions from locomotive exhaust; congestion and collision along roadways and rail lines; and associated health impacts including injury and death.

Fires involving crude oil and/or fuel oil have several challenging aspects worth noting. Oil fires must be suppressed using specialized foam, and also release a noxious plume of toxic smoke. Only 10% of fire agencies in the State of Oregon are trained and equipped to respond with foam for an oil fire and 81% do not have the proper equipment to respond to a crude oil incident.[11] In addition, and depending on wind speed and direction, the plum from an oil train fire can greatly increase the area impacted by such an incident. For example, the Casselton, ND explosion and ensuing toxic cloud led to a five mile evacuation zone to the south and east of the incident.[12]

Concern about safety is also heightened because of population proximity to rail lines. A Multnomah County Health Department analysis (The Human Health Effects of Rail Transport of Coal Through Multnomah County, Oregon, February 2013) found that a large portion of the County's population lives near rail lines. The demographics of this study also suggested that people of color make up a larger portion of the population in areas near rail lines than they do in the County as a whole, raising environmental justice concerns with ORB transport.

Because of the novelty and rapid increase of OBR shipments in Multnomah County, combined with the proximity of rail lines to population centers and the risk to public safety, the Multnomah County Office of Sustainability undertook this assessment. The Multnomah County Office of Emergency Management and Multnomah County Health Department also provided important data and review. In addition, Oregon Physicians for Social Responsibility raised concerns to Multnomah County on the potential risk posed by oil trains to the public.

FINDINGS

Accidents involving rail cargo are relatively rare given the total volume of cargo shipped by rail. Accidents do occur, however. During the last decade, overall rail accidents have declined, along with accidents involving the transport of hazardous materials. According to the Federal Railroad Administration, the number of derailments on long-haul tracks in the United States has declined by around 21 percent since 2009 (to 2014). Of that decline in overall derailments, however, the number of accidents related to fire or violent rupture nearly doubled from 20 in 2009 to 38 in 2014.[13]

Since 2012 there have been 27 rail accidents in Multnomah County representing 34% of all rail accidents statewide during the same period. Statewide, derailments account for 85% of total accidents, while side collisions and fire/violent-rupture account for 5% of total accidents (see appendix A for more details).[14] The severity of an incident involving OBR depends on a complex mix of factors. These factors include the type of accident (derailment, spill, fire and/or explosion), the number of rail cars involved, the location of the incident, and the time of day and weather conditions when the incident occurs. The likelihood of a major accident from an oil train derailment, fire, and/or explosion is small, but the impact from such an incident would be high.

Additive factors combine to raise the overall level of concern for OBR shipments through Multnomah County. These factors include the especially volatile nature of the crude being transported, lagging federal safety rules for rail cars, the insufficient local emergency response capability, and the proximity of OBR shipments to heavily populated areas.

The Oregon Office of the State Fire Marshal recommends that in the event of a large oil train incident/spill, initial downwind evacuation should be at least 1,000 feet (300 meters). Further, if the tank or car is involved in a fire, officials should isolate and consider evacuation for 0.5-mile (800 meters) in all directions.[15] The impacts of the incident are likely to be felt over a much wider area, however, with toxic smoke from the plume impacting downwind communities.

An analysis of 2010 Census data showed that 26% of residents in Multnomah County live within a half-mile of rail lines that carries OBR. The same analysis revealed that 108 schools are also located within a half-mile of OBR rail lines, as well as 100 child care facilities within the evacuation zone.

Not only does OBR pose a threat to public health and safety generally, increased transport of crude is an environmental justice issue in Multnomah County. A demographic analysis of the 0.5-mile evacuation zone shows that Black/ African Americans in Multnomah County are 1.8 times more likely to live in the evacuation zone as compared to Whites. Pacific Islanders in Multnomah County are 1.48 times more likely to live in the evacuation zone as compared to Whites. In addition, there is a significantly higher proportion of Multnomah County's Pacific Islander population located in the evacuation zone as compared to Whites. Conversely, Asians are significantly underrepresented in the evacuation zones, and no meaningful difference between Latinos and Whites. Overall, people of color represent a greater percentage people in the evacuation zone (26.2%) versus general population (23.5%).

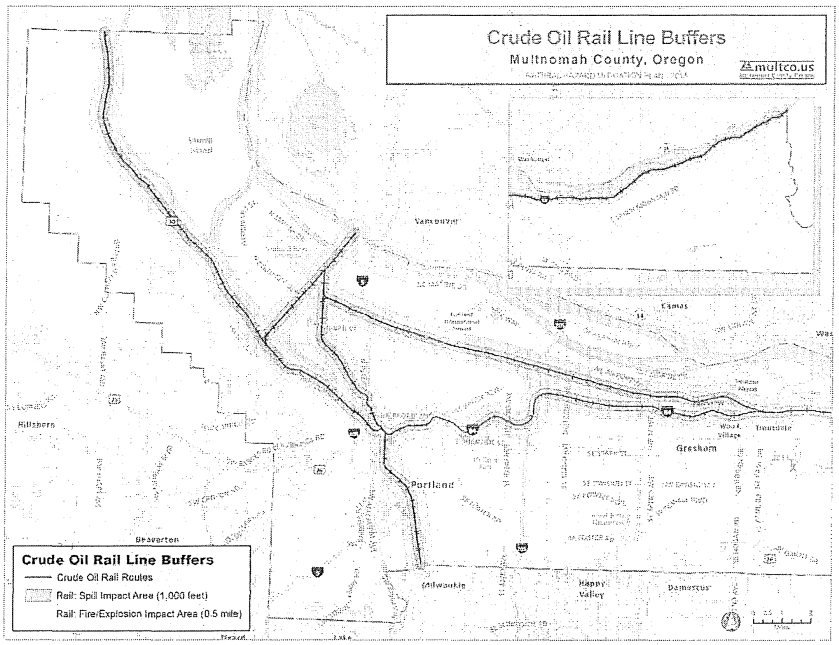

Figure 1: Oil-By-Rail Line Impact Buffers in Multnomah County

In addition to the human health impacts of OBR incidents, significant physical assets are also located with the evacuation zone. An analysis conducted by the Multnomah County Office of Emergency Management found that over $25 billion dollars in infrastructure is located within a half-mile of OBR tracks.

Table 2 on the following page shows the approximate number of parcels/buildings and improved value.

SUMMARY OF FINDINGS

- Up to 12 trains a week carry 1,000,000 gallons of crude oil through Multnomah County.
- Smaller shipments of crude oil are not reported on, but do pass through Multnomah County regularly.
- More than a quarter of the Multnomah County population lives within the half-mile "evacuation zone" around the oil transport route.
- 108 schools and a 100 child care facilities are within the evacuation zone.
- People of color are more likely to live within a half-mile of a rail line.
- Over $25 billion dollars of improved property is within a half-mile of rail lines in Multnomah County.
- The potential negative impacts of an oil train accident are heightened due to the volatility of the oil and the special equipment needed to extinguish it.
- Proposed new or expanded oil facilities in the NW will increase volumes of OBR transiting through Multnomah County.
- The lifting of the US oil export ban in 2015 is likely to increase pressure for new or expanded oil facilities in the Northwest.
- Emergency responders do not have adequate equipment to respond to a large scale OBR event.
- New safety requirements for rail cars carrying crude oil won't be fully implemented until 2025.

This briefing is not intended as a comprehensive analysis of all potential risks posed by OBR. Nor does this briefing capture potential benefit from increased OBR activity, for example new jobs. Further study and analysis is needed to create a comprehensive assessment. It is the finding of this briefing, however, that potential for serious and grave injury to life and property in Multnomah County warrants additional public scrutiny up to and including public policy that will protect public health and safety.

Table 2: Exposure of Improved Property to Crude Oil Rail Hazardous Materials Spill

APPENDIX A

Impact Buffer Selection

Oregon Department of Transportation (ODOT) maintains records on which rail lines are used to carry crude oil by rail throughout Oregon. This study used the data provided by ODOT to examine these rail lines in Multnomah County using ArcGIS. A buffer analysis was used to estimate which populations were most likely to be impacted in case of an accident involving rail cars that are carrying crude oil. A buffer of 0.5-miles was used to analyze the area most likely to be impacted in the event of an accident involving crude by rail.

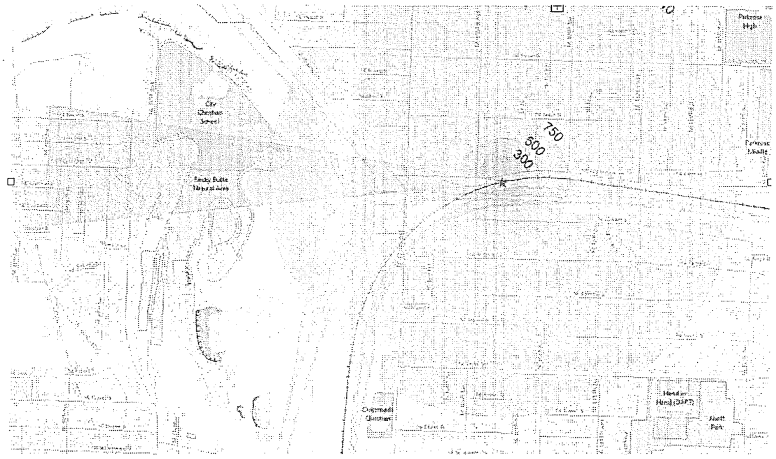

Figure 2: I-84 Crash Zone with plume (PBEM Desktop Exercise - OBR fire)

Various agencies including the federal Department of Transportation's Pipeline and Hazardous Materials Safety Administration have issued initial response guidelines codified in the Emergency Response Guidebook. For an incident involving a single oil tank car (whether truck or train), the primary set of responses is codified under response protocol 128 for petroleum crude oil, or UN hazmat code 1267. That guideline recommends initial evacuation range of 800 meters (approximately 0.5-miles) for a single burning car.[17] The Oregon Office of the State Fire Marshal also recommends that in the event of a large oil train incident/spill, initial down-wind evacuation should be at least 1,000 feet (300 meters). Further, if the tank or car is involved in a fire, officials should isolate and consider evacuation for 0.5-mile (800 meters) in all directions.[18] Therefore, the buffer area that was selected for this analysis is 0.5-mile (fire/explosion area) as the most likely area of impact in case of an emergency and is referred to in this report as the evacuation zone.

The 0.5-miles evacuation zone is a simplified version of what in practice is a highly complex set of potential responses by first responders and other safety personnel. Fire officials have the ability to model the plume based on the actual situation, similar to Figure 2. In practice, the evacuation zones may be much smaller (a single tipped car with no puncture in Seattle led to no evacuation) or much larger.

Appendix B

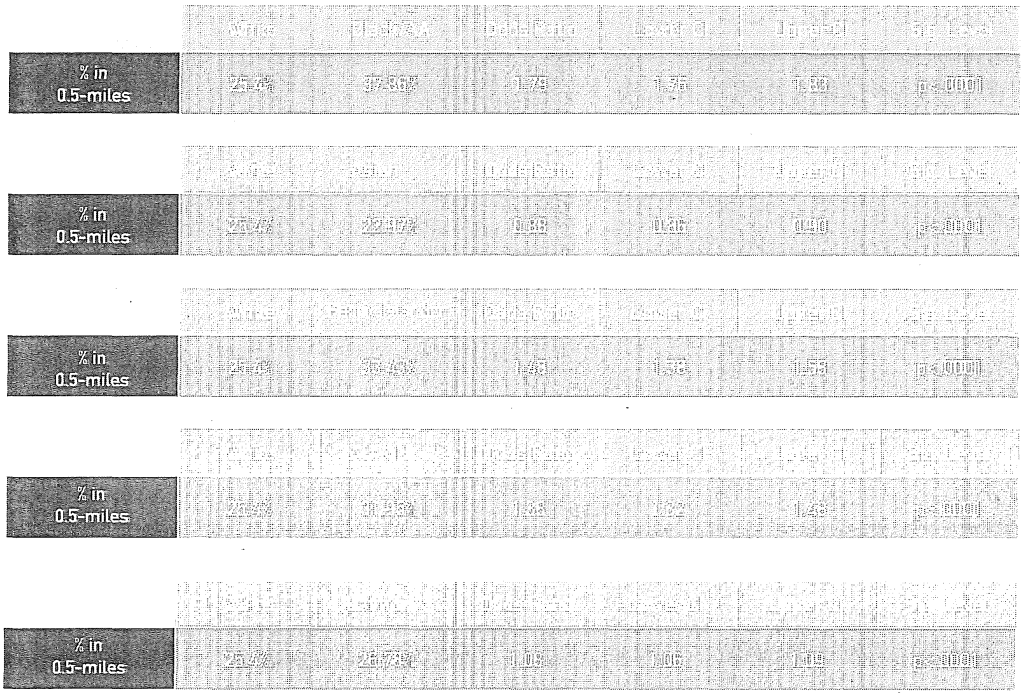
Appendix C

Estimated Population Within Evacuation Zone of Rail Lines Transporting Crude Oil In Multnomah County and Environmental Justice Analysis



Population Group	Multnomah County	% of Total Population	Evacuation Zone (0.5-mile from railway)	% of Total Population in Evacuation Zone
Total Population		100%		100%
Age				
Under 18 years		19%		19%
18 to 64 years		68%		68%
65 years and over		13%		13%
Race				
White		77%		77%
Black or African American		6%		6%
American Indian and Alaska Native		1%		1%
Asian		8%		8%
Native Hawaiian and Other Pacific Islander		0%		0%
Some other race		3%		3%
Two or more races		5%		5%
Hispanic or Latino (of any race)		9%		9%
Ethnicity				
Not Hispanic or Latino		91%		91%

Source: 2010 U.S. Census

Analysis Note: Census blocks were selected that intersect a half-mile buffer around rail lines that are identified by Oregon Emergency Management as transporting crude oil. Some of the Census blocks selected have areas that extend further than a half-mile from the rail line so this analysis may over-estimate the number of persons within the evacuation zone.

Environmental Justice Analysis, Statistical Test for Significance

Method:
Statistical tests - 2 x 2 Chi-Square tests (White, including Latinos compared to each racial group)

Note: Though the test is statistically significant, Whites and Latinos are about equally likely to be located in the evacuation zone.

Position Statement on Crude Oil Transport and Storage

To Governors of Washington & Oregon

From Concerned Washington & Oregon Health Care Professionals*

Energy companies have proposed increases in oil-by-rail transport and storage in the states of Washington and Oregon with subsequent ocean shipments from Pacific Northwest ports. While there was no movement of oil-by-rail in Washington three years ago, dramatic increases in oil extraction from the Bakken fields in North Dakota and Montana and from Canadian oil/tar sands have occurred with significant increases in oil-by-rail traffic. If current proposals are allowed to proceed, the volume of oil-by-rail coming into Washington would increase from the current 19 trains per week to as many as 137 trains per week, each about 1.5 miles long. Each would carry approximately 2.9 million gallons of volatile crude to be stored, in some cases refined, and then exported to other states. This is a larger daily volume than would flow through the proposed Keystone XL pipeline. Trains also carry Bakken oil through Oregon to California, and barges carry it from Oregon ports on the Columbia River to Washington and California refineries via the Pacific Ocean. If the federal crude oil export ban were lifted, the number of crude-by-rail trains and barges traveling through Washington and Oregon could increase significantly more than currently projected.

The known risks associated with oil-by-rail transport, oil tank storage, and oil export by vessel pose an unacceptable threat to human health and safety. As concerned Washington and Oregon health care professionals, we are deeply troubled by the public health and safety impacts of these proposals.

A thorough review of data published in peer-reviewed medical journals and other reliable sources is summarized below, and the findings are discussed in greater detail in Appendices A-F.

* Statement prepared by Washington & Oregon Physicians for Social Responsibility, released February 2015

wpsr.org / 206.547.2630 / wpsr@wpsr.org
oregonpsr.org / 503.274.2720 / info@oregonpsr.org

Summary of Major Risks
Major health risks of the proposed oil-by-rail transport, storage, and vessel export in Washington and Oregon include:

1) Delay of emergency vehicles (See Appendix A, Appendix B)
- Proposed routes in WA could cause emergency services delays in up to 93 towns and cities;[114] and
- In Oregon, 88 communities currently have at-grade crossings over which unit oil trains operate.[77]

2) Oil rail car fires, spills, explosions and derailments (See Appendix A)
- Bakken crude is more volatile and flammable than most other crude oil;[88]
- Most is carried in hazardous tank cars (DOT-111s) prone to puncture, spills and fires in train accidents;[23, 73]
- Nine significant train derailments have occurred in North America since July 2013,[114] one of which resulted in multiple fatalities and injuries;
- Between June 2011 and December 2013, train derailments occurred on average every 3.5 days in the Northwest;[27]
- Three million Washington residents and more than half a million Oregon residents live within a recommended evacuation zone as defined by the US Department of Transportation;[108, 114] and
- Rescue and cleanup crews face risks of toxic exposures, in addition to risks of fires. (See number 5 below)

3) Adverse health impacts of train noise (see Appendix A)
- Train noise in populated areas is associated with significant sleep disturbance;[1]
- Increased cardiovascular events including myocardial infarction and arrhythmia are associated with nighttime noise and noise exposure greater than 90 decibels (in the range of train horns);[95,100] and
- Adverse cognitive performance and increased psychiatric illness have been observed in children exposed to noise.[45]

4) Oil storage tank spills, fires and explosions (See Appendix B)
- Major fires and explosions of petroleum products have occurred at storage terminals within the past 10 years (e.g., Hertfordshire, England, 2005; Raleigh, Mississippi, 2006);
- Should a fire or explosive event occur at proposed sites located in close proximity to schools and residential areas, injuries and deaths would likely occur; and
- Several proposed storage tank sites would be located in an earthquake and tsunami zone, [37] increasing the risk of spills, fires and explosions.

5) Oil spills during loading and vessel transport (See Appendix C, Appendix D)
- Crude oil exposure during spill and cleanup increases the risk of neurotoxicity, cancer, lung disease, loss of cognitive function, and endocrine disruption in humans;[13, 21, 63]
- Dispersant chemicals used in cleanup are also highly toxic and associated with increased risks of cancer, lung and endocrine diseases.[66, 103]

6) **Increased air pollution**, including diesel particulate matter (See Appendix A)

- Accounts for the majority of air-toxic cancer risks in the Puget Sound area;[33, 90]
- Increased risks of cancers, particularly lung and breast cancer;[6, 9, 18, 26, 29, 32, 98, 117]
- Lower infant birth weight and increased risk of respiratory death in first year of life;[22, 75, 121]
- Impaired pulmonary development and increased risk of lung disease in infants,[55] children,[16, 36, 123] and adolescents;[36]
- Increased risk of neurodevelopmental and behavioral disorders in children;[8, 15, 74, 82, 83, 93, 111, 112]
- Increased risk of asthma diagnosis, exacerbation of symptoms, and asthma-related hospitalizations;[11, 16, 25, 41, 46, 81, 98, 99, 104]
- Increased risks of acute cardiovascular and cerebrovascular events;[10, 14, 30, 65, 69, 70, 84, 85, 87, 92, 97, 118, 119]
- Enhanced reactions to airborne allergens and immune system impairment;[38, 47, 67] and
- Increased risks of acute and chronic obstructive lung disease,[46] systemic inflammation, and overall risk of disease and mortality.[6, 29, 30, 61, 70, 87, 89]

7) **Increased water pollution** (See Appendix E)

- Cancer, digestive, and reproductive health risks associated with oil-contaminated drinking water sources;[3, 4, 105]
- Reduced short- and long-term viability of food sources, including salmon and shellfish;[51, 94, 114] and
- Pollution of tribal fishing resources.[20, 39, 80, 114]

8) **Contributions to climate change-induced injury and disease** (See Appendix F)

- Increased heat related illness and health care costs;[54, 57, 68]
- Increased extreme weather events with associated injuries and deaths;[5, 52, 54, 72]
- Food supply disruption;[64]
- Spread of infectious diseases;[64] and
- Disproportionate adverse effects on low income and communities of color.[52]

As Washington and Oregon health care professionals, we oppose the transport by rail and the storage and shipment of crude oil within our states on the basis of very serious, credible threats to the health of our residents. Further, we call upon the Governors of Washington and Oregon, as well as agencies in both states, to deny permits that facilitate the transport, storage and handling of crude oil by rail and/or barge.

Appendices:

Appendix A: Summary of Health Risks for Crude-by-Rail Transport
Appendix B: Summary of Health Risks for Oil Tank Storage
Appendix C: Summary of Health Risks for Oil Export by Marine Vessels
Appendix D: Washington & Oregon Oil Transport Routes & Oil Spill Response Plans
Appendix E: Overview of Water Pollution Risks & Sources
Appendix F: Summary of Health Risks from Climate Change
Appendix G: References

Appendix A:
Summary of Health Risks for Crude-by-Rail Transport

1. Delay of Emergency Vehicles:

- A total of 93 cities and towns and approximately 3 million Washington residents live on or near the crude-by-rail train routes. Crude-by-rail train routes pass through 38 heavily populated cities and towns in Washington, delaying traffic and emergency vehicle routes.
- In Oregon, 88 communities, including the state's largest, have at-grade crossings over which unit trains now operate. Mile-long oil trains can potentially operate over 403 crossings (ODOT, 2015).
- Emergency vehicle delay at railroad crossings could result in increased fatalities. Five to ten minute delays in emergency medical service (EMS) can critically alter chances for survival, particularly in the case of cardiovascular and respiratory emergencies as well as trauma. The additional blocked traffic at train crossings could make the difference between life and death.
- Example: Individual commercial streets in Aberdeen would be blocked for 17 minutes per train, given their length and mandated 5 mph speed within the city. A projected increase of 6-10 trains per day, multiplied by 17 minutes each, means a total blockage time of 12-20 hours per week.

2. Rail Car Fires and Explosions:

- The Pipeline and Hazardous Materials Safety Administration has concluded that crude oil from the Bakken Shale region of North Dakota is more flammable and more dangerous to ship than crude oil from other regions (2014).

  Train Derailment Statistics & Bakken Explosion Events
  - Trains carrying crude oil on major US railroads have increased from 9,500 carloads in 2008 to 415,000 carloads in 2013 (US DOT, 2014).
  - In 2013 the US Department of Transportation reported 154 rail car "failures" and 116 "episodes" involving tank cars carrying crude oil (US DOT, 2014).
  - The Sightline Institute has tracked derailments in the Northwest from June 2011 through December 2013. Their calculations map 276 reported derailments over a 31-month period – an average of 8.9 derailments per month, or one every three-and-a-half days (de Place & Abbotts, 2014).
  - The heads and shells of DOT-111 tank cars, which carry much of the nation's crude-by-rail, can almost always be expected to breach in derailments that involve pileups or multiple car-to-car impacts (NTSB, 2012).
  - Severe accidents involving oil train derailments have increased significantly in recent years, resulting in explosions, fires, and multiple deaths. Recent incidents include:
    - July 2013: a 79-car train carrying Bakken crude oil derailed in Lac-Mégantic, Quebec, killing 47 people.
    - December 2013: several explosions sent flames and mushroom clouds into the air when a 106-car train derailed in Casselton, North Dakota.
    - April 2014: a train derailed into the James River in Lynchburg, Virginia, sending burning volatile compounds into the water.

3. Increased Air and Diesel Particulate Matter (DPM) Pollution:

- Diesel exhaust from train engines is made up of a number of substances with gaseous and soot (particulate) components. Gaseous components include carbon monoxide, nitric oxide, nitrogen dioxide, sulfur oxides, and polycyclic aromatic hydrocarbons (PAHs). Diesel exhaust particulate is comprised of carbon particles, organic components (including PAHs), and trace metals. Individuals living in proximity to trains are vulnerable to inhalation of diesel gases and particulate matter.
- The World Health Organization's (WHO) International Agency for Research on Cancer (IARC) specifically classifies diesel engine exhaust as "carcinogenic to humans" (Simon, 2013).
- Fine particulate matter, categorized as less than 2.5 microns ($PM_{2.5}$), is especially harmful to humans because of its potential to deeply penetrate the alveoli of the lungs, resulting in lung inflammation. Additionally, exposure to particulate matter and gaseous pollutants such as benzene and PAHs is linked to systemic inflammation, increasing risk of disease and mortality (Avogbe et al., 2004; Dominici et al., 2006; Mustafic et al., 2012; Pieters et al., 2012).
- The US Environmental Protection Agency (EPA) placed the Puget Sound area in the top 5% nationally for potential cancer risk from air toxics (1996).
- DPM poses the largest potential cancer risk of all air toxics in the Puget Sound area (PSCAA, 2011).
- Fetuses, infants, children, the elderly, and those with preexisting disease or impaired immune systems are particularly vulnerable to health impacts from DPM air pollution.
- Even low levels of DPM below current federal standards have been linked to adverse health effects in children, the elderly, and other vulnerable populations (EPA, 2009).

Given this information, it is not surprising that many studies have demonstrated adverse health impacts associated with exposure to ambient air pollution in general and to diesel particulate matter specifically, including:

Cancer

- Increased cancer rates, particularly lung and breast (Beeson et al., 1998; Crouse et al., 2010; Demetriou et al., 2012; Dockery et al., 1992; Wei et al., 2012)
- DPM contributes 78% of the risk for cancer from airborne toxics in the Puget Sound area (PSCAA, 2015)
- Increased biological markers associated with risk of lung cancer (Demetriou et al., 2012)
- Increased oxidative DNA damage predictive of cancer risk (Avogbe et al., 2004)

Cardiovascular Diseases

- Higher rates of heart attack and stroke (Chen et al., 2013; Dominici et al., 2006; Lue et al., 2013; Mustafic et al., 2012; Qian et al., 2013; Wellenius et al., 2012; Shaw et al., 2013; Brook et al., 2010)
- Increased cardiovascular disease, overall mortality and morbidity for short- and long-term $PM_{2.5}$ exposure (Brook et al., 2010)
- Increased hospitalization for cardiac arrhythmias (Peters et al., 2000)

- Increased probability of hospitalization for acute myocardial infarction (Mustafic et al., 2012; Peters et al., 2001)
- Increased ischemic heart disease, arrhythmias, congestive heart failure (Dominici et al., 2006) and biomarkers (HRV) associated with cardiac morbidity and mortality (Pieters et al., 2012)

Cerebrovascular Diseases

- Increase in hospital admissions for strokes (Dominici et al., 2006; Lue et al., 2013; Wellenius et al., 2005)
- Significant increase in stroke mortality (Chen et al., 2013; Qian et al., 2013)
- Increased risk of stroke associated with increased exposure to fine particulate matter ($PM_{2.5}$), black carbon, and nitrogen dioxide (Wellenius et al., 2012)
- Increased risk of stroke and death from stroke for postmenopausal women (Miller et al., 2007)

Neurodevelopmental Disorders

- Higher rates of neurodevelopmental disorders in children (prenatally exposed) such as autism spectrum disorder (ASD), attention deficit hyperactivity disorder (ADHD), lowered IQ, and adverse behaviors (Becerra et al., 2013; Chiu et al., 2013; Newman et al., 2013; Perera et al., 2013; Perera et al., 2009; Roberts et al., 2013 Volk et al., 2013; Volk et al., 2011).
- Increased behavioral symptoms such as anxiety, depression, social problems, rule breaking, and aggression in children (Perera et al., 2013)

Pulmonary Diseases and Disorders

- Respiratory deaths in infants during first year of life and lower infant birth weights (Woodruff et al., 2006; Dadvand et al., 2012; Olsson et al., 2013)
- Impaired lung development in children (Gauderman et al., 2004; WHO, 2005)
- Impaired pulmonary development in adolescents and measurable airway inflammation (Gauderman et al., 2004)
- A 6% higher risk of infant bronchiolitis (Karr et al., 2009) and significantly increased risk of asthma diagnosis with early life exposure to traffic-related air pollution (Clark et al., 2010)
- Increased frequency and severity of asthma attacks in children (Slaughter et al., 2003)
- Overall decreased lung function (WHO, 2003)
- Increased asthma rates and exacerbation of preexisting asthma and chronic obstructive pulmonary disease (COPD) (Carlsten et al., 2011; Gowers et al., 2012; Delamater et al., 2012; HEI Panel, 2010; Trasande & Thurston, 2005; Simon, 2013)
- Worsening asthma symptoms and increased hospitalization (Delameter et al., 2012; Gowers et al., 2012; HEI Panel, 2010; Pandya et al., 2002)

Reproductive and Developmental Disorders

- Reduced sperm quality in men exposed to air pollution, particularly diesel exhaust (De Rosa et al., 2003)

- Disruption of normal sexual differentiation during fetal development, including 2.42% higher odds of male cryptorchidism (undescended testes) amongst babies of fathers exposed to diesel exhaust before conception (Kurahashi et al., 2005)
- Increased congenital heart, lung, and immune system anomalies in children (Gauderman et al., 2004; Vrijheid et al., 2011)
- A 10 microgram increase in DPM (2.5) is associated with a 3.4% increase risk in daily mortality (Laden et al., 2000)
- In 2005 the World Health Organization published a summary of the health risks of air pollution on childhood health and concluded that "sound evidence already exists for a causal link between air pollution and children's health" (WHO, 2005, p.7)
- In the same document the WHO recommended that policy makers take measures to reduce childhood exposure to air pollution (WHO, 2005)

Multi-System and Overall Mortality

- Increased cardiovascular, pulmonary, and overall mortality (Dockery et al., 1993; Pope et al., 2002)
- Long-term exposure linked to decreased life expectancy from cardiopulmonary mortality (Krishnan et al., 2012; WHO, 2014)

4. Adverse Health Impacts of Train Noise and Vibration:

- Environmental noise pollution is a growing concern, and several studies have documented negative health consequences of chronic noise including sleep disturbance, cognitive impairment, cardiovascular disease and psychiatric disorder (Goines & Hagler, 2007; Babisch, 2005).
- Noise and vibrational effects from rail traffic vary from idling, screeching, and horn sounding. Horn sounding poses the most significant to risk to human health.
- The U.S. Department of Transportation's "Train Horn Rule" (49 CFR Part 222) requires engineers to sound train horns at 96 to 110 decibels (dB) fifteen to twenty seconds in advance of all public grade crossings (US DOT, 2005).
- The World Health Organization's "Guidelines on Community Noise" (1999) states that sleep disturbances and risk of adverse health effects of noise have been observed at 45 dB or less, recommending that noise events exceeding 45 dB be "limited if possible" (p. 8).

Despite public safety mitigation in some urban areas where quiet zones have been established, a growing body of research demonstrates that continuous noise, as well as intermittent nocturnal noise and vibrations, result in sleep disturbances and can cause impaired cognitive function and cardiovascular effects.

Sleep Disturbance

- Studies have demonstrated that outside nocturnal noise >50 decibels (dB) is associated with sleep disturbance, that railway noise has greater impacts than road noise, that intermittent noise is more sleep-disruptive than continuous noise, and that even one railway noise event during sleep significantly decreases rapid eye movement (REM) sleep (Aasvang et al., 2011; Carter, 1996).
- A recent case-control experimental study found that train transportation noise and subsequent vibrations led to a significant acceleration of heart rate of at least 3 beats

per minutes in 79% of sleeping participants after experiencing high-vibration periods produced from trains passing. These nocturnal heart rate accelerations are believed to potentially affect long-term cardiovascular health for populations living in close proximity to railroads with frequent rail traffic (Croy et al, 2013).

- Millions of people living along these rail lines will be at risk for disrupted sleep and associated health risks from proposed rail traffic volume (Kim et al., 2012; Hume et al., 2012).

Cardiovascular Effects

- New epidemiological studies support previous evidence that night-time noise and noise in excess of 90 decibels are associated with cardiovascular disease including risk of acute coronary events, myocardial infarction, arrhythmia, accelerated hypertension, and stroke (Hume et al., 2012),
- More specifically, the elevation of stress hormones such as epinephrine and cortisol resulting from high decibel noise exposure increases endogenous risk factors of heart disease from both short-term and chronic exposures (Ising & Kruppa, 2004; Selander et al., 2009; Sørensen et al., 2011; Sørensen et al., 2012).

Impaired Cognitive Function and Mental Health Effects

- Another less well appreciated risk of high decibel rail noise and vibration exposure is the impact on mental health and cognitive function.
- Sleep disturbance resulting in fatigue increases risk of hypertension, arrhythmia, and risk of accidental injury.
- Elevated noise is associated with cognitive impairment in children, as well as exacerbation of mental health disorders including depression and anxiety (Lercher, et al. 2003; Haines et al., 2001; Hygge et al., 2002).
- The health implications of chronic and nocturnal noise from increased rail traffic are highly likely and will impact human health in multiple areas and all age ranges (Goines & Hagler, 2007; Babisch, 2005).

Appendix B:
Summary of Health Risks for Oil Tank Storage

5. Oil Storage Tank Spills, Fires and Explosions:

- Three companies have plans to build facilities to receive, transfer, store and ship crude oil from Hoquiam, WA. US Development Group has detailed plans for a 42,000,000-gallon tank farm; their proposal has received initial approval by the WA Department of Ecology. Imperium proposes a 30,240,000-gallon tank farm, and Westway Group proposes a 42,000,000-gallon tank farm. The US Development proposal would site eight 5,250,000-gallon tanks within about 1,900 feet of the Hoquiam High School and only slightly farther away from both the middle and elementary schools. The two other tank farms are just south of the city commercial center but adjacent to each other. The proposed Imperium project would locate nine 3,360,000-gallon tanks immediately adjacent to an existing biodiesel production facility and its tank farm. Adjacent to the biodiesel site would be the proposed Westway project with five 8,400,000 gallon tanks. Existing storage tanks on the Westway site already include four tanks utilized for other liquid products including ethanol.
- Tesoro-Savage Petroleum Terminal (Tesoro-Savage) proposes to construct a facility in Vancouver, WA, to receive crude oil by rail and transfer it to vessels on the Columbia River. The "Vancouver Energy Distribution Terminal" would include six crude oil storage tanks. Annual throughput for each of the tanks would be 868,700,000 gallons per year, for a total facility throughput of over 5.2 billion gallons per year (Tesoro-Savage Application, 2013). The Tesoro-Savage tank farm and related rail traffic would be located near Vancouver's Fruit Valley neighborhood and a proposed waterfront development to include permanent housing. This would be the largest oil-by-rail facility in the nation (Florip, 2014).
- In Anacortes, WA, Shell Puget Sound Refinery proposes to expand access to its existing refinery for crude-by-rail to augment decreasing supplies coming by tanker from Alaska. The crude oil unloading facility would be served by a railroad extension from the existing BNSF rail line. Shell anticipates it would receive one unit train per day, with each unit train hauling 102 rail cars, or 612 incoming fully loaded cars per week. This unloading facility would be served by a 15-mile spur from the BNSF line near Mount Vernon and Burlington, running through heavily populated residential areas in proximity to the rail line.
- In Oregon, Global Partners, which was operating in 2014 with two 3,800,000-gallon tanks, has received a permit which allows expansion to include four 4,500,000-gallon tanks and the handling of over 1.8 billion gallons of crude oil annually. This facility is located on the Columbia River (OR DEQ, 2014).
- Oil storage tanks of varying sizes are at risk of fires and explosions from both man-made and natural causes. Man-made fires and explosions have resulted from maintenance errors (Smith County, MS, 6/5/2006; Baton Rouge, LA, 5/28/14) and inadequate venting of combustible vapors. Natural causes have included lightning-induced explosions (Baytown, TX, 9/14/14) and spontaneous explosions (Meadville, PA, 8/19/13).

There are at least two categories of potential causes of fires and related explosions at oil storage terminals: A) man-made causes including equipment failure, and B) natural causes including earthquake and tsunami.

A. Tank Fires from Equipment Failure or Other Man-Made Causes

There is an inherent risk of fire when handling, transporting, and refining crude oil. Further, Bakken crude has a large component of light hydrocarbons, making it highly volatile (Pipeline and Hazardous Materials Safety Administration, 2014).

Fires and explosions in tanks holding petroleum products are quite common and well documented throughout the industry. While many have been caused by human error, some have occurred because of inherent risks from equipment, technology, and the highly combustible nature of these fossil fuels. This is why oil storage tanks are most commonly sited away from population centers.

> Case Study #1: Hertfordshire, England, December 11, 2005
> The Hertfordshire Oil Storage Terminal (a.k.a. Buncefield Oil Depot) was the fifth largest oil-products storage facility in the United Kingdom. One of the gasoline storage tanks over-filled. A switch should have detected that the tank was full and shut off the supply, but it failed to operate properly. The switch failure should have triggered an alarm, but it also failed. Hundreds of gallons of gasoline spilled through the roof vent, down the side of the tank and onto the ground. The overflow resulted in the rapid formation of a rich fuel and air vapor cloud, triggering a so-called fuel-air explosion. The explosion was presumed to have been ignited by an electric generator or the depot's fire pumping system (COMAH, 2011). The resulting fires burned for 5 days. As a result of the event, 240 people visited accident and emergency departments. Of these 187 were emergency services workers, 17 were oil depot workers, and 40 were members of the public. Sixty-six had respiratory complaints, and 38 injuries were recorded (Hoek et al., 2007). The Buncefield Depot was located far from a residential area. Had this event occurred within a town, presumably many more injuries and even deaths would have been reported.

> Case Study #2: Raleigh, Mississippi, June 5, 2006
> The Partridge-Raleigh oilfield is located in rural Smith County, Mississippi. Three workers died and a fourth was injured in a fire caused by human error. Welders were attempting to connect oil tanks via pipes, when the welding torch sparked vapors escaping from one of the tanks. The fire traveled from one tank to another through connecting pipes. The explosion threw the workers from the top of the tanks. The US Chemical Safety and Hazard Investigation Board determined that a number of errors were made, including unsafe work practices such as utilizing a lit torch to determine the presence of flammable vapor instead of testing with a gas detector. Other hazards that contributed to the fire included neglecting to remove residual oil in the tanks prior to welding in the area (US CSB, 2007).

B. Natural Causes, Including Earthquake and Tsunami

For terminals at Washington and Oregon ports, earthquakes and subsequent tsunamis pose the risk of dislodging crude oil storage tanks from their foundations.

The Port of Grays Harbor resides within the potential zone of impact from a tsunami. While the US Development Group engineering study addresses the structural requirements for its eight

proposed tanks to withstand an earthquake (Shannon & Wilson, 2013), it does not address the structural requirements to withstand a subsequent tsunami.

The USGS Professional Paper 1661-B, Local Tsunami Hazards in the Pacific Northwest from Cascadia Subduction Zone Earthquakes, reports the following: "Comparing the results in this study at specific sites where previous inundation models have been formulated, the range in tsunami amplitude offshore Grays Harbor, WA, 2 to 7 meters, is slightly lower compared to the offshore amplitudes predicted by Preuss and Hebenstreit (7-8 meters)" (Geist, 2005).

Considering that the US Development's engineering study (Shannon & Wilson, 2013) showed that soils in the tank farm area up to depths of 150 feet or more consist of "outwash from alpine glaciation", meaning unstable sand, gravel, silt, etc. – and the recommended depth for pilings as support foundations would extend only a few feet into the "dense to very dense" alluvium (not bedrock) – one could argue that the foundation structures for the storage tanks would be very unlikely to withstand a tsunami wave of up to 24 feet. Structural integrity could be further compromised by the fact that the groundwater depth begins at only 17 feet below the surface.

Oil tank dislodgement from a massive tsunami increases the likelihood of subsequent fire and related explosions involving multiple tanks, discharging massive quantities of highly flammable crude oil into the area and the ocean.

Appendix C:
Summary of Health Risks for Oil Export by Marine Vessels

6. Oil Spills during Vessel Loading and Transport:

- A total of eight or more Panamax-sized ships, each carrying 16 million gallons of oil, are proposed to make 16 or more crossings per month transporting petroleum products out of Bellingham, Anacortes, Grays Harbor, and offshore from the mouth of the Columbia River between Washington and Oregon.
- Washington has a history of major oil spills including a 239,000-gallon tanker spill at Port Angeles in 1985; a 231,000-gallon barge spill in Grays Harbor in 1988; a 130,000-gallon refinery spill in Anacortes in 1991; and a 600,000-gallon refinery spill in Tacoma in 1991.

Health Impacts of Crude Oil Exposure

- Crude oil is a complex mixture of thousands of chemical compounds, many of them harmful to human health and the environment. These include but are not limited to: benzene, cadmium, toluene, ethylbenzene, xylene, and polycyclic aromatic hydrocarbons (PAHs). Some oil contains other hazardous chemicals such as the bioaccumulative neurotoxin mercury. Many of these chemicals have potential to damage organ systems through a variety of mechanisms including endocrine disruption and fetal mutations. They potentiate a number of diseases including cancer and can cause multi-generational birth defects (CDC, 1999).
- Volatile organic compounds (VOCs) found in unrefined petroleum, including benzene and toluene, readily enter the atmosphere, where they can be easily inhaled. Once they enter the body, they can be stored in fat, dissolve into cell membranes, and reside on mitochondria in the cell nucleus. This "change in viscosity" of the cell nucleus affects DNA transcription and replication and therefore has the potential to cause malignancy in any organ.
- Health implications of human exposure to crude oil constituents vary from individual to individual based upon multiple factors: time and duration of oil exposure, route of exposure, interaction with dispersant cleanup chemicals, use of personal protective equipment, wave action, heat, previous exposure to crude oil chemicals, medications used at the time of exposure, and pre-existing medical conditions.
- Exposure can occur directly through inhalation of contaminated air or dermally via skin contact with contaminated air or water. It can also occur indirectly via consumption of seafood or water.

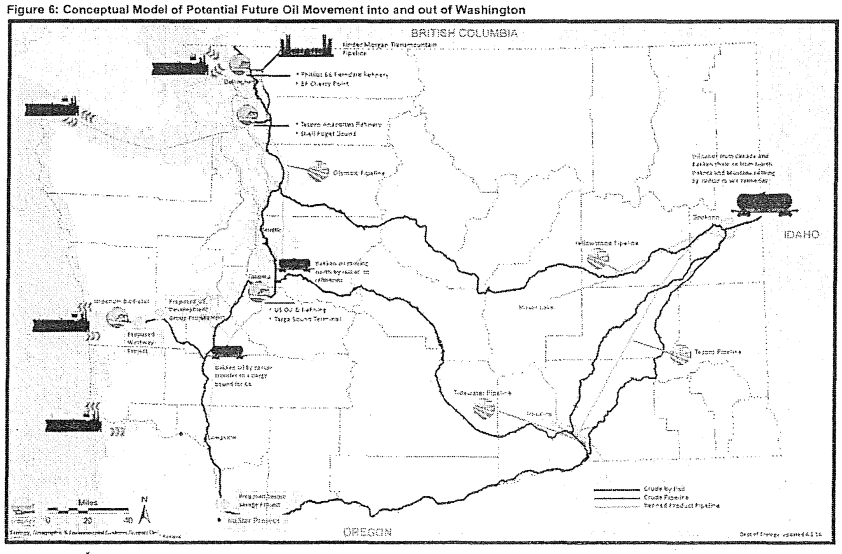
A recent review summarized research of acute and long-term adverse health effects from exposure to eight major oil spills prior to 2010 (Levy and Nassetta, 2011).

Acute health effects among cleanup workers and community residents included:

- Respiratory symptoms (throat irritation, cough, shortness of breath)
- Eye symptoms (irritation and sore, itchy and/or reddened eyes)
- Headache
- Skin symptoms (irritation, itching, rashes, skin lesions)
- Nausea
- Dizziness
- Tiredness and fatigue

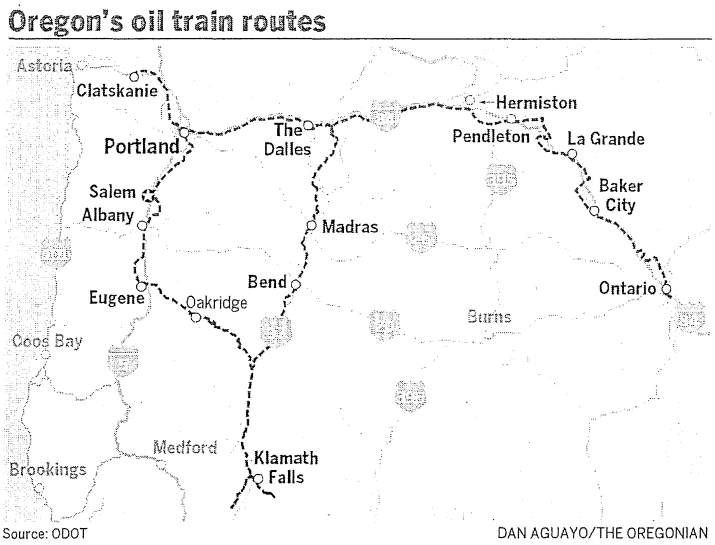
Chronic health effects included:

- Psychological disorders (generalized anxiety disorder, post-traumatic stress disorder (PTSD), lack of energy, and depression)
- Respiratory damage (impaired lung function; reductions in forced vital capacity, forced expiratory volume, forced expiratory flow, and maximum voluntary ventilation)
- Endocrine biomarkers (significant decrease in plasma cortisol concentrations in all groups and significant decrease in prolactin concentrations of workers performing high pressure cleaning)



Toxicity of Oil Spill Cleanup Chemicals

- Clean-up response to the 2010 Deepwater Horizon explosion and resulting oil spill in the Gulf of Mexico involved the application of an unprecedented 1.84 million gallons of a chemical dispersant known as Corexit to subsea and surface waters. Little was known about Corexit toxicity or its environmental impacts prior to the spill.
- Collectively, the 57 ingredients in oil dispersant products listed by the EPA as appropriate for oil spill response at the time of the Deepwater Horizon incident were shown to be a myriad of known or suspected toxins with capacity to impact every organ system of the human body: 5 are linked to cancer; 33 are potential, suspected, or known skin irritants and toxins; 33 are eye irritants; 11 are respiratory toxins; 10 are kidney toxins; 8 are reproductive toxins; 7 are liver toxins; 6 are neurotoxins; 5 are toxic to the immune system; 4 are blood toxins; 3 are associated with asthma; and 1 is toxic to the endocrine system (Toxipedia Consulting Services, 2011).
- A recent study of 247 BP Gulf oil spill clean-up workers published in the *American Journal of Medicine* found the workers were at an increased risk of developing cancer, leukemia and other illnesses; also, "clean-up workers exposed to the oil spill and dispersant experienced significantly altered blood profiles, liver enzymes, and somatic symptoms" (D'Andrea & Reddy, 2013).
- The use of Corexit 9500A dispersant during the BP cleanup increased the toxicity of exposure by up to 52 times over crude oil alone (Martinez et al., 2013).



Appendix D:
Washington & Oregon Oil Transport Routes & Oil Spill Response Plans

Conceptual Model of Potential Future Oil Movement in and out of Washington:

Figure 6: Conceptual Model of Potential Future Oil Movement into and out of Washington

Rail Routes in Oregon:

Overview of Routes in Washington and Oregon

- Primary routes and proposals include transporting tar sands oil from Canada and Bakken shale oil from North Dakota and Montana, entering Washington near Spokane. The crude-by-rail would then continue on multiple routes across the state, passing through heavily populated cities and towns and along the entire I-5 Washington corridor. The trains will travel along dozens of rivers and streams including the Columbia River and past resource-rich areas including farmland, forests and the Columbia Gorge before storage near uniquely sensitive areas including city centers and a wildlife refuge, before export to refineries via marine vessels along the Pacific coast.
- Final refinery and/or export destinations in Washington include Bellingham (Phillips 66 Ferndale Refinery and BP Cherry Point), Anacortes (Tesoro Refinery and Shell Puget Sound), Tacoma (US Oil & Refining and Targa Sound Terminal), Grays Harbor (Imperium Biodiesel, proposed Westway and US Development facilities), and Vancouver (proposed Tesoro Savage Project and proposed NuStar Energy terminal conversion). Crude oil tank storage facilities are proposed for Grays Harbor and Vancouver.
- In Oregon, facilities in Clatskanie (Global Partners LP) and Portland (Arc Logistics Partners LP) handle and/or store crude oil. Crude oil is not refined in Oregon. Trains carry Bakken crude oil from Washington into Oregon, then through Portland to Global Partners in Clatskanie, where it is stored and later loaded onto barges that travel down the Columbia River to the Pacific Ocean and on to Washington and California refineries. Trains carrying Utah crude oil enter eastern Oregon bound for Arc Logistics Partners LP in Portland. Trains carry Bakken oil along the Columbia River, south along Deschutes River to Bend, and then continue south to California. Oil trains travel through Portland, Salem and Eugene en route to Klamath Falls and California.
- The Washington State Department of Ecology (WA DOE) *Marine & Rail Oil Transportation Study* shows crude-by-rail train routes passing 38 heavily populated Washington cities and towns (over 3,000 people per square mile) and at least a dozen other towns with population densities of 2,500 to 3,000. A total of 93 Washington communities and at least 3 million residents live in close proximity to crude-by-rail routes (WA DOE, 2014).
- In Oregon, 88 communities, including the state's largest, have at-grade crossings over which unit oil trains operate. Nearly half a million Oregon residents reside within a half mile of these tracks. Four hundred and twenty-six at-grade crossings currently have the potential for mile-long trains to operate over them (ODOT, 2015).
- Each unit train may have 100-125 railcars, be up to 1.5 miles long and hold approximately 2.9 million gallons of crude.
- Currently there is no legal limit to the number of oil trains that can travel through Washington or Oregon in a specific timeframe, and there have been limits on public disclosure (Davis, 2014).

Responding to an Oil Spill in Washington State

- A Department of Ecology study in 2004 found that a major oil spill could cost Washington's economy $10.8 billion and impact 165,000 jobs (DOE, 2011).
- The Department of Ecology currently lists 30 Oil Spill Contingency Plans for Washington State for Facilities, Pipelines, Refineries, and Vessels. Many of these will need to be updated and adapted to incorporate new oil storage and export proposals: www.ecy.wa.gov/programs/spills/preparedness/cplan/cpmanagers.htm
- Preliminary findings of the *Marine and Rail Oil Transportation Study* reflect an overall lack

of adequate training, resources, design and regulatory oversight to properly respond to an oil spill given current proposals (WA DOE, 2014). Findings and recommendations included:

- The Facility Oil Handling Regulation, Chapter 173-180 WAC, has not been updated for spill prevention standards since 1994. Ecology should update these standards to reflect modern spill prevention procedures based on handling volume (p. 64).
- "[N]one of the current crude by rail trains are subject to requirements for comprehensive response plans." And, "[r]ailroad spills are not currently covered by state approved oil spill contingency plans…" (p. 67).
- "Equipment necessary for oil spill containment, responder health and safety monitoring and fire suppression during a crude oil emergency response are insufficient in much across much [sic] of Washington" (p. 70).
- In a survey of the state's 278 fire districts near crude by rail routes, 62% "believe that their departments are not sufficiently trained or do not have the resources to respond to a train derailment accompanied by fire" (p. 70).
- An overwhelming majority of first responders surveyed "are not aware of the response strategies or resources in place by the railroads should an incident take place" (p. 71).
- Because crude by rail transport is fairly new to the US and Canada, there are few, if any, studies analyzing the risk of accidents and spills from crude-by-rail (p. 81).

Responding to an Oil Spill in Oregon

- Oregon has not initiated a study or investigation of the state's response preparedness for potential derailments and spills at the scale of Washington, which recently published preliminary findings of the *Marine and Rail Oil Transportation Study* (WA DOE, 2014).
- A "Hazardous Material By Rail Rulemaking Advisory Committee" began meeting in August 2014 to deal with notification issues for emergency responders.
- The Chief of the Eugene-Springfield Fire Department, Randall Groves, stated that three major criteria should factor into any future rule making related to crude-by-rail: prevention and mitigation accidents, response to a derailment or fire, and recovery and clean-up after an accident. Groves' memorandum suggested that a new, uniform response plan for Oregon is anticipated but not yet available (Groves, 2014).

Furthermore, research and technology for cleaning up oil spills is still lagging despite lessons learned from recent events, as stated in the 2011 National Commission on the BP Deepwater Horizon Oil Spill and Offshore Drilling report:

> *"The technology available for cleaning up oil spills has improved only incrementally since 1990. Federal research and development programs in this area are underfunded. In fact, Congress has never appropriated even half the full amount authorized by the Oil Pollution Act of 1990 for oil spill research and development. In addition, the major oil companies have committed minimal resources to in-house research and development related to spill response technology."* (p. 269)

Additional Washington and Oregon oil spill response resources may be found on the Region 10 Regional Response Team and the Northwest Area Committee website:
http://www.rrt10nwac.com/NWACP/Default.aspx

Appendix E:
Overview of Water Pollution Risks & Sources

7. Water Pollution from Oil Contamination:

Crude and diluted bitumen oil spills resulting from train derailments, oil-loading accidents, and storage leaks pose a serious public health risk to downstream drinking water systems as well as primary Washington and Oregon food sources, including salmon and shellfish. The health risks of contamination by Bakken crude versus diluted bitumen from tar sands oil vary due to differences in toxic components as well as their environmental persistence and adherence properties. Nevertheless, significant risks to drinking water and food security are associated for any type of oil spill. Primary water pollution health risks include: A) drinking water contamination, B) damage to and loss of food sources, and C) pollution of subsistence and tribal fishing resources.

A. Drinking Water Contamination

Drinking water intake sources along the Columbia River exist in Kennewick, Longview, Pasco, and Richland. These, in addition to several inland wells and aquifers, are at risk of oil spill contamination due to the proposed transport of oil-by-rail across Washington State to the proposed Tesoro storage and loading facility in Vancouver (WA DOE, 2014).

In Oregon, residents of St. Helens and Boardman rely on the Columbia River as their primary drinking water source (OHA, 2015). A nearby oil spill could degrade their drinking water.

The US Environmental Protection Agency defines a principal or sole source aquifer as one supplying at least 50% of drinking water consumed in the area overlying the aquifer. "These areas may have no alternative drinking water source(s) that could physically, legally and economically supply all those who depend on the aquifer for drinking water" (EPA, 2012). One sole-source aquifer is located in the Spokane area (DOE, 2014), where all trains enter WA State. Environmental monitoring of drinking water safety in the face of potential oil spills should include current baseline data and levels of concern for oil and oil byproducts.

Contamination of drinking water by oil and its byproducts has the potential to persist for years and poses numerous risks to human health. Research on the health impacts of oil contamination has been largely limited to areas outside the US where significant oil spills have polluted primary drinking water sources. In Nigeria, Africa's largest oil producer and most populated nation, oil spill responses have been erratic and minimal. The United Nations Environment Programme found that families have been drinking from oil contaminated groundwater wells with carcinogenic benzene levels 900 times over the World Health Organization guidelines. They estimate clean up will take at least 30 years (UNEP, 2011).

Oil spills in Ecuador, the Niger Delta, and Kuwait have resulted in thousands of miles of land contaminated with crude oil and byproducts. Researchers found that oil ingested in these countries either directly through drinking water contamination or indirectly through consumption of oil-contaminated livestock increased the incidence of cancer and digestive problems across populations (Armstrong et al., 2001). Pregnant women who ingested oil-contaminated water in Ecuador were also found to have spontaneous abortion rates 2.34 times higher than a nearby

control group (Armstrong et al., 2002).

B. Damage to and Loss of Food Sources

Numerous communities rely on fish and shellfish from inland waterways, the Columbia River, and marine waters along Washington and Oregon's coastlines. Oil contamination from a spill during transport, storage and transfer – whether it be an inland or an ocean spill – would be extremely detrimental to the public health and economic viability of coastal wetlands, marine ecosystems, and critical food sources in our states. Immediate effects may be toxic to fish and other marine life, resulting in mass mortality. Other effects will manifest long-term, poisoning the organic substrate, interrupting food chains, and reducing the reproductive capacity of fish and shellfish exposed to oil pollution. The viability of salmon along these waterways is a specific concern.

When oil is spilled into water, the type of oil, its relative density and composition determine the rate and volume of spread into the water. An oil slick may be formed on the surface of the water, or it may be dissolved or dispersed into the water dependent upon wave currents and vessel traffic, temperature, wind force, and cleanup interventions such as the use of dispersant products. Oil containing volatile organic compounds will partially evaporate, becoming denser and more viscous, and increasing flow resistance. Eventually the oil will emulsify with particulate matter and sink, the remainder forming sticky tar balls, which then decompose from light exposure (photo-oxidation) and biodegrade via microorganisms at the bottom of the food chain. The biodegradation rate varies based on temperature as well as nutrient and oxygen availability.

The physical and chemical properties of diluted bitumen, such as tar sands oil from Canada, in the case of a spill include greater probability of sinking or submerging into water, increasing in the presence of sediment and turbulence. This makes diluted bitumen spill risk of greater concern in rivers such as the Columbia due to larger sediment volumes, shallower depths, and higher currents. Polycyclic aromatic hydrocarbons (PAHs) from diluted bitumen that reaches streams and rivers could have a significant adverse effect on spawning fish (WA DOE, 2014). When considering the safety of fish and seafood in the event of an oil spill, ongoing contamination in the Gulf of Mexico from the BP spill offers evidence of oil's detrimental health effects on fish and marine life, for which BP has been fined federal penalties up to $13.7 billion under the Clean Water Act (Guardian, 2015).

Another public health concern regarding ocean spills and food safety is current federal risk assessment levels for seafood contamination. A 2012 evaluation examined the Food and Drug Administration's (FDA) risk criteria for accumulated polycyclic aromatic hydrocarbons (PAHs) in seafood after the BP spill. As stated previously, PAHs accumulate in the food chain and are known carcinogens and developmental toxicants. The evaluation found that PAH levels of concern set by the FDA for Gulf shrimp after the BP spill were 53% higher than recommended for vulnerable populations such as pregnant women and children (Rotkin-Ellman et al., 2012).

C. Pollution of Subsistence and Tribal Fishing Resources

Current oil transport proposals present potentially significant public health implications for tribal lands and fishery habitats. Fisheries associated with tribes' Usual and Accustomed Areas (U&A) are at significant risk. The 2014 preliminary findings from the Washington State Marine & Rail Oil Transportation Study stated, "Nearly all of the 29 tribes of Washington State and several bordering tribes have the potential for impacts related to either rail and/or marine incidents associated with the crude marine and rail transportation and associated facilities in their traditional use areas, ceded lands, or treaty U&As" (WA DOE, 2014, p. 37).

Long-term health impacts after the 1989 Exxon Valdez oil spill to the Alaskan fishing community of Cordova, Alaska, where 50% of the economy was comprised of commercial fishing, included significantly higher levels of social disruption and psychological stress as a result of the disturbance in their food source and livelihood (Curry et al., 1992; Gill & Pico, 1996). Post traumatic stress disorder (PTSD) was also found to be higher in native Alaskan families who had subsisted on natural resources and land contaminated by the spill (Palinkas et al., 2004). Many of the tribal nations living in Washington and Oregon near proposed oil transport and storage sites are renewable resource communities similar to native communities in Alaska, for whom fishing is not only an income source but also a primary food source and a major component of cultural identity.

Appendix F:
Summary of Health Risks from Climate Change

8. Climate Change-related Injury and Disease:

Beyond the more apparent hazards of oil transport, storage and export, there is an undeniable connection between increased fossil fuel usage and its impact on climate change and health. The science is clear that the earth is warming and that people, through the burning of massive quantities of fossil fuels, are the main cause of this rapid increase in global temperatures. Heat trapping and warming temperatures are a result of increases in atmospheric greenhouse gases, which efficiently absorb heat from the earth's surface and prevent outgoing thermal energy from radiating back into space. The crude oil carried by trains into WA and OR, when eventually burned, will significantly add to an already dangerous burden of greenhouse gases being emitted into the atmosphere.

Numerous studies, reported in leading scientific and medical journals, show that ongoing changes to our climate are correlated with: changes in rainfall patterns; worsening heat waves; an increased frequency and magnitude of extreme weather events, droughts, and fires; a rise in sea levels; increased potency of allergens; and the spread of infectious diseases – all of which pose a real and serious threat to human health. Unless global carbon emissions start to fall within the next decade, we can expect to see further and more drastic changes in our climate, and related adverse health impacts all over the world.

Populations that could be most vulnerable to health impacts of climate change include those with:

- Demographic vulnerability: People with existing illnesses, people with disabilities, older adults, mothers, infants, children, people with low socioeconomic status, linguistically or socially-isolated populations, immigrants and refugees, communities of color, and American Indians
- Occupational vulnerability: Wildland firefighters, outdoor workers, growers, ranchers and farmworkers, emergency responders and health care workers
- Geographic vulnerability: Urban and suburban areas, coasts, steep slopes, and private water systems (Haggerty et al., 2014)

Health Impacts of Increased Ground Level Ozone

- Ground level ozone increases with hot weather, vehicle and diesel exhaust, gasoline vapors, and other outdoor air pollutants. Ground level ozone is known to irritate the respiratory tract, cause premature aging of the lungs, and has been linked to the development of asthma and exacerbation of existing asthma cases. In fact, people who spend more time being active in the outdoors working or playing are at greater risk for adverse health effects from ozone exposure than those who spend more time inside or are sedentary (McConnell et al., 2002; Gent et al., 2003).
- Asthma currently affects over 9% of Washington adults (ages 18 and older), and over 110,000 youth in Washington suffer from asthma. The Centers for Disease Control ranks asthma prevalence in Washington State residents as higher than the national average. In 2010, $73 million was spent on hospitalization costs for asthma-related illness in Washington. Asthma is the primary cause of school-age absenteeism nationally and is

associated with reduced quality of life, depression, and suicidal ideation (WA DOH, 2013).

- In Oregon, an estimated 10.8% of adults and 7.8% of children have asthma. Oregon has a higher burden of asthma than the overall US and was among the top six states with the highest percentage of adults with asthma in 2011. Children 0-4 years and females have the highest rates of asthma hospitalizations. In 2011, the total cost of asthma hospitalizations was more than $28 million, with an average of over $14,000 per hospitalization (Garland-Forshee & Gedman, 2013).
- The University of Washington's Climate Impacts Group has estimated that ozone levels will rise due to climate change and increases in train, auto, bus, and truck transportation in the state. Ozone levels are expected to increase by 16% in Spokane County and 28% in King County by midcentury (2045-2054) from 1997-2006, increasing the risk for deaths by cardiovascular disease, asthma, and lung cancer. They also estimate an increase in ozone-related deaths by 17% in Spokane County and 27% in King County during the same time period (Jackson et al., 2010).
- Health related costs of current ozone air pollution nationally were an estimated $6.5 billion in 2008 and will continue to rise without change in regulatory controls (Knowlton et al., 2011).

Health Impacts of Increased Extreme Weather Events and Wildfire

- Extreme weather events with associated injuries are already being witnessed globally. Precipitation extremes including heavy rainfall, flooding, and droughts are projected to increase in all regions of the US (IPCC, 2012).
- Floods account for approximately 98 deaths per year in the US and are the second deadliest of all weather-related hazards (Ashley & Ashley, 2008; NOAA, 2012).
- Steep slopes and intense rainfall can trigger landslides that result in injury and death.
- Smoke from wildfires is associated with cardiopulmonary disease, ischemic heart disease, asthma, bronchitis, pneumonia, cancer and motor vehicle crash injury (Haggerty et al., 2014).

Health Impacts of Shifting Disease Ranges

- Climate change is associated with the spread of vector- and water-borne disease and illness. Vectors such as fleas, ticks, and mosquitoes transmit pathogens that cause diseases including Lyme, dengue fever, West Nile virus, and Rocky Mountain spotted fever.
- Large-scale weather shifts in temperature, precipitation, and humidity can result in vector adaptation or geographic expansion, increasing the number of people at risk for acquiring vector-borne diseases.
- Water-borne illnesses such as pediatric gastrointestinal infections have also been associated with extreme weather events, large-scale flooding, and water source contamination (Luber et al., 2014).

Food Security and Vulnerable Populations

- An anticipated decline in crop yields, livestock, and fish production from extreme weather, changes in rainfall patterns, and ocean acidification is predicted to raise global food prices, resulting in food shortages.
- Elevated atmospheric carbon dioxide is also associated with decreased plant nitrogen concentration, resulting in decreased protein content of existing plants.
- Mental health disorders and anxiety around climate-related disease and illnesses are an additional concern for health care providers (Luber et al., 2014).
- Air pollution and climate change will continue to disproportionately affect minorities and lower socio-economic populations both in the US and worldwide. Those least responsible for the atmospheric content of carbon and other pollutants are positioned to bear the most significant brunt of their ill effects, including increased respiratory and infectious illness, extreme weather events and food shortages.

Medical Approach to Climate Change: The Precautionary Principle

The Intergovernmental Panel on Climate Change unequivocally states that a substantial and ongoing reduction in greenhouse gas emissions is necessary to prevent further imbalances in earth's climate and subsequent climate-related disease and illnesses (McCoy & Hoskins, 2014). As medical doctors and healthcare providers, we firmly invoke The Precautionary Principle in consideration of proposed substantial expansion of crude oil transport and storage projects. The Precautionary Principle – a substantial component of public and environmental health practice – states: "should an activity raise threats of harm to human health or the environment, precautionary measures should be taken even if some cause and effect relations are not fully established scientifically" (Wingspread Conference, 1998).

The proposed increases in oil-by-rail transport and storage projects in Washington and Oregon externalize massive long-term threats to human, environmental, and economic health in our states in favor of short-term financial incentives. The reality of these projects in their totality pose significant risks to the health and livelihood of future generations and the viability of our planet.

Subject: [User Approved] PSC Fossil Fuel Zoning Testimony

Dear Portland PSC Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing implementation of its November 2015 Fossil Fuel Policy.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to:

-Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

-An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the fight against climate change. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland can remain at the forefront of

addressing the most pressing concern of our time.

Sincerely,
Sheelagh Oliveria

Dear Portland PSC Planning and Sustainability Commission,

What a relief that you voted for the November 2015 Fossil Fuel Policy. It makes me feel safer, and more in line with what we need to do to combat climate change.

Then I found out you are looking at making some exceptions. No, that makes no sense.

Large or small, a new fossil fuel terminal is a new fossil fuel terminal. You voted to actively oppose new fossil fuel infrastructure.

A new fossil fuel terminal, even a small one, or a multitude of small ones would allow the more fossil fuel trains, with the resulting dangers like what happened in the Gorge.

Since NW natural has no plans now, when you make this exception, it sounds like you are encouraging them to make plans for more LNG storage - but that is against the 2015 Fossil Fuel Policy. Allowing smaller ones would allow them to have multiple ones that would be the same as a big one. Making the exception for small size makes no sense.

What would help is to encourage more safety improvements at the current bulk fossil fuel terminals, especially if they enlarge. That makes sense.

It is a relief to be a citizen of the City of Portland, a leader in addressing the important fuel issues here in Portland. Stick to the original purposes and ideals that you made with the 2015 Fossil Fuel Policy. Stay a leader. Do not let that leadership drain away by allowing exceptions for small terminals that add to the danger to us as citizens.

Sincerely,
Helen Ost

Subject: Testimony on fossil fuels for today's September 13, 2016 hearing.

Welcome to the Socialist Republic of Portland: A city where there is a code change being put forward to outlaw the opportunity for good paying jobs in the energy industry; where in an industry that supports nearly ten percent of the jobs nationwide, automobile ownership and usage is being overtaxed to subsidize costly alternative transport mode infrastructure for freeloaders; and where homelessness is on the rise because the increasing costs of housing and the bloating of government through ever increasing taxation is out pacing the incomes of the working class.

If the social engineering policy makers truly want to reduce the use of fossil fuel, they need start by city government setting the example. This must include eliminating the entire city fleet of automobiles - most of which are utilized in single occupancy service by our public servants, and restricting air travel, or better yet even banning air travel by public and elected city officials.

Individual airline miles traveled - one seat on an airliner has a similar carbon footprint to driving a modern car the same distance. Two round trips to Washington, DC or one round trip to Europe have about the same carbon footprint as an average motorist who drives ten to twelve thousand miles per year. Therefore it is hypocritical to campaign against the use of fossil fuels and then simply jump on an airplane and fly across the country or overseas. Maybe the flights in and out of PDX should be capped with the airport placed on a diet.

And don't forget about the protesters that bring media attention to themselves with their disruptive antics and civil disobedience. They hang from bridges using nylon ropes flying nylon flags, paddle around in the water using plastic kayaks and canoes, and pedal their bicycles on asphalt all of which are made of petroleum and fossil fuel products. They often arrive at those protests in their petroleum fueled Escalades and

trucks hauling their bicycles and plastic flotillas.

The city is continually running out of other people's money to spend and wanting to increase taxes even more just to keep the mounting costs of existing social engineering programs on track. Given the increasing amount of homelessness coupled with lack of good paying jobs that are both directly related to an unfriendly business climate, the day of unsustainable social engineering policy making is just around the corner if not already here.

The simple fact is that we need fossil fuels today and in the near term foreseeable future to keep the economy moving forward. It is shortsighted and pretentious to create city codes that will be detrimental to and have a negative impact on both jobs and the economic health of the region.

Respectfully submitted,

Terry Parker

To the City of Portland:

Please, I urge you to amend the proposed draft to based on the fossil fuel goals that were in the resolution last fall. This plan enacts a full ban on all new fossil fuel terminals, large or small with an exception for new facilities that are 5 million gallons or less unnecessary. The plan strengthens restrictions on expansions allowed at existing facilities through adding binding limits in the City's non-conforming use review process. It also includes the prevention of any aggregate increase in fossil fuel infrastructure in Portland.

The City of Portland needs to fulfill their promise of its historic fossil fuel resolution to keep our environment healthy and green. Backing down from this crucial promise means the death of our vision for Portland's fossil fuel goals. Please do not let this happen.

Sincerely,

Jennifer Parks, 7706 SW Barnes Rd., Unit C, Portland, OR 97225

Subject: PSC Fossil Fuel Zoning Testimony: I want a Full Ban!

Dear Members of the Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the

regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Jim Plunkett
7112 SW53rd
Portland, OR 97219

Chair Schultz and Commissioners,

Thank you for the opportunity to speak to you today. My name is Sandy Polishuk. I'm the Divestment/Reinvestment Team Coordinator at 350PDX.

The City has placed the Carbon Tracker 200 on their do-not-buy list. The Carbon 200 is the list of 200 public companies holding the vast majority of listed coal, oil and gas reserves, reserves which must be 'kept in the ground' if we are to have a livable climate for our children and grandchildren.

Under the Paris Accord world governments agreed to set limits on carbon emissions which will mean that 80% of the world's current reserves remain untapped and underground forever, becoming stranded assets. So it turns out the City's decision is also an excellent act of fiduciary responsibility.

The resolution before you today also recognizes the critical nature of the climate crisis. It makes perfect sense that if Portland is no longer invest its cash in fossil fuel, it will also cease investment in fossil fuel infrastructure. Any new or expanded infrastructure will also become a stranded asset as we will need to abandon it as we move into the renewable energy world of the future.

I urge you to propose a full ban on **all** new fossil fuel terminals, with no exceptions, and to strengthen restrictions on expansions allowed at existing terminals with binding limits as well as criteria for safety and climate impacts. Please help us prevent any aggregate increase in fossil fuel infrastructure in Portland. It's what best for our health, our safety and our pocketbooks.

Subject: enact a full fossil fuel ban

Members of the Planning and Sustainability Commission,

Thank you for your hard work on our city's fossil fuel policy. The draft is a good beginning. However, it falls far short of the bold intention of the 2015 resolution when it allows new construction of terminals up to 5 million gallons. 5 million gallons of LNG or Bakken Crude would require transport through our cities and rural areas--an exceedingly dangerous process the City of Portland sought to alleviate via this ban. For examples of this, there is no need to look in the past to the horrific spill in Mosier or the the explosion in north Portland that killed the oil transport worker and launched a massive fire. Just this week there have been two pipeline spills--one in Texas and one in Arkansas--and yet another train derailment and spill, this time in Canada. We cannot risk another accident here in Portland--not only for the damage to the natural beauty of our area and the potential contamination of our water--but also for the longterm health risks to the workers doing the clean-up and containment and the communities adjacent to the transport lines and facilities, most of whom are the most vulnerable in Portland--poor and people of color.

Additionally, storage of these fuels--especially in the expanded terminals allowed for in this draft--does not fulfill the intention of the ban, which sought to improve safety and seismic durability.

It is time to make a real transition away from fossil fuels and Portland is poised to lead the country in this process. Please ban ALL new fossil fuel terminals. And, at existing terminals, please focus work on safety--worker safety at the terminal, and safety for all citizens, through reviewing climate impacts and strengthening seismic durability.

Please follow the true intention of the 2015 fossil fuel ban, by strengthening the fossil fuel

zoning amendments.

Thank you so much,

Diana Rempe, PhD

Testimony:

Dear Commission Members,
I would like to suggest changes to your draft of the Fossil Fuel Terminal Zoning Amendments:
1. Do not make an exception for new storage facilities under 5 million gallons. The rules should apply to all terminals.
2. Existing terminals should become a non-conforming use and therefore any expansion of a terminal would have to go through a non-conforming use process.
3. The non-conforming use review process should be strengthened by adding climate impacts and safety criteria.
4. Total fossil fuel infrastructure increases should not be allowed. Don't allow the industry to build many small facilities that in total will be above the current infrastructure.

September 13, 2016

Dear Members of the Planning and Sustainability Committee,

Audubon Society of Portland (Audubon) appreciates the opportunity to comment on the draft Fossil Fuel Terminal Zoning Code Amendments (Amendments). We urge you adopt amendments that are strong, clear and fully meet the objectives laid out in the historic Fossil Fuel Resolution (Resolution #37168) that was passed unanimously by the Portland City Council last November. While this was an historic statement on the importance of preventing further expansion of our existing bulk fossil fuel infrastructure, it ultimately will only be as effective as the amendments that are adopted to implement it.

Audubon strongly supports that approach taken by the City in the draft amendments which would make bulk fossil fuel terminals a prohibited use and require that existing fossil fuel terminals be treated as a non-conforming use subject to a Type II nonconforming use review. We believe that prohibiting bulk fossil fuel facilities on the basis of the risk that they present public health and safety is one which is clearly supported by the science and also one which is clearly within the City's purview to regulate through the land-use process. It utilizes well established designations (prohibited uses and non-conforming uses) that are clear, familiar and well tested in our community. Finally, and most importantly, with limited modifications delineated below, it substantially achieves the goals that were strongly supported by the community and adopted by the Portland City Council. We appreciate the work that the City has done to date to develop these amendments.

We strongly urge the City not to back away from this approach as is being advocated by some Fossil Fuel interests. Specifically we urge the City not to eliminate the Type II process that would be required for expansion of local faculties for expansion to meet local demand and instead replace it with either allow existing facilities a blanket allowance to expand up to 10% beyond the existing capacity on the date of adoption of these amendments or allow existing facilities a blanket allowance to expand up to 10% beyond the existing capacity on the date adoption plus allow additional expansions through the conditional use permitting process (options 2B and 2C in the September 9, 2016 Memo from Staff). Neither of these approaches in consistent with the City Council Resolution which would only allow expansion in order to meet regional demand. Options 2B and 2C would functionally allow existing facilities to expand for any reason at all, regardless of whether or not it is tied to regional demand.

We reject arguments that the non-conforming review process would result in too much work for city staff. Quite, the contrary, we believe that this situation represents a textbook case for why we have the non-conforming use process in the first place. The expansion of existing facilities represents a real and significant threat to our communities and the non-conforming use process is the mechanism that the city in place to ensure that prohibited uses do not expand unnecessarily and that the public has adequate opportunity to engage in these decisions.

We do not believe that non-conforming use process would lead to excessively onerous work for the Bureau of Development Services (BDS). First, there are relatively few existing bulk fossil fuel facilities in Portland (11) so the number of non-conforming use applications would be limited. Second, most applications would be non-controversial and would simply result in a staff review. Third, those applications that are controversial deserve the extra scrutiny that a Type II process offers---again, these facilities pose serious risks to our communities and it is specifically for these types of situations that we have a public review process in place. We urge you to retain the Type II review process for non-conforming uses to address proposed expansions of existing fossil fuel terminal facilities—it provides an existing, understood and effective pathway that will allow expansions consistent with the objectives of the resolution and amendments, but provide the public with recourse in the event that those objectives are not achieved.

Additionally we would recommend the following improvements to the proposed amendments which we believe will allow it to better achieve the objectives of the resolution:

1) Significantly reduce the new fossil fuel facility threshold of 5,000,000 gallons: This threshold is meant to allow expansion or new facilities to meet regional fuel needs. However, the City provides no rational for setting the threshold at 5,000,000 gallons beyond simply asserting that a 5,000,000 gallon facility is too small to serve as a bulk terminal. We disagree. 5 million gallons represents almost 120,000 barrels of oils which is enough to fill nearly two unit trains. We believe that the threshold is set far above what is necessary to achieve this objective and creates significant opportunity for fossil fuel providers to create infrastructure to serve much broader objectives which go beyond the intent of the fossil fuel resolution. It could also promote significant expansion in the number of dangerous oil trains passing through Portland placing our communities real and direct risk. We recommend substantially lowering this threshold to less the 2,000,000 gallons, which is less that the capacity of a single unit train (50,000 barrels/ 2.1 million gallons). This would still allow facilities to meet regional need but minimize the likelihood of fossil fuel providers gaming the system and triggering significant increases in the number of oil trains passing through our communities.
2) Add additional review criteria to the non-conforming use review for existing facilities by including criteria that address public safety and climate change impacts. We support the amendments that have been submitted by 350PDX to address these concerns.

We urge you to move forward with the draft amendments including the two recommended changes in this letter.

Thank you for your consideration of these comments.

Respectfully,

Bob Sallinger

Dear Portland PSC Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing implementation of its November 2015 Fossil Fuel Policy.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to:

-Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

-An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the fight against climate change. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland can remain at the forefront of

addressing the most pressing concern of our time.

Let's go for it! And be a model to the rest of the country and the world.

Sincerely,
Sasha Samuels

Testimony:

Portland hails itself as a green leader in a fossil fuel dependent economy. It would be the height of fatalistic hypocrisy to allow new fossil fuel infrastructure to be built and further entrench our dependence on fossil fuels when the first thing we need to accomplish is to be able to move away from them. A full ban and further restrictions are the only options to decrease our fossil fuel dependency, give a boost to a green economy, and mitigate the disastrous effects of climate change.

Subject: submitting comments on Fossil Fuel Infrastructure Code Changes

Dear PSC,

Please accept my comments below on the Fossil Fuel Infrastructure Code Changes hearing:

Please hold true to City Council's wise vision that was voted for unanimously last year in regards to the building of fossil fuel infrastructure in Portland: a full ban on the building of new fossil fuel terminals in our city!

Please keep their historic and visionary decision and vote INTACT. From the turnout at City Council discussions and votes - and from seeing the public turnout here today, its clear:

Portlanders don't want these dangerous shipments to and from these facilities moving through our community, nearby communities, the Columbia Gorge, along our rivers - and we don't want these dangerous and hazardous fuels stored within our community either.

Please regulate all fossil fuel terminals in the city as non-conforming use and make all changes or expansions at terminals in all city zones undergo non-conforming use review processes.

Please modify codes to require all storage terminals to make seismic upgrades that will keep our community safe.

Please require all city reviews of how terminals operate to include strict criteria for considering:
- public safety/risk
- seismic safety/risk
- potential risk to waterways and public safety while the products these terminal will hold are

being transported to and from terminals
- climate change impacts both to our community and to the global community caused by the use of these fossil fuels

Please substantially reduce the storage capacity threshold of 5 million gallons for ALL current or future fossil fuel terminals in our city. I oppose allowing existing facilities to increase their storage capacity by 10%.

Please prevent fossil fuel companies and their subsidiaries from being able to build, modify or aggregate a number of smaller terminals.

I urge you to listen to our community and our City Council who have made our desire clear to leave these dirty and dangerous fossil fuel products behind – and ban the building of new fossil fuel infrastructure.

Our community- and the global community - are counting on the wisdom of groups such as this one - to move us forward towards a more positive approach to energy sources. We need decision-makers to be brave, bold and innovative – we (including you!) are the people we have been waiting for to build a wiser, cleaner, healthier future.

Thank you,
Dawn Smallman

Subject: PSC Fossil Fuel Zoning Testimony: I want a Full Ban!

Dear Members of the Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the

regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Jane Stackhouse
2643 NE 43rd Ave
Portland, OR 97213

I'm Don Steinke from Vancouver.

Therefore They are bringing

The fossil fuel industry sees our local ports as the shortest pathway to Asia. ~~We currently have~~ 16 oil trains per week ~~traveling~~ through the Columbia Gorge. One year ago, the Los Angeles City Council voted unanimously to oppose 5 oil trains per week.

voted to place

A month ago the Spokane City Council ~~placed~~ a measure on the ballot banning oil trains and uncovered coal trains. Immediately BNSF took out a full page ad condemning the action. The Council removed the proposal from the ballot but some council members are considering a plan B.

BNSF

They wrote a letter cosigned by councilmembers from Mosier, and Edmonds WA. It appeared in the Seattle Times a week ago. It said:

We applaud those jurisdictions with control over oil-terminal expansions that have passed ordinances that don't allow crude oil terminals, such as the cities of Hoquiam, Aberdeen and Vancouver.

And we greatly appreciate the work of Whatcom County to implement a moratorium on any new permit applications as it considers a more permanent solution.

In contrast to this, your proposed zoning laws could allow more crude oil trains to come through Mosier and Portland.

You should not enable more fossil fuel trains to come through the Columbia Gorge to a terminal in Portland. In Vancouver we are fighting NuStar which proposed to handle 1 million gallons of crude oil per day, and you ~~seem willing~~ proposal would to allow storage of 5 million gallons.

The treaty tribes of the Columbia Gorge are adamantly opposed to coal and oil trains through the Gorge. Many of their councilmembers are right now in North Dakota blocking a pipeline to protect the water.

Don't accept any more fossil fuel project applications unless the treaty tribes have first approved the project.

You don't want ethanol terminals either. The NTSB says that ethanol trains are just as dangerous as crude oil trains. Your own Fire Department was maxed out on May 4, 2011, when a log fell off another train and caused an ethanol train to puncture and catch fire.

Russia's Prime Minister Medvedev has ordered all gas stations to install charging stations at their own expense, by November of this year.

Don't allow any expansion of the fossil fuel industry in Portland. We cannot transition off of fossil fuels if we invest more in fossil fuel infrastructure.

Testimony:

Time is short for addressing climate change. A recent study by NOAA says that we may see a 3 meter sea level rise by 2050-2060. That is much sooner than the IPCC report which is now much out of date. This amount of sea level rise will create hundreds of millions of climate refugees. There is much other evidence indicating the severity of our collective circumstances. At this point, the situation is so severe, that concerns over a companies profits are of no meaning. It is like the point in a disaster movie when everyone finally realizes that catastrophe has struck. Business as usual then comes to an end. We are already at that point. The usual considerations must be set aside and extraordinary measures taken. This is exactly what the science is telling us.

I want the City of Portland and the Planning and Sustainability Commission to:

1 - Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

Subject: PSC Fossil Fuel Zoning Testimony: I want a full ban!

Testimony:

Dear City Council,

I was so proud of our city when, last year, we showed our commitment to a clean energy future and passed the ban on new fossil fuel infrastructure. Portland is my home, and part of why I love it so much is because every day I see evidence that we are a community dedicated to social and environmental justice. We are willing to embrace the need to change our ways and move off of unsustainable fossil fuels.

Now the time has come to enact that ban, and our actions need to be as strong as our words. Every day we delay taking strong action, we create more difficult and complex climate challenges for all those who come after us. That is why I urge you to enact a full ban on all new fossil fuels. Allowing an exemption for smaller new facilities undermines the power of the ban both practically and symbolically. Similarly, if we do not strengthen limits on existing facilities, we will not only allow continued disastrous impacts on the climate, we send the message that solving this problem can be done slowly, step by step.

We are long past the time for slow and steady change. We need to be bold. Those of us living now are already seeing the impacts of climate change through more extreme weather, increased temperatures affecting crops and loss of biodiversity, and the many social effects of destabilized societies. All those who come after us will have to live with the results of the choices we make today. Let's make the strongest, bravest choices we can, to end fossil fuel dependence now, with no new fossil fuel terminals and no expansions to a dying industry.

Thank you for your leadership.

Subject: [User Approved] PSC Fossil Fuel Zoning Testimony

Dear Portland PSC Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing implementation of its November 2015 Fossil Fuel Policy.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to:

-Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

-An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the fight against climate change. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland can remain at the forefront of

addressing the most pressing concern of our time.

Sincerely,
Ann Turner

Climate Solutions
PRACTICAL SOLUTIONS TO GLOBAL WARMING

September 13, 2016

Portland Planning and Sustainability Commission
1900 SW 4th Ave. Suite 7100
Portland, OR 97201

RE: Draft Rule for Fossil Fuel Terminal Zoning Amendments

Dear Commission Members,

We write in **strong support of moving forward with the Draft Rules with proposed modifications as detailed below.** Climate Solutions is a regional non-profit working to accelerate practical and profitable solutions to global warming. For more than 15 years, Climate Solutions has been working to implement energy efficiency, renewable energy, and carbon reduction policies that demonstrate that clean energy and broadly shared economic prosperity go hand-in-hand. The City of Portland has long reflected the bold leadership and thoughtful attention to fair and effective climate solutions that we support. We are excited that the City is taking this important step to align its investments with its values and its commitments to climate action.

While the Draft Rules are a strong attempt to act on the City Council resolution, the following would improve the strength and impact of the rules in a way that furthers the City Council intent. Please consider including these modifications to the Draft Rules:

1. **We support the alternative proposed by staff to prohibit new bulk terminals.** We also support the staff alternative that existing terminals may not exceed 10 percent of the total terminal capacity. In the event that that the Commission should disagree with those approaches and prefer to have a permitting pathway for new bulk terminals, we propose that the threshold for such new terminals be limited to 2 million gallons and not 5 million gallons. That smaller amount would allow for some flexibility while minimizing potential gaming of the system or the chance for multiple 5 million gallon facilities being built going forward.
2. Condition any permit approval for a new or expanded facility with the following:
    a. Include a condition that the permit holder may only operate the facility as described in the application. For instance, if an applicant claims they will store and export ethanol only, then clearly state it would be a violation of the permit to switch to storage and export of a fossil fuel. This would help prevent the bait and switch that increasingly is occurring around the country. It also is consistent with other siting/permitting regulations such as the Oregon Energy Facility Siting Council which requires a site certificate holder to go through the amendment process if they alter the operations from what was described in their site certificate application.

b. Include a condition that the permit holder submit annually to the City of Portland a letter describing the operations and what is stored in tanks and any difference between the current operations and what was described in their permit application.
c. Include a condition that the City may inspect the facility at any time to ensure that the tanks are being used to store the same fuel described in the permit application.

Thank you for your leadership,

David Van't Hof

Working Waterfront
COALITION

September 13, 2016

Portland Planning and Sustainability Commission
City of Portland
1900 SW 4th Avenue, Suite 7100
Portland, OR 97210

Subject: Proposed Draft of Fossil Fuel Terminal Zoning Amendments

Dear Portland Planning Commissioners,

The Working Waterfront Coalition (WWC) opposes the proposed Fossil Fuel Terminal Zoning Amendments, (draft dated August 12, 2016). The WWC and several of its members have repeatedly met with City of Portland representatives as these amendments moved from concept to draft code language. The WWC continues to oppose any zoning code amendment that would make existing multimodal fuel terminals nonconforming uses, or that would in any way limit these critically important energy facilities from serving as a distribution hub for the region, the state and for other states in the Pacific Northwest.

We further agree with the comments contained in the September 7, 2016 letter from Frank Holmes, Director of the Northwest Region of the Western States Petroleum Association (WSPA) to the Portland Planning and Sustainability Commission (PSC), and adopt his comments as our own.

We note that we are in receipt of an email from Steve Kountz dated September 12, 2016 transmitting a memo from Steve Kountz and Tom Armstrong dated September 9, 2016 to the PSC, indicating that Bureau of Development Services (BDS) has confirmed what the WWC has been saying for several months, namely that "expansions of existing terminals may not be possible through a nonconforming situation review." In response to this fundamental flaw, Mr. Kountz mentions two concepts, which he refers to as the "Limited Use" alternative and the "Conditional Use" alternative. These alternatives are not discussed in any detail in the related memo, nor is any specific code language proposed in support of these alternative. In essence these "alternatives" are mere concepts. Accordingly, we have nothing of substance to review in that regard. If the PCS is interested in exploring these alternatives proposed by the Bureau of Planning and Sustainability (BPS), the WWC requests that this hearing be continued for a period of at least 30 days to allow staff to prepare proposed code language to support these alternatives and for stakeholders to have a meaningful opportunity to review and comment on the resulting code language. Thank you for your continued attention to this important matter.

Sincerely,

Ellen Wax

Ellen Wax, Executive Director
Working Waterfront Coalition

Established in 2005, the Working Waterfront Coalition, with its extensive knowledge of harbor industry needs and active industry participation, is dedicated to working with its partners to ensure an appropriate balance between environmental concerns and the needs of river-related, river-dependent employers. Portland's Harbor is a vital employment area: home to thousands of valuable high-wage, high-benefit jobs. In addition, WWC members are conscientious stewards of the environment, making significant investments in the harbor consistent with state and federal laws.

Denise Weller

Portland Planning Commission,

The proposed plan for fossil fuel terminal zoning as written allows expansion on existing facilities, allows facilities to add new tankage and infrastructure as long as it is within their current facilities footprint.

This does not conform with resolution 37168 which opposes expansion of infrastructure whose primary purpose is transporting or **STORING** fossil fuels in or through Portland or adjacent waterways.

Nor does it address PBEMS recommendations for seismic risks.

Resolution 37168 states "Whereas:

- tribal communities in Ore. and Wash .have expressed concerns about the safety risks of fossil fuel infrastructure and the related threats to human health, cultural heritage, and environmental quality
- economic opportunities presented by expanding fossil fuel infrastructure are modest, with few jobs and little added value when compared to the related environmental costs
- the 2015 Climate Action Plan commits the city to continue to advance policy and programs to reduce fossil fuel use both in the city's own operations and through community-wide initiatives
- oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways
- fossil fuel infrastructure poses considerable risks in the event of a major earthquake

Therefore, be it resolved that the city of Portland will actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or throughout Portland or adjacent waterways.
Be it further resolved, this resolution is binding City policy."

The proposed fossil fuel zoning plan advocates expansion of fossil fuels facilities.Expansion through height or within footprint boundaries of existing fuel storage facilities does not comply with this resolution

[Type text]

Besides the impending Cascadia Subduction Zone Earthquake, there are three other earthquake fault lines that run under and adjacent to the tank farms.

According to DOGAMI the area of Linnton / Willbridge tank farms are on liquefiable soils.

In the event of an earthquake the tank farms are at great risk for sliding into the adjacent waterways. Thereby contaminating the Willamette River and the Columbia River

There are fire risks. In the event of an earthquake the shaking of the tanks particularity the floating lidded gasoline tanks and the very evacuation of the fuel from the tanks create sparks that will ignite the fuel, cause explosions. Linnton is the most at risk neighborhood for wildfires according to the Portland Fire Bureau, with Forest Park and the residential areas and the St Johns Bridge adjacent to the tank farms, the risk in dollars and lives would be substantial and catastrophic. Also fire risks from accidents such as the RR car accident a few years back where a traveling train slightly derailed and tore a fuel RR tanker stored on the tracks causing a huge fire. This was only minutes from happening in Linnton where the tanks are located and explosive chemicals are continually stored some as close as 25 feet from Linnton's daycare center. The recent tanker truck accident next to the LNG tank at Gasco, is another example of dodging a bullet for a catastrophic event. If there had been a more volatile chemical in the RR tanks the LNG tank would have exploded causing a quarter mile blast area, that means a quarter mile hole and everything within that quarter mile disintegrated, including the tank farms causing a domino effect of ignition, the St Johns bridge, Linnton, Forest Hills Park, and the Liquid hydrogen tank stored at Siltronics which has its own blast area that would severely affect St Johns. As it turns out even though the RR tanks did not catch on fire the instruments were affected that control the super low temps that the LNG needs to be kept at, a good reason to not allow expansion of the LNG tank. Numerous other accidents associated with the tank farms over the years have put residents at risk.

The tank farms are located in an insanely hazardous location, way too close to the river, extremely susceptible to homeland security issues, on liquefiable soils, are an eventual environmental catastrophe, and have health and safety risks for the residential neighborhoods of Linnton and St. Johns and NW Portland.

I am commenting today to remind all – all those whose job it is to oversee the planning and progress of Portland - This City, this Land, this Planet – I am here to remind you that we are stewards of this Earth. A steward is someone who has the job to protect and manage. It is the duty, then, to figure out what is best for the individuals, the town, and even the land itself and to use that knowledge to make plans and policies that will sustain those things. Like a 3 legged stool, all three must solidly exist. One not being more important than another.

Take the work of a farmer. A farmer knows that the goals of achieving a plentiful crop require care of the land. A crop that is planted might grow wonderfully the first year – but if the seeds are not saved, or if the soil is not cared for properly, successive years of abuse or neglect yield diminishing crops to an exponential degree.

Take the fisherman or the hunter. Those who hunt and fish know that

a catch that empties the waters or clears the lands of the animals, is not sustainable. There is no future in hunting to extinction. Leaving enough wildlife behind ensures the future of the animal – but moreover – the ability to continue to hunt and fish in the years to come.

It is the responsibility of these people, who already intimately know the delicate balances they live around and among, to maintain that balance. They do it because they already know that to not do so, is disastrous. City folk, who have spent much time removed from nature, often forget there is a delicate balance. They live in a contrived world where it is easy to believe they are the masters of all resources – that there is an endless supply of whatever they should want. But it simply is not so.

Fossil Fuels have had their time. When the science was new, we did not know the ramifications of using this finite resource. We only saw the benefits of our new crop. But we are older and wiser, now. It is important to the health of our world, that we stop using fossil fuels. It is important to this city, that we make planning choices that protect our city, and moreover, our planet. So when big business comes knocking, looking for a place to set up their business where money is paramount to environmental ethics, please give them a loud "no" for an answer. Our health depends on it. Thank you.

Subject: PSC Fossil Fuel Zoning Testimony: I want a full ban!

Testimony:

Dear PSC,

I applaud the creation of a fossil fuel ban and together with 350PDX would suggest the following amendments to the current draft code:

Enact a full ban on all new fossil fuel terminals, large or small.

Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.

Prevent any aggregate increase in fossil fuel infrastructure in Portland.

sincerely,

Marilyn ZORNADO

I live on a houseboat DOWNSTREAM from the "Tank Farms" on Hwy 30.

Portland needs to phase out ALL storage of fossil fuels on the banks of the Willamette. Currently the tanks are located on soil predicted to "Liquify" in an earthquake, spilling a toxic cocktail of fossil fuels into the river, endangering humans and wildlife. Start now to move fossil fuels OFF the River!

Dear Portland PSC Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing implementation of its November 2015 Fossil Fuel Policy.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to:

-Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

-An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the fight against climate change. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland can remain at the forefront of

addressing the most pressing concern of our time.

Absolutely no ban on fuel movement, and lessen other restrictions.
The City should be working in every way to promote commerce, especially since the Port of Portland shipping business is evaporating.
Pipelines should be built to move oil and other petrochemicals with the resulting commercial growth.

Subject: [User Approved] PSC Fossil Fuel Zoning Testimony

Dear Portland PSC Planning and Sustainability Commission,

Last year, when our Portland City Council voted to dedicate our city to a new fossil fuel infrastructure policy, I was very proud to be a citizen of a city that can serve all other cities in this nation as a model of what we must do to leave to our grandchildren a livable world. Now I am writing to urge the City of Portland live up to the high standards set forth in its November 2015 Fossil Fuel Policy. We must not back away in the smallest detail from those standards. And, as I read the current proposal, we are in danger of backing away from a major intent of the 2015 policy statement.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to:

-Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

-An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel

shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the fight against climate change. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland can remain at the forefront of addressing the most pressing concern of our time.

Sincerely,
Stephen Bartlett

Portland, OR 97217-7968

NW Natural®

Planning and Sustainability Commission
1900 SW 4th Avenue, Suite 7100
Portland, OR 97201

September 12, 2009

Members of the Planning and Sustainability Commission,

NW Natural appreciates the opportunity to provide comments on the BPS Zoning amendments. NW Natural has been operating in Oregon since 1859 and now provides natural gas to over 700,000 customers in the region; 167,000 of these customers are located in Portland.

We hope the comments below help the PSC better understand the regulatory process under which NW Natural operates, and the inherent limits this process places on the Company's LNG facility in Portland. We hope that a more granular understanding of the regulatory process will assuage any concerns you have about LNG infrastructure expansion, and request that you consider excluding the property from classification as a bulk fossil fuel terminal.

Background: According to the Fossil Fuel Terminal Zoning Amendments Proposed Draft, the City Council adopted Resolution 37168 in November 2015, which opposes expansion of fossil fuel infrastructure, except for safety improvements, service to end users, and infrastructure that accelerates transition to non-fossil fuel energy. The 2035 Comprehensive Plan (Policy 6.48) also calls for limiting fossil fuel distribution and storage facilities to those necessary to serve the regional market.[1]

NW Natural's Business: NW Natural is a local distribution company (LDC) that provides natural gas directly to end users in Oregon and Washington. Throughout the region, the Company owns pipelines that carry gas to homes and businesses for water and space heating, cooking, and industrial processes.

NW Natural Environmental Values: NW Natural takes climate action very seriously. Pipeline replacement is the number one strategy for reducing greenhouse gas emissions from the LDC system: the Company took early action and, with the completion of our pipeline replacement program in 2015, we can now claim one of the tightest local distribution systems in the country. Additionally, Smart Energy was one of the first voluntary emission reduction programs offered by an LDC. The Company also joined the U.S. EPA Natural Gas Star Methane Challenge in March 2016 as a founding member. Under this program, companies adopt best practices and report reductions to the EPA annually.

How NW Natural is Regulated: NW Natural operates by a fairly unique set of rules because we are a state-regulated monopoly that provides a necessary service. The Oregon Public Utility Commission (OPUC) carefully monitors and regulates the Company's actions to protect ratepayers through rate

[1] Fossil Fuel Terminal Zoning Amendments Proposed Draft, August 12, 2016. Page 23. www.portlandoregon.gov/bps/article/586612

proceedings, audits, and the Integrated Resource Plan (IRP) process[2], a complex modeling exercise NW Natural is required to produce every 2 years to demonstrate how the Company plans to meet customer demand. The Citizens' Utility Board (CUB), a residential customer advocacy organization, the NW Industrial Gas Users Association, and environmental advocates actively engage in the regulatory processes at the OPUC, in order to ensure customers are protected and to monitor NW Natural's actions with respect to climate and efficiency goals.

The regulatory process is multifaceted; as such, there are requirements on the Company to provide reliable service, as well as rules that guide how NW Natural infrastructure can be used today and in the future. Our LNG tank exists at the intersection of these regulations: the facility ensures that NW Natural can provide reliable service to its customers. NW Natural's planning processes demonstrate that the fuel is needed to meet customers' peak demands in instances where the region may experience high loads, during events such as cold weather. This purpose and function of the tank is a central part of NW Natural's portfolio of resources, and is a topic of its Integrated Resource Planning.

It is important to note that any changed use or expansion of the facility would be vetted through processes at the OPUC. These processes are open to the public, and closely monitored and followed by a variety of outside groups – including those mentioned above – and the OPUC's professional staff.

Issues with Non-Conforming Use Designation: The designation of the facility as a non-conforming use creates consequences not intended by the original resolutions, which specifically exempt service to end users and storage facilities to those necessary to serve the regional market. Facilities designated as a nonconforming use can find it difficult to attract investment or credit to make alterations or upgrades, including safety upgrades, particularly when they are subject to discretionary review processes.

For instance, any upgrades to the facility – seismic, safety, or otherwise – will be considered more risky because they might trigger a Type II Discretionary Land Use Review. This kind of review is highly subjective and may make it more difficult and expensive to invest in the kinds of upgrades the city seeks to incent. Additionally, there are state policies in place that incent the use of LNG in river barges and heavy duty fleets in order to displace more carbon-intensive fuels like diesel. Even if NW Natural received approval for such a project from the OPUC, the non-conforming use designation would create additional cost and uncertainty, and might prohibit NW Natural from providing LNG to those end users.

Preferred Language: Since NW Natural is regulated by the OPUC through transparent processes that include stakeholder engagement opportunities, and since the intent of the original resolutions sought to exempt service to end users and service to the regional market, we request the code avoid classifying the facility as a "bulk fossil fuel terminal." We have included language below to this effect that would fit on page 23 under *"Exceptions that are not Bulk Fossil Fuel Terminals."* Such a carve-out would impact only NW Natural and would not create a loop-hole for other terminal owners and operators.

<u>Proposed Language</u>	*Any facility operated by a public utility and regulated by the Oregon Public Utility Commission under ORS Chapter 757 for the purpose of ensuring fuel reliability to direct users through an interconnected system.*

[2] Oregon Administrative Rules 860-027-0400. "... "Integrated Resource Plan" or "IRP" means the energy utility's written plan satisfying the requirements of Commission Order Nos. 07-002, 07-047 and 08-339, detailing its determination of future long-term resource needs, its analysis of the expected costs and associated risks of the alternatives to meet those needs, and its action plan to select the best portfolio of resources to meet those needs."

Secondary Approach: If the PSC is unable to exempt our facility, we ask that an additional section be added to the zoning code that deals specifically with bulk fossil fuel terminals as a non-conforming use. To ensure fairness, a separate code section should be drafted because the existing code does not implement the intent for a fair process, as professed in the staff report, and the staff report relies too much on the Council Resolution, which is not codified, and is not part of the zoning code.

We do not have sample language at this time, but as an example, the PSC should consider the following:

- If a change in law would impose technical or engineering requirements that would curtail capacity and ability to serve customers, modifications to maintain capacity and service should be allowed outright as a matter of regulatory entitlement.
- For repair and maintenance, the code should explicitly prohibit the City from using such measures as an opportunity to curtail or impose costly upgrades.
- Changes in related or supporting facilities or accessory uses should be allowed upon a showing of no increased public safety risk.
- Changes in intensity of uses – through efficiency and upgrades – that allow greater throughput also should be allowed upon demonstrating no increased risk to public safety.

Again, we appreciate the opportunity to offer comments on this proposed draft. We are happy to answer any questions you may have.

Sincerely,

Gary Bauer

Subject: [User Approved] PSC Fossil Fuel Zoning Testimony

Dear Portland PSC Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing implementation of its November 2015 Fossil Fuel Policy.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to:

-Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

-An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the fight against climate change. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland can remain at the forefront of

addressing the most pressing concern of our time.

Sincerely,
Jo Beall

addressing the most pressing concern of our time.

We could even become more progressive and put solar panels on every city building, and require all new construction in this city to have solar panels on the roof. We could offer discounted services for solar panels being installed on the rest of the rooms on this town, make it a work program for people who are unemployed to teach them skills, and make this is solar city. There are so many things we can model for the rest of this country and make such a large difference in our environment. We can sponsor living trees as the preference for Holiday trees and plant them all over the city. We can do a lot to make a difference here and Portland has the means to put the legislation in place locally to be an example for the whole country. And we have the will of the people here on our side. Thank you for listening. Thank you for going forward with these ideas as well.

Sent: Monday, September 12, 2016 4:40 PM
To: Planning and Sustainability Commission <psc@portlandoregon.gov>
Subject: PSC Fossil Fuel Zoning Testimony

I am writing to ask that the City of Portland amend the proposed draft to reflect the city's fossil fuel goals:

- Enact a full ban on all new fossil fuel terminals, large or small. An exception for new facilities that are 5 million gallons or less is unnecessary. The City's code changes should not allow more unit trains of dangerous fossil fuels like Bakken crude oil.
- Strengthen restrictions on expansions allowed at existing terminals by adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.
- Prevent any aggregate increase in fossil fuel infrastructure in Portland.

I, like many Portlanders, live very close to train tracks that carry fossil fuels now. It is a question of when, not if, our neigborhoods will be dealing with a disaster like our friends in Mosier just endured. They were so very lucky that the Gorge winds were still that day...a real miracle. They blow hard in Northeast Portland too. We should not expect the miracles to happen every time.

Thank you.
Sincerely,

Subject: [User Approved] PSC Fossil Fuel Zoning Testimony

Dear Portland PSC Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing implementation of its November 2015 Fossil Fuel Policy.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to:

-Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

-An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the fight against climate change. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland can remain at the forefront of

addressing the most pressing concern of our time.

Sincerely,
Alicia Cohen

RE: **Fossil Fuel Terminal Zoning Amendments, Proposed Draft**

Since the 1950's the League of Women Voters has worked at federal and state levels to protect air, land and water resources. More recently, the League has lobbied vigorously for comprehensive legislation to control global climate change. Any increase in fossil fuel infrastructure is not consistent with the current League of Women Voters natural resources and climate change positions, or with Portland's Climate Action Plan.

The Proposed Draft allows for the expansion of capacity in existing terminals within their current sites and for the construction of an unlimited number of 5 million gallon fossil fuel facilities. And, although the 2035 Comprehensive Plan would *limit* fossil fuel distribution and storage facilities to those serving the regional market, the plan does not *require* that we continue to rely on fossil fuels for anticipated future growth.

Your own Proposed Draft document acknowledges the velocity with which we must transition from fossil fuels on p.19: "The lower-carbon fossil fuels do have appeal as a bridge to widespread use of renewable energy, but investments in major infrastructure typically take decades to recoup, and the transition to renewables needs to go much faster than that to stabilize global emissions."

90% of Portland's industrial areas have moderate-to-high liquefaction susceptibility in a major earthquake. There is almost no safe, seismically stable industrial land on which to site further growth of fossil fuel terminals and facilities in the city of Portland.

We echo the concerns expressed in the Proposed Draft, that "Substantial local investment in fossil fuel infrastructure and large new terminals could hinder local growth mo-

mentum in Clean Energy industries."

Family wage jobs can be grown in the emerging renewable energy sectors.

Burning fossil fuels for energy to supply the needs of an increasing regional population is counterproductive in its adverse impacts on climate and increasing mitigation costs on local, national and global scales. When governments in the United States are spending billions to respond to disasters intensified or directly caused by climate change (wild fires, extreme heat "events," drought, sea level rise contributing to storm and tidal surges), a commitment to the rapid transition to non-fossil fuel energy sources is crucial.

In light of this, the League of Women Voters of Portland believes that increasing capacity for fossil fuels in the city of Portland is contrary to our long-range goal of combating climate change. We must invest in energy sources that don't emit greenhouse gases and in the grid capacity to utilize them efficiently.

If "Cities Lead," we want to head in the right direction!

Subject: [User Approved] PSC Fossil Fuel Zoning Testimony

Dear Portland PSC Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing implementation of its November 2015 Fossil Fuel Policy.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to:

-Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

-An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the fight against climate change. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland can remain at the forefront of

addressing the most pressing concern of our time.

Sincerely,
Pati Gallagher

Testimony:

No new fossil fuel anything anywhere in Oregon! As a native Oregonian I feel our beautiful state should lead the way in eliminating all fossil fuel businesses and encourage other states to follow our example. Show the nation and the world that we care about the future of our children, grandchildren, and the future of the planet! Oregon rocks!!!

Sent: Monday, September 12, 2016 6:02 PM
To: Planning and Sustainability Commission <psc@portlandoregon.gov>
Subject: PSC Fossil Fuel Zoning Testimony: I want a full ban!

Testimony:

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes closer to the original intent of the 2015 Resolution.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland". Although this draft prohibits new larger bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine).

While this proposal will mark any bulk terminals as 'non-conforming', it still needs to strengthen the regulations on the size and type of expansion to pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

I want the City of Portland and the Planning and Sustainability Commission to:

1 - Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

2 - Remove the exception for new facilities that are 5 million gallons or less which would

allow more unit trains of dangerous fossil fuels like Bakken crude oil.
Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

3 - Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.

4 - Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

September 12,2016
Testimony Portland Planning Sustainability Commission regarding bulk fossil fuel facilities

Presenter: Patrick Jones Vice-president Northwest Heigths Neighborhood Association speaking as an individual

Members of the Commission:

Most large Metro areas have at least two gas, oil, petrol terminals. Almost all of Portland's storage/distribution resources are located on sand fill between the railroad bridge and the St Johns bridge. In the subduction zone quake the geologic base will fail as the base liquifies causing destruction of the tank farm and as a rep from Wacker Siltronics stated - we will see a massive and toxic fireball and that will completely destroy the infrastructure and us. So when the first responders, hospitals, gas stations run out of fuel for vehicles and generators, well....that's it.

So a responsible city governance would mitigate risk by creating a redundancy which means new hardened storage and distribution facilities
This proposed city action seems to a) preclude construction of new hardened facilities b) give the major multinational distributors every excuse to not make the essential improvements required so that after quake the rebuild of the whole region can take place. This proposed action is an expansion in scope of the efforts to block the construction of major coal and fracking oil terminals which I completely support. I do not support the careless expansion of scope which may put all of our futures at risk.

The availability to have access to fuel after the quake is also a regional concern, and development of redundant or replacement facilities should be carried by a regional entity such as Metro, the Port of Portland or the State. I urge the commission to look at unintended consequences which in this case could be drastic. There is no guarantee that Portland would be able to recapture its vitality if the resources needed to rebuild have not been secured.

Dear Portland PSC Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing implementation of its November 2015 Fossil Fuel Policy.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to:

-Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

-An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the fight against climate change. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland can remain at the forefront of

addressing the most pressing concern of our time.

Sincerely,

Subject: PSC Fossil Fuel Zoning Testimony: I want a full ban!

Testimony:

I was so proud of my city in the fall when city council passed the resolution banning all new fossil fuel infrastructure. I originally moved to Portland because it was known as a leader on climate issues, and it has mostly lived up to that. This resolution was a major step in the right direction, and showed the kind of environmental leadership that I've come to love about this city.

I appreciate the work that the Bureau of Planning and Sustainability has done during the process of shifting the resolution toward policy. The most current draft represents significant progress from the first version. That being said, I feel that there is still more work to be done:

1) There should NOT be an exception for facilities under 5 million gallons. First of all, that is still a huge amount of fossil fuels. Secondly, The resolution originally stated that we would "actively oppose" fossil fuel infrastructure, not allow loopholes for more of those facilities to pop up, as long as they're smaller.

2) There should be stronger language to prevent expansion of existing terminals. The lack of such language would represent another loophole by which fossil fuel infrastructure could grow within our city.

Portland has long been a leader in climate action. I love that about my city. Please continue to take bold action by making this policy binding and strong.

Thank you,
David Kennedy

Subject: PSC Fossil Fuel Zoning Testimony: I want a full ban!

Testimony:

Enact a full ban on all new fossil fuel terminals, large or small. An exception for new facilities that are 5 million gallons or less is unnecessary. The City's code changes should not allow more unit trains of dangerous fossil fuels like Bakken crude oil.
Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.
Prevent any aggregate increase in fossil fuel infrastructure in Portland.

Dear Portland PSC Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing implementation of its November 2015 Fossil Fuel Policy.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to:

-Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

-An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the fight against climate change. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland can remain at the forefront of

addressing the most pressing concern of our time.

Sincerely,
Walter Lichtenberg

Hello,

Thank you for your comments to the Planning and Sustainability Commission. For your testimony to be officially part of the public record, it does need to include your mailing address (including house or PO number). Without this information, the City is not able to send you notification of Council hearing dates or the Council's final decision, and you may not be able to appeal the Council's final decision.

So that I may include your comments in the record and forward them to PSC members, can you please email me your mailing address?

Thanks,
julie

I am writing to ask that you enact a ban on any new fossil fuel terminals in Portland, regardless of size. I also ask that you prohibit any further development of fossil fuel infrastructure. More infrastructure or expansion of existing infrastructure will lead to more oil trains going through the Columbia River
Gorge National Scenic Area.
We have seen what happened with the oil train derailment in Mosier. We can't ever let this happen again!
Thank you.

Subject: PSC Fossil Fuel Zoning Testimony: I want a full ban!

Testimony:

To: Portland Planning and Sustainability Commission
Re: Fossil Fuel Terminal Zoning Amendments

The City of Portland has the opportunity to take a historical stand by enacting a full ban on new fossil fuel terminals.

Human use of fossil fuels is causing global climate change. Due to rising temperatures, there are more severe weather systems, infectious disease are spreading beyond their usual latitudes, and rising temperatures are threatening our water supplies and food production. For those of us with chronic conditions such as emphysema and heart disease, rising temperatures are compromising our well being and will make our day-to-day existence more and more intolerable. All of us want a world which is safe and secure for ourselves, our children, and generations far into the future. For this to happen, we must act now to stop the expansion of fossil fuel use.

We as a city need to do our part in these ways:
-Enact a full ban on all new fossil fuel terminals, large or small.
Remove the exception for new facilities that are 5 million gallons or less which would allow more unit trains of dangerous fossil fuels like Bakken crude oil. We do not need new LNG storage in Portland.
-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.
-Add language to prevent smaller related "terminals" from clustering and aggregating to

increase fossil fuel shipments through Portland.

Thank you for allowing we the public to voice our concerns.

Respectfully submitted,
Patricia Mizutani, MD

Subject: [User Approved] PSC Fossil Fuel Zoning Testimony

Dear Portland PSC Planning and Sustainability Commission,

Please, let's not backslide from our November 2015 Fossil Fuel Policy.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to:

-Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

-An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the fight against climate change. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland can remain at the forefront of addressing the most pressing concern of our time.

Sincerely,
Donna Murphy

RE: Comments for PSC Fossil Fuel Terminal Zoning Amendments Hearing

Dear Commissioners,

Please accept these comments from the Columbia Pacific Building Trades Council (CPBTC) regarding the Planning and Sustainability Commission's Fossil Fuel Terminal Zoning Amendments Draft. CPBTC is an organization that represents 25 different crafts, including: heat and frost insulators, boilermakers, brick and stone masons, cement masons, electricians, elevator constructors, glaziers, ironworkers, laborers, linoleum and carpet layers, operating engineers, painters & tapers, plasterers, plumbers, pipe fitters and steamfitters, roofers, sheet metal workers, sprinkler fitters and teamsters.

Last fall, CPBTC testified in opposition to the City Council's anti-fossil fuels Resolution No. 37 166 because of the unintended consequences of blocking any new fossil fuel infrastructure and the impact that will have on the men and women of the CPBTC and the region's economy as a whole. This past July, we also submitted comments on the Bureau of Planning and Sustainability staff discussion draft. We are extremely disappointed with the current draft because it totally ignored CPBTC's input and double downs the impact to the existing fossil fuel infrastructure by designating them nonconforming uses.

Fossil fuels are a lot more than the gas we pump into our cars. They fuel the jets we fly, the farms that grow our food and the trucks that deliver everyday products. They fuel industrial processes and heat our homes, businesses, schools and hospitals. Our entire economy and way of life depend directly on reliable and cost-effective fuel sources. Even as we pursue alternative energy strategies, fossil fuels will remain crucially important for decades to come.

Allowing existing fossil fuel infrastructure to enhance capacity would increase our energy independence by reducing reliance on fossil fuels from potentially unstable foreign sources, including Iraq, Russia, Venezuela and other countries. Beyond enhanced energy independence, these projects would generate thousands of new jobs, millions in economic activity and additional tax revenue to fund education, health care, transportation and other valuable public services here in the region.

It's also important for the future of our region to at the fossil fuel terminals be allowed and encouraged to update and modernize their facilities to improve safety, efficiencies, and environmental impacts. These projects create family-wage jobs, generate new revenue for public services and support important public policy goals, such as lowering carbon emissions and

seismic resiliency. The proposed zoning changes will also impede the region's ability to pursue economic development projects.

Additionally, based on our review of the Commission's draft, we strongly believe that the proposal does not align with regional (Metro), state and federal policy. The draft fails to provide for the economic assessment called for by Resolution. Finally, the timeline for implementing the proposed amendments is too aggressive and does not allow for thoughtful discussion to address the many concerns.

Thank you for the opportunity to comment on the Fossil Fuel Terminal Zoning Amendments Draft. If you have any questions, please contact me at 503-318-7691.

Sincerely yours,

Willy Myers

Dear Portland PSC Planning and Sustainability Commission,

Your diligent effort and transparency in pursuing implementation of its November 2015 Fossil Fuel Policy is so hopeful. What is needed is absolute integrity in the drafting of the actual policy and implementation of it so that the spirit and the body of it reflect the historic stand that this city took in late 2015. Keep in mind that the age of fossil fuel is over. It is killing us! Doesn't that simplify what you must do to protect this city's citizens?

Anything less is prevarications, replicating the Congress we have in Washington.

Please me resolute that the following safeguards and limitations are met:

-Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

-An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

To: Planning and Sustainability Commission <psc@portlandoregon.gov>
Subject: PSC Fossil Fuel Zoning Testimony: I want a Full Ban!

Dear Members of the Planning and Sustainability Commission,

I absolutely want to see NO transporting or storing of fossil fuels in or through Portland or adjacent waterways. One spill in the Columbia River, one underground water source poisoned, one explosion that reaches a town, or schools, etc. is too horrendous to contemplate. Fossil Fuels = poison. They MUST be phased out, not further developed.

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy

was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Dear Planning & Sustainability Commission,

Dear Member of the Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways."

Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Nora Polk

Please amend the proposed fossil fuel draft to reflect the city's fossil fuel goals:

- Enact a full ban on all new fossil fuel terminals, large or small. An exception for new facilities that are 5 million gallons or less is unnecessary. The City's code changes should not allow more unit trains of dangerous fossil fuels like Bakken crude oil.
- Strengthen restrictions on expansions allowed at existing terminals by adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.
- Prevent any aggregate increase in fossil fuel infrastructure in Portland.

I live in the Columbmia River Gorge in The Dalles. I witnessed the explosion of oil trains in Mosier earlier this summer. I do not want fossil fuels traveling through this beautiful and protected area as well as exposing residents and visitors to this terrible hazard. We need to rely more on renewable resources and I have recently seen large windmill blades traveling by train to the interior as we have for many years. Let's get solar going too and other methods. Stop supporting dangerous fossil fuels which are polluting out earth! My power is 100% wind. Thank you. Jan Polychronis

Dear Portland PSC Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing implementation of its November 2015 Fossil Fuel Policy.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to:

-Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

-An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the fight against climate change. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland can remain at the forefront of

addressing the most pressing concern of our time.

Sincerely,
L. Michael Pope, S.J.

Dear Portland PSC Planning and Sustainability Commission,

I know the rest of this is one of those "canned" letters from an environmental activist group but it's as heartfelt as what I'm about to say first. I was there during the passage of that moments and seminal measure. I watched as Michael _____ promised to implement this measure into legalese that fit the gravity of the vote and the importance of the issue. Well, sort of thank you Michael but your job was not to be the judge and jury of what should and should not be part of prohibited activities. Your job was to make a City Code provision that echoed the sentiment and the words each councillor and mayor spoke as they all cast YEA votes. What you have presented almost end runs their entire effort and a smart guy like you should have known better.

Thank you for the diligent effort and transparency with which the City is pursuing implementation of its November 2015 Fossil Fuel Policy.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to:

Subject: PSC Fossil Fuel Zoning Testimony: I want a Full Ban!

Dear Planning and Sustainability Commissioners,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy.

The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways."

As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

I wish to thank the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland City Council supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways."

Although the PCC draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (e.g., rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

* Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

* Create an exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

* Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

* Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,
Alastair Roxburgh

Subject: [User Approved] PSC Fossil Fuel Zoning Testimony

Dear Portland PSC Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing implementation of its November 2015 Fossil Fuel Policy.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to:

-Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

-An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the fight against climate change. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland can remain at the forefront of

addressing the most pressing concern of our time.

Sincerely,
Daniel Sims

addressing the most pressing concern of our time.

Just today, September 12, 2016 there was a train of tanker cars several miles long on the track that parallels NE Lombard. Unless they are empty and on the way out, they should not be there. I thought oil trains had been stopped after the derail and spill east of Mt Hood town. This is why I was surprised to see a train of tankers.

Subject: PSC Fossil Fuel Zoning Testimony: I want a Full Ban!

Dear Members of the Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the

regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Subject: PSC Fossil Fuel Zoning Testimony: I want a full ban!

Testimony:

Hello, My name is Danny thiemann. I am a poverty law attorney in the Hillsboro area, but I live and vote in portland. My clients tell me that warmer summers cause them greater heat stress as they work outside, where temperatures in the sun can reach 15 degrees warmer than the temperature listed in the newspaper for that day. Warmer summers also cause parents who move around for work to pull their children out of school earlier than planned as unseasonably temperatures change job start dates that no longer coincide with the school year. These warmer summers are linked to Oregons warmer climate and I recommend you enact a fossil fuel infrastructure policy that is as strong as possible to reduce impact of climate change on poorest workers. Oregon, unlike California, does not have heat stress protections. Please strengthen restrictions on fossil fuel infrastructure.

Thank you!!

Portland, OR 97206

September 12, 2016

Dear Planning & Sustainability Commission,

Dear Member of the Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways."

Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Sincerely, Satya Vayu

To: City of Portland Planning & Sustainability Commission

Subject: Bulk Fossil Fuel Terminal Zoning Amendments

Esteemed Commissioners:

Thank you for the opportunity to submit testimony on the proposed Zoning Code amendments covering Bulk Fossil Fuel Terminal (BFFT) Zoning amendments submitted by the City of Portland Bureau of Planning and Sustainability (BPS) on 12 August 2016, with suggested revisions per Memorandum dated 9 September 2016.

This testimony addresses Sections 2 and 3 of the 9 September 16 Memorandum which involve "Regulating existing terminal expansion" and "Additional review criteria" respectively. It also addresses the serious issue of terminal aggregation, wherein the fossil fuel industry submits a number of connected small facility proposals that individually meet size limitations but in aggregate exceed them.

- **Regulating existing terminal expansion**

The City of Portland Building and Development Services (BDS) Department reports that requiring expansion of existing terminals to undergo Non-conforming Situation Type II "would be difficult to approve." As a result of this feedback, BPS is recommending that the original Zoning amendment proposal be revised to *"allow limited expansion of existing terminals to not exceed 10 percent of the total terminal capacity"*.

This revision to the original zoning amendment should be rejected for two reasons:

1. **Expansion of existing fossil fuel infrastructure <u>should</u> be difficult to approve.** The City's Resolution #37618 was adopted for the express purpose to *"Oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways."* The recommendation to classify BFFT as Non-conforming Uses is a correct and appropriate method of achieving the goal stated in Resolution #37618. Any revisions to the Code which would facilitate - rather than inhibit -expansion of existing fossil fuel infrastructure would stand in direct contradiction to the City Resolution. Allowing limited expansion of facilities up to 10 percent of capacity without land use review would facilitate expansions and thus should not be adopted. Funding for any additional staff and/or consultant time required by BDS to process fossil fuel expansion applications should be borne solely by the applicant.

2. **Proposed revision gives BFFT preferential treatment.** No other Use category in Nonconforming Situations is allowed to expand up to 10 percent of existing capacity without Land Use Review. The proposed revision gives unwarranted preferential treatment to a category of Uses, specifically BFFT. Furthermore, the 10 percent expansion threshold is completely arbitrary on the part of the City and has no basis in any other legally adopted

standard; it is based solely on the reluctance of BDS to see an increase in work load. Adoption of this revision could expose the City to a LUBA challenge.

- **Additional review criteria**

The review criteria for Nonconforming Situation Review included in the current version of the Zoning Code were developed to evaluate primarily changes to Residential and/or Commercial Nonconforming Uses, especially Commercial Uses in Residential Zones. As a result they address the types of compatibility issues typically presented by these types of Uses, e.g. noise and traffic. Given the severity of impact that BFFT pose to surrounding properties, the current review criteria alone are inadequate to address the serious threats presented by BFFT. Resolution #37168 includes the following findings:

  - *Fossil fuels pose risks to safety, health, and livability, including mobility of people, other freight, and other commercial vehicles;*
  - *Fossil fuel infrastructure poses considerable risks in the event of a major earthquake;*
  - *The extraction and combustion of fossil fuels are significant sources of greenhouse gas emissions and major contributors to climate change and pollution;*
  - *Crude oil, including oil derived from the Bakken shale reservoir, is known to be volatile, highly flammable and to contain elevated levels of benzene, a potent carcinogen; and*
  - *Given the record of crude oil and coal or other fossil fuel transport accidents, such as Lac Megantic in 2013, the 1999 Bellingham pipeline leak or a coal train derailment, an event could have catastrophic effects if it occurred in any of Oregon's populated areas.*

Thus it is not only appropriate and necessary, but legally justified to impose stricter review criteria on applications to expand the Nonconforming Situation review criteria only for BFFT. The additional review criteria that need to be taken into consideration are: (1) impact of increase in greenhouse gas (GHG) emissions and climate change, (2) impact of potential fire and/or explosion, and (3) impact of potential release of fossil fuels into the Columbia River and/or any tributary waterways.

The addition of these review criteria for BFFT would allow for proposed expansions that involve either facilities used for mixing of clean fuels and/or seismic upgrades to existing facilities, as net decreases in either GHG emissions and/or risk of explosion and fire in the event of an earthquake could justify approval of the request.

Lastly, BDS asserts that if additional review criteria are adopted, because "they do not have staff expertise to implement discretionary land use review criteria addressing greenhouse gas emissions or safety impacts of hazardous material storage and transportation," BFFT "applicants would be required to hire specialized consultants to show compliance of the particular criterion." This is both necessary and appropriate, as justified by the above listed findings from Resolution #37168. Furthermore, BDS notes that this would be inconsistent with Comprehensive Plan Policy 6.16 Regulatory Climate. The additional criteria would, however, be in compliance with the recently adopted Comprehensive Plan Policy on Fossil Fuel Distribution which *"Limit fossil fuels distribution and storage facilities to those necessary to serve the regional market."* Given the severity of the

impacts noted above in the City's resolution, adopting Zoning code language for BFFT that aligns with the applicable Comprehensive Plan Policy for fossil fuel distribution is of greater importance than reducing the regulatory burden on the fossil fuel industry.

Proposed language to enact these additional criteria is attached as Appendix "A".

- **Terminal Aggregation**

It is important to note a trend of terminal aggregation in fossil fuel projects, of which we have some examples in the Pacific Northwest. In BC, where nearly two dozen liquefied natural gas (LNG) export projects are in the proposal stage, the annual production of several LNG proposals would be three to four times larger than the annual production of the largest existing LNG terminal in the world. The way in which the projects would achieve these production volumes is through the aggregation of several terminals of equal size, each with its own liquefaction equipment, storage and other structures. The terminals would be geographic neighbors. Through the benefits of the project umbrella they would be greenlit under the same permits with respect to land use, pipelines, etc.

While the existing Zoning code definitions for "site", "ownership", and "development" do an excellent job of precluding this practice of small facility aggregation, there does exist opportunities for the fossil fuel industry to sidestep Zoning code prohibtions. One way would be by submitting separate applications for multiple projects, each owned by an entity that is a subsidiary of a single corporation. Another would be to separate contiguous lots by a lot or lots under different Ownership, but to connect facilities on the non-contiguous lots by easements containing pipelines, access roads, &c.

The existing Zoning code definition for "Ownership" should be revised to include the following language:

> *Contiguous lots that are owned by multiple entities that are subsidiaries of a single corporation are considered to be a single ownership. Non-contiguous lots that are Owned by the same entity and connected via an easement granted by the Owner(s) of the lot(s) located between the non-contiguous lots are considered to be a single ownership.*

This concludes my written testimony. Please feel free to contact me with any questions or concerns. Thank you for your attention to this issue.

Cordially

trish.weber@gmail.com

APPENDIX "A"

NONCONFORMING SITUATION REVIEW – ADDITIONAL CRITERIA LANGUAGE

33.258.80 Nonconforming Situation Review

A. Procedure. A nonconforming situation review is processed through a Type II procedure.

B. Approval criteria. The request will be approved if the review body finds that the applicant has shown that all of the following approval criteria are met:

1. All requests must comply with the following review criteria:

~~1.~~ a. With mitigation measures, there will be no net increase in overall detrimental impacts (over the impacts of the last legal use or development) on the surrounding area taking into account factors such as:

~~a.~~ (1) The hours of operation;

~~b.~~ (2) Vehicle trips to the site and impact on surrounding on-street parking;

~~c.~~ (3) Noise, vibration, dust, odor, fumes, glare, and smoke;

~~d.~~ (4) Potential for increased litter; and

~~e.~~ (5) The amount, location, and nature of any outside displays, storage, or activities; and

~~2.~~ b. If the nonconforming use is in an OS or R zone, and if any changes are proposed to the site, the appearance of the new use or development will not lessen the residential character of the OS or R zoned area. This is based on taking into account factors such as:

~~a.~~ (1) Building scale, placement, and facade;

~~b.~~ (2) Parking area placement;

~~c.~~ (3) Buffering and the potential loss of privacy to abutting residential uses; and Lighting and signs; and

~~d.~~ (4) Lighting and signs; and

~~3.~~ c. If the nonconforming use is in a C, E, or I zone, and if any changes are proposed to the site, the appearance of the new use or development will not detract from the desired function and character of the zone~~.~~; and

2. Because fossil fuels pose risks to safety, health, and livability, including mobility of people, other freight, and other commercial vehicles, because the extraction and combustion of fossil fuels are significant sources of greenhouse gas emissions and major contributors to climate change and pollution, and given the record of crude oil and coal or other fossil fuel transport accidents, Bulk Fossil Fuel Terminal are subject to these additional review criteria. With mitigation measures, there will be no net increase in overall detrimental impacts (over the impacts of the last legal use or development) on the surrounding area based on the following factors:

a. The effects of greenhouse gas (GHG) emissions and climate change, where:

(1) GHG is defined as the following:

- carbon dioxide,
- methane,
- nitrous oxide,
- hydrofluorocarbons,
- perfluorocarbons,
- nitrogen trifluoride,
- and sulfur hexafluoride,

(2) Both direct and indirect GHG emissions are to be considered, where

- Direct GHG emissions are emissions from the Bulk Fossil Fuel Terminal Use site, and
- Indirect GHG emissions are emissions that are a consequence of the activities of the Bulk Fossil Fuel Terminal Use site, but occur at sources located elsewhere, and

(3) Quantification tools and methodology employed is to be per the White House Council on Environmental Quality's publication *"2012 Guidance for Accounting and Reporting,"* as amended over time.

As the totality of climate change impacts is not attributable to any single action, but are exacerbated by a series of actions, a statement that emissions from a request involving a Bulk Fossil Fuel Terminal represent only a small fraction of global emissions is essentially a statement about the nature of the climate change challenge, and is not an appropriate basis for deciding the impact of climate change impacts on the surrounding area. Moreover, these comparisons are also not an appropriate method for characterizing the potential impacts associated with a request, because this approach does not reveal anything beyond the nature of the climate change challenge itself: the fact that diverse individual sources of emissions each make a relatively small addition to global atmospheric GHG concentrations that collectively have a large impact.

(b) The effects of a fire and/or explosion at either the Bulk Fossil Fuel Terminal Site or transportation equipment or infrastructure used to convey fossil fuels to or from the Bulk Fossil Fuel Terminal, and

(c) The effects of a breach and release of fossil fuels from either the Bulk Fossil Fuel Terminal Site or transportation equipment or infrastructure used to convey fossil fuels to or from the Bulk Fossil Fuel Terminal, into the Columbia River and/or tributary waterways.

(d) When considering the effects of (b), and (c), above, the likelihood of an event occurring should be evaluated in the context of the scale and severity of the deleterious impact on the surrounding area.

September 12, 2016

Dear Planning & Sustainability Commission,

Dear Planning and Sustainability Commissioners,

Thank you for the diligence and transparency in pursuing the City's implementation of its 11/15 Fossil Fuel Policy. The City's draft makes real progress towards the goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved. The proposed changes are much closer to the original intent of the 2015 Resolution. It's great to see the city making decisions that are both environmentally responsible, and responsive to citizen input.

However, I'm concerned that the current Fossil Fuel Zoning Amendments proposal still falls short. It will allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, but is undermined by new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil.

We still need to strengthen the regulations when it comes to expanding pre-existing terminals. It is unclear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

Let's make the City's policy as strong as it can be by doing the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- Get rid of the exception for new facilities that are 5 million gallons or less. WHAT LOBBYIST WROTE THAT? Allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

- Let's build in strong restrictions on allowable expansions of existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland. That's a loop hole that allows end-runs. Please!

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate change awareness movement. With these important improvements to the Fossil Fuel Zoning Amendments, Portland will once again be on the forefront addressing a critical threat to humankind of our time.

Sincerely,

Sincerely,
Steve Wheeler

Subject: [User Approved] PSC Fossil Fuel Zoning Testimony

Dear Portland PSC Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing implementation of its November 2015 Fossil Fuel Policy.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to:

-Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

-An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the fight against climate change. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland can remain at the forefront of

addressing the most pressing concern of our time.

Sincerely,
Bridget Wyatt

Testimony:

Dear Portland City Council Members,
Please fulfill the policy promise you made last year to not allow new fossil fuel infrastructure in Portland. It was a bold move that sent an important message to the entire country. You must honor that policy through the city code. We do not need an exception for facilities of 5 million gallons or less. Any expansions allowed at existing terminals must happen only for local demand and include criteria for safety and climate impacts in the non-conforming use review process.
Thank you, Lynn Youngbar

Dear City of Portland:
Thank you for your attention to this very important matter. If you haven't read Naomi Klein's book, This Changes Everything, I want to tell you the most important statement in the entire book. She says that the energy companies who want to produce this dirty energy and send it to Asia are heavily leveraged, and meanwhile the Saudis are keeping energy prices low and China is turning toward solar and other renewables in a big way. What this means is that if we can hold the line on West Coast fossil fuel terminals for just two years, that business model will DIE. It will no longer be feasible, and the U.S. government will have no choice but to turn toward renewables. We CAN win this. We need you.

Subject: PSC Fossil Fuel Zoning Testimony: I want a full ban!

Testimony:

Dear Members of the Portland City Council -

Last November, you adopted a Fossil Fuel resolution that placed Portland in the vanguard of leadership toward a future that is not dominated by carbon combustion. It was a bold and historic action. Such actions are essential if we are to have any livable future at all. It is appropriate that Portland, along with other nodes of leadership like Vermont and California, set the tone for the rest of the nation.

Now it is time for you to show integrity by adopting regulations that fully implement the clear intent of your resolution. At this critical time in the fight against impending climate chaos, any waffling on your part is unacceptable.

My testimony is simple. Please adopt strong regulations/ordinances WITHOUT loopholes and compromises.

Specifically -

(1) Enact a full ban on all new fossil fuel terminals, large or small with NO exception for smaller facilities (less than 5 million gallons).

(2) Strengthen restrictions on expansions allowed at existing terminals by adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. Strong requirements for seismic upgrades should be required for any expansions and/or modifications of existing terminals.

(3) Prohibit any aggregate increase in fossil fuel infrastructure in Portland.

Thank you for considering my testimony.

Andrew Crosby

Testimony:

The Cully Association of Neighbors represents the most diverse neighborhood in Oregon, it is dedicated to working cooperatively to build a safe and livable neighborhood. The UP tracks run through Cully and are adjacent to schools parks and homes and business, recently UP increased the number of unit oil trains running through Cully, especially at night- we request an immediate moratorium on these potentially dangerous trains and terminals that support the shipment of more Fossil Fuels. The ban on all new fossil fuel infrastructure was applauded by Cully, changing the intention and to increase of facilities allowing 5,000,000 more gallons goes in opposition of what the city of Portland passed and what Cully Association of Neighbors desires and intended.

September 11, 2016

Dear Planning & Sustainability Commission,

Dear Member of the Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways."

Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Sincerely,
Ted Dreier

Subject: PSC Fossil Fuel Zoning Testimony: I want a full ban!

Testimony:

The Fossil Fuel Terminal Zoning Amendments need to follow the original intent of the 2015 Resolution, which was to "actively oppose" new fossil fuel infrastructure. That means it should include a full ban on new fossil fuel terminals, without an exception for smaller terminals. Existing terminals must not be allowed to expand, and must be subject to review for safety and climate impacts. The Amendments should also include language that prevents existing fossil fuel facilities of any kind, whether officially designated as "terminals" or not, from being leveraged in any way to increase shipments through the Portland area. To "actively oppose" new fossil fuel infrastructure means all of these things. It does not mean to allow the infrastructure to grow in smaller increments or in previously unanticipated ways. The climate crises means that we must be putting the brakes on fossil fuel use as rapidly as we can, not further abetting or even accelerating it.

Dear Planning & Sustainability Commission,

Dear Member of the Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways."

Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Sincerely,
James Nielson

Testimony:

Hi folks,
MY name's Tim Norgren, and I'm a member of the building trades through Laborer's local 737. I know from a few YEARS of conversations with others in the trades that I speak for many other workers in the Laborers, Carpenters, iron workers, pipefitters, and operating engineers unions (as well as a few staffers) who are afraid (or too busy with kids, work, etc.) to testify openly, when I ask you to pursue nothing less than a complete ban on new or expanded fossil fuel infrastructure, regardless of the size or whether some infrastructure already exists! This should include LNG! Northwest Natural has no current plans to expand its storage capacity and if we're to transition away from a fuel that leaks so much methane it's effectively worse than coal, then there's no need to think they ever will.
I remember when earthquakes in Oklahoma were unheard of. Now thanks to fracking there are increasing levels of quakes including two this year which were over five on the richter scale! We want jobs we can feel good about; not jobs that insure more children and families like our own will be hurt in earthquakes, exposed to poisonous water, or fooled into eating crops irrigated by such water, as has been the case in California and elsewhere! To add to the risks any new or expanded infrastructure would increase volatile tanker traffic through the region as well, and that is clearly not something any of us want. Mosier was more than enough warning, and the city council has already banned such an increase.
Please insure that these bans will be tangibly effective by including binding limits and criteria for safety and climate impacts in the City's non-conforming use review process.
Thank you. Sincerely, Tim Norgren

Subject: PSC Fossil Fuel Zoning Testimony: I want a full ban!

Testimony:

Thank you very much for the work you have done to to listen to the public and make changes to your original draft of the Fossil Fuel Terminal Zoning Amendments. There is still work to be done to "actively oppose" new fossil fuel infrastructure. A FULL ban on all new fossil fuel terminals, large or small does exactly that- opposes new fossil fuel infrastructure. Allowing facilities under 5 million gallons makes no sense, in fact, it waters down the resolution and sends a message to our children that we believe the fossil fuel industry still has a right to poison their atmosphere a little bit and that continuing on a path of relying on CO2 producing energy is good for their future. Also, any more infrastructure, no matter how small, will increase the oil transportation into our city, which right now, is at dangerous levels.
In addition, we must have binding limits on future expansion of existing terminals and make safety and climate impacts on our city a priority in the non-conforming use review process.
This is our opportunity, as a city, to set an example for the rest of the world, by being bold and brave. Please make the improvements to the Fossil Fuel Zoning Amendments that send the right message to our children that their lives are worth protecting and that we are ready and excited about moving in an energy direction that demonstrates this.
Thank you.

I am writing to ask the city of Portland to amend the proposed draft re: PSC Fossil Fuel Zoning so that it reflects Portland"s fossil fuel goals.

There should be a ban on all new fossil fuel terminals without exception. Restrictions should be strengthened on expansions of existing terminals by adding binding limits as well as criteria for safety and climate impacts in Portland's non-conforming use review process. And, any aggregate increase in fossil fuel infrastructure in Portland should be prevented.

Portland is a model that many other communities in the US look up to. Please lead the way to a brighter future for our children and for our country by taking a stand against fossil fuel proliferation and by doing so, taking a stand for a better America.

With the greatest respect,

September 10, 2016

Dear Planning & Sustainability Commission,

Dear Member of the Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways."

Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Subject: PSC Fossil Fuel Zoning Testimony

Dear Sir:

Thank you for passing a historic resolution to "actively oppose expansion of infrastructure whose primary purpose is transporting fossil fuels in or through Portland or adjacent waterways".

Please amend your proposed draft to reflect the city's fossil fuel goals and remain steadfast in your commitment to prohibit dirty fossil fuel projects:

1. Enact a full ban on all new fossil fuel terminals, large or small. An exception for new facilities that are 5 million gallons or less is unnecessary. The City's code changes should not allow more unit trains of dangerous fossil fuels like Bakken crude oil.
2. Strengthen restrictions on expansions allowed at existing terminals by adding binding limits as well as criterial for safety and climate impacts in the City's non-conforming use review process.
3. Prevent any aggregate increase in fossil fuel infrastructure in Portland.

The proposed expansion would negatively impact Portland, the Columbia River, the Columbia River Gorge National Scenic Area, and four National Wildlife Refuges (Steigerwald Lake, Franz Lake, Pierce, and Ridgefield), of which I was on the management team for over 25 years.

Please assist in stopping the development of those fossil fuel infrastructures that would

negatively impact these extremely valuable and non-replaceable resources.

Thank you for your consideration of my comments.

September 10, 2016

Dear Planning & Sustainability Commission,

Dear Member of the Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways."

Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Sincerely,
Ann B Clarkson

Testimony:

It is imperative that commissioners set a standard for leadership on moving our economy off of fossil fuels as soon as possible. I urge you to ban all new fossil fuel terminals, regardless of size, strengthen restrictions on expansions of existing terminals to account for safety and climate hazards, and limit the aggregate fossil fuel structure to its current capacity. We cannot afford to be incentivizing this kind of energy activity at a time when we face such dire consequences from climate disruption. A decision to restrict fossil fuel infrastructure is a sound long-term business and public health decision.

Subject: PSC Fossil Fuel Zoning Testimony: I want a full ban!

Testimony:

It's time for Portland to take a bold stand against fossil fuel companies, and let them go the way of the dinosaur!

Enact a full ban on all new fossil fuel terminals, large or small. An exception for new facilities that are 5 million gallons or less is unnecessary. The City's code changes should not allow more unit trains of dangerous fossil fuels like Bakken crude oil.
Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.
Prevent any aggregate increase in fossil fuel infrastructure in Portland.

It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways."

Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Sincerely,
Don Jacobson

Subject: PSC Fossil Fuel Zoning Testimony

Planning and Sustainability Commission:

I am writing to request that you stop all fossil fuel transport coming into and/or through Portland. If the humans, and all other life on the planet, are to survive into the future, it is imperative that we keep all fossil fuels in the ground where they belong. The extraction, transport and use of any and all fossil fuels, including Bakken crude oil creates pollution, toxicity, and direct danger to human and other life.

Oil by rail threatens not only our communities and the health and safety of the City of Portland, it poses a dire and direct threat to the Columbia River and the Columbia River Gorge National Scenic Area. This risk was made very clear with the June 2016 derailment disaster in Mosier. Every train delivering oil to a facility in Portland would have to move through the Gorge, putting scenic, natural, cultural, and recreational resources at risk and endangering and/or eliminating the lives of humans and wild and aquatic life. In addition, it puts all life any where along the rail line at risk - and it adds to the already precarious climate crisis world wide!

As noted by Portland's Mayor, Charlie Hales, "If we are aggressive about carbon reduction, we can, city by city, make a difference."

Therefore, I am asking that you **amend the proposed draft to reflect the city's fossil fuel goals:**

- Enact a full ban on all new fossil fuel terminals, large or small. An exception for

new facilities that are 5 million gallons or less is unnecessary. The City's code changes should not allow more unit trains of dangerous fossil fuels like Bakken crude oil.

- Strengthen restrictions on expansions allowed at existing terminals by adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.
- Prevent any aggregate increase in fossil fuel infrastructure in Portland.

Thank you kindly for your consideration,

My wife and I live in Hood River and recently witnessed the train disaster occurring in Mosier. We are totally against oil trains passing through the Columbia Gorge in view of the high risks associated with this type of transfer. We encourage you to deny the railroad companies the opportunities to completely ruin one of the most beautiful parts of the US and an asset for Oregon.

(We lived in Houston, Texas for many years. For those who don't believe in the damages to the environment by oil transport, they should visit the Galveston Bay area. Oh, if you do visit that area, make certain you purchase chemicals to remove the oil globs from between your toes and on your clothes.)

Dear Planning & Sustainability Commission,

Dear Member of the Planning and Sustainability Commission,

I appreciate the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways."

Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Dear Planning & Sustainability Commission,

Dear Member of the Planning and Sustainability Commission,

I advocate for the environment because of my kids, grandkids, and great-grandkids. For me, those successive generations are not theoretical; they're already here. And I hope to leave behind a habitable planet for them, one that will sustain and support them. I know that you want the same for your loved ones. I know you want to do all you can to ensure that they are able to live in comfort on planet Earth. But in order to provide a sustainable planet, we must all make changes and must act quickly.

I'm so proud of my chosen city of residence and the leaders here who recognize the need and took action. They used the power of their position for the good of all. My wish is that all those in similar positions (across the nation and around the world) will recognize the wisdom shown by those here and follow their lead.

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make

Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Dear Members of the PSC,

Thanks for your July and August draft proposed code changes to implement Portland's landmark fossil fuel policy to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways."

While I applaud and support the changes you have proposed, I join with many groups (Oregon Physicians for Social Responsibility, Columbia Riverkeeper, 350PDX, Audubon Society of Portland, Portland Rising Tide, etc.) in requesting that additional changes be made to:

-- eliminate the exception for new projects that are 5 million gallons or less,
-- ban all new fossil fuel terminals, including those designed for liquefied natural gas (LNG) or gaseous fuel storage.

Sincerely,

Testimony:

I urge you to enact a full ban on all new fossil fuel terminals, large or small. An exception for new facilities that are 5 million gallons or less is unnecessary. The City's code changes should not allow more unit trains of dangerous fossil fuels like Bakken crude oil.
Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.
Prevent any aggregate increase in fossil fuel infrastructure in Portland.

Subject: PSC Fossil Fuel Zoning Testimony: I want a full ban!

Testimony:

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes closer to the original intent of the 2015 Resolution.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland". Although this draft prohibits new larger bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine).

While this proposal will mark any bulk terminals as 'non-conforming', it still needs to strengthen the regulations on the size and type of expansion to pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

I want the City of Portland and the Planning and Sustainability Commission to:

1 - Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

2 - Remove the exception for new facilities that are 5 million gallons or less which would

allow more unit trains of dangerous fossil fuels like Bakken crude oil.
Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

3 - Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.

4 - Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Dear Planning & Sustainability Commission,

Dear Member of the Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways."

Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Sincerely,
Sarah Prowell

Testimony:

City of Portland and the Planning and Sustainability Commission,
It is time for Portland look forward. We know fossil fuels are not part of a healthy future. The Fossil Fuel Zoning Amendments need to be strengthened. No more fossil fuel terminals of any size and no fossil fuel infrastructure of any kind should be built. The old should be phased out. There is no better town to lead the way to renewable energy than Portland. We can do this. What are we waiting for?
Sincerely,
Amy Robbins

Dear Planning & Sustainability Commission,

Dear Member of the Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways."

Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

thank you.

Dear Planning & Sustainability Commission,

Dear Member of the Planning and Sustainability Commission,

I am a systems ecologist, teacher, and I vote.

State and Federal officials will not act. Change only occurs with pressure from us. We can and will contribute to this movement.

Multnomah county acknowledged marriage equality early. Even though this was overturned it contributed to the national effort to normalize a human rights discussion.

Likewise it is important for future generations that Portland RIGHT NOW takes steps to move forward he conversation and legislation / regulation of fossil fuels.

The eyes of the nation are on Portland (albeit for different reasons.) We are going to do this - with or without you.

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its

November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Sincerely,
Andrew Stone

Dear Commission Members<
My name is Blaine Ackley and I reside at 655 NW 229th Ave. Hillsboro, OR 97124.
I urge you to ban all future fossil fuel development within the city of Portland. Also, please make any expansion of existing facilities rigorous and conscious of public safety.
My point to you is that all you have to do is look at what happened at Mosier, Oregon minor train derailment to see what horrendous disaster could happen here.
I urge you to consider the health, safety and welfare of your children and grandchildren in making this decision.
Sincerely yours,
:)Blaine Ackley

I am a citizen of Portland, OR very concerned for the health and safety of all of us here!
I wholeheartedly support the resolution passed by the Portland City Council opposing the building of new oil pipelines, terminals and any other infrastructure used by the fossil fuel industry. NO Exemptions for small Ones! Any size in totally unacceptable!
We must keep fossil fuels in the ground and get going on renewable energies! No time to waste if we are going to survive on this planet!
Thank you!

Subject: PSC Fossil Fuel Zoning Testimony: I want a full ban!

Testimony:

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes closer to the original intent of the 2015 Resolution.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland". Although this draft prohibits new larger bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine).

While this proposal will mark any bulk terminals as 'non-conforming', it still needs to strengthen the regulations on the size and type of expansion to pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

I want the City of Portland and the Planning and Sustainability Commission to:

1 - Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

2 - Remove the exception for new facilities that are 5 million gallons or less which would

allow more unit trains of dangerous fossil fuels like Bakken crude oil.
Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

3 - Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.

4 - Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,
Jody Bleyle

Subject: PSC Fossil Fuel Zoning Testimony: I want a full ban!

Testimony:

Thank you for your courageous stances and resolution on behalf of life and Earth. Please keep going, setting an example for the rest of the nation.

Enact a full ban on all new fossil fuel terminals, large or small. An exception for new facilities that are 5 million gallons or less is unnecessary. The City's code changes should not allow more unit trains of dangerous fossil fuels like Bakken crude oil.

Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.

Prevent any aggregate increase in fossil fuel infrastructure in Portland.

Testimony:

It truly is time to start downsizing the fossil fuel industry until it no longer exists...not add to it. The dangers of contamination to our rather pristine environment in the Pacific Northwest are too great to list and you are already aware of them. Please stop the expansion of terminals, downsize the existing ones with intent to close. Thank you for your interest in our environmental health.

Subject: PSC Fossil Fuel Zoning Testimony: I want a full ban!

Testimony:

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes closer to the original intent of the 2015 Resolution.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland". Although this draft prohibits new larger bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine).

While this proposal will mark any bulk terminals as 'non-conforming', it still needs to strengthen the regulations on the size and type of expansion to pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

I want the City of Portland and the Planning and Sustainability Commission to:

1 - Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

2 - Remove the exception for new facilities that are 5 million gallons or less which would

allow more unit trains of dangerous fossil fuels like Bakken crude oil.
Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

3 - Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.

4 - Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Subject: PSC Fossil Fuel Zoning Testimony

Dear Planning and Sustainability Commission:

It seems that original proposal to not allow new fossil fuel infrastructure in Portland was revised to allow more terminals afterall, and then revised with modifications that still favor the dirty energy's agenda to expand their terminals. We need be moving forward with alternative energy, not constantly kowtowing to the dirty energy industry as they recklessly destroy our planet for bigger and bigger profits.

Therefore I urge the City of Portland to amend the proposed draft to reflect the city's fossil fuel goals:
Enact a FULL ban on all new fossil fuel terminals, large or small. An exception for new facilities that are 5 million gallons or less is unnecessary. The City's code changes should not allow more unit trains of dangerous fossil fuels like Bakken crude oil.
Strengthen restrictions on expansions allowed at existing terminals by adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.
Prevent any aggregate increase in fossil fuel infrastructure in Portland.

Please stick to your original proposal and make Portland a leader in alternative energy and put the dirty energy industry on notice that they are not welcome there.

Sincerely,
Gayle Janzen

Dear City of Portland,

In regard to the PSC Fossil Fuel Zoning Testimony, please

- Enact a full ban on all new fossil fuel terminals, large or small. An exception for new facilities that are 5 million gallons or less is unnecessary. The City's code changes should not allow more unit trains of dangerous fossil fuels like Bakken crude oil.
- Strengthen restrictions on expansions allowed at existing terminals by adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.
- Prevent any aggregate increase in fossil fuel infrastructure in Portland.

I understand I have copy & pasted from Ryan Rittenhouse's email. I did that to echo the sentiment to please stay true to our commitments to the environment. The constant expansion of fossil fuel infrastructure has just got to stop, especially with out any regulation or oversight going unchecked in relation to this industry. It's been said countless times. Fossil fuel use has NO MORE PLACE in this country or any other. It has had it's time & no doubt, a use for the growth the world has enjoyed. This is our very earth at stake now. Please go full bore & enact the strongest & strictest ban on ANY fossil fuel infrastructure permitting.

Respectfully,

As a native Portlander currently living in Washington state, I am troubled by the oil industry's continued push to open new fuel terminals of ANY size in the greater Portland area.

Oil is a filthy fossil fuel whose use has driven pollution levels to the point that our entire planet's climate has been disrupted in ways that threaten not just human life, but most life on earth. Fossil fuel profiteers must not be enabled by the building of new production facilities. And Bakken crude oil is even more dirty and explosively dangerous than other "natural" oils.

The recent film carried the meme, "If you build it, they will come." Its opposite should be put in effect here (anywhere in the Pacific Northwest) and now: If you DON'T build it, they CAN'T come!

Please prevent any increase, whether new or "upgraded" facilities, to increase fossil fuel infrastructure in Portland.

Thank you for your consideration.

Sincerely,

(Ms.) Meryle A. Korn

Re: Fossil Fuel Zoning Testimony

Dear Members of the Planning and Sustainability Commission,

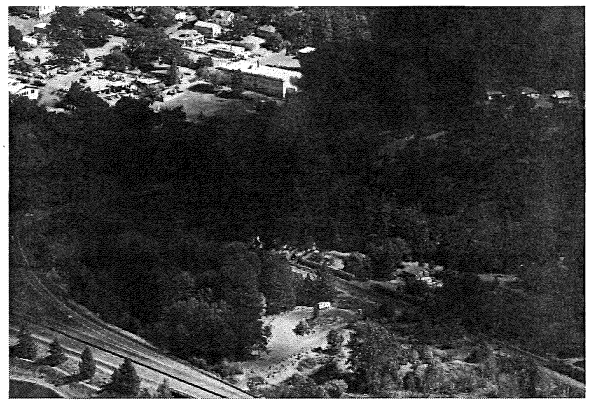
Thank you for the opportunity to offer our comments on the proposed draft of the City of Portland's Fossil Fuel Terminal Zoning Amendments ("amendments"). We offer these comments on behalf of Columbia Riverkeeper and Friends of the Columbia Gorge. Riverkeeper and Friends of the Columbia Gorge recognize that the amendments are still in draft form, and we appreciate and support the revisions the Bureau of Planning and Sustainability (BPS) staff made between the discussion draft and the current proposed draft. As discussed below, we offer further suggested changes that will more fully reconcile the proposed code changes with the City's November 2015 Fossil Fuel Policy Resolution, Resolution # 37168. Riverkeeper and Friends of the Columbia Gorge support the concept of prohibiting bulk fossil fuel terminals and assigning existing fossil fuel terminals the status of a legal, nonconforming use. The proposed zoning code changes offer the flexibility to improve the safety and reliability of Portland's fossil fuel terminals through a non-conforming use Type II process, and they properly reflect the intention of the City's original resolution to limit to the greatest extent possible fossil fuel infrastructure in the City of Portland.

We urge the City to amend the draft zoning code changes to further align the proposed amendments with the original intent of Portland's landmark Fossil Fuel Policy Resolution, Resolution # 37168. Portland's Fossil Fuel Policy Resolution ("resolution") stated that the City would "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." The draft amendments come much closer to accomplishing this impressive goal than the previous discussion draft, but gaps remain in the code language that could allow unintended fossil fuel projects – including dangerous oil train terminals – to establish or expand in Portland. For this reason, the proposed amendments do no fully achieve the City Council's intention to prohibit new major fossil fuel infrastructure, and we urge Planning and Sustainability Commission (PSC) members to make modest changes to the proposed amendments that bolster the fossil fuel zoning code proposal.

We appreciate the effort of staff and the PSC to solicit input on zoning amendments that would implement the City's new fossil fuel policy. Columbia Riverkeeper and Friends of the

Columbia Gorge submit the following brief comments to explain the need for stronger language in the amendments that would prohibit new fossil fuel infrastructure in the City of Portland.

I. The amendments should prohibit new bulk fossil fuel terminals.



Riverkeeper and Friends of the Columbia Gorge support the proposed amendments' prohibition of bulk fossil fuel terminals. The amendments correctly identify bulk fossil fuel terminals as having the ability to transload fossil fuels and wisely prohibit new facilities with this capability. Proposed fossil fuel code changes Section 33.920.300, "Bulk Fossil Fuel Terminal," states,

> Bulk Fossil Fuel Terminals are establishments primarily engaged in the transport and bulk storage of fossil fuels. Terminal activities may also include fuel blending, regional distribution, and wholesaling. The firms rely on access by marine, railroad or regional pipeline to transport fuels to or from the site, and either have transloading facilities for transferring a shipment between transport modes, or have storage capacity exceeding 5 million gallons (or equivalent volume) of fossil fuels. There is minimal on-site sales activity with the customer present.[1]

This language is a huge improvement from the discussion draft, and we strongly support the intent to prohibit bulk fossil fuel terminals. However, we remain concerned that the language of the proposed zoning code changes carves out too large an exception for potential new terminals by allowing projects up to 5 million gallons of new storage. Staff considers facilities below 5 million gallons too small to be considered "bulk fossil fuel terminals," but this volume represents almost 120,000 barrels of crude oil – approximately enough for two unit trains of oil.

Portland's resolution was meant to steer Portland away from increased fossil fuel use rather than simply accommodating forecast fossil use by relying on estimates from the fossil fuel industry. Portland's landmark policy can be strengthened by reducing or eliminating the 5 million gallon exception for new fossil fuel storage.

As Northwest residents recently learned first-hand during an oil train derailment, spill, and fire in Mosier, Oregon on June 3rd, 2016, oil trains pose an acute safety risk. The derailment occurred as a result of oil shipments to the U.S. Oil facility in Tacoma, which receives one oil train per week, on average. The City's proposed amendments would potentially allow new crude-by-rail deliveries to the Portland area, with each unit train of oil carrying 2.5 to 3 million gallons of crude oil. The City

Oil Train derails, spills, and burns in Mosier, OR on June 3, 2016.

[1] Fossil Fuel Terminal Zoning Amendments Draft. Page 47.

should eliminate or reduce the 5 million gallon threshold because it is still high enough to accommodate oil trains.

Furthermore, the draft amendments fall short of aligning with Portland's Resolution # 37164 in opposition to crude-by-rail, passed unanimously by City Council on November 4, 2015, which called for the City to oppose any project that would increase oil train traffic through Portland. As currently written, the proposed amendments could facilitate an increase in crude-by-rail traffic through the City of Portland. The City's draft amendments acknowledge that "derailment risks to natural resources, especially along rivers, and to rural communities appear to be significant."[2] The City should address these risks by prohibiting new crude oil facilities, as the cities of Vancouver, Aberdeen, and Hoquiam have done already. In the alternative, the City should consider lowering the limit for crude oil facilities to below the volume of one unit train, 50,000 barrels[3] (2.1 million gallons) or less.

The City of Vancouver passed a new ordinance on July 18, 2016 that prohibits oil storage and handling facilities, oil refineries, and prohibits expansion at existing crude oil facilities. Vancouver's ordinance states that "development of new crude petroleum facilities, petroleum refineries, and expansion of existing crude petroleum facilities is contrary to the health, safety, and welfare of its citizens and business community," and prohibits the expansion of existing crude oil facilities in Vancouver.[4] Portland should consider a similar approach with respect to new and existing petroleum terminals by either lowering the threshold of what constitutes a "bulk fossil fuel terminal" or prohibiting them altogether.

We also urge the City to eliminate the 5 million gallon exception because it is unnecessary for liquid gas storage, particularly methane ("natural gas"). We urge the City to prohibit new liquefied natural gas (LNG) or gaseous fuel bulk terminals outright in the same manner that the proposed amendments would prohibit bulk coal terminals. The draft amendments indicate that the existing NW Natural Gas LNG plant/terminal has existing storage capacity of 7,000,000 gallons. As noted in our previous comments, neither NW Natural's 2014 Integrated Resource Plan (IRP) nor its 2016 Draft IRP indicate that NW Natural anticipates any increase in storage demand at its Portland LNG Gasco facility. On the contrary, NW Natural's projections show capacity remaining constant at its Portland LNG facility throughout the planning period for the report. Further, NW Natural's Draft 2016 IRP indicates that seismic investigations are ongoing at its Portland facility, a major issue of concern for highly volatile LNG storage:

> One additional matter is that **studies are just beginning for each LNG plant** in regard to Oregon's seismic initiative. It is too soon to know what actions may arise from these studies, but recommendations will be directed to reducing the consequences at each plant from a major Cascadia earthquake/tsunami event, such as minimizing tank leakage. There is no intention of making major changes to the plants, so the cost impact is expected to be modest.[5]

---

[2] Fossil Fuel Terminal Zoning Amendments Draft. Page 22.
[3] Unit trains of oil are typically 90 cars or more in length, often carrying in excess of 60,000 barrels of oil.
[4] See details in City of Vancouver's Staff Report: http://www.cityofvancouver.us/sites/default/files/fileattachments/city_council/page/20031/08_sr099-16_prohibition_of_crude_oil_facilities.pdf
[5] NW Natural Draft IRP. 2016. P. 3.24

Where Portland's fossil fuel resolution called for the City to oppose new fossil fuel infrastructure, BPS' proposed amendments seem to grant unplanned-for expansions of new LNG storage in Portland. To bring the amendments back into alignment with the resolution, the discussion draft should be revised to prohibit new LNG storage altogether.

Lastly, we encourage the Planning and Sustainability Commission to clarify that facilities approved for one purpose – say, the storage of biofuels – may be limited to that purpose. City permits can carry conditions, and it will be reasonable for the City to condition new or expanded facilities to ensure that liquid bulk storage facilities are not transitioned to use for crude oil or other fossil fuels. The City can accomplish this goal by requiring that new applications for new or expanded facilities be limited by a condition of approval to the purpose for which they are authorized in their applications. In this way, the City's proposed ban on new fossil fuel bulk terminals fossil can preclude proposals that would circumvent the City's policy.

II. The Amendments Should Limit Existing Fossil Fuel Facilities and Prevent Aggregation of Projects

Riverkeeper and Friends of the Columbia Gorge support the City's proposal to identify existing fossil fuel facilities as legal nonconforming use facilities. By assigning existing facilities this status, the City preserves the ability for these facilities to address safety, seismic, and local market response issues while still preserving the City's ability to achieve the larger goal of reducing reliance on fossil fuels. The City summarizes its approach to existing facilities as follows:

> Existing Bulk Fossil Fuel Terminals would become legal, non-conforming uses, which may continue to operate. Expansion would require approval through a nonconforming situation review, which is a Type II discretionary land use review. The Type II procedure is an administrative process with the opportunity for public notice and comment.[6]

Portland's Climate Action Plan sets forth goals for the City to curb its emissions, and limiting fossil fuel infrastructure will be critical to achieve an 80% reduction in greenhouse gas emissions by 2050 for the City of Portland. The staff's report regarding the proposed amendments acknowledges that the continued use and expansion of any fossil fuels would hinder the City's ability to meet this goal, stating, "While fossil fuels like natural gas and propane have the potential to replace higher-carbon fuels, substituting these fuels for higher-carbon fuels does not begin to approach the goal of an 80% reduction in carbon emissions by 2050 established in Portland's Climate Action Plan or the State's 75% goal."[7] Accordingly, we support the City's proposal to require expansion of existing terminals to go through a Type II non-conforming use process to limit fossil fuel infrastructure at existing facilities.

The City is likely to allow bulk fossil fuel terminals that are already operating to continue to do so at their current capacity, but the City may act to limit expansion at existing facilities by adding specific review criteria for nonconforming use review. We ask that the City add to the nonconforming use review the following factors:

---

[6] Fossil Fuel Terminal Zoning Amendments Draft. Page 27.
[7] Fossil Fuel Terminal Zoning Amendments Draft. Page 8.

- Expansion shall not increase greenhouse gas emissions and climate change impacts;
- Expansion shall not increase the risk of fire and/or explosion at either the Bulk Fossil Fuel Terminal Site, or the transportation route used to convey fossil fuels to or from the Bulk Fossil Fuel Terminal, and
- Expansion shall not increase the risk of the release of fossil fuels from either the Bulk Fossil Fuel Terminal Site or transportation equipment or infrastructure used to convey fossil fuels to or from the Bulk Fossil Fuel Terminal, into the environment, the Columbia River or other waterways;

Additionally, we ask that the City consider adding language that prohibits the aggregation of smaller projects in order to avoid the 5 million gallon threshold that defines a "bulk fossil fuel terminal." By limiting aggregation and adding more stringent criteria to its nonconforming use review, consistent with the City's resolution, the proposed code changes would not inhibit improvements at these existing facilities that address seismic upgrades, safety improvements, or accelerate the transition to non-fossil energy.[8]

III. Focus on Public Safety, Seismic Upgrades and Reducing Risks at Existing Facilities

The City's fossil fuel resolution contains clear direction that "City bureaus are directed to examine existing laws, including those related to public health, safety, building, electrical, nuisance, and fire codes, and develop recommendations to address fossil fuels that strengthen public health and safety." According to the City's resolution, bulk fossil fuel terminals "pose risks to safety, health, and livability, including mobility of people, other freight, and other commercial vehicles," and "pose considerable risks in the event of a major earthquake."[9] Furthermore, NW Natural has indicated that their own LNG storage is undergoing new seismic reviews. We urge the City to revise its draft amendments to require or incent seismic upgrades at existing fossil fuel terminals.

We urge BPS staff to work with Portland's Bureau of Emergency Management to develop amendments or future code changes that protect Portland residents, consistent with the direction of the resolution and the comprehensive plan update.

IV. Conclusion

Thank you for the opportunity to comment on Portland's proposed draft of zoning code amendments to implement Portland's Fossil Fuel Policy Resolution 37168. Columbia Riverkeeper and Friends of the Columbia Gorge are pleased to support much of the language included in the proposed amendments. With a few modest changes, the City can attain the goals set forth in the original resolution - to prohibit new fossil fuel bulk terminals, limit existing fossil fuel terminals, and strengthen public safety and seismic protections at the City's existing terminals.

Subject: PSC Fossil Fuel Zoning Testimony: I want a full ban!

Testimony:

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes closer to the original intent of the 2015 Resolution.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland". Although this draft prohibits new larger bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine).

While this proposal will mark any bulk terminals as 'non-conforming', it still needs to strengthen the regulations on the size and type of expansion to pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

I want the City of Portland and the Planning and Sustainability Commission to:

1 - Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

2 - Remove the exception for new facilities that are 5 million gallons or less which would

allow more unit trains of dangerous fossil fuels like Bakken crude oil.
Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

3 - Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.

4 - Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,
Beth Slikas

City of Portland

Dear Sir:

Please amend the proposed draft to reflect the city's fossil fuels goals. I would like Portland to enact a ban on all new fossil fuel terminals, large or small. The city's code changes should not allow more trains of explosive fossil fuels, such as Bakken oil.

We saw how dangerous Bakken oil can be if one remembers the oil train disaster last June in Mosier, Oregon.

Sincerely,

Earl C. Switzer

Subject: PSC Fossil Fuel Zoning Testimony: I want a full ban!

Testimony:

It is time to enact a full ban on ALL new fossil fuel terminals in or around the city of Portland. An exception for facilities that allow five million or fewer gallons of dangerous fossil fuels such as the Bakken crude oil must never be allowed.

By using the City's non-conforming review process, it is time to strengthen restrictions on the expansion of existing terminals with binding limits as well as with the strongest safety and climate impacts criteria possible. We know the damage that the mining for and burning of fossil fuels creates to people, for our communities (especially the poorest in the direct impact zones) and for the planet as a whole. It is, therefore, a must that the fossil fuel infrastructure for the city of Portland be limited to what already exists with a future goal of downsizing it and then putting Portland (along with the state of Oregon) on a path to 100% renewables in the coming decades.

We chose to retire from the US Army in what we saw as the environmentally progressive city of Portland, OR. We hope the Planning and Sustainability Commission continues along this path of sanity and sustainability for every residents' well being and it begins with a full BAN on fossil fuel terminals.

Subject: PSC Fossil Fuel Zoning Testimony: I want a full ban!

Testimony:

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes closer to the original intent of the 2015 Resolution.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland". Although this draft prohibits new larger bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine).

While this proposal will mark any bulk terminals as 'non-conforming', it still needs to strengthen the regulations on the size and type of expansion to pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

I want the City of Portland and the Planning and Sustainability Commission to:

1 - Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

2 - Remove the exception for new facilities that are 5 million gallons or less which would

allow more unit trains of dangerous fossil fuels like Bakken crude oil.
Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

3 - Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.

4 - Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

It's not that I don't care about the price of gas, I do. I want its price to include to include all its costs. Those would be, among many others, the far more expensive processes necessary to get the remaining less accessible oil out of the ground, the money that should be reimbursed to FEMA for the cost of every "natural" disaster caused or exacerbated by drilling or oil transport, the cost of every improvement to stormwater systems needed because too much land is covered by impermeable roadway, the cost of almost every action/war in the Middle East, and more that I'm not up to arguing on a tiny phone.

I have a car; I drive it on occasion. It is not entitled to cheap gas, nor am I, nor is anyone.

Please do not allow any more oil terminals in Portland.

Subject: PSC Fossil Fuel Zoning Testimony

To the Planning and Sustainability Commission, City of Portland,

Regarding Fossil Fuel Zoning, I encourage the City of Portland to amend the proposed draft to better reflect the city's fossil fuel goals laid out in the resolution last fall.

Enact a full ban on all new fossil fuel terminals, large or small. An exception for new facilities that are 5 million gallons or less is unnecessary. The City's code changes should not allow more unit trains of dangerous fossil fuels like Bakken crude oil.

Strengthen restrictions on expansions allowed at existing facilities through adding binding limits in the City's non-conforming use review process.

Prevent any aggregate increase in fossil fuel infrastructure in Portland.

Take action now to ensure Portland fulfills the promise of its historic fossil fuel resolution.

Sincerely,

Lynn Herring

Subject: PSC Fossil Fuel Zoning Testimony: I want a Full Ban!

Dear Members of the Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

jeff kipilman

Re: BDS Comments on Fossil Fuel Terminal Proposed Draft

Thank you for the opportunity to review and comment on the proposed code language for the Fossil Fuel Terminal Zoning project. This project will help implement new policy direction for fossil fuel distribution and storage facilities through changes to the zoning code.

The comments below highlight our primary areas of concern and provide comments on the proposal. We look forward to working with BPS staff to address our concerns and to providing additional feedback as the project develops.

Primary Areas of Concern

1. **Nonconforming Situation Review**
   The proposed code is intended to implement policy direction to allow development of emergency backup capacity, infrastructure that will accelerate transition to non-fossil fuels, safety and efficiency improvements, service to end users, and infrastructure for processing of used petroleum products at existing Bulk Fossil Fuel Terminals. The proposed code prohibits Bulk Fossil Fuel Terminals and existing facilities would become non-conforming uses. As noted in the code analysis, expansions of nonconforming uses require a Type II Nonconforming Situation Review. The approval criteria for Nonconforming Situation Review in an I zone are as follows:

   With mitigation measures, there will be no net increase in overall detrimental impacts (over the impacts of the last legal use or development) on the surrounding area taking into account factors such as:
   a. The hours of operation;
   b. Vehicle trips to the site and impact on surrounding on-street parking;
   c. Noise, vibration, dust, odor, fumes, glare, and smoke;
   d. Potential for increased litter; and
   e. The amount, location, and nature of any outside displays, storage, or activities.

Approval of expansions of existing terminals consistent with the stated policy direction will be problematic and may not be possible – it will be difficult to show that expansion of tanks or addition of capacity would not increase fumes or odors per criterion (c). Expansions that result in additional vehicle trips, either due to movement of goods or additional staff on-site, would not be approvable per criterion (b). Lastly, new storage tanks would be considered additional exterior storage, and would likely be unable to satisfy criterion (e).

BDS suggests an approach similar to that used for Drive-Through facilities in the Hollywood Plan District (33.563.210.D). In the zones where fossil fuel terminals currently exist, this approach would be to prohibit Bulk Fossil Fuel Terminals unless there was a legal terminal on the site on a specific date, and then to provide limits for expansions of terminals that were existing as of that date. The limits on expansion could include that expansions be for seismic or safety upgrades, that they be for non-fossil fuels, or that they be infrastructure for re-processing of used fossil fuels. If including limits related to infrastructure, the proposed Code would need to be specific about what this includes. (Note that it will be difficult to ensure that infrastructure is used only for non-fossil fuels or used fuels, as BDS regulates the development of processing infrastructure but does not regulate the type of fuels processed). The limitations could include a cap on the volume of storage that could be permitted, to ensure that the expansions permitted would be appropriate for emergency backup or for service to end users.

An alternative approach would be to designate Bulk Fossil Fuel Terminals as a Conditional Use, subject to the approval criteria of 33.815.125 for Specified Uses in Industrial Zones. Expansions beyond the limitations of 33.815.040.B would require conditional use review. In order to prohibit new Bulk Fossil Fuel Terminals but allow expansions through the conditional use process, the use could have a footnote in the Allowed Uses table for the I zones, stating that new Bulk Fossil Fuel Terminals are prohibited, but that those that were legally in place on a specified date are a conditional use.

2. **Description of the Proposed "Bulk Fossil Fuel Terminals" Use Category**
The code concept includes a new land use category – Bulk Fossil Fuel Terminals. The use description includes an exception for industrial, commercial, institutional, and agricultural firms that exclusively store fossil fuels for use as an input. If these facilities otherwise meet the use characteristics (have marine or railroad access to transport fuels, or have storage capacities exceeding 5 million gallons), it will be difficult for BDS to determine whether the fossil fuels are being used exclusively as an input. If such a facility did begin shipping fuels that were being stored on site, that would constitute a change in operations rather than a change of use, and could occur without notice to BDS.

The use characteristics described in 33.920.300.A refer to firms that rely on access by marine services, railroad, or regional pipelines. The reference to firms could be confusing – the characteristics refer to the use and the facility, not necessarily to the firm that is conducting the use.

3. **Size Limits in General**
   The code should make it clear whether the storage capacity limits in the proposed Bulk Fossil Fuel Terminals use category apply to sites, or to operators, of which there could be more than one on a site. BDS will need guidance about how best to verify the capacity of existing and/or proposed fossil fuel storage on a site or per operator – through information shown on a site plan, or through manufacturer or other specifications. Storage capacity is not something that BDS will easily be able to inspect or enforce.

4. **Methanol**
   Fossil fuels will be defined as part of this project. The analysis on page 24 of the proposed draft document states that methanol is intended to be included in this definition, and that the proposed code is intended to limit large methanol plants. The analysis also states, however, that biogas is intended to be excluded and that the proposed definition specifies that fossil fuels are made from decayed plants and animals that lived millions of years ago, in order to exclude biogas. Methanol produced from natural gas appears to meet the proposed definition, but methanol produced from other sources such as biomass does not appear to meet this definition. It also appears that a facility producing methanol would fit the manufacturing and production use category, regardless of the input, and therefore would not be limited by the proposed code language.

I want to say thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. I appreciate that the current draft is much improved, bringing the proposed changes closer to the original intent of the 2015 Resolution. However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015.
More than anything, the city's responsibility is to ensure a liveable climate for our future generations. All signs and studies are showing that climate change is moving on us faster than we want to acknowledge. If Portland can pass a true strong resolution on this then we will be taking one step in the right direction as a city, towards a reasonable future, and towards taking full responsibility to help reduce the severity of this global crisis.

This visionary resolution of 2015 called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland". Although the current draft prohibits new larger bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine).

While this proposal will mark any bulk terminals as 'non-conforming', it still needs to strengthen the regulations on the size and type of expansion to pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. Testimony:

I very much appreciate the opportunity to have input to your committee before you submit your report to City Council and I thank you for the improvements you have made to the initial draft. However, I think the current proposal still needs more improvement to be in accord with the original intent of the resolution passed last Fall.

The point was no expansion of fossil fuel infrastructure. This means no new terminals and no expansion of the current ones! Seems pretty clear and simple to me.

I also think it's very important that all the current fossil fuel storage be seismically improved. We all know the 'big one' is coming eventually, and it could be sooner rather than later. We must protect our city and river from fuel spills that will cause contamination and possible explosions and fires.

We need to be sure that there is no increase in trains carrying oil. Ideally, we should stop them all. They are a danger to our health and safety!
