Subject: PSC Fossil Fuel Zoning Testimony: I want a full ban!

Testimony:

Hello, I realize that most of this comment is part of a sample letter written by others who have put in much more time and energy researching the published staff report and recommendations. I know it sounds like rubber stamping someone else's thoughts but why not? It says what I want to say better and more knowledgeably than me fumbling around and making factual or quasi legal errors.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes closer to the original intent of the 2015 Resolution.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland". Although this draft prohibits new larger bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine).

While this proposal will mark any bulk terminals as 'non-conforming', it still needs to strengthen the regulations on the size and type of expansion to pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

I want the City of Portland and the Planning and Sustainability Commission to:

1 - Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

2 - Remove the exception for new facilities that are 5 million gallons or less which would allow more unit trains of dangerous fossil fuels like Bakken crude oil.
Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

3 - Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.

4 - Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

From: Rick Rappapor

Subject: PSC Fossil Fuel Zoning Testimony: I want a Full Ban!

Dear Members of the Planning and Sustainability Commission,

Thank you for the transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways."

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is wonderful to observe the city making decisions that are environmentally responsible and responsive to citizen input.

Sadly, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." This draft still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary and undesirable: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Janet Roxburgh

Testimony:

I support a full ban on all new fossil fuel terminals, large or small. We should be urgently moving away from fossil fuel dependency, and the oil companies have the resources to do so and develop clean energy. The only thing preventing them from doing so is greed. If we make fossil fuel extraction and use less accessible and profitable, they will be forced to invest in the cleaner, safer alternatives. They will not do it willingly, therefore, it is up to us to force the redirection of effort and investment through our actions and legislation. The City of Portland has the power to change the energy/climate paradigm. Embrace this opportunity to be leaders and energy policy shapers for the betterment of our local and global environments.

Climate change is real. Staying the course is obviously unacceptable as it will only hasten the pace of global warming, causing more catastrophic storms, and loss of plant and animal species. One of the greatest causes of global warming is from the use of fossil fuels in internal combustion engines.

New infrastructure for fossil fuel extraction, transport, storage, and refining indicate a willingness to go forward to planet disaster. This is unacceptable. We must transition to other sources of energy if we are going to have a livable planet for our grandchildren's grandchildren.

Subject: PSC Fossil Fuel Zoning Testimony: I want a full ban!

Testimony:

We must have a full ban all new fossil fuel terminals of any size. There must be no exceptions; we must not allow any more trains fossil fuels, especially Bakken crude, through our city (and hopefully the state).
As it is now, trains dragging oil tanks run frighteningly close to Max tracks and our freeways. We cannot afford to increase the risk of explosions that would harm so many people.
In addition, we should prevent any aggregate increase in fossil fuel infrastructure in Portland. We are on the confluence of two rivers and risk pollution that can move far and wide via their waters. It was wise to pull out of the Pembina project last year. Let's shrink our risks and not allow ourselves to be used by big corporations to export their foul products.
We need to strengthen restrictions on any and all expansions at existing terminals by adding binding limits and criteria for safety and climate impacts in Portland's non-conforming use review process. In fact, it would be great to reduce terminals now in existence for our own safety.

Re: WSPA Comment for PSC Fossil Fuel Terminal Zoning Amendments Public Hearing

Dear Commissioners:

The Western States Petroleum Association (WSPA) is a non-profit trade association representing companies that explore for, produce, refine, transport, and market petroleum, petroleum products in five western states including Oregon. WSPA appreciates the opportunity to provide comments on the City of Portland's Bureau of Planning and Sustainability Fossil Fuel Terminal Zoning Amendments Proposed Draft, but is highly concerned about the proposal's disregard regard for federal, state, regional policy, and resulting unintended consequences.

Several WSPA members operate petroleum terminals in Portland. These members have responsibly operated in the energy corridor along Northwest St. Helens Road for decades. This corridor provides key energy and emergency infrastructure as recognized by various city, state, and federal documents. WSPA opposes the City's push to regulate fossil fuels under Resolution No. 37 166, Fossil Fuel Terminal Zoning Amendments, or otherwise, but submits these comments in an attempt to mitigate some of the unintended consequences of the contemplated zoning amendments.

The draft amendments explicitly propose to control state and regional energy and transportation policy, and exclude Metro and the State from their proper role in this issue. The proposal acknowledges the City's unique position in energy distribution and attempts to make a bottleneck in Portland, and thereby reduce the energy options available in all other jurisdictions in Metro, Oregon, and other states. As discussed in the Proposed Draft, the City serves as a distribution hub for the region and state. Terminals in the City serve more than 90 percent of the statewide market. The policy decisions that the City is trying to force on the region and state belong at the regional

975 Carpenter Road N.E., Suite 106, Lacey, Washington 98516
360 352-4506 • 360 352-4507 • 360 789-1435 Cell

and state level and wrongfully exclude impacted parties in smaller cities and rural areas of the state.

The proposed zoning amendments contradict and misalign with federal and state laws pertaining to energy infrastructure and transportation, including but not limited to Oregon's low carbon fuel standards, Oregon's Renewable Fuel Standards, federal Renewable Fuel Standards, and similar laws. The Proposed Draft further contradicts policy direction in Resolution No. 37166 and the City's Comprehensive Plan enabling energy infrastructure to serve the region as well as transition to non-fossil fuel sources.

Of particular concern to WSPA, the proposed zoning amendments would create a number of substantial unintended consequences. Specifically, the Proposed Draft:

- Introduces a host of ambiguities and uncertainties to marketplace necessary for a thriving economy;
- Prevents and discourages replacing equipment that has reached end of life;
- Prevents and discourages equipment upgrades necessary to meet market demand or comply with federal and state law;
- Prevents and discourages safety and efficiency upgrades;
- Restricts infrastructure that serves the region, in contradiction of the new City Comprehensive Plan provision governing fossil fuel infrastructure;
- Fails to clearly specify how existing infrastructure can expand on existing sites, to adjacent properties, and to nearby non-adjacent properties;
- Restricts infrastructure related to Oregon's low carbon fuel standards, Oregon's Renewable Fuel Standards, federal Renewable Fuel Standards, and similar laws;
- Fails to provide for sufficient facilities to serve future energy needs;
- Stymies potential future technologies that do not fit within the contemplated framework;
- Attempts to exclude Portland from the national and regional energy market;
- Bases decisions on whether to allow energy infrastructure expansion on impacts to the surrounding area (Nonconforming Situation Review) instead of the energy and transportation needs of the City, region, and state;
- Generally does not align with state and federal policy regarding siting energy infrastructure or transportation of fuels;

- Encourages less efficient (and potentially less safe) transportation by truck over more efficient modes of transportation;
- Fails to provide for the economic impact assessment called for by Resolution No. 37166;
- Pushes for an adoption timeline that is too fast to allow for thoughtful discussion and tailoring addressing the above and other concerns; and
- Fails to adequately engage Oregon and Metro residents and business outside Portland who will be impacted by the bottleneck in energy distribution created by the proposal.

We have enclosed proposed zoning code language in Appendix 1 that would address some of the issues raised in this comment. While the proposed language does not resolve all the problems with the contemplated amendments, it addresses some of them.

Again, thank you for this opportunity to comment on the Fossil Fuel Terminal Zoning Amendments Proposed Draft. We hope the City reconsiders its push to pass regulations in this area, and if does, that it will more narrowly tailor its rules to not contradict federal and state direction and avoid unintended consequences.

Thank you for your consideration of WSPA's comments. If you have any questions, please contact me at this office at fholmes@wspa.org and (360) 352-4506.

Sincerely,

Frank E Holmes

Subject: PSC Fossil Fuel Zoning Testimony: I want a full ban!

Testimony:

Congratulations to all of you at the Bureau of Planning and Sustainability for your work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes closer to the original intent of the 2015 Resolution, and to truly protecting Portland and its residents from further health, safety, and climate risks.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland". Although this draft prohibits new larger bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine).

While this proposal will mark any bulk terminals as 'non-conforming', it still needs to strengthen the regulations on the size and type of expansion to pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

I want the City of Portland and the Planning and Sustainability Commission to:

1 - Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

2 - Remove the exception for new facilities that are 5 million gallons or less which would allow more unit trains of dangerous fossil fuels like Bakken crude oil.
Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

3 - Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.

4 - Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

As a long time Oregonian who loves her state I an VERY concerned about fossil fuel terminals whether they are large or small infrastructures. There needs to be a ban in place, When you consider the fires, derailments, enviromental disasters and explosions that have happened as in Mosier it is very dangerous to all Oregonians on so many levels. We need this ban to prevent future loss of life and damage to our ecosystem. It's not a matter of "if " these dangerous events will happen but "when"! We need to give careful thought when considering any expansions to existing terminals. You have the responsibilty and DUE dilligence to protect The state of Oregon as a whole!

Subject: PSC Fossil Fuel Zoning Testimony: I want a full ban!

Testimony:

Thank you for the hard work done to date to develop the draft Fossil Fuel Terminal Zoning Amendments. I am writing today to encourage the addition of further restrictions on size and expansion of existing terminals to better meet the intent of the original City Council resolution, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland". Although this draft prohibits new larger bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine).

While this proposal will mark any bulk terminals as 'non-conforming', it still needs to strengthen the regulations on the size and type of expansion to pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

I encourage the City and the Planning and Sustainability Commission to:

1 - Enact a full ban on all new fossil fuel terminals, large or small, as clearly stated in the 2015 resolution.

2 - Remove the exception for new facilities that are 5 million gallons or less which would allow more unit trains of dangerous fossil fuels like Bakken crude oil.
Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

3 - Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.

4 - Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now is the time to tighten up these amendments to ensure Portland's people and the natural environment are protected from fossil fuel transport and the location and expansion of terminals within our community. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Thank you for your consideration!

I am writing to voice my opposition to any expansion of fossil fuel transport through my beloved city.

I moved to Portland in 2009 not because of job opportunities but because of Portland's reputation as a leader in all environmental issues. This is important to me because I am a person of faith and as such am called to environmental stewardship. Our miracle planet, it's vegetation, oceans, atmosphere, climate, humans and animals are all part of God's creation and are thus good and sacred.

Corporate greed for profit threatens all that is perfect in it's originally created state and our Rose City should not give into temptation and intimidation and thereby aid in the destruction of creation. This city, country, and world has more than enough acres of parking lots and rooftops for solar panels and plenty of wind to go around to spin countless wind turbines. Not to mention other renewables. I ask my city to stand on the side of righteousness and I want the following:

1.Enact a full ban on all new fossil fuel terminals, large or small. An exception for new facilities that are 5 million gallons or less is unnecessary. The City's code changes should not allow more unit trains of dangerous fossil fuels like Bakken crude oil.
2.Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.

Subject: PSC Fossil Fuel Zoning Testimony: I want a Full Ban!

Dear Members of the Planning and Sustainability Commission,

The fossil fuel industry sees the region downstream from the I-5 Bridge over the Columbia as the shortest path for getting our natural resources on to a marine vessel.

You do not want to allow propane trains, oil trains, LPG trains or coal trains to come through the Columbia Gorge to a terminal in Portland.

In Vancouver we are fighting NuStar which proposed to handle 1 million gallons of crude oil per day, and you seem willing to allow storage of 5 million gallons.

One year ago, the Los Angeles City Council voted 15-0 to oppose a project that would have generated 5 oil trains per week of oil train traffic. Based on safety considerations, they would have opposed 1 oil train per week because their fire department cannot handle an oil train fire. One train holds approximately 1 million gallons.

The treaty tribes of the Columbia Gorge are adamantly opposed to coal and oil trains through the Gorge. Many of their councilmembers are right now in North Dakota blocking a pipeline and fending off attack dogs.

Twice within the last five years there has been a major pipeline leak into the Missouri. The Tribes are blocking a pipeline that would go under the Missouri and jeopardize the water. Back in the early 40s, Woody Guthrie wrote a song sayng, "If I was president Roosevelt . . . I'd shoot the first big oil man that killed the fishing creek."

You don't want ethanol terminals either. The NTSB says that ethanol trains are just as dangerous as crude oil trains. You own Fire Department was maxed out on May 4, 2011, when a log fell off another train and caused an ethanol train to puncture and catch fire. This happened on Hiway 30 near Cornelius Pass Road.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Don Steinke

Subject: PSC Fossil Fuel Zoning Testimony: I want a full ban!

Testimony:

I appreciate that the Bureau of Planning and Sustainability incorporated public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes closer to the original intent of the 2015 Resolution.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the strong resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland". Although this draft prohibits new larger bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine).

While this proposal will mark any bulk terminals as 'non-conforming', it still needs to strengthen the regulations on the size and type of expansion to pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

I urge the City of Portland and the Planning and Sustainability Commission to enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure. The exception for new facilities that are 5 million gallons or less needs to be removed as it would allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

Also, restrictions need to be strengthened on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. Finally, please add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Subject: PSC Fossil Fuel Zoning Testimony: I want a Full Ban!

Dear Members of the Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes closer to the original intent of the 2015 Resolution.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland". Although this draft prohibits new larger bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine).

While this proposal will mark any bulk terminals as 'non-conforming', it still needs to strengthen the regulations on the size and type of expansion to pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

I want the City of Portland and the Planning and Sustainability Commission to:

1 - Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

2 - Remove the exception for new facilities that are 5 million gallons or less which would allow more unit trains of dangerous fossil fuels like Bakken crude oil.
Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

3 - Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.

4 - Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

G. Gibson

Testimony:

I would like to see a full ban on all new fossil fuel infrastructure in Portland. A full ban should not have exceptions for new facilities that are 5 million gallons or less. The code changes should not allow more unit trains of dangerous, highly combustible fossil fuels like Bakken crude oil. I would like to see the code strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. I would like to see the code prevent any aggregate increase in fossil fuel infrastructure in Portland.

Subject: PSC Fossil Fuel Zoning Testimony: I want a full ban!

Testimony:

Dear Commissioners,
The revised version of the fossil fuel proposal is much improved, however it still needs improvement in the following areas:

1) Enact a full ban on all new fossil fuel terminals, large or small. An exception for new facilities that are 5 million gallons or less is unnecessary. The City's code changes should not allow more unit trains of dangerous fossil fuels like Bakken crude oil.
2) Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.
3) Prevent any aggregate increase in fossil fuel infrastructure in Portland.

In order to keep global warming under 2C and have a livable future, we need to immediately transition to clean, renewable energy sources. We can't allow new multi-decade investments in fossil fuels that lock us into a world of climate chaos. Instead, we must draw the line to stop the growth of the fossil fuel industry, protect the health and safety of our community, and transition to a 100% renewable energy economy now!
Thank-you,

Subject: Fwd: Opposition to Planning Bureau proposal to allow existing tank farms to expand

I am writing to oppose the expansion of tank farms. This is against the City Council resolution to limit carbon based fuels. As you know having nearly all of Oregon's energy infrastructure in one place is careless, and presents an extreme hazard for the City in the event of accidents or natural disasters.

There are many safety issues raised by having volatile, dangerous chemicals near busy highways and communities.

Thank you,

Alissa Leavitt

Subject: PSC Fossil Fuel Zoning Testimony: I want a full ban!

Testimony:

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes closer to the original intent of the 2015 Resolution.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland". Although this draft prohibits new larger bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine).

While this proposal will mark any bulk terminals as 'non-conforming', it still needs to strengthen the regulations on the size and type of expansion to pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

I want the City of Portland and the Planning and Sustainability Commission to:

1 - Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

2 - Remove the exception for new facilities that are 5 million gallons or less which would allow more unit trains of dangerous fossil fuels like Bakken crude oil.
Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

3 - Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.

4 - Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Linnton Neighborhood Association
c/o Neighbors West Northwest
2257 NW Raleigh St.
Portland, OR 97210

September 6, 2016

Members of the Planning and Sustainability Commission

The Linnton Neighborhood Association passed the following motion at their July 6, 2016 general membership meeting with 31 people present regarding the Bureau of Planning and Sustainability's discussion draft Fossil Fuel Terminal Zoning project.

The proposed zoning code changes do not address the city's resolution 37168 - opposing expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through the city of Portland or adjacent waterways.

Nor do the changes address PBEMS recommendations for seismic risks.

Linnton Neighborhood Association's position is no new or expanding (including height) of the tank farm facilities, rather the tanks farms need to move to safer, non-liquifiable soil areas.

Sincerely,

Shawn Looney
Chair, Linnton Neighborhood Association

Subject: PSC Fossil Fuel Zoning Testimony

Dear Members of the Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.
- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.
- Strengthen restrictions on expansions allowed at existing terminals through adding binding limits in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

- Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now, more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate

justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

I want the City of Portland and the Planning and Sustainability Commission to:

1 - Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

2 - Remove the exception for new facilities that are 5 million gallons or less which would allow more unit trains of dangerous fossil fuels like Bakken crude oil.
Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

3 - Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.

4 - Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Subject: PSC Fossil Fuel Zoning Testimony: I want a full ban!

Testimony:

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes closer to the original intent of the 2015 Resolution.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland". Although this draft prohibits new larger bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine).

While this proposal will mark any bulk terminals as 'non-conforming', it still needs to strengthen the regulations on the size and type of expansion to pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

I want the City of Portland and the Planning and Sustainability Commission to:

1 - Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

Testimony:

We know that fossil fuels have to be phased out and soon. It would be utter folly then to spend precious resources on new infrastructure for those fuels. That money must instead be diverted to renewables. That's the future and the future needs to start now. Fossil fuel companies must not be allowed to bring new terminals and other new infrastructure to Portland or Oregon for that matter. If they do they will clamor to recoup their investment by recovering and selling ever more fossil fuels.

Testimony:

Dear Mayor Hales & Portland City Council,

Portland made national and international headlines last year with the first-ever resolution calling for no new fossil fuel infrastructure projects in Portland. I was so proud of Portland that day! Now as you code that resolution into law, let's stay true to its intent and ensure that it is not watered down to allow projects that clearly violate the intent of the resolution. Specifically, this law should:
--Enact a full ban on all new fossil fuel terminals, large or small. An exception for new facilities that are 5 million gallons or less is unnecessary. The City's code changes should not allow more unit trains of dangerous fossil fuels like Bakken crude oil.
--Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.
--Prevent any aggregate increase in fossil fuel infrastructure in Portland.

Thanks for all you do to serve and protect this great city, and to make sure Portland leads the way to a clean and just energy future!

Subject: PSC Fossil Fuel Zoning Testimony: I want a Full Ban!

Dear Members of the Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Subject: PSC Fossil Fuel Zoning Testimony

Members of the Portland Planning and Sustainability Commission,

As a Portland resident, I am pleased by the diligent effort and transparency with which the City is pursuing the implementation of its November, 2015 Fossil Fuel Policy. The City's draft policy makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." I thank the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution.
However, I think that the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in November, 2015. Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's Resolution.

While this proposal will designate any bulk terminal as 'non-conforming', it still needs to strengthen regulations with respect to expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as possible, I ask the City of Portland and the Planning and Sustainability Commission to:

- Enact a full ban on all new fossil fuel terminals, large or small. An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.
- Strengthen restrictions on expansions allowed at existing terminals through adding binding limits in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.
- Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Thank you for considering my comments,
Walter Mintkeski

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Nicholas Curtright

Testimony:

Dear City of Portland,

As a Portlander, this ban is very important to me as well as my fellow friends and neighbors. We NEED a full ban. Any exceptions to a full ban are just plain wrong. In the world we live in today, we cannot afford to continue this behavior any longer. It is irresponsible. Please enact a full ban on ALL new fossil fuel terminals. Along with this is the need to place the strongest of restrictions of expanding existing terminals. Again, we cannot continue this behavior any longer. Let us be a leader for the rest of the country. It is what the people want!

Thank you

Subject: Re: PSC Fossil Fuel Zoning Testimony: I want a Full Ban!

Dear Members of the Planning and Sustainability Commission,

I'm very excited about your efforts implementing the new Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." This is something I have been thinking about and working towards for many years.

The current draft from the Bureau of Planning and Sustainability regarding the Fossil Fuel Terminal Zoning Amendments is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is encouraging that the city is responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported. It called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear. New fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels undermines the promise of the City's 2015 Resolution.

I would also recommend that the regulations regarding the expansion of pre-existing terminals make it clear that there are definitive limits to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

- Eliminate an exception for new facilities that are 5 million gallons or less. This is unnecessary and could allow more unit trains of dangerous fossil fuels. Allowing new LNG storage in Portland is unnecessary: NW Natural has no plans for more LNG storage in Portland.
- Strengthen restrictions on expansions allowed at existing terminals through adding binding limits in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.
- Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

We can be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront of addressing the most pressing concern of our time.

Subject: PSC Fossil Fuel Zoning Testimony: I want a Full Ban!

Dear Members of the Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Subject: PSC Fossil Fuel Zoning Testimony

Robert Grossman
3224 NE 17th Ave
Portland 97212

I do not support a ban on fossil fuel terminals that still allows new facilities to store as much as 5 million gallons of fuel. It is not necessary to allow such a terminal in the city since the facts are overwhelmingly clear that such terminals are a grave risk to the health and well being of Portland residents. I question the rationale behind such a proposal and know that when I voted for each member of the city council, no one ran on a platform that included such proposals.

Portland needs to strengthen restrictions on expansions at existing terminals through binding limits as well as criteria for safety and climate impacts as part of the city's non-conforming use review process. Climate change is real and our city needs to do more to reduce carbon emissions. Tighter limits would be a step in the right direction.

Finally, the city needs to prevent any aggregate increase in fossil fuel infrastructure in Portland. Renewables are the future and it makes no sense to bring on more capacity for an energy source that is destroying our climate and that we need to phase out.

Thanks, Bob Grossman

To the esteemed members of the Planning and Sustainability Commission:

Thank you for your dedicated efforts and transparency with you are pursuing the implementation of November 2015 Fossil Fuel Policy.

The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways."

As a resident of Portland since 1986, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you also to the Bureau of Planning and Sustainability for your work in incorporating public input on the initial draft of the Fossil Fuel Terminal Zoning Amendments.
... The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the City making decisions that are not only environmentally responsible, but also responsive to its citizens' input.

This being said:
I am of the firm conviction that the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways."

... Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons (provided that the terminal cannot shift fossil fuels from one transportation mode to another, e.g. rail to marine).

The City's policy was clear...

... and I am of the firm conviction that new fossil fuel facilities -- which can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil -- undermine the promise and impact of the City's 2015 Resolution.

Furthermore:
While this proposal will mark any bulk terminal as 'non-conforming', it still needs to:
* strengthen regulations around ///expansion of pre-existing terminals.///

It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals.

The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

* Enact a full, unconditional ban on all new fossil fuel terminals -- large or small....
... especially given that this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

* An exception for new facilities that are 5 million gallons or less is unnecessary...
... and could allow more unit trains of dangerous fossil fuels like Bakken crude oil.
... Additionally, allowing new LNG storage in Portland is unnecessary:
NW Natural has no current plans for more LNG storage in Portland.

* Strengthen restrictions on expansions allowed at existing terminals, by adding:
** binding limits; as well as
** criteria for safety and climate impacts...
... in the City's non-conforming use review process.
The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

* Add language to prevent smaller related "terminals" from clustering and aggregating that would increase fossil fuel shipments through Portland.

Now more than ever, Portland has the opportunity to be a leader in the U.S. climate justice movement.
By a very simple, few more improvements to the Fossil Fuel Zoning Amendments, Portland can continue to be on the forefront addressing the most pressing concern of our time.

Thank you for your time.

Respectfully,

Joseph Merrick

Hello! I am a teacher and artist living in Portland. I believe there is nothing more important for the city to do than to care for it's citizens and do what is safest and smartest for the people. Rejecting fossil fuel as a basis of our economy is vital to a livable future. Fully and effectively banning all new fossil fuel infrastructure is necessary to protect Portland and move us toward a more just and sustainable way of life.
I want you to enact a full ban on all new fossil fuel terminals, large or small. An exception for new facilities that are 5 million gallons or less is unnecessary. The City's code changes should not allow more unit trains of dangerous fossil fuels like Bakken crude oil. Pipelines can leak or explode, oil trains derail, coal dust falls off trains and barges. We don't want these in our region, or anywhere.
I urge you also to strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.
Do what you can to prevent any increase in fossil fuel infrastructure in Portland. To thrive in a changing climate, we must adapt to sustainable, local technologies, live simpler, and end systemic violence and racism. It is an important action to ban new fossil fuel infrastructure and expansion!

Testimony:

Hello,

I live in the Woodstock neighborhood and I am very, very concerned about global climate change and fossil fuel zoning. As a progressive city, I would like to see Portland enact a full ban on all new fossil fuel terminals, large or small. An exception for new facilities that are 5 million gallons or less is unnecessary. I would like to see strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. I would like to prevent any aggregate increase in fossil fuel infrastructure in Portland. We need to be a leader in this issue. We live in a beautiful place and fossil fuels are the enemy of beauty. We need to invest in alternative energy and not rely on a type of energy that is destroying the planet.....By continuing to invest in fossil fuels because the money is attractive is only to delay the coming catastrophe.....

Portland must send a strong message to the fossil fuel corporations and their transporters to PHASE OUT (not ramp up!) production, storage, and transportation of the stuff that is ruining our fragile mother Earth as we know and love it! If we have to find "greener" substitutes for oil, coal, and gas for everything from energy production to plastics, so be it. The City should do all it can to encourage production and distribution of these substitutes!

Subject: PSC Fossil Fuel Zoning Testimony: I want a Full Ban!

Dear Members of the Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Teresa McFarland

To Whom It May Concern at the City of Portland,

Thank you for what you've already done in the fossil fuel zoning debate. Portland City Council has already passed a resolution with the stronger language that I support, and I urge you to strengthen the proposal to **enact a full ban on all new fossil fuel terminals, large or small**. No exceptions. Additionally, please **strengthen the restrictions on expansions for existing terminals** through binding limits during the use review process. Finally, please **prevent any aggregate increase in fossil fuel infrastructure in Portland**.

We can lead by example in this situation and help keep Portland a leader in the US climate justice movement.

Thank you for reading and listening!

Sincerely,
Jon McNeill

As an environmental scientist I think Portland should certainly consider that shipping any fossil fuels to China is shipping fuels that our children may one day need away to fund the greed of the fossil fuel industry and in return gets us air pollution. The pollution China puts into the air eventually ends up here. If they don't have cheap fuels to use they will be motivated to develop renewable energy and that will help us all deal with global climate change. A full ban on fossil fuel export is the only strategy that makes long term sense.

Fossil fuels, in particular ones whose transportation poses great danger to ecosystems and human communities, even though we are still dependent on them now, are already things of the past. Using them makes our planet a worse place to live.

The only sensible action to take in light of these facts is to ban any new terminals and minimize the use and impact of existing ones. We must adjust to this reality, which will involve some discomfort, but nothing compared to the grim alternative.

Dear Members of the Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Nancy Anderson

Subject: PSC Fossil Fuel Zoning Testimony: I want a Full Ban!

Dear Members of the Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Ban new fossil fuel terminal.

The dangerous oil trains should also be ban. We know the terminals and trains are not safe for our environment, we need immediate solutions for clean energy.

Testimony:

Please don't let the process water down what Portlanders spoke very, very clearly in favor of this year. Enact a full ban on fossil fuel terminals, no matter what size! We are in a crucial moment for the climate. This kind of precedent could change our future for the better. Please don't leave holes in our fossil fuel export policy. Furthermore, I believe Portland's leadership should strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. Last but not least, I'd like to see Portland lead the nation by preventing any aggregate increases in fossil fuel infrastructure in the city. It's unlikely to have more than a subtle impact on existing business here, but it can set a wonderful precedent, allowing Portland to be the true leader on climate change action that we purport to be. Thank you.

Members of the Planning and Sustainability Commission:

I am writing to request that you amend the proposed PSC Fossil Fuel Zoning draft to better reflect the city's fossil fuel goals laid out in the resolution from last fall. I recommend that the City of Portland amend the proposal to reflect the city's fossil fuel goes laid out in the resolution for the following 3 points:

- Enact a full ban on all new fossil fuel terminals, large or small. An exception for new facilities that are 5 million gallons or less is unnecessary. The City's code changes should not allow more unit trains of dangerous fossil fuels like Bakken crude oil.
- Strengthen restrictions on expansions allowed at existing facilities through adding binding limits in the City's non-conforming use review process.
- Prevent any aggregate increase in fossil fuel infrastructure in Portland.

Sincerely,
Stacie Hall

Subject: PSC Fossil Fuel Zoning Testimony: I want a Full Ban!

Dear Members of the Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Douglas Hayner

No new terminals of any size. And for that matter let's shut down existing terminals and make Portland 100% renewable with expanded transit like they have in Latin America. Solar & wind and massive weatherization by the city. Pay for it with our share of the money saved by cutting the 5.3 TRILLION per year subsidies to fossil fuel companies world wide.

Testimony:

Given all the evidence of climate change taking place all around us (wildfires, flooding, rising sea levels, melting ice sheets), we simply cannot scrimp on enacting a FULL ban on all new fossil fuel terminals, no matter what the size. If we keep burning fossil fuels, the future is bleak. It's time to step up! Do NOT all ow an exception for new facilities that are five million gallons or less! That doesn't work.

At the same time, we MUST strengthen restrictions on expansions at existing terminals by adding binging limits and criteria for safety and impacts from climate change in the City's non-conforming use review process.

The time is NOW. We don't have another option. Please prevent any increase in fossil fuel infrastructure in Portland. Our Planet can no longer tolerate our burning of fossil fuels. Thank you!

While the new draft has important improvements, it still misses the most important change: Ending ***all*** use of fossil fuels.

Our world is already at extreme risk of irreversible climate change. Thus we must do more than limit the size of new fossil fuel terminals. Having an exception for new facilities that are five million gallons or less pretends that there is room for compromise. There isn't!

Please change the draft to recognize the emergency conditions we are in.

Thank you.

Planning and Sustainability Commission,

Please amend the proposed draft for fossil fuel zoning to better reflect the city's goals laid out in the resolution last fall. Here in the Pacific Northwest, we take pride in our nationwide leadership on environmental issues. Fossil fuel zoning is part of a larger legacy we can write.

We want the ban to be as strong as possible. I am a member and highly active volunteer at Portland Audubon and echo their sentiments to make the ban better via these three aspects:

- Enact a full ban on all new fossil fuel terminals, large or small. An exception for new facilities that are 5 million gallons or less is unnecessary. The City's code changes should not allow more unit trains of dangerous fossil fuels like Bakken crude oil.
- Strengthen restrictions on expansions allowed at existing facilities through adding binding limits in the City's non-conforming use review process.
- Prevent any aggregate increase in fossil fuel infrastructure in Portland.

I look forward to all of us making this ban a success.
Thank you in advance,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Jason Nolin

Testimony:

If the pipeline is large enough to refill the 4,999,999 gallon storage tanks quickly the proposed limit is meaningless. there should be no new fossil fuel storage facilities allowed.

There should be no expansion of current facilities allowed.

If the PSC decided to recomment allowing any new construction I would like to see some kind of bonding language contained in the ordinance in the event of a spill.

If Portland is serious about keeping our city at the level of health and sustainability that we presently have, we cannot allow any loopholes in our codes and ordinances that high priced lawyers and planners can take advantage of because if they find them they will use them.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Charles Townsend

Subject: PSC Fossil Fuel Zoning Testimony

Amend the proposed draft to reflect fossil fuel goals that close all loopholes and enacts a full ban on all new fossil fuel terminals:

1. Enact a full ban on all new fossil fuel terminals without exceptions of any size.
2. Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.
3. Prevent any aggregate increase in fossil fuel infrastructure in Portland.

Subject: PSC Fossil Fuel Zoning Testimony: I want a Full Ban!

Dear Members of the Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Testimony:

Dear PSC,

I really hope that you will honor the City Council's resolution and amend the draft rule to fully ban ALL new fossil fuel infrastructure - regardless of size. The time has come to make fossil fuels scarce so that we can make the transition to a clean energy economy that leaves our planet intact enough for us to live on it. Please.

Many thanks!

Subject: PSC Fossil Fuel Zoning Testimony

Hi friends at the sustainability commission.

I stood in citty hall multiple times when the fossil fuel policy was being debated and voted on. As a longtime Portland resident and someone who has worked on sustainability issues for many years, I felt a deep sense of pride.

Now it is time to follow through on the high standards we set.

Please amend the proposed draft to reflect the city's fossil fuel goals:

- Enact a full ban on all new fossil fuel terminals, large or small. An exception for new facilities that are 5 million gallons or less is unnecessary. The City's code changes should not allow more unit trains of dangerous fossil fuels like Bakken crude oil.
- Strengthen restrictions on expansions allowed at existing terminals through adding binding limits in the City's non-conforming use review process.
- Prevent any aggregate increase in fossil fuel infrastructure in Portland.

Thank you for your dedication and work on this issue. Let's continue to lead the nation in sustainabiity.

Best regards

Dear Members of the Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

I am very concerned that the Beautiful and Historic Columbia River Gorge is becoming a dirty fossil fuel Export corridor. Local residents bear the costs for toxic air and water when there are spills and coal dust. It is time to invest in Renewables. There are no toxic spills with wind or solar energy! Please help us leave a livable planet for our grandchildren.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Subject: Full ban, PSC Fossil Fuel Zoning Testimony

Dear Members of the Planning and Sustainability Commission,

I am a voter in the City of Portland and support your pursuing the implementation of the November 2015 Fossil Fuel Policy.

City leaders have made a good start in making Portland an example that other cities can follow. However, allowing new fossil fuel facilities that can store 5 million gallons of fossil fuels is a mistake.

I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. A

-Strengthen restrictions on expansions allowed at existing terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Tony and Phyllis DeCristofaro

Subject: PSC Fossil Fuel Zoning Testimony

Hi,

Please enact a full ban on all new fossil fuel terminals, large or small. An exception for new facilities that are 5 million gallons or less is unnecessary. The City's code changes should not allow more unit trains of dangerous fossil fuels like Bakken crude . Strengthen restrictions on expansions allowed at existing terminals through adding binding limits in the City's non-conforming use review process. Prevent any aggregate increase in fossil fuel infrastructure in Portland.

Kind Regards,

Lenny Dee
2580 NE 31 Ave.

Subject: PSC Fossil Fuel Zoning Testimony: I want a Full Ban!

Dear Members of the Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Robert Deering

Subject: PSC Fossil Fuel Zoning Testimony: I want a Full Ban!

Dear Members of the Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Rachael Hawkey

Subject: Ban fossil fuel terminals

Dear Members of the Planning and Sustainability Commission,

Thank you for the transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. Your actively opposing expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways is just what we need.

The Bureau of Planning and Sustainability has incorporated public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments, though not completely in line with the original intent of the 2015 Resolution.

But the Fossil Fuel Zoning Amendments proposal is still less than the resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways."

The current draft still allows new terminals up to 5 million gallons. The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil underminethe City's 2015 Resolution.

Also, this proposal still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals.

The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

* Ban ALL new fossil fuel terminals.

- Do NOT except "small" facilities under 5 million gallons. Do NOT allow new LNG storage in NW Natural didn't ask for it and expansion would be in a sensitive area.

-Add binding limits and safety and climate criteria on expansions allowed at existing terminals . The Be sure that seismic and safety improvements are included in any changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Subject: PSC Fossil Fuel Zoning Testimony.

I thinks it is important that Portland take a leading role in limiting fossil fule extraction, transportation and consumption. I urge the PSC to follow the City recommendation and
1. Enact a full ban on all new fossil fuel terminals, large or small. An exception for new facilities that are 5 million gallons or less is unnecessary.

2. The City's code changes should not allow more unit trains of dangerous fossil fuels like Bakken crude oil.

3. Strengthen restrictions on expansions allowed at existing terminals through adding binding limits in the City's non-conforming use review process.

4. Prevent any aggregate increase in fossil fuel infrastructure in Portland.

Thank you

Subject: PSC Fossil Fuel Zoning Testimony: I want a Full Ban!

Dear Members of the Planning and Sustainability Commission,

I am writing to you about a subject that I think is very important: enacting a full ban on all fossil fuel terminals and infrastructure, and completely outlawing the expansion of all existing fossil fuel facilities.

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Subject: PSC Fossil Fuel Zoning Testimony: Full Ban!

Dear Members of the Planning and Sustainability Commission,

While I would be inclined to thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy...I remember all too well your ridiculous vote on the Pembina Terminal when public testimony at several hearings ran 80%-20% AGAINST such a facility.

So, given that City Hall has already taken the brunt of the political flack on this one....it would be not only appreciated, but appropriate...for the Commission to follow suit.

Given the fact that the Federal government makes no secret of its desire to tunr the greater Portland Area, as well as the Columbia River Basin...into a fossil fuel export hub, the citiznes of Oregon as well as Washington must rely on their Local and Municipal Leaders and Councils to stand up and protect our Health, Safety, and Welfare.

The Portland Metro area is too large a population zone, and too important an ecosystem....to risk for the sake of some Corporations which will not really be providing a large number of permanent jobs for Oregonians.

Regards,

George Jacobs
Portland

Subject: PSC Fossil Fuel Zoning Testimony: Support a Total Ban on new Fossil Fuel Terminals

Dear Portland Planning and Sustainability Commission,

The City's draft of the Fossil Fuel Policy makes progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." While the current draft is much improved, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways."

Although this new draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). New fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil will undermine the promise and impact of the City's 2015 Resolution.

While this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations regarding the expansion of pre-existing terminals. It is not clear whether there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I urge that the City of Portland and the Planning and Sustainability Commission do the following:

1. Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.
2. An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing dangerous new LNG storage in Portland is unnecessary, because NW Natural has no current plans for more LNG storage in Portland.

3. Strengthen restrictions on expansions allowed at existing terminals through adding binding limits in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.
4. Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

The City of Portland has a rare opportunity to be recognized as a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be in the forefront of addressing the most pressing concern of our time.

Thank you very much for your attention.

Sincerely,

Daniel Jaffee

Subject: PSC Fossil Fuel Zoning Testimony: I want a Full Ban!

Dear Members of the Planning and Sustainability Commission,

I first want to thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

I also want to thank the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.
- Remove the exception for new facilities that are 5 million gallons or less. This is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary; NW Natural has no current plans for more LNG storage in Portland.
- Strengthen restrictions on expansions allowed at existing terminals through adding binding limits in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.
- Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now, more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Thank you for your efforts on this urgent matter.

It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Thomas Keys

Subject: PSC Fossil Fuel Zoning Testimony: I want a Full Ban Now!

Dear Members of the Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

- Strengthen restrictions on expansions allowed at existing terminals through adding binding limits in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

- Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now, more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Regards

Subject: PSC Fossil Fuel Zoning Testimony: I want a Full Ban!

Dear Members of the Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

John Nicol

Subject: PSC Fossil Fuel Zoning Testimony

Dear PSC,

I support the general concept of the proposed new fossil fuel infrastructure policy: make it more difficult, expensive or impossible to build new fossil fuel facilities. Climate change is a crisis. We need to take bold, decisive action, even if it seems severe. Along with other things (including reduction in the food we get from animal agriculture), we need to stop enabling the production and use of fossil fuels. The proposed new policy seems like a step in the right direction.

Thank you for considering my comments.

Regards,

Brian Posewitz

Subject: PSC Fossil Fuel Zoning Testimony: I want a Full Ban!

Dear Members of the Planning and Sustainability Commission,

As we know that fossil fuels have to be phased out it seems terribly counterproductive to add any new infrastructure for them. Let's use any new investment on renewables instead and help our planet fight climate change!

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

RE: PSC Fossil Fuel Zoning

Please amend the proposed draft to reflect the city's fossil fuel goals:

- Enact a full ban on all new fossil fuel terminals, large or small. An exception for new facilities that are 5 million gallons or less is unnecessary. The City's code changes should not allow more unit trains of dangerous fossil fuels like Bakken crude oil.
- Strengthen restrictions on expansions allowed at existing terminals through adding binding limits in the City's non-conforming use review process.
- Prevent any aggregate increase in fossil fuel infrastructure in Portland.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Berklee Robins

Subject: PSC Fossil Fuel Zoning Testimony: I want a Full Ban!

Dear Members of the Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,

Subject: PSC Fossil Fuel Zoning Testimony: I want a Full Ban!

Dear Members of the Planning and Sustainability Commission,

As a resident of Portland, I am proud and relieved that the City is committed to doing the right thing for current and future generations.

The current draft of the Fossil Fuel Terminal Zoning Amendments is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution.

Still, the current proposal falls short of the bold and inspired resolution that Portland supported in the fall of 2015. The most recent draft allows new terminals up to 5 million gallons, provided the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The idea if allowing new facilities that can store 5 million gallons of liquefied natural gas (LNG) and crude oil flatly undermines the intention and impact of the City's 2015 Resolution.

To make the City's policy as strong as it can be, I urge you to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small - "to actively oppose" new fossil fuel infrastructure, as the City promised.

- The exception for new facilities 5 million gallons or less has to go.

- Another Mosier, or Lac Megantic, in the heart of Portland would be catastrophic.

-Strengthen restrictions on expansions at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process.

- Add strong language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

The City of Portland has the opportunity to be a leader in the U.S. climate justice movement. NOW is the time!

With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could reclaim its place at the forefront of addressing the most pressing concern of our time.

Sincerely,

Betsy Toll

Subject: Re: PSC Fossil Fuel Zoning Testimony

Dear Members of the Planning and Sustainability Commission,

I want to thank you for the continued effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a parent of two children and a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution, "to actively oppose" new fossil fuel infrastructure.
- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.
- Strengthen restrictions on expansions allowed at existing terminals through adding binding limits in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.
- Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now, more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Subject: PSC Fossil Fuel Zoning Testimony: We must have a Full Ban!

Dear Members of the Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy.

However, the current Fossil Fuel Zoning Amendments proposal falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.
We need to strengthen the regulations with regard to the expansion of pre-existing terminals. It is unclear from the draft whether there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, we ask the City of Portland and the Planning and Sustainability Commission to consider the following:

First, enact a FULL ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

Second, an exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

Third, you must strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

Finally, we must add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Sincerely,
Osiel Bonfim, PhD

Subject: PSC Fossil Fuel Zoning Testimony: I want a Full Ban!

Dear Members of the Planning and Sustainability Commission,

Thank you for the diligent effort and transparency with which the City is pursuing the implementation of its November 2015 Fossil Fuel Policy. The City's draft makes real progress towards the 2015 Resolution's goal to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." As a resident of Portland, I am proud to see City leaders working to make Portland an example that other cities can follow.

Thank you to the Bureau of Planning and Sustainability for its work in incorporating public input on its initial draft of the Fossil Fuel Terminal Zoning Amendments. The current draft is much improved, bringing the proposed changes much closer to the original intent of the 2015 Resolution. It is good to see the city making decisions that are not only environmentally responsible, but also responsive to citizen input.

However, the current Fossil Fuel Zoning Amendments proposal still falls short of the bold and visionary resolution that Portland supported in the fall of 2015, which called for the city to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." Although this draft prohibits new bulk terminals, it still allows new terminals up to 5 million gallons, provided that the terminal cannot shift fossil fuels from one transportation mode to another (i.e. rail to marine). The City's policy was clear, and new fossil fuel facilities that can store 5 million gallons of dangerous fossil fuels such as liquefied natural gas (LNG) or crude oil undermine the promise and impact of the City's 2015 Resolution.

Additionally, while this proposal will mark any bulk terminal as 'non-conforming', it still needs to strengthen the regulations when it comes to the expansion of pre-existing terminals. It is not clear from the draft if there is any binding limit to potential expansion at existing bulk fossil fuel terminals. The City's intention with its 2015 Resolution was to ensure that changes to the City's fossil fuel infrastructure would be used to improve safety, seismic resiliency, and the use of lower-carbon fuels.

To make the City's policy as strong as it can be, I ask the City of Portland and the Planning and Sustainability Commission to consider the following:

- Enact a full ban on all new fossil fuel terminals, large or small. After all, this was the plain language of the City's 2015 Resolution - "to actively oppose" new fossil fuel infrastructure.

- An exception for new facilities that are 5 million gallons or less is unnecessary and could allow more unit trains of dangerous fossil fuels like Bakken crude oil. Additionally, allowing new LNG storage in Portland is unnecessary: NW Natural has no current plans for more LNG storage in Portland.

-Strengthen restrictions on expansions allowed at existing terminals through adding binding limits as well as criteria for safety and climate impacts in the City's non-conforming use review process. The City should use this process to ensure that seismic and safety improvements are the basis for any new changes to Portland's existing bulk fossil fuel terminals.

-Add language to prevent smaller related "terminals" from clustering and aggregating to increase fossil fuel shipments through Portland.

Now more than ever, the City of Portland has the opportunity to be a leader in the U.S. climate justice movement. With just a few more improvements to the Fossil Fuel Zoning Amendments, Portland could once again be on the forefront addressing the most pressing concern of our time.

Subject: Let's Revive Portland's Fossil Fuel Ban!

Dear Mr. Kountz and Portland Bureau of Planning and Sustainability:

In its effort to develop code changes to implement the City's historic November 2015 Fossil Fuel Policy, I am encouraging the Bureau of Planning and Sustainability to return to the initial intent and plain language of the resolution. The resolution stated the City's intent to "actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways."

In short, I am asking the City to enact a ban of new fossil fuel infrastructure - in particular oil, gas, and coal terminals in Portland.

Unfortunately, the Fossil Fuel Terminal Zoning Amendments discussion draft falls far short of the 2015 Fossil Fuel Resolution that the City Council passed last year. Where the resolution was bold, visionary, and historic, this discussion draft is short-sighted and prioritizes the fossil fuel industry over the health and safety of Portlanders.

Please revise proposed code changes to include:
- A ban on new bulk fossil fuel terminals
- Strong limits on expansions at existing facilities
- Provisions to improve the safety and resilience of existing terminals

Presently, the discussion draft allows new bulk terminals to be built, setting limits that would significantly increase fossil fuel projects in the City, including 21 million gallons of new crude oil storage and a new LNG tank the size of NW Natural's existing facility in NW Portland. New LNG tanks and petroleum storage (enough to hold 7 unit trains worth of oil) would double down on precisely the kind of fossil fuel projects that the City Council intended to ban in November 2015. Please revise the proposed code changes to ban new bulk fossil fuel terminals.

The proposed code changes would also allow existing facilities to expand, which will grow our carbon footprint past the point of being able to meet our local and state carbon reduction goals. Proposed code The City of Portland needs to hold these industries accountable for improving their safety without promising them more room to grow. We need to shrink fossil fuel use, not grow it! Please revise proposed code changes to set limits on existing bulk fossil fuel terminals, and add provisions to encourage existing facilities to improve their safety and resilience in a large seismic event.

As one of thousands who supported the City's Fossil Fuel Policy, I urge you to develop a new, strengthened draft before the Planning and Sustainability's Commission's hearing in September.

Sincerely,

Ruba Leech

Subject: support of restrictive fossil fuel zoning proposal

Portland's economy is dangerously overinvested in fossil fuels. A carbon cap or tax is on the way sooner or later, very possibly approved by state voters within several elections; permitting further local investment in the fossil fuel economy will only embed various parts of the local economy more deeply in business relationships, loans and business plans that will and must become inviable as the carbon price ratchets upward.

Every further investment in fossil fuels digs this future economic hole deeper. Portland should stop digging -- no new bulk fossil fuel terminals, no new gas stations, and no city interference with people who use direct action to block fossil fuel trade.

Failing that, the proposed regulations are an acceptable half measure.

Fossil fuel money is stupid money. We don't need it and we don't want it.

Subject: PSC Fossil Fuel Zoning Testimony

The proposed limitations are a good first step.

Let's go even farther!

No new bulk fossil fuel terminals of any capacity.
No new gas stations.
City police stop enforcing trespassing laws against protestors interfering with fossil fuel shipments or fossil fuel extraction equipment.
No new fossil fuel vehicles in the city fleet.
More investment in walking, cycling, and public transit at the expense of autos, like the Comprehensive Plan or whatever it's called already says we are doing. (We aren't really doing it...)

I want to be able to tell my grandchildren, "Hey, at least we took the issue seriously and tried to do something, even if it was too little too late."

Meeting Minutes

Commissioners Present: Jeff Bachrach (left at 3 p.m.), Andre' Baugh, Mike Houck, Katie Larsell, Gary Oxman (arrived 1:12 p.m.), Katherine Schultz (by phone; left at 2 p.m.), Chris Smith, Eli Spevak, Teresa St Martin, Maggie Tallmadge

Commissioners Absent: Michelle Rudd

City Staff Presenting: Susan Anderson, Joe Zehnder, Michael Armstrong, Tom Armstrong, Phil Nameny, Steve Kountz

Vice Chair Smith called the meeting to order at 12:31 p.m. and gave an overview of the agenda.

Documents and Presentations for today's meeting

Written testimony received

Director's Report

Susan Anderson

- The draft transmittal letter from the PSC to Council for the Comp Plan Task 5 projects will be shared at the officer meeting this Thursday. We had a work session this morning with Council on the Task 5 projects and will have another on Thursday. I will send an email update with further information.

Consent Agenda

Consideration of Minutes from the August 23, 2016 PSC meeting
Commissioner Bachrach moved to approve the Consent Agenda. *Commissioner Baugh* seconded.

The Consent Agenda was approved with an aye vote.
(Y9 – Bachrach, Baugh, Houck, Larsell, Schultz, Smith, Spevak, St Martin, Tallmadge)

Mass Shelters and Housing Zoning Code Update

Hearing / Recommendation: Joe Zehnder, Phil Nameny

Disclosures from PSC members

- none

Joe gave an overview and background about the project. We are all aware of the rising rents and values of housing in Portland, and their effect on people living or attempting to move here. During discussions at City Council about the state of housing in 2015, these listed issues were noted: increases in rents, low vacancy rates, increases in homeless counts and more people being newly homeless.

Council declared the housing emergency in October 2015. Council also directed the City and County to collaborate on housing programs which led to the creation of the joint office, A Home for Everyone. In March of this year, Council passed two other forms of legislation. The first was a resolution that directed the Bureau of Planning and Sustainability to amend Title 33 "to simplify regulations, remove regulatory obstacles and expedite processes for land use review and permits for affordable housing

projects, mass shelters and short-term housing". This resolution requested to have staff present the council with the PSC's recommendation by December 1 whether favorable or unfavorable. The second was an ordinance that created an alternative land use review process for design or historic reviews for affordable housing projects that met specific affordability standards

Phil reviewed the proposal that the PSC is hearing and considering today. He walked through what temporary housing includes as well as issues and concerns we've heard about from providers.

Several zones that allow mass shelters by right have strict limitations on the number of beds allowed within a wide radius of 1300 feet. If these thresholds are not met, the facility can go through a conditional use review to receive approval.

The amendments increase both the number of overall beds allowed by right in the zones and decrease the separation from 1300 to 600 feet which is closer to about 2.5 to 3 blocks. In many cases the number of beds allowed is proposed to be doubled.

In general, many providers feel that 200 beds is the maximum number that can be efficiently cared for. Other commercial zones are often found within neighborhoods, so the number is smaller to limit the impacts of a by-right facility.

To address a potential issue related to having to provide additional parking, we are proposing to waive any additional parking requirements if the mass shelter is provided on the site of an existing institutional use such as a church, school or other community service use.

Currently there is one conditional use approval process for building a new mass shelter. If they are subject to a CU, they must go through a Type III review which requires a pre-application conference, and a hearing. The timeline and fees can be fairly substantial.

The code amendments add flexibility for where a CU is required. If the shelter is provided in an existing building or on the site of an existing institution, the type of review is a Type II staff review that doesn't require a pre-app and only has a hearing if appealed.

CU approval criteria are also amended for shelters within existing buildings so that the focus is less on traffic/service issues and more on livability issues.

Currently mass shelters are prohibited in EG zones, while all other community service uses including short-term housing is allowed by right. We are proposing that a mass shelter be subject to a conditional use review, so any proposal could have reviewed its impacts on the surrounding employment zone through the approval criteria on a case by case basis.

We are not expanding mass shelters in any other zone where they are currently prohibited such as open space and industrial zones, since there are strong city policies to protect these zones for open space and industrial users.

For short-term housing, there are fewer barriers to entry, especially if they are proposed in commercial or EX zones. However, to create a parallel review path, we are amending the code in situations where we would like the short-term housing requirements to mimic those for mass shelters. This includes similar changes to the Conditional Use review and criteria in certain situations and a similar waiver of parking requirements in situations where short term housing is allowed by right with an existing institution.

Religious institutions are currently allowed to host a temporary transitional household for up to 60 days. This does not need to be within a legal dwelling unit. We have heard that several religious institutions have been interested in hosting a larger number, and some of them have a concern that the 60-day limit does not provide enough time to find more permanent living arrangements. In addition,

the city council passed a resolution in 2011 that allowed a church to host up to 4 car camping vehicles without having any code compliance repercussions, but this has never been codified. Our proposal expands the allowance for a religious institution to host a transitional household from 1 to 4 households as an accessory use and extends the number of days from 60 to 180.

The last item that we are reviewing is in response to the Council's ordinance earlier this year to provide a review option to city subsidy affordable housing projects that go through design or historic review. Our proposal codifies the council provision, but expands equitably city wide instead of only applying it to the central city or gateway plan districts.

This option applies to City Subsidy projects that make at least 20 percent of its units available to people earning 60 percent or less median family income. They can choose one of two ways to review their design or historic review. They can either:

- Follow current procedure which, for projects above certain $ thresholds, requires a pre-application conference and a Type III review with a hearing in front of the design or landmarks commission, or
- They can choose to go through a Type IIx staff level review, where only the appeal is heard in front of the respective commissions. However, this option does require the applicant to present their initial proposal through a design advice request in front of the commission. These requests are normally optional.

Phil noted the project has come down the line quite quickly. It is not the "be all, end all" to address our housing crisis. There are several other projects and conversations currently happening that also address affordability including the mixed use zoning project, the CC2035 Plan and inclusionary housing. Changes to the Zoning Code do not have a large effect on coordination, permitting and fee issues. Those need to be addressed by Council.

Discussion

Commissioner Baugh asked about the DLCD letter.

- We are aware of the requirements to protect industrial and employment lands. In EG, we have just taken the step to make it a conditional use.

Commissioner Tallmadge: We heard this code update doesn't facilitate permitting. We heard that it's not design review that's the most cumbersome but permitting for developers is.

- The permitting package is processes with BDS, PHB and PBOT for the post-land-use parts of the permit. The timing it takes to do all this is a big issue, and any time savings we can do is beneficial. But it's not a Zoning Code issue.
- What has to happen is that there are other steps Council has to look at, for example, waiving certain fees, to help facilitate this. Similarly, with some of the processing pieces, there could be a staff member as a process manager, so Council would have to dedicate fees for this. Again, we can't address this with the Zoning Code.

For the conditional use with EG, how long does the process take and how much does it cost?

- It's being placed in an existing building, which can take 8-10 weeks for that review process. Type II review is about $4000. Type III conditional review (new building) requires a pre-app ($5000) and hearing (3-4 months).

Commissioner Spevak: Religious institutions can have four units. What about people who could sleep in their vehicle? Also, if we go beyond 180 days, would the building department step in if they're buildings? What if people are living in their cars?

- We'll have to check on this. In a building, there needs to be adequate safety components in place. If it's a camping situation, there is a coordination between buildings and state code. The definition of household is a whole line of conditions plus up to five unrelated individuals. So the institution could state that cars with up to 6 people total constitute a household.

In Eugene, their car camping includes a 90-day limit to sleep in your car (they used to not have a limit).

Commissioner Bachrach: This is intended for short-term. Is there a potential for others than religious institutions to provide?

- We're talking about providing housing in an institution that is supportive of households through homelessness that arises through a situation that they face. Under an emergency, this is subject through a separate approach (e.g. winter larger-scale temporary cold-weather shelters). This project is more about seeing the Zoning Code that we've allowed religious institutions to house a family for 60 days, so this is looking to just expand that timeline.

Commissioner Tallmadge: Why don't we extend "religious institutions" in the code to more generally "institutions"?

- We can continue to look at this. Generally other institution provisions don't include this in their use.

Testimony

Ryan Diebert, A Home for Everyone: We are a joint City/County office looking at exactly what it would take to achieve having a home for everyone. Increased investments in affordable housing is the long-term solution. We've provided funding and volunteers to support 650 more beds than currently by the end of the year, but many of these are temporary. Smaller volunteer shelters have faced hurdles in the Zoning Code and onerous challenges getting through Type III land use reviews. I've worked closely with BPS and other bureau staff to develop this draft code update. The proposed changes go a long way to achieving the shared vision and address the concerns we've heard along the way. Staff has done great outreach. Our one recommendation to improve the proposal: providers can usually do 75-100 with greater efficiency than smaller shelters. So where it's allowed, we'd like to see these allowed by right.

Commissioner Baugh: Part of Type III review is community input, but there is less of that with a Type II review. How can we assure the neighborhoods that they'll still be involved? What about services and linking those to the beds?

- Even with a Type II process, there is ample testimony review from the community. Beyond that, we've had excellent opportunities to work with community groups through the siting process. The operation after being permitted is really dedicated by the non-profit partners, often through Good Neighbor Agreements and open dialogue with the community.

Commissioner Bachrach: Is changing from Type II to Type III review the issue?

- The full package and expansion of what's allowed by right helps to address the hurdles providers have faced.

Tad Savinar and Julie Livingston, Portland Design Commission: The reason things are taking so long is the sheer volume of projects coming through. DC has gone from 8 to 24 hours of meeting time in the last few months. The Type II process will increase the workload on BDS staff, which is already overloaded. Staff and DC usually see eye-to-eye on projects. The IIx process could dilute public trust. The buildings built to house low-income should be of a design and quality that make people living there feel good. The timeline in our letter is predicated by the Council. There are unintended consequences as proposed. *see written testimony*

Commissioner Baugh noted the Type III review is not the impediment. There are many elements to how much time it takes to develop in Portland, but the public investment projects are where the process has been streamlined.

Commissioner Tallmadge: You noted two projects in your letter, one a Type IIx and one a Type III.

- Only 2 affordable housing projects have come before the DC in the past months. Without IZ playing a role yet, it is a limited impact. With IZ, there will be more burden on the process.

Commissioner Houck noted the volume of permit applications. Could we expedite projects that involve affordable housing?

- Design Commission has specifically given this opportunity and approach to facilitate a quicker process for affordable housing projects.

Kristen Minor, Historic Landmarks Commission: We concur with the DC comments. We presented a letter to Council in March, and the points are still very salient. Staff was directed to remove obstacles to affordable housing. One is the cost of land use reviews. The PHLC concurs with lowering these fees, but we have strong concerns about reducing the process. Maintaining historic districts is our focus. Changing from a Type III to a Type II review reduces public input.

1. Peter Meijer, AIA: We provide advice to applicants going through Design Review as well as support to staff and the commission to provide initial review on projects. We are supportive of taking down the road blocks to building affordable housing. We are not in favor of the change in review process.

2. Jennifer Chang, PHB: Supports BPS' proposed zoning code update. We applaud the work BPS staff has taken that are responsive to our housing emergency. The proposed code changes increase access to safe options and provide links to support. The simpler review process is helpful.

3. Matthew Tschabold, PHB: PHB and Commissioner Saltzman support these code changes. This is one element of a number of actions being taken by the City. Increase URA funds to housing, homeless services dollars, new CET funds directly for affordable housing, dedication of short-term rental income to affordable housing are some of the other measures we're working on to address our housing and homelessness crisis. We are supportive of the proposed code changes.

   Vice Chair Smith: The challenge we've heard is that Type III may be faster and given more certainty than IIx. Are you confident that IIx provides a faster timeline? What about cost?

   We're still determining if that is the case. There are improvements being made and legitimate concerns about the review process. We should establish the Type IIx and give it a full year then evaluate what adjustments we might need to make going forward to ensure development standards and time to get projects built is efficient and effective. We have to design our buildings to last 60 years of affordability for any building we put financing into. Cost is some of the issue, but we're seeing improvements in both process and cost.

   Commissioner Houck: It seems that what's allowed by right and doubling that will have a large impact on what we're trying to accomplish. Why couldn't you retain Type III in the next year instead of IIx?

   We know that the code allows for increased capacity, but BPS has reached out to shelter providers to hear their concerns about the review process.

4. George Devendorf, Transition Projects: Supports the proposed revisions. We are the largest provider of mass shelters in the area. Current code places many restrictions on a difficult process of siting shelters. The revisions bring thoughtful flexibility to the process. We second Ryan Diebert's comments on lessening the restrictions.

5. Charles Johnson, Oregonians for Food, Shelter Plus: The scope of what we have before us is huge. Any type of human services institution should have the same rights as religious institutions. For a 14-story building, the type of review is not the issue. I don't think the type of review is a make-or-break issue. What matters is displacement of people on the Springwater Corridor and making sure people are not able to use the design code to keep people out of housing. Also be sure to think about balancing historic districts and if those have helped a neighborhood's diversity.

6. Mary Ann Schwab: Upset about what's happening to people. We need quality construction when we're building low-income and mass shelters to meet the needs of people.

7. Andrew Riley, 1000 Friends: Staff have done a good job about siting shelters, but we also have some comments and suggestions. Eliminate all parking minimums. Expand housing options for religious institutions. Allow shelters by right in EG zones. *see written testimony*

Vice Chair Smith closed testimony at 2:04 p.m.

Discussion

Joe: On page 17 of the staff report is a list of use categories in the Zoning Code. We'd like to proposed to amend the staff proposal to include community service, schools, colleges, medical centers and religious institutions.

Regarding Type IIx versus Type III: IIx and III reflected in the proposal is about the development of new affordable housing projects. Staff's proposal reflects you can go through IIx for an affordable housing project. This does not pre-empt choosing a Type III review. Type II has a staff review; on appeal it goes to DC. Type III goes to both staff and DC then can be appealed at Council (using the same criteria). Right now, objectively we don't know which type of review is better. Type IIx is not inherently reducing the quality of design. Type IIx is slightly faster and less expensive. Type III has a wider notification and it goes to a hearing; Type II has a smaller notification process and testimony would be written only.

Chair Schultz: It is a complex issue, but price and timing of the process isn't always consistently more for either a II or III review. Both are expensive because of the process, not necessarily because of fees. Design review can hang things up, and that becomes critical path for the project. So being able to shorten timelines is more at issue than the type of review process. I'm not convinced Type IIx is the right review. I'm almost inclined to side with not preceding with Type IIx.

Commissioner Baugh agrees on the Type II versus III review. Having a staff-level review in a historic district could be problematic.

Commissioner Larsell asked about shelter operators wanting to see the size increase for more efficiency. How would we influence this?

- We talked with providers about the numbers that, as a right, would be appropriate. All can be bigger through a conditional use process. The number may be from a concern about concentration of services in, for example, Old Town / Chinatown.

Commissioner Bachrach: The distinction between review types is minimal for affordable housing. Isn't IIx the resolution directive from Council? I would keep it in.

- Yes.

Commissioner Bachrach: Both Ryan and Transition Projects talked about 75-100 beds as an efficiency number. Are there some zones where they're asking to bump it up?

- Table on page 31 (shelter by right and max number of beds): They are suggesting more be available.

Commissioner Tallmadge: Didn't we say we want to avoid siting additional services in Old Town?
- We'd have to put in a separate provision for excluding this district.

Commissioner St Martin: I'm most concerned about unintended consequences. Type II versus Type III is a good example; maybe we need process help rather than changing the types of review process. I also support reducing parking requirements.

Commissioner Spevak: My frustration is the political leadership. I wish we had more of a chance to put something on the table to help our most in-need people.
I have a few amendments to propose:
- Go from 4 to 10 transitional units. Define a transitional housing unit as up to 3 people. (see page 51).
- 100 days to 365 days.
- Density standard for group living to drop. Not limit the number of people who are living in a structure.
- Drop the definition of household.
- Remove parking minimums for all mass shelters.
- 400 from 600 feet on the siting distance reference.

Vice Chair Smith continued the work session and decision to the September 27 PSC meeting. Commissioners should send in any amendments to staff, and we'll compile these and get through a recommendation at that meeting.

The written record will remain open until this Friday, September 16 at 5 p.m.

Fossil Fuel Infrastructure Code Changes
Hearing: Michael Armstrong, Tom Armstrong, Steve Kountz

Tom and Steve presented an overview of the project.

The *proposed amendments*:
- Define Bulk Fossil Fuel Terminals as a regulated land use.
- Prohibit Bulk Fossil Fuel Terminals in all base zones.
- Existing Bulk Fossil Fuel Terminals would become legal, non-conforming uses that can continue to operate.

We propose a *new land use category*, Bulk Fossil Fuel Terminals:
- Marine, railroad, or pipeline transport access; and
- Transloading facilities (such as train-to-ship) or storage capacity exceeding 5 million gallons.

exclusions:
- Distributors with access exclusively by truck;
- End-user facilities, including filling stations and firms that store fossil fuels for use as an input;
- Recovery or reprocessing used petroleum

Definition
Fossil fuels are petroleum products (such as crude oil and gasoline), coal, and gaseous fuels (such as natural gas, methanol, and propane) that are made from decayed plants and animals that lived millions of years ago and are used as a source of energy.
exclusions: Denatured ethanol and similar fuel additives and biodiesel/renewable diesel with less than 5 percent fossil fuel content are not fossil fuels.

Regarding a restricted expansion of existing terminals, we have three options as ways to proceed:

- As proposed, existing terminals become non-conforming uses. It would be difficult to approve any sort of expansion under current standards.
- Limited use with expansion not exceed 10 percent of the total terminal capacity as of adoption.
- Conditional use that would allow expansion greater than 10 percent through a land use review with special criteria for emergency backup capacity, seismic upgrades, GHG emissions and clean and renewable fuels.

In terms of seismic upgrades to existing tanks, we've recommended additional guidance in the Council ordinance for PBEM and BDS to take on a process similar to what they're doing with unreinforced masonry buildings; depending on the risk and the area, you have a certain timeline to bring the tank up to code. We're also recommending as part of the next Climate Action Plan update is a study of market dynamics around compliance to state codes and make adjustments to these standards as part of that update in 2020. We want to make sure we're not keeping companies from not doing necessary seismic upgrades or to clean, renewable fuels.

Commissioner Bachrach: The proposal to make it a non-conforming use makes it impossible (pretty much) to expand. If the Comp Plan direction is to limit, we are implicitly saying there is no greater need or expansion to meet local demand for the next 20 years.

Commissioner Houck: It would be helpful to know projections for expansions local companies may be looking at.

Commissioner Baugh: What region do the current facilities serve today? How far does that product go? What about growth capacity outside of the Portland region?

- It varies by product. 90 percent petroleum in state is housed in Portland. Some serve a wider area, including all on the west coast. As we define bulk fossil fuels in the Zoning Code we want with numerical standards as a regional.
- The declining trend is statewide. The Portland facilities serve the state, and trends state-wide are flat and declining. Also for natural gas. There is more variety, but it is largely flat.

Disclosures from PSC members

- none

Testimony

1. Arlene Burns, Mayor of Mosier, OR: Supports the proposal. We had a derailment in Mosier and are still dealing with the consequences from it, even though we dodged a large bullet. Infrastructure expansion that could happen would make the Columbia River Gorge into a fossil fuel super highway. All we can do until federal regulations change is to stop expansion. Thank you for addressing the seismic concerns as well.

2. Peter Cornelison, Hood River Councilmember: Supportive of the proposal. Hood River passed a resolution opposing all oil by rail shipments through the Gorge.

3. Joana Kirchhoff, Raging Grannies: Terminals are bad for the climate. Don't renege on Portland's promise. 500 million gallons for storage barrels is too large.

4. Daphne Wysham, PDX350: Spoke to sections 2 and 3 of the memo. Revisions to original proposal should be removed. Revisions give preferential treatment to one industry (bulk fossil fuels). 10 percent expansion option is arbitrary. 5M gallon is also arbitrary. *see written testimony*

5. Marilee Dea, Cully NA: Cully has been told by Multnomah County that it's in the crude oil evacuation zone. The Union Pacific rail line runs through our neighborhood. We are concerned about these trains and were pleased that we have a ban on all new fossil fuel infrastructure.

Don't backtrack on what was passed before. We need to transition away from high-carbon fossil fuel.

6. Damon Motz-Storey: Move to Portland less than two weeks ago. Part of the reason I moved here was because of the beauty of the Pacific Northwest. Don't backtrack on the 2015 Council resolution. I believe we can do better by closing loopholes.

7. Mark Darienzo, Climate Jobs PDX: We are working to transition to a clean work situation and have the labor movement understand the climate change crisis. A move to clean energy jobs should be explicitly supported.

8. Rick Brown, 350PDX: We have context versus specifics. Shared a quote from Mark Jacobson at Stanford about renewables and converting energy infrastructure in Oregon for all purposes by 2050 via wind and solar energy. Many jobs would be added, we'd eliminate emissions and stabilize the economy.

9. Sandy Polishuk, 350PDX: The Carbon 200 is a list of public companies holding most oil, coal and gas reserves. These resources must be kept in the ground and untapped. The resolution also recognizes the critical nature of the climate crisis. Cease investment in fossil fuel infrastructure as it will be abandoned as we move to using only renewable energy. There should be no exceptions on fossil fuel expansion or current terminals. Prevent any aggregate increase in capacity here. *see written testimony*

10. Dr Gregory Monahan, OR Sierra Club: Staff has been operating from a business-as-usual framework. We need to change this. If we wish to create the possibility for future generations, we need to stop the use of fossil fuels. The PSC should take a change perspective. Prohibit new terminals and disallow expansion of existing terminals.

11. Deborah Romerin: Climate change is here, and it is now. I was proud of the Council resolution banning all new fossil fuel infrastructure. PSC should uphold the intention of this and commit to a full ban of new fossil fuel infrastructure nor expansion of existing sites.

12. Patricia Bellamy: Think health and safety for now and the future. I'm concerned about health-related illnesses from climate change. Portland has been a national leader. Strengthen and codify a full ban and expansion. Prevent any new fossil fuel infrastructure building. Citizens and nurses will support you.

13. Sharon Miller: Take this opportunity to make Portland a leader in the climate justice movement. I support a full ban on new fossil fuel terminals; stronger restrictions on expansion of current terminals; and don't allow any aggregate increases either.

14. Dr Rose Christopherson, Care of Creation Ministry: Heard the plans of Union Pacific expansion traffic near Mosier. We've seen that the needs for fossil fuels in Oregon are decreasing. Of course we want to upgrade seismically. But if needs are going down, it seems like we don't want a 10 percent increase allowed. Why not cap it and have the seismic upgrades happen under the limitation?

15. Dr Patrick O'Herron, OPSR: Thank you for the work that's already been done. The best way to honor the resolution is to prohibit terminals and make current ones legal non-conforming uses. Existing fossil fuel infrastructure is already a huge liability. Simplify this work and follow the resolution. *see written testimony*

16. Ragna Merrit on behalf of Dr Diana Rempe: Follow the resolution in its entirety, not whittled away by the code.

17. Bob Sallinger, Portland Audubon: Support the amendments that are being proposed. But you need to add criteria for non-conforming use review. Lower the threshold for new facilities down substantially from the 5 million gallons, which is way too much. Allowing existing facilities to increase 10 percent violates the resolution. I think non-conforming use mechanism is the right one, it sends the right message, and it gives the community a way to challenge the decisions the City makes. *see written testimony*

18. Shanna Brownstein, NW Natural: Local distribution company, provide natural gas directly to end users. Territory from northern Clark County south to Coos Bay, east to The Dalles. NWN owns an LNG tank in the harbor that holds 7 million gallons, which is quite small comparatively. We take safety and environmental stewardship very seriously. We are a state-regulated monopoly, and we must provide reliable service to our customers, which means we need to have backup supplies. This is what the LNG facility is for. *see written testimony*

    Commissioner Houck asked about serving the need to address peak could be done somewhere outside of this liquefaction zone.

    Part of the regulatory process is looking at where we can store gas. The Oregon Public Utilities Commission has found that this facility is necessary for our overall capacity.

19. Amy Monahan, on behalf of high school students: *see video*

20. Mia Reback, 350PDX: Supports lowering terminal threshold from 5 million gallons. Supports the proposal for the legal non-conforming use designation for current facilities. We should criteria in the proposal to specifically address climate and safety. We need to transition to 100 percent renewables now.

21. Nicholas Caleb, Center for Sustainable Economy: NW Natural has been a leader in community philanthropy, but it is still a dirty gas.

22. David van't Hof, Climate Solutions: Supports the process and leadership from the City. We also support the idea that we don't need new fossil fuel terminals. Regarding expansion and the region's need, we shouldn't be required to meet all the needs of the state. Any expansions should be looked at outside of liquefaction zones. Concern that with ethanol no be counted as a fossil fuel and then switch the use. Look carefully at how you can specify that the permit is only applicable if the energy facility use is only for that offered in the permitting process. *see written testimony*

    Commissioner Houck: You noted the concern about aggregation of facilities. Do you have examples of smaller facilities aggregating to a larger overall capacity?

    Examples are in BC. And also the Dakota Pipeline is multiple small projects.

23. Dr Theodora Tsongas: Changes to the proposed draft don't fulfill the resolution from 2015. Strengthen the regulations about existing terminals. Ban all new fossil fuel facilities including those smaller than 5 million gallons. Add language to disallow aggregation.

24. Byran Tenant, NECN: The proposal is moving in the right direction but could be strengthened to meet last year's resolution. A new facility could mean additional more trains traveling through our neighborhoods and adding additional risk to our neighborhoods.

25. Maya Jarrad, 350PDX: Terminal aggregation seems to be allowed in the current proposal. We should add language to limit projects that in aggregate are more than allowed by a single facility. *see written testimony*

26. Chris Turner: The proposed code change does not go far enough. Expansions should not be allowed at all. There is an issue with backup capacity and seismic upgrades, but these need appropriate approval criteria. Allow terminals to be upgraded, but not the capacity.

27. Amirah Field: Fossil fuels are toxic. We are adding work for the trees to combat climate changes. Please don't add to this.

28. Captain Peter Wilcox, Columbia Riverkeepers: Supports further steps to ensure the final zoning does not increase capacity for fossil fuels to come through or be stored in the area. It's important that new policies don't conflict with building new infrastructure for clean fuel storage such as biodiesel. *see written testimony*

29. Mike Litt: Why do you think that expansion of fossil fuels capacity may be necessary because of the clean fuels program? Why is it that there is a suspicion that expansion under 5 million gallons may be necessary? *see written testimony card*

30. Rob Lee, Linnton NA: No new or expanding, including height, of tank farm facilities. These should be moved to non-liquefiable lands. *see written testimony*

31. Denise Weller, Linnton NA: Zoning is about protecting people. Tank farms in Linnton are on liquefiable lands. *see written testimony*

32. Nancy Harrison: Thank you for the work you've done on this issue. I have a number of considerations about the amendments. Since we've seen that our use is going down, we shouldn't allow exemptions for new facilities of any size or 10 percent capacity increases. Seismic retrofits would be a good thing to allow.

33. Alona Steinke: What happened between the proposed code and what the Council resolution stated? We need to ban all new fossil fuel terminals as was the intent of the resolution.

34. Don Steinke: Local ports are seen as the fastest route to Asia. A number of west coast cities have banned or reduced capacity for the number of trains they're allowing through or crude oil terminals to be built. Portland is not on this list. The proposed code enables more trains to come through the Gorge to Portland.

35. Tom Sincic: We can't measure need by demand; we need less fossil fuels. Referenced a World Health Organization report on air quality.

36. Tori Cole, SEIU 503: Reject building of any and all new fossil fuel infrastructure in Portland. Transition to 100 percent renewables by 2050. Make deliberate choices for our future. Invest in renewable fuels infrastructure. Don't be divided by labor or environment… it's both or neither. *see written testimony*

37. Charles Johnson, Oregonians for Food, Shelter Plus: Council needs your help. they support the Standing Rock Sioux Tribe. Don't save stranded assets but save the future for the children. Don't make something easier for a fossil fuel terminal. Reduce the 5 million gallons to zero. Don't worry about saving old technology that is holding us back from safer, newer technology.

38. Edith Gillis: Supports a total ban on all new fossil fuel infrastructure. Ban anything larger than the existing truck stops. Oppose allowing the 5-million-gallon exception. Improve and add to permit review to save Portlanders money and risk.

39. Cody Tucker: The current policy draft is not enough to significantly combat climate change. We can't consider building any new facilities without upgrading our current ones for safety.

40. Julio Forges: Originally from Haiti. Our biggest problem at home today is environmental degradation. I'm here working with 350PDX. People in my country feel climate change and suffer the consequences. Beaches are disappearing into the ocean. Portland is a leader in the US and the world against fossil fuels.

41. Mukta Akter: From Bangladesh, one of the most climate change impacted countries in the world. I'm here working with 350PDX. It is mainly a low-elevation country, and that coupled with increasing storms have been devastating. Our country contributes extremely minimally to global carbon emissions but has experienced the effects of climate change more than most countries. Much more needs to be done. *see written testimony*

42. Julie Chapman, League of Women Voters: Global climate change is the largest issue. Any increase in expanding fossil fuels goes against our need to invest in renewable and clean energy industries. We need to shift rapidly to energy sources that don't emit GHGs. *see written testimony*

43. Dawn Smallman: Hold true to Council's resolution and a full ban on all new fossil fuel facilities. Portlanders don't want these dangerous shipments coming through the Gorge and along our waterways through the city. Regulate current terminals as non-conforming uses. Seismic upgrades should be required. Also require public safety and risk, risk to waterways, transit, and criteria that take climate change into consideration. *see written testimony*

44. Micah Meskel: NW Natural and staff have a fear about a non-conforming use designation could stall or eliminate seismic upgrades. Only one of the facilities are being upgraded annually. We should encourage the upgrades. At the current rate, we have a public safety and environmental risk.

45. Marcia Denison: Don't put more facilities (bombs) on our land. No more oil tanks on my river.

46. Ted Gleichman, OR Sierra Club: Pass the strongest ban possible on fossil fuel infrastructure and new facilities. *see written testimony*

47. Samantha Bailey: Children should not be responsible for having to deal with this and coming to testify. They are trying to fix their future, but that is our job.

Vice Chair Smith closed oral testimony at 4:52 p.m. Written testimony will remain open through Friday, September 16 at 5 p.m.

Discussion

In terms of the 5-million-gallon recommendation, Michael noted this allowance was responsive to the Council resolution. We want to oppose expansion but not hamper seismic upgrades. We need to accommodate regional demand, but people disagree about if demand is going down or up. The other piece is to enable blending of fuels. As we get new fuels coming in, you have to mix things in a tank. We don't know about the size of those tank requirements, so there is likely some need for infrastructure (tanks) to do this. To accommodate seismic upgrades, about one tank per year is being retrofitted. When they are retrofitted they are slightly larger. The question of the number is certainly worth discussing.

Commissioner Tallmadge: Why can't we require seismic upgrades to the current tanks?

- We could, but it's much bigger than that. It takes time and money, and there are issues around our ability versus state and national government.
- Seismic standards are embedded in the state building code. The City administers the code. In Oregon you have to comply with current codes, but there's little done about enforcing

retrofits. This is a barrier we've faced, and we'd need to go to the state to get the authority to preempt the state codes.
- Looking at the energy code, for example, Portland has wanted to have a stricter code than the state has allowed us to have. In this case, the way to do it is to build a coalition and go to the state level.

Commissioner Spevak noted the property maintenance code. Is there a way we could say you're built under codes from the past, but you need to conform to today's restrictions?

Staff is interested in working with BDS on non-conforming use as an option, but we wanted to list the other options as well. We can come up with standards around non-conforming versus a conditional use. In the end we have a higher bar under non-conforming because the presumption there is that these will go away in the future.

Vice Chair Smith: My guess is that some of these facilities are viable outside liquefaction zones. Could NW Natural store their gas elsewhere with pipelines and trucks to transfer it? Yes. But most of our industrial lands in Portland are in some sort of liquefaction- or other-impeded location.

Commissioner St Martin noted the energy corridor overlay zone concept. In light of the liquefaction zone, could that be an overlay that has some requirements about what can and can't be developed there? The transition to clean fuels is a safety question. Encouraging these in the liquefaction zone is also not a good idea.

Commissioner Oxman: Concerned about the seismic situation, which is huge health and safety issue. I like the non-conforming use strategy, but I'm not sure if it's realistic or that it makes sense. If we can allow for diminishing fuel use and seismic upgrades over about 20-30 years, that would be a good discussion. The issue of smaller facilities aggregating: you sited 130 small facilities that haven't been inventoried. Is there a huge hole in the policy by setting the limit at "x million"? We need to better understand the market and capacity. I don't think it makes sense to have ethanol on this list.

Commissioner Spevak: We have a role to incent improvements, but I'd like to hear more about the BDS side to require upgrades. Also, Council gave us direction to look at both storage and transport. I don't see any reference about throughput. By just regulating the size of tanks, the throughput could still continue to grow. Storage size is only an indirect way to address transport, so I'd like to see more direct information about quantity and time. It seems the code doesn't address if someone wants to build a pipe directly through Portland to a transfer facility elsewhere.
- Stand-alone pipelines were not part of this proposal.

Commissioner Houck: The document is pretty good. I do have concerns with the proposed changes and in reading it, it seems like lots of policy is being affected by BDS' concern about workload and expertise. I don't think that should drive this type of decision. We can address that separately. I'd like to get as much out of the liquefaction zone. I support non-conforming use, but if it inhibits retrofitting, that is a concern. If the big one hits, I am not sure if have confidence that seismic upgrades will do the job anyway. I did meet with NW Natural, and I heard their concerns about the non-conforming use option.

Commissioner St Martin: I noted my concerns about safety and expansion in the liquefaction zone. Also, if we have more frequent service (trucks and/or trains) to smaller tanks, that is a concern.

Commissioner Larsell: I'm concerned about unintended consequences. I don't want us to pass anything that would cause more transportation of fossil fuels coming through the Gorge. The worst issue in an earthquake are the tanks along the river. How many of the companies that have fuels in Portland are included in the OPUC?
- NW Natural and electric companies.

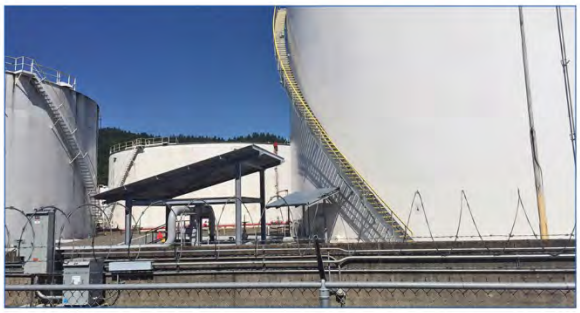
Commissioner Baugh: Throughput is a big deal. If the price is right, facilities can put a lot of product through without expanding or at least for very few dollars. There is the question of "regional". We are regulating facilities that are broader than the city of Portland. There are a series of regulations from Homeland Security around use that we don't want to take issue with.

Vice Chair Smith: Do we have an obligation for regional consultation with Metro? Have we sufficiently done an economic analysis as required in the resolution? There is an exception for recycled oil, but that is particularly dirty. What about language to cover the change in use loopholes? The Linnton question about the 400-foot buffer is a good one. If the quake does hit, how would we want these facilities rebuilt? A different pattern of development? Should we try to capture that in the code?

Commissioner Tallmadge: If we were to build a coalition and go to the state for new seismic standards, is it possible to build the concept so that it's elective for any given jurisdiction?

- Lots of legislation is enabling to give local governments flexibility.

Staff will take these questions from Commissioners and put together a memo to the PSC. We will summarize additional written testimony we receive and will have proposals for your consideration on October 11. Also to note, there will be a Council work session on this topic next Tuesday at 10:30 a.m.



Adjourn
Vice Chair Smith adjourned the meeting at 5:24 p.m.

Submitted by Julie Ocken

Fossil Fuel Terminal Zoning Amendments

Proposed Draft

City of Portland, Oregon
August 12, 2016

Bureau of Planning and Sustainability
Innovation. Collaboration. Practical Solutions.
City of Portland, Oregon

How can I provide feedback to decision-makers?

The Fossil Fuel Terminal Zoning Amendments project would begin to implement new policy direction on fossil fuel distribution and storage facilities through changes to the Zoning Code. This proposal would restrict development and expansion of bulk fossil fuel terminals.

You may testify about proposed changes to the Planning and Sustainability Commission (PSC) in the following ways:

Testify in person at the PSC public hearing.
You may speak for 2 minutes to the Commission, and your testimony will be added to the public record.

> **PSC Fossil Fuel Terminal Zoning Amendments Public Hearing**
> Tuesday, September 13, 2016 at 12:30 p.m.
> 1900 SW 4th Avenue, Room 2500, Portland, OR
> To confirm the time and date, check the PSC calendar at www.portlandoregon.gov/bps/35452

Testify in writing between now and September 13, 2016.
Please provide your full name and mailing address.

- Email: *psc@portlandoregon.gov* with subject line "PSC Fossil Fuel Zoning Testimony"
- U.S. Mail: Portland Planning and Sustainability Commission, Fossil Fuel Zoning Testimony, 1900 SW 4th Ave., Suite 7100, Portland OR 97201

Next Steps

The PSC may amend this proposal and will subsequently vote to recommend the code changes to Portland City Council. This is called the *Recommended Draft*.

Recommended Draft: City Council will hold an additional public hearing and take formal public testimony on the Recommended Draft. The City Council may amend the Recommended Draft before they vote to adopt the code changes. This will likely occur in December 2016.

The Bureau of Planning and Sustainability is committed to providing equal access to information and hearings. If you need special accommodation, please call 503-823-7700, the City's TTY at 503-823-6868, or the Oregon Relay Service at 1-800-735-2900.

1. Introduction

In recent years, the rapid development of fossil fuel resources in the Western United States and Canada has prompted many proposals in the Pacific Northwest for new large fuel terminals and infrastructure projects. In early 2015, Pembina Pipeline Corporation proposed a propane terminal in Portland that drew substantial public opposition. Mayor Charlie Hales withdrew a proposed zoning code amendment that the development needed to move forward, effectively blocking that proposal. In November 2015, Portland City Council adopted Resolution 37168 calling for opposition to expansion of fossil fuel infrastructure. In June 2016, City Council adopted the 2035 Comprehensive Plan, which included Policy 6.48 to limit fossil fuel distribution and storage facilities to those needed to serve the regional market. This code-change project begins to implement the policy direction in the resolution by prohibiting large bulk fossil fuel terminals.

Project summary

The Fossil Fuel Terminal Zoning Amendments project would restrict the development and expansion of Bulk Fossil Fuel Terminals.

Proposed zoning code amendments:

- Identify "Bulk Fossil Fuel Terminals" as a regulated land use, characterized by marine, railroad, or pipeline transport access and storage capacity exceeding 5 million gallons.
- Prohibit Bulk Fossil Fuel Terminals in all base zones.
- Existing Bulk Fossil Fuel Terminals would become legal, non-conforming uses that can continue to operate. Expansion would be limited to their current site and require approval through a Nonconforming Situation Review.

Why is this important?

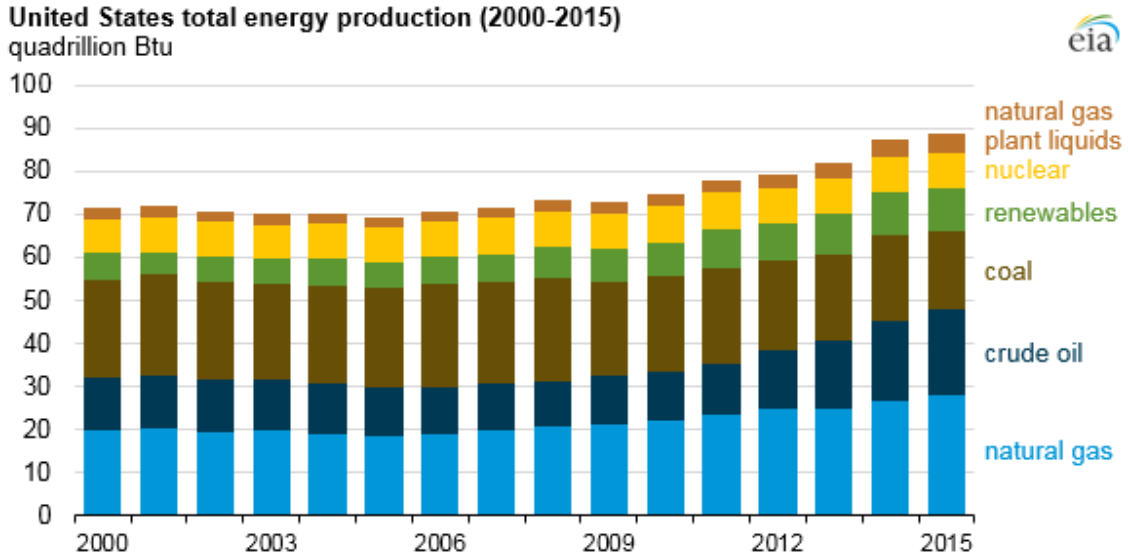
Fossil fuel distribution policy – New policy directions adopted by City Council in November 2015 and in the 2035 Comprehensive Plan would limit fossil fuel distribution and storage facilities to those serving the regional market. City Council adopted these policies after holding public hearings and hearing testimony from hundreds of Portlanders.

Climate action goals – Fossil fuels are major contributors to climate change and pollution. The rapid development of fossil fuel resources in the Western United States and Canada has prompted many recent proposals for new export terminals in the Pacific Northwest. The City's Climate Action Plan seeks to reduce greenhouse gas emissions with fossil fuels being the largest source of emissions.

Public safety and environmental protection – Several recent accidents involving fossil fuel distribution across the nation and in Oregon highlight public safety risks in cities and environmental risks along rivers. Most of Portland's industrial areas have moderate-to-high liquefaction susceptibility in a major earthquake.

Oregon's industrial and distribution center – Portland is Oregon's largest, most diverse distribution hub, and existing Portland petroleum terminals serve more than 90 percent of the statewide market. Proposed code changes would restrict the expansion of these facilities in Portland.

Project scope and timing



The energy distribution market in the Pacific Northwest is changing. Production of crude oil and natural gas, particularly from North Dakota, has substantially increased in the U.S. since 2009, as shown in Figure 1. In turn, several large new fuel distribution terminals have been proposed in the Pacific Northwest to access West Coast and export markets, as shown in Figure 2. Similar trends have occurred in Alberta and British Columbia.

This project is proposing a prompt, focused response to these market changes. The proposed code amendments will restrict development of new fossil fuel terminals and limit the expansion of existing terminals, consistent with City and State objectives on climate change and public safety.

Where are Portland's existing bulk fossil fuel terminals?

Portland's industrial districts are Oregon's largest seaport, rail hub and truck distribution center. The Northwest Industrial District in Portland is also the end of the Olympic Pipeline, which supplies most of Oregon's petroleum fuels from Puget Sound refineries. The ten petroleum terminals located in Northwest Portland are the gateway distribution facilities serving Oregon and Southern Washington markets. Additionally, NW Natural's GasCo terminal provides peak-consumption storage of natural gas for much of the regional market. In Northwest Portland, these "tank farm" storage facilities have direct access to pipeline, deep-water port, railroad and truck route infrastructure.

Figure 1. Increasing U.S. energy production

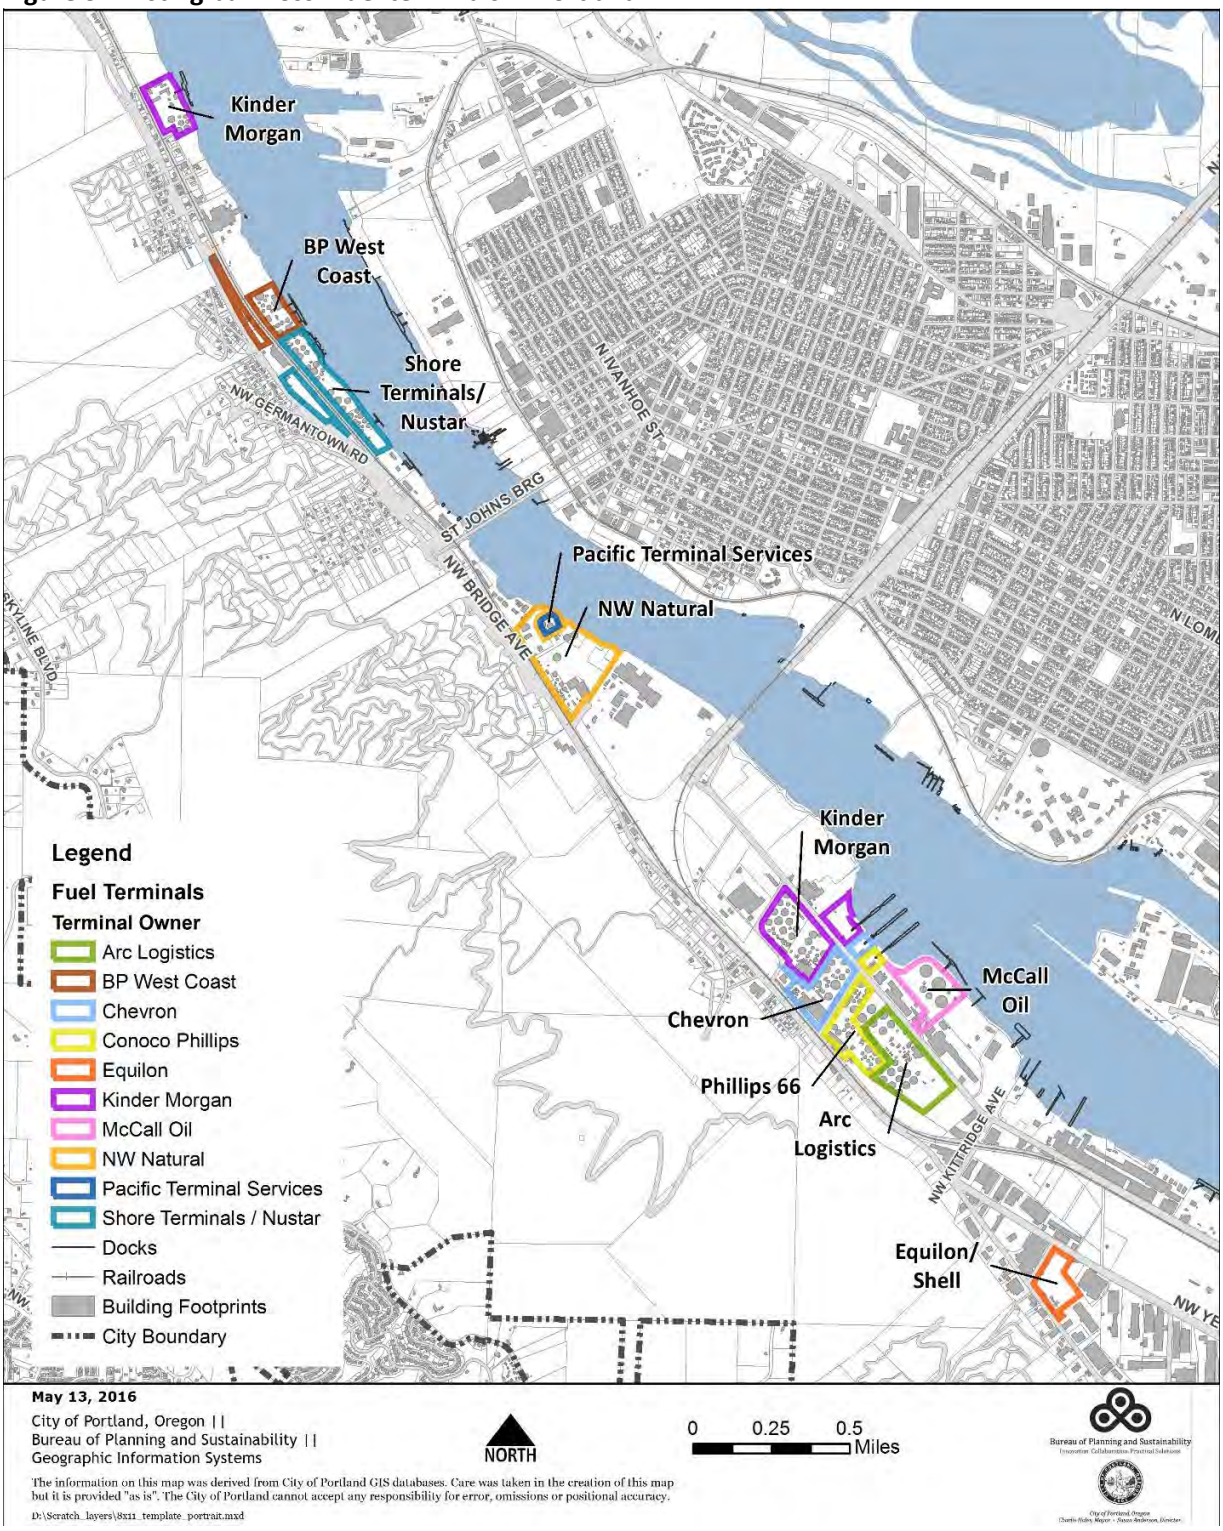

Figure 2. Examples of recent fossil terminal proposals in the Pacific Northwest

Operator	*Facility type*	*Location*	*Proposed new storage capacity*
Petroleum fuels			barrels
Vancouver Energy	Crude oil terminal	Vancouver WA	2,160,000
Imperium Renewables	Biofuels terminal	Grays Harbor WA	720,000
Gaseous fuels			gallons
Oregon LNG terminal	New LNG terminal	Warrenton OR	84,000,000
Jordan Cove LNG	New LNG terminal	Coos Bay OR	84,000,000
Pembina	Propane terminal	Portland	35,000,000
Haven Energy	Propane terminal	Longview WA	23,000,000
Coal			Stockpile acres
Millennium Bulk Terminal	Coal terminal	Longview WA	~20
Ambre Energy	Coal transload facility	St. Helens OR	no storage
Gateway Pacific Terminal	Coal terminal	Bellingham WA	80

Five petroleum terminals are located in the Willbridge area of NW Portland.

Figure 3. Existing bulk fossil fuel terminals in Portland

What's in this report?

This *Proposed Draft* of Fossil Fuel Terminal Zoning Amendment is proposed by the Bureau of Planning and Sustainability for consideration by the Planning and Sustainability Commission. The audience is the Commission and the general public, including stakeholders, inter-governmental partners, implementers and other interested parties. Project stakeholders include property owners, businesses, employees, residents, neighbors, business district and neighborhood associations, underrepresented and underserved groups, environmental groups and other community groups. Implementers include the real estate industry, development review staff and others who use the zoning code.

Your feedback on the Proposed Draft should be directed to the Planning and Sustainability Commission (PSC). You may testify about the proposed changes in person at the PSC public hearing on September 13, 2016, or testify in writing before the public hearing (see information about how to provide feedback on the inside cover of this report).

This report consists of seven parts:

- **Section 1** introduces the project.
- **Section 2** describes how the proposed code changes implement City policies in Resolution 37168 and the 2035 Comprehensive Plan.
- **Section 3** summarizes public and stakeholder involvement activities that have helped shape and inform this project.
- **Section 4** describes background conditions that inform the proposed zoning changes.
- **Section 5** describes the analysis of proposed zoning concepts, including related policy directions, implementation issues and rationale.
- **Section 6** specifies the draft code language, along with code commentary pages that clarify expected implementation.
- **Section 7** recommends future implementation directions for building code amendments to address seismic resilience and periodic monitoring for code effectiveness.

2. Policy direction

Section 2 describes how the proposed code changes implement relevant City policies in Resolution 37168 and the Comprehensive Plan.

City of Portland Fossil Fuel Resolution 37168

> BE IT RESOLVED, that the City Council will actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways; and

The proposed zoning code changes are a key implementation action of Resolution 37168, adopted November 2015. Addressing the overall direction of the resolution to oppose expansion of fossil fuel distribution and storage infrastructure, this project proposes to restrict development and expansion of bulk fossil fuel terminals.

> BE IT FURTHER RESOLVED, that this Resolution does not restrict:
> 1. improvements in the safety, or efficiency, seismic resilience, or operations of existing infrastructure;
> 2. the provision of service directly to end users;
> 3. development of emergency backup capacity;
> 4. infrastructure that enables recovery or re-processing of used petroleum products; or
> 5. infrastructure that will accelerate the transition to non-fossil fuel energy sources; and

The proposed code changes will require a discretionary land use review for many of the exceptions listed in the Resolution. Expansion projects at existing fuel terminals that improve safety (1), provide wholesale fuel supply to local or regional end users (2), add backup capacity (3), or add tanks for clean/renewable fuels (5) would require approval through a Nonconforming Situation Review. The review criteria include that, with mitigation measures, there will be no net increase in overall detrimental impacts on the surrounding industrial zone (such as hours of operation and vehicle trips) and the expansion will not detract from the desired function and character of the industrial zone. Terminal improvements would also be limited to their existing site area. Improvements that address the exceptions 1-5 in the Resolution are not generally expected to result in additional detrimental impacts on the surrounding industrial zone. The proposed code changes also substantially address exceptions 2 and 4 in the Resolution through exclusion of specific end-user facilities and recovery or re-processing of used petroleum products from the proposed new land use restrictions on Bulk Fossil Fuel Terminals.

> BE IT FURTHER RESOLVED, that City bureaus are directed to examine existing laws, including those related to public health, safety, building, electrical, nuisance, and fire codes, and develop recommendations to address fossil fuels that strengthen public health and safety; and

The resolution broadly addresses fossil fuel infrastructure. The zoning code regulates land use patterns and development of fossil fuel distribution facilities on parcels. Zoning does not regulate the quantity of products handled (throughput) on developed sites or their destination (such as exports). Additional amendments to building, fire and energy codes would need to be addressed in future projects.

BE IT FURTHER RESOLVED, that the Bureau of Planning and Sustainability is directed to develop proposed code changes for Council consideration to advance the policies set forth in this Resolution; and

The proposed project will specifically implement this provision of the resolution.

BE IT FURTHER RESOLVED, that prior to any further Council action, the mayor shall schedule (1) a work session to review any proposed code changes and (2) an executive session to review the legal considerations of any proposed code changes; and

The proposed project will implement this process requirement of the resolution.

BE IT FURTHER RESOLVED, that the Bureau of Planning & Sustainability shall undertake an analysis of the economic impacts of any proposed Code changes to advance the policies set forth in this resolution, with a particular focus on potential impacts to local blue-collar jobs; and

This report includes summary analysis of economic impacts in Section 4, specifically addressing impacts on middle-wage blue collar jobs. Analysis to date is limited on the potential impacts on fuel supply to meet regional demand. Fossil fuel demand in this growing region may increase moderately, as indicated by trend-based forecasts, or may plateau and decline with implementation of climate resilience goals and strategies. Staff will continue to research and analyze potential economic impacts of proposed code changes prior to adoption.

BE IT FURTHER RESOLVED, that the City and applicable bureaus shall seek and identify opportunities to invest in Portland's 'human infrastructure' by supporting programs to retrain our workforce as the city transitions to a clean energy economy; and

This provision of the resolution is expected to be implemented as a future action.

BE IT FURTHER RESOLVED, that the City shall consult with its Tribal Government Partners, the State of Oregon, local governments, and other key stakeholder including labor, business, environment, neighborhoods and communities of color in advancing this policy;

The Mayor's Office staff has sought input from and will continue to reach out to the entities identified above to implement this process requirement of the resolution.

Guiding principles of the 2035 Comprehensive Plan

The Comprehensive Plan sets five Guiding Principles, which encourage balanced, integrated multi-disciplinary approaches that must comply with the Plan. This project is consistent with the Guiding Principles because it promotes major benefits to human health and safety, environmental health and resilience, and integrates considerations for economic prosperity and equity.

Economic prosperity

Guiding Principle: Support a low-carbon economy and foster employment growth, quality education and training, competitiveness, and equitably-distributed household prosperity.

The proposed code changes would restrict expansion at existing fuel terminals and prohibit new terminal development, impacting associated job growth and tax revenue. The proposed code

restrictions on fossil fuel terminal development would also limit potential financial risks from a major accident involving fossil fuel infrastructure.

Human health

> *Guiding Principle:* Avoid or minimize negative health impacts and improve opportunities for Portlanders to lead healthy, active lives.

Major benefit – The proposed code changes would reduce the scale of low, but potentially catastrophic, safety risks associated with the growth of fossil fuel infrastructure, including oil train derailments, explosive accidents at liquefied natural gas (LNG) and liquefied petroleum gas (LPG) facilities, and seismic risks of tank farms. Fossil fuel emissions and coal dust are also significant sources of air pollution associated with respiratory disorders.

Environmental health

> *Guiding Principle: Weave nature into the city and foster a healthy environment that sustains people, neighborhoods, and wildlife. Recognize the intrinsic value of nature and sustain the ecosystem services of Portland's air, water, and land.*

Major benefit – The human health benefits described above also extend to environmental health. The proposed code changes would reduce the scale of environmental health risks associated with the growth of fossil fuel infrastructure, including oil train derailments along the Columbia River, LNG and LPG facilities in riparian areas, and seismic risks of tank farms along the Willamette River. Fossil fuel emissions are also a significant source of air pollution.

Equity

> *Guiding Principle: Promote equity and environmental justice by reducing disparities, minimizing burdens, extending community benefits, increasing the amount of affordable housing, affirmatively furthering fair housing, proactively fighting displacement, and improving socio-economic opportunities for under-served and under-represented populations. Intentionally engage under-served and under-represented populations in decisions that affect them. Specifically recognize, address, and prevent repetition of the injustices suffered by communities of color throughout Portland's history.*

The proposed code changes would restrict expansion at existing fuel terminals and prohibit new terminal development, impacting associated middle-wage, industrial job growth that disproportionately benefits workers of color. Restricting potential increases in regional supply of fossil fuels could also have regressive impacts of increasing fuel costs, disproportionately affecting lower-income people.

Resilience

> *Guiding Principle: Reduce risk and improve the ability of individuals, communities, economic systems, and the natural and built environments to withstand, recover from, and adapt to changes from natural hazards, human-made disasters, climate change, and economic shifts*.

Major benefit – The proposed code changes would restrict development of fossil fuel terminals consistent with City and State objectives on climate change and public safety. While fossil fuels like natural gas and propane have the potential to replace higher-carbon fuels, substituting these fuels for higher-carbon fuels does not begin to approach the goal of an 80% reduction in carbon emissions by 2050 established in Portland's Climate Action Plan or the State's 75% goal.

2035 Comprehensive Plan policies specifically implemented in this project

The proposed zoning changes in the project are implementing the following specific policies.

Overall project direction: Fossil fuel distribution

> *Policy 6.48 Fossil fuel distribution. Limit fossil fuel distribution and storage facilities to those necessary to serve the regional market.*

The proposed code changes would implement Policy 6.48 by restricting development and expansion of fossil fuel distribution terminals. Analysis to date on the potential impacts of code amendments in constraining fossil fuel supply to meet regional demand is limited. Fossil fuel demand in this growing region may increase moderately, as indicated by trend-based forecasts reviewed in Section 4, or may plateau and decline with implementation of climate resilience goals and strategies. The Zoning Code provides discretionary flexibility for expansion of existing fuel terminals within their existing site area through a non-conforming situation review, subject to mitigating any net increase of detrimental impacts on the surrounding industrial zone.

Related policy directions

> *Policy 4.81 Disaster-resilient development. Encourage development and site-management approaches that reduce the risks and impacts of natural disasters or other major disturbances and that improve the ability of people, wildlife, natural systems, and property to withstand and recover from such events.*
>
> *Policy 4.82 Portland Harbor facilities. Reduce natural hazard risks to critical public and private energy and transportation facilities in the Portland Harbor.*

Policies 4.81 and 4.82 are partly met by prohibiting fuel terminal development in Portland's industrial areas that are predominantly in locations with high susceptibility to soil liquefaction (see Figure 7 in Section 4). Incremental expansion at existing terminals also provides a pathway for market-driven safety improvements, providing financial return to cover improvement costs. As described above, the Zoning Code provides discretionary flexibility for such expansion through a nonconforming situation review.

> *Policy 6.2 Diverse and expanding economy. Align plans and investments to maintain the diversity of Portland's economy and status as Oregon's largest job center with growth across all sectors (commercial, industrial, creative, and institutional) and across all parts of the city.*
>
> *Policy 6.5 Economic resilience. Improve Portland's economic resilience to impacts from climate change and natural disasters through a strong local economy and equitable opportunities for prosperity.*
>
> *Policy 6.6 Low-carbon and renewable energy economy. Align plans and investments with efforts to improve energy efficiency and reduce lifecycle carbon emissions from business operations. Promote employment opportunities associated with the production of renewable energy, energy efficiency projects, waste reduction, production of more durable goods, and recycling.*

The proposed code changes are consistent overall with the range of direction in Policies 6.2, 6.5 and 6.6, providing code-limited flexibility for incremental expansion of existing terminals as part of a diverse, expanding economy and prohibiting development of new fossil fuel terminals that conflict with resilience and climate action goals.

Existing Comprehensive Plan policies specifically implemented in this project

The 2035 Comprehensive Plan was adopted in June 2016 and is not expected to take effect until early 2018. In the meantime, the existing Comprehensive Plan is in effect.

> *Policy 7.6 Energy Efficient Transportation. Provide opportunities for non-auto transportation including alternative vehicles, buses, light rail, bikeways, and walkways. The City shall promote the reduction of gasoline and diesel use by conventional buses, autos and trucks by increasing fuel efficiency and by promoting the use of alternative fuels.*
>
> *Policy 7.8 Energy Supply. The City shall promote conservation as the energy resource of first choice. The City shall also support environmentally acceptable, sustainable energy sources, especially renewable resources such as solar, wind, hydroelectric, geothermal, biomass (wood, farm and municipal waste), cogeneration, and district heating and cooling.*

The proposed code changes are consistent with Policies 7.6 and 7.8, promoting the use of alternative energy sources by restricting development and expansion of fossil fuel terminals.

2015 Climate Action Plan

> *Goal: Reduce local carbon emissions 80 percent from 1990 levels by 2050, with an interim goal of 40 percent by 2030.*

As described in Section 4, lower-carbon fossil fuels like natural gas and propane have the potential to replace higher-carbon fuels, but they do not approach the goal of an 80% reduction in carbon emissions by 2050 in Portland's Climate Action Plan or the State's 75% goal. Investments in major infrastructure typically take decades to recoup, and the transition to renewables needs to go much faster than that to stabilize global emissions. The proposed code changes are consistent with the 80% goal of the Climate Action Plan by restricting development of fossil fuel terminals.

3. Public and stakeholder involvement

Section 3 summarizes public and stakeholder involvement activities that have helped shape and inform this project. Stakeholder focus group results are further explained in Appendix A of this report.

What have we heard leading up to this project?

Public hearings at the Planning and Sustainability Commission and City Council on the Pembina terminal development proposal in 2014 and Resolution 37168 in 2015 drew testimony from hundreds of people. The overall theme of that testimony was strong objection to the Pembina project and support for the fossil fuel resolution. Primary reasons included the neighborhood safety and health risks and inconsistency with the City's climate action objectives. The Resolution also drew letters with strong opposition from state and regional business associations.

Following adoption of the Resolution in November 2015, City Council added the related Policy 6.48 on fossil fuel distribution to the 2035 Comprehensive Plan, reflecting the recently adopted policy direction in the Resolution. Public involvement in the Comprehensive Plan Update included public hearings in April 2016 on City Council amendments and thousands of comments on the 2035 Comprehensive Plan over the previous 8 years. The proposed code amendments are consistent with several sustainability-related policies in the Plan. Addressing issues with policy tradeoffs, the 2035 Comprehensive Plan calls for a balanced, integrated approach to implement multiple goals. As described in Section 2, the proposed code amendments provide major benefits toward implementing three of the Plan's five guiding principles and integrates consideration of the other two guiding principles.

Public involvement activities in this project

Extensive public comments were received on the Discussion Draft and influenced substantial changes between the Discussion and Proposed Drafts.

Over 700 people sent emails asking for a "full ban" on new and expanded fossil fuel terminals. Their comments included three generally consistent recommendations: a ban on new bulk fossil fuel terminals; tight limits on expansion at existing facilities; and provisions to improve the safety and resilience of existing terminals. Common themes of these comments included:

- return to the initial intent and plain language of the resolution;
- where the resolution was bold, visionary, and historic, the discussion draft is short-sighted and prioritizes the fossil fuel industry over the health and safety of Portlanders;
- the discussion draft allows new bulk terminals to be built and existing facilities to expand, which will grow our carbon footprint past the point of being able to meet our local and state carbon reduction goals;
- transporting and storing fossil fuels are never safe, with risks ranging from oil train derailments and pipeline spills to storage tank explosions and tank destabilization from earthquakes;
- require existing fossil fuel terminals to make upgrades for seismic resilience to protect the health and safety of neighboring communities and the Willamette River;
- invest heavily in renewables with and urgency befitting the climate crisis.

Similar comments for further restrictions on terminal growth and seismic improvements were also made in letters from 350PDX, Portland Audubon, Center for Sustainable Economy, Columbia Riverkeeper, Oregon Sierra Club, Climate Solutions, members of a City Club seismic safety subcommittee, Linnton Neighborhood Association, League of Women Voters and other residents. Examples of other concerns raised in those letters include that code changes serve as a bold model for other jurisdictions; to partner with Portland Bureau of Emergency Management on seismic safety; and to clarify forecast growth methodologies relative to climate policies.

Themes of comments on the Discussion Draft from business and labor organizations included opposition to proposed code changes, requests for more time and analysis, and clarifications to address practical considerations. Letters were received from NW Natural, Port of Portland, Columbia Pacific Building and Construction Trades Council, Kinder Morgan, Arc Terminals, and Western States Petroleum Association (WSPA). Some examples of comments included that growth rates will change over time, that fuels meeting Oregon's Clean Fuel Standard should be excluded, inclusion of non-fuel methanol is inconsistent, and the economic analysis is cursory. WSPA submitted draft code language, including focusing terminal restrictions on extra-regional facilities beyond the West Coast (PADD V) region and a new Energy Corridor Overlay Zone that protects the historic energy cluster for energy infrastructure growth.

Public involvement in concept development for the project consisted primarily of four stakeholder focus groups, which were held in June 2016 to review preliminary code concepts and help identify and understand potential implementation issues. The focus groups highlighted the range of stakeholder perspectives and interests concerning proposed zoning changes. Figure 4 summarizes the themes of issues raised in the focus groups. Other outreach activities have included meetings with interagency partners, terminal operators, and other interested stakeholders. These activities and what we heard in them are further described in the appendix of this report.

Inter-governmental coordination

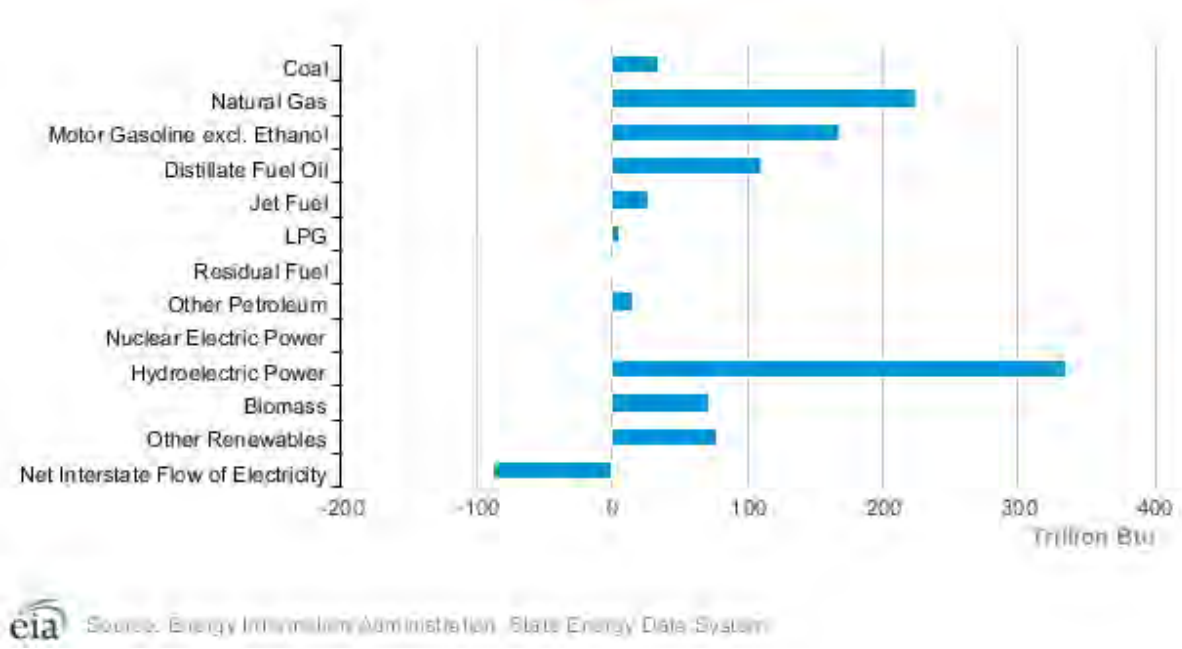
The Mayor's Office staff has sought input from and will continue to reach out to Tribal Government Partners to shape and inform the draft code amendments.

An In-House Draft Report was circulated to inter-bureau partners in June 2016, and their comments have helped to shape and inform the Discussion Draft, particularly addressing code administration and legal limitations. Bureau of Planning and Sustainability staff will continue to meet with inter-governmental partners to refine responses to implementation issues.

Figure 4. Summary themes of stakeholder focus group comments

TOPIC	FUEL TERMINAL REPRESENTATIVES	ENVIRONMENTAL AND HEALTH ORGANIZATIONS	STATE AND REGIONAL BUSINESS ORGANIZATIONS	NEIGHBORHOOD AND EQUITY ORGANIZATIONS
Key issues	▸ We've operated safely for decades. We meet the federal/state low-carbon fuel standards. ▸ Difficult to participate: very quick process; emotionally driven; antitrust restrictions. ▸ Unintended impacts: harder to meet clean fuel standards; more trucks on road; costs to rest of the state.	▸ Looking for strong, model code. Expect community backlash if expectations not met. ▸ Safety needs to be integral with climate - Mosier oil train wreck; terminals in liquefaction soils. ▸ Include disaster risks in economic analysis. Bonding or insurance for worst case.	▸ Resolution requires more research on economic impacts, etc. ▸ How will the code hold up in 5 years? ▸ What is the goal? If climate or safety, zoning tool is not the right fit. ▸ Portland is not an economic island. Statewide impact. ▸ Big political decision. Don't rush it.	▸ Safety and pollution are our priority. Look closely at seismic and explosion risks. ▸ A reasonable expectation for growth is smart. ▸ This is aggressive. Without LNG, won't China burn more coal? ▸ Rail safety in the Gorge is also a key issue that this can't resolve.
New land use category	▸ If unclear, permit staff could be pressured - unpredictable results. ▸ Use federal West Coast PADD 5 "region."	▸ Regulate both existing and new facilities. ▸ New code must effectively implement the policy.	▸ Need clear definitions: region, export, end user. ▸ Do not make terminals non-conforming or an ambiguous limited use.	▸ Why allow it in IG2? ▸ A new export terminal in contaminated harbor is unlikely.
Definition of fossil fuels	▸ Natural gas considered a low carbon fuel by State, so why included here? ▸ Tomorrow's cleaner fuels won't meet today's definitions.	▸ Excluding methanol undermines policy. ▸ If end use is mostly fuel, then limit it. ▸ One new LNG tank is a big risk. So is coal.	▸ Federal and state are going a different direction, requiring cleaner fossil fuels. Why restrict cleaner fuels at cross purposes?	▸ Make way for bio-diesel as a cleaner fuel. ▸ Methanol not a fuel in Oregon - overreaching. ▸ Fuels are okay if they have no emissions.
Terminal development restrictions	▸ Some sites are already built-out. ▸ Our non-contiguous sites are connected by pipelines. ▸ Can't comment on size.	▸ Most prefer Option A. ▸ Caution about Commerce Clause. ▸ 1% annual growth metric is too high.	▸ Don't come at sideways. Unclear rationales will lead to appeals. ▸ Size limits would put region on "import diet." ▸ Dated, low forecast.	▸ Option C preferred. ▸ Allow for modest growth of LNG and oil; not coal. ▸ Review size limits every few years.

4. Background conditions



This section of the report describes background conditions that inform the proposed zoning changes. Topics include access to energy, impacts on the economy, climate change impacts, and health and safety impacts of draft zoning code changes. Background information on changing energy markets in the Pacific Northwest and Portland's existing fossil fuel terminals is included in the Section 1. Legal and policy background information is presented in Section 2.

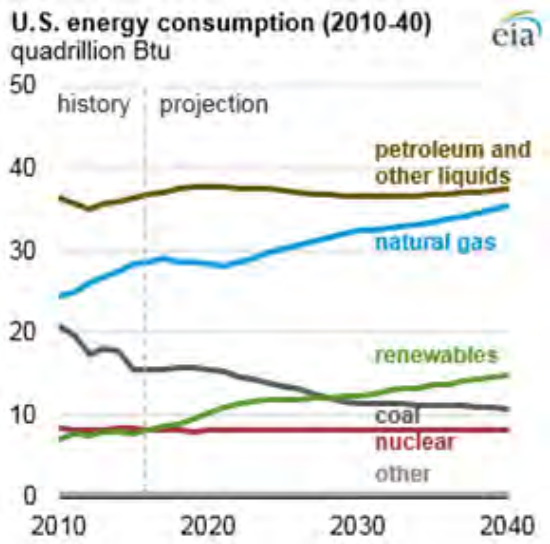
Access to energy

Energy consumption in Oregon

Oregon residents and businesses rely on Portland's fossil fuel distribution and storage facilities as a wholesale distribution hub to meet their energy consumption needs. Estimated state energy consumption by fossil fuels and other sources are shown in Figure 5. Residents and businesses in much of Southern Washington also rely on Portland terminals for access to fuels.

Figure 5. Oregon energy consumption estimates, 2014

Four refineries in the Puget Sound area supply nearly all of the petroleum fuels consumed in Oregon, delivered primarily through the Olympic Pipeline that terminates at the cluster of 10 petroleum terminals in Northwest Portland. From there, petroleum products are delivered to Oregon and Southern Washington markets via truck, pipeline and barge. NW Natural supplies natural gas to its Western Oregon market area and operates peak-consumption storage terminals in Northwest Portland



and Newport. Thus, fossil fuel terminals in Portland are a primary statewide distribution hub for transportation fuels and natural gas.

Energy consumption forecasts and the demand for additional storage capacity

Analysis to date is limited on the energy consumption forecasts and how the proposed code changes would impact the demand for additional fossil fuel storage capacity. Fossil fuel demand in this growing region may increase moderately, as indicated by trend-based forecasts, or may plateau and decline with implementation of climate resilience goals and strategies. National forecasts of energy consumption by the U.S. Energy Information Administration show varying growth trajectories by energy type, including a relatively flat outlook for petroleum fuels, decline for coal, and moderate growth for natural gas and renewables (see Figure 6).

Liquid bulk cargo in Portland Harbor is projected to expand at a range of 0.5% to 1.0% average annual growth (AAG) to 2040 (BST Associates, 2012), providing an estimate of potential market expansion needs for petroleum fuels, which could mean a need for an additional 10-20% increase in storage capacity. However, based on this forecast, ECONorthwest (2012) estimated that there was no additional land needed for new liquid bulk terminals in Portland. The 1.9% average annual growth forecast to 2034 (NW Natural 2014 Integrated Resource Plan) provides an estimate of market expansion needs for natural gas distribution facilities.

Figure 6. U.S. energy production and consumption projections to 2040

Source: US Energy Information Administration, Annual Energy Outlook 2016

Even if regional fossil fuel demand follows trend-based local forecasts, there is a wide margin between the size of recently proposed crude oil, coal, and LNG terminals proposed in the Pacific Northwest and the scale of expected growth of existing Portland fuel terminals that generally serve the regional market area, as shown in Figure 7.

Contradictory stakeholder comments were received that local growth projections are too high, too low, and could change substantially with market innovations. To address this uncertainty, periodic monitoring for code effectiveness is recommended in Section 7 as a future implementation project,

including monitoring for changes in regional fuel demand over time. Staff will continue to research and analyze potential economic impacts of proposed code changes prior to adoption.

Impacts of draft code changes on the economy

Jobs and wages at Portland's fuel terminals

In 2014, the 11 existing fuel terminals in Portland shown in Figure 3 provided approximately 280 jobs at their sites and supported an estimated 720 total jobs in the metropolitan area. The annual payroll at those terminals was $23 million, which supported total personal income of about $92 million in the metropolitan area.

BPS calculated these supported employment and income estimates from the induced and indirect impacts from metropolitan area purchases by these firms and their employees. For example, the jobs of the Longshore Union workers who unload fuels from tankers at these fuel terminals are not counted as direct jobs at the terminal sites. The multipliers used for these calculations were estimated from the average employment and income effects of marine terminals in Portland (Martin Associates, 2012). The job and wage estimates were calculated from Quarterly Census of Employment and Wages (QCEW) data.

Portland's industrial area jobs also have an important urban equity role in that they consist primarily of middle-wage jobs that do not require 4-year college degrees, which the overall economy has been losing since 2000. In contrast, jobs in commercial districts are concentrated primarily in low- and high-wage quartiles (fourths) of overall city employment. Middle-wage job growth supports the "income self-sufficiency" objectives of the Portland Plan and 2035 Comprehensive Plan (Policy 6.28) to expand access to self-sufficient wage levels.

Long-term job growth to 2035 is estimated at 1.6% average annual growth in the warehousing, transportation and utilities sector in Portland's 2016 Economic Opportunities Analysis and Metro's 2014 Urban Growth Report. Applying this growth rate to Portland's existing fuel terminals, approximately 110 net new permanent jobs are expected between 2014 and 2035, which is the equivalent of about four new terminals at their current average size. The total metropolitan area job impact of this fuel terminal expansion would be approximately 290 new jobs by 2035. If fuel terminal job growth occurred at a slower 1.0% average annual rate, matching the forecast growth of liquid bulk cargo volumes in Portland Harbor, approximately 65 net new terminal jobs would be generated by 2035, supporting a total 170 new jobs in the metro area. Pembina's proposed propane terminal in 2014 was estimated to create 30 to 40 new permanent jobs and 600-800 temporary construction jobs.

The proposed code changes would allow for code-limited expansion at existing terminals and new fuel distribution facilities smaller than 5 million gallons to accommodate potential increases in regional demand and resulting job growth.

Tax revenues of new terminals

State and local revenues from income and property taxes vary widely by facility. For example, property taxes on the depreciated improvements value of existing fuel terminals are much lower than new construction. If fuel terminals added 110 net new direct jobs by 2035 and the resulting state and local tax revenues is typical of businesses and developed facilities in Portland's Working Harbor (Martin Associates, 2016), the estimated new state and local tax revenues in fiscal year 2035 (in 2015 dollars) would be $1.6 million. In contrast, the proposed $500 million Pembina project was estimated to generate approximately $12 million in annual property tax revenue, reflecting the increased improvements value and property taxes of new construction.

The proposed code changes would allow for code-limited expansion at existing terminals and new fuel distribution facilities smaller than 5 million gallons and resulting state and local tax revenue. However, prohibiting large scale new terminals such as Pembina could result in similar levels of foregone property taxes. Development of the limited land supply along Portland Harbor for new auto or grain terminals would also result in substantial local and state tax revenues, offsetting foregone taxes on new fossil fuel terminals.

Growth opportunities in fossil fuel distribution

The most recent cargo forecast for Portland Harbor in 2012 projected 1.0% AAG in liquid bulk tonnage to 2040 as a high scenario and 0.5% AAG as a low scenario (BST Associates, 2012). Based on this forecast, ECONorthwest (2012) estimated no additional land need for new liquid bulk terminals. Since 2012, several new fuel terminals have been proposed in the Pacific Northwest, as shown in Figure 2.

Updating the liquid bulk forecast at this point would be challenging for several reasons. Most of the recent fuel terminal proposals have since been abandoned or appear to be dormant. Policy and permitting uncertainty complicate the development feasibility of new terminals and transportation infrastructure. Crude oil prices have fallen sharply in 2015 and 2016, reducing the current market potential for major investments. Expanding global industrial product markets after the Great Recession slowed substantially in 2015. And energy distribution markets could change abruptly with continuing product innovations and location shifts in global production.

In the long term, Portland has competitive advantages for accommodating energy terminal development as a Pacific Rim gateway location to growing Asian markets, the Columbia River's low-gradient railroad access for heavy cargo through the Cascades, and Oregon's freight infrastructure hub. On the other hand, Portland's industrial land supply for continuing growth is limited, and expanding cargo markets for autos, grain and dry bulks are competing for current growth capacity.

Other economic impacts

Energy infrastructure and terminal investments appear to have low but potentially catastrophic risks of major accidents, as described below. Examples include seismic resilience of petroleum terminals in the event of a Cascadia Subduction Zone earthquake, oil train derailments, explosions at LNG (liquefied natural gas) and LPG (liquefied petroleum gas, such as propane) facilities, and others.

Clean Energy is a target industry in the City of Portland. An emerging cluster of Portland area business activity in solar and wind energy manufacturing, green building development, and other fields of sustainable urban innovation present long-term business growth opportunities. Substantial local investment in fossil fuel infrastructure and large new terminals could hinder local growth momentum in Clean Energy industries.

Climate change impacts of draft code changes

Climate impact of fossil fuels

Fossil fuels are major contributors to climate change and pollution, as described in Portland's 2015 Climate Action Plan. Greenhouse gas emissions from the burning of fossil fuels and land use changes, including deforestation, are primary causes of climate change. The Intergovernmental Panel on Climate Change's most recent report documents the overwhelming evidence that human activities have been

the major driver of recent warming of the Earth's surface, and that climate change and its consequences will continue into the future (IPCC, 2013).

The magnitude of future climate impacts depends largely on the trajectory of future global greenhouse gas emissions. Greenhouse gas emissions from human activities have continued to rise in recent decades, reaching the highest rates in human history between 2000 and 2010 (IPCC, 2014). About half of all carbon dioxide emissions, the most prevalent greenhouse gas, between 1750 and 2010 occurred in the last 40 years. The energy, industry and transportation sectors have dominated these emissions increases. On the current trajectory, global transportation emissions will double by 2050.

Transition to "renewable" and "clean" fuels

The U.S. Environmental Protection Agency (USEPA) implements the federal Renewable Fuel Standard (RFS) that requires transportation fuel sold in the U.S. to contain a minimum volume of renewable fuels. The RFS originated with the Energy Policy Act of 2005 and was expanded and extended by the Energy Independence and Security Act of 2007 (EISA). Similarly, the Oregon Department of Environmental Quality (ODEQ)implements the Oregon Clean Fuel Program. ODEQ describes "clean fuel" as a fuel with a lower carbon intensity than that of the fuel it replaces.

Examples of "clean fuels" in Oregon's program include most types of ethanol, biodiesel, natural gas, biogas, electricity, propane and hydrogen. The Oregon Clean Fuel Standard sets 2015 as a baseline that represents 10 percent ethanol blended with gasoline and 5 percent biodiesel blended with diesel. The rule also requires a 10 percent reduction in average carbon intensity from 2015 levels by 2025.

Terminal representatives and business stakeholders urged that proposed zoning code changes not create a disincentive or barrier to compliance with these federal and state rules, which may require additional tank capacity to implement. Environmental and public health organization representatives pointed out that City Resolution 37168 addresses fossil fuels generally, including lower-carbon fossil fuels like natural gas and propane. The proposed code changes would allow for code-limited expansion at existing terminals and are not expected to hinder compliance with the renewable and clean fuel standards, as described in Section 5.

Velocity of transition to non-fossil fuel energy

Portland's Climate Action Plan sets a goal for an 80% reduction in greenhouse gas emissions by 2050. Oregon's climate action goals similarly call for 75% reduction by 2050. While fossil fuels like natural gas and propane have the potential to replace higher-carbon fuels, they don't begin to approach the 80% reduction that the City is striving for or the State's 75% goal. ODEQ estimates that the greenhouse gas emissions reduction from switching from gasoline to compressed natural gas, for example, is 18%; for propane, it is 15%. The lower-carbon fossil fuels do have appeal as a bridge to widespread use of renewable energy, but investments in major infrastructure typically take decades to recoup, and the transition to renewables needs to go much faster than that to stabilize global emissions.

During recent hearings and analysis on Resolution 37168 and the Pembina terminal proposal, the question of whether to differentiate between fossil fuels with different carbon content was widely

discussed. In the lead up to the resolution, an option was proposed that would oppose new coal and oil infrastructure but allow for other fossil fuels that could show a likely net decrease in carbon emissions. City Council decided not to apply this option in the resolution.

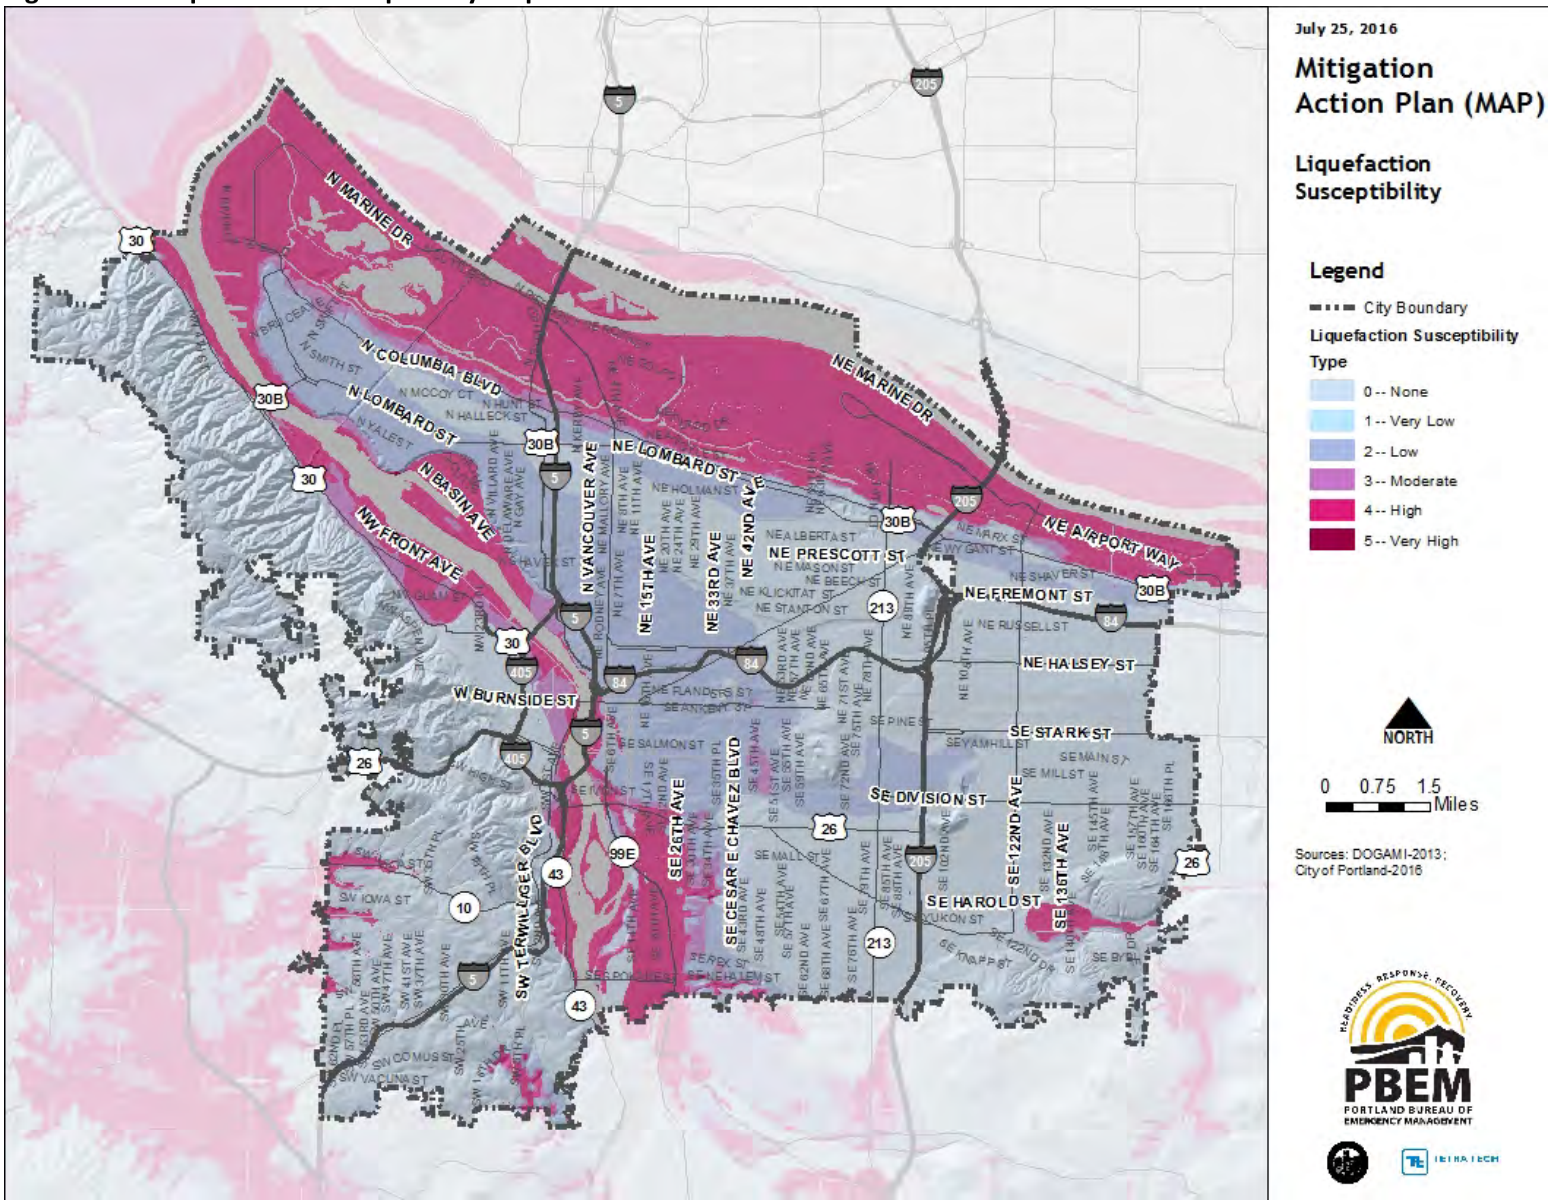
Health, safety and environmental impacts of draft code changes

Seismic resilience and liquefaction soils

The 2035 Comprehensive Plan sets policy direction (4.75 and 4.76) to encourage disaster-resilient development and specifically to reduce natural hazard risks to critical energy and transportation infrastructure in Portland Harbor.

The 2016 Critical Energy Infrastructure Hub Study underway by the Portland Bureau of Emergency Management includes a literature review and modeled risks of structural damage to critical infrastructure from earthquakes, floods, landslides, volcanic activity, wildfire and other sources. Along with petroleum and natural gas infrastructure, the study is also assessing infrastructure risks to emergency services, transportation, electricity, potable water and waste water. The study area includes the Northwest and Linnton industrial areas. PBEM has identified significant seismic risks at the fuel terminals from a major Cascadia Subduction Zone earthquake because of their location in a filled riverfront plateau area with moderate- to high-susceptibility location for soil liquefaction.

As shown in Figure 7, the Oregon Department of Geology and Mineral Industries (DOGAMI) has mapped most of the riverfront plateau areas, which account for over 90 percent of Portland's industrial zoning, as having high susceptibility for soil liquefaction, along with areas along the Central City riverfront and much of the Brooklyn and Sellwood-Moreland neighborhoods. Most of the existing fuel terminals in the Willbridge area are mapped as having moderate susceptibility for soil liquefaction, and the others are mapped in the high susceptibility areas. The proposed code amendments will improve the seismic resilience of new bulk fossil fuel terminals by precluding their development in areas with high susceptibility to soil liquefaction.



The proposed code changes provide for seismic improvements to existing terminals, through a Nonconforming Situation Review. Future amendments to building and fire codes to improve seismic safety of fossil fuel infrastructure may also be adopted to implement Resolution 37168. A future code project is recommended in Section 7 to develop building code amendments to improve seismic resilience and require seismic upgrades comparable to proposed requirements on unreinforced masonry buildings.

Safety of liquefied gas terminals

Liquefied natural gas (LNG) and liquefied petroleum gas (LPG), such as propane, facilities pose safety risks from potential explosions and fire. The Pembina propane terminal, which was proposed in 2015 at the Port of Portland Terminal 6, is an apt case study. The Pembina terminal would have required environmental zoning code amendments that did not move forward.

The issue of safety risks was discussed extensively during review of the proposed Pembina terminal, and a quantitative risk assessment study was prepared to inform that review process (Det Norske Veritas (U.S.A.), Inc., 2015). The study estimated the risk from flammable releases, such as jet fires, pool fire, flash fire, vapor cloud explosions, fireball and Boiling Liquid Expanding Vapor Explosion (BLEVE).

Figure 8. Soil liquefaction susceptibility map of Portland

The risk was presented as individual risk in the form of location-specific risk contours extending outward from the proposed facilities, and as societal risk in the form of potential loss of life and cumulative frequency of various accidents. The highest offsite risk level was found to be 1 fatality in 1,000 years in areas directly north and south of facility. The nearest residential zones are located beyond the risk level contour of 1 fatality in 100 million years. The cumulative societal risk was estimated at 1 statistical fatality every 38 years. The study also included various facility design and siting recommendations to mitigate identified risks.

Another risk assessment (Northwest Citizen Science Initiative, 2015) on the Pembina project was presented by environmental groups and neighbors including the Hayden Island Neighborhood Association. The analysis identifies additional sources of risk from BLEVE cascades, terrorist events and magnitude 9 earthquakes. The authors recommend not locating a propane terminal within 10 miles of the Portland/Vancouver urban area.

Public safety risks from a new LNG or LPG facility are estimated to be very low relative to other urban hazards, although possible impacts could be catastrophic. The proposed code amendments are expected to reduce public safety risks by prohibiting development of large new LNG or LPG facilities.

Oil train accidents

On June 3, 2016 an oil train traveling through the Columbia River Gorge partially derailed in Mosier en route to Tacoma. The 16-car derailment resulted in a 1,000-barrel spill and fires that lasted nearly a day. Small amounts of oil reportedly reached the river, and nearby drinking water and wastewater facilities in Mosier were affected.

An Associated Press analysis of accident records found that 26 oil-train derailments or fires have occurred nationally in the last decade. The national geography of increasing oil extraction in the inland Great Plains states and refineries concentrated on the coasts is contributing to this trend. Risk of how often such derailments are likely to occur in the Columbia Gorge is disputed, with one estimate as high as one every 30 months.

Preliminary reporting on the cause of the Mosier derailment pointed to failed bolts in the track that are difficult to detect. Union Pacific reported that improvements are underway to replace bolts on 530 miles of curved track nationwide. Railroad safety is regulated at the federal level and monitored by the Federal Railroad Administration. A recent Government Accounting Office report has identified challenges and delays in implementing some federal rail safety regulations.

The proposed code amendments could incrementally reduce rail accident risks by restricting development and expansion of fossil fuel terminals at a West Coast rail hub location. However, restricting the location of new petroleum terminals in the city of Portland is not expected to substantially affect the volume of petroleum cargo transported by rail to Puget Sound refineries. The Portland/Vancouver area is a rail hub location, where West Coast rail lines running north-south intersect the low gradient east-west rail corridor along both sides of the Columbia River. Roughly half of the east-west rail cargo destined for the Seattle-Tacoma area, in addition to Oregon-bound rail cargo, moves through the Portland metropolitan area. Derailment risk within Portland is reduced by the numerous siding destinations and congestion of the “Portland Triangle” area where UP and BNSF lines come together. However, derailment risks to natural resources, especially along rivers, and to rural communities appear to be significant.

5. Code concepts and analysis

This section of the report describes the proposed zoning change concepts by topic area, including the related policy directions, implementation issues, and rationale for the proposed zoning changes.

1. **Types of distribution and storage facilities to be regulated**

Policy direction:

- City Council Resolution 37168 (adopted November 2015) calls for opposing expansion of infrastructure for transportation and storage of fossil fuels, subject to various exceptions, including safety improvements, service to end users, and infrastructure that accelerates transition to non-fossil fuel energy.
- 2035 Comprehensive Plan Policy 6.48 Fossil Fuel Infrastructure (adopted June 2016, not effective until 2018) also calls for limiting fossil fuel distribution and storage facilities to those necessary to serve the regional market.

Preliminary code concepts:

- Limit development of new Bulk Fossil Fuel Terminals as a regulated land use.
- Bulk Fossil Fuel Terminals are engaged in freight movement or wholesaling of fossil fuels at facilities that are characterized by having (1) marine, pipeline or railroad transport access and (2) either transloading facilities for transferring a shipment between transport modes (such as from rail to ship) or bulk storage facilities exceeding 5 million gallons (or equivalent volume) of fossil fuels. Examples include petroleum terminals, liquid natural gas terminals, and coal terminals. Functionally, these terminals are typically regional gateway facilities, where fossil fuels enter and exit the region, but the use classification is intended to be clearly identifiable and not rely on a definition of region.
- Exceptions that are not Bulk Fossil Fuel Terminals:
    - Retail sales of fossil fuels, such as gasoline or propane filling stations;
    - Distributors, wholesalers, and industrial service uses that receive and deliver fossil fuels exclusively by truck;
    - End-user facilities that store fossil fuels for primary use at or near the site, such as manufacturing, agriculture, and airports;
    - Uses that recover or reprocess used petroleum products;
    - Waste-related uses that transfer or store solid or liquid wastes, such as landfills.

Implementation issues:

- Definition of region – Portland is a regional distribution hub for energy and other products, and this zoning change is not intended to restrict energy access to the growing region. However, the regional market area of Bulk Fossil Fuel Terminals varies by product and is difficult to define. Portland's 10 petroleum terminals generally serve Oregon and Southern Washington. This market area substantially exceeds the Portland metropolitan area, which is often colloquially referred to as the region. Some terminal representatives pointed out that the federal government's 5-state West Coast PADD 5 region is generally their regional market area. Bureau

of Development Services (BDS) staff commented that zoning does not regulate the target market (destination) of wholesale products, and the zoning code does not define region. Business organization representatives commented that the energy markets and related market areas are likely to change over time. Therefore, the proposed land use incorporates the concept of a regional market into the size limits, and a zoning definition of region is not proposed here.

- End users – Resolution 37168 lists a specific exception to not restrict service directly to end users. At a small scale, services to end users include retail gasoline filling stations, natural gas access lines in street right-of-way to residential and business customers, and heating oil tanks at home sites. Larger scale end users with fossil fuel storage and access infrastructure also include manufacturers, jet fuel facilities at the PDX Airport, vessel fuel facilities on Portland Harbor, and others where fossil fuels are used as an input. Again, the limits on new facilities are sized to apply only to larger distribution facilities.

- Interpretation of use category – Terminal and business representatives commented that ambiguity in the use description could result in conflicting expectations, pressured interpretations, appeals, and inconsistent code implementation. While underlying policy accommodates regional access and exceptions that may be difficult to clearly define, the land use designation is proposed to be defined by clear and objective size thresholds and marine/railroad/pipeline access.

2. **Definition of fossil fuels**

Policy direction: City Council Resolution 37168 applies to fossil fuel infrastructure and storage generally, and does not distinguish among types or carbon intensity of fossil fuels.

Preliminary code concept:

- Definition of fossil fuels: petroleum products (such as crude oil and gasoline), coal, and gaseous fuels (such as natural gas and propane) that are made from decayed plants and animals that lived millions of years ago and are used primarily as a source of energy.
- Exclusion of non-fuel products – Petrochemicals that are used primarily for non-fuel products are excluded, such as plastics, lubricants, fertilizer, roofing and paints.
- Methanol is included as a fossil fuel. Development of methanol storage and transportation facilities would be prohibited similarly to LNG and LPG terminals.
- Denatured ethanol and similar fuel additives and biodiesel/renewable diesel with less than 5% fossil fuel content are not fossil fuels.
- Biogas from wastewater treatment plants, anaerobic digesters, landfills and other sources is not a fossil fuel.

Implementation issues:

- Definition of fossil fuels – Definitions of fossil fuels vary by source. Here are some examples.
    - Oregon Department of Environmental Quality (ODEQ) – Fossil fuels: fuels such as oil, natural gas, and coal that are made from decayed plants and animals that lived millions of years ago. These fuels are made of hydrogen and carbon (hydrocarbons).

- U.S. Environmental Protection Agency (USEPA), 40 C.F.R. § 60.41 - Fossil fuel means natural gas, petroleum, coal, and any form of solid, liquid, or gaseous fuel derived from such materials for the purpose of creating useful heat.
- Oregon Department of Energy Administrative Rule, OAR 345-001-0010 - "Fossil fuel" means natural gas, petroleum, coal and any form of solid, liquid or gaseous fuel derived from such materials that serves as useful energy.

- Renewable and clean fuel standards – As described in Section 4, USEPA implements the federal Renewable Fuel Standard (RFS) that requires transportation fuel sold in the U.S. to contain a minimum volume of renewable fuels. Similarly, ODEQ implements the Oregon Clean Fuel Program. ODEQ identifies examples of "clean fuels" in Oregon as most types of ethanol, biodiesel, natural gas, biogas, electricity, propane and hydrogen. Terminal representatives and business stakeholders urged that proposed zoning code changes not create a disincentive or barrier to compliance with these federal and state rules, which may require additional tank capacity to implement. Environmental and public health organization representatives pointed out that City Resolution 37168 addresses fossil fuels generally, including clean fuels. The proposed allowance for code-limited expansion of existing terminals will allow enough supply to comply with the renewable and clean fuel standards.

- *Methanol – Large methanol plants have recently been proposed in Tacoma, Kalama, and St. Helens. Methanol plants tend to have structural similarities to LNG and LPG terminals, including large-scale and gas pipeline access, and they can have similar safety and climate impacts. Stakeholder focus groups were asked whether any* special inclusions, such as methanol, should be considered. Most people commenting noted that methanol is primarily used in the production of plastics and other non-fuel uses. Views differed among environmental organizations commenting. Some noted that excluding it undermines the policy. The proposed code limits development of large methanol plants similarly to LNG or LPG terminals.

- *Denatured ethanol* – A terminal operator pointed out that "pure" ethanol made from corn or other non-fossil source is required by the Alcohol and Tobacco Tax and Trade Bureau to be denatured in order to be transported to the site. Denatured ethanol typically contains up to 5% methanol, so that it is toxic and undrinkable. Storage of denatured ethanol is proposed to be exempted. In other words, denatured ethanol tanks would not be counted as part of the maximum storage capacity of fossil fuel terminals.

- Biogas products from landfills – Bureau of Environmental Services (BES) staff commented that biogas from landfills and other sources are not fossil fuels and should not be restricted by the proposed zoning changes. The proposed description of fossil fuel terminals specifically excludes waste-related uses, such as landfills, which are regulated as a separate land use in the zoning code. Also, the proposed definition of fossil fuels, described as being made from decayed plants and animals that lived millions of years ago, would not include biogas from a landfill.

3. **Prohibition of bulk fossil fuel terminals**

Policy direction:

- City Council Resolution 37168 (adopted November 2015) calls for opposing expansion of infrastructure for transportation and storage of fossil fuels, subject to various exceptions, including safety improvements, service to end users, and infrastructure that accelerates transition to non-fossil fuel energy.
- 2035 Comprehensive Plan Policy 6.48 Fossil Fuel Infrastructure (adopted June 2016, not effective until 2018) also calls for limiting fossil fuel distribution and storage facilities to those necessary to serve the regional market.

Preliminary code concept:

- Classify Bulk Fossil Fuel Terminals as a prohibited use in all base zones.

Implementation issues:

- Policy implementation – City Resolution 37168 reflected a major change in policy direction on fossil fuel distribution and storage facilities. Prohibition of Bulk Fossil Fuel Terminals is proposed as an unambiguous, assertive approach to implement this policy change, responding to increasingly evident safety risks of fossil fuel infrastructure, aggressive climate change goals, and changing energy markets in the Pacific Northwest.

- Community expectations – Over 700 people sent emails in response to the Discussion Draft asking for a "full ban" on new and expanded fossil fuel terminals. Climate resilience advocates are widely represented in the Portland community and the Pacific Northwest. Public involvement in Resolution 37168 and this project reveal broad community expectations for a bold approach to restrict fossil fuel distribution facilities in Portland.

- Providing regional market access to fuels – Analysis to date is limited on the potential impacts of the prohibition on constraining regional fuel supply. Fossil fuel demand in this growing region may increase moderately, as indicated by trend-based forecasts, or may plateau and decline with implementation of climate resilience goals and strategies. Staff will continue to research and analyze potential economic impacts of proposed code changes prior to adoption. The fossil fuels consumed in Oregon are generally not extracted or refined in the state. As a result, fossil fuel terminals provide multimodal transportation efficiency and price advantages for distributing fuels to the growing population of the regional market area.

- Option to set size limits on new fossil fuel terminals – The Discussion Draft proposed storage capacity size standards to limit new fossil fuel terminal development. Figure 7 in Section 4 indicates a wide margin between the size of recently proposed crude oil, coal and LNG terminals proposed in the Pacific Northwest and the scale of expected growth by existing Portland fuel terminals that serve the regional market area. Proposed terminal size limitations within that margin would allow for expansion at existing terminals and moderately sized new terminal development to meet potential market area consumption needs. Instead, the Proposed Draft code changes would prohibit Bulk Fossil Fuel Terminals, a more restrictive approach to more

assertively implement the new policy directions and respond to extensive community comments on the proposed code changes. Existing terminals can expand and make safety and seismic upgrades to their facilities within their current sites, providing the opportunity to meet potential market area consumption needs.

- Balanced, integrated policy approach – The proposed restrictions on fossil fuel distribution facilities entail tradeoffs among public goals for environmental protection, public health and safety, meeting energy needs, and economic prosperity, as described in Section 4. The Comprehensive Plan calls for a balanced, integrated approach in land use regulations to meet these public objectives, as described in Section 2. The proposed code changes provide for significant environmental and safety benefits in restricting development and expansion of fossil fuel terminals and provide for limited expansion of fossil fuel terminals to adequately meet regional energy needs and integrate economic prosperity and equity considerations.

4. Legal, nonconforming status of existing facilities

Policy direction:

- City Council Resolution 37168 includes various exemptions to not restrict safety or efficiency improvements, service to end users, emergency backup capacity, infrastructure for recovery or re-processing of used petroleum products, or infrastructure that will accelerate the transition to non-fossil fuel energy sources.
- 2035 Comprehensive Plan Policy 6.48 Fossil Fuel Infrastructure (adopted June 2016, not effective until 2018) also calls for limiting fossil fuel distribution and storage facilities to those necessary to serve the regional market.
- 2035 Comprehensive Plan Policies 4.75 and 4.76 call for encouraging disaster-resilient development and reducing natural hazard risks to critical energy and transportation infrastructure in Portland Harbor.

Preliminary code concept:

- Existing Bulk Fossil Fuel Terminals would become legal, non-conforming uses, which may continue to operate. Expansion would require approval through a nonconforming situation review, which is a Type II discretionary land use review. The Type II procedure is an administrative process with the opportunity for public notice and comment. The Director of the Bureau of Development Services makes the initial decision, which can be appealed to a City Hearings Officer, whose decision in turn can be appealed to the State Land Use Board of Appeals (LUBA).

Implementation issues:

- Flexibility for code-limited expansion - Significant improvements to non-conforming uses generally require a "nonconforming situation review." Given this requirement, the proposed code changes may be more restrictive than the exceptions in the resolution that call for not restricting improvements at existing fuel terminals that improve safety, provide wholesale fuel supply to local or regional end users, add backup capacity, or add tanks for clean/renewable fuels would require approval through a nonconforming situation review. However, the Zoning Code's provisions for expansion of nonconforming uses do provide discretionary flexibility to accommodate such improvements. Approval criteria for a nonconforming situation review

include that, with mitigation measures, there will be no net increase in overall detrimental impacts on the surrounding industrial zone (such as hours of operation and vehicle trips) and the expansion will not detract from the desired function and character of the industrial zone. Terminal improvements would also be limited to their existing site area. Improvements that address the exceptions in the resolution are not generally expected to result in additional detrimental impacts on the surrounding industrial zone. Given the level of community scrutiny about fossil fuel terminal expansion, this discretionary public review process could add to the cost and uncertainty of investments at fossil fuel terminals. Nonconforming situation reviews are "Type 2" staff level permits, which could be appealed to a hearings officer and further to the Land Use Board of Appeals.

- Option to not restrict expansion at existing terminals - The Discussion Draft proposed code concepts (storage capacity size standards to limits new fossil fuel terminal development) that would not restrict development on existing terminals. This option was intended to be consistent with the exceptions in the resolution (as described in the previous point) and to accommodate potential growth in regional fuel demand. Instead, the Proposed Draft code changes would apply a legal, non-conforming use status on existing Bulk Fossil Fuel Terminals, a more restrictive approach to more assertively implement the new policy directions and respond to extensive community comments on the proposed code changes.

- Divergent stakeholder views – Extensive comments on the Discussion Draft recommended tight limits on expansion of existing fuel terminals. In contrast, stakeholder focus group participants generally urged that existing fuel terminals should not be changed to a non-conforming use for reasons ranging from providing a critical product to not discouraging desired seismic and safety improvements on existing facilities. Stakeholder group comments from environmental and public health organizations generally supported restricting expansion of existing terminals, while some participants cautioned about political and legal tradeoffs of making the existing fuel terminals nonconforming.

6. Zoning code changes

This section of the report specifies the draft code language, along with code commentary pages that clarify expected implementation. The section is formatted to facilitate readability, showing proposed code changes on the right-hand pages and related code commentary on the facing left-hand pages.

33.910.030 Definitions

The definition of fossil fuels was added to clarify the land use category Bulk Fossil Fuel Terminals.

Petrochemicals that are used primarily for non-fuel products are excluded, such as plastics, lubricants, fertilizer, roofing, and paints. However, methanol is an exception that is included as a fossil fuel, because large methanol storage and distribution facilities tend to have structural similarities to liquid natural gas (LNG) and liquid petroleum gas (LPG) terminals, including large-scale storage and gas pipeline access, and because they can have similar safety and climate impacts.

Fuels containing 5% or less fossil-fuel volume are not considered fossil fuels under this definition. For example, "pure" ethanol made from corn or other non-fossil source is required by the Alcohol and Tobacco Tax and Trade Bureau to be denatured in order to be transported to the site. Denatured ethanol typically contains up to 5% methanol, so that it is toxic and undrinkable.

Some fossil fuels under this definition are also classified as "renewable fuels" in the federal Renewable Fuel Standard and "clean fuels" in Oregon's Clean Fuel Standard, such as liquid natural gas and liquid propane gas. These federal and state standards require transportation fuel sold within their jurisdiction to contain a minimum volume of renewable or clean fuels.

33.910.030 Definitions

The definition of words with specific meaning in the zoning code are as follows:

Fossil Fuel. Fossil fuels are petroleum products (such as crude oil and gasoline), coal, and gaseous fuels (such as natural gas, methanol, and propane) that are made from decayed plants and animals that lived millions of years ago and are used as a source of energy. Denatured ethanol and similar fuel additives and biodiesel/renewable diesel with less than 5% fossil fuel content are not fossil fuels.

Commentary

33.920.300 Bulk Fossil Fuel Terminal

Bulk Fossil Fuel Terminals are added as a new land use category to regulate their development in the Zoning Code. Regulation of Bulk Fossil Fuel Terminals implements policy direction in City of Portland Resolution 37168 (adopted November 2015) and 2035 Comprehensive Plan Policy 6.48 (adopted June 2016, expected to take effect in 2018), both of which address fossil fuel distribution and storage facilities.

Bulk Fossil Fuel Terminals are characterized by having (1) marine, pipeline or railroad transport access and (2) either trans-loading facilities for transferring a shipment between transport modes (such as from rail to ship) or bulk storage facilities exceeding 5 million gallons (or equivalent) of fossil fuels. Functionally, these terminals tend to be regional gateway facilities, where fossil fuels enter and exit the region. Additionally, Policy 6.48 calls for limiting fossil fuel distribution and storage facilities to those necessary to serve the regional market. However, the use classification is intended to be clearly identifiable by physical characteristics and not rely on a definition of region.

The regional market area of Bulk Fossil Fuel Terminals varies by product and is difficult to define. Portland's 10 petroleum terminals generally serve Oregon and Southern Washington. This market area substantially exceeds the Portland metropolitan area, which is often colloquially referred to as the region. Some terminal representatives pointed out that the federal government's 5-state West Coast PADD 5 region is generally their regional market area.

Resolution 37168 lists a specific exception to not restrict service directly to end users. At a small scale, services to end users include retail gasoline filling stations, natural gas access lines in street right-of-way to residential and business customers, and heating oil tanks at home sites. Larger scale end users with fossil fuel storage and access infrastructure also include manufacturers, jet fuel facilities at the PDX Airport, vessel fuel facilities on Portland Harbor, and others, where fossil fuels are used as an input.

Industrial Use Categories

33.920.300 Bulk Fossil Fuel Terminal

A. Characteristics. Bulk Fossil Fuel Terminals are establishments primarily engaged in the transport and bulk storage of fossil fuels. Terminal activities may also include fuel blending, regional distribution, and wholesaling. The firms rely on access by marine, railroad or regional pipeline to transport fuels to or from the site, and either have transloading facilities for transferring a shipment between transport modes, or have storage capacity exceeding 5 million gallons (or equivalent volume) of fossil fuels. There is minimal on-site sales activity with the customer present.

B. Accessory uses. Accessory uses may include retail sales of petroleum products, offices, food membership distribution, parking, storage, truck fleet parking and maintenance areas, rail spur or lead lines, and docks.

C. Examples. Examples include crude oil terminals, petroleum products terminals, natural gas terminals, propane terminals, and coal terminals.

D. Exceptions.

1. Truck or marine freight terminals that do not store, transport or distribute fossil fuels are classified as Warehouse and Freight Movement uses.
2. Truck or marine freight terminals that do not have transloading facilities and have storage capacity of less than 5 million gallons are classified as Warehouse and Freight Movement uses.
3. Gasoline stations and other retail sales of fossil fuels are not Bulk Fossil Fuel Terminals.
4. Distributors and wholesalers that receive and deliver fossil fuels exclusively by truck are classified as Warehouse and Freight Movement uses.
5. Industrial, commercial, institutional, and agricultural firms that exclusively store fossil fuels for use as an input are not Bulk Fossil Fuel Terminals.
6. Uses that involve the transfer or storage of solid or liquid wastes are classified as Waste-Related uses.
7. The storage of fossil fuels for exclusive use at an airport, surface passenger terminal, marine, truck or air freight terminal, rail yard, or as part of a fleet vehicle servicing facility are accessory to their use.
8. Uses that recover or reprocess used petroleum products are not Bulk Fossil Fuel Terminals.

33.920.310~~300~~ Industrial Service

33.920.320~~310~~ Manufacturing And Production

33.920.330~~320~~ Railroad Yards

33.920.340~~330~~ Warehouse And Freight Movement

A. Characteristics. Warehouse And Freight Movement firms are involved in the storage, or movement of goods for themselves or other firms. Goods are generally delivered to other firms or the final consumer, except for some will-call pickups. There is little on-site sales activity with the customer present.

B. Accessory uses. Accessory uses may include offices, food membership distribution, truck fleet parking and maintenance areas, rail spur or lead lines, docks, and repackaging of goods.

C. Examples. Examples include separate warehouses used by retail stores such as furniture and appliance stores; household moving and general freight storage; cold storage plants, including frozen food lockers; storage of weapons and ammunition; major wholesale distribution centers; truck, marine, or air freight terminals; bus barns and light rail barns; parcel services; major post offices; grain terminals; and the stockpiling of sand, gravel, or other aggregate materials.

D. Exceptions.

1. Uses that involve the transfer or storage of solid or liquid wastes are classified as Waste-Related uses.
2. Miniwarehouses are classified as Self-Service Storage uses.
3. Establishments that engage in the transfer or storage of fossil fuels, rely on access by marine, railroad or regional pipeline to transport fuels to or from the site, and either have transloading facilities or have storage capacity exceeding 5 million gallons of fossil fuels are classified as Bulk Fossil Fuel Terminal use.

33.920.350~~340~~ Waste-Related

33.920.360~~350~~ Wholesale Sales

A. Characteristics. Wholesale Sales firms are involved in the sale, lease, or rent of products primarily intended for industrial, institutional, or commercial businesses. The uses emphasize on-site sales or order taking and often include display areas. Businesses may or may not be open to the general public, but sales to the general public are limited as a result of the way in which the firm operates. Products may be picked up on site or delivered to the customer.

B. Accessory uses. Accessory uses may include offices, food membership distribution, product repair, warehouses, parking, minor fabrication services, and repackaging of goods.

C. Examples. Examples include sale or rental of machinery, equipment, heavy trucks, building materials, special trade tools, welding supplies, machine parts, electrical supplies, janitorial supplies, restaurant equipment, and store fixtures; mail order houses; and wholesalers of food, clothing, auto parts, building hardware, and office supplies.

D. Exceptions.

1. Firms that engage primarily in sales to the general public are classified as Retail Sales And Service.
2. Firms that engage in sales on a membership basis are classified as either Retail Sales And Service or Wholesale Sales, based on a consideration of the characteristics of the use.
3. Firms that are primarily storing goods with little on-site business activity are classified as Warehouse And Freight Movement.
4. Establishments that engage in the regional wholesaling of fossil fuels, rely on access by marine, railroad or regional pipeline to transport fuels to or from the site, and either have transloading facilities or have storage capacity exceeding 5 million gallons of fossil fuels are classified as Bulk Fossil Fuel Terminal uses.

7. Other implementation recommendations

This section of the report recommends future implementation directions for building code amendments to address seismic resilience and periodic monitoring for code effectiveness.

Seismic resilience

Considering setting direction to implement this future action within the adopting ordinance:

- Portland Bureau of Emergency Management and Portland Office of Government Relations are directed to develop proposed State building code changes to improve seismic resilience and require seismic upgrades comparable to proposed requirements on unreinforced masonry buildings.

Seismic resilience is one of the underlying rationales for fossil fuel distribution policies and the proposed code amendments. Seismic safety requirements of land development are addressed in building codes, which are adopted and amended at the state level.

Monitoring for code effectiveness

Considering setting direction to implement this future action within the adopting ordinance:

- Portland Bureau of Planning and Sustainability is directed to periodically monitor the effectiveness of the proposed zoning code amendments to implement underlying policies and consider code adjustments in response to regional fuel demand and market changes, product innovation, safety and climate action considerations, and related regulatory changes.

A monitoring and adaptation approach would provide for ongoing code effectiveness within a context of changing energy markets, products, and associate regulations.

Appendix A: Stakeholder focus group results

Public involvement in the concept development for the Fossil Fuel Terminal Zoning Project consisted primarily of four stakeholder focus groups as well as meetings with fuel terminals and other individuals or organizations. The focus groups were held in June 2016. The purpose of the focus groups was to help identify and understand the issues that should help shape the preliminary zoning code being considered by this project. The focus groups also helped to expeditiously reach out to a broad range of stakeholders. While their perspectives and interests are shared on some topics, they diverge on other topics.

In addition to the stakeholder focus groups, BPS staff met with several fuel terminals to explain the proposal, answer questions, and discuss their individual concerns. This was needed because antitrust regulations constrained discussion about certain topics, for example supply chains, in the presence of representatives from other fuel terminals. Primarily, the terminal operators explained their operations and facilities, many of which differed substantially from other terminals.

Who participated?

Figure 9 lists the participants of the four focus groups conducted. Ten to twelve participants were invited to each meeting, although not everyone was able to attend. The first focus group consisted of fuel terminal representatives who have a direct stake in the proposed regulations. The second group was environmental and public health organizations, some of whom advocated for the resolution before City Council and have community safety and sustainability in mind. The third group were state and regional business and government organizations. Their interest was to protect the state economy by testing the proposal against economic realities. The fourth group was neighborhood and equity community organizations whose interests were to protect neighborhoods adjacent to the terminals and underserved communities who may rely on terminals for employment. Additionally, the Mayor's Office invited input from Native communities and tribal governments.

Preliminary code concepts discussed

- Identify "bulk fossil fuel terminals" as a regulated land use, characterized by inter-regional transport access and larger storage facilities.
- Either prohibit new terminals or set storage capacity limits high enough to accommodate regional growth.
- Allow existing terminals to expand for seismic upgrades, access to greener fuels and capacity for regional growth.

What discussion questions were asked?

The focus groups were provided background materials describing the preliminary code change concepts about two weeks before the focus group meetings. BPS staffed prompted the focus group across four topics:

Figure 9. Stakeholder Focus Group Participants, June 2016

STAKEHOLDER	DATE	ATTENDEES
Fuel terminal representatives	Thursday, June 02, 2016	Gilbert Betancourt, Phillips 66 Nick Giotta, Phillips 66 Stephanie Williams, Phillip 66 Andrew Holbrook, Kinder Morgan Shanna Brownstein, Northwest Natural Kevin Jones, McCall Oil Pamela Brady, BP West Coast Jerry Henderson, Chevron Kevin Buffum, Pacific Terminal Services Steve Kober, NuStar Will Rassmussen, WSPA Frank Holmes, WSPA Chris West, Pac/West and Arc Terminals Nathan Eggers, Arc Terminals Jerome Jackson, NuStar Rob Hill, NuStar Zach Klonoski, Mayor's Office

1. Issues that should shape the project
2. Types of distribution and storage facilities to be regulated
3. Definition of fossil fuels
4. Zoning approach for limiting new storage facilities

In addition to specific questions within each topic, participants were invited to share any general and wrap-up comments during the focus group.

What we heard

For each topic area, the results of the focus groups are summarized in Figure 4 of Section 3. That table summarizes the main themes and concerns raised during the focus groups.

Key issues

Fuel terminal representatives objected to this policy direction in general. They discussed their safe operating history and commitment to implement the federal and state standards for renewable and clean fuels. There were challenges to participating in the conversation, but they agreed to work cooperatively on this project to get the code right. For example, anti-trust laws precluded the group from engaging in certain conversations because it would involve disclosing information about their supply chains and could be considered collusion in court of law. This group was concerned with the fast timeline and felt the policies should be discussed first.

They also felt the process was emotionally driven, not having considered the unintended consequences. For example, with renewable and clean fuel standards constantly in flux, they felt that zoning rules could make it more difficult to meet these standards. Restricting growth here in Portland at the end of the Olympic Pipeline could put more trucks on the road, instead of more efficient pipeline or rail transportation. The group asserted that there could also be significant economic impacts on the rest of the state, given that 95% of Oregon's fuel passes through Portland first. Lastly, fuel terminal representatives expressed concern for additional administrative burdens that a new land use category would bring. For example, what steps would be necessary for these firms to demonstrate that they were existing operations prior to the new zoning rules? Additionally, they warned that their site configuration may pose a challenge to effective zoning rules, as they are often non-contiguous operations connected by interconnected pipelines.

Environmental and public health organizations felt the policy direction was less aggressive toward fossil fuels than what the City Council resolution had proclaimed. They felt the resolution sought to outright prohibit new development and expansion on existing facilities. Because of this, they cautioned about community backlash if this proposal did not meet expectations. In this vein, they highlighted that Portland will be the first city to fully implement this type of policy, so the project could be an opportunity to set a strong precedent and model code for other cities. This group also felt that resident health and safety was also a top priority. They noted the seismic risks posed by fuel terminal tank farms that lie on liquefaction zones as well as the June 2016 oil train wreck in Mosier. For these reasons, they felt Portland Bureau of Emergency Management (PBEM) and other environmental justice groups should be involved in safety considerations. Lastly, the group felt the economic impact statement should include more than the impact on jobs. It should also consider the risks of economic and financial damages from a natural disaster. Members of this focus group offered to provide technical analysis on the impacts that the proposed options could have on the environment and public health and safety.

Some noted that risks should be accounted for through bonding or insurance requirements under worst-case scenarios.

State and regional business organizations felt that this undertaking requires more research. The resolution set required tasks, including an economic impact analysis and an examination of relevant laws, and they felt these tasks should be completed before laying the groundwork through code development. They felt the marine cargo forecast for liquid bulks of 1% growth is outdated and too low. (Note, an opposite reaction was expressed by environmental and health organization representatives who felt this figure was too high.) Similarly, they feared that the code may not hold up well in five years because of constantly changing energy markets. For example, in five years Portland could be shipping cleaner fuels to the Midwest. Some members expressed concern that the zoning code may not be the right tool to achieve some of the GHG (greenhouse gas) reduction and public safety goals that this resolution aimed to achieve. If the goal is public safety, then the City should require or create incentives for seismic upgrades. They stated that, if the goal is to reduce greenhouse gases, then prohibiting the export of cleaner-burning fuels, such as LNG (liquefied natural gas), may have the opposite intended effect. Lastly, the group asserted the important role that Portland's fuel terminal facilities play in rest of the state economy. They warned of political and economic repercussions that these decisions could have. They shared the view with fuel terminal representatives that this is a big political decision—the timeline is too short and the process should not be rushed.

Neighborhood and equity community organizations communicated that safety, pollution and accidental releases were their top priority when considering zoning for fuel terminals. They wanted a close examination of the seismic and explosion risks associated with fuel terminals. For example, which terminals are in liquefaction zones? Where are the storage tanks located in relation to neighborhoods? They sought honesty about the risks posed to the Linnton neighborhood specifically. Rail safety in the Columbia Gorge was also a key issue. The June 2016 incident in Mosier highlighted the risks. A potential solution they offered would be more pipelines, but they are difficult to get built. This group recognized the difficulty in managing competing values. They felt a reasonable expectation of growth is a smart idea. One participant described the proposal as aggressive, adding that by prohibiting LNG export terminals, global export destinations like China may end up burning dirtier fuels, such as coal. They felt this also meant Portland would forego export profits.

New land use category

Fuel terminal representatives were concerned for the clarity of the rules. They felt that the definition of "bulk terminal" is very important to be clear. If the definition was open to interpretation, then permit staff could be pressured. They warned that creating "bulk fuel terminal" as a specifically regulated use could lead to unpredictable results. This group was also concerned with the definition of "region." They were unsure if off-shore distribution was the issue, advocating for using the federally recognized West Coast region (PADD 5) as the definition of "regional market." PADD 5 includes Oregon, Washington, California, Nevada, Arizona, Alaska and Hawaii.

Environmental and public health organizations wanted to see the regulation go beyond new facilities and also look at limits on expansion at existing facilities. They felt the City Council resolution was clear and unambiguous about opposing expansion of fossil fuel infrastructure, which includes expansions at existing sites. They emphasized the importance for getting the right definition of "bulk terminal" and the associated size limit (or prohibition)—these must be correct in order to effectively implement the policy. Some members questioned whether seismic upgrades at existing facilities could be allowed but

expansions prohibited. This group also urged the inclusion of PBEM's work on hazards in liquefaction zones in this project.

State and regional business organizations echoed the concerns for clear and correct definitions that the fossil fuel representatives posed. "Region," "export," "end user," and "fossil fuel" are all important terms to get right. They also were strongly opposed to making existing facilities non-conforming uses, as well as making them limited uses with unclear exceptions. This would expose projects to discretionary land use actions, which is costly and unpredictable, and hence risky. It would likely make improvements that the community values, such as seismic upgrades, more difficult to attain.

Neighborhood and equity community organizations were skeptical that a new export terminal would be proposed in the Portland area in the wake of Pembina. They felt that Superfund sites were too expensive to acquire and build on. The group also wondered whether a new zone for fossil fuels ought to be created instead of a land use. They questioned why it ought to be allowed in IG2.

Definition of fossil fuels

Fuel terminal representatives were primarily concerned with the long-term applicability of the proposed rules. Energy markets and new technologies are constantly in flux, and it is difficult to know what the size requirements might be for newer—perhaps cleaner—fuels, particularly blended fuels. This group sought clarification for what "green fuels" meant. They noted that the proposed inclusion of LNG among city-regulated fossil fuels is inconsistent with the State of Oregon's inclusion of LNG as a "clean fuel." They called for periodic review of the rules when tomorrow's cleaner fuels become known, as they may not meet today's definitions. They cautioned about unintended consequences of placing restrictions on fossil fuel terminals, such as potentially putting more trucks on the road by restricting growth at facilities with pipeline, marine and rail access. This may result in considerably more GHG emissions. They also felt that methanol should not be included in the list of regulated fuels because it is used more as a value-added commodity than a fuel. They shared this last viewpoint with most other focus groups, except the environmental and health organizations.

Environmental and public health organizations looked to the intent of the City Council resolution and noted that it included propane, methanol, natural gas and other low-carbon fuels. At the same time, they agreed that code changes should provide flexibility to meet Oregon's low carbon fuel standard. They noted that methanol is currently being used as a fuel, so excluding it undermines the policy. The group sought clarification on how to address non-fuels. Some suggested that the GHG emissions of these input commodities should help ground their use. Others thought that the proportions (e.g., in blended fuels) should be considered—if the product is mostly used as a fossil fuel, then it should be regulated and restricted. Lastly, they highlighted how even one new LNG tank in Portland is a major safety issue. Although not explosive, coal also poses a significant risk, especially in transportation. Because of these risks, they believed that the resolution should be implemented through health and safety standards.

State and regional business organizations expressed frustration that while the federal and state government are going one direction requiring cleaner-burning fuels, the City of Portland appears to be choosing to restrict distribution of these cleaner fuels in another policy direction. Some members thought the City could try to incentivize a higher blend of renewables, and others warned of the disincentives that could discourage investment—disincentives should limit GHG emissions, not seismic upgrades.

Neighborhood and equity community organizations thought that restricting methanol exports would be an overreach. They said it is not being used as a fuel in the United States, and instead it is a value-added product used in manufacturing of plastics and other goods. Including methanol would negatively impact the manufacturing sector that requires it as an input, and it could open the door to regulating other non-fuel commodities, such as paints and asphalt. In general, they felt that if we can make certain fuels cleaner burning, then it poses minimal threat. They asserted that, since there is no clear transitional path away from our dependency on fossil fuels, we should make way for cleaner alternatives, such as blended bio-diesel.

Terminal development restrictions

Fuel terminal representatives were concerned with potential restrictions precluding development on certain site configurations, which have some peculiarities. For example, where two existing tank farms are non-contiguous (e.g., at Willbridge) and are connected by facility pipelines, they should be allowed an option for expansion. Additionally, some sites may already be built out and cannot accommodate the new growth that is expected. This group could not comment on facility size and anticipated growth, because of anti-trust laws, but they noted that it is critically important. For this reason, they could not provide feedback on the implementation options presented.

Environmental and public health organizations generally preferred Option A. However, some recognized the legal challenges posed by federal restrictions. They wondered if health and human safety risks may provide a defensible rationale. Some members also noted that while prohibiting all new facilities and making existing facilities non-conforming uses might be more legally defensible, it is much less politically feasible. Finally, some members of this group were skeptical of the 1% annual growth forecast for liquid bulks. They felt this was too high, which is contrary to what the state and regional business organization representatives stated.

State and regional business organizations criticized the approach to implementing the City Council resolution. They felt that zoning to regulate tank size approaches the problem sideways, and the unclear rationale could lead to appeals and legal challenges. One participant advocated to prohibit exports more directly, rather than a sideways approach. They cautioned that tank size limits could essentially put the region on an "import diet," even if the intent of the limit is to reduce throughput. They did not think this proposal accounted for these unintended impacts. Docked ships in the harbor may need an LNG tank to power their facilities and improve air quality, for example. They also noted that there are economic advantages and efficiency gains to being a bigger facility, and placing restrictions on size will have consequences that we don't want—lower wages for example. Lastly, they felt the 1% annual growth forecast for liquid bulks was outdated—an updated forecast would be higher. This was the opposite of what environmental and public health organizations stated.

Neighborhood and equity community organizations generally preferred Option C, calling it a realistic proposal that allows for some growth but doesn't restrict it too much. While the group was fairly resolute that coal is not a good alternative, they recognized that LNG is a cleaner-burning fuel. However, since the facilities in the region are already at capacity, Option C would allow for some wiggle room for the region's growth. They felt it would allow the "invisible hand" to guide the market more easily. They recommended that the City review the size limits every few years as the market changes.

MEMO

DATE: September 9, 2016

TO: Planning and Sustainability Commission

FROM: Tom Armstrong, Steve Kountz

CC: Michael Armstrong, Susan Anderson, Zach Klonoski

SUBJECT: Fossil Fuel Terminal Zoning Amendments

Many comments have been received in last couple weeks on the Proposed Draft of Fossil Fuel Terminal Zoning Amendments. This memo is intended to summarize and discuss themes of comments for major changes to the Proposed Draft.

Summary themes of comments received through September 8th:

- Emailed testimony has been received from about 300 people generally calling for a full ban. While their comments varied, predominant recommendations included removing the 5-million-gallon terminal size threshold and adding expansion criteria on climate and safety impacts.
- BPS convened a meeting on August 31st to review the Proposed Draft with environmental organization representatives who commented on the Discussion Draft. Their recommendations similarly included adding expansion criteria on climate and safety impacts and substantially reducing or removing the 5-million-gallon terminal size threshold.
- BPS convened another meeting on August 31st with business organization representatives and on September 6th with fuel terminal representatives who commented on the Discussion Draft. Their recommendations included allowing 10-20% terminal expansion for seismic upgrades and clean fuel standard compliance without a non-conforming situation review, exempting regulated utilities, expanding the analysis of statewide economic impacts, and clarifying that pipelines are not inadvertently categorized as transloading facilities.

- A September 7th letter from Bureau of Development Services (BDS) commented that approval of expansions of existing terminals may not be possible through a non-conforming situation review. Instead they recommend an alternative approach that provides specific limits on expansions with specific review criteria.

Zoning Code Options

1. Fossil Fuel Terminal size threshold

The 5-million-gallon threshold in the Proposed Draft is intended to represent and focus on regional gateway facilities where fossil fuels are brought into the region. The purpose of the threshold is to implement 2035 Comprehensive Plan Policy 6.48 Fossil Fuel Distribution, which is to limit fossil fuel distribution and storage facilities to those necessary to serve the regional market. In comparison, recent proposals for export terminals are many times larger than the proposed 5 million gallon threshold. For example, the recent crude oil terminal proposal in Vancouver (Washington) was for 91 million gallons of storage capacity and the Pembina propane terminal proposal in Portland was for 34 million gallons of storage capacity. Existing petroleum terminals in Portland are generally supplied by the Olympic Pipeline and tankers or barges rather than unit trains, along with relatively small railcar deliveries of ethanol from Oregon producers. The NW Natural GasCo facility is supplied by a natural gas pipeline.

A size threshold of a use category in the Zoning Code would apply to both new and existing terminals. Staff have not attempted to inventory or reach out to the smaller fossil fuel distributors that could be affected. For example, a recent Yellow Pages listing of oil distributors in Portland found 130 entries. In comparison, BPS identified 11 facilities shown in Figure 3 of the Proposed Draft that fit the draft description of Bulk Fossil Fuel Terminals. BPS involved representatives of these 11 terminals in early outreach activities for this project in May 2016, along with environmental organizations, neighborhood and equity organizations, and state and regional business associations.

A change to effectively eliminate the bulk fossil fuel storage aspect of the use description may also appear to inadvertently expand the use category to include general freight transportation facilities, such as rail yards and barge lines that handle fossil fuels and other commodities. This change would substantially expand the policy scope, resulting in additional economic impacts. A clarification in the use description could be added to exclude railroad yards and freight movement uses that handle fossil fuels among other commodities.

Options:

A. No change. The storage capacity threshold is 5 million gallons.

B. Reduce the storage capacity threshold.

C. Eliminate the storage capacity threshold and exclude general-commodity railroad yards and freight movement facilities.

BPS Recommendation: No change.

Printed on 100% post-consumer waste recycled paper.

2. Regulating existing terminal expansion

The Proposed Draft assumes some opportunity to approve expansion of existing terminal storage capacity that would allow the existing terminals to expand for new fuel additive tanks to meet clean and renewable fuel standards, seismic upgrades of existing tanks, and emergency backup capacity, consistent with Resolution 37168. However, comments from BDS clarify that such expansion would be difficult to approve through a non-conforming situation review. BDS recommends considering an alternative approach to set limitations on expansion - with or without a land use review.

One option would be to allow no more than 10-20 percent expansion of total storage capacity at existing terminals. New tanks would automatically be required to meet current building code standards for seismic safety. Another approach could allow specific types of expansion, such as emergency backup capacity, seismic upgrades, and tanks for clean and renewable fuels. For example, seismic upgrade limitations could allow for tank replacement projects that include removal of tanks which do not meet current seismic standards and installation of new tanks that do not exceed the capacity of removed tanks by 10-20 percent. This second approach could accommodate long-term flexibility to meet clean and renewable fuel standards.

Options:

A. No change. Prohibit new Bulk Fossil Fuel Terminals and existing terminals become non-conforming uses and any expansion must go through a non-conforming situation review.

B. Prohibit new Bulk Fossil Fuel Terminals and allow limited expansion of existing terminals to not exceed 10 percent of the total terminal capacity on the effective date of the code changes.

C. Prohibit new Bulk Fossil Fuel Terminals and allow expansion of existing terminals greater than 10 percent through a conditional use review process with special criteria for emergency backup capacity, seismic upgrades, and tanks for clean and renewable fuels.

BPS recommendation: Option B - a clear and simple approach.

3. Additional review criteria

A large number of comments support stronger restrictions on expansions at existing terminals through adding binding limits as well as criteria for safety and climate impacts.

The Zoning Code includes multiple sets of review criteria for conditional use reviews that are specific to particular uses and zones.

BDS staff have commented that they do not have staff expertise to implement discretionary land use review criteria addressing greenhouse gas emissions or safety impacts of hazardous material storage and transportation. If new conditional use criteria are added to limit or

City of Portland, Oregon | Bureau of Planning and Sustainability | www.portlandonline.com/bps
1900 SW 4th Avenue, Suite 7100, Portland, OR 97201 | phone: 503-823-7700 | fax: 503-823-7800 | tty: 503-823-6868

Printed on 100% post-consumer waste recycled paper.

require no net increase of greenhouse gas emissions or safety impacts of hazardous material storage and transportation facilities, applicants would be required to hire specialized consultants to show compliance of the particular criterion, which would affect the complexity, predictability, and cost of land use reviews in new ways. This change would be inconsistent with 2035 Comprehensive Plan Policy 6.16 Regulatory Climate, which calls for improving development review processes and regulations to encourage predictability and support local and equitable employment growth and encourage business retention.

Options:

A. No change.

B. Add conditional use criteria for expansion of existing terminals to mitigate adverse land use impacts on greenhouse gas emissions and safety impacts of hazardous materials storage and transportation.

BPS and BDS recommendation: No change.

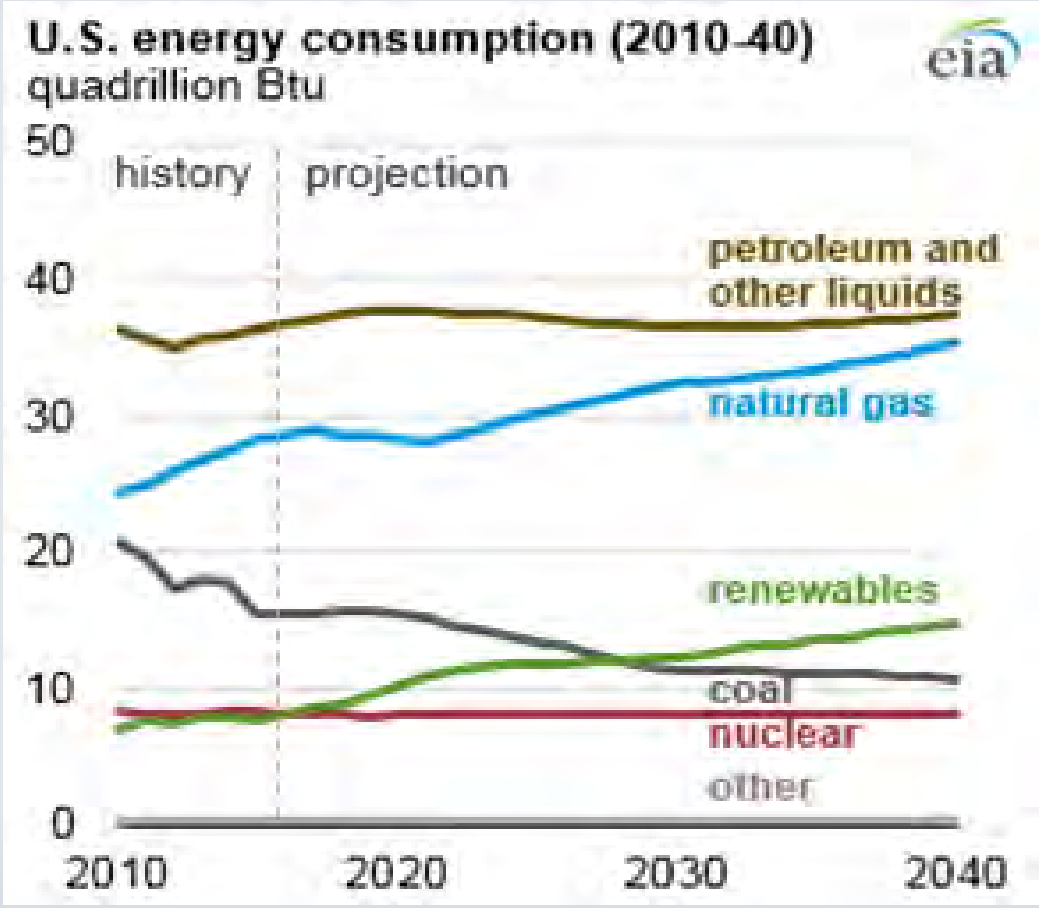
Fossil Fuel Terminal Zoning Amendments: Proposed Draft

Bureau of Planning and Sustainability
Innovation. Collaboration. Practical Solutions.

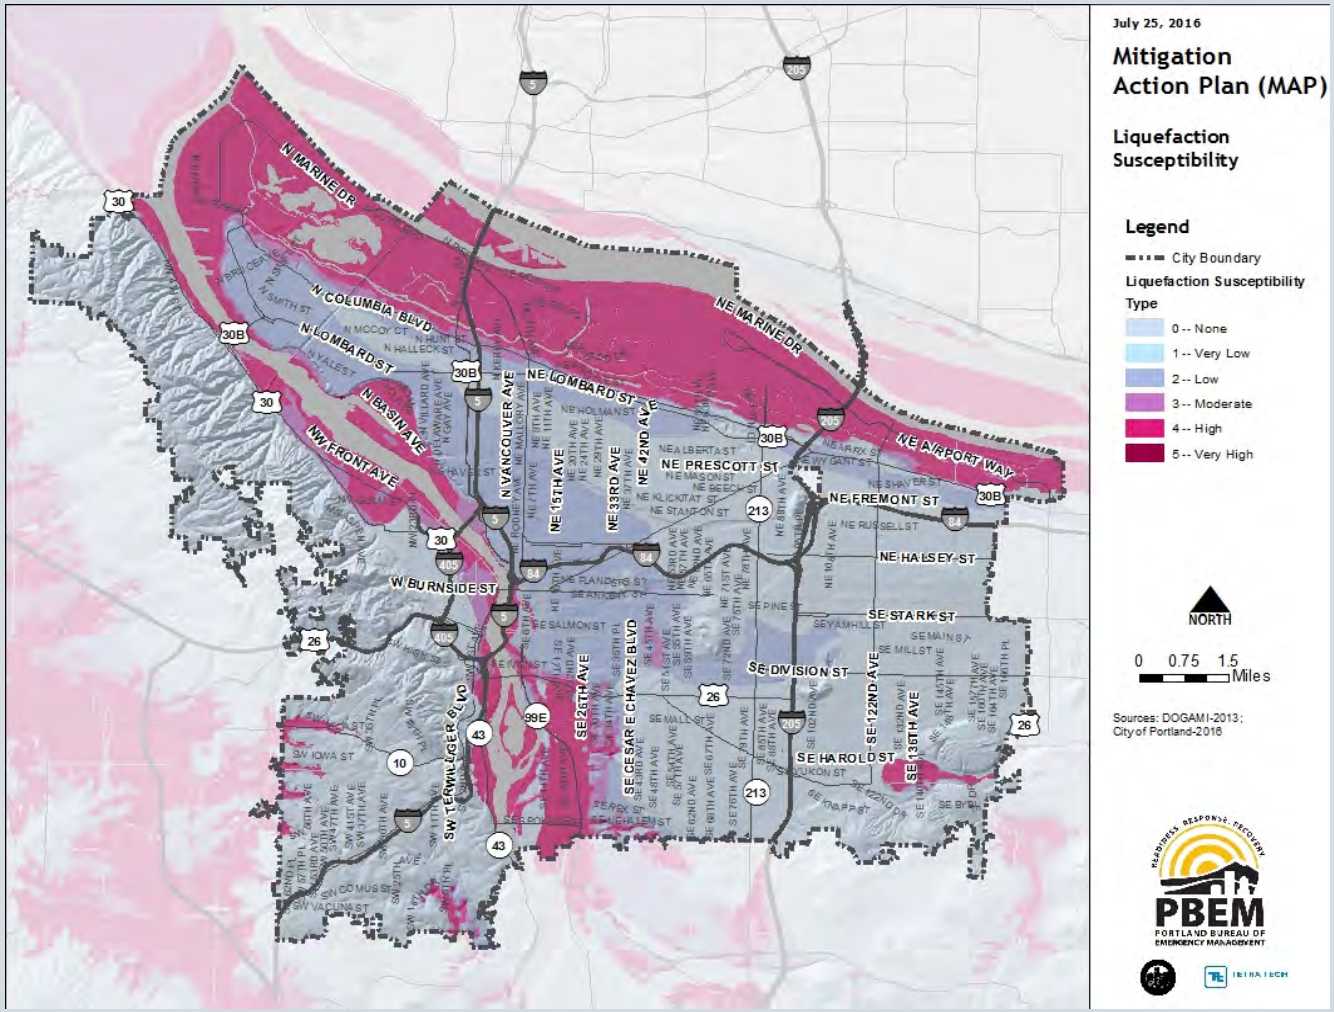
New policy direction on fossil fuel infrastructure

Fossil Fuel Infrastructure Resolution, November 2015: City Council will actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways.



2035 Comprehensive Plan
Policy 6.48 Fossil fuel distribution. Limit fossil fuel distribution and storage facilities to those necessary to serve the regional market.

Statewide fuel distribution hub



- Over 90% of petroleum sold in Oregon is handled at the 10 Portland terminals.
- Hub infrastructure: harbor, pipelines, railroads, truck routes.
- Natural gas storage for regional peak consumption.

U.S. energy consumption projections to 2040

Public safety and environmental risks

3375
LUBA No. 2020-009
Page 3661

Proposed zoning code amendments

- **Define** Bulk Fossil Fuel Terminals as a regulated land use.
- **Prohibit** Bulk Fossil Fuel Terminals in all base zones.
- Existing Bulk Fossil Fuel Terminals would become legal, non-conforming uses that can continue to operate.

New land use category:
Bulk Fossil Fuel Terminals

Bulk Fossil Fuel Terminals:

- Marine, railroad, or pipeline transport access; and
- Transloading facilities (such as train-to-ship) or storage capacity exceeding 5 million gallons.

Exclusions:

- Distributors with access exclusively by truck;
- End-user facilities, including filling stations and firms that store fossil fuels for use as an input;
- Recovery or reprocessing used petroleum

Defining fossil fuel

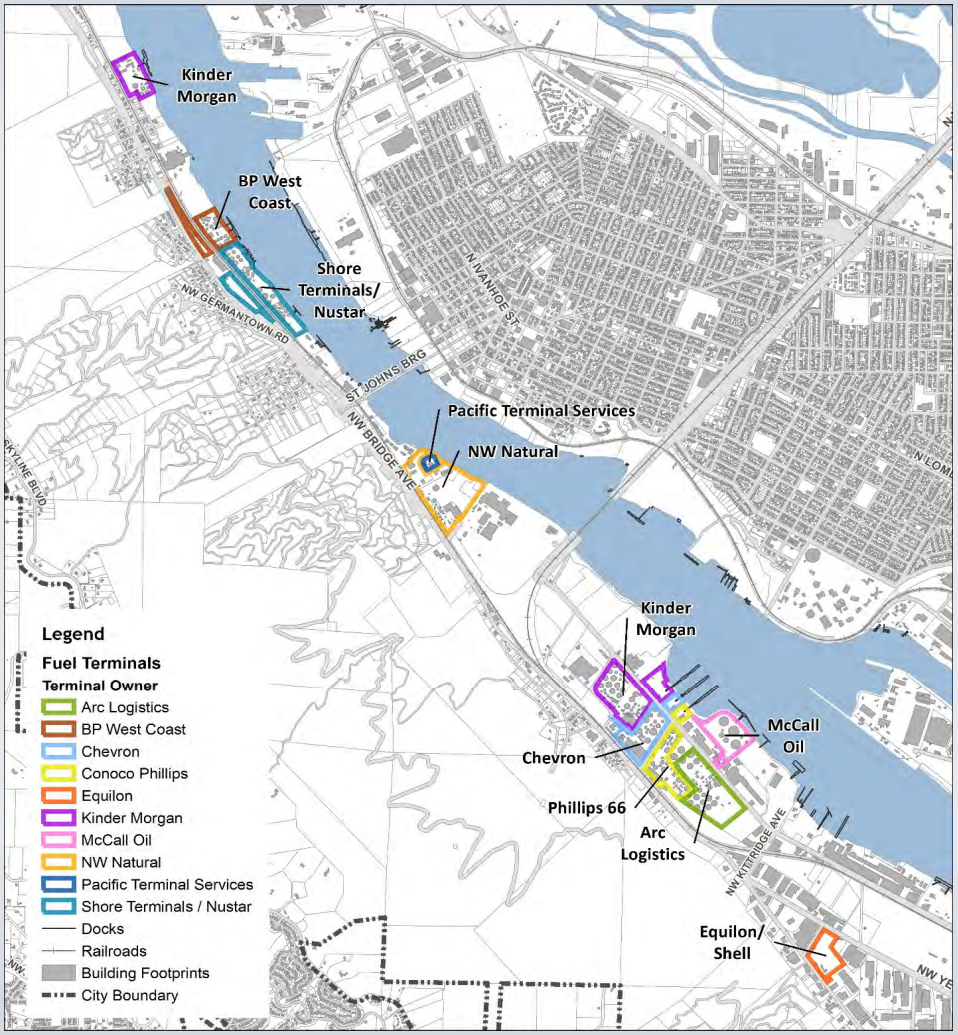
Fossil fuels are petroleum products (such as crude oil and gasoline), coal, and gaseous fuels (such as natural gas, methanol, and propane) that are made from decayed plants and animals that lived millions of years ago and are used as a source of energy.

Exclusions: Denatured ethanol and similar fuel additives and biodiesel/renewable diesel with less than 5% fossil fuel content are not fossil fuels.

Capacity of new terminals

Proposed: 5 million gallons

Existing: Wide range



Largest: 67 million gallons

Average: 32 million gallons

Smallest: 11 million gallons

3379
LUBA No. 2020-009
Page 3665

Restricted expansion of existing terminals

Restricted expansion of existing terminals

A. Existing terminals become non-conforming uses.

B. Limited use with expansion not exceed 10 percent of the total terminal capacity as of adoption.

C. Conditional use that would allow expansion greater than 10 percent through a land use review with special criteria for emergency backup capacity, seismic upgrades, GHG emissions and clean and renewable fuels.

To comment on the proposal:

Testify in person at the Planning and Sustainability Commission Hearing:

- You may speak for two minutes to the Commission, and your testimony will be added to the public record.

Testify in writing between now and the hearing date:

- You must provide your full name and mailing address.
  - Email: psc@portlandoregon.gov, refer to this proposal in the subject line.
  - U.S. Mail: Portland Planning and Sustainability Commission, 1900 SW 4th Avenue, Suite 7100, Portland, OR 97201

All testimony to the Planning and Sustainability Commission (PSC) is considered public record.

The Bureau of Planning and Sustainability is committed to providing equal access to information and hearings. If you need special accommodation, translation or interpretation please call 503-8232-7700, the City's TTY line at 503-823-6868, or the Oregon Relay Service at 711.

Planning and Sustainability Commission Public Hearing on the

Fossil Fuel Terminal Zoning Amendments

Tuesday, September 13, 2016, at 12:30 p.m.

1900 SW 4th Avenue, Room 2500, 2nd Floor, Portland, Oregon.

3456

BALLOT MEASURE 56, ADOPTED BY VOTERS IN 1998, REQUIRES THE FOLLOWING LANGUAGE IN THIS NOTICE:

THIS IS TO NOTIFY YOU THAT THE CITY OF PORTLAND HAS PROPOSED A LAND USE REGULATION THAT MAY AFFECT THE PERMISSIBLE USES OF YOUR PROPERTY AND OTHER PROPERTIES.

Date of Notice: August 19, 2016

Why am I receiving this notice?

On September 13, 2016, the Portland Planning and Sustainability Commission will hold a public hearing regarding the adoption of the Fossil Fuel Terminal Zoning Amendments Project and proposed ordinance (ordinance number to be assigned at a later date). This project proposes changes to Portland's Zoning Code. The City used a geographic information system to identify tax lots potentially affected by the Fossil Fuel Terminal Zoning Amendments Project; you have received this notice for this reason. The City has determined that the adoption of this ordinance may affect the permissible uses of your property, and other properties in the affected IH Heavy Industrial, IG1 and IG2 General Industrial, and EG1 and EG2 General Employment zones, and may change the value of your property.

What is this project about?

This code change project would restrict development and expansion of Bulk Fossil Fuel Terminals. These code changes would implement new policy direction on fossil fuel distribution and storage facilities in City Resolution 37168. Specifically, the proposed code changes: (1) add a new definition of the term "fossil fuel;" (2) add a new industrial use category entitled "Bulk Fossil Fuel Terminal" characterized by having more than 5 million gallons of storage capacity; and (3) prohibit bulk fossil fuel terminals in all zones. The effect of these amendments would be:

- Fossil fuels include petroleum products (such as crude oil and gasoline), coal, natural gas, and propane, and methanol, which is produced from natural gas.
- No new terminals would be allowed.
- The existing 11 terminals in the Portland Harbor would become nonconforming uses, which would limit expansions to their current site.

How can I review this proposal?

Copies of the Fossil Fuel Terminal Zoning Amendments Proposed Draft are available (at no charge) at the Portland Bureau of Planning and Sustainability, 1900 SW 4th Ave, 7th Floor. Call 503.823.7700 to request that a copy be sent by mail. The proposal can also be viewed at www.portlandoregon.gov/bps

Will my property's base zone change?

NO.

How does this proposal affect my property?

If adopted, the proposed amendment will prohibit Bulk Fossil Fuel Terminals, which may be currently allowed on your property.

For more information

Fossil Fuel Terminal Zoning Amendments

Portland Planning and Sustainability Commission Hearing

September 13, 2016 at 12:30 pm

1900 SW 4th Avenue, Second Floor, Room 2500A

***Please call 503-823-7700 one week before the hearing for the scheduled time of this agenda item.**

Planning and Sustainability Commission Hearing on: Fossil Fuel Terminal Zoning Amendments

Why am I receiving this notice?

You are receiving this notice because you have expressed interest in being notified of certain Bureau of Planning and Sustainability projects, you are on one of our advisory groups, or you are a member of a neighborhood or business association.

What is this project about?

This code change project would restrict development and expansion of Bulk Fossil Fuel Terminals. These code changes would implement new policy direction on fossil fuel distribution and storage facilities in City Resolution 37168. The proposal is to prohibit bulk fossil fuel terminals that have more than 5 million gallons of storage capacity.

- Fossil fuels include petroleum products (such as crude oil and gasoline), coal, natural gas, and propane, and methanol, which is produced from natural gas.
- No new terminals would be allowed.
- The existing 11 terminals in the Portland Harbor would become nonconforming uses, which would limit expansions to their current site.

The zoning code change will not immediately impact the day-to-day operations of the 11 fossil fuel terminals in Portland. It will limit their future expansion to their current sites – but they can make improvements for safety, seismic upgrades, and expand capacity to meet future regional demand.

The code changes will not apply to gas stations; distributors and wholesalers that receive and deliver fossil fuels exclusively by truck; industrial, commercial, institutional, and agricultural uses that store fossil fuels for use as an input; uses that involve the transfer or storage of solid or liquid wastes are classified as Waste-Related uses. Fossil fuel storage facilities at airports, marine terminals, rail yards, and fleet vehicle fuel facilities are specifically exempted.

How can I review this proposal?

Get a copy of the report. The *Fossil Fuel Terminal Zoning Amendments Proposed Draft* will be available the week of August 12, 2016. You can pick up a copy at our office at 1900 SW 4th Avenue, 7th Floor. The Bureau receptionist will mail you a copy if you call 503-823-7700. The document will also be available on the Bureau of Planning and Sustainability website at www.portlandoregon.gov/bps/71118.

How can I comment on this proposal?

Testify at the Planning and Sustainability Commission hearing. The hearing, on September 13, 2016 at 12:30 pm, will be on the second floor at 1900 SW Fourth Avenue (SW 4th Avenue and Hall Street). Please call 503-823-7700 a week before the hearing for the scheduled time of this agenda item. Metered and pay parking is available in the vicinity. MAX, the Portland Streetcar and many buses serve this building; call Tri-Met at 503 238 7433 or go to their web site at http://www.trimet.org for routes and times.

Write to the Planning and Sustainability Commission. Mail written testimony to the Planning and Sustainability Commission at 1900 SW Fourth Avenue, Suite 7100, Portland, Oregon 97201, FAX comments to 503-823-7800, or email comments to PSC@PortlandOregon.gov. Written testimony must be received by the time of the hearing and must include your name and address.

What happens next?

The Planning and Sustainability Commission will consider public comments on this proposal. They will then forward a recommendation to City Council for consideration and additional public review and comment.

For more information, contact Tom Armstrong, Supervising Planner, at the Bureau of Planning and Sustainability 503-823-3527 or tom.armstrong@PortlandOregon.gov or visit the Bureau of Planning and Sustainability's website: www.portlandoregon.gov/bps/71118.

Fossil Fuel Terminal Zoning Amendments

Proposed Draft

City of Portland, Oregon

August 8, 2016

Bureau of Planning and Sustainability
Innovation. Collaboration. Practical Solutions.
City of Portland, Oregon

How can I provide feedback to decision-makers?

The Fossil Fuel Terminal Zoning Amendments project would begin to implement new policy direction on fossil fuel distribution and storage facilities through changes to the Zoning Code. This proposal would restrict development and expansion of bulk fossil fuel terminals.

You may testify about proposed changes to the Planning and Sustainability Commission (PSC) in the following ways:

Testify in person at the PSC public hearing.
You may speak for 2 minutes to the Commission, and your testimony will be added to the public record.

> **PSC Fossil Fuel Terminal Zoning Amendments Public Hearing**
> Tuesday, September 13, 2016 at 12:30 p.m.
> 1900 SW 4th Avenue, Room 2500, Portland, OR
> To confirm the time and date, check the PSC calendar at *www.portlandoregon.gov/bps/35452*

Testify in writing between now and September 13, 2016.
Your full name and mailing address is required.

- Email: *psc@portlandoregon.gov* with subject line "PSC Fossil Fuel Zoning Testimony"
- U.S. Mail: Portland Planning and Sustainability Commission, Fossil Fuel Zoning Testimony, 1900 SW 4th Ave., Suite 7100, Portland OR 97201

Next Steps

Proposed Draft: The PSC may amend the proposal and will subsequently vote to recommend the code changes to Portland City Council. This is called the *Recommended Draft*.

Recommended Draft: City Council will hold an additional public hearing and take formal public testimony on the Recommended Draft. The City Council may amend the Recommended Draft before they vote to adopt the code changes. This will likely occur in December 2016.

The Bureau of Planning and Sustainability is committed to providing equal access to information and hearings. If you need special accommodation, please call 503-823-7700, the City's TTY at 503-823-6868, or the Oregon Relay Service at 1-800-735-2900.

1. Introduction

In recent years, the rapid development of fossil fuel resources in the Western United States and Canada has prompted many proposals in the Pacific Northwest for large new fuel terminals and infrastructure projects. In early 2015, Pembina Pipeline Corporation proposed a propane terminal in Portland that drew substantial public opposition. Mayor Charlie Hales withdrew a proposed zoning code amendment that the development needed to move forward, effectively blocking that proposal. In November 2015, Portland City Council adopted Resolution 37168 calling for opposition to expansion of fossil fuel infrastructure. In June 2016, City Council adopted the 2035 Comprehensive Plan, which included Policy 6.48 to limit fossil fuel distribution and storage facilities to those needed to serve the regional market. This code-change project begins to implement the policy direction in the resolution by prohibiting large bulk fossil fuel terminals.

Project summary

The Fossil Fuel Terminal Zoning Amendments project would restrict the development and expansion of Bulk Fossil Fuel Terminals.

Proposed zoning code amendments:

- Identify "Bulk Fossil Fuel Terminals" as a regulated land use, characterized by marine, railroad, or pipeline transport access and storage capacity exceeding 5 million gallons.
- Prohibit Bulk Fossil Fuel Terminals in all base zones.
- Existing Bulk Fossil Fuel Terminals would become legal, non-conforming uses that can continue to operate. Expansion would be limited to their current site and require approval through a Nonconforming Situation Review.

Why is this important?

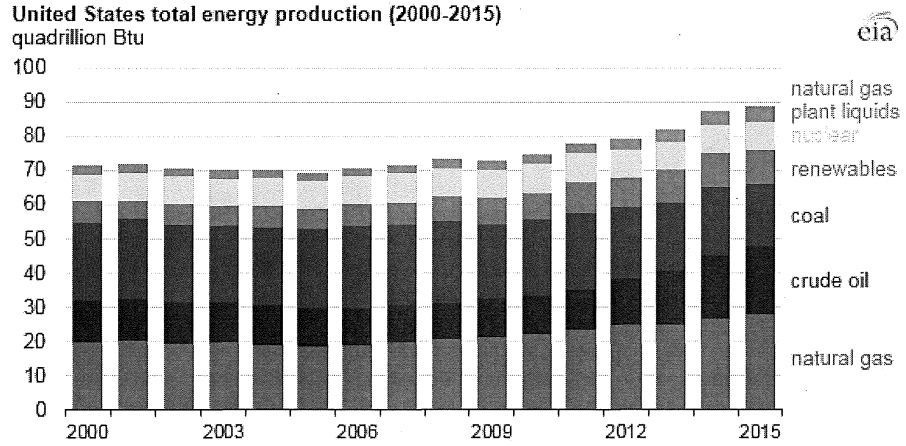
Fossil fuel distribution policy – New policy directions adopted by City Council in November 2015 and proposed in the 2035 Comprehensive Plan would limit fossil fuel distribution and storage facilities to those serving the regional market. City Council adopted these policies after holding public hearings and hearing testimony from hundreds of Portlanders.

Climate action goals – Fossil fuels are major contributors to climate change and pollution. The rapid development of fossil fuel resources in the Western United States and Canada has prompted many recent proposals for new export terminals in the Pacific Northwest. The City's Climate Action Plan seeks to reduce greenhouse gas emissions, however, and fossil fuels are the largest source of emissions.

Public safety and environmental protection – Several recent accidents involving fossil fuel distribution across the nation and in Oregon highlight public safety risks in cities and environmental risks along rivers. Most of Portland's industrial areas have moderate-to-high liquefaction susceptibility in a major earthquake.

Oregon's industrial and distribution center – Portland is Oregon's largest, most diverse distribution hub, and existing Portland petroleum terminals serve more than 90 percent of the statewide market. Proposed code changes would restrict the expansion of these facilities in Portland.

Project scope and timing



The energy distribution market in the Pacific Northwest is changing. Production of crude oil and natural gas, particularly from North Dakota, has substantially increased in the U.S. since 2009, as shown in Figure 1. In turn, several large new fuel distribution terminals have been proposed in the Pacific Northwest to access West Coast and export markets, as shown in Figure 2. Similar trends have occurred in Alberta and British Columbia.

This project is proposing a prompt, focused response to these market changes. The proposed code amendments are will restrict development of new fossil fuel terminals and limit the expansion of existing terminals , consistent with City and State objectives on climate change and public safety.

Where are Portland's existing bulk fossil fuel terminals?

Portland's industrial districts are Oregon's largest seaport, rail hub, and truck distribution center. The Northwest Industrial District in Portland is also the end of the Olympic Pipeline, which supplies most of Oregon's petroleum fuels from Puget Sound refineries. The ten petroleum terminals located in Northwest Portland are the gateway distribution facilities serving Oregon and Southern Washington markets. Additionally, NW Natural's GasCo terminal provides peak-consumption storage of natural gas for much of the regional market. In Northwest Portland, these "tank farm" storage facilities have direct access to pipeline, deep-water port, railroad, and truck route infrastructure.

What's in this report?

This *Proposed Draft* of Fossil Fuel Terminal Zoning Amendment is proposed by the Bureau of Planning and Sustainability for consideration by the Planning and Sustainability Commission. The audience is the Commission and the general public, including stakeholders, inter-governmental partners, implementers, and other interested parties. Project stakeholders include property owners, businesses, employees, residents, neighbors, business district and neighborhood associations, underrepresented and underserved groups, environmental groups and other community groups. Implementers include the real estate industry, development review staff and others who use the zoning code.

Your feedback on the Proposed Draft should be directed to the Planning and Sustainability Commission (PSC). You may testify about the proposed changes in person at the PSC public hearing on September 13, 2016, or testify in writing before the public hearing (see information about how to provide feedback on the inside cover of this report).

This report consists of seven parts:

- **Section 1** introduces the project.
- **Section 2** describes how the proposed code changes implement City policies in Resolution 37168 and the 2035 Comprehensive Plan.
- **Section 3** summarizes public and stakeholder involvement activities that have helped shape and inform this project.
- **Section 4** describes background conditions that inform the proposed zoning changes.
- **Section 5** describes the analysis of proposed zoning concepts, including related policy directions, implementation issues and rationale.
- **Section 6** specifies the draft code language, along with code commentary pages that clarify expected implementation.
- **Section 7** recommends future implementation directions for building code amendments to address seismic resilience and periodic monitoring for code effectiveness.

2. Policy direction

Section 2 describes how the proposed code changes implement relevant City policies in Resolution 37168 and the Comprehensive Plan.

City of Portland Fossil Fuel Resolution 37168

> BE IT RESOLVED, that the City Council will actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways; and

The proposed zoning code changes are a key implementation action of Resolution 37168, adopted November 2015. Addressing the overall direction of the resolution to oppose expansion of fossil fuel distribution and storage infrastructure, this project proposes to restrict development and expansion of bulk fossil fuel terminals.

> BE IT FURTHER RESOLVED, that this Resolution does not restrict:
> 1. improvements in the safety, or efficiency, seismic resilience, or operations of existing infrastructure;
> 2. the provision of service directly to end users;
> 3. development of emergency backup capacity;
> 4. infrastructure that enables recovery or re-processing of used petroleum products; or
> 5. infrastructure that will accelerate the transition to non-fossil fuel energy sources; and

The proposed code changes will require a discretionary land use review for many of the exceptions listed in the Resolution. Expansion projects at existing fuel terminals that improve safety (1), provide wholesale fuel supply to local or regional end users (2), add backup capacity (3), or add tanks for clean/renewable fuels (5) would require approval through a Nonconforming Situation Review. The review criteria include that, with mitigation measures, there will be no net increase in overall detrimental impacts on the surrounding industrial zone (such as hours of operation and vehicle trips) and the expansion will not detract from the desired function and character of the industrial zone. Terminal improvements would also be limited to their existing site area. Improvements that address the exceptions 1-5 in the Resolution are not generally expected to result in additional detrimental impacts on the surrounding industrial zone. The proposed code changes also substantially address exceptions 2 and 4 in the Resolution through exclusion of specific end-user facilities and recovery or re-processing of used petroleum products from the proposed new land use restrictions on Bulk Fossil Fuel Terminals.

> BE IT FURTHER RESOLVED, that City bureaus are directed to examine existing laws, including those related to public health, safety, building, electrical, nuisance, and fire codes, and develop recommendations to address fossil fuels that strengthen public health and safety; and

The resolution broadly addresses fossil fuel infrastructure. The zoning code regulates land use patterns and development of fossil fuel distribution facilities on parcels. Zoning does not regulate the quantity of products handled (throughput) on developed sites or their destination (such as exports). Additional amendments to building, fire, and energy codes would need to be addressed in future projects.

BE IT FURTHER RESOLVED, that the Bureau of Planning and Sustainability is directed to develop proposed code changes for Council consideration to advance the policies set forth in this Resolution; and

The proposed project will specifically implement this provision of the resolution.

BE IT FURTHER RESOLVED, that prior to any further Council action, the mayor shall schedule (1) a work session to review any proposed code changes and (2) an executive session to review the legal considerations of any proposed code changes; and

The proposed project will implement this process requirement of the resolution.

BE IT FURTHER RESOLVED, that the Bureau of Planning & Sustainability shall undertake an analysis of the economic impacts of any proposed Code changes to advance the policies set forth in this resolution, with a particular focus on potential impacts to local blue-collar jobs; and

This report includes summary analysis of economic impacts in Section 4, specifically addressing impacts on middle-wage blue collar jobs. Analysis to date is limited on the potential impacts on fuel supply to meet regional demand. Fossil fuel demand in this growing region may increase moderately, as indicated by trend-based forecasts, or may plateau and decline with implementation of climate resilience goals and strategies. Staff will continue to research and analyze potential economic impacts of proposed code changes prior to adoption.

BE IT FURTHER RESOLVED, that the City and applicable bureaus shall seek and identify opportunities to invest in Portland's 'human infrastructure' by supporting programs to retrain our workforce as the city transitions to a clean energy economy; and

This provision of the resolution is expected to be implemented as a future action.

BE IT FURTHER RESOLVED, that the City shall consult with its Tribal Government Partners, the State of Oregon, local governments, and other key stakeholder including labor, business, environment, neighborhoods and communities of color in advancing this policy;

The Mayor's Office staff has sought input from and will continue to reach out to the entities identified above to implement this process requirement of the resolution.

Guiding principles of the 2035 Comprehensive Plan

The Comprehensive Plan sets five Guiding Principles, which encourage balanced, integrated multi-disciplinary approaches that must comply with the Plan. This project is consistent with the Guiding Principles because it promotes major benefits to human health and safety, environmental health and resilience and integrates considerations for economic prosperity and equity.

Economic prosperity

Guiding Principle: Support a low-carbon economy and foster employment growth, quality education and training, competitiveness, and equitably-distributed household prosperity.

The proposed code changes would restrict expansion at existing fuel terminals and prohibit new terminal development, impacting associated job growth and tax revenue. The proposed code

restrictions on fossil fuel terminal development would also limit potential financial risks from a major accident involving fossil fuel infrastructure.

Human health

> *Guiding Principle:* Avoid or minimize negative health impacts and improve opportunities for Portlanders to lead healthy, active lives.

Major benefit – The proposed code changes would reduce the scale of low, but potentially catastrophic, safety risks associated with the growth of fossil fuel infrastructure, including oil train derailments, explosive accidents at LNG (liquefied natural gas) and LPG (liquefied petroleum gas) facilities, and seismic risks of tank farms. Fossil fuel emissions and coal dust are also significant sources of air pollution associated with respiratory disorders.

Environmental health

> *Guiding Principle: Weave nature into the city and foster a healthy environment that sustains people, neighborhoods, and wildlife. Recognize the intrinsic value of nature and sustain the ecosystem services of Portland's air, water, and land.*

Major benefit – The human health benefits described above also extend to environmental health. The proposed code changes would reduce the scale of environmental health risks associated with the growth of fossil fuel infrastructure, including oil train derailments along the Columbia River, LNG and LPG facilities in riparian areas, and seismic risks of tank farms along the Willamette River. Fossil fuel emissions are also a significant source of air pollution.

Equity

> *Guiding Principle: Promote equity and environmental justice by reducing disparities, minimizing burdens, extending community benefits, increasing the amount of affordable housing, affirmatively furthering fair housing, proactively fighting displacement, and improving socio-economic opportunities for under-served and under-represented populations. Intentionally engage under-served and under-represented populations in decisions that affect them. Specifically recognize, address, and prevent repetition of the injustices suffered by communities of color throughout Portland's history.*

The proposed code changes would restrict expansion at existing fuel terminals and prohibit new terminal development, impacting associated middle-wage, industrial job growth that disproportionately benefits workers of color. Restricting potential increases in regional supply of fossil fuels could also have regressive impacts of increasing fuel costs, disproportionately affecting lower-income people.

Resilience

> *Guiding Principle: Reduce risk and improve the ability of individuals, communities, economic systems, and the natural and built environments to withstand, recover from, and adapt to changes from natural hazards, human-made disasters, climate change, and economic shifts.*

Major benefit – The proposed code changes would restrict development of fossil fuel terminals consistent with City and State objectives on climate change and public safety. While fossil fuels like natural gas and propane have the potential to replace higher-carbon fuels, substituting these fuels for higher-carbon fuels does not begin to approach the goal of an 80% reduction in carbon emissions by 2050 established in Portland's Climate Action Plan or the State's 75% goal.

2035 Comprehensive Plan policies specifically implemented in this project

The proposed zoning changes in the project are implementing the following specific policies.

Overall project direction: Fossil fuel distribution

> *Policy 6.48 Fossil fuel distribution. Limit fossil fuel distribution and storage facilities to those necessary to serve the regional market.*

The proposed code changes would implement Policy 6.48 by restricting development and expansion of fossil fuel distribution terminals. Analysis to date is limited on the potential impacts of code amendments in constraining fossil fuel supply to meet regional demand. Fossil fuel demand in this growing region may increase moderately, as indicated by trend-based forecasts reviewed in Section 4, or may plateau and decline with implementation of climate resilience goals and strategies. The Zoning Code provides discretionary flexibility for expansion of existing fuel terminals within their existing site area through a nonconforming situation review, subject to mitigating any net increase of detrimental impacts on the surrounding industrial zone.

Related policy directions

> *Policy 4.81 Disaster-resilient development. Encourage development and site-management approaches that reduce the risks and impacts of natural disasters or other major disturbances and that improve the ability of people, wildlife, natural systems, and property to withstand and recover from such events.*
>
> *Policy 4.82 Portland Harbor facilities. Reduce natural hazard risks to critical public and private energy and transportation facilities in the Portland Harbor.*

Policies 4.81 and 4.82 are partly met by prohibiting fuel terminal development in Portland's industrial areas that are predominantly in locations with high susceptibility to soil liquefaction (see Figure 7 in Section 4). Incremental expansion at existing terminals also provides a pathway for market-driven safety improvements, providing financial return to cover improvement costs. As described above, the Zoning Code provides discretionary flexibility for such expansion through a nonconforming situation review.

> *Policy 6.2 Diverse and expanding economy. Align plans and investments to maintain the diversity of Portland's economy and status as Oregon's largest job center with growth across all sectors (commercial, industrial, creative, and institutional) and across all parts of the city.*
>
> *Policy 6.5 Economic resilience. Improve Portland's economic resilience to impacts from climate change and natural disasters through a strong local economy and equitable opportunities for prosperity.*
>
> *Policy 6.6 Low-carbon and renewable energy economy. Align plans and investments with efforts to improve energy efficiency and reduce lifecycle carbon emissions from business operations. Promote employment opportunities associated with the production of renewable energy, energy efficiency projects, waste reduction, production of more durable goods, and recycling.*

The proposed code changes are consistent overall with the range of direction in Policies 6.2, 6.5, and 6.6, providing code-limited flexibility for incremental expansion of existing terminals as part of a diverse, expanding economy and prohibiting development of new fossil fuel terminals that conflict with resilience and climate action goals.

Existing Comprehensive Plan policies specifically implemented in this project

The 2035 Comprehensive Plan was adopted in June 2016 and is not expected to take effect until early 2018. In the meantime, the existing Comprehensive Plan is in effect.

> 7.6 Energy Efficient Transportation. Provide opportunities for non-auto transportation including alternative vehicles, buses, light rail, bikeways, and walkways. The City shall promote the reduction of gasoline and diesel use by conventional buses, autos and trucks by increasing fuel efficiency and by promoting the use of alternative fuels.
>
> 7.8 Energy Supply. The City shall promote conservation as the energy resource of first choice. The City shall also support environmentally acceptable, sustainable energy sources, especially renewable resources such as solar, wind, hydroelectric, geothermal, biomass (wood, farm and municipal waste), cogeneration, and district heating and cooling.

The proposed code changes are consistent with Policies 7.6 and 7.8, promoting the use of alternative energy sources by restricting development and expansion of fossil fuel terminals.

2015 Climate Action Plan

> Goal: Reduce local carbon emissions 80 percent from 1990 levels by 2050, with an interim goal of 40 percent by 2030.

As described in Section 4, lower-carbon fossil fuels like natural gas and propane have the potential to replace higher-carbon fuels, but they do not approach the goal of an 80% reduction in carbon emissions by 2050 in Portland's Climate Action Plan or the State's 75% goal. Investments in major infrastructure typically take decades to recoup, and the transition to renewables needs to go much faster than that to stabilize global emissions. The proposed code changes are consistent with the 80% goal of the Climate Action Plan by restricting development of fossil fuel terminals.

3. Public and stakeholder involvement

Section 3 summarizes public and stakeholder involvement activities that have helped shape and inform this project. Stakeholder focus group results are further explained in Appendix A of this report.

What have we heard leading up to this project?

Public hearings at the Planning and Sustainability Commission and City Council on the Pembina terminal development proposal in 2014 and Resolution 37168 in 2015 drew testimony from hundreds of people. The overall theme of that testimony was strong objection to the Pembina project and support for the fossil fuel resolution. Primary reasons included the neighborhood safety and health risks and inconsistency with the City's climate action objectives. The Resolution also drew letters with strong opposition from state and regional business associations.

Following adoption of the Resolution in November 2015, City Council added the related Policy 6.48 on fossil fuel distribution to the 2035 Comprehensive Plan, reflecting the recently adopted policy direction in the Resolution. Public involvement in the Comprehensive Plan included public hearings in April 2016 on City Council amendments and thousands of comments on the 2035 Comprehensive Plan over the previous 8 years. The proposed code amendments are consistent with several sustainability-related policies in the Plan. Addressing issues with policy tradeoffs, the 2035 Comprehensive Plan calls for a balanced, integrated approach to implement multiple goals. As described in Section 2, the proposed code amendments provide major benefits toward implementing three of the Plan's five guiding principles and integrates consideration of the other two guiding principles.

Public involvement activities in this project

Extensive public comments were received on the Discussion Draft and influenced substantial changes between the Discussion and Proposed Drafts.

Over 700 people sent emails asking for a "full ban" on new and expanded fossil fuel terminals. Their comments included three generally consistent recommendations: a ban on new bulk fossil fuel terminals; tight limits on expansion at existing facilities; and provisions to improve the safety and resilience of existing terminals. Common themes of these comments included:

- return to the initial intent and plain language of the resolution;
- where the resolution was bold, visionary, and historic, the discussion draft is short-sighted and prioritizes the fossil fuel industry over the health and safety of Portlanders;
- the discussion draft allows new bulk terminals to be built and existing facilities to expand, which will grow our carbon footprint past the point of being able to meet our local and state carbon reduction goals.
- transporting and storing fossil fuels are never safe, with risks ranging from oil train derailments and pipeline spills to storage tank explosions and tank destabilization from earthquakes.
- require existing fossil fuel terminals make upgrades for seismic resilience to protect the health and safety of neighboring communities and the Willamette River
- invest heavily in renewables with and urgency befitting the climate crisis.

Similar comments for further restrictions on terminal growth and seismic improvements were also made in letters from 350PDX, Portland Audubon, Center for Sustainable Economy, Columbia Riverkeeper, Oregon Sierra Club, Climate Solutions, members of a City Club seismic safety subcommittee, Linnton Neighborhood Association, League of Women Voters, and other residents. Examples of other concerns raised in those letters include that code changes serve as a bold model for other jurisdictions; to partner with Portland Bureau of Emergency Management on seismic safety; and to clarify forecast growth methodologies relative to climate policies.

Themes of comments on the Discussion Draft from business and labor organizations included opposition to proposed code changes, requests for more time and analysis, and clarifications to address practical considerations. Letters were received from NW Natural, Port of Portland, Columbia Pacific Building and Construction Trades Council, Kinder Morgan, Arc Terminals, and Western States Petroleum Association (WSPA). Some examples of comments included that growth rates will change over time, that fuels meeting Oregon's Clean Fuel Standard should be excluded, inclusion of non-fuel methanol is inconsistent, and the economic analysis is cursory. WSPA submitted draft code language, including focusing terminal restrictions on extra-regional facilities beyond the West Coast (PADD V) region and a new Energy Corridor Overlay Zone that protects the historic energy cluster for energy infrastructure growth.

Public involvement in concept development for the project consisted primarily of four stakeholder focus groups, which were held in June 2016 to review preliminary code concepts and help identify and understand potential implementation issues. The focus groups highlighted the range of stakeholder perspectives and interests concerning proposed zoning changes. Figure 4 summarizes the themes of issues raised in the focus groups. Other outreach activities have included meetings with interagency partners, terminal operators, and other interested stakeholders. These activities and what we heard in them are further described in the appendix of this report.

Inter-governmental coordination

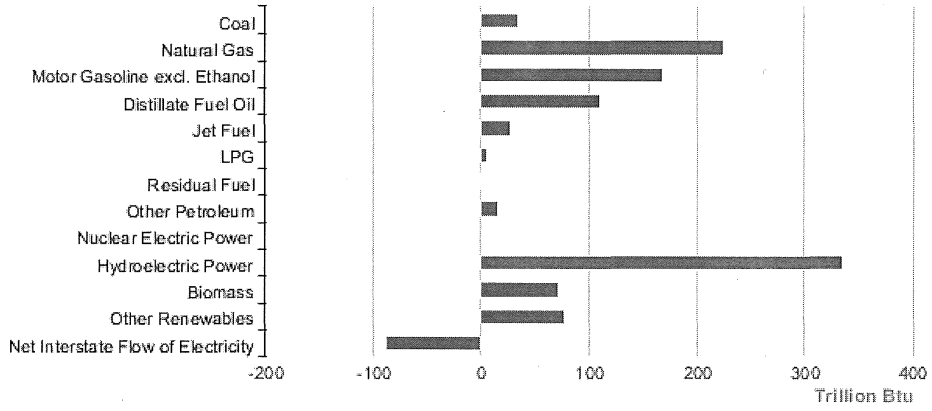
The Mayor's Office staff has sought input from and will continue to reach out to Tribal Government Partners to shape and inform the draft code amendments.

An In-House Draft Report was circulated to inter-bureau partners in June 2016, and their comments have helped to shape and inform the Discussion Draft, particularly addressing code administration and legal limitations. Bureau of Planning and Sustainability staff will continue to meet with inter-governmental partners to refine responses to implementation issues.

Figure 4. Summary themes of stakeholder focus group comments

TOPIC	FUEL TERMINAL REPRESENTATIVES	ENVIRONMENTAL AND HEALTH ORGANIZATIONS	STATE AND REGIONAL BUSINESS ORGANIZATIONS	NEIGHBORHOOD AND EQUITY ORGANIZATIONS
Key issues	▸ We've operated safely for decades. We meet the federal/state low-carbon fuel standards. ▸ Difficult to participate: very quick process; emotionally driven; antitrust restrictions. ▸ Unintended impacts: harder to meet clean fuel standards; more trucks on road; costs to rest of the state.	▸ Looking for strong, model code. Expect community backlash if expectations not met. ▸ Safety needs to be integral with climate - Mosier oil train wreck; terminals in liquefaction soils. ▸ Include disaster risks in economic analysis. Bonding or insurance for worst case.	▸ Resolution requires more research on economic impacts, etc. ▸ How will the code hold up in 5 years? ▸ What is the goal? If climate or safety, zoning tool is not the right fit. ▸ Portland is not an economic island. Statewide impact. ▸ Big political decision. Don't rush it.	▸ Safety and pollution are our priority. Look closely at seismic and explosion risks. ▸ A reasonable expectation for growth is smart. ▸ This is aggressive. Without LNG, won't China burn more coal? ▸ Rail safety in the Gorge is also a key issue that this can't resolve.
New land use category	▸ If unclear, permit staff could be pressured - unpredictable results. ▸ Use federal West Coast PADD 5 "region."	▸ Regulate both existing and new facilities. ▸ New code must effectively implement the policy.	▸ Need clear definitions: region, export, end user. ▸ Do not make terminals non-conforming or an ambiguous limited use.	▸ Why allow it in IG2? ▸ A new export terminal in contaminated harbor is unlikely.
Definition of fossil fuels	▸ Natural gas considered a low carbon fuel by State, so why included here? ▸ Tomorrow's cleaner fuels won't meet today's definitions.	▸ Excluding methanol undermines policy. ▸ If end use is mostly fuel, then limit it. ▸ One new LNG tank is a big risk. So is coal.	▸ Federal and state are going a different direction, requiring cleaner fossil fuels. Why restrict cleaner fuels at cross purposes?	▸ Make way for bio-diesel as a cleaner fuel. ▸ Methanol not a fuel in Oregon - overreaching. ▸ Fuels are okay if they have no emissions.
Terminal development restrictions	▸ Some sites are already built-out. ▸ Our non-contiguous sites are connected by pipelines. ▸ Can't comment on size.	▸ Most prefer Option A. ▸ Caution about Commerce Clause. ▸ 1% annual growth metric is too high.	▸ Don't come at sideways. Unclear rationales will lead to appeals. ▸ Size limits would put region on "import diet." ▸ Dated, low forecast.	▸ Option C preferred. ▸ Allow for modest growth of LNG and oil; not coal. ▸ Review size limits every few years.

4. Background conditions



This section of the report describes background conditions that inform the proposed zoning changes. Topics include access to energy, impacts on the economy, climate change impacts, and health and safety impacts of draft zoning code changes. Background information on changing energy markets in the Pacific Northwest and Portland's existing fossil fuel terminals is included in the Section 1. Legal and policy background information is presented in Section 2.

Access to energy

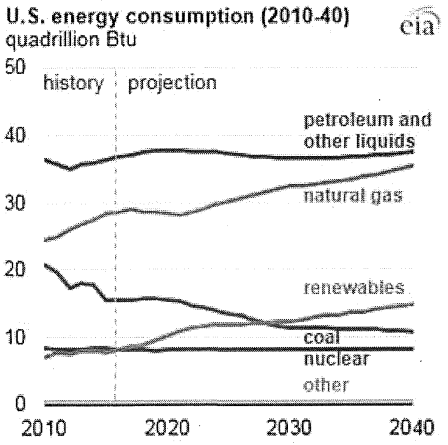
Energy consumption in Oregon

Oregon residents and businesses rely on Portland's fossil fuel distribution and storage facilities as a wholesale distribution hub to meet their energy consumption needs. Estimated state energy consumption by fossil fuels and other sources are shown in Figure 5. Residents and businesses in much of Southern Washington also rely on Portland terminals for access to fuels.

Figure 5. Oregon energy consumption estimates, 2014

eia Source: Energy Information Administration, State Energy Data System

Four refineries in the Puget Sound area supply nearly all of the petroleum fuels consumed in Oregon, delivered primarily through the Olympic Pipeline that terminates at the cluster of 10 petroleum terminals in Northwest Portland. From there, petroleum products are delivered to Oregon and Southern Washington markets via truck, pipeline and barge. NW Natural supplies natural gas to its Western Oregon market area and operates peak-consumption storage terminals in Northwest Portland



and Newport. Thus, fossil fuel terminals in Portland are a primary statewide distribution hub location for transportation fuels and natural gas.

Energy consumption forecasts and the demand for additional storage capacity

Analysis to date is limited on the energy consumption forecasts and how the proposed code changes would impact the demand for additional fossil fuel storage capacity. Fossil fuel demand in this growing region may increase moderately, as indicated by trend-based forecasts, or may plateau and decline with implementation of climate resilience goals and strategies. National forecasts of energy consumption by the U.S. Energy Information Administration show varying growth trajectories by energy type, including a relatively flat outlook for petroleum fuels, decline for coal, and moderate growth for natural gas and renewables (see Figure 6).

Liquid bulk cargo in Portland Harbor is projected to expand at a range of 0.5% to 1.0% average annual growth (AAG) to 2040 (BST Associates, 2012), providing an estimate of potential market expansion needs for petroleum fuels, which could mean a need for an additional 10-20% increase in storage capacity. However, based on this forecast, ECONorthwest (2012) estimated that there was no additional land needed for new liquid bulk terminals in Portland. The 1.9% average annual growth forecast to 2034 (NW Natural 2014 Integrated Resource Plan) provides an estimate of market expansion needs for natural gas distribution facilities.

Figure 6. U.S. energy production and consumption projections to 2040

Source: US Energy Information Administration, Annual Energy Outlook 2016

Even if regional fossil fuel demand follows trend-based local forecasts, there is a wide margin between the size of recently proposed crude oil, coal, and LNG terminals proposed in the Pacific Northwest and the scale of expected growth of existing Portland fuel terminals that generally serve the regional market area, as shown in Figure 7.

Contradictory stakeholder comments were received that local growth projections are too high, too low, and could change substantially with market innovations. To address this uncertainty, periodic monitoring for code effectiveness is recommended in Section 7 as a future implementation project,

including monitoring for changes in regional fuel demand over time. Staff will continue to research and analyze potential economic impacts of proposed code changes prior to adoption.

Impacts of draft code changes on the economy

Jobs and wages at Portland's fuel terminals

In 2014, the 11 existing fuel terminals in Portland shown in Figure 3 provided approximately 280 jobs at their sites and supported an estimated 720 total jobs in the metropolitan area. The annual payroll at those terminals was $23 million, which supported total personal income of about $92 million in the metropolitan area.

BPS calculated these supported employment and income estimates from the induced and indirect impacts from metropolitan area purchases by these firms and their employees. For example, the jobs of the Longshore Union workers who unload fuels from tankers at these fuel terminals are not counted as direct jobs at the terminal sites. The multipliers used for these calculations were estimated from the average employment and income effects of marine terminals in Portland (Martin Associates, 2012). The job and wage estimates were calculated from Quarterly Census of Employment and Wages (QCEW) data.

Portland's industrial area jobs also have an important urban equity role in that they consist primarily of middle-wage jobs that do not require 4-year college degrees, which the overall economy has been losing since 2000. In contrast, jobs in commercial districts are concentrated primarily in low- and high-wage quartiles (fourths) of overall city employment. Middle-wage job growth supports the "income self-sufficiency" objectives of the Portland Plan and 2035 Comprehensive Plan (Policy 6.28) to expand access to self-sufficient wage levels.

Long-term job growth to 2035 is estimated at 1.6% average annual growth in the warehousing, transportation and utilities sector in Portland's 2016 Economic Opportunities Analysis and Metro's 2014 Urban Growth Report. Applying this growth rate to Portland's existing fuel terminals, approximately 110 net new permanent jobs is expected between 2014 and 2035, which is the equivalent of about four new terminals at their current average size. The total metropolitan area job impact of this fuel terminal expansion would be approximately 290 new jobs by 2035. If fuel terminal job growth occurred at a slower 1.0% average annual rate, matching the forecast growth of liquid bulk cargo volumes in Portland Harbor, approximately 65 net new terminal jobs would be generated by 2035, supporting a total 170 new jobs in the metro area. Pembina's proposed propane terminal in 2014 was estimated to create 30 to 40 new permanent jobs and 600-800 temporary construction jobs.

The proposed code changes would allow for code-limited expansion at existing terminals and new fuel distribution facilities smaller than 5 million gallons to accommodate potential increases in regional demand and resulting job growth.

Tax revenues of new terminals

State and local revenues from income and property taxes vary widely by facility. For example, property taxes on the depreciated improvements value of existing fuel terminals is much lower than new construction. If fuel terminals added 110 net new direct jobs by 2035 and the resulting state and local tax revenues is typical of businesses and developed facilities in Portland's Working Harbor (Martin Associates, 2016), the estimated new state and local tax revenues in fiscal year 2035 (in 2015 dollars) are $1.6 million. In contrast, the proposed $500 million Pembina project was estimated to generate approximately $12 million in annual property tax revenue, reflecting the increased improvements value and property taxes of new construction.

The proposed code changes would allow for code-limited expansion at existing terminals and new fuel distribution facilities smaller than 5 million gallons and resulting state and local tax revenue. However, prohibiting large scale new terminals such as Pembina could result in similar levels of foregone property taxes. Development of the limited land supply along Portland Harbor for new auto or grain terminals would also result in substantial local and state tax revenues, offsetting foregone taxes on new fossil fuel terminals.

Growth opportunities in fossil fuel distribution

The most recent cargo forecast for Portland Harbor in 2012 projected 1.0% AAG in liquid bulk tonnage to 2040 as a high scenario and 0.5% AAG as a low scenario (BST Associates, 2012). Based on this forecast, ECONorthwest (2012) estimated no additional land need for new liquid bulk terminals. Since 2012, several new fuel terminals have been proposed in the Pacific Northwest, as shown in Figure 2.

Updating the liquid bulk forecast at this point would be challenging for several reasons. Most of the recent fuel terminal proposals have since been abandoned or appear to be dormant. Policy and permitting uncertainty complicate the development feasibility of new terminals and transportation infrastructure. Crude oil prices have fallen sharply in 2015 and 2016, reducing the current market potential for major investments. Expanding global industrial product markets after the Great Recession slowed substantially in 2015. And energy distribution markets could change abruptly with continuing product innovations and location shifts in global production.

In the long term, Portland has competitive advantages for accommodating energy terminal development as a Pacific Rim gateway location to growing Asian markets, the Columbia River's low-gradient railroad access for heavy cargo through the Cascades, and Oregon's freight infrastructure hub. On the other hand, Portland's industrial land supply for continuing growth is limited, and expanding cargo markets for autos, grain and dry bulks are competing for current growth capacity.

Other economic impacts

Energy infrastructure and terminal investments appear to have low but potentially catastrophic risks of major accidents, as described below. Examples include seismic resilience of petroleum terminals in the event of a Cascadia Subduction Zone earthquake, oil train derailments, explosions at LNG (liquefied natural gas) and LPG (liquefied petroleum gas, such as propane) facilities, and others.

Clean Energy is a target industry in the City of Portland. An emerging cluster of Portland area business activity in solar and wind energy manufacturing, green building development, and other fields of sustainable urban innovation presents long-term business growth opportunities. Substantial local investment in fossil fuel infrastructure and large new terminals could hinder local growth momentum in Clean Energy industries.

Climate change impacts of draft code changes

Climate impact of fossil fuels

Fossil fuels are major contributors to climate change and pollution, as described in Portland's 2015 Climate Action Plan. Greenhouse gas emissions from the burning of fossil fuels and land use changes, including deforestation, are primary causes of climate change. The Intergovernmental Panel on Climate Change's most recent report documents the overwhelming evidence that human activities have been

the major driver of recent warming of the Earth's surface, and that climate change and its consequences will continue into the future (IPCC, 2013).

The magnitude of future climate impacts depends largely on the trajectory of future global greenhouse gas emissions. Greenhouse gas emissions from human activities have continued to rise in recent decades, reaching the highest rates in human history between 2000 and 2010 (IPCC, 2014). About half of all carbon dioxide emissions, the most prevalent greenhouse gas, between 1750 and 2010 occurred in the last 40 years. The energy, industry and transportation sectors have dominated these emissions increases. On the current trajectory, global transportation emissions will double by 2050.

Transition to "renewable" and "clean" fuels

The U.S. Environmental Protection Agency (USEPA) implements the federal Renewable Fuel Standard (RFS) that requires transportation fuel sold in the U.S. to contain a minimum volume of renewable fuels. The RFS originated with the Energy Policy Act of 2005 and was expanded and extended by the Energy Independence and Security Act of 2007 (EISA). Similarly, ODEQ implements the Oregon Clean Fuel Program. ODEQ describes "clean fuel" as a fuel with a lower carbon intensity than that of the fuel it replaces.

Examples of "clean fuels" in Oregon's program include most types of ethanol, biodiesel, natural gas, biogas, electricity, propane and hydrogen. The Oregon Clean Fuel Standard sets 2015 as a baseline that represents 10 percent ethanol blended with gasoline and 5 percent biodiesel blended with diesel. The rule also requires a 10 percent reduction in average carbon intensity from 2015 levels by 2025.

Terminal representatives and business stakeholders urged that proposed zoning code changes not create a disincentive or barrier to compliance with these federal and state rules, which may require additional tank capacity to implement. Environmental and public health organization representatives pointed out that City Resolution 37168 addresses fossil fuels generally, including lower-carbon fossil fuels like natural gas and propane. The proposed code changes would allow for code-limited expansion at existing terminals and are not expected to hinder compliance with the renewable and clean fuel standards, as described in Section 5.

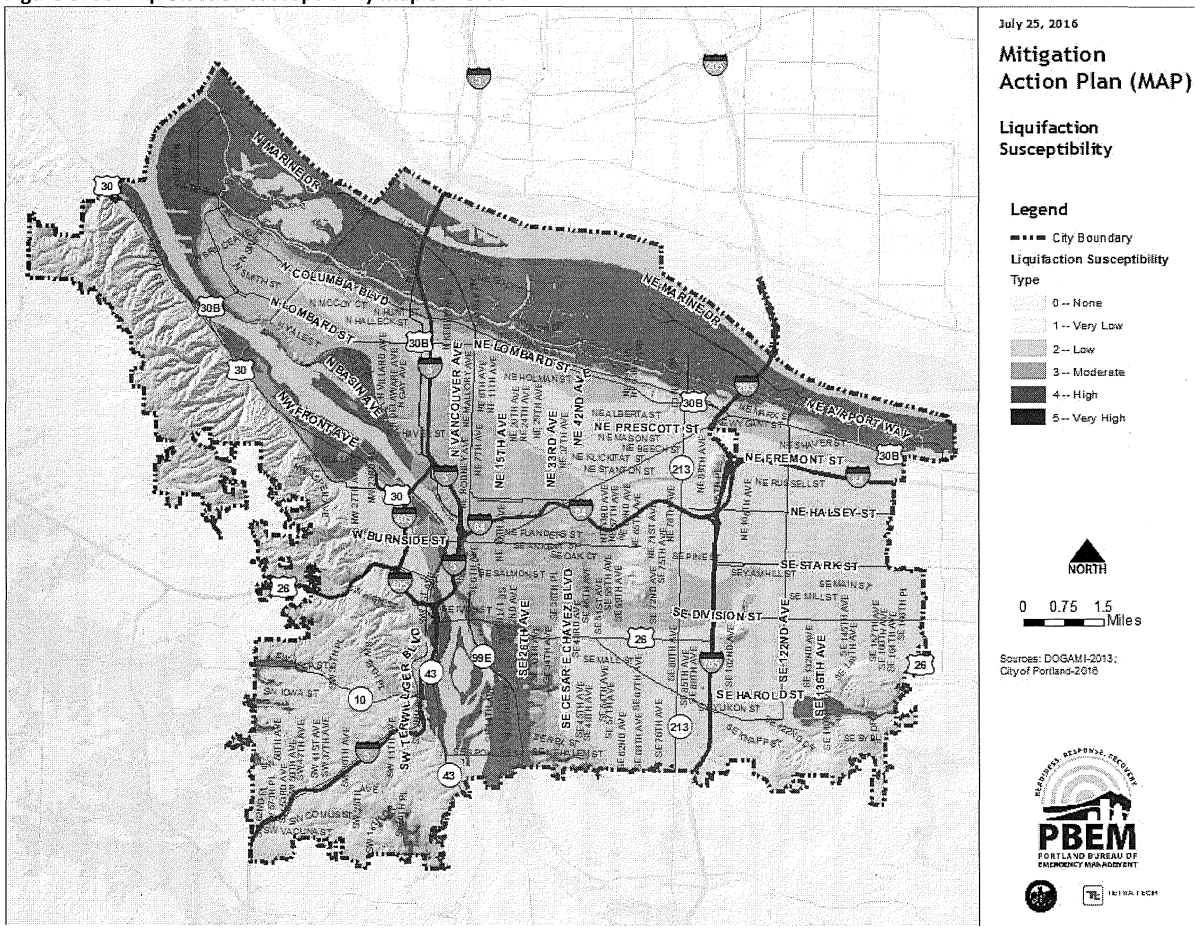
Velocity of transition to non-fossil fuel energy

Portland's Climate Action Plan sets a goal for an 80% reduction in greenhouse gas emissions by 2050. Oregon's climate action goals similarly call for 75% reduction by 2050. While fossil fuels like natural gas and propane have the potential to replace higher-carbon fuels, they don't begin to approach the 80% reduction that the City is striving for or the State's 75% goal. ODEQ estimates that the greenhouse gas emissions reduction from switching from gasoline to compressed natural gas, for example, is 18%; for propane, it is 15%. The lower-carbon fossil fuels do have appeal as a bridge to widespread use of renewable energy, but investments in major infrastructure typically take decades to recoup, and the transition to renewables needs to go much faster than that to stabilize global emissions.

During recent hearings and analysis on Resolution 37168 and the Pembina terminal proposal, the question of whether to differentiate between fossil fuels with different carbon content was widely

discussed. In the lead up to the resolution, an option was proposed that would oppose new coal and oil infrastructure but allow for other fossil fuels that could show a likely net decrease in carbon emissions. City Council decided not to apply this option in the resolution.

Health, safety, and environmental impacts of draft code changes



Seismic resilience and liquefaction soils

The 2035 Comprehensive Plan sets policy direction (4.75 and 4.76) to encourage disaster-resilient development and specifically to reduce natural hazard risks to critical energy and transportation infrastructure in Portland Harbor.

The 2016 Critical Energy Infrastructure Hub Study underway by the Portland Bureau of Emergency Management includes a literature review and modeled risks of structural damage to critical infrastructure from earthquakes, floods, landslides, volcanic activity, wildfire, and other sources. Along with petroleum and natural gas infrastructure, the study is also assessing infrastructure risks to emergency services, transportation, electricity, potable water, and waste water. The study area includes the Northwest and Linnton industrial areas. PBEM has identified significant seismic risks at the fuel terminals from a major Cascadia Subduction Zone earthquake because of their location in a filled riverfront plateau area with moderate- to high-susceptibility location for soil liquefaction.

As shown in Figure 7, the Oregon Department of Geology and Mineral Industries (DOGAMI) has mapped most of the riverfront plateau areas, which account for over 90 percent of Portland's industrial zoning, as having high susceptibility for soil liquefaction, along with areas along the Central City riverfront and much of the Brooklyn and Sellwood-Moreland neighborhoods. Most of the existing fuel terminals in the

Figure 8. Soil liquefaction susceptibility map of Portland

Willbridge area are mapped as having moderate susceptibility for soil liquefaction, and the others are mapped in the high susceptibility areas. The proposed code amendments will improve the seismic resilience of new bulk fossil fuel terminals by precluding their development in areas with high susceptibility to soil liquefaction.

The proposed code changes provide for seismic improvements to existing terminals, through a non-conforming situation review. Future amendments to building and fire codes to improve seismic safety of fossil fuel infrastructure may also be adopted to implement Resolution 37168. A future code project is recommended in Section 7 to develop building code amendments to improve seismic resilience and require seismic upgrades comparable to proposed requirements on unreinforced masonry buildings.

Safety of liquefied gas terminals

Liquified natural gas (LNG) and liquefied petroleum gas (LPG, such as propane) facilities pose safety risks from potential explosions and fire. The Pembina propane terminal, which was proposed in 2015 at the Port of Portland Terminal 6, is an apt case study. The Pembina terminal would have required environmental zoning code amendments that did not move forward.

The issue of safety risks was discussed extensively during review of the proposed Pembina terminal, and a quantitative risk assessment study was prepared to inform that review process (Det Norske Veritas (U.S.A.), Inc., 2015). The study estimated the risk from flammable releases, such as jet fires, pool fire, flash fire, vapor cloud explosions, fireball and Boiling Liquid Expanding Vapor Explosion (BLEVE). The risk was presented as individual risk in the form of location-specific risk contours extending outward from the proposed facilities, and as societal risk in the form of potential loss of life and cumulative frequency of various accidents. The highest offsite risk level was found to be 1 fatality in 1,000 years in areas directly north and south of facility. The nearest residential zones are located beyond the risk level contour of one 1 fatality in 100 million years. The cumulative societal risk was estimated at 1 statistical fatality every 38 years. The study also include various facility design and siting recommendations to mitigate identified risks.

Another risk assessment (Northwest Citizen Science Initiative, 2015) on the Pembina project was presented by environmental groups and neighbors, including the Hayden Island Neighborhood Association. The analysis identifies additional sources of risk from BLEVE cascades, terrorist events, and magnitude 9 earthquakes. The authors recommend not locating a propane terminal within 10 miles of the Portland/Vancouver urban area.

Public safety risks from a new LNG or LPG facility are estimated to be very low relative to other urban hazards, although possible impacts could be catastrophic. The proposed code amendments are expected to reduce public safety risks by prohibiting development of large new LNG or LPG facilities.

Oil train accidents

On June 3, 2016 an oil train traveling through the Columbia River Gorge partially derailed in Mosier en route to Tacoma. The 16-car derailment resulted in a 1,000-barrel spill and fires that lasted nearly a day. Small amounts of oil reportedly reached the river, and nearby drinking water and wastewater facilities in Mosier were affected.

An Associated Press analysis of accident records found that 26 oil-train derailments or fires have occurred nationally in the last decade. The national geography of increasing oil extraction in the inland Great Plains states and refineries concentrated on the coasts is contributing to this trend. Risk of how

often such derailments are likely to occur in the Columbia Gorge is disputed, with one estimate as high as one every 30 months.

Preliminary reporting on the cause of the Mosier derailment pointed to failed bolts in the track that are difficult to detect. Union Pacific reported that improvements are underway to replace bolts on 530 miles of curved track nationwide. Railroad safety is regulated at the federal level and monitored by the Federal Railroad Administration. A recent Government Accounting Office report has identified challenges and delays in implementing some federal rail safety regulations.

The proposed code amendments could incrementally reduce rail accident risks by restricting development and expansion of fossil fuel terminals at a West Coast rail hub location. However, restricting the location of new petroleum terminals in the City of Portland is not expected to substantially affect the volume of petroleum cargo transported by rail to Puget Sound refineries. The Portland/Vancouver area is a rail hub location, where West Coast rail lines running north-south intersect the low gradient east-west rail corridor along both sides of the Columbia River. Roughly half of the east-west rail cargo destined for the Seattle-Tacoma area, in addition to Oregon-bound rail cargo, moves through the Portland metropolitan area. Derailment risk within Portland is reduced by the numerous siding destinations and congestion of the "Portland Triangle" area where UP and BNSF lines come together. However, derailment risks to natural resources, especially along rivers, and to rural communities appear to be significant.

5. Code concepts and analysis

This section of the report describes the proposed zoning change concepts by topic area, including the related policy directions, implementation issues, and rationale for the proposed zoning changes. Specific code changes are not included in this report, but will be part of the Proposed Draft, which is scheduled to be completed in August 2016 and discussed by the Planning and Sustainability Commission in September 2016.

1. **Types of distribution and storage facilities to be regulated**

Policy direction:

- City Council Resolution 37168 (adopted November 2015) calls for opposing expansion of infrastructure for transportation and storage of fossil fuels, subject to various exceptions, including safety improvements, service to end users, and infrastructure that accelerates transition to non-fossil fuel energy.
- 2035 Comprehensive Plan Policy 6.48 Fossil Fuel Infrastructure (adopted June 2016, not effective until 2018) also calls for limiting fossil fuel distribution and storage facilities to those necessary to serve the regional market.

Preliminary code concepts:

- Limit development of new Bulk Fossil Fuel Terminals as a regulated land use.
- Bulk Fossil Fuel Terminals are engaged in freight movement or wholesaling of fossil fuels at facilities that are characterized by having (1) marine, pipeline or railroad transport access and (2) either transloading facilities for transferring a shipment between transport modes (such as from rail to ship) or bulk storage facilities exceeding 5 million gallons (or equivalent volume) of fossil fuels. Examples include petroleum terminals, liquid natural gas terminals, and coal terminals. Functionally, these terminals are typically regional gateway facilities, where fossil fuels enter and exit the region, but the use classification is intended to be clearly identifiable and not rely on a definition of region.
- Exceptions that are not Bulk Fossil Fuel Terminals:
    - Retail sales of fossil fuels, such as gasoline or propane filling stations;
    - Distributors, wholesalers, and industrial service uses that receive and deliver fossil fuels exclusively by truck;
    - End-user facilities that store fossil fuels for primary use at or near the site, such as manufacturing, agriculture, and airports;
    - Uses that recover or reprocess used petroleum products;
    - Waste-related uses that transfer or store solid or liquid wastes, such as landfills.

Implementation issues:

- Definition of region – Portland is a regional distribution hub for energy and other products, and this zoning change is not intended to restrict energy access to the growing region. However, the regional market area of Bulk Fossil Fuel Terminals varies by product and is difficult to define. Portland's 10 petroleum terminals generally serve Oregon and Southern Washington. This

market area substantially exceeds the Portland metropolitan area, which is often colloquially referred to as the region. Some terminal representatives pointed out that the federal government's 5-state West Coast PADD 5 region is generally their regional market area. BDS staff commented that zoning does not regulate the target market (destination) of wholesale products, and the zoning code does not define region. Business organization representatives commented that the energy markets and related market areas are likely to change over time. Therefore, the proposed land use incorporates the concept of a regional market into the size limits, and a zoning definition of region is not proposed here.

- End users – Resolution 37168 lists a specific exception to not restrict service directly to end users. At a small scale, services to end users include retail gasoline filling stations, natural gas access lines in street right-of-way to residential and business customers, and heating oil tanks at home sites. Larger scale end users with fossil fuel storage and access infrastructure also include manufacturers, jet fuel facilities at the PDX Airport, vessel fuel facilities on Portland Harbor, and others, where fossil fuels are used as an input. Again, the limits on new facilities are sized to apply only to larger distribution facilities.

- Interpretation of use category – Terminal and business representatives commented that ambiguity in the use description could result in conflicting expectations, pressured interpretations, appeals, and inconsistent code implementation. While underlying policy accommodates regional access and exceptions that may be difficult to clearly define, the land use designation is proposed to be defined by clear and objective size thresholds and marine/railroad/pipeline access.

2. **Definition of fossil fuels**

Policy direction: City Council Resolution 37168 applies to fossil fuel infrastructure and storage generally and does not distinguish among types or carbon intensity of fossil fuels.

Preliminary code concept:

- Definition of fossil fuels: petroleum products (such as crude oil and gasoline), coal, and gaseous fuels (such as natural gas and propane) that are made from decayed plants and animals that lived millions of years ago and are used primarily as a source of energy.
- Exclusion of non-fuel products – Petrochemicals that are used primarily for non-fuel products are excluded, such as plastics, lubricants, fertilizer, roofing, and paints.
- Methanol is included as a fossil fuel. Development of methanol storage and transportation facilities would be limited similarly to LNG and LPG terminals.
- Denatured ethanol and similar fuel additives and biodiesel/renewable diesel with less than 5% fossil fuel content are not fossil fuels.
- Biogas from wastewater treatment plants, anaerobic digesters, landfills and other sources is not a fossil fuel.

Implementation issues:

- Definition of fossil fuels – Definitions of fossil fuels vary by source. Here are some examples.

- Oregon Department of Environmental Quality (ODEQ) – Fossil fuels: fuels such as oil, natural gas, and coal that are made from decayed plants and animals that lived millions of years ago. These fuels are made of hydrogen and carbon (hydrocarbons).
- U.S. Environmental Protection Agency (USEPA), 40 C.F.R. § 60.41 - Fossil fuel means natural gas, petroleum, coal, and any form of solid, liquid, or gaseous fuel derived from such materials for the purpose of creating useful heat.
- Oregon Department of Energy Administrative Rule, OAR 345-001-0010 - "Fossil fuel" means natural gas, petroleum, coal and any form of solid, liquid or gaseous fuel derived from such materials that serves as useful energy.

- Renewable and clean fuel standards – As described in Section 4, USEPA implements the federal Renewable Fuel Standard (RFS) that requires transportation fuel sold in the U.S. to contain a minimum volume of renewable fuels. Similarly, ODEQ implements the Oregon Clean Fuel Program. ODEQ identifies examples of "clean fuels" in Oregon as most types of ethanol, biodiesel, natural gas, biogas, electricity, propane and hydrogen. Terminal representatives and business stakeholders urged that proposed zoning code changes not create a disincentive or barrier to compliance with these federal and state rules, which may require additional tank capacity to implement. Environmental and public health organization representatives pointed out that City Resolution 37168 addresses fossil fuels generally, including clean fuels. The proposed allowance for code-limited expansion of existing terminals will allow enough supply to comply with the renewable and clean fuel standards.

- *Methanol – Large methanol plants have recently been proposed in Tacoma, Kalama, and St. Helens. Methanol plants tend to have structural similarities to LNG and LPG terminals, including large-scale and gas pipeline access, and they can have similar safety and climate impacts. Stakeholder focus groups were asked whether any* special inclusions, such as methanol, should be considered. Most people commenting noted that methanol is primarily used in the production of plastics and other non-fuel uses. Views differed among environmental organizations commenting. Some noted that excluding it undermines the policy. The draft code concept proposes to prepare code amendments that limit development of large methanol plants similarly to LNG or LPG terminals.

- *Denatured ethanol* – A terminal operator pointed out that "pure" ethanol made from corn or other non-fossil source is required by the Alcohol and Tobacco Tax and Trade Bureau to be denatured in order to be transported to the site. Denatured ethanol typically contains up to 5% methanol, so that it is toxic and undrinkable. Storage of denatured ethanol is proposed to be exempted. In other words, denatured ethanol tanks would not be counted as part of the maximum storage capacity of fossil fuel terminals.

- Biogas products from landfills – BES staff commented that biogas from landfills and other sources are not fossil fuels and should not be restricted by the proposed zoning changes. The proposed description of fossil fuel terminals specifically excludes waste-related uses, such as landfills, which are regulated as a separate land use in the zoning code. Also, the proposed

definition of fossil fuels, described as being made from decayed plants and animals that lived millions of years ago, would not include biogas from a landfill.

3. **Prohibition of bulk fossil fuel terminals**

Policy direction:

- City Council Resolution 37168 (adopted November 2015) calls for opposing expansion of infrastructure for transportation and storage of fossil fuels, subject to various exceptions, including safety improvements, service to end users, and infrastructure that accelerates transition to non-fossil fuel energy.
- 2035 Comprehensive Plan Policy 6.48 Fossil Fuel Infrastructure (adopted June 2016, not effective until 2018) also calls for limiting fossil fuel distribution and storage facilities to those necessary to serve the regional market.

Preliminary code concept:

- Classify Bulk Fossil Fuel Terminals as a prohibited use in all base zones.

Implementation issues:

- Policy implementation – City Resolution 37168 reflected a major change in policy direction on fossil fuel distribution and storage facilities. Prohibition of Bulk Fossil Fuel Terminals is proposed as an unambiguous, assertive approach to implement this policy change, responding to increasingly evident safety risks of fossil fuel infrastructure, aggressive climate change goals, and changing energy markets in the Pacific Northwest.

- Community expectations – Over 700 people sent emails in response to the Discussion Draft asking for a "full ban" on new and expanded fossil fuel terminals. Climate resilience advocates are widely represented in the Portland community and the Pacific Northwest. Public involvement in Resolution 37168 and this project reveal broad community expectations for a bold approach to restrict fossil fuel distribution facilities in Portland.

- Providing regional market access to fuels – Analysis to date is limited on the potential impacts of constraining regional fuel demand. Fossil fuel demand in this growing region may increase moderately, as indicated by trend-based forecasts, or may plateau and decline with implementation of climate resilience goals and strategies. Staff will continue to research and analyze potential economic impacts of proposed code changes prior to adoption. The fossil fuels consumed in Oregon are generally not extracted or refined in the state. As a result, fossil fuel terminals provide multimodal transportation efficiency and price advantages for distributing fuels to the growing population of the regional market area.

- Option to set size limits on new fossil fuel terminals – The Discussion Draft proposed storage capacity size standards to limits new fossil fuel terminal development. Figure 7 in Section 4 indicates a wide margin between the size of recently proposed crude oil, coal, and LNG terminals proposed in the Pacific Northwest and the scale of expected growth by existing

Portland fuel terminals that serve the regional market area. Proposed terminal size limitations within that margin would allow for expansion at existing terminals and moderately sized new terminal development to meet market area consumption needs. Instead, the Proposed Draft code changes would prohibit Bulk Fossil Fuel Terminals, a more restrictive approach to more assertively implement the new policy directions and respond to extensive community comments on the proposed code changes.

- Balanced, integrated policy approach – The proposed limitations on fossil fuel distribution entail tradeoffs among public goals for environmental protection, public health and safety, meeting energy needs, and economic prosperity, as described in Section 4. The Comprehensive Plan calls for a balanced, integrated approach in land use regulations to meet these public objectives, as described in Section 2. The proposed code changes provide for significant environmental and safety benefits in restricting development and expansion of fossil fuel terminals and provide for code-limited expansion of fuel terminals to adequately meet regional energy needs and integrate economic prosperity and equity considerations.

4. Legal, non-conforming status of existing facilities

Policy direction:

- City Council Resolution 37168 includes various exemptions to not restrict safety or efficiency improvements, service to end users, emergency backup capacity, infrastructure for recovery or re-processing of used petroleum products, or infrastructure that will accelerate the transition to non-fossil fuel energy sources.
- 2035 Comprehensive Plan Policy 6.48 Fossil Fuel Infrastructure (adopted June 2016, not effective until 2018) also calls for limiting fossil fuel distribution and storage facilities to those necessary to serve the regional market.
- 2035 Comprehensive Plan Policies 4.75 and 4.76 call for encouraging disaster-resilient development and reducing natural hazard risks to critical energy and transportation infrastructure in Portland Harbor.

Preliminary code concept:

- Existing Bulk Fossil Fuel Terminals would become legal, non-conforming uses, which may continue to operate. Expansion would require approval through a non-conforming situation review.

Implementation issues:

- Flexibility for code-limited expansion - Significant improvements to non-conforming uses generally require a "non-conforming situation review." Given this requirement, the proposed code changes may be more restrictive than the exceptions in the Resolution that call for not restricting improvements at existing fuel terminals that improve safety, provide wholesale fuel supply to local or regional end users, add backup capacity, or add tanks for clean/renewable fuels would require approval through a non-conforming situation review. However, the Zoning Code's provisions for expansion of non-conforming uses do provide discretionary flexibility to accommodate such improvements. Approval criteria for a non-conforming situation review include that, with mitigation measures, there will be no net increase in overall detrimental impacts on the surrounding industrial zone (such as hours of operation and vehicle trips) and

the expansion will not detract from the desired function and character of the industrial zone. Terminal improvements would also be limited to their existing site area. Improvements that address the exceptions in the Resolution are not generally expected to result in additional detrimental impacts on the surrounding industrial zone. Given the level of community scrutiny about fossil fuel terminal expansion, this discretionary public review process could add to the cost and uncertainty of investments at fossil fuel terminals. Non-conforming situation reviews are "Type 2" staff level permits, which could be appealed to a hearings officer and further to the Land Use Board of Appeals.

- Option to not restrict expansion at existing terminals - The Discussion Draft proposed code concepts that exclude existing terminals from development restrictions on Bulk Fossil Fuel Terminals. This option was intended to be consistent with the exceptions in the Resolution (as described in the previous point) and to accommodate potential growth in regional fuel demand. storage capacity size standards to limits new fossil fuel terminal development. Instead, the Proposed Draft code changes would apply a legal, non-conforming use status on existing Bulk Fossil Fuel Terminals, a more restrictive approach to more assertively implement the new policy directions and respond to extensive community comments on the proposed code changes.

- Divergent stakeholder views – Extensive comments on the Discussion Draft recommended tight limits on expansion of existing fuel terminals. In contrast, stakeholder focus group participants generally urged that existing fuel terminals should not be changed to a non-conforming use for reasons ranging from providing a critical product to not discouraging desired improvements on existing facilities. Stakeholder group comments from environmental and public health organizations generally supported restricting expansion of existing terminals, while some participants cautioned about political and legal tradeoffs of making the existing fuel terminals non-conforming.

6. Zoning code changes

This section of the report specifies the draft code language, along with code commentary pages that clarify expected implementation. The section is formatted to facilitate readability, showing proposed code changes on the right-hand pages and related code commentary on the facing left-hand pages.

33.910.030 Definitions

The definition of fossil fuels was added to clarify the land use category Bulk Fossil Fuel Terminals.

Petrochemicals that are used primarily for non-fuel products are excluded, such as plastics, lubricants, fertilizer, roofing, and paints. However, methanol is an exception that is included as a fossil fuel, because large methanol storage and distribution facilities tend to have structural similarities to liquid natural gas (LNG) and liquid petroleum gas (LPG) terminals, including large-scale storage and gas pipeline access, and because they can have similar safety and climate impacts.

Fuels containing 5% or less fossil-fuel volume are not considered fossil fuels under this definition. For example, "pure" ethanol made from corn or other non-fossil source is required by the Alcohol and Tobacco Tax and Trade Bureau to be denatured in order to be transported to the site. Denatured ethanol typically contains up to 5% methanol, so that it is toxic and undrinkable.

Some fossil fuels under this definition are also classified as "renewable fuels" in the federal Renewable Fuel Standard and "clean fuels" in Oregon's Clean Fuel Standard, such as liquid natural gas and liquid propane gas. These federal and state standards require transportation fuel sold within their jurisdiction to contain a minimum volume of renewable or clean fuels.

33.910.030 Definitions

The definition of words with specific meaning in the zoning code are as follows:

Fossil Fuel. Fossil fuels are petroleum products (such as crude oil and gasoline), coal, and gaseous fuels (such as natural gas, methanol, and propane) that are made from decayed plants and animals that lived millions of years ago and are used as a source of energy. Denatured ethanol and similar fuel additives and biodiesel/renewable diesel with less than 5% fossil fuel content are not fossil fuels.

Commentary

33.920.300 Bulk Fossil Fuel Terminal

Bulk Fossil Fuel Terminals are added as a new land use category to regulate their development in the Zoning Code. Regulation of Bulk Fossil Fuel Terminals implements policy direction in City of Portland Resolution 37168 (adopted November 2015) and 2035 Comprehensive Plan Policy 6.48 (adopted June 2016, expected to take effect in 2018), both of which address fossil fuel distribution and storage facilities.

Bulk Fossil Fuel Terminals are characterized by having (1) marine, pipeline or railroad transport access and (2) either trans-loading facilities for transferring a shipment between transport modes (such as from rail to ship) or bulk storage facilities exceeding 5 million gallons (or equivalent) of fossil fuels. Functionally, these terminals tend to be regional gateway facilities, where fossil fuels enter and exit the region. Additionally, Policy 6.48 calls for limiting fossil fuel distribution and storage facilities to those necessary to serve the regional market. However, the use classification is intended to be clearly identifiable by physical characteristics and not rely on a definition of region.

The regional market area of Bulk Fossil Fuel Terminals varies by product and is difficult to define. Portland's 10 petroleum terminals generally serve Oregon and Southern Washington. This market area substantially exceeds the Portland metropolitan area, which is often colloquially referred to as the region. Some terminal representatives pointed out that the federal government's 5-state West Coast PADD 5 region is generally their regional market area.

Resolution 37168 lists a specific exception to not restrict service directly to end users. At a small scale, services to end users include retail gasoline filling stations, natural gas access lines in street right-of-way to residential and business customers, and heating oil tanks at home sites. Larger scale end users with fossil fuel storage and access infrastructure also include manufacturers, jet fuel facilities at the PDX Airport, vessel fuel facilities on Portland Harbor, and others, where fossil fuels are used as an input.

Industrial Use Categories

33.920.300 Bulk Fossil Fuel Terminal

A. **Characteristics.** Bulk Fossil Fuel Terminals are establishments primarily engaged in the transport and bulk storage of fossil fuels. Terminal activities may also include fuel blending, regional distribution, and wholesaling. The firms rely on access by marine, railroad or regional pipeline to transport fuels to or from the site, and either have transloading facilities for transferring a shipment between transport modes, or have storage capacity exceeding 5 million gallons (or equivalent volume) of fossil fuels. There is minimal on-site sales activity with the customer present.

B. **Accessory uses.** Accessory uses may include retail sales of petroleum products, offices, food membership distribution, parking, storage, truck fleet parking and maintenance areas, rail spur or lead lines, and docks.

C. **Examples.** Examples include crude oil terminals, petroleum products terminals, natural gas terminals, propane terminals, and coal terminals.

D. **Exceptions.**

1. Truck or marine freight terminals that do not store, transport or distribute fossil fuels are classified as Warehouse and Freight Movement uses.
2. Truck or marine freight terminals that do not have transloading facilities and have storage capacity of less than 5 million gallons are classified as Warehouse and Freight Movement uses.
3. Gasoline stations and other retail sales of fossil fuels are not Bulk Fossil Fuel Terminals.
4. Distributors and wholesalers that receive and deliver fossil fuels exclusively by truck are classified as Warehouse and Freight Movement uses.
5. Industrial, commercial, institutional, and agricultural firms that exclusively store fossil fuels for use as an input are not Bulk Fossil Fuel Terminals.
6. Uses that involve the transfer or storage of solid or liquid wastes are classified as Waste-Related uses.
7. The storage of fossil fuels for exclusive use at an airport, surface passenger terminal, marine, truck or air freight terminal, rail yard, or as part of a fleet vehicle servicing facility are accessory to their use.
8. Uses that recover or reprocess used petroleum products are not Bulk Fossil Fuel Terminals.

33.920.310~~300~~ Industrial Service

33.920.320~~310~~ Manufacturing And Production

33.920.330~~320~~ Railroad Yards

Commentary

33.920.340~~330~~ Warehouse And Freight Movement

A. **Characteristics.** Warehouse And Freight Movement firms are involved in the storage, or movement of goods for themselves or other firms. Goods are generally delivered to other firms or the final consumer, except for some will-call pickups. There is little on-site sales activity with the customer present.

B. **Accessory uses.** Accessory uses may include offices, food membership distribution, truck fleet parking and maintenance areas, rail spur or lead lines, docks, and repackaging of goods.

C. **Examples.** Examples include separate warehouses used by retail stores such as furniture and appliance stores; household moving and general freight storage; cold storage plants, including frozen food lockers; storage of weapons and ammunition; major wholesale distribution centers; truck, marine, or air freight terminals; bus barns and light rail barns; parcel services; major post offices; grain terminals; and the stockpiling of sand, gravel, or other aggregate materials.

D. **Exceptions.**

1. Uses that involve the transfer or storage of solid or liquid wastes are classified as Waste-Related uses.

2. Miniwarehouses are classified as Self-Service Storage uses.

3. Establishments that engage in the transfer or storage of fossil fuels, rely on access by marine, railroad or regional pipeline to transport fuels to or from the site, and either have transloading facilities or have storage capacity exceeding 5 million gallons of fossil fuels are classified as Bulk Fossil Fuel Terminal use.

33.920.350~~340~~ Waste-Related

33.920.360~~350~~ Wholesale Sales

A. **Characteristics.** Wholesale Sales firms are involved in the sale, lease, or rent of products primarily intended for industrial, institutional, or commercial businesses. The uses emphasize on-site sales or order taking and often include display areas. Businesses may or may not be open to the general public, but sales to the general public are limited as a result of the way in which the firm operates. Products may be picked up on site or delivered to the customer.

B. **Accessory uses.** Accessory uses may include offices, food membership distribution, product repair, warehouses, parking, minor fabrication services, and repackaging of goods.

C. **Examples.** Examples include sale or rental of machinery, equipment, heavy trucks, building materials, special trade tools, welding supplies, machine parts, electrical supplies, janitorial supplies, restaurant equipment, and store fixtures; mail order houses; and wholesalers of food, clothing, auto parts, building hardware, and office supplies.

Commentary

D. Exceptions.

1. Firms that engage primarily in sales to the general public are classified as Retail Sales And Service.
2. Firms that engage in sales on a membership basis are classified as either Retail Sales And Service or Wholesale Sales, based on a consideration of the characteristics of the use.
3. Firms that are primarily storing goods with little on-site business activity are classified as Warehouse And Freight Movement.
4. Establishments that engage in the regional wholesaling of fossil fuels, rely on access by marine, railroad or regional pipeline to transport fuels to or from the site, and either have transloading facilities or have storage capacity exceeding 5 million gallons of fossil fuels are classified as Bulk Fossil Fuel Terminal uses.

7. Other implementation recommendations

This section of the report recommends future implementation directions for building code amendments to address seismic resilience and periodic monitoring for code effectiveness.

Seismic resilience

Considering setting direction to implement this future action within the adopting ordinance:

- Portland Bureau of Emergency Management and Portland Office of Government Relations are directed to develop building code changes to improve seismic resilience and require seismic upgrades comparable to proposed requirements on unreinforced masonry buildings.

Seismic resilience is one of the underlying rationales for fossil fuel distribution policies and the proposed code amendments. Seismic safety requirements of land development is addressed in building codes, which are adopted and amended at the state level.

Monitoring for code effectiveness

Considering setting direction to implement this future action within the adopting ordinance:

- Portland Bureau of Planning and Sustainability is directed to periodically monitor the effectiveness of the proposed zoning code amendments to implement underlying policies and consider code adjustments in response to regional fuel demand and market changes, product innovation, safety and climate considerations, and related regulatory changes.

A monitoring and adaptation approach would provide for ongoing code effectiveness within a context of changing energy markets, products, and associate regulations.

Appendix A: Stakeholder focus group results

Public involvement in the concept development for the Fossil Fuel Terminal Zoning Project consisted primarily of four stakeholder focus groups as well as meetings with fuel terminals and other individuals or organizations. The focus groups were held in June 2016. The purpose of the focus groups was to help identify and understand the issues that should help shape the preliminary zoning code being considered by this project. The focus groups also helped to expeditiously reach out to a broad range of stakeholders. While their perspectives and interests are shared on some topics, they diverge on other topics.

In addition to the stakeholder focus groups, BPS staff met with several fuel terminals to explain the proposal, answer questions, and discuss their individual concerns. This was needed because antitrust regulations constrained discussion about certain topics, for example supply chains, in the presence of representatives from other fuel terminals. Primarily, the terminal operators explained their operations and facilities, many of which differed substantially from other terminals.

Who participated?

Figure 9 lists the participants of the four focus groups conducted. Ten to twelve participants were invited to each meeting, although not everyone was able to attend. The first focus group consisted of fuel terminal representatives who have a direct stake in the proposed regulations. The second group was environmental and public health organizations, some of whom advocated for the resolution before City Council and have community safety and sustainability in mind. The third group were state and regional business and government organizations. Their interest was to protect the state economy by testing the proposal against economic realities. The fourth group was neighborhood and equity community organizations whose interests were to protect neighborhoods adjacent to the terminals and underserved communities who may rely on terminals for employment. Additionally, the Mayor's Office invited input from Native communities and tribal governments.

Preliminary code concepts discussed

- Identify "bulk fossil fuel terminals" as a regulated land use, characterized by inter-regional transport access and larger storage facilities.
- Either prohibit new terminals or set storage capacity limits high enough to accommodate regional growth.
- Allow existing terminals to expand for seismic upgrades, access to greener fuels and capacity for regional growth.

What discussion questions were asked?

The focus groups were provided background materials describing the preliminary code change concepts about two weeks before the focus group meetings. BPS staffed prompted the focus group across four topics:

Figure 9. Stakeholder Focus Group Participants, June 2016

STAKEHOLDER	DATE	ATTENDEES
Fuel terminal representatives	Thursday, June 02, 2016	Gilbert Betancourt, Phillips 66 Nick Giotta, Phillips 66 Stephanie Williams, Phillip 66 Andrew Holbrook, Kinder Morgan Shanna Brownstein, Northwest Natural Kevin Jones, McCall Oil Pamela Brady, BP West Coast Jerry Henderson, Chevron Kevin Buffum, Pacific Terminal Services Steve Kober, NuStar Will Rassmussen, WSPA Frank Holmes, WSPA Chris West, Pac/West and Arc Terminals Nathan Eggers, Arc Terminals Jerome Jackson, NuStar Rob Hill, NuStar
Environmental and health organizations	Tuesday, June 07, 2016	Zach Klonoski, Mayor's Office Regna Merritt, Ore. Physicians for Social Responsibility Trish Weber, Center for Sustainable Economy Meredith Connolly, Climate Solutions Kristen Sheeran, Climate Solutions Nick Caleb, 350PDX/CSE Bob Salinger, Audubon Society Dan Serren, Columbia Riverkeeper Adriana Voss-Andreae, 350PDX Micah Meskel, Portland Audobon
State and regional business organizations	Thursday, June 09, 2016	Jana Jarvis, Oregon Trucking Association Greg Theisen, Port of Portland Ellen Wax, Working Waterfront Jay Clemens, Associated Oregon Industries Mark Landauer, Oregon Public Ports Association Marion Haynes, Portland Business Alliance Corky Collier, Columbia Corridor Association Kelly Ross, NAIOP Shanna Brownstein, Northwest Natural Emerald Bogue, Port of Portland Susan Lahsene, Port of Portland Phil Grillo, Davis Wright Tremaine
Neighborhood and equity organizations	Tuesday, June 14, 2016	Jeff Geisler, Hayden Island Neighborhood Association John Bradley, Northwest District Association Travis Argue, UA Local 290 Willy Myers, Columbia Pacific Building Trades

1. Issues that should shape the project
2. Types of distribution and storage facilities to be regulated
3. Definition of fossil fuels
4. Zoning approach for limiting new storage facilities

In addition to specific questions within each topic, participants were invited to share any general and wrap-up comments during the focus group.

What we heard

For each topic area, the results of the focus groups are summarized in Figure 4 of Section 3. That table summarizes the main themes and concerns raised during the focus groups.

Key issues

Fuel terminal representatives objected to this policy direction in general. They discussed their safe operating history and commitment to implement the federal and state standards for renewable and clean fuels. There were challenges to participating in the conversation, but they agreed to work cooperatively on this project to get the code right. For example, anti-trust laws precluded the group from engaging in certain conversations because it would involve disclosing information about their supply chains and could be considered collusion in court of law. This group was concerned with the fast timeline and felt the policies should be discussed first.

They also felt the process was emotionally driven, not having considered the unintended consequences. For example, with renewable and clean fuel standards constantly in flux, they felt that zoning rules could make it more difficult to meet these standards. Restricting growth here in Portland at the end of the Olympic Pipeline could put more trucks on the road, instead of more efficient pipeline or rail transportation. The group asserted that there could also be significant economic impacts on the rest of the state, given that 95% of Oregon's fuel passes through Portland first. Lastly, fuel terminal representatives expressed concern for additional administrative burdens that a new land use category would bring. For example, what steps would be necessary for these firms to demonstrate that they were existing operations prior to the new zoning rules? Additionally, they warned that their site configuration may pose a challenge to effective zoning rules, as they are often non-contiguous operations connected by interconnected pipelines.

Environmental and public health organizations felt the policy direction was less aggressive toward fossil fuels than what the City Council resolution had proclaimed. They felt the resolution sought to outright prohibit new development and expansion on existing facilities. Because of this, they cautioned about community backlash if this proposal did not meet expectations. In this vein, they highlighted that Portland will be the first city to fully implement this type of policy, so the project could be an opportunity to set a strong precedent and model code for other cities. This group also felt that resident health and safety was also a top priority. They noted the seismic risks posed by fuel terminal tank farms that lie on liquefaction zones as well as the June 2016 oil train wreck in Mosier. For these reasons, they felt Portland Bureau of Emergency Management (PBEM) and other environmental justice groups should be involved in safety considerations. Lastly, the group felt the economic impact statement should include more than the impact on jobs. It should also consider the risks of economic and financial damages from a natural disaster. Members of this focus group offered to provide technical analysis on the impacts that the proposed options could have on the environment and public health and safety.

Some noted that risks should be accounted for through bonding or insurance requirements under worst-case scenarios.

State and regional business organizations felt that this undertaking requires more research. The resolution set required tasks, including an economic impact analysis and an examination of relevant laws, and they felt these tasks should be completed before laying the groundwork through code development. They felt the marine cargo forecast for liquid bulks of 1% growth is outdated and too low. (Note, an opposite reaction was expressed by environmental and health organization representatives who felt this figure was too high.) Similarly, they feared that the code may not hold up well in five years because of constantly changing energy markets. For example, in five years Portland could be shipping cleaner fuels to the Midwest. Some members expressed concern that the zoning code may not be the right tool to achieve some of the GHG (greenhouse gas) reduction and public safety goals that this resolution aimed to achieve. If the goal is public safety, then the City should require or create incentives for seismic upgrades. They stated that, if the goal is to reduce greenhouse gases, then prohibiting the export of cleaner-burning fuels, such as LNG (liquefied natural gas), may have the opposite intended effect. Lastly, the group asserted the important role that Portland's fuel terminal facilities play in rest of the state economy. They warned of political and economic repercussions that these decisions could have. They shared the view with fuel terminal representatives that this is a big political decision—the timeline is too short and the process should not be rushed.

Neighborhood and equity community organizations communicated that safety, pollution and accidental releases were their top priority when considering zoning for fuel terminals. They wanted a close examination of the seismic and explosion risks associated with fuel terminals. For example, which terminals are in liquefaction zones? Where are the storage tanks located in relation to neighborhoods? They sought honesty about the risks posed to the Linnton neighborhood specifically. Rail safety in the Columbia Gorge was also a key issue. The June 2016 incident in Mosier highlighted the risks. A potential solution they offered would be more pipelines, but they are difficult to get built. This group recognized the difficulty in managing competing values. They felt a reasonable expectation of growth is a smart idea. One participant described the proposal as aggressive, adding that by prohibiting LNG export terminals, global export destinations like China may end up burning dirtier fuels, such as coal. They felt this also meant Portland would forego export profits.

New land use category

Fuel terminal representatives were concerned for the clarity of the rules. They felt that the definition of "bulk terminal" is very important to be clear. If the definition was open to interpretation, then permit staff could be pressured. They warned that creating "bulk fuel terminal" as a specifically regulated use could lead to unpredictable results. This group was also concerned with the definition of "region." They were unsure if off-shore distribution was the issue, advocating for using the federally recognized West Coast region (PADD 5) as the definition of "regional market." PADD 5 includes Oregon, Washington, California, Nevada, Arizona, Alaska and Hawaii.

Environmental and public health organizations wanted to see the regulation go beyond new facilities and also look at limits on expansion at existing facilities. They felt the City Council resolution was clear and unambiguous about opposing expansion of fossil fuel infrastructure, which includes expansions at existing sites. They emphasized the importance for getting the right definition of "bulk terminal" and the associated size limit (or prohibition)—these must be correct in order to effectively implement the policy. Some members questioned whether seismic upgrades at existing facilities could be allowed but

expansions prohibited. This group also urged the inclusion of PBEM's work on hazards in liquefaction zones in this project.

State and regional business organizations echoed the concerns for clear and correct definitions that the fossil fuel representatives posed. "Region," "export," "end user," and "fossil fuel" are all important terms to get right. They also were strongly opposed to making existing facilities non-conforming uses, as well as making them limited uses with unclear exceptions. This would expose projects to discretionary land use actions, which is costly and unpredictable, and hence risky. It would likely make improvements that the community values, such as seismic upgrades, more difficult to attain.

Neighborhood and equity community organizations were skeptical that a new export terminal would be proposed in the Portland area in the wake of Pembina. They felt that Superfund sites were too expensive to acquire and build on. The group also wondered whether a new zone for fossil fuels ought to be created instead of a land use. They questioned why it ought to be allowed in IG2.

Definition of fossil fuels

Fuel terminal representatives were primarily concerned with the long-term applicability of the proposed rules. Energy markets and new technologies are constantly in flux, and it is difficult to know what the size requirements might be for newer—perhaps cleaner—fuels, particularly blended fuels. This group sought clarification for what "green fuels" meant. They noted that the proposed inclusion of LNG among city-regulated fossil fuels is inconsistent with the State of Oregon's inclusion of LNG as a "clean fuel." They called for periodic review of the rules when tomorrow's cleaner fuels become known, as they may not meet today's definitions. They cautioned about unintended consequences of placing restrictions on fossil fuel terminals, such as potentially putting more trucks on the road by restricting growth at facilities with pipeline, marine and rail access. This may result in considerably more GHG emissions. They also felt that methanol should not be included in the list of regulated fuels because it is used more as a value-added commodity than a fuel. They shared this last viewpoint with most other focus groups, except the environmental and health organizations.

Environmental and public health organizations looked to the intent of the City Council resolution and noted that it included propane, methanol, natural gas and other low-carbon fuels. At the same time, they agreed that code changes should provide flexibility to meet Oregon's low carbon fuel standard. They noted that methanol is currently being used as a fuel, so excluding it undermines the policy. The group sought clarification on how to address non-fuels. Some suggested that the GHG emissions of these input commodities should help ground their use. Others thought that the proportions (e.g., in blended fuels) should be considered—if the product is mostly used as a fossil fuel, then it should be regulated and restricted. Lastly, they highlighted how even one new LNG tank in Portland is a major safety issue. Although not explosive, coal also poses a significant risk, especially in transportation. Because of these risks, they believed that the resolution should be implemented through health and safety standards.

State and regional business organizations expressed frustration that while the federal and state government are going one direction requiring cleaner-burning fuels, the City of Portland appears to be choosing to restrict distribution of these cleaner fuels in another policy direction. Some members thought the City could try to incentivize a higher blend of renewables, and others warned of the disincentives that could discourage investment—disincentives should limit GHG emissions, not seismic upgrades.

Neighborhood and equity community organizations thought that restricting methanol exports would be an overreach. They said it is not being used as a fuel in the United States, and instead it is a value-added product used in manufacturing of plastics and other goods. Including methanol would negatively impact the manufacturing sector that requires it as an input, and it could open the door to regulating other non-fuel commodities, such as paints and asphalt. In general, they felt that if we can make certain fuels cleaner burning, then it poses minimal threat. They asserted that, since there is no clear transitional path away from our dependency on fossil fuels, we should make way for cleaner alternatives, such as blended bio-diesel.

Terminal development restrictions

Fuel terminal representatives were concerned with potential restrictions precluding development on certain site configurations, which have some peculiarities. For example, where two existing tank farms are non-contiguous (e.g., at Willbridge) and are connected by facility pipelines, they should be allowed an option for expansion. Additionally, some sites may already be built out and cannot accommodate the new growth that is expected. This group could not comment on facility size and anticipated growth, because of anti-trust laws, but they noted that it is critically important. For this reason, they could not provide feedback on the implementation options presented.

Environmental and public health organizations generally preferred Option A. However, some recognized the legal challenges posed by federal restrictions. They wondered if health and human safety risks may provide a defensible rationale. Some members also noted that while prohibiting all new facilities and making existing facilities non-conforming uses might be more legally defensible, it is much less politically feasible. Finally, some members of this group were skeptical of the 1% annual growth forecast for liquid bulks. They felt this was too high, which is contrary to what the state and regional business organization representatives stated.

State and regional business organizations criticized the approach to implementing the City Council resolution. They felt that zoning to regulate tank size approaches the problem sideways, and the unclear rationale could lead to appeals and legal challenges. One participant advocated to prohibit exports more directly, rather than a sideways approach. They cautioned that tank size limits could essentially put the region on an "import diet," even if the intent of the limit is to reduce throughput. They did not think this proposal accounted for these unintended impacts. Docked ships in the harbor may need an LNG tank to power their facilities and improve air quality, for example. They also noted that there are economic advantages and efficiency gains to being a bigger facility, and placing restrictions on size will have consequences that we don't want—lower wages for example. Lastly, they felt the 1% annual growth forecast for liquid bulks was outdated—an updated forecast would be higher. This was the opposite of what environmental and public health organizations stated.

Neighborhood and equity community organizations generally preferred Option C, calling it a realistic proposal that allows for some growth but doesn't restrict it too much. While the group was fairly resolute that coal is not a good alternative, they recognized that LNG is a cleaner-burning fuel. However, since the facilities in the region are already at capacity, Option C would allow for some wiggle room for the region's growth. They felt it would allow the "invisible hand" to guide the market more easily. They recommended that the City review the size limits every few years as the market changes.

DLCD FORM 1

NOTICE OF A PROPOSED CHANGE TO A COMPREHENSIVE PLAN OR LAND USE REGULATION

FOR DLCD USE
File No.:
Received:

Local governments are required to send notice of a proposed change to a comprehensive plan or land use regulation **at least 35 days before the first evidentiary hearing**. (*See* OAR 660-018-0020 for a post-acknowledgment plan amendment and OAR 660-025-0080 for a periodic review task). The rules require that the notice include a completed copy of this form.

Jurisdiction: **City of Portland**

Local file no.: **Fossil Fuel Terminal Zoning Amendments**

Please check the type of change that best describes the proposal:

☐ **Urban growth boundary (UGB) amendment** including more than 50 acres, by a city with a population greater than 2,500 within the UGB

☐ **UGB amendment** over 100 acres by a metropolitan service district

☐ **Urban reserve designation,** or amendment including over 50 acres, by a city with a population greater than 2,500 within the UGB

☐ **Periodic review task** – Task no.:

☒ **Any other change** to a comp plan or land use regulation (*e.g.*, a post-acknowledgement plan amendment)

Local contact person (name and title): Tom Armstrong
Phone: 503-823-3527 E-mail: tom.armstrong@portlandoregon.gov
Street address: 1900 SW 4th Ave., Ste. 7100 City: Portland, OR Zip: 97201-

Briefly summarize the proposal in plain language. Please identify all chapters of the plan or code proposed for amendment (maximum 500 characters):

This code change project would implement new policy direction in City Resolution 37168 on fossil fuel distribution and storage, consistent with City and State objectives on climate change and public safety. Draft code changes would prohibit Bulk Fossil Fuel Terminals in all base zones, and existing terminals would become legal, non-conforming uses. Zoning Code Sections that would be amended include 100, 110, 120, 130, and 140 on base zones (allowed uses) and 910 and 920 on general terms.

Date of first evidentiary hearing: 09/13/2016
Date of final hearing: 2016

☐ This is a revision to a previously submitted notice. Date of previous submittal:

Check all that apply:

☐ Comprehensive Plan text amendment(s)

☐ Comprehensive Plan map amendment(s) – Change from to
Change from to

☒ New or amended land use regulation

☐ Zoning map amendment(s) – Change from to
Change from to

☐ An exception to a statewide planning goal is proposed – goal(s) subject to exception:

☐ Acres affected by map amendment:

Location of property, if applicable (site address and T, R, Sec., TL):

List affected state or federal agencies, local governments and special districts: ODEQ, ODOT, DOGAMI, ODOE, Business Oregon, Oregon Building Codes Division, USEPA, USDOT, USDOE, Metro, Port of Portland

NOTICE OF A PROPOSED CHANGE – SUBMITTAL INSTRUCTIONS

1. Except under certain circumstances,[1] proposed amendments must be submitted to DLCD's Salem office at least 35 days before the first evidentiary hearing on the proposal. The 35 days begins the day of the postmark if mailed, or, if submitted by means other than US Postal Service, on the day DLCD receives the proposal in its Salem office. **DLCD will not confirm receipt of a Notice of a Proposed Change unless requested.**

2. A Notice of a Proposed Change must be submitted by a local government (city, county, or metropolitan service district). DLCD will not accept a Notice of a Proposed Change submitted by an individual or private firm or organization.

3. **Hard-copy submittal:** When submitting a Notice of a Proposed Change on paper, via the US Postal Service or hand-delivery, print a completed copy of this Form 1 on light green paper if available. Submit **one copy** of the proposed change, including this form and other required materials to:

Attention: Plan Amendment Specialist
Dept. of Land Conservation and Development
635 Capitol Street NE, Suite 150
Salem, OR 97301-2540

This form is available here:
http://www.oregon.gov/LCD/forms.shtml

4. **Electronic submittals** of up to 20MB may be sent via e-mail. Address e-mails to plan.amendments@state.or.us with the subject line "Notice of Proposed Amendment."

Submittals may also be uploaded to DLCD's FTP site at
http://www.oregon.gov/LCD/Pages/papa_submittal.aspx.

E-mails with attachments that exceed 20MB will not be received, and therefore FTP must be used for these electronic submittals. **The FTP site must be used for all .zip files** regardless of size. The maximum file size for uploading via FTP is 150MB.

Include this Form 1 as the first pages of a combined file or as a separate file.

5. **File format:** When submitting a Notice of a Proposed Change via e-mail or FTP, or on a digital disc, attach all materials in one of the following formats: Adobe .pdf (preferred); Microsoft Office (for example, Word .doc or docx or Excel .xls or xlsx); or ESRI .mxd, .gdb, or .mpk. For other file formats, please contact the plan amendment specialist at 503-934-0017 or plan.amendments@state.or.us.

6. **Text:** Submittal of a Notice of a Proposed Change for a comprehensive plan or land use regulation text amendment must include the text of the amendment and any other information necessary to advise DLCD of the effect of the proposal. "Text" means the specific language proposed to be amended, added to, or deleted from the currently acknowledged plan or land use regulation. A general description of the proposal is not adequate. The notice may be deemed incomplete without this documentation.

7. **Staff report:** Attach any staff report on the proposed change or information that describes when the staff report will be available and how a copy may be obtained.

8. **Local hearing notice:** Attach the notice or a draft of the notice required under ORS 197.763 regarding a quasi-judicial land use hearing, if applicable.

9. **Maps:** Submittal of a proposed map amendment must include a map of the affected area showing existing and proposed plan and zone designations. A paper map must be legible if printed on 8½" x 11" paper. Include text regarding background, justification for the change, and the application if there was one accepted by the local government. A map by itself is not a complete notice.

10. **Goal exceptions:** Submittal of proposed amendments that involve a goal exception must include the proposed language of the exception.

[1] 660-018-0022 provides:
(1) When a local government determines that no goals, commission rules, or land use statutes apply to a particular proposed change, the notice of a proposed change is not required [a notice of adoption is still required, however]; and
(2) If a local government determines that emergency circumstances beyond the control of the local government require expedited review such that the local government cannot submit the proposed change consistent with the 35-day deadline, the local government may submit the proposed change to the department as soon as practicable. The submittal must include a description of the emergency circumstances.

If you have any questions or would like assistance, please contact your DLCD regional representative or the DLCD Salem office at 503-934-0017 or e-mail plan.amendments@state.or.us.

Notice checklist. Include all that apply:

☒ Completed Form 1

☒ The text of the amendment (e.g., plan or code text changes, exception findings, justification for change)

☒ Any staff report on the proposed change or information that describes when the staff report will be available and how a copy may be obtained

☐ A map of the affected area showing existing and proposed plan and zone designations

☒ A copy of the notice or a draft of the notice regarding a quasi-judicial land use hearing, if applicable

☐ Any other information necessary to advise DLCD of the effect of the proposal

RESOLUTION No. 37168 As Amended

Oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways (Resolution)

WHEREAS, the rapid development of fossil fuel resources in the western U.S. and Canada has resulted in numerous facility and infrastructure projects proposed to transport coal, diluted bitumen, natural gas, propane or other fossil fuels through the West Coast; and

WHEREAS, fossil fuels pose risks to safety, health, and livability, including mobility of people, other freight, and other commercial vehicles; and

WHEREAS, fossil fuel infrastructure poses considerable risks in the event of a major earthquake; and

WHEREAS, the extraction and combustion of fossil fuels are significant sources of greenhouse gas emissions and major contributors to climate change and pollution; and

WHEREAS, coal contains toxic heavy metals, including mercury, arsenic and lead, and exposure to these toxic heavy metals is linked to cancer, birth defects and other health problems; and

WHEREAS, transportation of coal using open top rail cars results in significant volumes of materials escaping during transit, exposing communities to toxic heavy metals in coal dust and particulates at levels potentially harmful to adjacent communities, workers, wildlife and nature; and

WHEREAS, crude oil, including oil derived from the Bakken shale reservoir, is known to be volatile, highly flammable and to contain elevated levels of benzene, a potent carcinogen; and

WHEREAS, extraction of fossil fuels through fracking and tar sands processing, which has become widespread throughout the Western United States and Canada, has damaging impacts to human and environmental health and fracking increases the potential for earthquakes; and

WHEREAS, transporting crude oil, coal and other fossil fuels into Oregon involves traversing challenging mountain passes, areas laced with significant earthquake faults and numerous older unsafe bridges lacking appropriate infrastructure maintenance or upgrades, significantly increasing the risks of serious accidents; and

WHEREAS, given the record of crude oil and coal or other fossil fuel transport accidents, such as Lac Mégantic in 2013, the 1999 Bellingham pipeline leak or a coal train derailment, an event could have catastrophic effects if it occurred in any of Oregon's populated areas; and

WHEREAS, the risks posed by the transportation of fossil fuels through the Columbia Gorge are inconsistent with the Gorge's designation as a National Scenic Area; and

WHEREAS, historically, when environmental accidents do occur, litigation over damages is drawn out over years, deflecting blame while undercutting timely assistance to affected communities; and

WHEREAS, tribal communities in Oregon and Washington have expressed concerns about the safety risks of fossil fuel infrastructure and the related threats to human health, cultural heritage, and environmental quality; and

WHEREAS, economic opportunities presented by expanding fossil fuel infrastructure are modest, with few jobs and little value added when compared to the related environmental costs; and

WHEREAS, local, regional and global economies are transitioning to low-carbon energy sources, and West Coast businesses are leaders in providing energy efficiency and renewable energy technologies and services; and

WHEREAS, the future of the fossil fuel industry is questionable given global action to reduce greenhouse gas emissions; and

WHEREAS, climate change, if unchecked, will continue impact human health, natural systems, and infrastructure, creating new costs for individuals, businesses, and governments; and

WHEREAS, the City's *2015 Climate Action Plan* (adopted by Resolution 37135) identifies the need to establish a "fossil fuel export policy that considers lifecycle emissions, safety, economics, neighborhood livability and environmental impacts" (*Climate Action Plan*, action 3G, page 69); and

WHEREAS, the City and Multnomah County, working together with many individuals, and community and business partners, have reduced local carbon emissions 14 percent since 1990 while adding population and jobs; on a per person basis, carbon emissions have decreased 35 percent since 1990; and

WHEREAS, the *2015 Climate Action Plan* commits the City to continue to advance policy and programs to reduce local fossil fuel use both in the City's own operations and through community-wide initiatives; and

WHEREAS, in September 2015, the Council added fossil fuel companies to the City's Corporate Securities Do-Not-Buy List, committing the City to hold no financial stake in the 200 largest fossil fuel firms. Resolution 37153; and

WHEREAS, 27 Oregon and Washington communities have passed resolutions addressing fossil fuel transport and export, and hundreds of public officials, including the governors of Oregon and Washington, state and federal agencies, tribes, health organizations, religious leaders and other community leaders, have recognized the harms presented by fossil fuels to the environment and Northwest communities; and

WHEREAS, in 2012, the Council expressed opposition to coal trains traveling through Portland until a programmatic, comprehensive and area-wide Environmental Impact Statement and comprehensive Health Impact Assessment are completed. Resolutions 36959 and 36962; and

WHEREAS, the City is continuing to work with utilities to reduce coal and other fossil fuels in Portland's electricity supply;

NOW, THEREFORE, BE IT RESOLVED, that the City Council will actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways; and

BE IT FURTHER RESOLVED, that this Resolution does not restrict:

1. improvements in the safety, or efficiency, seismic resilience, or operations of existing infrastructure;
2. the provision of service directly to end users;
3. development of emergency backup capacity;
4. infrastructure that enables recovery or re-processing of used petroleum products; or
5. infrastructure that will accelerate the transition to non-fossil fuel energy sources; and

BE IT FURTHER RESOLVED, that City bureaus are directed to examine existing laws, including those related to public health, safety, building, electrical, nuisance, and fire codes, and develop recommendations to address fossil fuels that strengthen public health and safety; and

BE IT FURTHER RESOLVED, that the Bureau of Planning and Sustainability is directed to develop proposed code changes for Council consideration to advance the policies set forth in this Resolution; and

BE IT FURTHER RESOLVED, that prior to any further Council action, the mayor shall schedule (1) a work session to review any proposed code changes and (2) an executive session to review the legal considerations of any proposed code changes; and

BE IT FURTHER RESOLVED, that the Bureau of Planning & Sustainability shall undertake an analysis of the economic impacts of any proposed Code changes to advance the policies set forth in this resolution, with a particular focus on potential impacts to local blue-collar jobs; and

BE IT FURTHER RESOLVED, that the City and applicable bureaus shall seek and identify opportunities to invest in Portland's 'human infrastructure' by supporting programs to retrain our workforce as the city transitions to a clean energy economy; and

BE IT FURTHER RESOLVED, that the City shall consult with its Tribal Government Partners, the State of Oregon, local governments, and other key stakeholder including labor, business, environment, neighborhoods and communities of color in advancing this policy; and

BE IT FURTHER RESOLVED, notwithstanding anything in this resolution, the Council will exercise its duty as a quasi-judicial land use decision making body in an impartial manner consistent with City Code and Oregon law.

BE IT FURTHER RESOLVED, this resolution is binding City policy.

Adopted by the Council: NOV 12 2015

MEMO

DATE: December 17, 2018

TO: Portland City Council

FROM: Tom Armstrong, Supervising Planner

SUBJECT: Fossil Fuel Terminal Zoning Amendments – Technical Amendments

There three technical amendments proposed by BPS staff.

Amendment #1 – amend the ordinance as follows:

27. Ordinance No. 188142 was appealed to the Oregon Land Use Board of Appeals (LUBA). LUBA ~~issued a decision upholding two assignments of error~~ issued an order reversing the City's Ordinance in *Columbia Pacific Building Trades Council et al v. City of Portland*, LUBA Case No. 2017-001, July 19 2017).

NOW THEREFORE, The Council directs:

a. Adopt Exhibit A Findings of Fact Report (as amended) December 2019 as additional findings.
b. Amend Title 33, Planning and Zoning, as shown in Exhibit B, Fossil Fuel Terminal Zoning Amendments, Remand Report, dated ~~October 30~~ December 18, 2019.
c. Adopt the commentary in Exhibit B, Fossil Fuel Terminal Zoning Amendments, Remand Report, dated ~~October 30~~ December 18, 2019, as legislative intent and further findings.

Amendment #2 – Adopt Findings of Fact Report (as amended) December 2019

Adopt the revised Findings of Fact Report with findings that respond to the public testimony.

Amendment #3 – Adopt Remand Report (as amended) December 18, 2019

The Remand Report has been revised to respond to the public testimony.

IMPACT STATEMENT

Legislation title: *Readopt remanded Ordinance No. 188142 to restrict bulk fossil fuel terminals. (Ordinance; Amend Title 33, Planning and Zoning)

Contact name: Tom Armstrong, Bureau of Planning and Sustainability
Contact phone: 503-823-3527
Presenter name: Andrea Durbin and Tom Armstrong, Bureau of Planning and Sustainability

Purpose of proposed legislation and background information:
This ordinance is a reconsideration of Fossil Fuel Terminal Zoning amendments (Ordinance No. 188142) that were adopted in 2016. That ordinance was appealed to the Oregon Supreme Court and is now back before City Council. These code changes restrict development and expansion of Bulk Fossil Fuel Terminals.

- Bulk Fossil Fuel Terminals are characterized by (a) marine, railroad, or pipeline transport access and (b) either storage capacity exceeding 2 million gallons or transload facilities (such as rail-to-ship loading)
- Fossil fuels include petroleum products (such as crude oil and gasoline), coal, natural gas, and propane, and methanol, which is produced from natural gas.
- No new Bulk Fossil Fuel Terminals are allowed.

The existing Bulk Fossil Fuel Terminals in Industrial and General Employment zones become "limited uses" that can continue to operate. Expansion of fossil fuel storage at these existing terminals would be prohibited, with limited exceptions.

The code changes will not apply to gas stations; distributors and wholesalers that receive and deliver fossil fuels exclusively by truck; industrial, commercial, institutional, and agricultural uses that store fossil fuels for use as an input; uses that involve the transfer or storage of solid or liquid wastes are classified as Waste-Related uses. Fossil fuel storage facilities for airports, marine terminals, rail yards, and fleet vehicle fuel facilities are specifically exempted.

Previous Council Actions
- Resolutions 36959 and 36962 adopted in 2012, the Council expressed opposition to coal trains traveling through Portland until a programmatic, comprehensive and area-wide Environmental Impact Statement and comprehensive Health Impact Assessment are completed.
- Resolution 37168, adopted November 12, 2015, expressed the City Council's opposition to the "expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." It also expressed the Council's intent not to restrict improvements in safety, efficiency, or seismic resilience; the provision of service directly to end users; or infrastructure that will accelerate the transition to non-fossil fuel energy sources.

- The 2015 Climate Action Plan to advancing policy and programs to reduce local fossil fuel use both in the City's own operations and through community-wide initiatives.
- The 2035 Comprehensive Plan sets policy direction (Policies 4.75 and 4.76) to encourage disaster-resilient development and specifically to reduce natural hazard risks to critical energy and transportation infrastructure in Portland Harbor.
- The original version (Ordinance No. 188142) was adopted in 2016 and appealed to the Oregon Land Use Board of Appeals (LUBA), the Oregon Court of Appeals, and the Oregon Supreme Court. It has been remanded back to the City of Portland for reconsideration of policies and additional evidence.

Financial and budgetary impacts:

- There are no long-term financial impacts for the City (e.g. ongoing debt payments, purchase of property requiring operations and maintenance, ratification of labor contract, etc.)
- There are no budget impacts – the action does not amend the budget.
- The legislation does not authorize additional spending on a new or existing project or program.
- There is no expected change in current and future revenues.
- The legislation does not create, eliminate or re-classify positions now or in the future. This legislation will require staff time to defend an expected appeal of this ordinance and on-going monitoring of development permits associated with the existing fossil fuel terminals.
- The legislation does not result in a new or modified financial obligation or benefit, including IAs, IGAs, MOUs, grants, contracts or contract amendments.

Community impacts and community involvement:

These regulations apply to only one type of business that makes up a minority part of the businesses found in Portland's industrial districts. The remaining industrial uses continue to operate under the current development review standards. The FFTZ amendments support the retention of existing fossil fuel terminals by designating them as a limited use that allows the terminals to continue to operate and invest in upgrades and supports opportunities for growth through exceptions, such as aviation or renewable fuels. Further, the use limitations provide flexibility to FFTs to replace and reconfigure existing storage tank capacity, such as consolidating smaller tanks into larger tanks, to meet future needs.

Given that this ordinance is a reconsideration of a previously adopted ordinance, BPS relied upon the previous public testimony that informed that ordinance. This ordinance is substantially the same ordinance with a few minor adjustments to reconcile the code amendments with the current Zoning Code.

The community involvement process for the previous ordinance included stakeholder focus group meetings with terminal owners and business groups as well as environmental groups. The process also included extensive public testimony that informed the Planning and Sustainability Commission recommendation as well as the final adoption by the City Council.

100% Renewable Goal:

- This action does not affect the City's total energy use.
- This action supports the City's renewable energy use by allowing for additional storage tank capacity for renewable fuels at existing fossil fuel terminals.

CITY OF

PORTLAND, OREGON

OFFICIAL MINUTES

[Excerpt Council Meeting December 18-19, 2019. Item 1194]

A RECESSED MEETING OF THE COUNCIL OF THE CITY OF PORTLAND, OREGON WAS HELD THIS **18th DAY OF DECEMBER, 2019** AT 2:30 P.M.

THOSE PRESENT WERE: Mayor Wheeler, Presiding; Commissioners Eudaly, Fritz and Hardesty, 4.

OFFICERS IN ATTENDANCE: Karla Moore-Love, Clerk of the Council; Matt Farley, Senior Deputy City Attorney, and Lauren King, Deputy City Attorney, from 3:11 to 3:27 p.m.; and Daniel Sipe and Ian Williams, Sergeants at Arms.

1193	**TIME CERTAIN: 2:30 PM –** Amend Motor Vehicle Fuels Code to move authority to establish, revise as necessary and enforce standards for biofuels sold in the City to the Director of the Bureau of Planning and Sustainability (Ordinance introduced by Mayor Wheeler; amend Code Chapter 16.60) 30 minutes requested	**PASSED TO SECOND READING JANUARY 8, 2020 AT 9:30 AM**
***1194**	**TIME CERTAIN: 3:00 PM –** Readopt remanded Ordinance No. 188142 to restrict bulk fossil fuel terminals (Previous Agenda 1082; Ordinance introduced by Mayor Wheeler; amend Title 33, Planning and Zoning) 90 minutes requested **Motion to amend Finding 27 to correct a reference to LUBA decision, and change reference to Exhibits to reflect today's date and decision as amended in the following motions**: Moved by Eudaly and seconded by Fritz. (Y-4) **Motion to Adopt the revised Findings of Fact Report with findings that respond to the public testimony**: Moved by Eudaly and seconded by Fritz. (Y-3, N-1 Hardesty) **Motion to adopt Remand Report as amended December 18, 2019 to respond to the public testimony**: Moved by Eudaly and seconded by Fritz. (Y-3, N-1 Hardesty) **Motion to move the amendment fossil fuels terminal zoning amendments ordinance for a vote to approve**: Moved by Eudaly and seconded by Fritz. (Y-4)	**189807** **AS AMENDED**

At 4:04 p.m., Council recessed.

MARY HULL CABALLERO
Auditor of the City of Portland

18 DECEMBER 2019 2:30 PM

Item 1194
Wheeler: Colleagues, we're back today to continue our work on the fossil fuel terminal zoning amendments. To help reorient everyone where we are on the proposals, the intent of the fossil fuel terminal zoning amendments is to restrict new storage tank capacity for fossil fuels. This had originally come to the city council back in 2019 and upon legal review by the courts was remanded back to the city of Portland so we have now retooled it. We believe it will withstand even careful legal scrutiny. Voting on this is in line with our values as a city to do everything possible to protect the health and safety of our community from fossil fuel infrastructure expansion. As we work to reduce our dependence on fossil fuels the first step is to ensure that the situation doesn't get any worse. As you may recall we held a public hearing November 20th and we left the written record open until December 2nd. Today we'll be voting on the amendments to the fossil fuel terminal zoning ordinance, the findings and the staff report to reflect on that testimony. I note that a lot of the testimony we received mentioned the urgency with which we need to act to address this danger and to further the transition off fossil fuels which is why this item is presented as an emergency ordinance that will go into effect immediately upon passage. Tom Armstrong from bps will give us an overview of the ordinance amendments, but just briefly to remind you there are three amendments that we'll be voting on. The first is the fossil fuels terminal zoning amendments ordinance, the second is to vote on the amendments to the ordinance findings, the third to then vote on the amendments to exhibit b, the remand report, and then of course to vote on the main motion as amended. Tom, good afternoon. How are you today?
Tom Armstrong, Bureau of Planning and Sustainability: Doing well.
Wheeler: Excellent.
Armstrong: Happy to be here finally this afternoon. I'm Tom Armstrong from the bureau of planning and sustainability. As the mayor just described the first amendment is to amend the ordinance. There's really two types of changes, one of the findings we have modified or corrected the reference to the luba order that identified the remand issues that we needed to address. Then the second changes are to just correct the exhibits to refer to the exhibits that are in front of you today, so that we have the ordinance in alignment with all the other pieces.
Wheeler: All right. Very good. For each of these items staff will provide a very brief introduction followed by a motion, a second and then our votes. Does that make sense to everyone? Commissioner hardesty.
Hardesty: Thank you, mayor. Let me just say when I get this at council and I have only got a couple of page resolution ahead of time that causes me concern.
Wheeler: Tom, can you explain then what these documents are? These are the documents that reflected the hearings that we had last --
Armstrong: Yes. Sure. So I understand commissioner hardesty your concern about this. We have been trying to update this document since the record closed on December 2nd. So really the main, the thick document, exhibit a, are the findings of fact and that is where and this is sort of what the issue was in front of Luba. We have to go through and address

all of the policies in the comp plan and we had done that as part of the original finding and then once we have heard all of the testimony especially the written testimony that raised specific issues, legal issues with respect to the ordinance, we went back through these findings to specifically address and point to evidence in the record as to how the ordinance addresses those issues that have been raised.
Wheeler: Tom, can I try to put this in plain speak? Because my understanding of what this document is, this is our legal defense, correct?
Armstrong: Correct.
Wheeler: Because the last time it was remanded my recollection is the city was admonished for not reviewing the record fully including potential criticisms of the 2016 ordinance and tying it back to the ordinance. So, this is actually the painstaking work of going back through all of the individual testimony that council heard tying it back to the ordinance and responding to each and every criticism. Is that a fair interpretation of what this document is?
Armstrong: Yes, that is. It is and it shows how we considered that testimony and how we respond or refute much of that testimony with evidence in the report, in the record, the seismic safety studies, the fossil fuel consumption forecast that I presented at the hearing and all of that to document how we as the city and the council have considered those issues in adopting this.
Wheeler: This is not additional testimony.
Armstrong: Correct.
Wheeler: This is a statement about why we believe the ordinance is legally defensible given the criticism we all heard in the public testimony.
Armstrong: Correct.
Wheeler: Legal counsel, anything you want to add to that?
Lauren King, Senior Deputy City Attorney: I would just supplement to say that the findings were included in the initial filing. This is just an amendment to further reflect the testimony and respond to that testimony.
Wheeler: Thank you. Commissioner Fritz.
Fritz: Tom, did you present this at commissioners assistance on Monday or at execs last Friday?
Armstrong: I did not. I did send a copy of it yesterday when we finally finished our review and back and forth with the city attorney's office when it was complete.
Fritz: So, Derek in your office and Claire in mine, others at 1:00 yesterday afternoon got this.
Hardesty: Well, that's lovely. Neither of them have a vote on the counsel. So I'm happy they got it yesterday, and it would have been helpful had I had some information prior too. So it's nice that staff finally got it but again, when you're presenting something that thick and you actually -- it's an emergency you probably want to make sure that we have time to actually ask any questions that we may have.
Wheeler: Very good. All right, so the first item is the vote on the amendments to the fossil fuel terminal zoning amendments ordinance. Tom, could you briefly describe these amendments?
Armstrong: Yeah, as shown under amendment 1 on the memo, again there's two types of changes, the first is defining 27 that corrects the reference to the Luba decision and then there are, the second set of changes are to change the references to the exhibits to reflect today's date and today's decision as they will be amended in the next motions.
Wheeler: Very good. I'll entertain a motion to move the amendments to the ordinance for the vote to approve.
Eudaly: So moved.
Fritz: Second.

Wheeler: I have a motion from Commissioner Eudaly, a second from Commissioner Fritz. Any further discussion? Karla, can you please call the roll on that amendment, on those amendments.
Eudaly: So is this the one and only vote? Or are we doing multiple --
Wheeler: No, there are three –
Eudaly: Oh I see.
Wheeler: This is the first package.
Fritz: Just let us know when we're on the last one.
Armstrong: Yes.
Eudaly: Yes, Aye.
Fritz: Aye. **Hardesty:** Aye.
Wheeler: Aye. The amendment package passes. Our next item is to vote on the amendments to the ordinance findings. Tom, could you please describe those?
Armstrong: Yes, this is exhibit a, this is the thick document in your packet. And as I explained we received a number of substantial written testimony from the Portland business alliance, from zenith energy, from the western states petroleum association that raised a number of different legal issues that we needed to consider. This is the document that Luba refers to that shows, well, how did council consider those arguments? And what evidence in the record shows supports the decision that you're taking today? So we have amended and updated this exhibit a to reflect that testimony and to point to specific reports and evidence in the record to show that we have considered and incorporated that into this exhibit.
Eudaly: So moved.
Fritz: Second.
Hardesty: It's been moved and seconded.
Wheeler: Great. Call the roll.
Eudaly: Aye. **Fritz:** Aye. **Hardesty:** No.
Wheeler: Aye. The amendment passes. The next vote is on –
Armstrong: Exhibit b.
Wheeler: Thank you. I'm on the wrong page. The next vote is on amendments to exhibit b, the remand report. Tom, will you please describe these amendments.
Armstrong: Yeah, if you recall back on the November 20th hearing we had some technical amendments to change the neighborhood contact section of the ordinance to make it align with recent changes to the zoning code. That has now been incorporated into this exhibit, this exhibit shows all of the detailed line item strike-throughs to the zoning code along with the commentary explaining those changes and so it's been updated to reflect that amendment.
Wheeler: Any further discussion? Please call the roll.
Eudaly: Did we move it?
Wheeler: Oh, I'm sorry, I apologize.
Eudaly: So moved.
Fritz: Second.
Wheeler: Commissioner Eudaly moves. Commissioner Fritz seconds. Karla, please call the roll.
Eudaly: And there's one more vote, right.
Armstrong: Yes.
Eudaly: Okay, Aye.
Fritz: Aye. **Hardesty:** No.
Wheeler: Aye. The amendment is adopted. Now do I have a motion to move the amendment fossil fuel terminal zoning amendments ordinance for a vote to approve?
Eudaly: So moved.
Fritz: Second.

Wheeler: We have a motion from Commissioner Eudaly. A second from Commissioner Fritz. Karla, can you please call the roll?
Eudaly: Well, I didn't get to be here the first time this passed so it's exciting to be here now. I'm proud to serve on a council at a time when as a collective we're taking forward thinking steps to create resiliency and to protect our future in the city. Knowing how a major earthquake will change the landscape requires us to act now to ensure we aren't fighting a river on fire. River of fire. My favorite earthquake related term. While also trying to save lives and rebuild our community. Decreasing our vulnerabilities now will help save lives, quicken our recovery and strengthen our ability to be there for each other in the event of a major catastrophe. Thank you to my colleagues, bureau staff and especially as always the community for working together on this commitment. I vote Aye.
Fritz: So river of fire would be a great name for a rock band. Other than that we do not want to see it. So thank you, tom Armstrong, and the entire bureau and everybody who's has worked on this. Thank you, mayor wheeler, for your support of this. We have been working so long, it's been, several of my staff who have been involved with it, Cristina Nieves, Claire Adamsick, Cynthia Castro, and of course, Tim Crail my chief of staff, and so thank you to all of them. This has been a very complicated process and we really want to make it right so while I might on occasion nitpick on various details on this one I know that our staff and city attorney's office and with the bureau of planning and sustainability have really dotted all the I's and crossed the T's and I am not qualified to nitpick. So I'm glad to not be able to do that. I'm glad to be able to support it. Thank you to our community advocates who are here to make sure that things went well this afternoon even though we're not taking testimony. We appreciate seeing your smiling faces. Aye.
Hardesty: I appreciate the long time that's been devoted to actually updating this policy. I would have liked to have heard more about it as we were moving through the process. I do understand that there have been a couple of questions that my staff have asked that you answered very quickly and I appreciate that. As a rule I read every single thing I vote on because I want to make sure that where my neighbors walk up to me and say why did you do this stupid thing I actually have a good reason for why I did that stupid thing. Right? And so I understand the sense of urgency with this and therefore I will vote Aye on the motion.
Wheeler: Continuing to allow new fossil fuel terminals and additional storage tank capacity is a threat to our community from a public safety perspective, from a public health perspective and from an environmental perspective. This is especially true in the event of a major Cascadia subduction zone earthquake. We know that. The first step to reduce the risk is to ensure that the situation doesn't get any worse by allowing more terminals and additional storage tanks to be built in an area that we know is at high risk for liquefaction in the event of a significant earthquake. By allowing more terminals we also undermine our local and our global efforts to transition off of fuels that lead to climate change. While we recognize that there are other measures that need to be taken, this in and of itself is hardly sufficient and that we intend to bring forward other ideas in 2020. It's imperative that we adopt readopt these zoning code amendments to have them go into effect without any further delay. I want to thank all of my prior colleagues. This was originally supported back in 2016. It was very controversial then. I want to remind people of that and my former colleagues, mayor hales at the time and other commissioners who are not with us here today, commissioner Fritz who is, commissioner Fish who is probably watching on television, it took a lot of heat for this. It was a very important and a very principled stand that they took. So I feel grateful – well first of all, I'm not grateful that it got remanded but I'm grateful that I get to stand here in their footsteps and second and support the work that they did back in 2016. I thank our legal counsel who has been working on this pretty much nonstop for the last three'ish years and I want to thank the bureau and your hard work on this. Perseverance does pay off. I'm very happy to support this. I vote Aye. The ordinance is adopted as amended. [applause]

CITY OF

PORTLAND, OREGON

OFFICIAL MINUTES

[Excerpt Council Meeting November 20-21, 2019. Item 1082]

A RECESSED MEETING OF THE COUNCIL OF THE CITY OF PORTLAND, OREGON WAS HELD THIS **20th DAY OF NOVEMBER, 2019** AT 2:00 P.M.

THOSE PRESENT WERE: Mayor Wheeler, Presiding; Commissioners Eudaly, Fritz and Hardesty, 4.

OFFICERS IN ATTENDANCE: Karla Moore-Love, Clerk of the Council; Robert Taylor, Chief Deputy City Attorney; and Christopher Alvarez and Tonia Kohlman, Sergeants at Arms.

***1082**	**TIME CERTAIN: 2:00 PM –** Readopt remanded Ordinance No. 188142 to restrict bulk fossil fuel terminals (Ordinance introduced by Mayor Wheeler; amend Title 33, Planning and Zoning) 3 hours requested **No additional oral testimony will be taken. Written testimony will be accepted until December 2, 2019 at 9:00 a.m.** **Motion to accept technical amendments:** Moved by Hardesty and seconded by Fritz. (Y-4)	**CONTINUED TO DECEMBER 18, 2019 AT 3:00 PM TIME CERTAIN AS AMENDED**

At 3:35 p.m., Council recessed.

MARY HULL CABALLERO
Auditor of the City of Portland

By Karla Moore-Love
Clerk of the Council

For a discussion of agenda items, please consult the following Closed Caption File.

This file was produced through the closed captioning process for the televised City Council broadcast and should not be considered a verbatim transcript.
Key: *** means unidentified speaker.**

November 20, 2019 2:00 pm

Wheeler: This is the November 20, 2019 afternoon session of the Portland city council. Welcome, everyone. Hello, Karla, can you please call the roll.
Moore-Love: Yes.
Eudaly: Here. **Fritz:** Here. **Fish: Hardesty:** Here.
Wheeler: Here and now we'll hear from legal counsel on the rules of order and decorum. Good afternoon, Robert.
Robert Taylor, Chief Deputy City Attorney: Thank you mayor. Welcome to Portland city council. The city council represents all Portlanders and meets to do the city's business. The presiding officer preserves order and decorum during city council meetings so everyone can feel welcome, comfortable, respected and safe. To participate in council meetings you may sign up in advance with the council clerk's office for communications to briefly speak about any subject. You may also sign up for public testimony on resolutions or the first readings of ordinances. Your testimony should address the matter being considered at the time. If it does not you may be ruled out of order. When testifying please state your name for the record. Your address is not necessary. Please disclose if you are a lobbyist. If you're representing an organization please identify it. The presiding officer determines the length of testimony. Individuals generally have three minutes to testify unless otherwise stated. When you have 30 seconds left a yellow light goes on. When your time is done a red light goes on. If you are in the audience and would like to show your support for something that is said, please feel free to do thumbs up. If you want to express that you do not support something, please feel free to do a thumbs down. Please remain seated in council chambers unless entering or exiting. If you are filming a proceedings please do not use bright lights or disrupt the meeting. Disruptive conduct such as shouting or interrupting testimony or council deliberations will not be allowed. If there are disruptions a warning will be given that further disruption may result in the person being ejected for the remainder of the meeting. After being ejected a person who fails to leave the meeting is subject to arrest for trespass. Thank you for helping your fellow Portlanders feel welcome, comfortable, respected and safe.
Wheeler: Thank you very much, Karla, please read item 1082.
Item 1082. Readopt remained ordinance number 188142 to restrict bulk fossil fuel terminals.
Wheeler: Colleagues fossil fuels are a dual threat to our community. They are the primary component of carbon emissions that threaten our planet, and they are a safety threat to our community, especially in the event of a major Cascadia subduction zone earthquake which geologists say is not a matter of if its going to happen, but when it's going to happen. As we work to reduce our dependence on fossil fuels the first step we need to take is to ensure that the situation doesn't get any worse. Continuing to allow new fossil fuel terminals increases the risk to the surrounding industrial district, the Willamette river and indeed our entire city. By allowing more terminals we undermine our local and global efforts to transition off the fossil fuels that cause climate change. Reducing our reliance on fossil fuels will take a concerted effort at the local level in the region, by the state of Oregon and by our federal government. City council previously adopted this ordinance back in 2016. Since that time it's been appealed to the Oregon supreme court and now it's

back before us. While we recognize that there are other measures that need to be taken and we intend to bring those forward in 2020, it's imperative that we readopt this package now without any further amendments to have the code go into effect without any further delay. Future amendments and actions will require planning commission review. City staff have already been researching a planning for the future ordinance which is part of our larger action plan to address fossil fuels in Portland. Andrea Durbin, director of bureau of planning and sustainability, will give us an overview of that work. Tom Armstrong from the bureau of planning and sustainability will give us an overview of the ordinance since only two of us, commissioner Fritz and commissioner Fish, who wanted to be here today, but extends his regrets, only two of them were on the council when these changes were originally adopted. Good afternoon, director Durbin.
Andrea Durbin, Director, Bureau of Planning and Sustainability: Good afternoon, mayor, good afternoon city council.
Wheeler: I'm sorry, I have a note, I forgot it. Commissioner Fritz wanted to make a few statements up front. I apologize commissioner.
Fritz: Thank you, mayor. I was proud to co-sponsor this when it was here in December of 2016, so on behalf of commissioner Fish and myself I just wanted to thank everybody for coming back again and thank their staff for getting this back to us. If ever there was a time that I would have liked to do a land acknowledgment this is one of them. Our tribal director Laura John has asked us not to do a land acknowledgment so we have done the necessary research to decide what the language should be. So I thought a fitting substitute would be the words of Greta Thunberg “our house is on fire, I'm here to say our house is on fire. According to the intergovernmental panel on climate change we are less than 12 years away from not being able to undo our mistakes. In that time unprecedented changes in all aspects of society need to have taken place including a reduction of our common dark side emissions by at least 50% and please note these numbers do not include the aspect of equity which is necessary to make the Paris agreement work on a global scale nor does this include tipping points or feedback loops like the extremely powerful methane gas released from the thawing artic permafrost. People like to tell success stories, but financial success has come with an unthinkable price tag and on climate change we have to acknowledge that we have failed. All political movements in their present form have done so and the media has failed to create broad public awareness. We are at a time in history where anyone with any insight of the climate crisis that threatens our civilization and the entire biosphere must speak out in clear language no matter how uncomfortable and unprofitable that may be. We must change almost everything in our current societies, the bigger your carbon footprint the bigger your moral duty. The bigger your platform the bigger your responsibility. Adults keep saying we owe it to the young people to give them hope, but I don't want your hope, I don't you to be hopeful, I want you to panic. I want you to feel the fear I feel every day and then I want you to act. I want you to act as you would in a crisis. I want you to act as if our house is on fire because it is”.
Wheeler: Thank you, director Durbin.
Durbin: Thank you. For the record I’m Andrea Durbin, director of the bureau of planning and sustainability. Mayor as you’ve stated fossil fuel operations pose a significant threat to the health of our community. We have heard from the public community members, youth advocates that reducing the risk and improving community safety is critically important as is transitioning away from our fossil fuel dependence towards cleaner fuels. Before we walk through the zoning amendments today I would like to update you on the other work that the city is doing to address fossil fuels that will be coming before council next year. Bps has been working closely with several other bureaus including the Portland bureau for emergency management, the city attorney's office, bureau of development services and Portland fire and rescue. Reducing the risks posed by these operations in a liquefaction zone and providing the community with more information is one of our priorities. To that

end we appreciated the city council contributing funding to pbem in the fall bump process to join with Multnomah county to research the economic and environmental impacts of the seismic disasters specific to the critical energy infrastructure hub as well as research risk bonding options to support response, cleanup and remediation. We expect the study to be done next year providing important information for both the city and the county to determine the best ways for to mitigate risk. Pbem is also developing a proposal for city council consideration next year to adopt seismic requirements for storage tanks in Portland critical energy infrastructure for safety and resiliency and also to strengthen community right to know and pre notification requirements for the receipt and storage of fossil fuels and other hazardous materials in Portland. Pbem director mike Myers will be joining invited testimony later and he can answer any questions you have specific to the work that they are leading. It's also important to quicken the transition to cleaner fuels including the electrification of the transportation sector to reduce our dependence on fossil fuels. To that end bps will propose in an ordinance scheduled for December 18th to move implementation of the renewable fuels standards from bds to bps, so that we can start the update for renewable fuel standards to help transition more quickly to clean fuels, we expect to do this work next year. Bps is also working with bds and pbot to explore local options for electric vehicle charging. We know that we need to make it easier for people to charge their electric vehicles at home and work to encourage more adoptions of electric vehicles. And finally we are working to place limits and restrictions on expansion of fossil fuel operations in Portland. That is in part what you'll be hearing about today, but what we will consider today is just the first phase of the zoning work. As the mayor mentioned because today's amendment is not as comprehensive as we need to reduce the risks posed by these operations we intend to work on phase 2 and bring that back to council next year. For example we will need an additional ordinance to address offloading and transloading facilities. Public testimony today will likely raise concerns and suggestions for what we might consider in this phase 2 process of the fossil fuel zoning policies. To ensure that Portland has a more comprehensive and protective zoning provisions in place that reduces risks, improves safety and better protects the health of our communities. With that broader context for the work that is currently underway, I will now introduce Tom Armstrong, who's a planning and sustainability supervising planner to brief you on this zoning amendment.

Tom Armstrong, Bureau of Planning and Sustainability: Thank you, yes Tom Armstrong from bps. I have a presentation but the projector isn't working so you have a printout, we've distributed printouts through the audience so they can follow along as well and it has been posted to the project website so people can download it as well. Starting on slide two there's a map of the existing terminals in Portland. All of these are located in what we call the northwest industrial district stretching along the river out past the St. John's bridge. There are 11 fossil fuel terminals, 10 of them are focused on petroleum fuels and products and one natural gas storage facility that really manages the regional peak consumption in the wintertime. These fossil fuel terminals handle over 90% of the fossil fuels that serve Oregon and are sold in Oregon, and it really is often referred to as the critical energy infrastructure hub because you have a confluence of the river access, the freight routes, the rail access, and the pipeline access because almost all of our fuel comes from the refineries in Puget sound, most of it via pipeline, the Olympic pipeline down Washington, and that main pipeline ends in the Portland harbor area and serves these terminals. On page three is the policy direction that we had that guided us in how we constructed these zoning amendments. First the council adopted a resolution in November 2015 to oppose, actively oppose the expansion of infrastructure that was primarily for transporting or storing fossil fuels in or through Portland and then the second policy direction was in 2016 as part of the comprehensive plan we adopted a policy to limit the fossil fuel storage facilities to those necessary to serve the regional market and I will get

into a little bit later as to what that actually means. On slide four is a map that was prepared by dgami, the state department of geology and mineral industries, I think that's it. That shows the probability of liquefaction in and as you can see in the red areas that really covers almost all of Portland's industrial districts. That is why these zoning code amendments apply to all of our industrial and employment zones and not just some sort of overlay that applies to the northwest industrial district. So on page five we get into the zoning code amendments and this package what we did, we defined what we mean by a bulk fossil fuel terminal and that is a larger facility that really handles or does what we call transloading. So, they move the product from one type of transportation mode, pipeline, barge, rail, to another type of transportation mode. Most of this comes in via pipeline and barge and goes out to the rest of Oregon and southwest Washington via truck, there's a smaller pipeline that serves the Willamette valley down to Eugene. Once we have defined that use then we regulate it and what we have essentially done is prohibited all new terminals in all of the zones in Portland and then we've designated the existing fossil fuels as a limited use and designating it as limited use allows it to continue to operate, continue to make seismic upgrades. The only thing they can't do is expand the storage tank capacity from what they have today. In the ordinance, there are a few minor technical changes that we made because since 2016 when these amendments were originally adopted the zoning code there have been subsequent amendments to the zoning code, so we have made some adjustments to realign it and reconcile it with those changes that have been made over the last three years. Slide six is an important concept. The way these regulations are structured is, and we know out there on these terminals that they have a mix of older tanks. I think the last tank out there was built in 2012, and the way the regulations have been structured is that the terminals do have the option of replacing their storage capacity. So that if they want to take down some smaller tanks and consolidate that and put that same amount of storage capacity into a larger tank that is built to current seismic codes they can do that and that's one way that we think that we've allowed those terminals to continue to operate and eventually hopefully invest in their facilities to make them safer. On slide seven is the new use category that I talked about, a bulk fossil fuel terminal, has that multimodal access. I think what we're trying to do there is distinguish it between oftentimes the gasoline will come into these ten terminals that handle it and go by out to other trucks. They may have an intervening distribution facility before it goes out to the retail outlets. If it's coming in by truck and out by truck, that's not covered by these regulations. We also last time around in 2016 when we adopted this we included exclusions for airports and marine and rail service facilities. So at the airport, for example, there's fuel storage, jet fuel storage and in the port and at the railyards there's fuel depos that are not included in these regulations. On slide eight is the definition of what is a fossil fuel and we carefully worded this definition specifically to not include new renewable fuels such as renewable biodiesel and other renewable additives such as ethanol that are going to be needed and used to transition us off of fossil fuels, so we wanted to make that distinction there. As has been stated on slide nine, this was appealed to Luba and then the court of appeals and eventually to the Oregon supreme court. It has come back down to us. There were two errors that were sustained through that whole process. There were three errors, actually, two of them are relevant today. The first error is there's guilds lake industrial sanctuary plan which was actually adopted way back in 2001. The first time around we did not address those policies and so in the policy findings today with this ordinance we have done that. Luba faulted us around not having enough evidence or discussion about addressing the demand, future demand for fossil fuels and how we weigh cargo forecasts versus other consumption forecasts and trends and I'll talk a little bit about those today. The third issue is Luba found that we didn't adequately address an objective in the old comprehensive plan but subsequently we adopted a new comprehensive plan with new policies that were evaluating this proposal against, so that remand issue has

become moot because that policy is no longer in effect. On slide 10, the guilds lake industrial sanctuary plan applies to that northwest industrial district along the river. It was adopted in 2001, it was designed to limit uses, further limit uses in that industrial area to preserve it as an industrial sanctuary. Many of those use limits have been incorporated into our new prime industrial overlay zone that was adopted with the comp plan and these amendments really only apply to one type of use in that area and that I think the higher level or the more important issue we're not changing the map, the zoning map, we're keeping our same industrial base. We are not regulating other industrial uses in that area and so we think we have made findings that show that we are consistent with the guilds lake plan policies. On slide 11 as I mentioned before we have a new policy around fossil fuel distribution, and that it seeks to limit those facilities to those necessary to serve the regional market, and that's the key phrase, is for you to decide what is necessary and what is the regional market. On page 12, it really is sort of again the regional market as we have recommended that you find and define really is the state of Oregon because we are that gateway hub from the petroleum refineries up in Puget sound. We also do we recognize that we serve southwest Washington as well. Unfortunately the data that is available doesn't allow us to parse it below the state level so we think that just limiting it to the state of Oregon is close enough and good enough for defining the regional market under this comprehensive plan policy. So what are we going to need? What's going to be necessary to serve the region? On slide 13 is information from the u.s. energy information administration. Every year they produce what's called the energy outlook, annual energy outlook. This is a chart from the 2019 version, where they project out for the nation what they think the demand for petroleum and other liquids will be out to 2050 and they go through a number of scenarios and we have focused here on the reference case and what that says for the nation they expect it to be flat in terms of the amount of petroleum that will be consumed in the nation, so that's one forecast of what we are going to need in the future. I think what they find is there's increasing energy efficiency across all of the end users, but again unfortunately in this instance they do not break it down to the state level. So we have this forecast at a national level, but there's nothing to indicate that Oregon would be any different than the national. On slide 14 is state level data. This looking back at what the trends have been since 1990. Again this comes from the u.s. energy information administration. The top line is total petroleum fuel consumption and we have broken out subcategories that account for most of that, which is gasoline is the uppermost of those lower lines. The next one is distillate fuel oil or diesel fuel and the bottom one is aviation and jet fuel. Then on slide 15 shows why these are -- these lines are relatively flat when we have a growing population and a growing economy, and that's because fuel efficiency and per capita consumption has been going down over this period, so as we have grown in the number of end users the amount per person has dropped. So that allows these lines to be flat over that time where we have had a lot of growth. The one state forecast that we have on consumption side comes from odot and their projections for gas tax revenue out into the future, this one is was done this year, goes out to the year 2029 and they are projecting a flat or lower in terms of the number of gallons of gas that they expect to be consumed and generate gas tax revenue.

Fritz: What does with or without conditional, what does that mean?

Armstrong: My understanding is when they passed the state legislation to raise the gas tax it's at two steps. They immediately implemented a 4 cent gas tax and there's another 6 cents bump if certain conditions are met, but if you look, those two lines line up exactly the same. So, whether or not those conditions, whether it goes from four cents or ten cents odot saying that price indicator isn't enough to really change the amount of gas that gets consumed and they are both down from where it is today.

Fritz: Is that what we found in Portland since we had the gas tax that hasn’t really affects how much people drive?

Armstrong: I don't know that but I can check with pbot on what they've seen in terms of the gas tax revenue.
Fritz: Thank you.
Armstrong: So on slide 17, what was opposite of this showing flat or declining consumption in the future are a series of cargo forecasts that really look at the types of cargo flowing through the Portland harbor and this is both port of Portland facilities as well as the private facilities, and this is really what Luba found us not clearly addressing last time is how do you reconcile these other consumption forecasts with the cargo forecast and the cargo forecast there's been a number of them over the last eight years. They are sort of declining in terms of the amount of growth that they are projecting and these rates are for what we call liquid bulks which is primarily petroleum fuel and some other materials, but most of it is petroleum products. I would say the 2011 Oregon freight plan really reached back and if you dig into the numbers it's based on 2002 federal data so it's getting pretty old when you look at that. Odot did an update of the freight plan in 2017, they did not update this forecast as part of that, it was mostly a policy update. We had some studies done 2012 as related to the west Hayden island study at that time and that study was really significant in that they projected a .7% annual growth rate. Also those studies found that even at that growth rate out to 2035 there was enough capacity in the system to accommodate that growth. So again, it calls into question how much additional capacity we're going to need in the future. The other balance to this is on page 18 and I think we'll hear in testimony today a series of other policy initiatives that have not been factored into these consumption trends fully yet or the forecasts that really look at reducing fossil fuel use. You know, it is at the state level with odot and deq programs, it's at the regional level with metro and their climate smart communities program and it is at the city level with our climate action plan and our transportation system plan. They are all looking to bend that consumption curve and reduce the consumption of gasoline. On page 19 I think where we're at in the findings and looking at the comp plan policy as a whole is that there's a wide range of policies that we have to balance when making these decisions. I think this ordinance does that in terms of when you look at the policies that talk about reducing risk from natural hazards including earthquakes we have again as we have just gone through limiting fossil fuel terminals to what is existing is likely to be what is necessary to serve the regional market when you look at all of these trends and forecasts.
Then finally we're doing it in a way that maintains our economic base and our industrial sanctuaries. This one use out of many. The other industrial uses are, the regulations do not change for them as part of this. Finally I want to note in your packet and again posted to our website we have one technical amendment that we would like put on the table. They are in this as part of this original adoption. We had a neighborhood contact, and this speaks to some of our other actions about right to know, in that in the future if any of these terminals come in for new storage capacity, whether that's to replace and reconfigure their existing capacity or for nonfossil fuels, or for aviation fuels, they need to notify the neighborhood ahead of time. There's a whole series of regulations about how they do that. So that there is advance notice and a community dialogue about what they are doing and why they are doing it. So everybody understands what is going on, which is not what happens today.
Wheeler: Are there any questions on the technical amendment proposed by bps? Can I get a motion?
Hardesty: So moved.
Fritz: Seconded.
Wheeler: Motion from Commissioner Hardesty. Second from Commissioner Fritz.
Armstrong: Are there any other questions about this amendment package?
Wheeler: Call the roll on the amendment.
Eudaly: Aye. **Fritz:** Aye. **Hardesty:** Aye.

Wheeler: Aye. The amendment is adopted. All right, so we are moving on to the exciting part of the program. That's the public testimony phase. So we're going to be opening up the floor to testimony on the fossil fuels terminal zoning ordinance and the draft amendments. We would like to start with the invited testimony portion of the hearing. We have a few special guests with us today. We're greatly appreciative of their presence. Multnomah county commissioner susheela jayapal is here today. It's good to see you again. Aja Decoteau from the Columbia river intertribal fish commission has joined us. Thank you for being here today. And of course mike Myers, the Portland bureau of emergency management director. Thanks all three of you for being here today.
Susheela Jayapal: Good afternoon. Good afternoon mayor and commissioners. Thank you so much for having us here. My name is Susheela Jayapal, I am the Multnomah county commissioner for district two which represents north and northeast Portland and includes the neighborhood of St. John's and other north Portland neighborhoods that are right across the bridge, right across the river from the critical energy infrastructure hub. I'm really here to thank you for the action today that you've taken today and for your partnership with the county in matters relating to the hub and to fossil fuel infrastructure. The first step to getting out of the hole is to stop digging it deeper. That's what today's action by the council does. It prevents the further development of fossil fuel infrastructure. We can no longer afford fossil fuel infrastructure in our community. We can't afford it because if we hope to prevent climate collapse we must move away from the fossil fuel economy with both speed and urgency. To do that we have to stop investing in 20th century sources of energy, embrace 21st century renewable energy resources and manage the responsible transition away from the fossil fuel economy. In addition to the climate crisis, as you've heard as we know we have another reason to act. The critical energy infrastructure hub that's being regulated with today's council action is built in the worst place imaginable. Next to the river, near neighborhoods and homes, on soils that will liquefy and spread when the earthquake arrives. The cei hub has 360 million gallons of storage tank capacity. Most of that capacity is in tanks that were built before we knew about the risks of earthquakes in our region and those tanks won't survive an earthquake. For comparison the exxon valdez spilled 11 million gallons of oil. Closer to home we saw a small preview of what could happen at a tank farm when two storage tanks at a new star facility in california burst into flames and released a cloud of choking black smoke because of the suspected impact of a small earthquake. The commitment of the city of Portland in today's action is a testament to our community's resolve to address these difficult threats to our safety and the safety of future generations. Today's action combined with the ongoing partnership between the county and the city to address risk from the cei hub is a step in the right direction. It's one of many steps in our journey out of the hole that we are in, an ecological and emergency preparedness crisis caused by the fossil fuel industry. We need to stop digging ourselves further into that hole and start climbing out. This is happening here in Portland and Multnomah county because we have the community's resolve and support and it will happen across the country because we have no choice but to act boldly, bravely and with urgency. Thank you.
Wheeler: Thank you, commissioner jayapal, for being here today. We appreciate your leadership and we appreciate the partnership with Multnomah county. Thank you. Good afternoon.
Aja Decoteau: Good afternoon, mayor Wheeler, members of city council. It's a pleasure to be here today amongst you and also amongst this panel of distinguished folks. My name is Aja Decoteau, I am a citizen of the Yakama nation. I also serve as the watershed department manager for the Columbia river intertribal fish commission who represent the lower Columbia river treaty tribes who have reserved rights throughout the Columbia river basin. The Columbia river is the life blood of this region supporting a rich and diverse ecosystem that has molded cultures, diets and religions of the tribes since time

immemorial. In the past 200 years, the Columbia river and this region has changed dramatically not always for the best for the resources it supports. The tribes are on the frontlines when it comes to bearing the burdens of climate change having already begun experiencing changes to our first foods, the salmon, the game, the roots and the berries. For us, these natural resources are our cultural resources. The Columbia river and its fishery resources are battling impacts from development and pollution. Tribal fishers in the Columbia face even larger risks and potential impacts. In addition to our diets rich in fish we spend much of the year outside where we are exposed to the air and water in and along the river. The tribes and the railroads have a long and complicated relationship. Trains run along both sides of the Columbia river, impeding tribal fishers' access to fishing sites and creating risks of accidents. The recent escalation in hauling fossil fuels by unit trains alarmed our tribal members, not only because of increased risk of harm to them, but also because of the increased risk of what is often called low probably high consequence accident. A spill of any type of crude, be it heavy tar or light bakken will have significant and long term impacts to the aquatic resources of the river. We learned this lesson from the exxon valdez spill 25 years ago. Despite a quarter of a century, alaskans still find oil residue on the beaches and under rocks. The 2016 mosier crude train derailment fortunately did not involve a devastating spill into the river however it woke the region up to the potential of a major catastrophy. There were many lessons learned from this spill but the primary lesson is we must protect the river at all costs. With the current legal landscape we cannot totally prohibit trains laden with fossil fuels from traveling through the gorge, however, we can do our part to reduce our need for them in the first place. We support the city of portland's recent resolutions opposing coal trains and curtailing the expansion of fossil fuel infrastructure as first steps to addressing climate change and protecting the environment. We fully support ordinance #188142. Thank you.
Wheeler: Thank you, ms decoteau. We appreciate it very much. Thanks for your leadership. Good afternoon.
Mike Myers, Director, Portland Bureau of Emergency Management: Good afternoon, mayor, commissioners. For the record my name is mike Myers, I'm the director of the Portland bureau of emergency management. I have worked as a firefighter, fa ire chief, emergency manager for over 30 years. I have seen a lot of disasters both large and small. Not much phases me to be honest. I'm not a nervous guy, but what I do worry about is the cei hub. The concentration of the state's fuel storage tanks in such a perfectly bad location on liquefiable soils in a 500-year flood plain, next to the urban wildland interface with very limited ingress and egress could hardly be worse. In a major earthquake the cei hub poses a grave threat to the safety of the surrounding community. It also threatens our environment and the economy on a scale that is difficult to imagine. A major disaster at the cei hub could hamper lifesaving response actions and delay needed assistance by weeks and months due to fuel shortages. Meanwhile that spilled fuel could poison the Columbia river all the way to its mouth. Together these impacts would economically cripple our state. It is for that reason that I am focused on efforts to decrease the vulnerability of the cei hub. My colleague Andrea Durbin has already mentioned that I intend to propose seismic upgrades requirements for tanks. I very much look forward to bringing this to you and the council in 2020. But in the meantime, the first step to improving safety in the cei hub is to stop making it bigger. The code changes proposed prevent the expansion of fuel storage and location that should never have been used for fuel storage in the first place. At the same time it permits equipment replacements and upgrades that increases safety and that is a good thing. I'm happy to support the work of our partners at bps in taking this important step to increase the disaster resilience of the city and our state. Thank you.
Wheeler: Thank you. We appreciate it very much. Thanks all three of you for being here today. All right, so now we're going to open this up to public testimony. Karla our able board clerk is going to read the names of people in the order in which they signed up,

however, if you have a disability or if you have small children or if there are other pressing circumstances that require you to be moved up in the line please let Karla know and we will accommodate you. She will read three. If people could come up, the microphones slide around and we find that six inches is about the right distance. There are about 16 people signed up so we can give three minutes for each person to testify. I would ask as your testimony comes to an end and the buzzer goes off if you could please stop your testimony. You have three minutes but there's a lot of people who do want to speak. So without further ado, Karla, could you please read the first three.
Moore-Love: Yes, the first three please come on up, are Mario mijares, Cathy sampson-kruse, Elijah cetas, and they'll be followed by kelly o'hanley, ella shriner and violet o'herron.
Wheeler: Welcome. Thank you. Name for the record. We do not need your address unless you want to give it to us for some reason. If you'd like to start please. Thank you.
Mario Mijares: Yes. Hello, my name is Mario Mijares, organizer for Columbia river keeper. Thank you for the opportunity to comment on today's very important gathering. We strongly support the implementation of Portland's landmark fossil fuel zoning code ordinance. We know that city staff have provided information that resolves the few outstanding issues that Oregon's land use board of appeals has identified. We support the policy as it is proposed and as it was approved in 2016. It's an important step in preventing the fossil fuel industry from expanding their shipment of toxic fossil fuels. Fossil fuels pose major risks to the health and safety of nearby neighborhoods, communities on oil train routes and downriver towns that rely on the Columbia river for drinking water. These recent events highlight some of the risks. In september an lpg train car struck the ongoing bridge onto swan island causing more than $1 million in damage and impacting traffic in and out of swan island. This event could have been much worse if the lpg railcar had ruptured and burned. In October a new star tank explosion rocked a refinery complex in Crockett, California, collapsing fuel tanks, closing i-80 and releasing plumes of toxic smoke. It's possible that this fire and tank farm failure resulted from a 4.5 magnitude earthquake. A small fraction of the seismic risks we face here in our region. Those are only two incidents that demonstrate the level of impact and the risk of gambling the safety of people and environment. The community is more motivated than ever to support the city's ordinance. We look forward to the council's vote to readopt the fossil fuel terminal zoning amendments as written and to put this important policy into effect. We also look forward to working with the city to continue to develop proactive policies to address the health, safety and environmental risks associated with fossil fuel infrastructures.
Wheeler: Thank you. We appreciate your support.
Mijares: Thank you.
Wheeler: Thanks for your hard work. Good afternoon.
Cathy Sampson-Kruse:[speaking in foreign language] in my native Walla Walla wallulapum language I say [foreign language] good day. My wallulapum name is wey-ow'-sux, Cathy samson-Kruse. I'm an enrolled member of the Walla Walla tribe, the cayuse and umatilla in eastern Oregon. My parents are otwey carl sampson, chief yellowbird, and marion arleta sampson. I'm not an elected leader but I'm an elder now. I'm on the board of the Columbia river keeper in hood river and the advisory board of the civil liberties defense center in Eugene Oregon. My husband and I have eight children, 12 grandchildren and two great grandchildren. I have lived many places in my life. From our umatilla indian reservation to a Yukon-kuskokwim village of bethel, alaska. In the early 1970s I lived across the river in northeast. I commuted to Portland state university. I have returned to support my daughter who is attending ohsu. I enjoy the parks and the walks near the Willamette river with my granddaughter juniper. I was raised as my ancestors were to cherish mother earth, all that she provides her people and all the creatures living on and with her. In return we have always been taught to respect and protect mother earth. The

land, the air and the water. This is the balance of things that has allowed us to live on this land for all generations before. A new threat is upon us, the rapid growth and execution of plans for northwest expansion of fossil fuel infrastructures, small modular nuclear reactors and the devastation of coal and fracked gas exploration. I was here in 2016, before you. I'm going to continue my pleas for us to move past dependence on king kong. The coal, the oil, the nuclear and the fracked gas which there is nothing natural about fracked gas. Be it solar, wind, net-zero homes and listening to indigenous wisdom for sustainable solutions hand in hand with scientific wisdom for a just transition to clean energy and livable planet. A new attack on mother earth must be stopped. I stand with all who join this fight so I ask you to be on the right side of history. Be the wisdom keepers for the city of Portland, the entire state of Oregon and the northwest communities will follow your lead. Be the ones who look seven generations ahead. Protect your community, protect the rivers, and the beauty our mother earth has given us. Vote in full support of the fossil few zoning ordinance. [foreign language] We are here forever. Aye.
Wheeler: Thank you. I appreciate it. Good afternoon.
Elijah Cetas: Good afternoon. This is close enough.
Wheeler: Yeah, that's perfect.
Cetas: Greetings, commissions. My name is Elijah cetas and I'm grass roots organizer with center for sustainable economy here in Portland. We support the fossil fuel terminal zoning amendments in their present form and we see them as an integral part of an eventual managed decline of the fossil fuel infrastructure in Portland coinciding with a deep investment in our communities in cleanup, restoration and resiliency. The passage of this ordinance in 2016 was a remarkable moment in Portland history when grass roots activists, city staff and elected officials responded to a crisis and decided large scale fossil fuel infrastructure expansion would no longer be legal here. The fossil fuel industry and local business advocacy organizations like the Portland business alliance saw their power threatened and sued the city. Having been thoroughly defeated in the court of popular opinion they turned to their high priced lawyers and sought to defeat the amendments in a court of law. Nevertheless, the city largely prevailed and the remand process before us is about curing some of the minor deficiencies in an otherwise defensible, reasonable and necessary regulation. The fossil fuel terminal zoning amendments represent an enormous step forward when it passed three years ago and it's still is a good law. Our victories have emboldened other jurisdictions to look at the risks that their communities face from spills, explosions and natural disasters, and to begin to regulate the many dangers of the fossil fuel industries in their homes. So in January of this year king county, Washington, passed a moratorium on new fossil fuel projects and will likely adopt permanent restrictions in coming months. In Vermont and New York state there are bills introduced for moratoria on all new fossil fuel infrastructure. These and other efforts are inspired by and directly utilized language from the Portland amendments. Even closer to home, the port of Vancouver recently made a binding policy to not allow new bulk fossil fuel terminals. This is an extraordinary development because it came just one year after the largest oil by rail export facility on the west coast was rejected by Washington state regulators and governor jay inslee in Vancouver. City of Portland has an important role to play in the energy transition beyond the fossil fuel terminal zoning amendments. Your collaboration with Multnomah county on a fossil fuel risk assessment and your commitment to further health and safety policy are welcome steps. Moving forward as we continue to innovate locally as we must we must also push hard on our state legislatures toward a statewide moratorium on new fossil fuel infrastructure and for a framework for a managed but rapid decline of the fossil fuel industry in line with 100% renewable energy powered economy. Portland has showed that cities can lead with direct and effective fossil fuel infrastructure policy. The community has showed up in the streets, in the halls of government and at the ballot to demonstrate

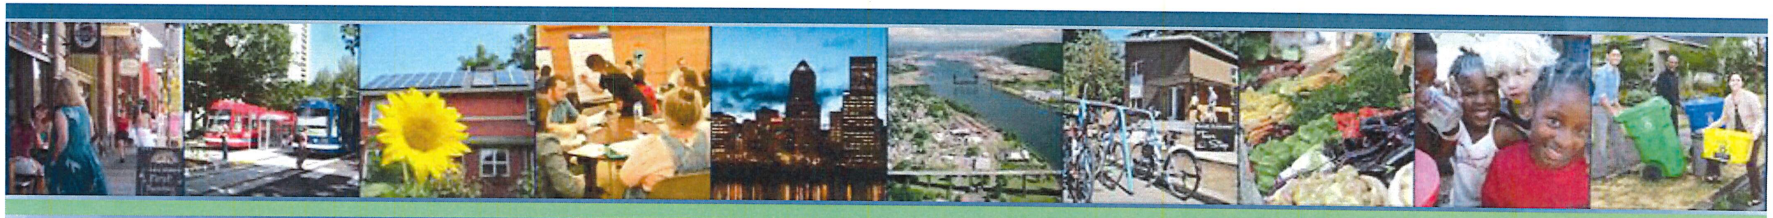
overwhelming support for strong climate action. We support the reduction of the fossil fuel terminal zoning amendments. Thank you.
Wheeler: Thank you. Thanks all three of you. We appreciate it. Next three, please, Karla.
Moore-Love: Kelly O'Hanley, Ella Shriner, Violet O'Herron, and they'll be followed by Robert Boyer, Micah Meskel, and Melanie Plaut.
Wheeler: Good afternoon. Would you like to start please.
Kelly O'Hanley: Sure. My name is dr. Kelly O'Hanley. I'm speaking on behalf of Oregon physicians for social responsibility.
Wheeler: Thank you.
O'Hanley: Thanks for letting us speak. As we have heard this afternoon if we don't act quickly on a global scale climate change will become essentially unsolvable. Technically it is possible to move away from climate busting fossil fuels. And so the real question is how do we get there? How do we make that happen? And that's where politics come in. Unlike other political fights balanced and measured answers will fail us. So we need so-called radical solutions. Happily there are some rays of hope. When trump pulled out the climate accords he explained he had been elected to govern Pittsburgh, not Paris, but the next day the mayor of Pittsburgh said that his town was planning on 100% renewable energy. [laughter] A pledge that was taken up by other cities. Cities and counties across the country are suing exxon, b.p., chevron, shell and others to pay for sea walls and other infrastructure and then there's Portland. We also passed a 100% renewable resolution and acted even more radically. We passed the landmark no fossil fuels infrastructure resolution, we fought and won the legal challenge to it, and hopefully today will pass the zoning code amendments and the eyes of the country have been watching. Milwaukie, Oregon, Eugene, Corvallis, hood river, Seattle, Tacoma, Vancouver b.c., los Angeles, Richmond, California, Baltimore, Honolulu are all considering or have actually passed their own versions. So what's next for Portland? Today hopefully we'll proudly celebrate no new fossil fuel infrastructure. Tomorrow we'll take additional radical steps for reinvention. Hopefully in addressing transportation, mass transit, risk bonding, use of forest products, building codes and so on in other words every aspect of our lives that affect climate. So Portland, keep leading and move fast. Thank you.
Wheeler: Thank you, appreciate it. Good afternoon.
Ella Shriner: Good afternoon. My name is Ella Shriner. I'm 17 years old and I was born and raised in Portland. I'm also a founding member of the Portland youth climate council but today I'm speaking to you as a concerned individual. This morning I was at home thinking about what I wanted to say to you today. I thought I would focus on the risks fossil fuel infrastructure poses to public health and safety, as well as our environment. I wanted my testimony to have facts and I wanted to say the perfect thing that would make it clear to you how important these zoning amendments are and how important it is that they just be the beginning of our rapid journey to dismantling fossil fuel infrastructure in Portland but as I sat hands poised above the keys waiting for inspiration to strike I broke down into tears. The truth is I don't know what I could say that could make it clear. What I could say that would make you and move you as leaders to take the necessary and ongoing actions. If leaders around the world are not stepping up because doing so would threaten their financial support from the very corporations responsible for this crisis, I don't know what I could say. If millions of young people have striked from school and marched together screaming for action without sufficient response I don't know what I could say. If a growing number of climate refugees facing the loss of their home and even death doesn't move us to action, I don't know what I could say. If polar ice melt, ocean acidification, sea level rise, devastating fires, climate enhanced heatwaves, arctic blasts, tornadoes and other extreme weather events are not enough for us to change then I just don't know what I could say. One thing I hear most as a climate activist is, wow, when I was your age I wasn't doing anything like you're doing. When I hear that I always think, well, that's because when you

were my age you didn't have to. The reality is we have never before faced a crisis like the one we're in. This moment in time calls for all of us to step out of our comfort zones and do things we have never done before. We need to take risks. Mayor Wheeler, I remember you told me about your daughter when I delivered a video to you about the danger of natural gas back when you were the state treasurer. Did you ever find yourself thinking about how fast she's grown up?
Wheeler: I do. [laughter]
Shriner: How it feels like just yesterday that you were watching her take her first steps, say her first words, and how old is she now? 12? 13?
Wheeler: 13.
Shriner: Well she was born more years ago than we have left to take drastic action. If we don't her fate, my fate, and the fates of the rest of our and future generations will be sealed. Four years ago I testified as a 13-year-old in favor of the resolution that led to these zoning amendments. Commissioner Fritz, you may remember the little middle schooler singing the times they are a-changing and presenting you with climate champion awards.
Fritz: They're in my office.
Shriner: Those were hopeful times but I'm not a middle schooler and I along with thousands of my peers are preparing to cast our first votes. The times, they really are changing and we're watching to see if all of you are willing to take the risks that this time demands. Thank you.
Wheeler: Thank you. Good afternoon.
Violet O'Herron: Hello, commissioners. My name is Violet O'Herron, I'm a member of the Portland youth climate council and a seventh grader at ockley green middle school in north Portland. I want to start by saying thank you. Makes me hopeful to know the city of Portland is actively working on climate solutions. There's no single simple solution to the climate crisis. It is clear however that there's no way we can solve the problem unless we stop building more fossil fuel facilities and drastically decrease the amount of fossil fuels we're using. The city's law to ban new fossil fuel infrastructure is a really good start. All of us need to do something. Having a future on a planet with a livable climate was something my parents were able to take for granted when they were growing up. I don't get that luxury. My generation doesn't get that luxury. I have a deep desire for things to be okay with the world but I know things are not. My concern that not enough is being done has led me to go on climate strike every Friday here at city hall. I'm inspired by Greta Thunberg and by her example of how much one young person can do. I'm also working together with other young people of Portland youth climate council to advocate for local climate solutions. I'm trying to do what I can do. I want to challenge everyone here to ask themselves, what more can you do? For the commissioners I think stopping the export of tar sands through zenith would be a good next step. Thank you for your time.
Wheeler: Thank you. Thanks all three of you. Commissioner hardesty.
Hardesty: I want to appreciate the two young people who came in and testified. The young woman who said when she was 13 when she testified the first time, I can assure you that at 13, the thought of going to Salem to testify to legislative hearing would not have been in my world view and I want to tell that other young lady what a fabulous job you did. I knew you were nervous when you came up, but I gotta tell you your voice didn't shake at all. You had very powerful testimony. Thank you so, so much for being here.
Wheeler: Next three, please, Karla.
Moore-Love: Robert Boyer, Micah Meskel, and Melanie Plaut, and they'll be followed by Monica Zazueta, Ryan Rittenhouse, and edith gillis.
Wheeler: Would you like to go ahead and start for us, please?
Micah Meskel: Sure.
Wheeler: Thank you.

Meskel: Council and mayor, my name is Micah Meskel, I work for Portland Audubon. Portland Audubon has been advocating on issues regarding the northwest industrial area for over 40 years. We have known for a long time many of the industries located along the river pose a huge risk to our environment and our community. This is especially true for the fossil fuel terminals and that is why we're here today to support the readoption. Situated in a liquefaction zone between two of our city's most important natural resources forest park and the Willamette river is less than ideal. With these facilities built before current building code and seismic standards were in place. This places is a huge public and – this places are public and private investments in the superfund cleanup and forest park restoration at great risk. As important or more important it also puts adjacent neighborhoods like linton and st. John's at risk as well. But also downstream communities, local workers and communities along the infrastructure that services these facilities like pipelines and rail lines. Many of this infrastructure intersects through low income and communities of color in north and northeast Portland. Several years ago alongside our coalition partners we helped push this policy forward. We worked collaboratively with the city to help shape it. We helped defend it in court when the oil industry and the Portland business alliance challenged it. Today we're here to give support for the proposed amendments and readoption. The reinstatement of this ordinance is an important step by the city in reimplementing the grass roots led vision to protect our community and environment from additional fossil fuel infrastructure and it must be followed by additional, more ambitious steps if we are to further mitigate the extensive risks of existing fossil fuel infrastructure located along the Willamette river throughout the city of Portland. We are happy to hear today about the ongoing work that the city is undergoing. As you see we're here to support you and to get behind your leadership and we will also be here to hold you accountable to that. Thank you.
Wheeler: Thank you. Good afternoon.
Melanie Plaut: Hi. Mayor and council, I am Melanie Plaut. I'm speaking today for 350 pdx. Dineen Orourke who is on the staff there was unable to come because she's ill. Three years ago then mayor Charlie hales said before making the vote unanimous, I'm really proud to be a Portlander and I'm really proud to preside over this city council. I vote Aye. The chamber erupted in cheers. In fact, dineen, who was working on the east coast in new England said that it was meaningful to her to all the way across the country when council passed this amendment the first time. The fossil fuel terminal zoning amendment was groundbreaking. I would like to think cities can still lead so I add my voice to those who support the council in reinstituting this code. In the intervening three years much has happened. The climate crisis has accelerated more rapidly than the most pessimistic estimates. Weather changes, floods, droughts and wildfires have made it hard for even those who profit from the fossil fuel industry to deny that climate change is occurring. Yet the federal government and state governments seem unable to take action commensurate with the crisis. What you do this council gives us hope and has proven to be a model for other jurisdictions. Here in Portland we are even more aware than we were three years ago of the risks posed by the tanks and trains in the critical energy hub. In three years trains across the country have derailed, pipelines have leaked and tanks have exploded. You know that here in Portland we have unique safety risks which I think mike Myers outlined more eloquently than anyone else could. This means that not only is it permissible as determined by the courts for the city to take action on the new bulk fuel storage code, it is the only moral option. The transition to renewables has started though not fast enough. To stand a chance of meeting the city goals for 100% renewable energy we will need to greatly accelerate the expansion. It makes less and less sense to build anything new that supports fossil fuel use when what we really need is the rapid transition off fossil fuels. We can do this. We just need to do it faster and we can't go backward. The fossil fuel zoning amendment is like insurance against backsliding. This code is a crucial step yet in itself is

not enough as others have said and we look forward to the discussed actions that the city can take. The first step today, however, is to complete what began in this room three years ago. We ask you to continue to stand strong in the face of the fossil fuel industry and the push to maintain the status quo. Remember cities lead, make us proud again.
Wheeler: Thank you. Appreciate it. Good afternoon.
Bob Boyer: Mr. Mayor, council members, I'm bob buyer. I love Portland. I have been here at the air base since 1961 before a lot of people here were born or in elementary school. I worked on the waterfront over 40 years. I was president of the union that run the tugboats. I had no idea when I worked at the shipyards sand blasting and painting ships that we were polluting the river. So I want to help clean it up. Right now I sit on the board of property tax appeal for Multnomah county, convincing people why their property taxes are at that rate. Here we are sitting on a time bomb. So I have decided to do a little research. I also was a yard foreman for the southern pacific railroad and before that I laid track. We have derailments in Mosier. Suppose they were all cars that went into the river. This heavy oil sinks right down to the bottom. I'm in support of 1082. I'm here to support you. As a yard foreman I have seen derailments. We just had one at the Albina yard in north Portland with a remote engines. So by having four generations here in Portland, father, grandfather and great-grandfather and myself, I love Portland and for that reason alone I put my hand up to protect this country when I went into the air force. I put my hand up to protect the state when I was a state senator. I have been active and created the neighborhood associations so the citizens could have a voice and for the mayor and city council to recognize us. I love Portland. I'm here to support you and some of you already know me. I mean what I say. Thank you.
Wheeler: Thank you, sir. We appreciate it. Thank you for being here. Thanks all three of you. Next three, please, Karla.
Moore-Love: Are Monica Zazueta, Ryan Rittenhouse, and Edith gillis**,** and they'll be followed by dorn burell, tara ota, and nick caleb.
Edith Gillis: I'm Edith Gillis and I'm saying wee need to ban crude oil until safe effective firefighting foam is on site, ban tar sands oil until zenith pays worst case costs to the county and city refundable 30 years after the end of its use and its cleanup. Require oil transport storage refining and use to supply their own safe, fire foam, and I want you to realize there has never been invented any firefighting foam that is effective, prompt thorough or safe or has ever been cleaned up from the environment. Every firefighting foam that's ever been used continues in the bodies and in the children and progeny of those who have used it and the environment and all the species that have been studied in the environment. It affects over 800 -- it causes proven to cause over 800 serious diseases, disabilities and deaths, and it's in every single system of the human body. It continues for generations. Don't allow tar sands oil in Portland or the surrounding waters until the owners and transporters prove through reliable third parties that they have adequate fire and explosion prevention, prompt soil suppression with safe and environmentally beneficial products and processes with each train, tank, terminal, ship and along the routes paid for by the owners. Make sure that their firefighting crews on staff have adequate training, supplies and lifetime for several generations of disability payments. Please read the intercept October 24, 2019 article. The top u.s. toxicologist was barred from saying pfas it causes disease in humans. She's saying it now. After her entire 40 career of study Dr. Linda Burnham retired from the national institute of environmental health sciences 19 years with the epa and the national toxicology program director says firefighting foams are unsafe and harmful. The chemicals known as pfas, or per, polycule and polymolecule and other substances persist in the environment and affect every system in the human body. Don't allow the cause or the need for it until you have proved what we have is safe to deal with it.
Wheeler: Thank you. Commissioner hardesty had a comment.

Hardesty: Thank you mayor, Edith I want you to know one of the things we're looking at is whether or not we can require these industries to have their own firefighting personnel and equipment. What we know is that if we have a major incident in this energy hub that is our firefighters have not been trained nor are we equipped to fight the kind of fire that these oil refineries -- these oil tanks would have. So know that we're working on it. We are working on it.
Gillis: We require fire extinguishers and if they can't come up with the fire extinguisher to put it out they don't have it.
Hardesty: You know Edith I'm not mad at you cause that's one of the first things I thought. I did not want to send my personnel into a situation that they have not been well trained or have the appropriate equipment to respond to, but they would go because that's what they do. That's not acceptable. So thank you.
Wheeler: Good afternoon.
Monica Zazueta: Good afternoon commissioners. My name is Monica Zazueta, I'm from Vancouver, Washington. I'm a wife and a mother of a beautiful five-year-old son named Aries Tabor. Before two months ago I was wrapped up in my own world and didn't watch much news and didn't know what the government really did or what the city council or the port of Vancouver did. I didn't educate myself on those matters because I didn't think they mattered to me. This morning I rewatched a video of Greta Thunberg speaking to the u.n. that was the video that changed everything about my life. I remember feeling scared, confused and shocked. How could we not have known about this, why weren't we pulling away from fossil fuels as soon as possible if our own lives are at stake. I wanted to know more about what was really happening to our planet, our home and wanted to plug in and try to help any way that I could. I didn't know what I could do but I had to do something. Every day the truth became more and more clear in the workshop, trainings and meetings that I was attending. Sierra club and sunrise over Vancouver, Washington were two groups I found. Their support and actions were inspiring and we all were working towards the same thing to save our generations and the generations to come. I'm a mother and when I start to think there's a big possibility that he might be living a miserable life with unbearable temperatures, earthquakes, hurricanes and so much more it breaks my heart. The stress, the anxiety, the fear, the anger all come up when I think about the climate crisis. I promised my son that I would try my best to take care of him and I'm going try to keep that promise. I urge council to reinstate the ordinance and continue to stand strong against fossil fuel companies. The work has just begun so I want you to know I want to tell you all that I'm here to stand with you. Vancouver, Washington and is here to stand with you and Portland is here to stand with you.
Wheeler: Awesome. I appreciate this. You know we're going to win this fight, right?
Zazueta: Yes. We are.
Wheeler: Thank you for being here.
Hardesty: We don't have an alternative.
Ryan Rittenhouse: Good afternoon. Thank you for letting us testify today, my name is Ryan Rittenhouse, I work for friends of the Columbia river gorge. With that name probably comes to mind Mosier and the oil train disaster that happened there which is pertinent to this conversation. One of the things I would like to remind folks about that disaster is one of the reasons it wasn't much worse that it was as bad as it was it could have been much worse, one reason it wasn't worse is that the train wasn't moving very quickly Union pacific is currently right now and actually before that disaster had already started the process of trying to expand their siding right through the town of Mosier for the express purpose of raising the speed of the trains to pass through that area. If they are successful at getting that expansion through as they want it they will be able to increase the speed of the trains to 60 miles an hour. The speed of the train that derailed in Lac-Mégantic Quebec and destroyed the town was running away at 65 miles an hour. So you can imagine how much



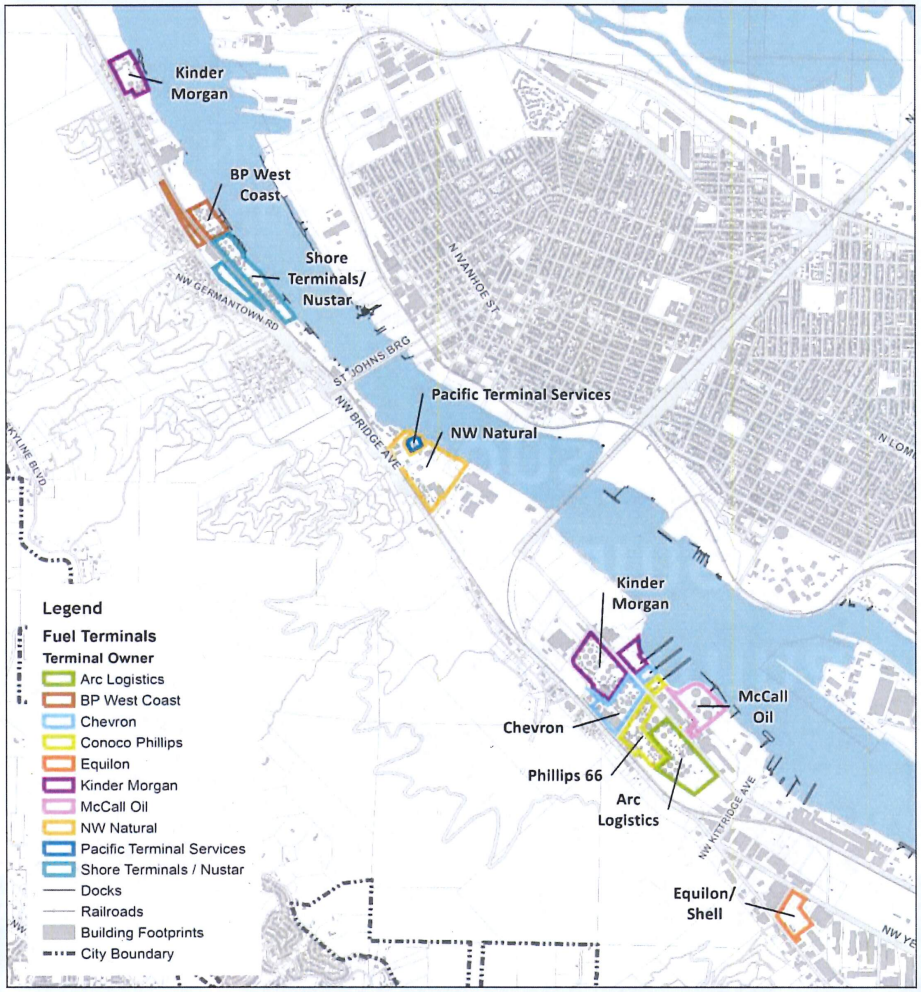
worse the disaster in Mosier would have been had it been moving at 60 miles an hour other that it was moving very, very slow. Also a quick note, I don't have much time but a quick note on biofuels, as you know we're very concerned with the zenith terminal, also global partners, all of the oil trains that serves those facilities, most of the oil trains that serve the facilities in California and of course all the ones up in the Puget sound all come through the Columbia river gorge national scenic area and while we recognize it's important to allow certain kinds of biofuels in the future, those should be disincentivized in favor of truly renewable resources especially because the fossil fuel industry is very savvy and very good at manipulating laws and loopholes. We have seen that. You're familiar with them over the zenith terminal and I'm worried that in the future they may try this again with biofuel terminals. So it needs to be very clear and we're going to need to maintain very extreme diligence over any such terminals that get approved in the future to make sure that the fossil fuel industry doesn't figure out a way to come and buy that facility and flip it as they have done with zenith and global partners. You have also heard a lot already and you'll probably hear more from the fossil fuel industry about how they want to do upgrades and how all of this is bad for them and bad for their economics. Just remember you are not here to make their jobs easier or to make their business more profitable. You are here to protect the citizenry and the environment and we're all here to dismantle the fossil fuel industry, not make it more profitable for them. To wrap up, this is just beginning. I'm glad to see you recognizing that as such. We need to move forward and this is a golden opportunity to make a just transition not just for the environment but for social justice. This is an opportunity to move towards more transit options more accessibility along those lines and just remember that every carbon atom we dig out of the ground and put into the air is one we have to take back out of the air and put back into the ground.
Wheeler: Thanks all three of you. Next three Karla.
Moore-Love: The last three who signed up Doran Burrell, Nick Caleb and Erin Saylor.
Wheeler: Nick you want to go ahead and start, thank you.
Nicholas Caleb: Greetings, commissioner, mayor, my name is Nicholas Caleb I'm the staff attorney for the center for sustainable economy. I have been working on fossil fuel infrastructure campaigns and policy making since 2013. The original energy that brought this infrastructure fight to Portland council has only grown over the years as there's increasing understanding throughout the world that the type of action Portland is taking must happen everywhere at once. I'm very pleased to see the fighting spirit for taking on the fossil fuel industry transcending several different councils. It's necessary given opposition from an industry with nearly bottomless resources. Thank you commissioner Fritz for being an early adopter of strong action, having a strong voice and for your continued attention to these issues. Thank you mayor Wheeler and commissioner Eudaly for your votes to defends the amendments in court and support for remand. Thank you commissioner Hardesty for your advocacy on climate justice issues and for smart and necessary regulations to protect Portland's residents. We look forward to working with you to manage fossil fuel infrastructure and I think we have a great momentum right now. Thank you.
Wheeler: Thank you Nicholas, appreciate it. Last, but not least.
Erin Saylor: Good afternoon, my name is Erin Saylor, I'm a staff person attorney with Columbia river keeper. Thank you for providing us all the opportunity to speak with you today. Industry has submitted testimony into the record arguing adoption of the fossil fuel terminal zoning amendments would prevent the development of renewable fuels. That is simply not the case. Biofuels are specifically exempted from the scope of the amendments and zenith's assertion that the city's recent denial of the request to build three new pipes under northwest front avenue extensively for biofuels was the result of the city resolution against the expansion of fossil fuel terminals completely ignores the rest of the city's decision which was clearly tied to zenith's past performance under its franchise

agreement. Companies who want to construct infrastructure dedicated solely to renewable fuels will not be prevented from doing so under these amendments. Companies who choose to handle both fossil fuels and renewable fuels at the same facility are not only free to but encouraged to reduce the amount of fossil fuels stored at their facilities in order to increase the amount of renewable fuels that they can store. Industries argument that these amendments will prevent them from completing seismic upgrades also falls flat. There are other was to complete the upgrades without building new temporary storage tanks. It's a total red herring to for them to argue that these incredibly important amendments will prevent them from completing these necessary upgrades. Thank you.
Wheeler: Thank you. Does that complete public testimony Karla?
Moore-Love: Yes, that's all who signed up.
Wheeler: Colleagues do we want to bring staff up for additional questions? Let's get on with it. Please call the roll.
Moore-Love: I'm sorry Robert did you have a?
Robert Taylor, Chief Deputy City Attorney: Sorry, mayor. We would like you to please keep the record for written testimony open until 9:00 a.m. Monday, December 2.
Wheeler: Why?
Taylor: To allow staff to complete their work.
Wheeler: What's the work they need to complete. Could you come up and clarify that for us, please?
Armstrong: Yes, mayor, if you will, one of the issues that we got dinged on by luba is not fully considering and responding to all of the testimony a number of testimony has come in this afternoon into our website. So I guess to put us in a better defensive position we want that time to be able to review the testimony over the holiday and to respond to it on the record before you guys make a decision.
Wheeler: We have waited this long. A few more weeks and it gives you something to do over the holidays.
Taylor: Right.
Wheeler: How nice, commissioner Fritz did you have any comments.
Fritz: I was going to suggest since our wonderful constituency here that we could each make our comments now so you don't have to come back next time. You can if you want because it's really nice to see you.
Wheeler: That would be fine. Let's go down the row. Commissioner Eudaly.
Eudaly: Good afternoon, everybody. I don't always feel that Portland deserves its progressive green reputation, but I'm proud of our city and our city council today. Earlier today we passed an item that clears the way for mobility hub on the central east side for electric cars, bikes and scooters. We're also taking action in investing and improving our public transit system. These are just a couple of ways we can combat climate change through sustainable transportation options where we have given preference to single occupant gas powered vehicles in the past. This ordinance is the flip side of these actions. While we make sustainable options more viable, we must carefully regulate and restrict industries and practices that endanger our people and our planet. Thank you to the council of 2016 especially commissioner Fritz and Fish. Thank you to our office and city staff and attorneys who do the hard work of turning our values, priorities and aspirations into making strong, defendable policies. Most of all thank you to community activist, advocates and organizations. We wouldn't be here without you and we need you to keep pushing us to do better.
Fritz: Waiting to be called upon. We have to not vote aye at the end I have to remember that because we of course want to make good findings before doing our vote. Sometimes people think that a remand from the land use board of appeals is a bad thing. In this particular instance it means we get to vote on this ordinance and vote on it again. I think I feel really best that we have the opportunity because it is a really important thing that we

did and that we are doing and we're going to do even more. So I appreciate my colleagues who didn't have that joyful experience in 2016 are getting to have it now. Thank you. I had forgotten about the paper stream as that's such a good thought. Oh, yes, really great. Thank you. I especially appreciate the young person from Ockley green who said that each of us needs to think about what more can with we do. I'm not going to ask for a show of hands if you took transit or walked or biked to get here, but every single day in everything we do we need to think how can I do more. Commissioner novick who you all remember was a strong supporter of this policy, texted me a few months ago to tell me about the energy use of clothes drier, tumble dryers and that's the most energy consumptive things in our homes. So I'm now hanging out my clothes to dry on a nice line that I have. I wouldn't have thought of that without the commissioner doing that. It's a very simple thing it takes a day to dry the clothes instead of an hour but if that can help stop getting millions of tons of carbon dioxide into the atmosphere if everybody in America did it why would we not want to do it? Again if people want to email me with further suggestions on things that could be done that I wouldn't necessarily have thought of, I am really interested and I think we all should be interested in what more can I do rather than as well as what more should the government be doing because it's clear that the cities are going to have to lead, our federal government is letting us all down badly. Each one of us can make a difference. Thank you so much each of you for being here.
Wheeler: Commissioner Hardesty.
Hardesty: I want to echo the thanks. I love when this chamber is filled from top to bottom. I love when this chamber is filled of people of all ages and all backgrounds. I love it especially when we're all here for a common cause. It's always good to have the other side but clearly there is no other side when we're talking about saving the planet, right? And the inhabitants of the planet. I take this issue very seriously because my role as managing three of the four first responder bureaus at the city of Portland means my folks are on the front line of this every single day. When a bad thing happens my folks will be the one that will show up no matter what. They will show up and they will do the best job they can possibly do. We have an obligation and responsibility to make sure that we are not putting public servants in harm's way, and that people who know that their products cause harm and will destroy communities have an obligation to remediate the harm that's done. So I as part of the regional disaster preparedness board talk about a reality check, recently at one of our meetings when there was like a 60-second video, it was a very short video that actually took pictures of all the tankers and just had a helicopter flying around and giving you a visual. When you see it from the air what you see is that these are very, very, very old tanks that you would think are probably leaking if they are not leaking today they leaked sometime in the past. So this action that we're going to take whenever this comes back to the city council is just one small piece of all the pieces that we have to do to address climate change. No one here wants to see the disaster happen because of the, even if it is working the way it is supposed to, disasters could happen and so we have an obligation to make sure that we are protecting the health and safety of not just public servants, but also the public in general. I appreciate each and every one of you for making the time to be here today and I would encourage you to not just show up and talk about this when it is on the agenda, but this is something we have to talk about every single day until we address the big issues that are on the table, thank you.
Wheeler: So, I don't have a well thought out speech so I'm going to wing it, bear with me. Number one, thank you for everybody who showed up today to testify. I thought it was fantastic testimony. This has really been a good day overall for the council in terms of very, very high-quality testimony. I learned a lot from everything that you said and I appreciate it. Number two, I was proud to publicly endorse support the ordinance when it came before the city council in 2016, but I did not have the opportunity to vote for it and so I'm glad I will have the opportunity to vote for it here, not today, but in the near future and I'll get to that

in just a moment. Number three, the sense of urgency here is obvious and has been mentioned many times. Cities have to lead, the federal government, the trump administration they are now working against us in terms of our efforts to address climate change on the planet and I was very proud to have recently gone to the c-40 global mayors global summit in Copenhagen and it was an opportunity for me to interact with mayors and leaders and heads of state from all around the world and the overall message there was we are still in and we are more aggressive than we've ever been in terms of addressing our climate action goals and I have to say this as an envoy from the city of Portland, Portland is very much regarded as a global leader when it comes to the issue of the environment and climate action. I want to second what commissioner Eudaly said earlier about how proud she is about the actions this council has taken recently. I am, too and in effect, we are now backing up a whole host of very specific strategies that we can take as a city and you'll be learning more about that in the weeks and the months ahead and I'm very glad about that. On a cautionary note front. The whole issue of oil trains going through our community bothers me on many fronts. The first is the obvious one the environmental and public health and public safety front. Somebody alluded to the crash in Quebec some number of years ago. I wanted to reiterate that crash killed over four dozen people and burned half the town to the grown. Shortly thereafter the derailment of 1996 fossil fuels cars in mossier, which could have been a environmental public health and a public safety catastrophe had things turned out just a little bit differently. As commissioner hardesty mentioned, and as other mentioned in their testimony, we had a oil train going through are the rail yards here in central city at a very low rate of speed the train still managed to hit an overpass and derail. If that had happened in a typical scenario with a more regular speed, who knows what the outcome could have been, but from my perspective it doesn't take a genius to figure out having oil trains going through natural habitats and then through densely populated neighborhoods is not a safe environmentally sound strategy nor is it in the best interest to the public health and if we are not here to protect those things, while else would we possibly be here? I am proud to have the opportunity to support this fossil fuel ordinance. I'm very glad, Robert is the best public sector legal counsel we can possibly have on these issues and we're right at every step. Let's dot the i's, lets cross the t's. Make sure that once we do this its done and its done we're not have to bring it back and do it again. We are done with oral testimony. The record for written testimony is going to remain open until 9:00 am on Monday, December 2nd, that means if anybody wants to submit an e-mail please submit an email, your testimony must be received by the council clerk by 9:00 am to be included in the official record at that time the record will be closed. This ordinance is continues to Wednesday, December 18th at 3:00 p.m. time certain, if you want to be here that's great you can be. When the council reconvenes there is the opportunity, should commissioners wish, to introduce amendments at that time. The council will determine whether additional public testimony is warranted for any proposed amendments and the council may, if it so chooses to reopen the record for the limited purpose of testimony on the amendments at that time. Is there any other business, colleagues? Then this hearing is continued to Wednesday, December 18th at 3:00 p.m. time certain, thank you everyone for showing up and we are adjourned.

At 3:35 p.m. Council recessed.



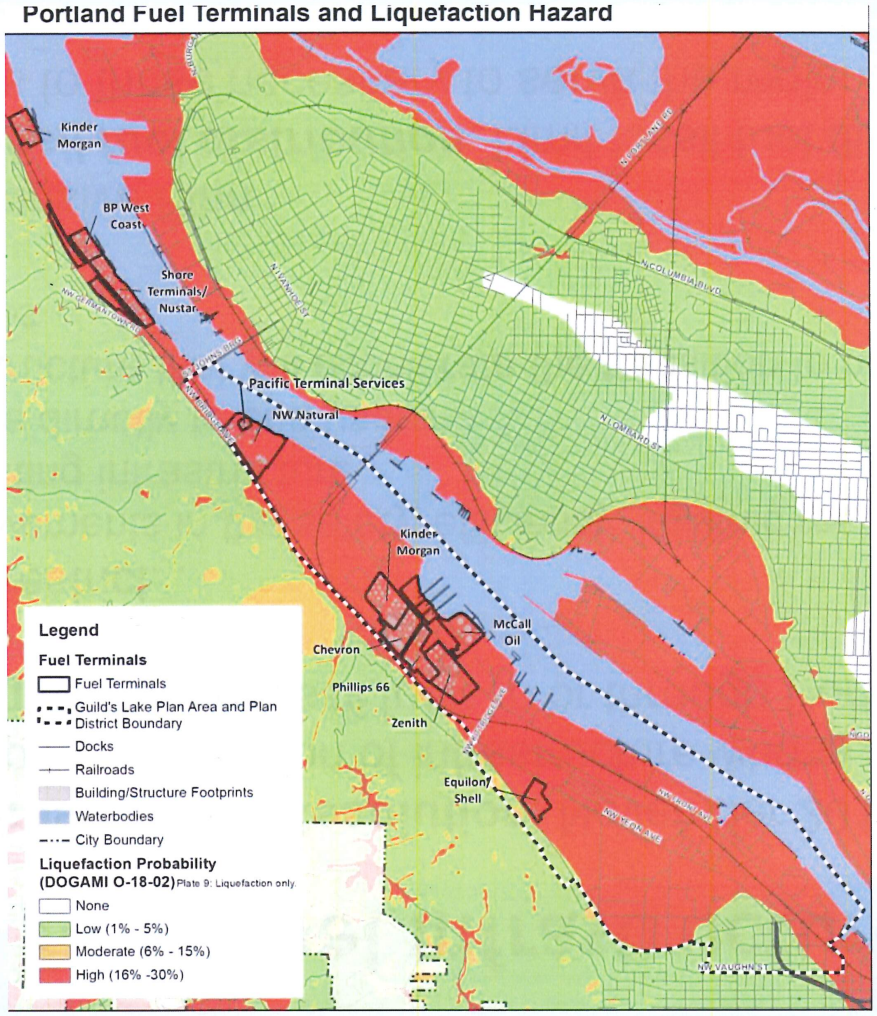
Fossil Fuel Terminal Zoning Amendments: Remand Reconsideration

City Council Public Hearing
November 20, 2019

Bureau of Planning and Sustainability
Innovation. Collaboration. Practical Solutions.

Existing Terminals

Policy direction on fossil fuel infrastructure

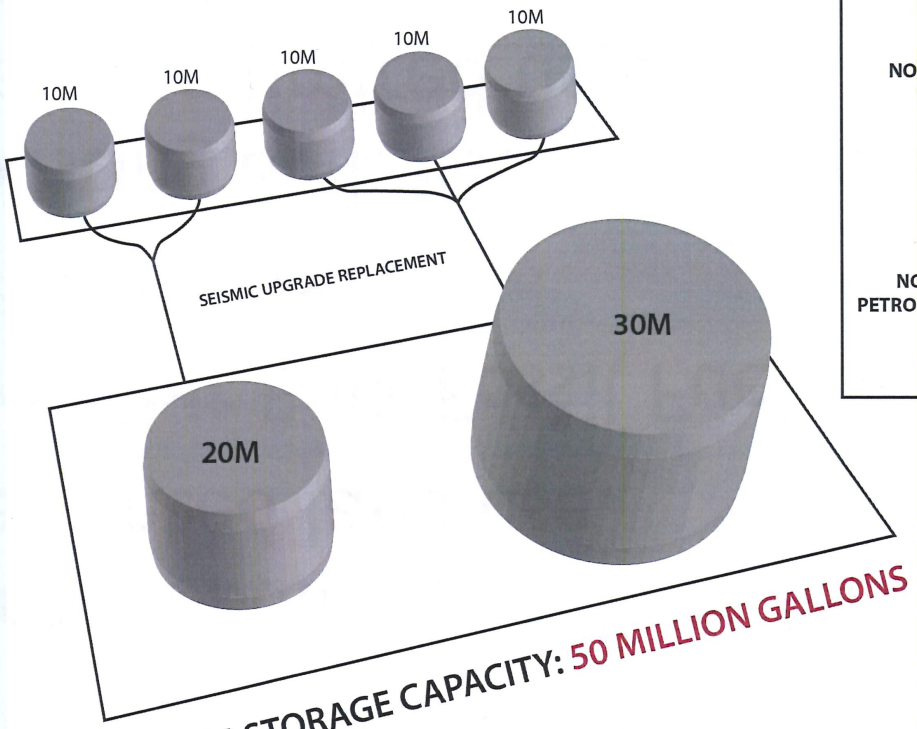


Fossil Fuel Infrastructure Resolution, November 2015:

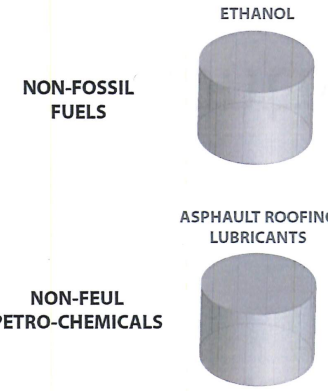
1. Actively oppose expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways.
2. But do not restrict. . .
   - improvements in the safety, efficiency, seismic resilience, or operations of existing infrastructure
   - service directly to end users
   - infrastructure that will accelerate the transition to non-fossil fuel energy sources

2035 Comprehensive Plan

Policy 6.48 Fossil fuel distribution. Limit fossil fuel distribution and storage facilities to those necessary to serve the regional market.



Public safety and environmental risks



Zoning code amendments

- **Define** Bulk Fossil Fuel Terminals as a regulated land use.
- **Prohibit** Bulk Fossil Fuel Terminals in all base zones.
- Existing Bulk Fossil Fuel Terminals become limited uses that can continue to operate.

Existing Terminals

NOT INCLUDED IN CAPACITY LIMIT:

MAXIMUM STORAGE CAPACITY: 50 MILLION GALLONS

New land use category:
Bulk Fossil Fuel Terminals

Bulk Fossil Fuel Terminals:

- Marine, railroad, or pipeline transport access; and
- Transloading facilities (such as train-to-ship) or storage capacity exceeding 2 million gallons.

Exclusions:

- Distributors with access exclusively by truck;
- End-user facilities, including filling stations and firms that store fossil fuels for use as an input;
- Airports, marine and rail servicing facilities.

Defining fossil fuel

Fossil fuels are petroleum products (such as crude oil and gasoline), coal, methanol, and gaseous fuels (such as natural gas and propane) that are made from decayed plants and animals that lived millions of years ago and are used as a source of energy.

Exclusions: Denatured ethanol and similar fuel additives, biodiesel/renewable diesel with less than 5% fossil fuel content, and petroleum-based products used primarily for non-fuel uses such as asphalt, plastics, lubricants, fertilizer, roofing and paints.

Remand Issues

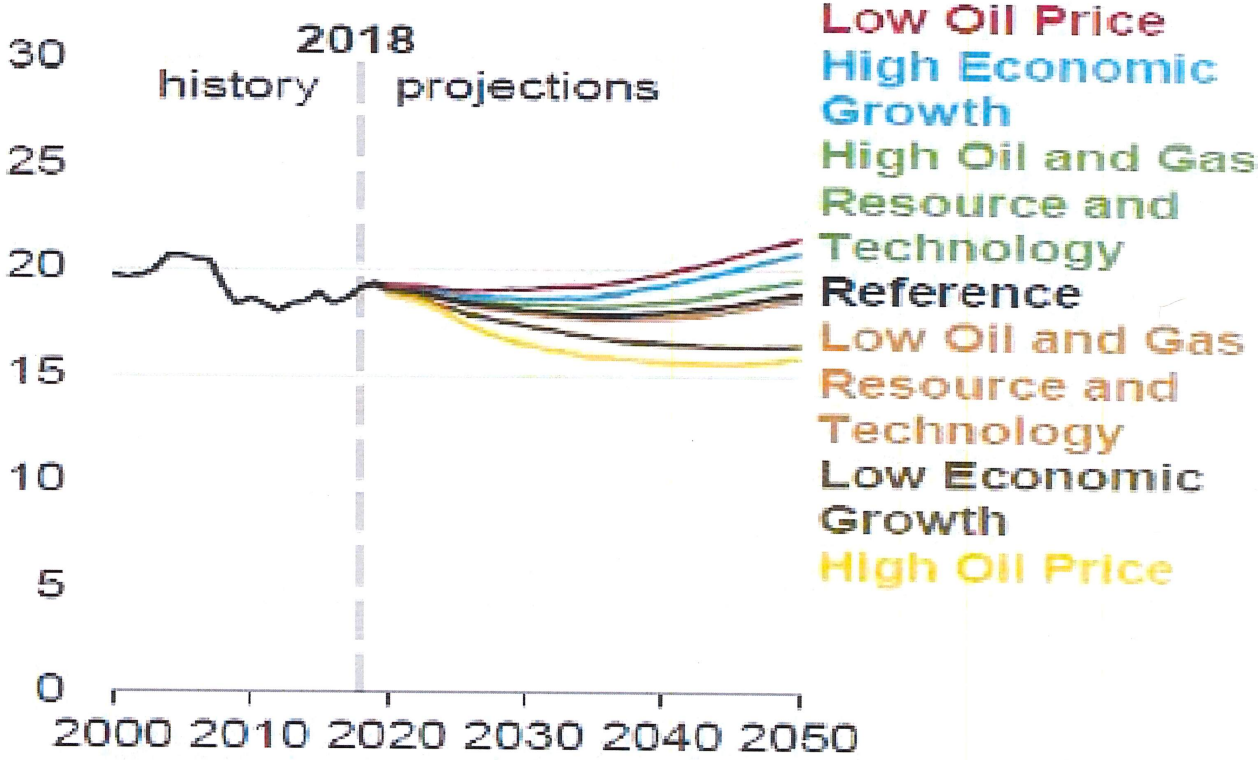
- Address policies in Guilds Lake Industrial Sanctuary Plan
- Address future demand for fossil fuels

Guilds Lake Industrial Sanctuary Plan

- Foster an environment that promotes continued investments in infrastructure, facilities, equipment and jobs.
- Maintain, protect, and enhance the multimodal transportation investments to ensure its continued viability as a major center for the import and export of industrial products in the state of Oregon.

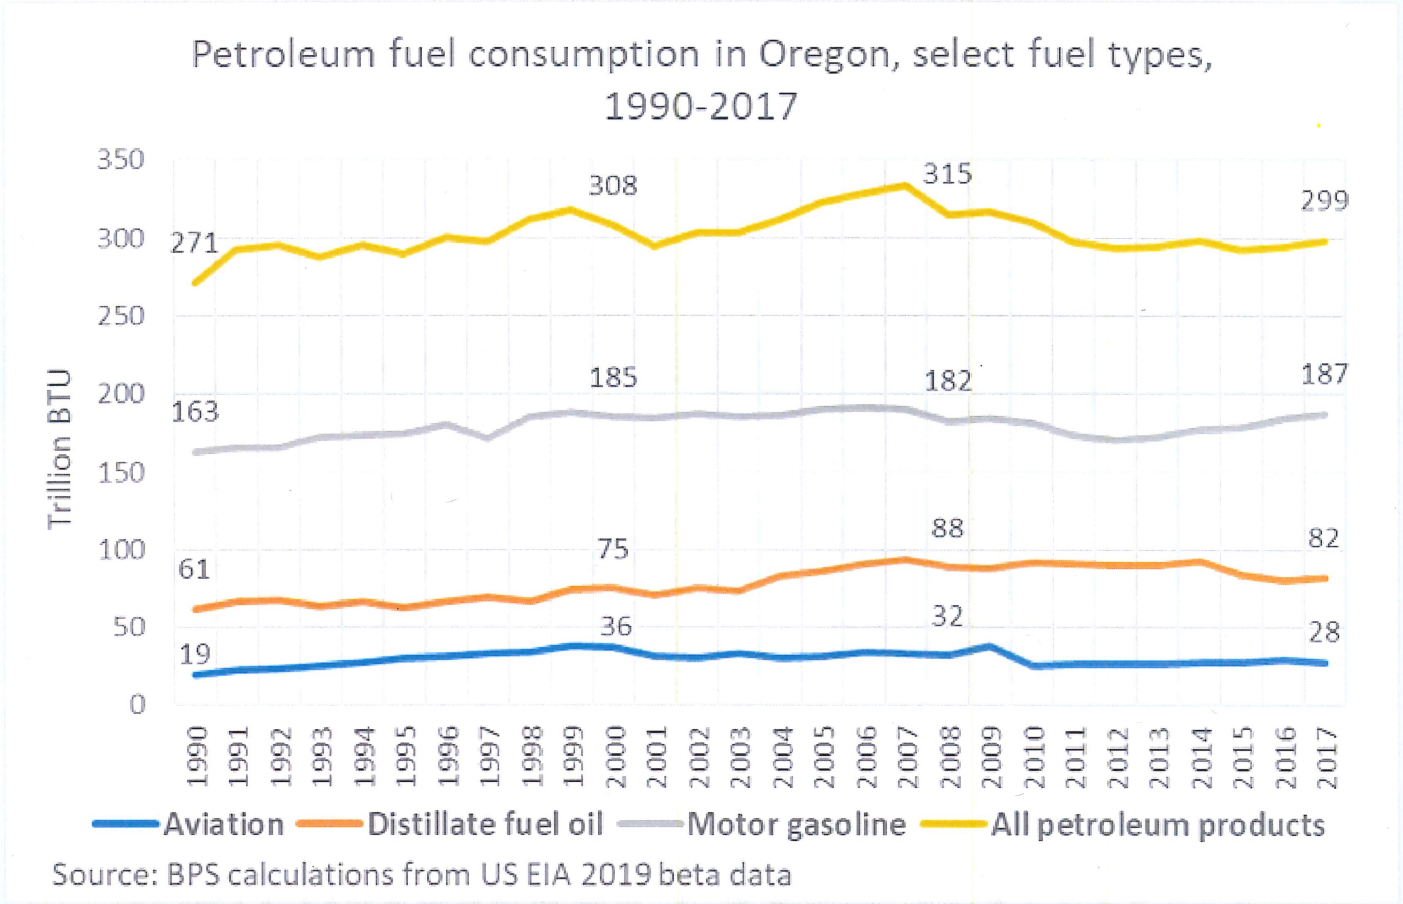
Future demand for fossil fuels

2035 Comprehensive Plan

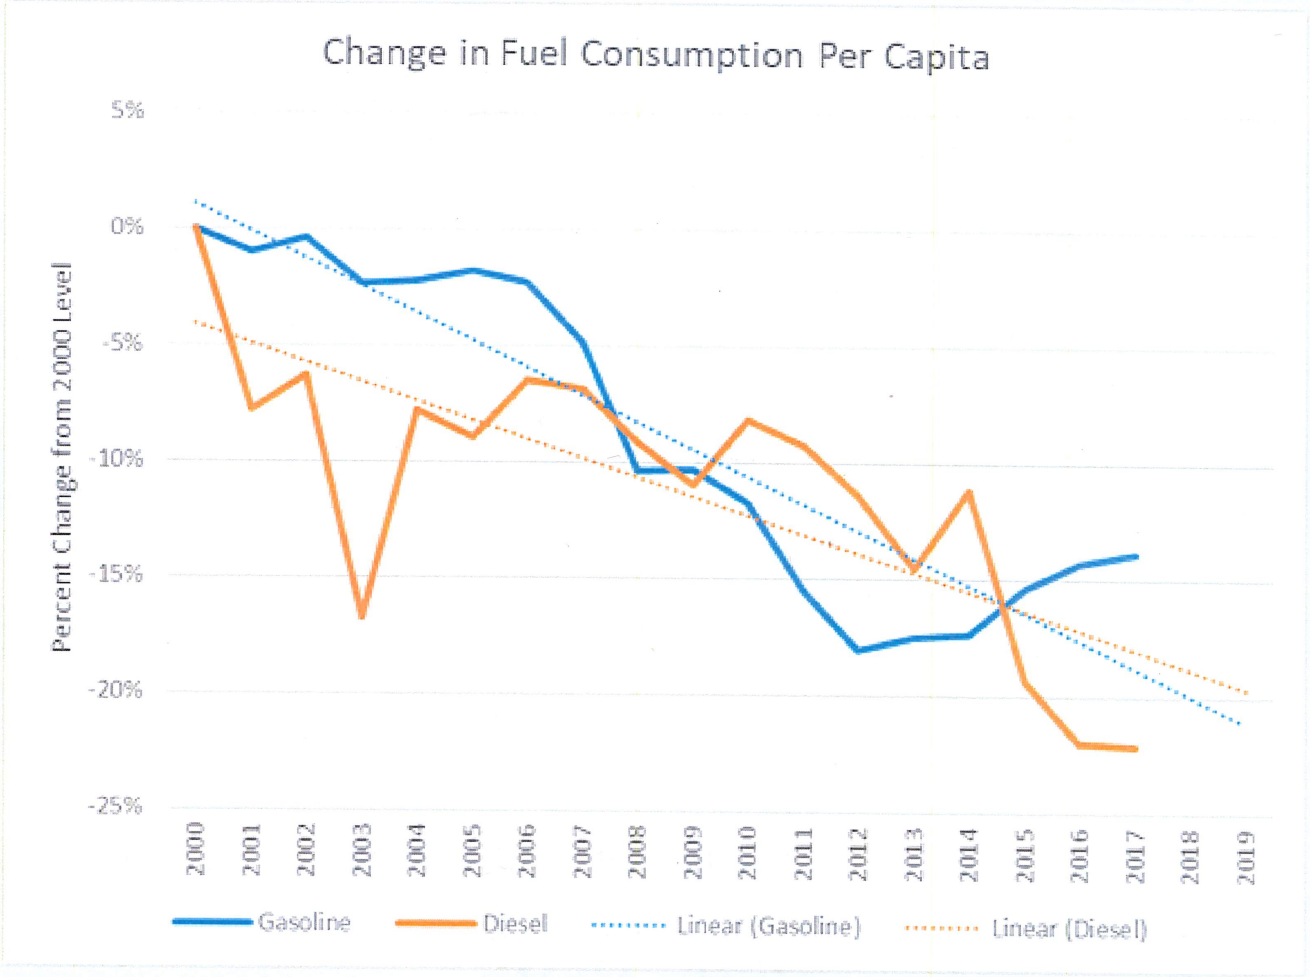


Policy 6.48 Fossil fuel distribution. Limit fossil fuel distribution and storage facilities to those necessary to serve the regional market.

Regional Market

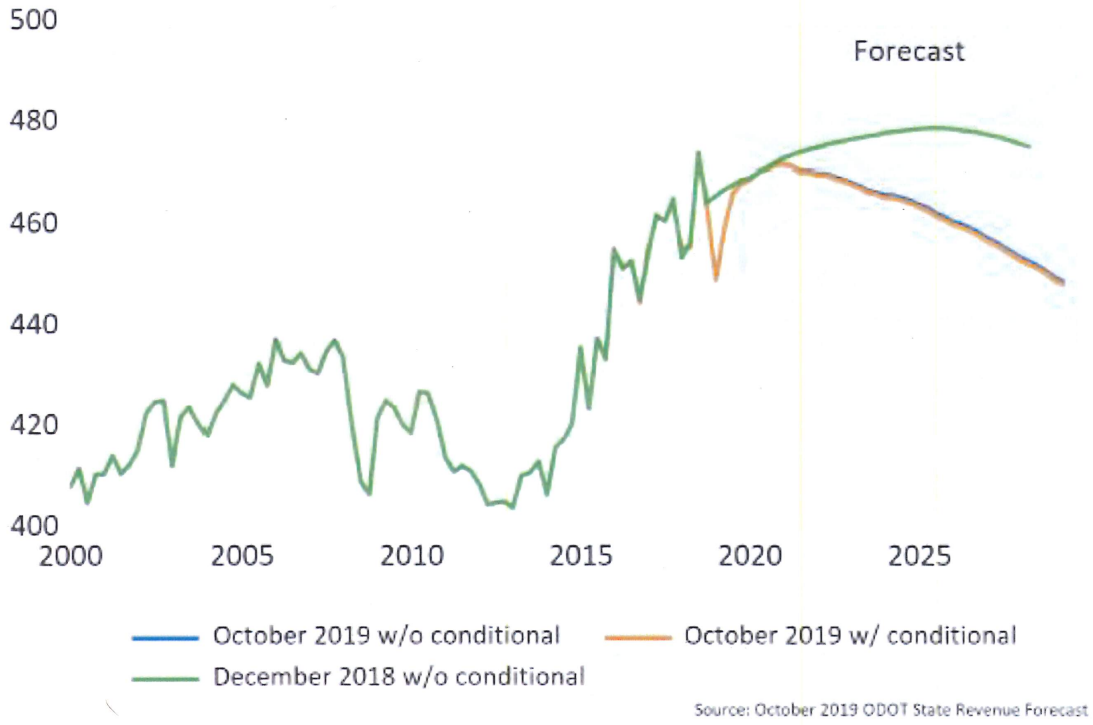


U.S. Energy Information Administration
2050 Reference Case - U.S. Total



Petroleum and other liquids consumption
million barrels per day

Oregon Petroleum Consumption



Oregon Gasoline Consumption

ODOT Motor Fuels Forecast 2020-2029

Figure 19. Gallons of Taxable Motor Fuels Forecast Comparison

Source: October 2019 ODOT State Revenue Forecast

Cargo Forecasts

- Liquid bulks – mostly petroleum products
- *2011 Oregon Freight Plan (revised 2017)*
  - 1.7% annual growth from 2002 to 2035
- *2012 Portland Harbor Forecast Update (BST)*
  - 0.7% annual growth from 2008 to 2040
- *2015 Port of Portland Commodity Flow Forecast*
  - 0.7% annual growth to 2040
- *2017 Marine Cargo Forecast (BST)*
  - 0.8% annual growth from 2008 to 2040

Policy and Programs to reduce fossil fuel consumption

- State GHG reduction goal
- ODOT Sustainable Transportation Initiative
- DEQ Clean Fuels Program
- Metro Climate Smart Communities
- Metro Regional Transportation Plan
- Portland Climate Action Plan
- Portland Transportation System Plan

Balance conflicting policies

On balance, is the decision equally or more supportive of the goals and policies as a whole

- Reduce risks from natural hazards
- Limit fossil fuel terminals to what is existing
- Maintain industrial sanctuaries

Technical Amendment

Neighborhood Contact

- Clarification that the neighborhood contact requirement only applies to new non-fossil fuel storage proposals.

Sue Tarjan

#62692 | December 2, 2019

Testimony to on the **Fossil Fuel Terminals Zoning Amendments, Remand Draft**

Email received on Sunday, December 1, 5:37pm My husband and I attended the Fossil Fuel Zoning Amendments Public Hearing on November 20, 2019, and we applaud the efforts of those who testified and of our city council members and staff. We hope that this issue continues to be prioritized. The matter is urgent. Our responsibility is clear, as we were reminded by the two passionate young ladies and others who testified. On the same day as our hearing, North Dakota's Department of Environmental Quality reported that the October 29 spill from the Keystone pipeline is ten times larger than initially reported. TC Energy Corporation (formerly known as TransCanada) now says that over 380,000 gallons of crude oil were spilled in a rural wetland. Yet nobody has gone to jail for lying about what occurred. This is just one of many oil spills and toxic releases and industrial accidents that happen over and over again across our nation and the world. In the US, the sham of corporate personhood may shield individual shareholders and employees and managers of corporations from criminal liability, but it does not shield them from ethical liability. The corporate practice of privatizing profits and socializing losses is really at issue here. If these corporate "persons" destroy our shared environment and communities, they should be punished. Ultimately, the only real way to do that is to yank their corporate charters. Socialism for the rich (bankruptcy court, bailouts, and tax breaks) and capitalism for the poor (pollution, environmental degradation, and higher taxes to pay for clean-ups) has got to stop. If corporations break it, they should own it, not pass on the costs of catastrophes onto their victims. The city council has heard suggestions about requiring that Zenith Energy and others be insured against catastrophic accidents, but what happens when those insurers go bankrupt? Such an outcome is not unlikely should the Cascadia fault gives way and take with it the tank farms on the Willamette. Who pays for cleanup after a disaster is a trivial issue, however, compared to the deaths, injuries, and permanent environmental damage that will be certain to occur should such a disaster transpire. So we need to be looking at prevention. That means requiring IMMEDIATE earthquake remediation of unsafe industrial structures, not just a ban on future growth. As an example, here is a link to a 2015 ordinance passed by the City of Los Angeles mandating retrofitting of older buildings: https://www.ladbs.org/docs/default-source/publications/misc-publications/ordinance_183893.pdf?sfvrsn=6 What we need is such a mandate covering industrial properties. Remember Fukushima. We are residents of St. Johns neighborhood and willing to help the city get this done to protect our community. Tell us how. Set an example and draw a line in the sand on the banks of the Willamette that will help other communities do the same. With the utmost sincerity, Sue and Jim Tarjan

MEMO

DATE: December 1, 2019

TO: Mayor Ted Wheeler
Portland City Council

FROM: Tom Armstrong, Supervising Planner

SUBJECT: Fossil Fuel Terminal Zoning (FTTZ) Amendments
Regional Demand for Fossil Fuels

In considering whether the FFTZ amendments are equally or more supportive of the comprehensive plan as a whole, Council must consider Policy 6.48:

> **Policy 6.48 Fossil fuel distribution**. Limit fossil fuel distribution and storage facilities to those necessary to serve the regional market.

Conclusion
What is necessary to serve the region?
The existing FFT storage capacity, with the allowed exceptions, is sufficient to serve the region out to a 2050 planning horizon based on the following findings:

- The US EIA national petroleum consumption forecast out to 2050 is essentially flat, which is a continuation of historic trends in Oregon and Washington.
- Jet fuel is one sector where consumption is forecasted to grow, but the FFTZ amendments specifically exempt those types of facilities.
- The ODOT gas tax revenue forecast out to 2029 shows a declining volume of motor fuels.
- The most aggressive cargo forecast is the oldest. The more recent cargo forecasts project a modest growth in volumes, but those volumes do not exceed the historic peak volumes that were handled by the Portland terminals.
- Federal energy forecasts out to 2050 do not indicate a significant change in trends.

- State, regional and local carbon reduction, land use, and transportation plans, policies and programs seek to reduce consumption of fossil fuels.

There are two key phrases that must be considered in interpreting Policy 6.48. First, determine what is necessary, as in how much fossil fuel is needed by when (planning horizon year). Second, determine what is the regional market.

Key Findings

- US energy forecast – fossil fuel transportation energy consumption peaks in 2019 because rising fuel efficiency more than offsets the effects of increases in total travel, but this trend reverses toward the end of the projection period (2050).
- Oregon historic trend – gasoline consumption has been essentially flat (1990-2017), overall all petroleum product consumption is still below historic highs (2007). Washington has a similar trend.
- Oregon gas tax revenue forecast – ODOT is forecasting decreased fuel sales out to 2029 compared to 2019. Washington does not have a similar forecast.
- There are other state, regional and local policies and programs, such as the Oregon Clean Fuels program, Metro's Climate Smart Strategy, and TriMet's Non-Diesel Bus Plan. The purpose of these policies and programs is to shift single-occupant vehicle travel to other transportation modes; encourage more fuel-efficient vehicles and more electric vehicles; and provide more renewable fuels that can be expected to further reduce the demand for fossil fuels.
- The projections of moderate growth are found in the cargo forecasts that include liquid bulks, which are mostly petroleum products. The 2012 Portland and Vancouver Harbor Forecast Update has a high scenario of 0.7% annual growth rate and a low scenario of 0.3% annual growth rate to the year 2040. ECONorthwest (2012) found that these volumes could be accommodated without a new terminal because this forecast and analysis was for marine cargo only and in 2000, Portland terminals are estimated to have handled the 2040 volumes when the Olympic pipeline shutdown for an extended period of time.
- As of November 30, no other forecasts or projections on future demand for fossil fuels have been presented, nor has the information presented at the November 20 City Council hearing been disputed.

There is uncertainty inherent in any forecast. In this situation, there is more uncertainty because there is limited data available on throughput capacity because fossil fuel terminals and pipelines are privately owned and not required to publicly disclose information on the amount or volume of product moving through their facilities.

Printed on 100% post-consumer waste recycled paper.

Define the regional market
For this analysis, the "region" or "regional market" for fossil fuels is defined as the State of Oregon and parts of Southwest Washington.

The Portland FFTs serve about 90 percent of the fossil fuels consumed by the State of Oregon. Petroleum refineries in the Puget Sound area supply nearly all the petroleum fuels consumed in Oregon and Southwest Washington, delivered primarily through the Olympic Pipeline that terminates at the cluster of the 10 existing petroleum terminals in Northwest Portland. From there, petroleum products are delivered to Oregon and Southern Washington markets via truck, pipeline and barge. NW Natural supplies natural gas to its Western Oregon market area and operates peak-consumption storage terminals in Northwest Portland and Newport. Thus, fossil fuel terminals in Portland are a primary statewide distribution hub for transportation fuels and natural gas.

As part of the initial adoption of this ordinance in 2016, some terminal operators suggested using the federal PADD 5 geography to define the region. PADDs are geographic aggregations of the 50 States and the District of Columbia into five districts: PADD 5 is the West Coast (see figure). However, for the purposes of determining the regional demand for fossil fuels, the PADD 5 geography is too large. California and Washington are different markets because they are served primarily by their own facilities (Puget Sound in the case of Washington, and the Bay Area and Long Beach in the case of California). Therefore, using PADD 5 to define the region would lead to a gross overestimate of the capacity needed to serve the regional market.

States and cities by PADD for retail motor gasoline

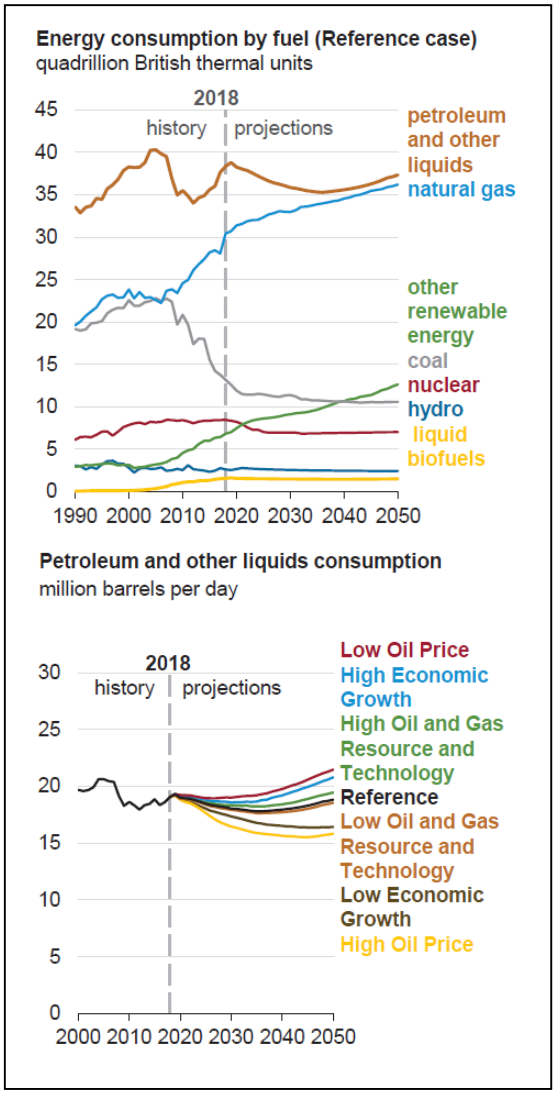
Printed on 100% post-consumer waste recycled paper.



Trends Analysis and Forecasts

There are two types of forecasts that are considered in determining the future demand for fossil fuel storage facilities: 1) energy consumption or 2) marine cargo. There is a wide range of federal and state data and forecast information on the consumption and demand for fossil fuels. This memo presents data from three sources:

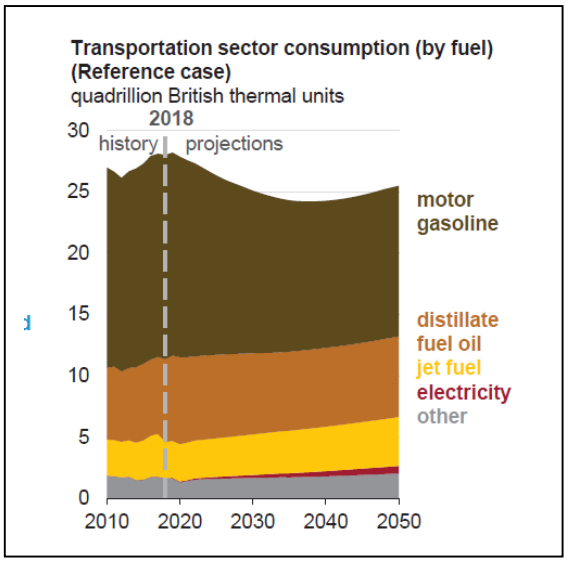
- US Energy Information Administration
- State of Oregon Motor Fuels (Gas Tax) Revenue Projections
- State and regional commodity flow/cargo forecasts

US Energy Information Administration (US EIA)

The US EIA presents information at the national and state level. The key finding is that although consumption of petroleum and other liquids has increased in recent years, the long-term projection anticipates declining consumption in the medium term with increases in the out years that brings the consumption back to current levels.

US EIA 2019 Annual Energy Outlook
https://www.eia.gov/outlooks/aeo/pdf/aeo2019.pdf

US Energy Information Administration produces the Annual Energy Outlook, which provides long-term energy projections. The 2019 report includes projections to 2050, and reflects current trends in energy production, delivery, and consumption technology, as well as economic and demographic trends. It includes different assumptions regarding macroeconomic growth, world oil prices, and technological progress. A key takeaway is that increasing energy efficiency across end-use sectors keeps U.S. energy consumption relatively flat, even as the U.S. economy continues to expand.



Transportation travel is measured in three ways, depending on the mode: highway

City of Portland, Oregon | Bureau of Planning and Sustainability | www.portlandonline.com/bps

Printed on 100% post-consumer waste recycled paper.

vehicle miles (light- and heavy-duty vehicles), passenger miles (bus, passenger rail, and air), and off-highway freight ton-miles (freight rail, air, and domestic shipping). The steepest decline in energy intensity is in the transportation sector, with the level of energy used per highway vehicle-mile traveled declining by 32% from 2018 to 2050 as a result of increasingly stringent fuel economy and energy efficiency standards for light- and heavy-duty vehicles.

The transportation sector is the largest consumer of petroleum and other liquids, particularly motor gasoline and distillate fuel oil. Transportation energy consumption is forecast to peak in 2019 in the Reference case because rising fuel efficiency more than offsets the effects of increases in total travel and freight movements, but this trend reverses toward the end of the projection period. Current fuel economy standards stop requiring additional efficiency increases in 2025 for light-duty vehicles and in 2027 for heavy-duty vehicles, but travel continues to rise, and as a result, consumption of petroleum and other liquids increases later in the projection period but does not exceed the amount consumed in 2018.

Increases in fuel economy standards temper growth in U.S. motor gasoline consumption, which decreases by 26% between 2018 and 2050. Increases in fuel economy standards result in heavy-duty vehicle energy consumption and related diesel use remaining at approximately the same level in 2050 as in 2018, despite rising economic activity that increases the demand of freight truck travel.

Jet fuel consumption is expected to grow, rising 35% from 2018 to 2050. This growth arises from increases in air transportation outpacing increases in aircraft fuel efficiency.

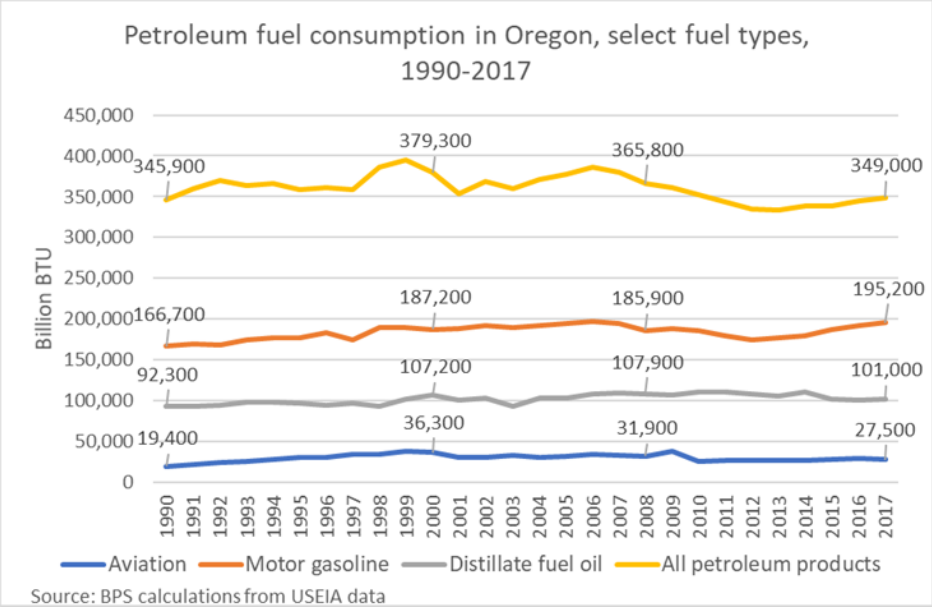
Energy use per passenger-mile of travel in light-duty vehicles declines nearly 40% between 2018 and 2050 as newer, more fuel-efficient vehicles enter the market, including both more efficient conventional gasoline vehicles and highly efficient alternatives such as battery electric vehicles. New vehicles of all fuel types show significant improvements in fuel economy because of compliance with increasing fuel economy standards. New vehicle fuel economy rises by 43% from 2018 to 2050. Light-duty vehicle energy efficiencies are affected by current federal fuel economy and greenhouse gas emission standards.

City of Portland, Oregon | Bureau of Planning and Sustainability | www.portlandonline.com/bps
1900 SW 4th Avenue, Suite 7100, Portland, OR 97201 | phone: 503-823-7700 | fax: 503-823-7800 | tty: 503-823-6868

Printed on 100% post-consumer waste recycled paper.

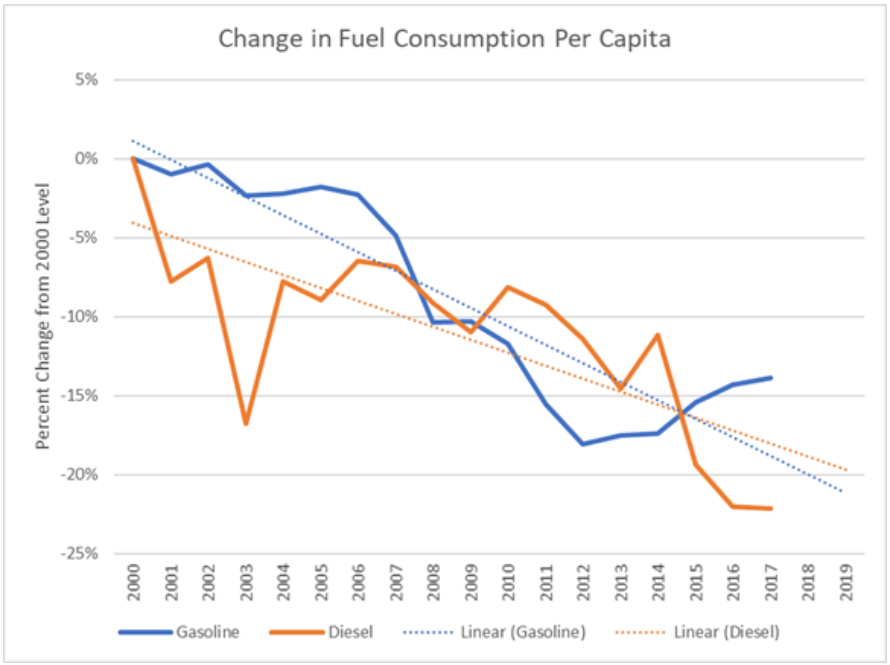
Energy use per ton-mile of travel by freight modes decreases, led by increases in the fuel economy of heavy-duty trucks across all weight classes as the second phase of heavy-duty vehicle efficiency and greenhouse gas standards takes full effect in 2027.

Select Sources	2018	2035	2050	Annual growth 2018-2050
Gasoline	17.22	13.07	13.04	-0.9%
Jet Fuel	3.58	4.15	4.77	0.9%
Natural Gas	30.42	33.86	36.20	0.5%
Coal	13.17	10.73	10.57	-0.7%
Total	**100.13**	**99.27**	**106.55**	**0.2%**



Total US energy consumption, Reference Case, 2019 AEO Table A2
(quadrillion Btu per year)

Gains in energy efficiency offset increases in travel for passenger and freight modes. These efficiency gains decrease energy use by light-duty vehicles and freight trucks later in the projection and temper the rise in energy use by other transportation modes.
The combined share of sales attributable to gasoline and flex-fuel vehicles (which use gasoline blended with up to 85% ethanol) declines from 93% in 2018 to 75% in 2050 because of the growth in battery electric vehicle (BEV), plug-in hybrid electric vehicle (PHEV), and hybrid electric vehicle sales.

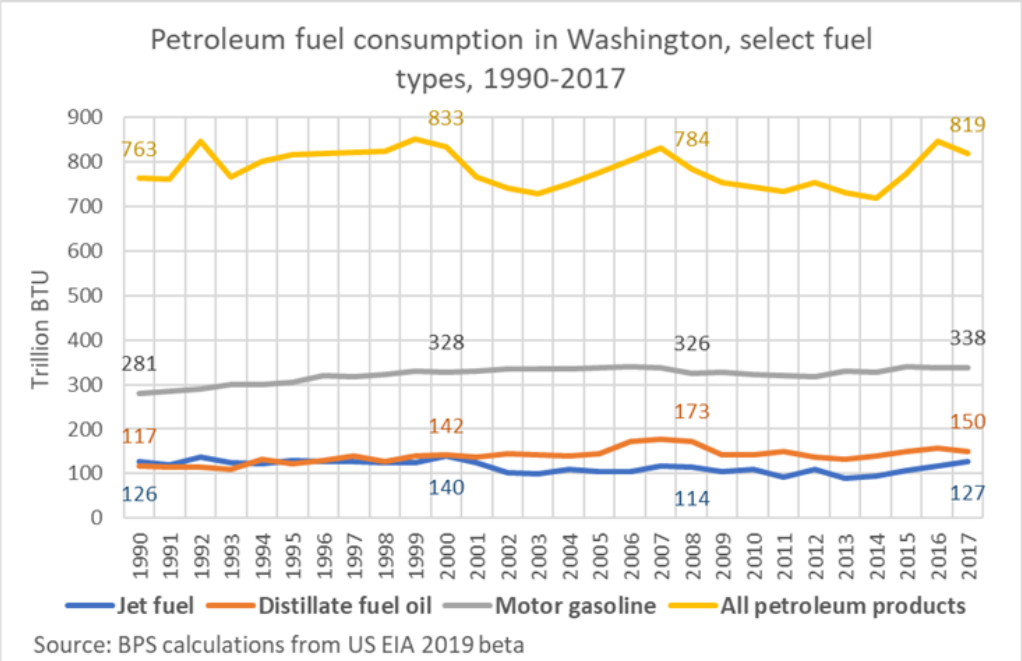


US EIA state profile and energy estimates
https://www.eia.gov/state/seds/data.php?incfile=/state/seds/sep_use/tra/use_tra_OR.html&sid=OR
US EIA State Energy Data System (SEDS) is a comprehensive data set that consists of annual time series estimates of state-level energy use by major economic sectors, energy production and consumption data that are defined as consistently as possible over time and across sectors for analysis and forecasting purposes. For Oregon, the historic trend (back to 1990) shows that overall the energy consumption for all petroleum products is still below historic highs. Gasoline accounts for 63% of petroleum consumption, but since 1993 the energy estimates also includes fuel ethanol blended into motor gasoline, which makes it difficult to determine the total fossil fuel content of that fuel type.

City of Portland, Oregon | Bureau of Planning and Sustainability | www.portlandonline.com/bps
1900 SW 4th Avenue, Suite 7100, Portland, OR 97201 | phone: 503-823-7700 | fax: 503-823-7800 | tty: 503-823-6868

Printed on 100% post-consumer waste recycled paper.

Per-person gasoline sales are down about 15% below 2000 levels. The increase in total motor gasoline consumption is largely the result of more people moving to Oregon and driving vehicles.



Source: BPS calculations from US EIA data

Printed on 100% post-consumer waste recycled paper.

For Washington, the historic trend (back to 1990) shows that overall the energy consumption for all petroleum products is still below historic highs and similar to the Oregon trends. Gasoline accounts for 41% of petroleum consumption.

State Forecasts

Oregon Clean Fuels Program

https://www.oregon.gov/das/OEA/Documents/Clean%20Fuels%20Forecast%202019.pdf

The Clean Fuels Program helps Oregon reduce its consumption of traditional petroleum fuels. Potential fuels that could be used to achieve the standard are ethanol, biodiesel, hydrogen, electricity, natural gas, propane, and biogas. The program goal is to reduce the average carbon intensity of Oregon's transportation fuels by 10 percent by 2025.

The Office of Economic Analysis (OEA), with assistance from the Department of Environmental Quality, produces annually a short-term (2-year) forecast on fossil and alternative fuel consumption. This is a short-term forecast that uses available public and program data to develop the estimates of low-carbon fuels available to Oregon and estimated consumption of fossil and alternative fuels in Oregon.

1,708 million gallons of gasoline, including ethanol, were consumed in 2018, the most recent year of data collected. Growth projections exhibited in the Oregon Department of Transportation's December 2018 forecast equal an annualized 0.8 percent from 2018 to 2020. There were two factors considered in adjusting these initial growth parameters. First, ODOT

City of Portland, Oregon | Bureau of Planning and Sustainability | www.portlandonline.com/bps

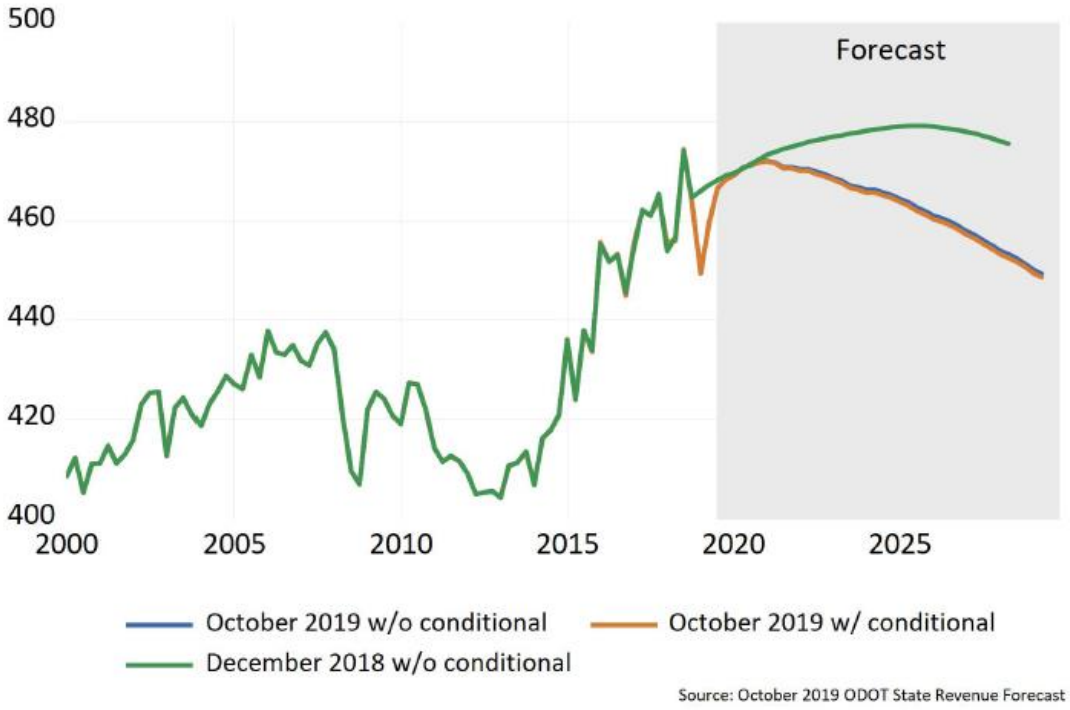
Printed on 100% post-consumer waste recycled paper.

observed gasoline consumption coming in lower than projected through the first two quarters of 2019. Second, the Clean Fuels Program mandated decreases in the carbon intensity targets for fossil fuels incentivize reporting parties to record supplies of fuel in the earliest year.

Table 1: Summary of fossil and alternative fuel consumption



(Mil. gallons, percent)	2018 Actual	2019 Forecast*	% change	2020 Forecast	annual %change vs 2018
Conventional Gasoline	1,535.4	1,437.0	-6.4%	1,546.3	0.4%

2019 ODOT Revenue Forecast
https://www.oregon.gov/ODOT/Data/Documents/October-2019-Revenue-Report.pdf
ODOT forecasts decreased fuel sales of motor fuels through the year 2029. There are three main reasons for this drop from the December 2018 forecast. First, the ODOT model variables are either all virtually unchanged from the prior forecast or changed in a way that would act as a drag on taxable fuel sales. Second, calendar year 2019 has not started off well for sales, where the first quarter was abnormally low. Third, the lower passenger stock forecast reduces the number of vehicles in the fleet, which translates into fewer gallons sold. By itself this change accounts for about half of the drop in the motor fuel taxable gallons forecast compared to the prior forecast.

Figure 19. Gallons of Taxable Motor Fuels Forecast Comparison

There is not a similar gas tax revenue or motor fuel forecast for the State of Washington.

Commodity Flow/Cargo Forecasts

The commodity flow or cargo forecasts are estimates that are based primarily on the historic growth trends in each cargo type in the Pacific Northwest, the Portland Harbor market share, as well as regional, national, and domestic macroeconomic variables and trade patterns. The commodity flow forecasts include all modes of freight movement (air, marine, rail, truck and pipeline), whereas much of the available information is focused on the marine cargo moving through the Columbia River ports in Oregon and Washington, which only accounts for waterborne marine cargo.

- The 2011 Oregon Freight Plan has the highest growth rate of the available forecasts but is based on a core commodity forecast based on 2002 federal data and was not updated in 2017.
- More recent cargo forecasts are for marine cargo, which only accounts for a portion of the fossil fuel commodity flows (does not include fossil fuels moving by pipeline, rail, or trucks), and show lower growth rates.

The cargo/commodity flow forecasts for "liquid bulks", which are primarily petroleum products. These cargo forecasts are complicated by the fact that all the fossil fuel terminals in Portland are privately owned and operate on private land, which means cargo volumes and capacity data is not publicly available. The throughput capacity of these facilities to handle petroleum products is not known. The same is true of the Olympic Pipeline, of which there are only passing references in public documents to near capacity utilization but no data. The FFT operators have not provided any data on throughput volumes as part of this process or the original ordinance adoption. Finally, each forecast uses a different unit of measurement—metric tons, barrels, gallons, BTUs—which makes accurate comparisons difficult.

2011 Oregon Freight Plan (revised 2017)
https://www.oregon.gov/ODOT/Planning/Documents/OFP-2017-Amended.pdf
https://www.oregon.gov/ODOT/Planning/Documents/OFP-Modeling-Analysis.pdf
The Oregon Freight Plan is based on 2009 economic and commodity flow forecasts. The 2009 Oregon Commodity Flow Forecast (CFF) is a county level commodity flow forecast for truck, rail, marine, air, and pipeline modes from 2002 to 2035. The key data source for the Oregon CFF is the 2002 Freight Analysis Framework (FAF2), a national commodity flow forecast dataset published by the Federal Highway Administration (FHWA). national commodity flow forecast.

This forecast identifies three types of fossil fuel commodities:

- STCC #11 – coal
- STCC #13 – petroleum, natural gas
- STCC #29 – petroleum or coal products

City of Portland, Oregon | Bureau of Planning and Sustainability | www.portlandonline.com/bps
1900 SW 4th Avenue, Suite 7100, Portland, OR 97201 | phone: 503-823-7700 | fax: 503-823-7800 | tty: 503-823-6868

Printed on 100% post-consumer waste recycled paper.

Exhibit 5: 2002-2035 Oregon Tonnage by Commodity (1000 tons, all modes)

STCC	Tonnage (1000 tons)			Growth Rate 2002-2035
	2002	2010	2035	
11 Coal	15,458	14,771	30,131	2.0%
13 Crude petroleum, natural gas, and gasoline	5,017	5,074	8,767	1.7%
29 Petroleum or coal products	32,361	34,500	54,487	1.6%

Natural gas is 100% delivered via pipeline. Natural gas imports used by Oregon (4.7M tons in 2002) are forecast to grow by 1.7% annually from 2002 to 2035.

Pipeline-delivered petroleum is imported to Oregon through the Olympic Pipeline from Washington via Portland (92%) and the Chevron Pipeline (8%) from Washington via Umatilla. The Kinder Morgan pipeline distributes petroleum from Portland to the Willamette Valley via Eugene, Oregon. Petroleum delivered by pipeline to Oregon is expected to grow by less than 0.1% from 2002 to 2035.

The Oregon Freight Plan was revised in November 2017, but the revisions did not include an update to the commodity flow forecast data.

2012 Portland and Vancouver Harbor Forecast Update (BST)
This report provides a summary update of the marine cargo forecasts for the Portland-Vancouver area from the April 2010 report, "West Hayden Island Marine Cargo Forecasts & Capacity Assessment". This update considered potential new market opportunities that were evaluated by individual ports in Oregon and Washington. Two growth scenarios were considered. The high-growth forecast included all the market opportunities under consideration. The low-growth forecast included a portion of the market opportunities as well as baseline cargo volumes.

The liquid bulk trades in the Pacific Northwest are dominated by petroleum, including crude oil and refined petroleum products. Other important commodities include chemicals, fertilizers and other liquid bulk products. One significant change that is expected to impact the flow of liquid bulk products is a shift in the source of crude oil for the Puget Sound refineries. The refineries are expected to begin receiving less crude oil by tanker from Alaska and more by rail from North Dakota, which may impact waterborne volumes. New opportunities for liquid bulk cargo are also considered; most notably LNG imports and/or exports. The liquid bulk cargo forecast remains the same for the revised 2012 forecast and the April 10, 2010 forecast.

Table 1-6: Portland Harbor Liquid Bulk Forecast (1,000 Metric Tons)

	April 2010 Study			2012 Update	
	Low	High		Low	High
2008	6,378	6,378		6,378	6,378
2040	6,912	8,011		6,912	8,011
Compound Annual Growth Rate					
2008-2040	0.3%	0.7%		0.3%	0.7%

Source: BST Associates

Estimates of existing cargo capacity are difficult to obtain, particularly for privately owned marine terminals, like the fossil fuel terminals. ECONorthwest (2012) prepared an estimate based on historical data for total cargo volumes for the years 2000 and 2010 from the BST report and consultation with the Port of Portland to determine the estimated current capacity. For private marine terminals, the assumption was that existing facilities do not have significant excess capacity, based on the assumption that recent historical peaks are a reasonable estimate of maximum capacity. Based on a 2000 report, BST estimated that there was 8.28 million metric tons of capacity for liquid bulks. Based on that capacity estimate, ECONW found that no additional land is needed for new liquid bulk terminals in Portland through the year 2040.[1]

2015 Port of Portland Commodity Flow Forecast
https://popcdn.azureedge.net/pdfs/Trade_Trans_Studies_LCR_Cmdty_Flw_Rpt.pdf
The key data source for this forecast is the federal Freight Analysis Framework 3 (FAF3) for the Portland-Vancouver region. 2040 forecast estimated the tonnage of gasoline and other fuels to increase at a 0.7% average annual growth rate. The forecast notes that future volume will be determined by the success or failure of domestic extraction and refining of oil, and growth of alternative fuels (e.g., natural gas).

2017 Marine Cargo Forecast and Rail Capacity Analysis (BST)
https://www.washingtonports.org/mcf
BST prepared a new cargo forecast for the Washington Public Ports Association that includes the Columbia River Ports in Oregon, including Portland. The study includes forecast of trade by commodity and cargo type from 2015 through 2035.

The summary finding for liquid bulk commodity is that the source will shift. As crude oil production decreases in Alaska, northwest refineries will shift to a combination of rail, pipeline, and foreign waterborne sources. Most of the crude by rail was shipped directly to Washington refineries, but a portion was shipped to a terminal near Clatskanie, Oregon, and then barged to

[1] https://www.portlandoregon.gov/bps/article/408438

City of Portland, Oregon | Bureau of Planning and Sustainability | www.portlandonline.com/bps

Printed on 100% post-consumer waste recycled paper.

Puget Sound. Shipments through this Oregon terminal peaked in 2014 at 9,151 railcars and then fell to 1,345 railcars in 2015. This decline was due to completion of rail unloading facilities at four of the five Puget Sound refineries.

The Lower Columbia Oregon region ports handled 3.4 million metric tons in 2015 and is projected to grow to 3.9 million tons by 2035 (0.8% per year growth). The Low case forecasts a decline (-0.6% per year growth). The High case includes new methanol facilities at St. Helens and crude-by-rail facilities in Portland and St. Helens and grows to 8.0 million tons (4.4% per year growth).

Policy Direction

The City's and the State's climate action goals call for an 80 percent and 75 percent reduction in greenhouse gas emissions by 2050, which cannot be achieved without a significant reduction in the consumption of fossil fuels. The following policies and plans help achieve these reduction goals.

State of Oregon

The Oregon State Legislature has established a goal of reducing greenhouse gas emissions 10 percent below 1990 levels by 2020 and 75 percent below 1990 levels by 2050.[2]

The Oregon Sustainable Transportation Initiative

https://www.oregon.gov/ODOT/Programs/Pages/OSTI.aspx

In 2018, the Oregon Transportation Commission adopted the Statewide Transportation Strategy, or STS, as part of the Oregon Transportation Plan. The STS, is a state-level scenario planning effort that examines all aspects of the transportation system, including the movement of people and goods, and identifies a combination of strategies to reduce greenhouse gas, or GHG, emissions. The STS identifies a variety of effective GHG emissions reduction strategies in transportation systems, vehicle and fuel technologies, and urban land use patterns. The STS Short-Term Implementation Plan identifies action items for Oregon Department of Transportation to implement in 2-5 years to help move Oregon towards achieving the STS vision. With a horizon year of 2050, implementing the STS will be an ongoing, long-term process that will likely include the development of mid-term and long-term implementation plans. The STS was developed as part of the Oregon Sustainable Transportation Initiative program.

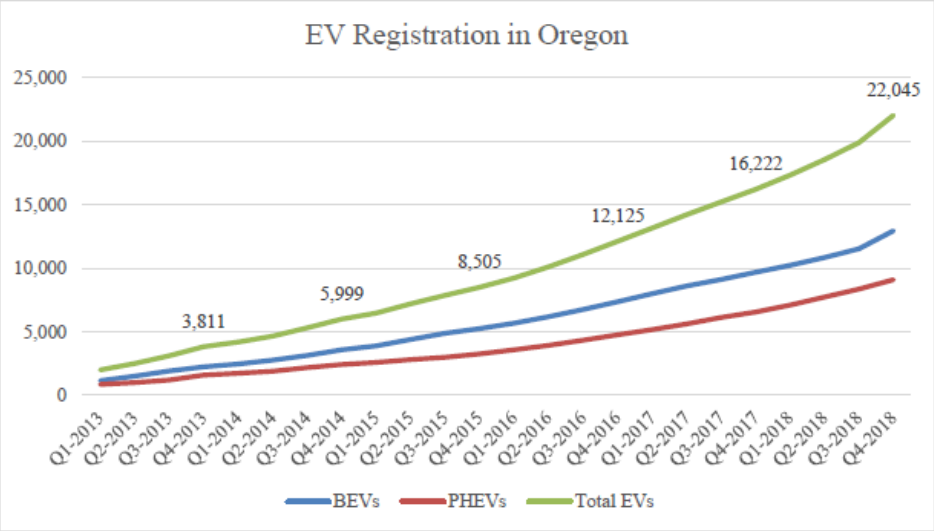
Oregon Fuel Efficiency Standards
https://www.oregon.gov/ODOT/Data/Documents/December-2018-Revenue-Forecast.pdf
In 2007 legislation was passed establishing new fuel efficiency standards for light vehicles in a two-phase approach. Phase 1 impacts model year 2012-2016 vehicles setting a fuel efficiency target of 34.1 miles per gallon (MPG) by model year 2016. Phase 2 builds on this by continuing to expect improvements with each model year reaching a model year 2025 target of 54.5 MPG. The actual standard is expected to be 49.6 MPG by 2025, with the remaining 5 MPG equivalent reached through improvements in vehicle air conditioners. As the 54.5 MPG target is only required under ideal test conditions not fully representative of all driving conditions, the actual on-road average is expected to be closer to 38 MPG. Still, at a minimum this is an improvement of over 10 miles per gallon compared to the previous standards. The EPA will explore potential changes to the current standards and initiate a rulemaking process to develop new standards. Until any final rule is passed the current standards remain in place and the forecast for fuel efficiency is based on these standards.

While the new vehicle fuel economy is expected to increase rapidly over the next 10 years, fleet fuel efficiency will grow much more slowly. With Oregon's 3.6 million registered passenger vehicles, 150,000 new registrations a year, and an average vehicle age of almost 13 years, it will take time before these new, higher efficient vehicles replace the older, less fuel-efficient ones.



Oregon Clean Fuels Program
https://www.oregon.gov/das/OEA/Documents/Clean%20Fuels%20Forecast%202019.pdf
The Oregon Department of Environmental Quality (ODEQ) is implementing the Oregon Clean Fuels Program, which requires a 10 percent reduction in average carbon intensity by 2025. Oregon DMV vehicle registration data shows that about 12,951 battery electric vehicles (BEVs) and 9,094 plug-in hybrid electric vehicles (PEVs) were registered in Oregon in June 2018. The Office of Economic Analysis (OEA) projects that those numbers will rise. By 2025, Oregon's forecasted annual PEVs sales are expected to be 21% of light-duty vehicle sales.[3]

Oregon Executive Order No. 17-21 Zero Emission Vehicles
https://www.oregon.gov/gov/Documents/executive_orders/eo_17-21.pdf
The Governor issued Executive 17-21 in November 2017 committing the State to the goal of achieving 50,000 or more registered electric vehicles by 2020.

Metro

2014 Climate Smart Strategy

https://www.oregonmetro.gov/sites/default/files/2015/05/29/ClimateSmartStrategy-FinalVersion-2014.PDF

Metro Climate Smart Strategy aims to reduce the region's per capita greenhouse gas emissions from cars and light trucks at least 20 percent by 2035. The Climate Smart Strategy is a set of policies and actions to guide how the region moves forward to integrate reducing greenhouse gas emissions. The strategy relies on adopted local and regional land use and transportation plans and expected advancements in cleaner, low carbon fuels and more fuel-efficient vehicles.

2018 Regional Transportation Policy

https://www.oregonmetro.gov/regional-transportation-plan

The 2018 Regional Transportation Plan is a key tool for implementing the adopted Climate Smart Strategy and achieving a new 2040 target adopted by the Land Conservation and Development Commission in 2017. The RTP recognizes the importance of prioritizing transportation investments that help reduce greenhouse gas emissions from cars and small trucks while making our transportation system safe, reliable, healthy and affordable.

By 2040, the plan, together with advancements in fleet and technology, is expected to reduce total annual greenhouse gas emissions from passenger cars and passenger trucks by 27 percent (compared to 2015 levels) and reduce annual per capita greenhouse gas emissions from passenger cars and passenger trucks by 46 percent (compared to 2015 levels).

City of Portland, Oregon | Bureau of Planning and Sustainability | www.portlandonline.com/bps

Tri-Met
https://trimet.org/electricbuses/pdf/TriMet-Non-Diesel-Bus-Plan-September-2018.pdf
In 2018, TriMet's Board of Directors approved a plan for TriMet to have a clean-energy bus fleet by 2040. TriMet will use grants from the Federal Transit Administration's Low or No Emission Vehicle Program (Low-No program) and the Statewide Transportation Improvement Fund (STIF) for public transit, which can be used for the purchase of electric or natural-gas buses.

City of Portland Policy
2015 Climate Action Plan
Goal: Reduce local carbon emissions 80 percent from 1990 levels by 2050, with an interim goal of 40 percent by 2030.

As described in Section 4, lower-carbon fossil fuels like natural gas and propane have the potential to replace higher-carbon fuels, but they do not approach the goal of an 80% reduction in carbon emissions by 2050 in Portland's Climate Action Plan or the State's 75% goal. Investments in major infrastructure typically take decades to recoup, and the transition to renewables needs to go much faster than that to stabilize global emissions. The adopted code changes are consistent with the 80% goal of the Climate Action Plan by restricting development of fossil fuel terminals.

Testimony to on the **Fossil Fuel Terminals Zoning Amendments, Remand Draft**

See attached updated Exhibit B Remand Report to reflect technical amendments adopted by City Council.

Testimony is presented without formatting.

Fossil Fuel Terminal Zoning Amendments

Exhibit B
Remand Report
As Amended

City of Portland, Oregon

December 1, 2019

Bureau of Planning and Sustainability
Innovation. Collaboration. Practical Solutions.
City of Portland, Oregon

Proposed Action

The City of Portland is considering the re-adoption of the Fossil Fuel Terminal Zoning Amendments. On December 14, 2016, the Portland City Council adopted Ordinance No. 188142 which amended the Zoning Code to create a new land use category (Bulk Fossil Fuel Terminals) with development standards to regulate the storage tank capacity. The amendments prohibited expansion of storage tank capacity at existing fuel terminals and limited new terminal development to 2 million gallons of storage tank capacity. The storage of coal at Bulk Fossil Fuel Terminals was prohibited.

The amendments allowed for the continued operation of existing terminals as a limited use in the industrial and employment zones. Terminals can continue to operate and invest in seismic and safety upgrades. The prohibition on the expansion of storage capacity included exceptions to the storage capacity limits to address issues identified in previous City Council resolutions, particularly for aviation fuels and renewable fuels.

Ordinance No. 188142 was appealed to the Oregon Land Use Board of Appeals (LUBA). In *Columbia Pacific Building Trades Council v. City of Portland*, LUBA Case No. 2017-001, LUBA reversed the Ordinance holding that the City's decision was unconstitutional; failed to demonstrate compliance with the Guild's Lake Industrial Sanctuary Plan (GLISP) and Statewide Planning Goal 12; and was not supported by an adequate factual base.

LUBA's decision was appealed to the Oregon Court of Appeals. In *Columbia Pacific Building Trades Council v. City of Portland*, 289 Or App 739 (2018), the court reversed LUBA's decision in part and affirmed in part. The Court found that the amendments are constitutional, and the City adequately demonstrated compliance with Goal 12.

The Court of Appeals decision was appealed to the Oregon Supreme Court. The Supreme Court denied review in *Columbia Pacific Building Trades Council v. City of Portland*, 363 Or 390 (2018).

On October 5, 2018, LUBA remanded Ordinance No. 188142 for City Council to demonstrate compliance with GLISP and demonstrate that the decision was supported by an adequate factual base.

The City intends to readopt the Fossil Fuel Terminal Zoning Amendments to comply with LUBA's Order. The Zoning Code amendments are similar to the changes adopted in 2016, except for a few minor adjustments to reconcile the Fossil Fuel Terminal Zoning Amendments with subsequent changes to the Zoning Code that have been adopted since 2016.

On November 20, 2019, the City Council held a public hearing on the consideration of additional evidence to ensure that the amendments are supported by an adequate factual base. Additionally, the findings will demonstrate that the amendments comply with the goals and policies in the 2035 Comprehensive Plan, which was adopted subsequent to the initial adoption of Ordinance No. 188142.

Timeline

In Resolutions 36959 and 36962, adopted in 2012, the City Council expressed opposition to coal trains traveling through Portland until a programmatic, comprehensive and area-wide Environmental Impact Statement and comprehensive Health Impact Assessment are completed.

The City's 2015 Climate Action Plan (adopted by Resolution 37135) identifies the need to establish a "fossil fuel export policy that considers lifecycle emissions, safety, economics, neighborhood livability and environmental impacts" (Climate Action Plan, action 3G, page 69). The City committed in its 2015 Climate Action Plan to advancing policy and programs to reduce local fossil fuel use both in the City's own operations and through community-wide initiatives.

Resolution 37168, adopted November 12, 2015, expressed the City Council's opposition to the "expansion of infrastructure whose primary purpose is transporting or storing fossil fuels in or through Portland or adjacent waterways." It also expressed the Council's intent not to restrict improvements in safety, efficiency, or seismic resilience; the provision of service directly to end users; or infrastructure that will accelerate the transition to non-fossil fuel energy sources. The City Council also expressed support for accelerating the transition to non-fossil fuel energy sources. As part of that transition, the Oregon Department of Environmental Quality (ODEQ) is implementing the Oregon Clean Fuels Program, which requires a 10 percent reduction in average carbon intensity by 2025. Fuels that could be used to achieve the standards include ethanol, biodiesel, electricity, hydrogen, natural gas, propane, and biogas, which may require additional storage capacity. In order to facilitate implementation of the Clean Fuels Program, non-fossil fuel storage tanks are not subject to the capacity limits.

Portland's existing fossil fuel terminals

Portland's industrial districts are Oregon's largest seaport, rail hub and truck distribution center. The Northwest Industrial District in Portland is also the end of the Olympic Pipeline, which supplies most of Oregon's petroleum fuels from Puget Sound refineries. The ten petroleum terminals located in Northwest Portland are the gateway distribution facilities serving Oregon and Southern Washington markets. Additionally, NW Natural's GasCo terminal provides peak-consumption storage of natural gas for the region. In Northwest Portland, these "tank farm" storage facilities have direct access to pipeline, deep-water port, railroad and truck route infrastructure.

Figure 1. An example of petroleum terminals located in the Willbridge area of NW Portland.

Figure 2. Existing fossil fuel terminals in Northwest Portland

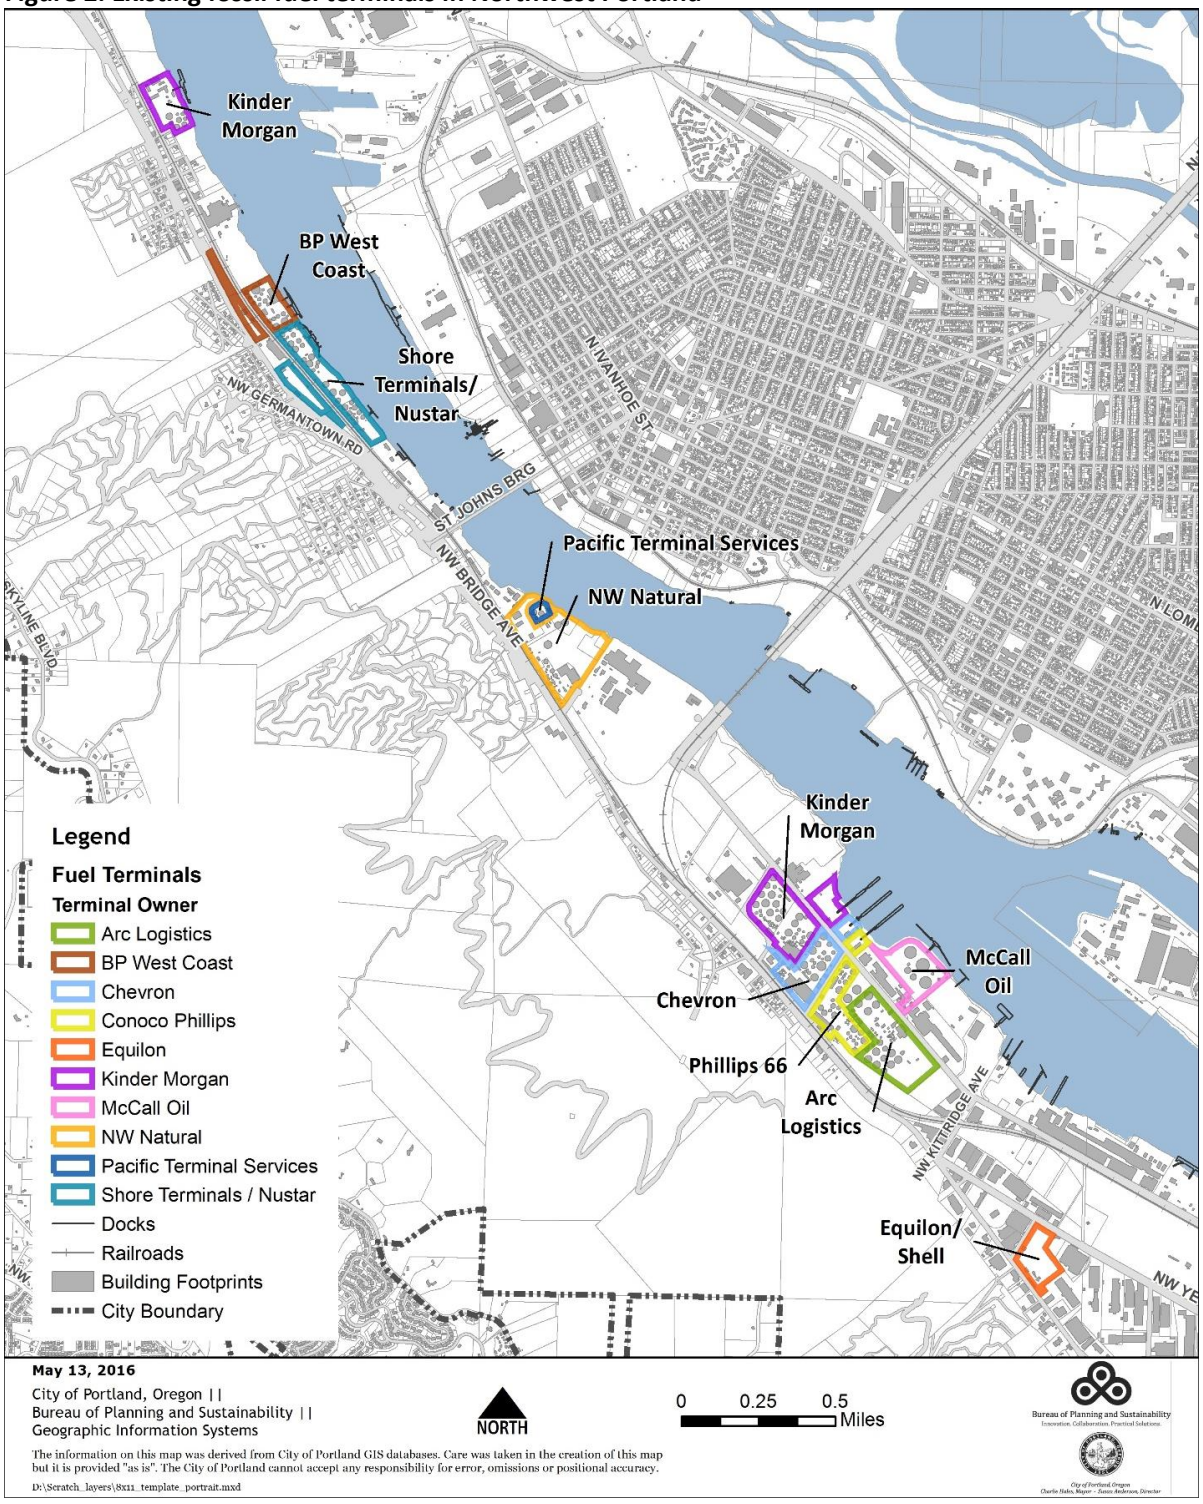

Figure 3. Estimated storage capacity at existing fossil fuel terminals

Operator	*Facility type*	*Site acres*	*Existing Storage capacity*	
Petroleum fuels			barrels	gallons
Chevron	Petroleum terminal	21	1,600,000	67,200,000
Kinder Morgan Willbridge	Petroleum terminal	33	1,551,000	65,142,000
Zenith (Arc Logistics)	Petroleum/crude oil	39	1,518,200	63,764,400
NuStar	Petroleum terminal	22	1,191,000	50,022,000

Commentary

33.140.050 Neighborhood Contact

As an alternative to a land use review, a public notice and meeting requirement applies to development of fuel storage structure, such as a new tank, at a Bulk Fossil Fuel Terminal, similar to the requirement for multi-dwelling residential development. This notice and meeting would create public awareness about the project and serve to discuss a proposal in an informal basis.

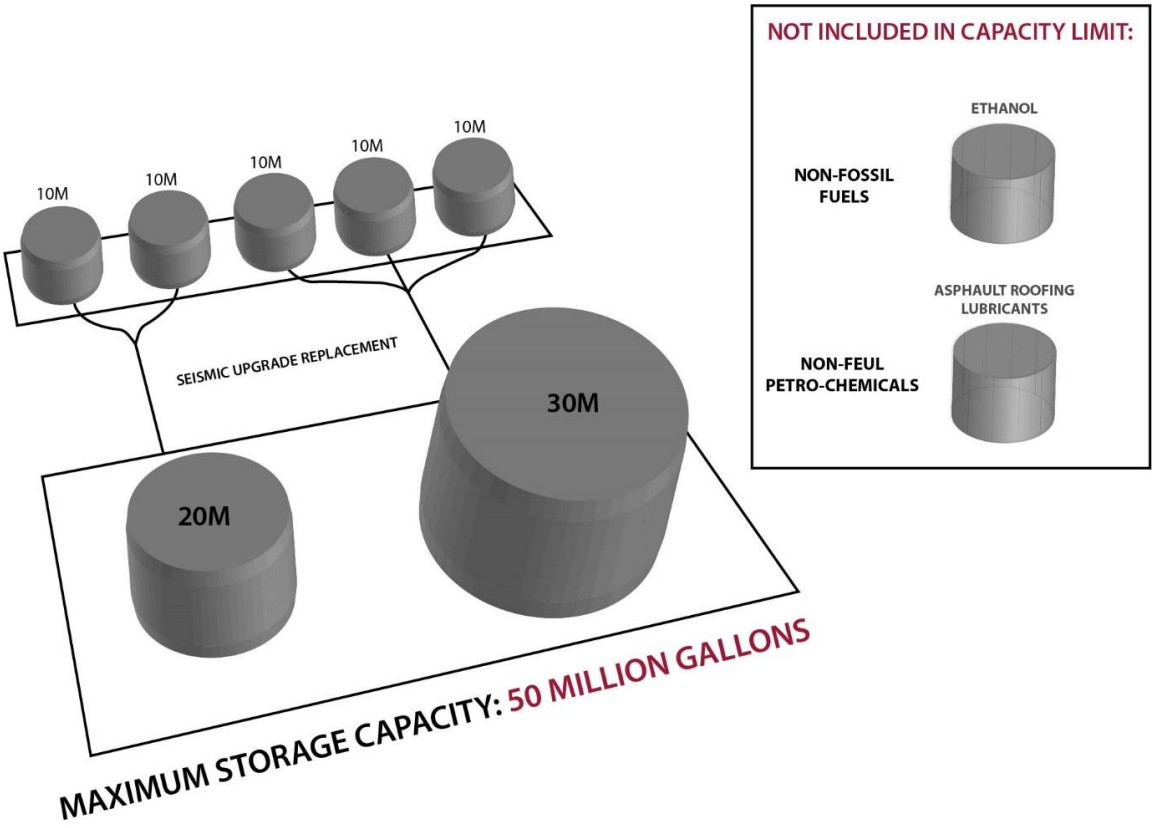
Language to be **added** is underlined
Language to be **deleted** is shown in ~~strikethrough~~

33.140.050 Neighborhood Contact in EG and I Zones

A. Purpose. Neighborhood contact is required when a new storage structure for any type of fuel will be built on a Bulk Fossil Fuel Terminal because of the impacts that fuel projects can have on the surrounding community.

B. Neighborhood contact requirement. Proposals meeting the following conditions are subject to the neighborhood contact requirement steps of 33.705.020.B., Neighborhood Contact II. All of the steps in 33.705.020.B. must be completed before an application for a building permit can be submitted:

1. The proposed development has not been subject to a land use review; and



2. The proposed development includes at least one new structure for the storage of any type of fuel on a site with a Bulk Fossil Fuel Terminal use.

Commentary

33.140.100 Primary Uses

The amendments to this section reflect changes to prohibit new Bulk Fossil Fuel Terminals in the employment and industrial base zones and reclassify existing terminals as limited uses. Regulation of Bulk Fossil Fuel Terminals implements policy direction in City of Portland Resolution 37168 (adopted November 2015) and, 2035 Comprehensive Plan Policies 4.79, 4.81, 4.82, 6.48, and 7.14 which address reducing natural hazard risks and fossil fuel distribution and storage facilities.

The limited use designation prohibits expansion of fossil fuel tank capacity at existing Bulk Fossil Fuel Terminals, but allows for the replacement and reconfiguration of existing fossil fuel tank capacity as of the date of adoption as a way to facilitate seismic and safety upgrades.

Language to be **added** is underlined
Language to be **deleted** is shown in ~~strikethrough~~

33.140.100 Primary Uses

A. No change

B. Limited uses. Uses allowed that are subject to limitations are listed in Table 140-1 with an "L". These uses are allowed if they comply with the limitations listed below and the development standards and other regulations of this Title. In addition, a use or development listed in the 200s series of chapters is also subject to the regulations of those chapters. The paragraphs listed below contain the limitations and correspond with the footnote numbers from Table 140-1.

1. – 16. No change

17. Bulk Fossil Fuel Terminals. This regulation applies to all parts of Table 140-1 that have a [17].

a. Existing Bulk Fossil Fuel Terminals. Bulk Fossil Fuel Terminals that existed on [insert effective date] are allowed, but the total amount of fossil fuel that can be stored on the site in storage tanks is limited to the fossil fuel storage tank capacity that existed on [insert effective date]. Total fossil fuel storage tank capacity on the site in excess of the capacity that existed on [insert effective date] is prohibited. Storing coal on the site is prohibited.

b. New Bulk Fossil Fuel Terminals are prohibited.

Commentary

Table 140-1 Employment and Industrial Zone Primary Uses

The amendments to this section reflect changes to prohibit new Bulk Fossil Fuel Terminals in all employment and industrial base zones and reclassify existing terminals as limited uses.

Commentary

33.730 Quasi-Judicial Procedures

The following amendments correct a mistake that was made as part of the recently adopted Neighborhood Contact Update project. The Neighborhood Contact Update project simplified, clarified and made the existing neighborhood contact requirements more effective. The only existing neighborhood contact requirement in the EG and I zones is a requirement related to development of new fuel storage tanks on fossil fuel terminals. In keeping with the policy direction of the project (clarify the exisiting rules), the Neighborhood Contact Update project did not add neighborhood contact requirements for development other than fuel tanks in the EG or I zones. However, an exemption for development in EG and I zones was inadvertently left out of the code that details the neighborhood contact steps for a land use review. The following amendments add that exemption.

33.730 Quasi-Judicial Procedures

730

33.730.013 Expedited Land Division Procedure

The Expedited Land Division (ELD) procedure provides an alternative to the standard procedures for some land divisions. The applicant may choose to use the ELD process if the land division request meets all of the elements specified in ORS 197.360. The steps of this procedure are in ORS 197.365 through .375. The application requirements are listed in Section 33.730.060, below. Two additional steps are required for land division requests using the ELD Procedure:

A. Neighborhood contact.

1. When the ELD includes four to ten lots, the applicant is required to meet the neighborhood contact requirements specified in 33.705.020.A., Neighborhood contact I. If the proposed expedited land division is in an EG or I zone, it is exempt from the neighborhood contact requirements.
2. When the ELD includes eleven or more lots, the applicant is required to meet the neighborhood contact requirements specified in 33.705.020.B., Neighborhood contact II. If the proposed expedited land division is in the EG1, EG2, or an I zone, it is exempt from the neighborhood contact requirements.

B. Pre-application conference. A pre-application conference is required for all land division requests processed through the ELD procedure. See 33.730.050, Pre-Application Conference. The pre-application conference must be held before applying for an ELD review.

33.730.014 Type I Procedure

The Type I procedure is an administrative process with public notice but no hearing.

A. Pre-application conferences. A pre-application conference is not required.

B. Neighborhood contact.

1. When the proposed development associated with the land use review will result in the addition of at least 10,000 square feet and not more than 25,000 square feet of net building area to the site, the neighborhood contact steps of 33.705.020.A., Neighborhood contact I, are required. If the proposed development is in the EG1, EG2, or an I zone, or it has already met the neighborhood contact requirements as part of a building permit process, it is exempt from the neighborhood contact requirements.

Commentary

2. When the proposed development associated with the land use review will result in the addition of more than 25,000 square feet of net building area to the site, the neighborhood contact steps of 33.725.020.B., Neighborhood contact II, are required. If the proposed development is in the EG1 , EG2, or an I zone, or it has already met the neighborhood contact requirements as part of a building permit process, it is exempt from the neighborhood contact requirements.

C.-H.[No change]

33.730.015 Type Ix Procedure
The Type Ix procedure is an administrative process with public notice but no hearing.

A. Pre-application conferences. A pre-application conference is optional.

B. Neighborhood contact.

1. When the proposed development associated with the land use review will result in the addition of at least 10,000 square feet and not more than 25,000 square feet of net building area to the site, the neighborhood contact steps of 33.705.020.A., Neighborhood contact I, are required. If the proposed development is in the EG1, EG2, or an I zone, or it has already met the neighborhood contact requirements as part of a building permit process, it is exempt from the neighborhood contact requirements.

2. When the proposed development associated with the land use review will result in the addition of more than 25,000 square feet of net building area to the site, the neighborhood contact steps of 33.705.020.B., Neighborhood contact II, are required. If the proposed development is in the EG1, EG2, or an I zone, or it has already met the neighborhood contact requirements as part of a building permit process, it is exempt from the neighborhood contact requirements.

C.-H.[No change]

33.730.020 Type II Procedure
The Type II procedure is an administrative process, with the opportunity to appeal the Director of BDS's decision to another review body.

A. Pre-application conference. A pre-application conference is optional unless it is a specific requirement of a review. See 33.730.050, Pre-Application Conference.

B. Neighborhood contact.

1. When the proposed development associated with the land use review will result in the addition of at least 10,000 square feet and not more than 25,000 square feet of net building area to the site and no portion of the site is in the Design overlay zone, the neighborhood contact steps of 33.705.020.A., Neighborhood contact I, are required. If the proposed development is in the EG1, EG2, or an I zone, or it has already met the neighborhood contact requirements as part of a building permit process, it is exempt from the neighborhood contact requirements.

Commentary

2. When the proposed development associated with the land use review will result in the addition of more than 25,000 square feet of net building area to the site and no portion of the site is in the Design overlay zone, the neighborhood contact steps of 33.705.020.B., Neighborhood contact II, are required. If the proposed development is in the EG1, EG2, or an I zone, or it has already met the neighborhood contact requirements as part of a building permit process, it is exempt from the neighborhood contact requirements.

3. When the proposed development associated with the land use review will result in the addition of more than 10,000 square feet of net building area to the site and the site is in the Design overlay zone, the neighborhood contact steps of 33.705.020.C, Neighborhood contact III, are required. If the proposed development is in the EG1, EG2, or an I zone, or it has already met the neighborhood contact requirements as part of a building permit process, it is exempt from the neighborhood contact requirements.

C.-J. [No change]

33.730.025 Type IIx Procedure

The Type IIx procedure is an administrative process, with the opportunity to appeal the Director of BDS's decision to another review body.

A. Pre-application conference. A pre-application conference is optional. See 33.730.050, Pre-Application Conference.

B. Neighborhood contact.

1. The neighborhood contact steps of 33.705.020.A., Neighborhood contact I, are required when:

   a. The application is for a land division that includes four to ten lots; or

   b. The application is for a land use review other than a land division and the proposed development associated with the land use review will result in the addition of at least 10,000 square feet and not more than 25,000 square feet of net building area to the site. If the proposed development is in the EG1, EG2, or an I zone, or it has already met the neighborhood contact requirements as part of a building permit process, it is exempt from the neighborhood contact requirements.

2. When the application is for a land use review other than a land division and the proposed development associated with the land use review will result in the addition of more than 25,000 square feet of net building area to the site, the neighborhood contact steps of 33.705.020.B., Neighborhood contact II, are required. If the proposed development is in the EG1, EG2, or an I zone, or it has already met the neighborhood contact requirements as part of a building permit process, it is exempt from the neighborhood contact requirements.

C.-J. [No change]

33.730.030 Type III Procedure

A Type III procedure requires a public hearing before an assigned review body. Subsections A through E~~D~~ apply to all sites. If the site is within the City of Portland, Subsections F~~E~~ through I~~H~~ also apply. If the site is in the portion of unincorporated Multnomah County that is subject to City zoning, Subsection J~~I~~ also applies.

A. Pre-application conference. A pre-application conference is required for all requests processed through a Type III procedure. See 33.730.050, Pre-Application Conference.

B. Neighborhood contact.

1. The neighborhood contact steps of 33.705.020.A., Neighborhood contact I, are required when:
   a. The application is for a land division that includes four to ten lots and does not include an environmental review; or
   b. The application is for a land use review other than a land division and the proposed development associated with the land use review will result in the addition of at least 10,000 square feet and not more than 25,000 square feet of net building area to the site and no portion of the site is in the Design overlay zone. If the proposed development is in the EG1, EG2, or an I zone, or it has already met the neighborhood contact requirements as part of a building permit process, it is exempt from the neighborhood contact requirements.
2. The neighborhood contact steps of 33.705.020.B., Neighborhood contact II, are required when:
   a. The application is for a land division that includes eleven or more lots and does not include an environmental review; or
   b. The application is for a land use review other than a land division and the proposed development associated with the land use review will result in the addition of more than 25,000 square feet of net building area to the site and no portion of the site is in the Design overlay zone. If the proposed development is in the EG1, EG2, or an I zone, or it was subject to a building permit process, it is exempt from the neighborhood contact requirements.
3. The neighborhood contact steps of 33.705.020.C., Neighborhood contact III, are required when:
   a. The application is for a land division that includes an environmental review; or
   b. The application is for a land use review other than a land division and the proposed development associated with the land use review will result in the addition of more than 10,000 square feet of net building area to the site and the site is in the Design overlay zone. If the proposed development is in the EG1, EG2, or an I zone it is exempt from the neighborhood contact requirements.

Commentary

33.910.030 Definitions

The definition of fossil fuels was added to clarify the land use category Bulk Fossil Fuel Terminals.

Petrochemicals that are used primarily for non-fuel products are excluded, such as asphalt, plastics, lubricants, fertilizer, roofing, and paints. However, methanol is an exception that is included as a fossil fuel, because large methanol storage and distribution facilities tend to have structural similarities to liquid natural gas (LNG) and liquid petroleum gas (LPG) terminals, including large-scale storage and gas pipeline access, and because they can have similar safety and climate impacts.

Fuels containing 5% or less fossil-fuel volume are not considered fossil fuels under this definition. For example, "pure" ethanol made from corn or other non-fossil source is required by the Alcohol and Tobacco Tax and Trade Bureau to be denatured in order to be transported to the site. Denatured ethanol typically contains up to 5% methanol, so that it is toxic and undrinkable.

Some fossil fuels under this definition are also classified as "renewable fuels" in the federal Renewable Fuel Standard and "clean fuels" in Oregon's Clean Fuel Standard, such as liquid natural gas and liquid propane gas. These federal and state standards require transportation fuel sold within their jurisdiction to contain a minimum volume of renewable or clean fuels. Renewable or clean fuels with more than 5 percent fossil fuel volume are defined as fossil fuels.

Language to be **added** is underlined

33.910.030 Definitions
The definition of words with specific meaning in the zoning code are as follows:

Fossil Fuel. Fossil fuels are petroleum products (such as crude oil and gasoline), coal, methanol, and gaseous fuels (such as natural gas and propane) that are made from decayed plants and animals that lived millions of years ago and are used as a source of energy. Denatured ethanol and similar fuel additives with less than 5 percent fossil fuel content, biodiesel/renewable diesel with less than 5 percent fossil fuel content, and petroleum-based products used primarily for non-fuel uses (such as asphalt, plastics, lubricants, fertilizer, roofing, and paints) are not fossil fuels.

Commentary

33.920.300 Bulk Fossil Fuel Terminal

Bulk Fossil Fuel Terminals are added as a new land use category to regulate their development in the Zoning Code. Regulation of Bulk Fossil Fuel Terminals implements policy direction in City of Portland Resolution 37168 and 2035 Comprehensive Plan Policies 4.79, 4.81, 4.82, 6.48, and 7.14 which address reducing natural hazard risks and fossil fuel distribution and storage facilities.

Bulk Fossil Fuel Terminals are characterized by having (1) marine, pipeline or railroad transport access and (2) either trans-loading facilities for transferring a shipment between transport modes (such as from rail to ship) or bulk storage facilities exceeding 2 million gallons of fossil fuels. The 2-million-gallon threshold is sized to include facilities that are large enough to unload unit trains. Functionally, these terminals tend to be regional gateway facilities, where fossil fuels enter and exit the region.

The use description is clarified with criteria that are intended to prevent the aggregation of new facilities smaller than 2 million gallons on adjacent sites into a larger terminal that could effectively circumvent the terminal storage capacity threshold.

Resolution 37168 lists a specific exception to not restrict service directly to end users. At a small scale, services to end users include retail gasoline filling stations, natural gas access lines in street right-of-way to residential and business customers, and heating oil tanks at home sites. Larger scale end users with fossil fuel storage and access infrastructure also include manufacturers, jet fuel facilities for PDX Airport, vessel fuel facilities on Portland Harbor, and others, where fossil fuels are used as an input.

Language to be **added** is underlined
Language to be **deleted** is shown in ~~strikethrough~~

33.920.300 Bulk Fossil Fuel Terminal

A. Characteristics. Bulk Fossil Fuel Terminals are establishments primarily engaged in the transport and bulk storage of fossil fuels. Terminal activities may also include fuel blending, regional distribution, and wholesaling. The firms rely on access by marine, railroad, or regional pipeline to transport fuels to or from the site, and either have transloading facilities for transferring a shipment between transport modes, or have storage capacity exceeding 2 million gallons for fossil fuels. There is minimal on-site sales activity with the customer present.

B. Accessory uses. Accessory uses may include retail sales of petroleum products, offices, food membership distribution, parking, storage, truck fleet parking and maintenance areas, rail spur or lead lines, and docks.

C. Examples. Examples include crude oil terminals, petroleum products terminals, natural gas terminals, propane terminals, and coal terminals.

D. Exceptions.

1. Truck or marine freight terminals that do not store, transport or distribute fossil fuels are classified as Warehouse And Freight Movement uses.
2. Truck or marine freight terminals that do not have transloading facilities and have storage capacity of 2 million gallons or less are classified as Warehouse And Freight Movement uses. However, multiple fossil fuel facilities, each with 2 million gallons of fossil fuel storage capacity or less but cumulatively having a fossil fuel storage capacity in excess of 2 million gallons, located on separate parcels of land will be classified as a Bulk Fossil Fuel Terminal when two or more of the following factors are present:
   a. The facilities are located or will be located on one or more adjacent parcels of land. Adjacent includes separated by a shared right-of-way;
   b. The facilities share or will share operating facilities such as driveways, parking, piping, or storage facilities; or
   c. The facilities are owned or operated by a single parent partnership or corporation.
3. Gasoline stations and other retail sales of fossil fuels are not Bulk Fossil Fuel Terminals.
4. Distributors and wholesalers that receive and deliver fossil fuels exclusively by truck are not Bulk Fossil Fuel Terminals.
5. Industrial, commercial, institutional, and agricultural firms that exclusively store fossil fuel for use as an input are not Bulk Fossil Fuel Terminals.
6. Uses that involve the transfer or storage of solid or liquid wastes are classified as Waste-Related uses.
7. The storage of fossil fuels for exclusive use at an airport, surface passenger terminal, marine, truck or air freight terminal, drydock, ship or barge servicing facility, rail yard, or as part of a fleet vehicle servicing facility are not Bulk Fossil Fuel Terminals.
8. Uses that recover or reprocess used petroleum products are not Bulk Fossil Fuel Terminals.

Commentary

Language to be **added** is underlined
Language to be **deleted** is shown in ~~strikethrough~~

33.920.310~~300~~ Industrial Service

33.920.320~~310~~ Manufacturing And Production

33.920.330~~320~~ Railroad Yards

33.920.340~~330~~ Warehouse And Freight Movement

A. Characteristics. Warehouse And Freight Movement firms are involved in the storage, or movement of goods for themselves or other firms. Goods are generally delivered to other firms or the final consumer, except for some will-call pickups. There is little on-site sales activity with the customer present.

B. Accessory uses. Accessory uses may include offices, food membership distribution, truck fleet parking and maintenance areas, rail spur or lead lines, docks, and repackaging of goods.

C. Examples. Examples include separate warehouses used by retail stores such as furniture and appliance stores; household moving and general freight storage; cold storage plants, including frozen food lockers; storage of weapons and ammunition; major wholesale distribution centers; truck, marine, or air freight terminals; bus barns and light rail barns; parcel services; major post offices; grain terminals; and the stockpiling of sand, gravel, or other aggregate materials.

D. Exceptions.

1. Uses that involve the transfer or storage of solid or liquid wastes are classified as Waste-Related uses.
2. Miniwarehouses are classified as Self-Service Storage uses.
3. Establishments that engage in the transfer or storage of fossil fuels, rely on access by marine, railroad or regional pipeline to transport fuels to or from the site, and either have transloading facilities or have storage capacity exceeding 2 million gallons for fossil fuels are classified as Bulk Fossil Fuel Terminal uses.

33.920.350~~340~~ Waste-Related

33.920.360~~350~~ Wholesale Sales

A. Characteristics. Wholesale Sales firms are involved in the sale, lease, or rent of products primarily intended for industrial, institutional, or commercial businesses. The uses emphasize on-site sales or order taking and often include display areas. Businesses may or may not be open to the general public, but sales to the general public are limited as a result of the way in which the firm operates. Products may be picked up on site or delivered to the customer.

B. Accessory uses. Accessory uses may include offices, food membership distribution, product repair, warehouses, parking, minor fabrication services, and repackaging of goods.

C. Examples. Examples include sale or rental of machinery, equipment, heavy trucks, building materials, special trade tools, welding supplies, machine parts, electrical supplies, janitorial supplies, restaurant equipment, and store fixtures; mail order houses; and wholesalers of food, clothing, auto parts, building hardware, and office supplies.

Commentary

Language to be **added** is underlined
Language to be **deleted** is shown in ~~strikethrough~~

D. Exceptions.

1. Firms that engage primarily in sales to the general public are classified as Retail Sales And Service.
2. Firms that engage in sales on a membership basis are classified as either Retail Sales And Service or Wholesale Sales, based on a consideration of the characteristics of the use.
3. Firms that are primarily storing goods with little on-site business activity are classified as Warehouse And Freight Movement.
4. Establishments that engage in the regional wholesaling of fossil fuels, rely on access by marine, railroad or regional pipeline to transport fuels to or from the site, and either have transloading facilities or have storage capacity exceeding 2 million gallons for fossil fuels are classified as Bulk Fossil Fuel Terminal uses.

Testimony to on the **Fossil Fuel Terminals Zoning Amendments, Remand Draft**

See attached BPS memo rebutting selected written testimony

Testimony is presented without formatting.

Bureau of Planning and Sustainability
Innovation. Collaboration. Practical Solutions.

MEMO

DATE: December 1, 2019

TO: Mayor Ted Wheeler
Portland City Council

FROM: Tom Armstrong, Supervising Planner

SUBJECT: Fossil Fuel Terminal Zoning (FTTZ) Amendments
Response to Industry and Business Testimony

There are five significant pieces of written testimony submitted by industry and business groups in opposition to the ordinance. In general, the testimony contains unsupported assertions that do not have sufficient supporting details or evidence. It is not the City's responsibility to presume or substitute our interpretation of these assertions. However, the following is a rebuttal to the key points in the testimony.

PBA OBI WWC Trades Council

1. No substantive changes to code amendments made in response to legal decisions.
   No substantive changes are required by the legal decisions. The assignment of errors are a lack evidence to support the decision, not the code itself. The purpose of this ordinance is to provide additional findings, including findings that address the goals and policies in the 2035 Comprehensive Plan, to support the decision and confirm that the decision is supported by an adequate factual base. The evidentiary record from the first decision is incorporated by reference and supplemented by additional evidence provided by BPS staff, the testimony Council received at the November 20 hearing and the written testimony received by December 2.

2. No public involvement in remand process. Need a collaborative approach.
   The City does not have adopted code or policies for how to respond to a remand decision. Given the extensive public process that happened as part of the initial adoption of the ordinance in 2016 and that no substantive changes are required to address the remand issues, it was appropriate to bring the item directly back to City Council. A legislative notice was sent to the standing list of interested parties, the owners of the existing terminals, and the parties to the appeals. Parties participated in City Council deliberations. Unfortunately, the opponents to the

ordinance only submitted written testimony and failed to appear at the November 20 hearing, so City Council was unable to engage in a discussion about how to achieve common goals. City Council can consider their process concerns and decide to re-open this ordinance for more discussion and deliberation.

3. It would hurt the local economy.
   This unsupported assertion provides no details or explanation as to how this ordinance will hurt the local economy. BPS staff provided evidence in the Council presentation and the written record that demonstrates the ordinance has been narrowly written to minimize impacts to the existing fossil fuel terminals (FFTs), while limiting risk from future natural hazards.

4. It will hinder climate and safety goals.
   This unsupported assertion provides no details or explanation as to how this ordinance will hinder climate or safety goals. BPS staff provided evidence in the Council presentation and the written record that demonstrates the ordinance has been narrowly written to support climate goals. Specifically, the ordinance exempts new storage capacity for non-fossil, renewable fuels and designates the existing FFTs as a limited use to allow those businesses to continue to operate and make safety improvements.

5. Consider the carbon emissions from transportation methods to meet local and regional demand. The current proposal would likely force fuels of all kinds to be transported by truck, instead of pipe and tank, forcing an increase in emissions when transporting fuels of all types.
   This unsupported assertion provides no details or explanation as to how this ordinance will force a change in transportation modes. There is no explanation or evidence on future demand, pipeline capacity utilization, or storage tank utilization or how or why truck traffic would increase. BPS staff provided evidence in the Council presentation and the written record that demonstrates that there is a reasonable expectation that the demand for fossil fuels will be flat and that the existing FFT storage capacity, with the allowed exceptions, will continue to meet the future demand for fossil fuels.

6. Explicitly allow the development of infrastructure that is necessary to transition towards lower emission fuel sources such as blending tanks and new intermodal links.
   New blending tanks that contain more than 5% fossil fuel are not allowed by the ordinance. Currently, gasoline is blended with ethanol and the existing blending tanks can continue to be used for that purpose. No explanation or evidence was provided to support the assertion that additional tanks are needed. BPS staff provided evidence in the Council presentation and the written record that demonstrates that there is a reasonable expectation that the demand for fossil fuels will be flat and that the existing FFT storage capacity, with the allowed exceptions, will continue to meet the future demand for fossil fuels. New intermodal links are not regulated by this ordinance.

City of Portland, Oregon | Bureau of Planning and Sustainability | www.portlandonline.com/bps
1900 SW 4th Avenue, Suite 7100, Portland, OR 97201 | phone: 503-823-7700 | fax: 503-823-7800 | tty: 503-823-6868

Printed on 100% post-consumer waste recycled paper.

7. The decision to reject a permit application by Zenith for pipes that would have been used exclusively for clean fuels undermines exemption for clean fuels, because the infrastructure for renewable fuels is essentially the same for fossil fuels.

   The Office of Community Technology decision is based on the City's franchise agreement with Zenith, and is not a land use decision and is not an indicator as to how the City will make future land use decisions that involve this ordinance.

8. Explicitly allow terminal safety and seismic upgrades. These upgrades typically occur in conjunction with market-based infrastructure changes, which the amendments prohibit.

   The FFTZ amendments designate existing FFTs as a limited use specifically to allow for safety and seismic upgrades. The ordinance only regulates new storage tank capacity. The testimony does not define or explain what is meant by a "market-based infrastructure changes." There is no evidence provided to support the argument that a seismic upgrade requires an expansion in storage capacity. Nothing in state land use law says local jurisdictions have to allow expansion of a use to make safety upgrades.

Working Waterfront Coalition

1. These multimodal fuel terminals have safely provided fuel.

   Agreed, the existing FFTs have safely provided fuel for decades. However, while there has not yet been a disaster, there have been numerous studies describing the risks and hazards from a major earthquake. The relatively few storage tank upgrades in the past 10 years means that the City should be proactive and limit expansions.

2. To justify private investment needed to upgrade energy and transportation infrastructure, existing FFTs need to grow. This ordinance eliminates incentives to make investments.

   No explanation or evidence is provided on the economics of upgrades and why FFTs need to grow in order to make safety upgrades. There is no state requirement that the City must provide incentives for safety upgrades.

3. The ordinance will create supply constraint/bottleneck, which will lead to more truck traffic to supply fuel, which will increase miles (and emissions).

   No evidence is provided regarding future demand or supply constraint. There is no explanation as to how limiting storage capacity will lead to increased truck traffic or how much truck traffic will increase. BPS presented evidence from federal and State of Oregon forecasts that indicate the opposite – that there will be flat or declining demand for fossil fuels that can be accommodated by the existing FFTs storage capacity.

4. It is important for FFTs to invest in facilities as demand continues and other unforeseen emergencies exist.

   The testimony does not define or explain what is meant by the phrase "as demand continues". Continues to do what? The FFTZ amendments designate existing FFTs as a limited use specifically to continue to operate to supply fossil fuels and to allow for safety and seismic upgrades. The testimony does not define or explain what is meant by the phrase "unforeseen emergencies". To

City of Portland, Oregon | Bureau of Planning and Sustainability | www.portlandonline.com/bps
1900 SW 4th Avenue, Suite 7100, Portland, OR 97201 | phone: 503-823-7700 | fax: 503-823-7800 | tty: 503-823-6868

Printed on 100% post-consumer waste recycled paper.

the contrary, the record contains ample evidence that a major earthquake is a foreseen event that state and local agencies have begun to prepare for. This ordinance specifically addresses that emergency by limiting expansion of storage capacity in an area at high risk for liquefaction.

Western States Petroleum Association (WSPA)

1. Locks existing infrastructure in place, which prevents efficiency, environmental, and safety improvements.
   This assertion is an oversimplification of the ordinance. The FFTZ amendments only regulates fossil fuel storage capacity. The ordinance allows existing tank capacity to be replaced, and allows, through exceptions, for additional storage capacity for aviation fuel and renewable fuels. Existing FFTs are designated as a limited use specifically to allow them to continue to operate and make efficiency, environmental, and safety improvements (which the testimony does not define or specify).

2. Undercuts the ability to meet future energy needs
   No supporting evidence is provided to define what is needed to meet future energy needs. BPS presented evidence from federal and State of Oregon forecasts that indicates that the demand for future petroleum will be flat.

3. Will inflict significant impacts on the ability to supply fuel and change fuel types as the region grows, technology advances, and fuel standards change.
   "Significant impacts" are not defined or supported by evidence. The letter does not explain how technology advances and fuel standard changes will create the need for additional fossil fuel storage capacity. The ordinance specifically exempts new storage capacity for renewable fuels as a means to support DEQ's Clean Fuels Program.

4. Will freeze existing infrastructure in place by location and size and would hinder improvements.
   The types of improvements are not defined. The ordinance only limits new fossil fuel storage tank capacity. The FFTZ amendments designate existing FFTs as a limited use specifically to continue to operate to supply fossil fuels and to allow for safety and seismic upgrades. Existing fossil fuel storage tank capacity can be reconfigured. Other aspects of terminal infrastructure (pipelines, docks, transloading facilities) are not regulated by this ordinance.

5. Prevent and discourage terminal upgrades, including tank seismic upgrades, due to the business impacts of capping tank capacity, resulting in fewer upgraded tanks.
   There have been relatively few storage tank upgrades in the past 10 years with the unlimited capacity expansion allowed under current regulations. No information is provided on what are the "business impacts" of regulating tank capacity. Only new fossil fuel storage tank capacity expansion is restricted. Renewable fuels and aviation fuels are exempt from these regulations. Other aspects of terminal infrastructure (pipelines, docks, transloading facilities) are not regulated by this ordinance.

1900 SW 4th Avenue, Suite 7100, Portland, OR 97201 | phone: 503-823-7700 | fax: 503-823-7800 | tty: 503-823-6868

Printed on 100% post-consumer waste recycled paper.

6. Prevent and discourage equipment upgrades necessary to meet market demand or comply with federal and state clean fuels law;
   Only new fossil storage tank capacity is restricted, other equipment upgrades are allowed. "Market demand" is not defined. Compliance with federal and state law is not defined, no specific citations are provided. The ordinance specifically exempts new storage capacity for renewable fuels as a means to support compliance with DEQ's Clean Fuels Program.

7. Prevent and discourage infrastructure upgrades, which typically occur concurrently with market-based infrastructure expansion and improvement;
   Only new fossil storage tank capacity is restricted, other equipment upgrades are allowed. There is no explanation of what is "market-based infrastructure expansion" or as why to storage capacity expansion is needed in conjunction with other infrastructure upgrades.

8. Prevent and discourage efficiency upgrades that generally reduce greenhouse gas emissions;
   Only new fossil storage tank capacity is restricted, other equipment upgrades are allowed. There is no explanation of what are "efficiency upgrades" that reduce greenhouse gas emissions or as why to storage capacity expansion is needed in conjunction with those upgrades.

9. Prevent and discourage the transition to newer lower-carbon-fuel sources in opposition to Oregon's low-carbon-fuel standards, Oregon's Renewable Fuel Standards, federal Renewable Fuel Standards, and similar laws;
   Only new fossil storage tank capacity is restricted, other equipment upgrades are allowed. Infrastructure that is required for the "transition to newer lower-carbon-fuel sources" is not defined. Compliance with federal and state law is not defined, no specific citations are provided. The ordinance specifically exempts new storage capacity for renewable fuels as a means to support compliance with DEQ's Clean Fuels Program.

10. Fail to provide for sufficient facilities and tank capacity to serve future energy needs;
    "Future energy needs" are not defined and no evidence is provided. BPS presented evidence that national petroleum consumption forecast out to 2050 is essentially flat, which is a continuation of historic trends in Oregon and Washington. In addition, ODOT is forecasting a decline in motor fuel consumption over the medium term to 2029.

11. Thwart future technologies that do not fit within the current infrastructure framework;
    Only new fossil storage tank capacity is restricted, other equipment upgrades are allowed. "Future technologies" is not defined and there is no explanation as to how this ordinance will "thwart" their deployment. If and when new technologies emerge that are cleaner and seismically safe, City Council can amend the ordinance but there is no reason to draft code around a vague hypothetical future.

12. Exclude Portland from the national and international energy markets;
    There is no explanation of what the opportunity is in national and international energy markets and no explanation as to how the ordinance excludes Portland from those markets. Only fossil tank capacity is regulated. Other types of infrastructure are not regulated by this ordinance.

City of Portland, Oregon | Bureau of Planning and Sustainability | www.portlandonline.com/bps
1900 SW 4th Avenue, Suite 7100, Portland, OR 97201 | phone: 503-823-7700 | fax: 503-823-7800 | tty: 503-823-6868

Printed on 100% post-consumer waste recycled paper.

Local and regional economic development strategies do not identify the energy sector as a key target industry.

13. Introduce a host of ambiguities and uncertainties to the marketplace that are necessary for a thriving economy;

    The vague terms "ambiguities and uncertainties" are not defined or explained. The FFTZ amendments designate existing FFTs as a limited use specifically to allow the FFTs to continue to operate to supply fossil fuels and to allow for safety and seismic upgrades. The ordinance restricts or limits new fossil fuel storage tank capacity. Existing fossil fuel storage tank capacity can be reconfigured. Other aspects of terminal infrastructure (pipelines, docks, transloading facilities) are not regulated by this ordinance. What is "necessary for a thriving economy" is not defined. BPS presented evidence that national petroleum consumption forecast out to 2050 is essentially flat, which is a continuation of historic trends in Oregon and Washington, during a period of a thriving economy. In addition, ODOT is forecasting a decline in motor fuel consumption over the medium term to 2029. Therefore, the fossil fuel storage capacity at the existing FFTs is sufficient to meet future needs.

14. Not align with state and federal policy regarding siting energy infrastructure or transportation of fuels

    No specific state or federal energy siting or transportation policy is cited. The testimony does not address the risks in citing energy infrastructure in an area of high risk of liquefaction.

15. Encourage less efficient, higher emission, and potentially less safe transportation by truck over more efficient modes of transportation, such as pipeline;

    The testimony fails to describe in detail the scenario that results in more fuel being transported by truck. Pipelines are not subject to these regulations.

16. Prohibit new terminals and new intermodal links that can deliver fuel more efficiently and with lower emissions.

    New FFTs with more than 2 million gallons of storage capacity are prohibited, primarily because Portland's industrial areas are, for the most past, areas with a high risk of liquefaction in a major earthquake. The testimony fails to address this safety issue. New intermodal links are not regulated by this ordinance. How new terminals and intermodal links can be more efficient and reduce emissions is not defined or explained.

17. The Proposed Amendments would freeze current infrastructure in place. This infrastructure is insufficient for future fuel demand, by both quantity and type of fuel.

    The ordinance will not "freeze current infrastructure in place". The FFTZ amendments designate existing FFTs as a limited use specifically to allow the FFTs to continue to operate to supply fossil fuels and to allow for safety and seismic upgrades. The ordinance restricts or limits new fossil fuel storage tank capacity. Existing fossil fuel storage tank capacity can be reconfigured. Other aspects of terminal infrastructure (pipelines, docks, transloading facilities) are not regulated by this ordinance. "Future fuel demand" is not defined. BPS presented evidence that national petroleum consumption forecast out to 2050 is essentially flat, which is a continuation of historic

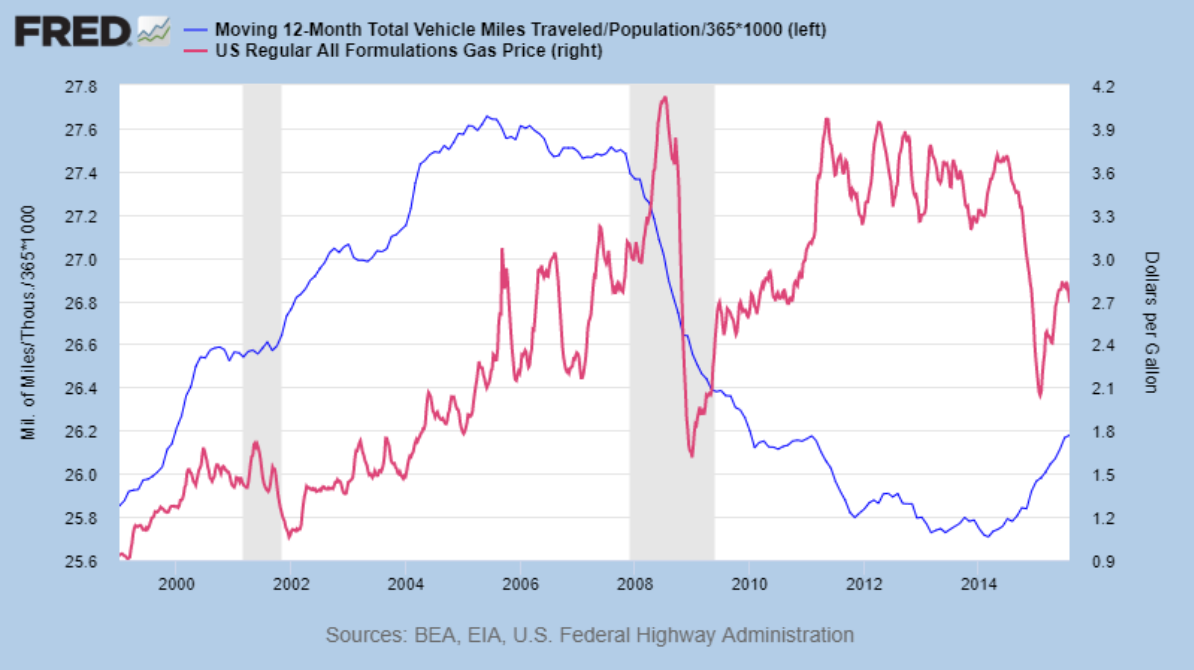
Printed on 100% post-consumer waste recycled paper.



trends in Oregon and Washington, during a period of a thriving economy. In addition, ODOT is forecasting a decline in motor fuel consumption over the medium term to 2029. Therefore, the fossil fuel storage capacity at the existing FFTs is sufficient to meet future needs.

18. The Proposed Amendments will inflict these negative impacts on the local, state, and regional economy, and ability to transition energy resources.

    The "negative impacts" to the economy are not defined. BPS presented evidence that the fossil fuel storage capacity at the existing FFTs is sufficient to meet future needs. The ordinance specifically exempts new storage capacity for renewable fuels as a means to support compliance with DEQ's Clean Fuels Program and a transition away from fossil fuels.

19. The Proposed Amendments do not limit the regional demand for fuel. Fuel is a classic example of a product with inelastic demand.

    No evidence is provided to demonstrate that the demand for fuel is inelastic. Fuel consumption is elastic and price-sensitive. As evidence, below is a graph retrieved from the Federal Reserve Bank of St. Louis.[1] It shows the elastic relationship between fuel prices and vehicle miles travelled. Since 2009, as fuel prices increased, vehicle miles traveled decreased until 2014, when fuel prices decreased, vehicle miles travelled increased.

There are many factors that go into the regional demand for fuel. "Future fuel demand" is not defined. BPS presented evidence that national petroleum consumption forecast out to 2050 is

[1] https://fred.stlouisfed.org/series/M12MTVUSM227NFWA, November 27, 2019

City of Portland, Oregon | Bureau of Planning and Sustainability | www.portlandonline.com/bps
1900 SW 4th Avenue, Suite 7100, Portland, OR 97201 | phone: 503-823-7700 | fax: 503-823-7800 | tty: 503-823-6868

Printed on 100% post-consumer waste recycled paper.

essentially flat, which is a continuation of historic trends in Oregon and Washington, during a period of a thriving economy. The testimony does not present any conflicting evidence.

20. Will prohibit new terminals, new intermodal links, and new fuel tanks in Portland, will result in dramatically increased fuel transport by truck

    The ordinance only prohibits new FFTs with storage tank capacity over 2 million gallons and new fossil fuel storage tank capacity at existing FFTs. New intermodal links are not regulated by this ordinance. The assertion that fuel transport by truck will dramatically increase is not supported by evidence. BPS presented evidence that the fossil fuel storage capacity at the existing FFTs is sufficient to meet future needs, based on national petroleum consumption forecast out to 2050 that is essentially flat, which is a continuation of historic trends in Oregon and Washington.

21. Prevent and discourage terminal safety improvements, including tank seismic upgrades, due to the business impacts of capping tank capacity, resulting in fewer upgraded tanks;

    There have been relatively few storage tank upgrades in the past 10 years with the unlimited capacity expansion allowed under current regulations. No information is provided on what are the "business impacts" of regulating tank capacity. Only new fossil fuel storage tank capacity expansion is restricted. Renewable fuels and aviation fuels are exempt from these regulations. Other aspects of terminal infrastructure (pipelines, docks, transloading facilities) are not regulated by this ordinance.

22. Prevent and discourage safety upgrades, which typically occur concurrently with market-based infrastructure expansion and improvement;

    Only new fossil storage tank capacity is restricted, other equipment upgrades are allowed. There is no explanation of what is "market-based infrastructure expansion" or as why to storage capacity expansion is needed in conjunction with other infrastructure upgrades.

23. Require locating fossil fuel tanks in liquefaction zones by prohibiting relocation of fossil fuel tanks outside of mapped liquefaction areas in Portland;

    The ordinance does not require locating fossil fuel tanks in liquefaction hazard areas. As shown on the attached map, there are very few areas in Portland's industrial zones, including no areas that have marine/harbor access, that are outside of the high risk liquefaction areas. Therefore, new FFTs are prohibited in all industrial and employment zones in Portland. No evidence has been presented to support the assertion that FFTs have to be located in Portland.

24. Prohibit siting newer, lower emission fuel facilities;

    The term "fuel facilities" is undefined and the testimony does not explain how those facilities will have lower emissions. The ordinance only prohibits new FFTs with storage tank capacity over 2 million gallons and new fossil fuel storage tank capacity at existing FFTs. The FFTZ amendments designate existing FFTs as a limited use specifically to allow the FFTs to continue to operate to supply fossil fuels and to allow for safety and seismic upgrades, including those facilities that lower emissions.

City of Portland, Oregon | Bureau of Planning and Sustainability | www.portlandonline.com/bps
1900 SW 4th Avenue, Suite 7100, Portland, OR 97201 | phone: 503-823-7700 | fax: 503-823-7800 | tty: 503-823-6868

Printed on 100% post-consumer waste recycled paper.

25. Prevent and discourage efficiency upgrades that generally reduce greenhouse gas emissions;
    The "efficiency upgrades that generally reduce greenhouse gas emissions" are not defined and there is no explanation as to how the ordinance will prevent or discourage them. The ordinance only prohibits new FFTs with storage tank capacity over 2 million gallons and new fossil fuel storage tank capacity at existing FFTs. The FFTZ amendments designate existing FFTs as a limited use specifically to allow the FFTs to continue to operate to supply fossil fuels and to allow for safety and seismic upgrades, including those facilities that lower emissions.

26. Prohibit new fuel tanks for blended fuels that transition towards lower-carbon-fuel sources; and
    The ordinance does not allow new blending tanks with more than 5% fossil fuel. Currently, gasoline is blended with ethanol. The testimony does not explain as to why additional blending tanks are needed.

27. Encourage higher emission and potentially less safe transportation by truck over more efficient modes of transportation, such as pipeline.
    The testimony fails to describe in detail the scenario that results in more fuel being transported by truck. Pipelines are not subject to these regulations.

Zenith Energy

1. Will inhibit infrastructure upgrades for safety and to meet changing market demands.
    The ordinance restricts new fossil storage tank capacity, other safety upgrades are allowed. There is no explanation of what are "changing market demands" or as why to storage capacity expansion is needed in conjunction with other infrastructure upgrades.

2. In light of OCT decision prohibiting development for renewable fuels, the FFTZ amendments also fails to adequately authorize renewable fuel storage.
    The OCT decision is based on the City's franchise agreement with Zenith, and is not a land use decision and is not an indicator as to how the City will make future land use decisions that involve this ordinance.

3. City has not identified and made available for public review additional facts that support re-adopting the FFTZA.
    The City provided additional findings as part of ordinance filing and presented additional evidence as part of City Council hearing. The written record was left open for 11 days to provide an opportunity for any interested party to respond. The record of evidence was publicly available, and, as of November 30, no requests were made to review the record.

4. As provided in previous (2016) testimony, terminal operators are unable to invest in upgrades without incentives.
    Current regulations have provided unlimited storage tank capacity expansion and very few upgrades (three tanks in 2012) have been made in the last 10 years, since the seismic vulnerability of the Critical Energy Infrastructure (CEI) hub has become a state and local concern.

City of Portland, Oregon | Bureau of Planning and Sustainability | www.portlandonline.com/bps
1900 SW 4th Avenue, Suite 7100, Portland, OR 97201 | phone: 503-823-7700 | fax: 503-823-7800 | tty: 503-823-6868

Printed on 100% post-consumer waste recycled paper.

Nothing in State law requires City to provide incentives as an offset to restrictive land use regulations.

5. Need opportunity to expand to meet market demand.
   "Market demand" and the need to expand storage capacity is not defined. BPS presented evidence that national petroleum consumption forecast out to 2050 is essentially flat, which is a continuation of historic trends in Oregon and Washington. In addition, ODOT is forecasting a decline in motor fuel consumption over the medium term to 2029. Therefore, the fossil fuel storage capacity at the existing FFTs is sufficient to meet future needs.

6. Safety upgrades require the construction of new infrastructure without interrupting service to customers. New storage tanks needed before old tanks can be taken out of service.
   No evidence is provided on storage tank capacity utilization at existing FFTs or the length of time that it takes to replace or retrofit a storage tank that indicates that new storage capacity is needed before existing storage capacity can be retrofitted or replaced. Zenith expanded transloading capacity without expanding storage tank capacity. Zenith proposed adding new transloading/intermodal pipeline capacity to utilize existing storage capacity.

7. Resolution 37168 prohibits City from restricting safety improvements and service to end users, and development of backup capacity.
   The testimony mischaracterizes the resolution. The text says that this resolution does not restrict safety improvements, service directly to end users, and development of emergency backup capacity, as in the resolution itself. The resolution provides guidance on future City actions, such as directing BPS to develop proposed code changes to advance the resolution. However, in the context of making a legislative land use decision (amending the Zoning Code), the 2035 Comprehensive Plan and Title 33 (Planning and Zoning) establish the procedures and approval criteria, which do not reference other resolutions that are not included in the 2035 Comprehensive Plan goals and policies.

8. The OCT decision is an indication that the City will prohibit new storage tanks capable of storing a variety of liquids, including fossil fuels. The City needs to clarify that there is no requirement to prove that storage facilities are not physically capable of being used for fossil fuels.
   The OCT decision addresses a proposed pipe in the public right-of-way and is based on the City's franchise agreement with Zenith, and is not a land use decision. It is not an indicator as to how the City will make future land use decisions that involve this ordinance. Per the limited use regulation (33.140.100.B.17.a), FFTs will need to demonstrate that new storage tanks will not increase the fossil fuel storage capacity beyond what existed on the date of the adoption of this ordinance.

9. Two years since Court of Appeals confirmed glaring evidentiary deficiencies. Use of emergency ordinance is without justification.
   LUBA did not remand the decision to the City until October 5, 2018. The remand assignments of error are based on lack of evidence supporting the decision, not the ordinance itself. The City Council has the discretion to declare an emergency. As evidenced in the oral testimony at the

City of Portland, Oregon | Bureau of Planning and Sustainability | www.portlandonline.com/bps
1900 SW 4th Avenue, Suite 7100, Portland, OR 97201 | phone: 503-823-7700 | fax: 503-823-7800 | tty: 503-823-6868

Printed on 100% post-consumer waste recycled paper.

November 20 public hearing, this is an urgent issue that requires immediate action. The City has determined that an emergency is appropriate here due to the fact that Portland is currently at risk of a major earthquake.

RE: Additional Testimony in Support of Re-Adopting Fossil Fuel Terminal Zoning Amendments

Dear Mayor Wheeler and Portland City Council Commissioners,

Thank you for the opportunity to offer additional comments on the proposed re-adoption of the City of Portland's Fossil Fuel Terminal Zoning Amendments ("amendments"). These comments are submitted on behalf of Columbia Riverkeeper, Center for Sustainable Economy, Oregon Physicians for Social Responsibility, Portland Audubon Society, 350PDX, Friends of the Columbia Gorge, Willamette Riverkeeper, Climate Action Coalition, Northwest Environmental Defense Center, Oregon Conservancy Foundation, and Human Access Project. We offer the following comments as response to written testimony submitted by various parties in opposition to the City's decision to re-adopt the amendments.

I. The Amendments Provide Flexibility for Improvements and Expansions for Non-Fossil and Renewable Fuel Storage and Transport.

Comments from Zenith Energy and other groups opposed to the amendments request that Council revise the text of the amendments to explicitly allow development of storage capacity and related infrastructure for renewable and non-fossil fuels. These comments reference the recent decision from the Office of Community Technology rejecting a request from Zenith to amend its franchise agreement to install new pipes for clean fuels and assert that OCT's decision is an indication that the City will deny similar projects in the future. However, Zenith's request to amend its franchise agreement was not reviewed pursuant to the amendments and OCT's letter makes no reference to the amendments as support for its decision.

The amendments clearly restrict "fossil fuel storage tank capacity" and "new bulk fossil fuel terminals." Proposed PCC 33.140.100(B)(17)(a). The amendments define "fossil fuel" to explicitly exclude "denatured ethanol and similar fuel additives with less than 5 percent fossil fuel content, biodiesel/renewable diesel with less than 5 percent fossil fuel content[.]" Proposed PCC 33.190.030 (Fossil Fuel). Thus, the amendments, as written, clearly allow for new or expanded infrastructure that will be used for non-fossil and renewable fuels. Council must assume that City staff will apply the amendments as written once they are actually implemented. Opponents provide no rational justification for revising the text of the amendments based on a decision that was made before the amendments were effective.

//

II. The Amendments Allow for Seismic and Safety Upgrades.

Next, several opponents argue that the amendments prohibit safety and seismic upgrades and should be revised to explicitly allow for these types of improvements. However, the amendments clearly allow safety and seismic upgrades and infrastructure replacement so long as fossil fuel storage tank capacity is not increased. Opponents' real concern is that the amendments may not allow for the most profitable means of performing such safety and seismic upgrades. Indeed, during the initial process leading up to the adoption of the amendments, terminal owners objected to the City's proposed 10% storage expansion allowance for seismic upgrades because they claimed it was not incentive enough to protect their infrastructure and the surrounding community from a catastrophic earthquake event. As Zenith states in its comments, operators of bulk fossil fuel terminals will not invest the resources needed for safety upgrades "without incentives" in the form of unlimited expansion.

However, the history and current state of the CEI Hub infrastructure suggests that even this type of so-called "incentive" will not drive bulk fossil fuel terminal owners to make seismic improvements unless and until it is absolutely necessary to meet their own corporate interests. As outlined in the 2019 PBEM CEI Hub study, the majority of large storage tanks in the CEI Hub were built prior to the 1990s, prior to our current understanding of the serious seismic risks in the region. However, in the past 30+ years nothing has compelled the owners of those storage tanks to implement seismic safety improvements. Thus, it is clear that what is really needed to "incentivize" safety improvements in the CEI Hub is for Council to adopt an enforceable requirement and firm deadline for replacement of older, unsafe tanks. The amendments, as written, clearly allow for such upgrades at any time that terminal owners decide to voluntarily implement them or when the City takes future action to require such upgrades.

III. The City has Satisfied its Obligations on Remand.

Several commenters have taken issue with the City's decision to re-adopt the amendments as they were originally adopted in 2016 without substantive changes, asserting that the amendments were declared "legally defective" by LUBA and the Court of Appeals. However, each of the issues sustained by LUBA and the Court of Appeals pertained to the City's lack of findings to address specific policies or lack of evidence in the record to support particular findings. None of the sustained legal errors touched on the legality of the text or the effect of the amendments. Thus, no substantive changes to the amendments are warranted or required. The City has prepared detailed findings on every potentially applicable policy in the 2035 Comprehensive Plan and other relevant city, regional, and statewide planning policies.

The City has also re-opened the record on remand to allow for the public, including opponents, to submit additional evidence into the record for Council to consider before re-adopting the amendments. BPS staff have also identified additional evidence to support the amendments and draft findings and to address the issues sustained by LUBA and the Court of Appeals. Additionally, Council held a public hearing to accept additional oral testimony before re-adopting the amendments. Notably, not a single representative from the groups opposed to the amendments appeared at the hearing to testify. These steps satisfy the City's procedural

obligations on remand and provided all parties with an adequate opportunity to submit testimony and evidence for Council's consideration.

Opponents Columbia Pacific Building Trades Council, Portland Business Alliance, Working Waterfront Coalition and Oregon Business & Industry take issue with the fact that the City has not attempted to "reach out to and work with our organizations...to find common ground." City staff actively engaged with representatives of these groups and the existing bulk fossil fuel terminals during the initial development of the amendments. Through those discussions and the opponents' lawsuit seeking to overturn the amendments it became clear that there is no "common ground" to be reached here. The City—and the many organizations and community members who support the amendments—are committed to taking action to address the serious health, safety, and climate risks associated with bulk fossil fuel terminals, while the opponents simply want to maintain the status quo where bulk fossil fuel terminals are allowed to expand and develop new infrastructure without limitation.

IV. Opponents Concerns Regarding Fossil Fuel Demand and Distribution Are Entirely Speculative.

Finally, several of the opponents' comments rely on flawed and unsupported assumptions that the amendments will impact fossil fuel transport, local carbon emissions, and market supply. For instance, in its comments Tidewater Barge Lines inexplicably asserts, "[i]f these terminals cease operations, fuel will have to be distributed in other modes of transportation such as truck or railcar." Nothing in the amendments requires existing bulk fossil fuel terminals to cease operations. Instead, the amendments explicitly authorize existing terminals to continue to operate by designating them as a limited use. Thus, there is no support for Tidewater's claim that barging of fossil fuels will be replaced with more trucks and rail cars travelling through Portland.

Similarly, several opponents argue that the amendments will result in an increase in vehicle miles traveled and carbon emissions because the amendments will cause more fossil fuels to be transferred through Portland by truck, instead of pipelines and other transport modes. However, the amendments do not regulate or restrict the format of fossil fuel transport and do not regulate docks, pipelines or rail infrastructure used to transport fuels to or through existing terminals. The opponents do not offer any evidence to support their assertion that the existing terminals will not be able to accommodate changes in market demand for fossil fuels. Council should not be persuaded to abandon this important action based on pure speculation.

As stated in our November 20, 2019 written testimony, we support the City's commitment to re-adopt the amendments as they were originally adopted in December 2016, with the minor revisions proposed by City staff. And we look forward to continuing to work with the City to develop policy solutions to address the risks posed by the CEI Hub infrastructure.

RE: ***Fuel Terminal Zoning Amendments on Remand***

Honorable Mayor Wheeler and Members of the City Council:

I am writing on behalf of IBEW Local Union 48 members that live and work in NW Oregon, we are also affiliated with the Columbia Pacific Building and Construction Trades Council. Our organization represents a broad diversity of members that work on a wide variety of projects that rely on a robust fuel facility infrastructure.

We wish to express our disappointment with the City's decision to once again propose a deeply flawed ordinance targeting fuel facilities. The proposal before you is a virtual carbon copy of the 2016 ordinance, which both the Land Use Board of Appeals (LUBA) declared legally defective on seven counts in 2017 and the Oregon Court of Appeals sustained in part.

We are aware that the new proposal contains "findings" purportedly to address the legal deficiencies of the 2016 proposal, but the official impact statement makes it clear that no substantive changes have been made. In the Community Impacts and Community Involvement section, it states:

> ***"Given that this ordinance is a reconsideration of a previously adopted ordinance, BPS relied upon the previous public testimony that informed that ordinance. This ordinance is substantially the same ordinance with a few minor adjustments to reconcile the code amendments with the current Zoning Code."***

This section also confirms that bureau staff relied almost entirely on the previous public input record, and since the court's decision in 2017, there has been no attempt to reach out and work with any of our organizations, who successfully challenged the 2016 ordinance, to find common ground.

This decision to bring back an ordinance that has already been rejected by LUBA and Oregon Courts, and the failure to event attempt to collaborate with the impacted stakeholders, calls into the question the rational and goals of this entire process. Not only could the current proposal result in another costly legal battle, it would also, if implemented, hurt the local economy and, in several ways, hinder, not help, the City's climate and safety goals.

We respectfully ask the Mayor and Council to reject the current redo of a legally deficient ordinance, and work with all stakeholders to develop a fact based proposal that is not only legal, but will support the City's climate action goals. A collaborative approach driven by facts, rather than ideological politics, would support, rather than prohibit, vital infrastructure improvement projects that increase worker safety; reduce, rather than increase, greenhouse gas emissions; and mitigate, rather than increase, risks posed by earthquakes.

Substantive amendments would address the deficiencies found by LUBA and the Court of Appeals, and could include the following:

1. Consider the carbon emissions of the various transportation methods used to meet local and regional demand. The current proposal would likely force fuels of all kinds to be transported by truck, instead of pipe and tank, forcing an increase in emissions when transporting fuels of all types.

2. Explicitly allow the development of infrastructure that is necessary to transition towards lower emission fuel sources such as blending tanks, and new intermodal links. Current city practice (highlighted in the recent Office of Community Technology decision to reject a permit application by Zenith for pipes that would have been used exclusively for clean fuels) to follow the 2015 fossil fuels resolution adopted by council, in practice, prevents the necessary infrastructure for the cleaner fuels the city says it wants our region to transition to, since the infrastructure for bio diesel and blended clean fuels is essentially the same for fossil fuels.

3. Explicitly allow terminal safety and seismic upgrades. These upgrades typically occur in conjunction with market-based infrastructure changes, which the Amendments prohibit.

IBEW Local Union 48 is committed to working with the City of Portland and all stakeholders to develop real solutions to speed up our community's transition to cleaner fuels and reduce emissions while ensuring that we can meet the energy needs of our City and State.

We understand the political pressure on public and private sector leaders to take more urgent action to address the growing impacts of climate change. We support the City taking real, actionable, and legally defensible steps to meet its climate action goals. We call on the council to reject this ordinance, which is identical to what was successfully contested by business, industry, and the trades in 2016, and work with us to identify those real solutions.

Sincerely,

Garth Bachman

Ella Shriner

#62667 | November 22, 2019

Testimony to on the **Fossil Fuel Terminals Zoning Amendments, Remand Draft**

See attached

Testimony is presented without formatting.

November 20th, 2019

Good afternoon commissioners. My name is Ella Shriner, I'm 17 years old, and I was born and raised in Portland. I'm also a founding member of the Portland Youth Climate Council, but I'm here today speaking as a concerned individual.

This morning I was at home before school thinking about what I wanted to say to you today. I thought I would focus on the risks fossil fuel infrastructure poses to our public health and safety, as well as our environment. I wanted my testimony to have facts and I wanted to say the perfect thing that would make it clear to you how important these zoning amendments are, and how important it is that they be just the beginning of our rapid journey to dismantle fossil fuel infrastructure in Portland. But as I sat, hands poised above the keys waiting for inspiration to strike, I broke down into tears.

The truth is, I don't know what I could say that could make it clear. What I could say that would move you as leaders to take the necessary and ongoing action. If leaders around the world are not stepping up because doing so would threaten their financial support from the very corporations that are responsible for this crisis, I don't know what I could say. If millions of young people have striked from school and marched together screaming for action, without sufficient response, then I don't know what I could say. If a growing number of climate refugees facing the loss of their home, and even death, doesn't move us to action, then I don't know what I could say. If polar ice melt, ocean acidification, sea level rise, devastating fires, climate enhanced heat waves, arctic blasts, tornados, and other extreme weather events are not enough for us to change, then I just don't know what I could say.

One of the things I hear most as a climate activist is "wow, when I was your age, I wasn't doing anything like what you're doing." When I hear that, I always think... "Well that's because when you were my age you didn't have to." The reality is, we've never before faced a crisis like the one we're in. This moment in time calls for all of us to step out of our comfort zone and do things we've never done before. We need to take risks.

Mayor Wheeler, I remember you told me about your daughter when I delivered a video to you about the danger of Liquified Natural Gas back when you were the State Treasurer. Do you ever find yourself thinking about how fast she's grown up? How it feels like just yesterday that you were watching her take her first steps, say her first words? And how old is she now? 12? 13? Well she was born more years ago than we have left to take drastic action. If we don't, her fate, my fate, and the fates of the rest of our, and future generations, will be sealed.

4 years ago, I testified as a 13 year old in favor of the resolution that led to these zoning amendments. Commissioner Fritz, you may remember the little middle schoolers singing "the times they are a changin'" and presenting you with climate champion awards. Those were hopeful times. But I'm not a middle schooler anymore, and I, along with thousands of my peers, are preparing to cast our first votes. The time's they really are a changin', and we're watching to see if all of you are willing to take the risks that this time demands.

To: The City Council of Portland, Oregon Nov. 20, 2019
Concerning: Proposed Ordinance On Fossil Fuel Infrastructure

Greetings to the City Council:

You have listened to the citizens of this city; you are aware how much we all love living here. You have also supported a proposed ban on all new fossil fuel infrastructure within it. Now it is time to finally, once and for all, pass it into law.

Most of us have children and grandchildren, and it should not be up to *them* to assure they will inherit a liveable planet. Yet, you on the council, are constantly pressured by powerful entities to maintain the status quo. An unending extraction and transporting of crude oil and petroleum products, with regard only for stock holder earnings...even at the peril of their own children and grandchildren. This is a form of madness seemingly unique to us short-sighted human kind.

To return to a sustainable world will require almost unimaginable *disruption* to this status quo. Yet it must be done, and soon. Otherwise we will surely create an unimaginable hell for all future generations to come.

Please continue the good work you have begun, so it may serve as a model for other cities across the country. When the vote is taken, please make it *unanimous* once again, supporting the proposed ordinance before you.

Thank you.

Dane Pikkola

TANK FARM POSITION STATEMENT

Communities along the Willamette, such as Linnton, value our views of four mountains and the sight of the flowing river. The forests surround us and sounds of foghorns are heard in the early morning hours. It is generally a peaceful scene. But the 6-mile riverfront is also home to scores of fuel tanks—a potentially catastrophic threat to local people and their homes. However, these tanks supply 90% of the entire state's fuel (gasoline, diesel, jet fuel, electricity) and pose a severe challenge to all of Oregon's resilience following a major seismic event. The Cascadia fault, the primary seismic hazard, runs for 700 miles from northern California to southern Canada.

History of Reports

The Oregon Resiliency Plan was published in 2013 by the Oregon Seismic Safety Policy Advisory Commission. After Oregon's Department of Geology and Mineral Industries (DOGAMI) staff studied the Critical Energy Infrastructure (CEI) Hub, they cited "major seismic vulnerabilities" due to "no or antiquated standards of building structure" and "soils susceptible to liquefaction." According to this report, "Cascadia earthquakes pose substantial risk to the CEI Hub and to Oregon. Not only are the energy sector facilities in the CEI Hub dependent on other sectors and systems in Oregon, including transportation and communication, they are interdependent upon each other." They recommended to the state that placement of tanks be diversified and located on bedrock.

Tony Schick, writing for OPB in 2015 in "How We Mapped NW Portland's 'Tank Farms'" furthered our knowledge of the CEI Hub risks. Schick dubbed the CEI Hub "Oregon's Seismic Achilles Heel" and stated, "when OPB began its coverage of the Cascadia subduction zone and Oregon's seismic vulnerabilities, the 'tank farms' in Northwest Portland emerged very quickly as an important part of the series." OPB produced a mapped database of storage tanks and their contents, each tank shaded according to the year of its construction, confirming these tanks dated back to the 1920's when seismic standards did not exist. Map tiles from historic topographic maps from 1905 were used to show where lakes, marshes, and the river path used to be. Then, using Portland's building footprint data, they identified where fill had been used to create the infrastructure to support the creation of commercial and industrial areas, including fuel tanks, substations, pipelines and transmission lines, thus confirming the locations of liquefaction risk.

So, how vulnerable are we?
Consider the variables here, each of which causes concern but taken together are a recipe for disaster.

- The CEI Hub is built on dredged soil which is likely to liquefy in an earthquake. In OPB's report, "the soils could become permeated with water, giving them the consistency of a sandy pudding. If that happens, it can damage buildings, tanks, and pipes." A report from the City Club of Portland, "Big Steps Before The Big One," echoes that prediction.

- Tanks were constructed scores of years ago. They date back to 1929, before any modern day seismic standards were established. This heightens the risk of their failure during an earthquake: toppling, splitting, and exploding are all possible.

- Pipelines are projected to suffer hundreds of breaks and scores of leaks. How effective will the current remediation efforts of operators be? These efforts include remotely operated valves, check valves, enhanced leak detection systems, and increased surveillance.

- Geologic fault structure and the activity of the Juan de Fuca plate have been studied by experts. They state there is a 15% probability of a whole margin subduction event in the next 50 years, and this figure jumps to 37% for a southern margin subduction event. Predictions of destruction are huge: 15 of 17 bridges, 1 out of every 3 fire stations, 1 of every 2 police stations, 2 out of 3 hospitals, and 3000 schools, according to Scott Burns, PSU seismic geologist. Following a major seismic event there will be no electricity for 1-3 months, no water for 1 month, no sewer or highways for 6 months, and taxpayers will pay 75% of the cost. The New Yorker predicts the devastation in detail at https://www.newyorker.com/magazine/2015/07/20/the-really-big-one

- Structures which are responsible for gasoline, diesel, jet fuel, and electricity are located in close proximity. The energy required for disaster recovery will be high. Resiliency will be inversely proportional due to impaired infrastructure for these key resources: energy, communication, and transportation.

What should we do?
This is not a NIMBY ("not in my backyard") position. Energy sources should not be centralized in any singular location, but especially not in one that is unstable and hazardous. Not only will their proximity exacerbate a disaster, but they will collectively handicap our recovery efforts. Those knowledgeable about the world's seismic events, such as Scott Burns, report the recovery efforts following a major seismic event are daunting and we must do all that we can to minimize the risk and maximize our recovery potential.

We acknowledge the following efforts:

The City Club of Portland recommends the following to reduce the risk of catastrophic CEI Hub Failure:

1. Oregon's DOGAMI should commission a geotechnical study of soils of the CEI Hub and alternatives for soil hardening. If grant funding is available, the Legislature should appropriate funds for the study.
2. The Governor and Legislature should designate a single state agency to oversee seismic risks at the CEI Hub. That agency should have the authority to:
   - Require all owners of CEI Hub facilities to provide an engineering assessment of their facilities' vulnerability to a CSZ earthquake and other information relevant to mitigating the current risks.
   - Develop and implement, in collaboration with industry stakeholders, standards for construction and retrofit of storage tanks at the CEI Hub. The standards should be designed to prevent releases and to preserve substantial functionality in the event of a CSZ earthquake.

The Oregon Seismic Safety Policy Advisory Committee has been formally tasked to conduct a 15-month study of the CEI Hub with a report to be submitted to the Office of the State Resilience Officer by December 31, 2019. The report will be provided to the House and Senate Veteran and Emergency Preparedness Committees with recommendations for the 2020 legislative short session which will focus on:

1. Conducting an analysis of state and federal guidance on the regulatory authority for seismic upgrades to both structures (tanks, terminals) and pipelines, to include land mitigation.
2. Working in conjunction with Oregon Solutions, determine incentives from a public-private view that focuses on hardening current infrastructure.
3. Showcasing the Earthquake Early Warning (ShakeAlert) system to encourage seismic awareness within the private sector.
4. Determining if a current state agency has statutory authority to develop long-term mitigation efforts. If not, recommend which state agency would be best suited for this new authority.

SB 850, Community Resilience Report, will be released in September 2018.
https://gov.oregonlive.com/bill/2017/SB850/

The above efforts promise to be lengthy and costly processes with unknown success. We don't need to make decisions about what is to be done; the experts have already done that: The CEI Hub must be decentralized and relocated to stable bedrock areas.

Linnton Neighborhood Association
Environmental Committee
September 13, 2019

We are concerned that transporting tar sands crude oil by rail poses immense risks to our community and the environment from accidents, potential spills, and explosions. We think the terminal facility site is prone to soil liquefaction that could cause tank failure during a Cascadia Subduction Zone earthquake or other seismic event. The marine tankers also pose unique risks to the Willamette River from spills or leaks. The City of Portland's Climate Action Plan acknowledges the need to dramatically reduce greenhouse gas emissions to mitigate the effects of climate change and tar sands are the most polluting form of fossil fuel.

We oppose the Zenith Energy expansion and all projects for new or expanded facilities that will result in an increase of tar sands transport or storage in Portland. We urge the Portland City Council, Multnomah County Commission, agencies, and officials to deny all support and permits for Zenith Energy and all future permits for new or expanded fossil fuel facilities. Portland City Council, Multnomah County Commission, and relevant agencies should conduct a neighborhood-by-neighborhood fossil fuel risk assessment that studies routine and worst case scenarios for spills, leaks, explosions, and train derailment.

We urge the Portland City Council and Multnomah County Commission to pursue policies that hold fossil fuel companies financially accountable for their pollution and other potential and real damage to Portland and surrounding waterways.

As a community living and working along the rail line, we are concerned about the threat to life, safety, health, and the environment due to accidents, potential spills, and explosions posed by oil trains carrying tar sands crude, by marine tankers, and at the CEI Hub. Increased rail traffic brings additional health impacts to Portland residents from diesel pollution.

Sincerely,

Nancy Hiser
Environmental Co-Chair for Linnton Neighborhood Association

TESTIMONY OF
Aja DeCoteau, Watershed Department Manager
Columbia River Inter-Tribal Fish Commission
Regarding City of Portland Ordinance No. 188142
City of Portland
November 20, 2019

- The Columbia River is the lifeblood of this region, supporting a rich and diverse ecosystem that has molded the cultures, diets, and religions of the region's tribes since time immemorial.
- In the past 200 years, the Columbia River – and this region – has changed dramatically, and not always for the best for the resources it supports.
- The tribes are on the frontlines when it comes to bearing the burdens of climate change, having already begun experiencing changes to our First Foods—the salmon, game, roots, and berries. For us, these natural resources are our cultural resources.
- The Columbia River and its fishery resources are battling impacts from development and pollution.
- Tribal fishers in the Columbia face even larger risks and potential impacts. In addition to our diets rich in fish, we spend much of the year outside where we are exposed to the air and water in and along the river.
- The tribes and the railroads have a long and complicated relationship. Trains run along both sides of the Columbia River, impeding tribal fishers' access to their fishing sites and creating risks of accidents.
- The recent escalation in hauling fossil fuels by unit trains alarmed our tribal members, not only because of increased risk of harm to them, but also because of the increased risk of what is often called a "low probability, high consequence" accident.
- A spill of any type of crude (heavy tar sands or light Bakken) will have significant and long-term impacts to the aquatic resources of the river. We learned this lesson from the Exxon-Valdez spill over 25 years ago. Despite a quarter century, Alaskans still find oil residue on the beaches and under rocks.
- The 2016 Mosier crude train derailment, fortunately, did not involve a devastating spill into the river, however it woke the region up to the potential of a major catastrophe. There were many lessons learned from that spill, but the primary lesson is we must protect the river at all costs.
- With the current legal landscape, we cannot totally prohibit trains laden with fossil fuels from traveling through the Gorge, however we can do our part to reduce the need to have them in the first place.
- We support the City of Portland's recent resolutions opposing coal trains and curtailing expansion of fossil fuel infrastructure as first steps to addressing climate change and protecting the environment.
- We fully support Ordinance No. 188142.

Portland, Oregon 97204

RE: Fuel Terminal Zoning Amendments on Remand

Honorable Mayor Wheeler and Members of the City Council,

NW Natural appreciates the opportunity to provide comments on the Fuel Terminal Zoning Amendments. NW Natural is a local distribution company (LDC) that provides natural gas directly to end users in Oregon and Washington, and has been operating in Oregon since 1859. It currently provides natural gas to more than 2.5 million people through 750,000 connections in the region, with the largest percentage of those customers residing in the Portland Metro Area.

We recognize along with council, that there is a climate imperative and that we must work together to address this future. It is in this light that NW Natural submits these comment to the record around the Fossil Fuel Terminal Zoning Amendments. This information about our Liquid Natural Gas (LNG) infrastructure and the renewable energy coming onto our system to reduce greenhouse gas emissions indicates that (i) our LNG facility should not be classified as a bulk fossil fuel terminal, (ii) the renewable energy should not be deemed a fossil fuel under the proposed zoning code amendments, and (iii) the City should avoid language that could hinder investment in storage capacity for renewable natural gas.

Background: According to the Fossil Fuel Terminal Zoning Amendments Remand Report, the proposed zoning code amendments seek to implement Resolution 37168. That resolution, which opposes expansion of infrastructure whose primary purpose is transporting or storing fossil fuels, also includes exemptions for safety, efficiency and operational improvements, service to end users, and infrastructure that accelerates transition to non-fossil fuel energy. The 2035 Comprehensive Plan (Policy 6.48) also calls for limiting fossil fuel distribution and storage facilities to those necessary to serve the regional market.

NW Natural's Business: Throughout the region, the company owns pipelines that deliver gas to homes and businesses for water and space heating, cooking, and industrial processes.

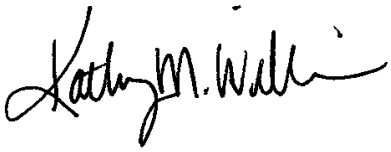
NW Natural Environmental Values: As a 160 year old company – one of the oldest in Oregon – NW Natural takes climate action very seriously. In 2018 Energy and Environmental Economics, Inc. released its analysis of alternative pathways to reduce by 2050 economy-wide greenhouse gas emissions in

Oregon and Washington to 80% of 1990 levels.[1] This analysis indicated that direct use of natural gas can be an important part of cost-effective pathways to reach this goal of deep decarbonization.

In addition, NW Natural is uniquely positioned to deliver renewable natural gas and renewable hydrogen. These forms of energy are newer than wind and solar, but offer similar climate benefits. In 2019, Oregon Governor Kate Brown signed Senate Bill 98 into law, creating a path for renewable natural gas to become an increasing part of the state's energy supply. Soon we will begin accepting renewable natural gas onto our pipeline system through a partnership with the City of Portland Bureau of Environmental Services and the Columbia Boulevard Wastewater Treatment Plant – a landmark project in the region.

We can do all this by leveraging one of the newest, tightest pipeline systems in the country because NW Natural took early action and completed our pipeline replacement program in 2015. Additionally, our Smart Energy carbon offset program was one of the first voluntary emission reduction programs offered by an LDC. We also joined the U.S. EPA Natural Gas Star Methane Challenge in March 2016 as a founding member. Under this program, companies adopt best practices and report reductions to the EPA annually.

Critical Service: The purpose and function of our LNG facility in northwest Portland is a central part of NW Natural's portfolio of resources, and is a topic of its Integrated Resource Planning. NW Natural's planning processes demonstrate that the energy stored at that facility is needed to meet customers' peak demands when the region experiences high loads, during cold weather events in the winter. Any changed use or improvement of the facility would be vetted through processes at the Oregon Public Utility Commission (OPUC). These processes are open to the public, and closely monitored and followed by a variety of outside groups – including those mentioned above – and the OPUC's professional staff. We encourage the council to ensure wording that will allow NW Natural to make safety and seismic upgrades to our LNG facility, in order to continue to safely, affordably and reliably serve our customers, especially during times of peak usage when this facility is essential.



We do not have sample language at this time, but as an example, the City Council should consider the following:

- Include language from Resolution 37168 and Comprehensive Plan so the intent and exemptions are accurately and clearly reflected in the zoning code.
- If a change in law would impose technical or engineering requirements that would curtail capacity and ability to serve customers, modifications (including construction of additional tank capacity) to maintain total capacity and service should be allowed outright as a matter of regulatory entitlement.
- For repair and maintenance, the code should explicitly prohibit the City from using such measures as an opportunity to curtail or impose costly upgrades.
- Renewable sources such as renewable natural gas and renewable hydrogen should be expressly exempted from the fossil fuel designation.
- Avoid language that could hinder investment in storage capacity for renewable natural gas. As a practical matter, renewable natural gas in our distribution system cannot be physically separated from fossil natural gas and stored in its own storage tank(s).

[1] Energy and Environmental Economics, Inc., "Pacific Northwest Pathways to 2050: Achieving an 80% reduction in economy-wide greenhouse gases by 2050" (November 2018).

Again, we appreciate the opportunity to offer comments on this proposed draft. We are happy to answer any questions you may have.

Sincerely,

Kathryn Williams

RE: Fuel Terminal Zoning Amendments on Remand

Honorable Mayor Wheeler and Members of the City Council,

NW Natural appreciates the opportunity to provide comments on the Fuel Terminal Zoning Amendments. NW Natural is a local distribution company (LDC) that provides natural gas directly to end users in Oregon and Washington, and has been operating in Oregon since 1859. It currently provides natural gas to more than 2.5 million people through 750,000 connections in the region, with the largest percentage of those customers residing in the Portland Metro Area.

We recognize along with council, that there is a climate imperative and that we must work together to address this future. It is in this light that NW Natural submits these comment to the record around the Fossil Fuel Terminal Zoning Amendments. This information about our Liquid Natural Gas (LNG) infrastructure and the renewable energy coming onto our system to reduce greenhouse gas emissions indicates that (i) our LNG facility should not be classified as a bulk fossil fuel terminal, (ii) the renewable energy should not be deemed a fossil fuel under the proposed zoning code amendments, and (iii) the City should avoid language that could hinder investment in storage capacity for renewable natural gas.

Background: According to the Fossil Fuel Terminal Zoning Amendments Remand Report, the proposed zoning code amendments seek to implement Resolution 37168. That resolution, which opposes expansion of infrastructure whose primary purpose is transporting or storing fossil fuels, also includes exemptions for safety, efficiency and operational improvements, service to end users, and infrastructure that accelerates transition to non-fossil fuel energy. The 2035 Comprehensive Plan (Policy 6.48) also calls for limiting fossil fuel distribution and storage facilities to those necessary to serve the regional market.

NW Natural's Business: Throughout the region, the company owns pipelines that deliver gas to homes and businesses for water and space heating, cooking, and industrial processes.

NW Natural Environmental Values: As a 160 year old company – one of the oldest in Oregon – NW Natural takes climate action very seriously. In 2018 Energy and Environmental Economics, Inc. released its analysis of alternative pathways to reduce by 2050 economy-wide greenhouse gas emissions in

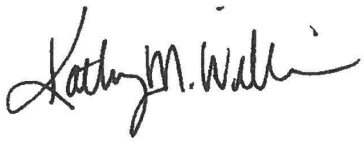
Oregon and Washington to 80% of 1990 levels.[1] This analysis indicated that direct use of natural gas can be an important part of cost-effective pathways to reach this goal of deep decarbonization.

In addition, NW Natural is uniquely positioned to deliver renewable natural gas and renewable hydrogen. These forms of energy are newer than wind and solar, but offer similar climate benefits. In 2019, Oregon Governor Kate Brown signed Senate Bill 98 into law, creating a path for renewable natural gas to become an increasing part of the state's energy supply. Soon we will begin accepting renewable natural gas onto our pipeline system through a partnership with the City of Portland Bureau of Environmental Services and the Columbia Boulevard Wastewater Treatment Plant – a landmark project in the region.

We can do all this by leveraging one of the newest, tightest pipeline systems in the country because NW Natural took early action and completed our pipeline replacement program in 2015. Additionally, our Smart Energy carbon offset program was one of the first voluntary emission reduction programs offered by an LDC. We also joined the U.S. EPA Natural Gas Star Methane Challenge in March 2016 as a founding member. Under this program, companies adopt best practices and report reductions to the EPA annually.

Critical Service: The purpose and function of our LNG facility in northwest Portland is a central part of NW Natural's portfolio of resources, and is a topic of its Integrated Resource Planning. NW Natural's planning processes demonstrate that the energy stored at that facility is needed to meet customers' peak demands when the region experiences high loads, during cold weather events in the winter. Any changed use or improvement of the facility would be vetted through processes at the Oregon Public Utility Commission (OPUC). These processes are open to the public, and closely monitored and followed by a variety of outside groups – including those mentioned above – and the OPUC's professional staff. We encourage the council to ensure wording that will allow NW Natural to make safety and seismic upgrades to our LNG facility, in order to continue to safely, affordably and reliably serve our customers, especially during times of peak usage when this facility is essential.

We do not have sample language at this time, but as an example, the City Council should consider the following:



- Include language from Resolution 37168 and Comprehensive Plan so the intent and exemptions are accurately and clearly reflected in the zoning code.
- If a change in law would impose technical or engineering requirements that would curtail capacity and ability to serve customers, modifications (including construction of additional tank capacity) to maintain total capacity and service should be allowed outright as a matter of regulatory entitlement.
- For repair and maintenance, the code should explicitly prohibit the City from using such measures as an opportunity to curtail or impose costly upgrades.

TIDEWATER
TRANSPORTATION & TERMINALS

November 20, 2019

City Council
Fossil Fuel Terminal Zoning Testimony
1221 SW Fourth Avenue, Room 130
Portland, Oregon 97204

RE: City of Portland - Bureau of Planning and Sustainability
Remanded - Fossil Fuel Terminal Zoning Amendments

Thank you for the opportunity for Tidewater Barge Lines ("Tidewater") to provide comments regarding the draft zoning amendments that would restrict development and expansion of bulk fossil fuel terminals.

Tidewater is a marine transportation and terminal company based in the Pacific Northwest that employs approximately 300 people. Tidewater has been in business since 1932 and is the largest inland marine transportation company west of the Mississippi River with a fleet of towboats and barges and five marine terminals. Tidewater's vessels help to move millions of tons of freight every year on Pacific Northwest waterways, reducing congestion on the state's highways and railroads while producing far fewer pollutants and carbon emissions than trucks and trains transporting equivalent tonnage.

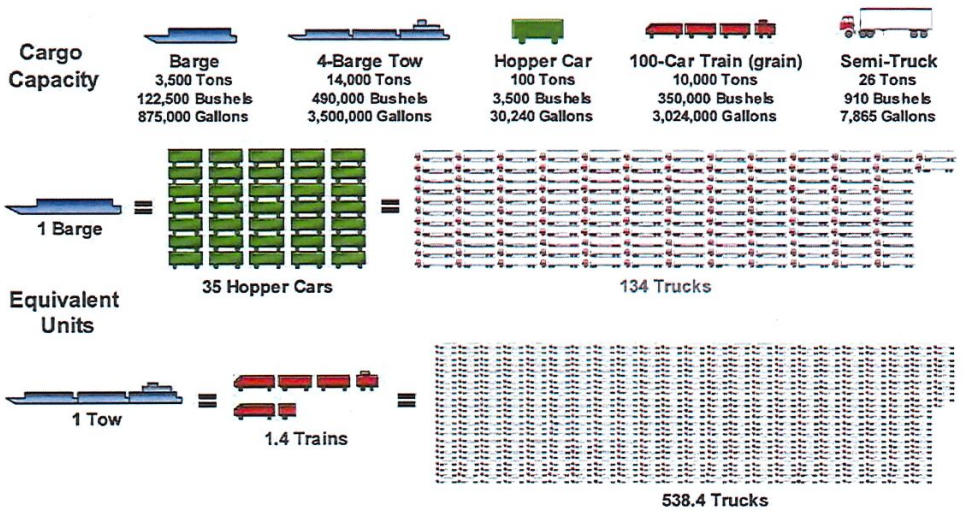
We have reviewed the proposed zoning changes and are concerned that these amendments will restrict economic development in the Pacific Northwest. We feel that energy terminals can be built, expanded and operated safely in the City of Portland. Energy terminals have the ability to create a positive economic impact and support new and existing family wage jobs in our region.

In addition, we have concerns that the proposed zoning changes will have negative environmental consequences to the Pacific Northwest. The proposed zoning changes create uncertainty about the future of energy terminals. These terminals are key to a fuel distribution network that allows Tidewater to supply fuel by barge from Portland to Eastern Oregon and Washington in an efficient and environmentally friendly matter. As noted in the enclosed document, four barges pushed by a tugboat is the equivalent of 538.5 trucks or 140 railcars that travel on the highways and railroads in our region. If these terminals cease operations, fuel will have to be distributed in other modes of transportation such as truck and railcar. Therefore, if barging is no longer a viable option for transporting fuel, then every four barge tow would be potentially replaced with approximately 538 trucks or 140 rail cars travelling on the highways and railroads in the Columbia River Gorge.

TIDEWATER
TRANSPORTATION & TERMINALS

In conclusion, Tidewater is an advocate for environmental stewardship in the Pacific Northwest and hopes the City of Portland will consider having a constructive dialogue with Tidewater and the other stakeholders to generate an implementable fossil fuel distribution policy that addresses climate change goals, public safety and environmental protection without significantly adversely impacting the viability of Oregon's economy and its waterfront industry. Tidewater urges the Portland City Council reconsider implementing the remanded fossil fuel terminal zoning amendments.

Thank you for your consideration and the opportunity to comment on this important matter.



Sincerely,

Robert A. Curcio
President & CEO

RE: Fuel Terminal Zoning Amendments on Remand

Honorable Mayor Wheeler and members of the City Council:

We are writing on behalf of the thousands of worker and employer members of the Columbia Pacific Building Trades Council, Portland Business Alliance, Working Waterfront Coalition and Oregon Business & Industry. Our organizations represent a broad diversity of businesses and organized labor in our city, region, and throughout the state of Oregon.

We write to express our concern with the city's decision to once again propose a deeply flawed ordinance targeting fuel facilities. The proposal before you is a virtual carbon copy of the 2016 ordinance, which both the Land Use Board of Appeals (LUBA) declared legally defective on seven counts in 2017 and the Oregon Court of Appeals sustained in part.

We are aware that the new proposal contains "findings" purportedly to address the legal deficiencies of the 2016 proposal, but the official impact statement makes it clear that no substantive changes have been made. On the impact statement you have today, under Community Impacts and Community Involvement section, it states on page 9:

"Given that this ordinance is a reconsideration of a previously adopted ordinance, BPS relied upon the previous public testimony that informed that ordinance. This ordinance is substantially the same ordinance with a few minor adjustments to reconcile the code amendments with the current Zoning Code." *(Council Agenda Item 1082, page 9)*

This section also confirms that bureau staff relied almost entirely on the previous public input record. Since the court's decision in 2017, there has been no attempt to reach out to and work with any of our organizations, who successfully challenged the 2016 ordinance, to find common ground.

This decision to bring back an ordinance that has already been rejected, in part by LUBA and Oregon Court of Appeals, and the failure to even attempt to collaborate with the impacted stakeholders, calls into question the stated rationale and goals of this ordinance. Not only could the current proposal result in another costly legal battle, if implemented, it would hurt the local economy and, in several ways, hinder the city's climate and safety goals.

We respectfully ask the mayor and council to reject the current redo of a legally deficient ordinance, and work with all stakeholders to develop a fact-based proposal that is legal and will support the city's climate action goals. A collaborative approach driven by facts, rather than ideological politics,

would support vital infrastructure improvement projects that increase worker safety; reduce greenhouse gas emissions; and mitigate risks posed by earthquakes.

Substantive amendments would address the deficiencies found by LUBA and the Court of Appeals, and could include the following:

1. Consider the carbon emissions of the various transportation methods used to meet local and regional demand. The current proposal would likely force fuels of all kinds to be transported by truck, instead of pipe and tank, forcing an increase in emissions when transporting fuels of all types.

2. Explicitly allow the development of infrastructure that is necessary to transition towards lower emission fuel sources such as blending tanks and new intermodal links. Current city practice to follow the 2015 fossil fuels resolution adopted by council prevents the necessary infrastructure for the cleaner fuels the city says it wants our region to transition to, since the infrastructure for biodiesel and blended clean fuels is essentially the same for fossil fuels. This is highlighted in the recent Office of Community Technology decision to reject a permit application by Zenith for pipes that would have been used exclusively for clean fuels.

3. Explicitly allow terminal safety and seismic upgrades. These upgrades typically occur in conjunction with market-based infrastructure changes, which the amendments prohibit.

Our organizations are committed to working with the City of Portland and all stakeholders to develop real solutions to speed up our community's transition to cleaner fuels, and reduce emissions while ensuring we can meet the energy needs of our city and state today and in the future.

We understand the political pressure on public and private sector leaders to take more urgent action to address the growing impacts of climate change. We support the city taking real, actionable and legally defensible steps to meet its climate action goals. We call on the council to reject this ordinance, which is identical to what was successfully contested by business, industry and the trades in 2016, and work with us to identify those real solutions.

Testimony to on the **Fossil Fuel Terminals Zoning Amendments, Remand Draft**

Portland City Council November 20, 2019 1221 SW 4th Avenue Portland, OR 97204 Re: Fossil Fuel Terminal Amendments on Remand (City Council Hearing, November 20, 2019) Dear Mayor Weaver and Portland City Commissioners, I am writing on behalf of the Working Waterfront Coalition (WWC) in opposition to the Fossil Fuel Terminal Zoning Amendments (FFT Amendments) Ordinance and Bureau of Planning and Sustainability report titled Fossil Fuel Terminal Zoning Amendments, Remand Report. The WWC represents a wide range of waterfront businesses along the Portland Harbor including several fossil fuel terminals (FFTs). The WWC actively participated and testified in the City's FFT Amendments process and related efforts, including the enactment of Resolution No. 37168, the adoption of the City's 2035 Comprehensive Plan, and the Council adoption of Ordinance No. 188142. Throughout the FFT Amendments process the WWC opposed the City's effort to prohibit new and limit the growth of multimodal terminals along the working waterfront. We testified previously, participated in the appeal, and we are testifying again on remand by virtue of this letter. These multimodal fuel terminals have safely provided the City, the Region and the State with most of the liquid fuel supply for decades. The energy cluster is Oregon's largest fuel distribution hub, providing more than 90 percent of the State's fuel supply. To economically justify the level of private investment needed to comprehensively upgrade critical energy and transportation infrastructure at existing FFTs, existing FFTs must be allowed to grow. This Ordinance eliminates any possible incentive for the massive amount of private investment needed to replace existing tanks in Portland. The Ordinance is shortsighted, and counterproductive to meaningful seismic upgrades over time. By prohibiting new FFTs and limiting the capacity of existing FFTs that serve the regional market the Ordinance creates a significant supply constraint for fossil fuels used within the region. Over time and in times of emergency, this supply constraint will create a significant fossil fuel bottleneck in Portland. When it becomes necessary to bypass this supply constraint, the only remaining option firms will have is to truck fossil fuels to and through Portland. This constraint will therefore increase vehicle miles traveled and will require more fossil fuel to be transferred to and through Portland by truck. For the foreseeable future, fossil fuels will continue to fill an important role in our energy economy. It is critically important for firms to invest in fossil fuel facilities over the next several decades, as demand continues and other unforeseen emergencies continue to exist. The WWC urges City Council to reject the Fossil Fuel Terminal Zoning Ordinance. Sincerely, Ellen M. Wax Executive Director

Re: Fossil Fuel Terminal Amendments on Remand (City Council Hearing, November 20, 2019)

Dear Mayor Weaver and Portland City Commissioners,

I am writing on behalf of the Working Waterfront Coalition (WWC) in opposition to the Fossil Fuel Terminal Zoning Amendments (FFT Amendments) Ordinance and Bureau of Planning and Sustainability report titled *Fossil Fuel Terminal Zoning Amendments, Remand Report*.

The WWC represents a wide range of waterfront businesses along the Portland Harbor including several fossil fuel terminals (FFTs). The WWC actively participated and testified in the City's FFT Amendments process and related efforts, including the enactment of Resolution No. 37168, the adoption of the City's 2035 Comprehensive Plan, and the Council adoption of Ordinance No. 188142. Throughout the FFT Amendments process the WWC opposed the City's effort to prohibit new and limit the growth of multimodal terminals along the working waterfront. We testified previously, participated in the appeal, and we are testifying again on remand by virtue of this letter.

These multimodal fuel terminals have safely provided the City, the Region and the State with most of the liquid fuel supply for decades. The energy cluster is Oregon's largest fuel distribution hub, providing more than 90 percent of the State's fuel supply. To economically justify the level of private investment needed to comprehensively upgrade critical energy and transportation infrastructure at existing FFTs, existing FFTs must be allowed to grow. This Ordinance eliminates any possible incentive for the massive amount of private investment needed to replace existing tanks in Portland. The Ordinance is shortsighted, and counterproductive to meaningful seismic upgrades over time.

By prohibiting new FFTs and limiting the capacity of existing FFTs that serve the regional market the Ordinance creates a significant supply constraint for fossil fuels used within the region. Over time and in times of emergency, this supply constraint will create a significant fossil fuel bottleneck in Portland. When it becomes necessary to bypass this supply constraint, the only remaining option firms will have is to truck fossil fuels to and through Portland. This constraint will therefore increase vehicle miles traveled and will require more fossil fuel to be transferred to and through Portland by truck.

For the foreseeable future, fossil fuels will continue to fill an important role in our energy economy. It is critically important for firms to invest in fossil fuel facilities over the next several decades, as demand continues and other unforeseen emergencies continue to exist. The WWC urges City Council to reject the Fossil Fuel Terminal Zoning Ordinance.

Sincerely,

Ellen M. Wax

Ellen M. Wax
Executive Director

Established in 2005, the Working Waterfront Coalition, with its extensive knowledge of harbor industry needs and active industry participation, is dedicated to working with its partners to ensure an appropriate balance between environmental concerns and the needs of river-related, river-dependent employers. Portland's Harbor is a vital employment area: home to thousands of valuable high-wage, high-benefit jobs. In addition, WWC members are conscientious stewards of the environment, making significant investments in the harbor consistent with state and federal laws.

EXECUTIVE SUMMARY

This report was prepared for the Regional Disaster Preparedness Organization (RDPO), with funding provided by the Urban Areas Security Initiative Program. The report provides damage and casualty estimates to buildings, people, and key infrastructure sectors resulting from a major earthquake in the Portland metropolitan region by using updated local geologic information and recent advances in loss estimation methods. Damage and casualty estimates are tabulated at county, jurisdiction, and neighborhood levels, providing actionable information for further use in emergency planning, earthquake mitigation, public awareness, and post-earthquake response and recovery.

The RDPO is a bi-state partnership of local and regional government agencies, non-governmental organizations, and private-sector stakeholders representing the Portland metropolitan region that collaborate to increase the region's resiliency to disasters. The region spans Clackamas, Columbia, Multnomah, and Washington Counties in Oregon and Clark County in Washington. In 2016 the RDPO Steering Committee identified a need for updated, region-wide, detailed loss estimates from a major earthquake and engaged the Oregon Department of Geology and Mineral Industries (DOGAMI) to conduct this study. Previously, earthquake damage estimates in large portions of the Portland metropolitan region were limited to studies conducted in the 1990s, when understanding of the Cascadia Subduction Zone (CSZ) risk was nascent. Since then, advances have occurred in several areas, including loss estimation tool capabilities, subduction zone science, and local geologic mapping in the Portland metropolitan region. The RDPO commissioned this study to harness such advances, thereby enabling local, regional, state, and federal planners and policy makers to apply the results in their efforts to mitigate risk and building seismic resilience and to prepare for response and recovery. DOGAMI and RDPO divided the project into two phases, with the first phase focused on methodology refinement and application of those methods to evaluate impact of a major earthquake in Clackamas, Multnomah, and Washington Counties (Oregon). Phase 2 will apply the same methods in Columbia County, Oregon, and Clark County, Washington.

The Portland metropolitan region is vulnerable to regional and local earthquakes. We modeled damage for two earthquake scenarios: a magnitude 9.0 CSZ earthquake, and a magnitude 6.8 Portland Hills fault earthquake, a local crustal fault situated at the foot of the Tualatin Mountains. In order to better understand the range of possible losses, our analysis quantified impacts during saturated and dry soil conditions—the former are more likely to have earthquake-induced landslides and liquefaction; the latter may have some earthquake-induced landslides, but little occurrence of liquefaction. We derived our damage estimates primarily from Hazus®, a geographic information system (GIS)-based tool and set of methods for loss estimation from natural hazards. Hazus is developed and supported by the Federal Emergency Management Agency (FEMA).

Our project consisted of several major efforts:

- **Building and infrastructure databases**: completion of a region-wide building footprint database, a building database containing detailed descriptions of each building, and an electric power transmission structure database
- **Geotechnical mapping updates:** earthquake-induced landslide susceptibility, liquefaction susceptibility, and soil classification, using recently published high-resolution geologic mapping
- **Ground motion and ground deformation updates:** local ground motion and ground failure data for two earthquake scenarios using the geotechnical mapping updates
- **Earthquake damage estimates:** quantifying impacts to buildings and the people that occupy them, to the region's designated emergency transportation routes, and to the electrical grid

A GIS database containing building footprints, population density grids, detailed casualty, debris, and building loss estimates by jurisdiction and neighborhood, key infrastructure sectors with loss estimates, and updated ground motion and ground deformation data accompanies this report. A separately published report describes the geologic mapping updates for the three-county area, consisting of National Earthquake Hazards Reduction Program (NEHRP) soil types, and earthquake-induced landslide and liquefaction susceptibility.

A Cascadia Subduction Zone (CSZ) magnitude 9.0 earthquake will have a severe impact on the three-county area, with building repair costs amounting to between 23.5 and 36.7 billion dollars (9% and 14% of the total building replacement cost, **Table ES-1**). Although damage estimates vary widely throughout the study area, no community will be unharmed. Depending on the time of day an earthquake occurs, casualties may be in the thousands or low tens of thousands. The earthquake will generate several millions of tons of debris from damaged buildings. Damage and casualty estimates resulting from a magnitude 6.8 Portland Hills fault earthquake are more than twice compared to a CSZ earthquake, primarily because of the Portland Hills fault location below densely populated and heavily developed areas (**Table ES-1**). However, the likelihood of a Portland Hills fault earthquake is considerably less than a Cascadia Subduction Zone earthquake.

Table ES-1. Loss estimate summary for two earthquake scenarios in the Portland metropolitan area. Lower value: dry soil conditions. Upper value: saturated soil conditions.

County	U.S. Census Population Estimate (2010)	Number of Buildings	Building Value ($ Billion)	Building Repair Cost ($ Billion)	Building Loss Ratio	Debris (Millions of Tons)	Long-Term Displaced Population (Thousands)	Total Casualties*	
								Daytime Scenario (Thousands)	Nighttime Scenario (Thousands)
Cascadia Subduction Zone magnitude 9.0 earthquake									
Clackamas	375,992	179,164	62.4	3.2–4.6	5%–7%	1.7–2.1	1.9–10.1	2.0–2.8	0.5–1.1
Multnomah	735,334	255,577	114.0	13.3–20.5	12%–18%	7.7–10.4	9.7–37.5	11.4–16.7	2.8–5.6
Washington	529,710	181,111	82.7	7.0–11.6	8%–14%	3.4–4.8	5.2–37.7	4.9–7.7	1.1–3.7
Total	1,641,036	615,852	259.1	23.5–36.7	9%–14%	12.8–17.3	16.8–85.3	18.3–27.2	4.4–10.4
Portland Hills fault magnitude 6.8 earthquake									
Clackamas	375,992	179,164	62.4	12.9–16.4	21%–26%	4.9–6.0	25.2–50.8	8.9–10.9	3.3–5.2
Multnomah	735,334	255,577	114.0	32.3–42.7	28%–37%	15.7–19.3	50.8–120	28.9–36.3	9.3–15.3
Washington	529,710	181,111	82.7	15.4–24.3	19%–29%	6.0–8.6	19.6–86.0	10.0–15.8	3.2–8.5
Total	1,641,036	615,852	259.1	60.6–83.4	23%–32%	26.6–33.9	95.6–257	47.8–63.0	15.8–29.0

* Casualty estimates include minor injuries, injuries requiring hospitalization, and fatalities.

The damage estimates are significantly higher than those given in previously published studies for the area, primarily due to usage of an updated building inventory that more accurately reflects the region's building code history with respect to seismic resiliency, and usage of updated soils and liquefaction susceptibility data.

This study addressed a major need for consistent, updated earthquake damage estimates in the Portland metropolitan region. The data are intended not as an end in themselves, but as a platform for counties, jurisdictions, and communities to better understand their needs to prepare for, respond to, and recover from a major earthquake. We conclude our report with recommendations supported by findings in this study that can reduce the region's vulnerability, shorten recovery time, and improve emergency operations.

1.0 INTRODUCTION

1.1 Overview

Casualty and loss estimates for a modeled earthquake provide planners with actionable data for pre-earthquake preparations and mitigation and for post-earthquake recovery efforts. The Regional Disaster Preparedness Organization (RDPO), a bi-state partnership of local and regional government agencies, non-governmental organizations, and private-sector stakeholders representing the Portland Metropolitan Region, collaborate to increase the region's resiliency to disasters, including earthquakes. The Portland Metropolitan Region spans Clackamas, Columbia, Multnomah, and Washington Counties in Oregon, and Clark County in Washington (**Figure 1-1**).

Figure 1-1. Regional Disaster Preparedness Organization counties, spanning Oregon and Washington. Phase 1 study area in tan, proposed Phase 2 study area in lavender. County seats shown as dots.

One of RDPO's guiding principles is ensuring equity and fairness in adopting regional policies, and from an earthquake planning perspective, that principle requires loss estimates that are developed using consistent methods and data across the region. Prior to this study, loss estimates from earthquakes in the Portland Metropolitan Region were derived from several studies, each done at different times, using different datasets (Wang, 1998; Hofmeister and others, 2003; FEMA, 2004; Tetra Tech, 2016a). Technologies and data available for earthquake impact analysis have improved since these studies. RDPO requested that Oregon Department of Geology and Mineral Industries (DOGAMI) develop—using the best tools and methods, updated local geological data, and detailed building and infrastructure data—updated loss estimates from a major earthquake for the five-county RDPO area.

We divided the project into two phases. **Phase 1** focused on methodology refinement and application of those methods to evaluate impact of a major earthquake in **Clackamas**, **Multnomah**, and **Washington Counties** (Oregon)—the "study area." Phase 2 will apply the same methods in Columbia County, Oregon, and Clark County, Washington. This report documents our Phase 1 work.

The three-county study area is home to 44% of Oregon's total population. It continues to experience significant growth, with population increasing from 1.45 million people in 2000, to 1.64 million people in 2010, to 1.78 million people in 2016 (Portland State University Population Research Center, 2016, https://www.pdx.edu/prc/population-reports-estimates). By 2030, the study area's total population is projected at 2.10 million people (Oregon Office of Economic Analysis, 2013, http://www.oregon.gov/das/OEA/Pages/forecastdemographic.aspx). The area hosts 894,000 jobs, or 50% of all jobs in Oregon, with total annual wages estimated at $50.5 billion (Oregon Employment Department, 2016). The area includes an infrastructure hub that houses all of Oregon's major liquid fuel port terminals, and Port of Portland facilities that include the state's largest airport. Most of the population in the study area is concentrated in cities (76%), but all three counties contain large tracts of unincorporated suburban development. All three counties have broad areas of dispersed rural development.

Geology in the 3,076-square-mile study area varies widely, influenced by local and regional processes (Evarts and others, 2009). It includes Columbia River basalts, alluvial deposits, volcanic outcrops, loess deposits, dredge and fill material placed on top of former riverine wetlands, and large areas of fine-grained to coarse-grained Missoula flood deposits (Ma and others, 2012). The geological diversity creates significant local variations in earthquake ground motion and in ground failure from earthquake-induced landslides and liquefaction.

1.2 Earthquake Scenarios and Earthquake Loss Estimation

An earthquake scenario tells the story of a defined earthquake and its potential impacts to a community, presenting narratives and data that can help planners and community members better understand the earthquake and plan for the future (Earthquake Engineering Research Institute [EERI], 2006). Scenarios use the best scientific information available on fault placement, rupture frequency, and earthquake magnitude. Because the loss estimate data are used for planning purposes, scenarios incorporate the upper end of predicted magnitude when modeling a specific earthquake. Full earthquake scenario exercises incorporate experts from multiple backgrounds and responsibilities, such as transportation and utilities. Past examples include the Seattle Fault (EERI, 2005) and the Wasatch Fault (EERI, 2015) scenarios.

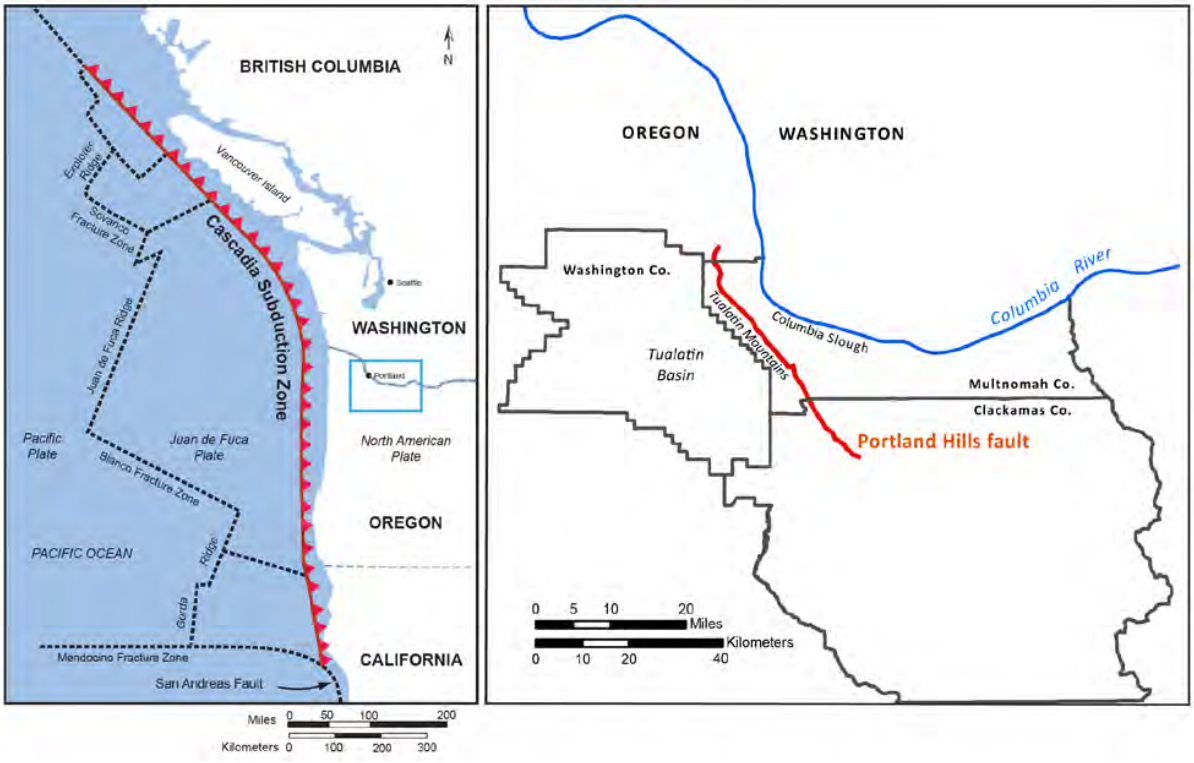
Our study is more limited in scope compared to the two example scenarios; we focus on damage to buildings and the people that occupy them, and to two key infrastructure sectors. In this report, our use of the term *scenario* refers to a specific combination of a particular earthquake and one or more additional variables. In order to provide planners a more complete picture of the range of potential impacts from a large earthquake, we modeled two distinct earthquakes: a Cascadia Subduction Zone and a Portland Hills fault. Each earthquake was modeled with a *wet* (saturated) and a *dry* soil condition, and each earthquake was modeled at two different times of the day, at "2 AM" and at "2 PM."

In western Oregon and Washington, soil moisture conditions vary widely throughout the calendar year. Soil moisture conditions influence the likelihood of an earthquake-triggered landslide or liquefaction. An earthquake occurring during wet (saturated) soil conditions is much more likely to induce landslides and liquefaction. Some earthquake-induced landslides may occur in dry soil conditions, but liquefaction is much less likely.

Throughout a typical day, people move between various buildings such as residences, schools, work facilities, and commercial facilities. Some buildings, due to their basic structural system, are more likely to sustain significant damage from an earthquake and, thus, depending on how many people are occupying the building at the time of the earthquake, cause more casualties.

Past earthquakes along the 600-mile Cascadia Subduction Zone fault (**Figure 1-1**) have occurred at highly variable intervals, from decades to centuries, and have ranged widely in magnitude (Oregon Seismic Safety Policy Advisory Commission [OSSPAC], 2013). At least 40 large-magnitude earthquakes have occurred along the fault in the past 10,000 years. The most recent earthquake, estimated at magnitude 9.0, occurred on January 26, 1700 A.D. Studies of the geologic record suggest that a Cascadia Subduction Zone earthquake of magnitude 9.0 has a 10% to 14% chance of occurring within the next 50 years (Petersen and others, 2002; Goldfinger and others, 2012). For the central and northern Oregon coast, recent research suggests the chance of occurrence within the next 50 years may be 15% to 20% (Goldfinger and others, 2017).

Although the Cascadia Subduction Zone fault has garnered significant attention, active local crustal faults should also be evaluated in an earthquake impact analysis. Wong and others (2001) concluded that the Portland Hills fault (**Figure 1-2**) might be seismogenic, with evidence suggesting two ruptures in the past 15,000 years (Liberty and others, 2003). Other active crustal faults exist in the Portland Metropolitan Region, but a rupture on the Portland Hills fault would be the most impactful, given its position directly underneath downtown Portland and the population centers of Clackamas County.



Hazus is a nationally applicable standardized methodology that contains models for estimating potential losses from earthquakes, floods, and hurricanes. Hazus uses geographic information system (GIS) technology to estimate physical, economic, and social impacts of disasters (FEMA, 2011). FEMA developed the earthquake model in cooperation with the National Institute of Building Sciences (Schneider and Schauer, 2006). Hazus damage and loss functions for generic model building types are considered to be reliable predictors of earthquake effects for large groups of buildings (FEMA, 2010). However, good estimates require accurate, updated data inputs.

The first Hazus-based study conducted in Oregon used a magnitude 8.5 model of a Cascadia Subduction Zone earthquake as it was understood at the time (Wang, 1998). The study was intended to provide an overall initial understanding of potential earthquake impacts across Oregon. Further, the Hazus tool at that time did not incorporate liquefaction or landslide information. Subsequent Hazus-based studies were limited to portions of the study area. The City of Portland had two Hazus-based studies (FEMA, 2004; Tetra Tech, 2016a), and Clackamas County had one Hazus-based study (Hofmeister and others, 2003). However, no studies have been conducted for Multnomah County (excluding the City of Portland) and Washington County since Wang (1998).

All previous Hazus-based earthquake studies in the study area were conducted at the census tract level—a spatial unit designated by the U.S. Census Bureau (https://www.census.gov/geo/reference/gtc/gtc_ct.html) that was chosen in the formative days of Hazus tool development out of computational necessity, but one that oversimplifies the building, seismic, and geologic heterogeneity within the census tract (Price and others, 2010). In the past five years, advances in Hazus tools and methods have enabled modeling earthquake damage using detailed data that incorporate local geologic variations and individual building seismic design characteristics. The advancements in the tools and methods provide more accurate loss estimates and permit analysis at a finer, neighborhood-scale level, rather than at the coarser census tract level. The updated methods require that considerable effort be expended on dataset development, including building and infrastructure inventory and local geological data. In Section 2, we provide background on the asset development, which includes all buildings and key infrastructure

sectors in the study area. Further background on the key infrastructure sectors is in the following subsections.

Figure 1-2. Cascadia Subduction Zone fault (left) and Portland Hills fault (right) locations. Blue rectangle in left figure is shown in right figure.

1.2.1 Critical Infrastructure Sectors

The Cities of Eugene and Springfield Multi-Jurisdictional Natural Hazards Mitigation Plan (2014) identified three critical infrastructure sectors fundamental to the operation, maintenance, and restoration of all other infrastructure sectors—namely, electricity, transportation, and fossil fuels. Given the challenges of enumerating the numerous interdependencies among various sectors and of quantifying potential earthquake damage to the components of those sectors, we determined that by limiting our analysis to the key sectors identified in that plan, we could establish a basis upon which to build future infrastructure studies and interdependencies.

In the Portland Metropolitan Region, fossil fuel supply seismic resiliency has been analyzed by Wang and others (2013), with a focus on the Critical Energy Infrastructure (CEI) Hub in northwest Portland. Tetra Tech (2016b) quantified damage estimates to the CEI Hub's fuel storage structures for a Cascadia Subduction Zone and for a Portland Hills fault earthquake scenario, and DOGAMI provided a substantive review of the report. We did not see a need to revisit damage estimates to the nonbuilding structures contained in the CEI Hub. Nonbuilding structures include water towers, storage tanks, piers, dams, and carports, and where human occupancy is incidental (FEMA, 2012b).

A Hazus-based study of the City of Portland (FEMA, 2004) included an analysis of an earthquake impact to electric substations and the transportation network. Although it used best available liquefaction and landslide data, the study was limited to the City of Portland, and its spatial data were not made available for further analysis.

1.2.1.1 Electric Power Transmission

Electric power infrastructure consists of power generation and distribution, including dams, substations, transmission network, and local transformers. Within the network, substation components are typically the most likely to fail given strong ground motion (Fujisaki and others, 2014). Transmission structures (towers and poles) generally perform well under strong ground motion but can fail due to lateral movement from liquefaction or earthquake-induced landslides (Good and others, 2009). Hazus provides a simplified damage model from ground motion and ground failure for substations as a whole unit, but the model may be overly conservative (Kongar and others, 2014), and a more accurate model should consider individual substation components.

From our literature review we determined that our project should 1) provide updated ground motion and ground failure data for local utilities to better quantify their substation seismic resiliency, and 2) address the risk to the transmission network between substations by quantifying potential ground failure at the transmission structures. An example of earthquake-induced ground failure impact on a transmission structure is shown in **Figure 1-3**. Our approach builds on the previous exposure analysis of electric transmission structures to mapped landslides established by Burns and others (2011, 2013).

Figure 1-3. Example of ground failure underneath a transmission tower, 1999 İzmit earthquake (Turkey). Photographic credit: University of California, Irvine Consortium of University for Research in Earthquake Engineering Archives.

1.2.1.2 Emergency Transportation Routes

Functioning transportation networks are essential for emergency response and post-earthquake recovery. Regional planners have identified a subset of arterials in the study area as routes essential for providing emergency services. Understanding which routes may be impacted from an earthquake can permit planners to consider alternative routes or how to distribute services in a more dispersed manner. An example of earthquake-induced ground failure impact on a surface road is shown in **Figure 1-4**. A complete analysis would include a seismic analysis of the bridges and overpasses used by the emergency transportation routes, but such an analysis requires detailed field-gathered information (e.g., Wang, 2017) and was beyond the scope of this project.

Figure 1-4. Damaged road due to liquefaction-induced lateral spreading, 2001 Nisqually, Washington earthquake. Photographic credit: DOGAMI Archives.

1.3 Study Limitations

Hazus-based risk analyses often include damage estimates to various assets such as buildings, buried utilities, above ground utilities, and essential facilities. Such analyses typically use the inventory data that accompany Hazus. Out of necessity, the Hazus inventory data are constructed from readily available nationwide datasets, and often capture a portion of the non-building assets in an area. Users can supplant the inventory with more detailed information, but at significant development cost. Given the constraints on time and budget for this project, and the challenges of obtaining more detailed and accurate local data, we limited our analysis to buildings and the people that occupy them, and the two key infrastructure sectors previously discussed. Specifically, we did not analyze earthquake impacts to communication networks or towers, storage tanks, dams, levees, hazardous material facilities, and buried utilities conveying natural gas, potable water, oil, stormwater, and wastewater.

We did not identify or individually analyze specific buildings that may be considered essential or critical facilities. As discussed in the Recommendations section (Section 7), we maintain that the identification of such facilities should be community driven, and that an earthquake impact analysis of such facilities should be done by using the Rapid Visual Screening method (FEMA, 2015a) rather than a Hazus-based method using generic building models.

The Critical Energy Infrastructure (CEI) Hub along the Willamette River in northwest Portland was not analyzed in this report. A recent analysis conducted by Tetra Tech (2016b) provided a detailed damage assessment of the infrastructure from the same earthquake scenarios we used for this study. We did not include the hub's nonbuilding structures, such as oil tanks, in our building database.

Our economic loss estimates were limited to the direct cost of repairing a damaged building or replacing a severely damaged building with an equivalent structure. Our model assumes standard labor and material costs and availability of capital and credit. It does not factor in any demand surge. We did not model income losses such as wage and rental income, as we maintain that the impacts of a regional earthquake will fundamentally alter the local economy, rendering the basic assumptions used in the current Hazus model moot.

Our study focused on loss to buildings, which includes damage from earthquake-induced landslides and liquefaction. We did not quantify permanent loss of use, and thus value, of the land due to the ground failure. Such loss of use can add to the overall indirect economic loss.

2.0 ASSET DATABASE DEVELOPMENT

In this study we limited our analysis, and thus our asset database, to three components: buildings and the people occupying them, the electric power transmission infrastructure, and emergency transportation routes. A building is defined as a structure containing a roof and walls and occupied by people. Nonbuilding structures include water towers, storage tanks, piers, dams, and carports, and where human occupancy is incidental (FEMA, 2012b). We excluded nonbuilding structures from our building database. The electrical transmission network is limited to the towers and poles that supply power to the distribution substations (Appendix E, **Plate 1**). The surface transportation network is limited to a subset of highways, arterials, and roads identified as Emergency Transportation Routes (Appendix E, **Plate 10**).

2.1 Building Database

A Hazus-compatible building database contains a record for each distinct building, with each record containing required information for estimating damage to the structure and potential harm to the building's occupants (**Table 2-1**). Information associated with the building record, commonly referred to as attributes in a GIS context, is populated primarily from county assessor records or, where better data are available, from other ancillary datasets. Examples of such datasets are provided in **Table 10-1**.

Table 2-1. Building information required by Hazus earthquake model.

Hazus Attribute	Example	Purpose
Location of building	latitude, longitude	Extract ground motion and ground deformation data
Building usage	Single-family Residential; Retail Commercial	Repair/replacement cost; Number of people per building
Building material	wood; steel	Response to ground motion; debris
Year built	1968	Seismic design level: response to ground motion
Number of stories	2	Response to ground motion
Square footage	2250	Repair/replacement cost; debris
Daytime occupancy[+]	2.1	Casualty estimate
Nighttime occupancy[+]	3.4	Casualty estimate

[+]Daytime and nighttime occupancy amounts at the individual building level are based on proration of aggregated population data using the building's square footage, thus are typically fractional.

2.1.1 Building Footprint Development

A building footprint is a GIS polygon representation outlining the shape of the building. It defines a record in the building database. The building footprint establishes the location of the building, thereby placing the building relative to a natural hazard.

Because building footprints define the building record, our first task was to complete a building footprint database for the study area. Building footprints were obtained from Metro Regional Land Information System (http://rlisdiscovery.oregonmetro.gov/, downloaded February 2016) and from two DOGAMI publications (Burns and others, 2011, 2013). Large portions of western Washington County and southwestern Clackamas County had no building footprint data. In these areas we digitized building footprints following the methods described by Mickelson and Burns (2012, Section 3.2.3). Where lidar

data were not present, we used 2016 orthoimagery from the National Agricultural Imagery Program (https://www.fsa.usda.gov/programs-and-services/aerial-photography/imagery-programs/naip-imagery/index). Our digitization effort included removing obsolete building footprints (teardowns) and modifying existing building footprints where additions had been made or other digitization errors were noted.

We did not digitize structures less than 400 square feet in area, as such features are assumed to be non-building structures, such as kiosks, or are not reasonable to model within Hazus, such as portable storage sheds. Structures obtained from previous digitization efforts that were less than 400 square feet were retained in the building footprint database but were attributed as not modeled.

Nonbuilding structures include developments such as water towers, billboards, docks, dams, piers, and hoop houses. Outlines of such structures are often included in a building footprint database. Our study focuses on estimating damage from an earthquake to buildings and the people that reside in them. Many of the nonbuilding structures have no damage model or an overly simplified damage model within the Hazus framework. We identified such structures using orthoimagery and tax lot database queries, and we attributed them as not modeled.

Floating structures such as houseboats do not directly experience seismic shaking. We identified such structures using orthoimagery, attributed them as floating structures, and excluded them from our analysis. As with nonbuilding structures, we retained the building footprint of floating structures in the database. We note that floating structures may be damaged from seismic seiches (Jones and others, 2008).

In the building footprint database obtained from Metro RLIS, building complexes that contain two or more distinct, contiguous buildings were commonly digitized as a single building. Such buildings typically occur in downtown areas and can be identified by several methods, including their spanning multiple tax lots with unique owners, and distinct building heights derived from lidar elevation models. Seismic design level, building usage, and construction material can vary between such contiguous buildings, each of which can influence the damage estimate. We determined that dividing such polygons into individual buildings would result in a more accurate representation of the built infrastructure. Orthoimagery and street-level imagery further clarified whether a building footprint needed further partition. Building footprints digitized as part of this project factored in the guidelines for contiguous buildings.

Although parking garages are by definition nonbuilding structures, Hazus considers them as buildings in its occupancy class library (FEMA, 2011, Table 3.2). We retained that modest inconsistency in our building database by including parking garages in our damage assessment.

2.1.2 Assessor Database Processing

County assessor databases form the basis for assigning Hazus-required information for individual buildings, as the databases have information for most to all of the tax lots in the study area. We obtained detailed tabular data from the three county assessor offices. We used the tax lot spatial data from the Metro RLIS database to associate assessor tabular data with specific buildings, and we extracted information from the assessor tabular data to assign values to the appropriate attributes (**Table 2-1**). For example, Oregon Administrative Rules (OAR 150-308.215) require that county assessors assign a 3-digit property code for all tax lots in Oregon. We constructed a reference table to translate the tax lot property code into one of 36 Hazus occupancy classes, and we assigned that value to the particular buildings occupying that particular tax lot.

Assessor tabular data provided direct or easily-derived information for the following attributes: year built, square footage, number of stories, and building usage. None of the three county assessor databases had consistent information on building type (e.g., wood, steel).

2.1.3 Usage of Ancillary Data

We used a supersedence paradigm, overriding the assessor-derived data with more accurate data where available (Appendix A, Section **10.1**). For example, Lewis (2007) provided detailed information on square footage and building type for public buildings, such as schools, in Oregon. Other examples include the Metro RLIS spatial data on single-family and multi-family residential buildings, and the locations of educational, fire, and police buildings. Appendix A, Section **10.1** provides a complete list of other datasets used to populate the building database.

2.1.4 Building Type

The Hazus building type attribute specifies the basic structural system of a building. For example, a steel-framed building can be categorized as a steel light frame or a steel moment frame. The Hazus Advanced Engineering Building Module (AEBM) tool provides building damage functions for 36 generic building types (FEMA, 2010), and the FEMA Rapid Visual Screening handbook (FEMA, 2015a) provides qualitative descriptions of each building type. We classified all buildings in the study area into one of the 36 generic building types. Although Hazus AEBM permits one to create a unique performance model for individual buildings, such an effort was well outside of this project's scope, given its three-county scale.

We could not find any information in any of the three county assessor databases that provided consistent information on the building's primary construction material. Building types for a portion of the buildings were available from several sources, and we incorporated these into our building database. Lewis (2007) provided building types for public schools, fire, and police buildings. The most valuable dataset was the Metro Area Disaster GIS (MADGIS) database (Metro, 1998), with 40,000 buildings spread across all counties in the study area, categorized into Hazus-compatible building types.

For buildings that had no information on their primary construction material, we assigned a value based on the building's occupancy class, year built, and number of stories. We used an in-house tool that implements the statistical distributions listed in Tables 3.A1–3.A10 of the Hazus Earthquake Technical Manual (FEMA, 2011).

2.1.5 Building Replacement Value

We used the RSMeans valuation method for estimating a building's replacement cost (Charest, 2017), multiplying the building square footage by a standard cost per square foot. We used values from Hazus SQL database tables ([dbo].[hzReplacementCost] and [dbo].[hzRes1ReplCost]) that incorporated the RSMeans valuation to compute the replacement cost. We made no inflation or regional adjustments to the tabular data, for the following reasons. The Hazus tables were based on 2014 RSMeans national values. Because the Consumer Price Index difference between 2014 and 2017 was minimal, we made no further adjustment. The RSMeans location factor adjusts for regional differences in labor and material costs. Portland area's location factor of 0.98 for residential construction (Charest, 2017) was, for simplicity, rounded to 1.0, and thus we did not adjust cost; the commercial construction location factor at 1.0 also resulted in no adjustment.

Building replacement cost is not the same as a property's assessed value. For analysis purposes, we assume repair or replacement costs to damaged structures will be charged at standard construction rates and are independent of a building's age or the land on which the building is placed. Assessed value

takes into account the land's value, which may fluctuate greatly depending on real estate markets, and for improvements, assessors typically factor in the building's depreciation into the assessed value.

An abnormal shortage of skilled labor or materials can occur after a large-scale disaster. Demand surge is a process resulting in a higher cost to repair building damage after large disasters than to repair the same damage after a small disaster (Olsen and Porter, 2011). Adjusting repair/replacement costs due to a likely demand surge was beyond the scope of this project.

2.1.6 Design Level Assignment

The design level assignment in the Hazus-MH earthquake model allows a user to specify, for the given building type, its seismic performance level. Oregon initially adopted seismic building codes in the mid-1970s (Judson, 2012). The established benchmark years of code enforcement are used in determining a "design level" for individual buildings. The design level attributes (pre-code, low-code, moderate-code, and high-code) are then used in the Hazus earthquake model to determine what damage functions are applied to a given building. The year built and the year of the most recent seismic retrofit are the main considerations for an individual design level attribute. We used the benchmark years listed in **Table 10-2** to assign a design level to each building. We are not aware of any building codes adopted at the local or county level that supersede, from a seismic design perspective, building codes established by the Oregon Building Codes Division.

In the past 20 years, many property owners, including private, public, and institutional, have implemented building seismic retrofits—modifications that improve building's seismic resilience. Ideally, we would obtain and incorporate such information into our database, instead of assigning a seismic design level based on the structure's original year of construction. However, such information was not available in any centralized, usable form from any of the county's permitting or assessor offices. The City Club of Portland's analysis (2017) identified a lack of reliable data, in part because permits are not often filed with seismic upgrades, or the seismic upgrades to a building may be part of a larger renovation. We found only one source of data for such information—the Unreinforced Masonry Building database maintained by the City of Portland (2017). Buildings identified as upgraded, 290 total, were assigned Reinforced Masonry (RM1), moderate code building type and design level values, respectively. The dataset was limited to the City of Portland. City Club of Portland's report (2017) found no other source of data for identifying locations of unreinforced masonry buildings in the region.

2.1.7 Daytime and Nighttime Population

In order to calculate casualties and displaced persons, we estimated the number of people occupying each building under two commonly implemented temporal scenarios: daytime and nighttime, commonly referred in a Hazus context as a "2 PM" and a "2 AM" scenario. The nighttime population assignment assumes that at least 95% of the people are in their primary residences and that nonresidential buildings have some level of occupancy, depending on their function. Fire stations, for example, are occupied by a nighttime shift. The daytime scenario assumes a typical weekday in a school year, with population distributed across schools, work facilities, and homes. The population assignments are primary driven by U.S. Census population data, the building's specific usage (i.e., its Hazus-designated occupancy class), and the building's square footage. We did not implement a "5 PM" scenario, as that requires assumptions on road occupancy and bridge failure models, and an evaluation of bridge and overpass seismic design performance was beyond the scope of this project.

For assigning permanent resident population quantities to residential buildings, we pro-rated the U.S. Census Bureau 2010 permanent population value for a given U.S. Census Bureau-defined census block group across the residential buildings, excepting the RES4 (hotel/motel) type, on a square footage

basis. We determined that the census block geometries are often imprecise relative to building footprints, creating frequent scenarios where a census block has one or more residential buildings and zero permanent residents, or zero residential buildings and one or more permanent residents. The census block group's geometries are generally along arterials or physiographic features. Although pro-rating at the census tract was a possible alternative, we decided the finer resolution of the census block group provided the best estimate of residential building occupancy, one that reflected varying demographics within a larger census tract. We retained a *permanent resident* population field, and we populated the *nighttime population* for residential buildings by multiplying the permanent resident population by 0.95—slightly less than the 99% suggested by FEMA (2011, Table 13.2), and one that accounts for night shift employment and recreational and business travel.

For daytime population in nonresidential buildings, we considered the suggested peak population density numbers published in the Hazus Tsunami Model Technical Guidance (FEMA, 2017c, Table 3.14), but we observed that the daytime population was at least 3 times the permanent population of the study area. We determined that such a ratio was unreasonably high, as we assume that at least 75% of the working population in the study area reside within the study area. Instead, we computed people-per-square-footage (ppsf) values by using the estimated commercial, industrial, and educational population estimates by Census Tract in the Hazus SQL database table [dbo].[hzDemographicsT], and our own building stock square footage summaries, and then used the ppsf values and the individual building's square footage to assign people per building.

We assigned daytime populations for residential buildings and nighttime populations for nonresidential buildings by using the Day to Night ratios provided by FEMA (2017c, Table 3.14).

Permanent resident figures per residential building were based on the April 1, 2010 U.S. Census numbers and the 2010 U.S. Census Block Group boundaries. The study area has seen significant growth since then, with the most recent estimate (July 1, 2016 Certified Population Estimates, Portland State University Population Research Center, https://www.pdx.edu/prc/population-reports-estimates) showing an 8.4% increase from 2010. Several jurisdictions have had boundary adjustments via annexations since 2010. Planners may wish to adjust the displaced population and nighttime casualty estimates using the percentages shown in **Table 2-2**. Given the larger uncertainty with the daytime population assignments compared to nighttime population assignments, we do not recommend adjusting daytime casualty numbers.

Table 2-2. Population changes in the study area, 2010 to 2016. Limited to cities with 2010 population of 20,000 or more people and with no to minimal annexations between 2010 and 2016. Certified Population Estimate: Portland State University Population Research Center.

County or Jurisdiction	2010 U.S. Census Population	Certified Population Estimate July 1, 2016	Percentage Increase
Study Area	1,641,036	1,779,245	8.4%
Clackamas County	375,992	404,980	7.7%
Multnomah County	735,334	790,670	7.5%
Washington County	529,710	583,595	10.2%
Portland	583,776	627,395	7.5%
Gresham	105,594	108,150	2.4%
Lake Oswego	36,619	37,425	2.2%
Oregon City	31,859	34,240	7.5%
Tualatin	26,054	26,840	3.0%
West Linn	25,109	25,615	2.0%

2.2 Electric Power Transmission

We constructed a transmission pole and tower point file database from several data sources, including Burns and others (2011, 2013), spatial data obtained from Portland General Electric Company (PGE, written communication, 2016), and where large gaps occurred, from our own digitization. Gaps in the transmission network were highlighted using the transmission line corridors and substations dataset downloaded from the Homeland Infrastructure Foundation-Level Data (HIFLD; U.S. Department of Homeland Security, 2017). The linear corridor data were used as a backdrop to digitize additional poles and towers, following the method established by Burns and others (2011). We did not distinguish between the type of structure (e.g., lattice tower or wood) or the voltage carried on the wires. To keep the problem tractable, we limited our analysis to the high-voltage network from power generation facilities up to the neighborhood distribution substations.

We identified a total of 18,098 poles and tower locations. The transmission network is incomplete, however, as we did not complete digitization of poles and towers in portions of North Portland, and data were not made available from the local utility. Electric power transmission distribution in North Portland is typically conveyed on single poles, which are difficult to distinguish using lidar-derived imagery or orthoimagery.

2.3 Emergency Transportation Routes

We obtained a GIS shapefile representing the Metro Emergency Transportation Routes (ETR) from Portland Bureau of Emergency Management (L. Bruno, written communication, 2017). Though the Metro Data Resource Center has not maintained the dataset for at least 10 years (S. Erickson, written communication, 2017), it is still considered operative at the regional level. The ETR extends into all five counties within the RPDO (**Figure 1-1**), but our analysis was limited to our three-county study area (Appendix E, **Plate 10**). Multiple transportation agencies have responsibility for various components of the ETR, and as outlined in a 2005 Memorandum of Understanding (Emergency Transportation Route Post-Earthquake Damage Assessment and Coordination Portland, Oregon/Vancouver, Washington Regional Area; State of Oregon Misc. Contracts & Agreements No. 21,273):

> (Terms of Agreement #1): ODOT, WSDOT and Agencies have identified the ETR. […] The ETR have been identified as "critical infrastructure" by the parties to the Memorandum of Understanding. ODOT, WSDOT and Agencies would give their jurisdictional ETR the highest priority for assessment of road and bridge conditions during an earthquake emergency […]
> (Exhibit A, I. Purpose [p. 8]): An Emergency Transportation Route or ETR is defined as a route needed during a major regional emergency or disaster to move response resources such as personnel, supplies, and equipment to heavily damaged areas.

The road network consists of GIS polylines placed at the road centerline and includes highway ramp and detailed highway intersection information. For our analysis purposes, polylines are not as useful as polygons, as we need to quantify the amount of ground deformation to a road that has some width. In order to prepare the road network for analysis, we first buffered the road centerlines by 50 foot, and then we dissolved the geometries. This typically generalizes highway areas, such as the I-5 corridor, into a single polygon. The dissolved polygon file was then manually edited to create a segment/node model,

with segments beginning and ending at intersections. However, major intersections, such as the I-5—I-205 intersection, were treated as a single segment instead of a node. We identified 238 road segments and gave each a unique key for analysis purposes.

3.0 NATURAL HAZARD DATA DEVELOPMENT

3.1 Bedrock Ground Motion

The Hazus model requires four descriptors of ground motion at a building's location: peak ground acceleration (pga), peak ground velocity (pgv), spectral acceleration at 1.0 second (sa10), and spectral acceleration at 0.3 second (sa03). Peak ground acceleration and peak ground velocity are the largest acceleration and velocity that can be expected at a particular site due to an earthquake. Peak ground acceleration is a widely used measure of ground shaking for a range of geotechnical and structural engineering applications. Spectral acceleration definitions and usage are given by the U.S. Geological Survey (USGS) at https://earthquake.usgs.gov/hazards/learn/technical.php.

For the Cascadia Subduction Zone magnitude 9.0 earthquake, Madin and Burns (2013) obtained synthetic bedrock ground motions from Arthur Frankel (USGS, written communication, 2012); we used the same bedrock ground motion data for this project. Bedrock ground motions for a synthetic Portland Hills fault magnitude 6.8 earthquake (firm rock conditions, V_{s30} = 760 m/s) were provided by Arthur Frankel (written communication, 2016) of the USGS at 0.01 degree intervals and are included in the accompanying geodatabase.

3.2 Site Ground Motion

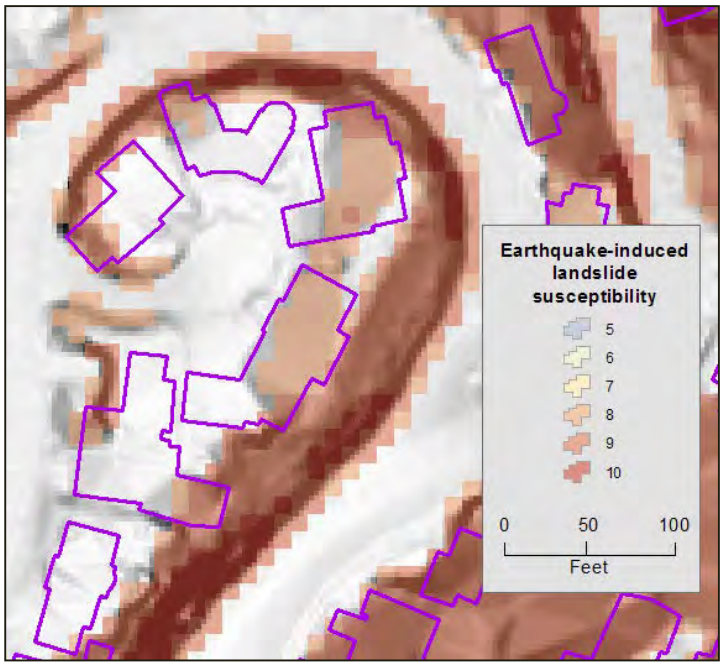
The intensity of ground shaking during an earthquake depends on the geotechnical properties of the soil or bedrock at a particular site. The National Earthquake Hazard Reduction Program (NEHRP) provisions (FEMA, 2015b) specify, for each ground motion descriptor, level of bedrock ground motion, and NEHRP soil classification, a multiplication factor for calculating the ground motion at the surface (also known as the site) where buildings and infrastructure are placed. The NEHRP soil classification for a site is based on the average shear wave velocity within 30 meters of the ground surface. NEHRP classifications and general descriptions of the bedrock and soil material are as follows:

- site class A—hard rock
- site class B—rock
- site class C—very dense soil and soft rock
- site class D—stiff soil
- site class E— soft soil
- site class F—soils susceptible to potential failure

For our site ground motion data, we used updated NEHRP soil classification mapping that we completed as part of this project (Appleby and others, in preparation). Sites classified as "F" were, for amplification purposes, reclassified as "E". This is a conservative but commonly implemented assumption for loss estimation purposes. We overlaid the bedrock ground motion data with the NEHRP soil classification polygons, and we applied the appropriate amplification to derive the site ground motion. Further details on the site ground motion dataset development are provided in Appendix B.

The site ground motion from the synthetic earthquakes in our two scenarios differ dramatically across the study area, with the Portland Hills fault exhibiting significantly higher ground motion proximal to the fault (Appendix E, **Plate 5**). The technical descriptions of earthquake ground motion, such as depicted on Plates 4 and 5 (Appendix E), can be challenging to interpret, so we developed damage potential maps using the Modified Mercalli Intensity (MMI) scale (Appendix E, Plates 6 and 7). The MMI scale is an empirical scale that describes the building damage and felt effects experienced from ground shaking in an earthquake. For the MMI categories, we used our site peak ground velocity ground motion data and the relationships used by USGS ShakeMap products (Wald and others, 2006, Figure 2.5).

What is not depicted in such maps is the duration of the earthquake. A local crustal fault will likely result in strong ground motion for up to 60 seconds, whereas a megathrust earthquake typically results in strong ground motion for 3 to 5 minutes. The Hazus building damage model uses the magnitude of the earthquake as a surrogate for duration, categorizing the earthquake as short, medium, or long duration (FEMA, 2011, Section 5.4), with a longer duration producing more building damage for a given ground motion. The Cascadia Subduction Zone magnitude 9.0 earthquake was modeled in Hazus as long duration, and the Portland Hills fault magnitude 6.8 earthquake was modeled in Hazus as medium duration.



3.3 Liquefaction and Landslide Susceptibility

For our Hazus building damage model, we provided a liquefaction and landslide susceptibility value for each building record, thereby allowing the Hazus model to calculate the amount of ground deformation and probability of ground deformation. The Hazus building loss model incorporates that calculated information into its overall building damage estimate.

A Hazus-based liquefaction susceptibility rating for each building record was obtained by using a simple overlay of the liquefaction susceptibility polygons developed for this project (Appleby and others, in preparation). Because the liquefaction susceptibility polygons are at a coarser scale relative to the building footprints, we determined that assigning the liquefaction susceptibility value at the building centroid was sufficient.

We developed a high-resolution, 10-foot Hazus-based landslide susceptibility grid for this project (Appleby and others, in preparation), following the methods specified in the Hazus®-MH 2.1 Technical manual, Earthquake model (FEMA, 2011, Chapter 4), for both a wet (saturated) and a dry scenario. We calculated landslide susceptibility zonal statistics for each building footprint by using the Esri® Spatial Analyst Zonal Statistics as Table tool. The arithmetic mean of the landslide susceptibility, rounded to the nearest integer, was then assigned to the building record. Such an assignment more accurately captures the earthquake-induced landslide hazard across the entire building footprint area, compared to a simple building centroid sampling approach (**Figure 3-1**).

Figure 3-1. Example: Capturing the variability of landslide susceptibility within building footprints (magenta polygons). Landslide susceptibility values use the Hazus landslide susceptibility 0 through 10 scale. Areas of no shading: minimal to no landslide susceptibility. Earthquake-induced landslide susceptibility data from Appleby and others (in preparation).

Liquefaction requires saturated soil conditions. Hazus permits a user to specify, on a per-building basis, the depth of the water table, and adjusts the ground failure estimates accordingly. However, there currently exists no region-wide groundwater mapping information. Water tables vary significantly throughout the year, and even if such information were available, the use of an average water table level could significantly underestimate liquefaction occurrence during peak moisture conditions. We were aware of a regional groundwater study (Snyder, 2008) but noted that it covered only a portion of the study area. We chose to mimic the "wet" (saturated soil) and "dry" landslide scenarios by setting water depth to two distinct values: 0 feet and 1,000 feet, respectively. Thus, each of the two synthetic earthquakes was run with "wet" and "dry" soil moisture conditions, for a total of four unique scenarios.

3.4 Permanent Ground Deformation

Permanent ground deformation (PGD) data include an estimate of the amount of lateral spreading due to liquefaction and ground failure due to earthquake-induced landslide, along with a probability of their occurrences. We provided the liquefaction and landslide susceptibility data from Appleby and others (in preparation) and the site ground motion data for both earthquakes developed in Section **3.2** as input to the tool developed by Sharifi-Mood and others (M. Sharifi-Mood, M. J. Olsen, D. T. Gillens, and I. P. Madin, Complementary ground motion, ground deformation, and damage potential maps for deterministic scenarios of Cascadia Subduction Zone earthquake events, manuscript in preparation). The tool implements the methods for ground deformation estimation described by Madin and Burns (2013, Section 4), and provides raster grids describing the PGD amount and probability of occurrence, using the Hazus ground deformation models described in the Hazus-MH 2.1 Technical manual (FEMA, 2011).

Because the tool is currently constrained to calculating liquefaction lateral spreading at a fixed water depth, we generated liquefaction ground deformation (lateral spreading) data for only the "wet" (saturated soil) scenario. We calculated earthquake-induced landslide ground failure data for both wet and dry soil condition. The PGD and probability of occurrence data are in the accompanying geodatabase. Further details on the dataset development are documented in Appendix B, Section **11.2**.

To quantify impacts to infrastructure, we combined the grids from the two ground failure mechanisms, obtaining the maximum PGD and maximum probability of occurrence across the area for a given earthquake and soil moisture scenario. Although liquefaction and landslide are two distinct physical mechanisms, the specific cause of the ground failure is not important for our key infrastructure sector analysis purposes.

4.0 LOSS ESTIMATION METHODS

4.1 Impacts to Buildings and People

4.1.1 Building Repair Cost and Casualties

We used the Hazus Advanced Engineering Building Module (AEBM) (FEMA, 2010) included in Hazus-MH v4.0 to calculate individual building repair costs and casualties and to obtain parameters needed to calculate debris and displaced population. Although the AEBM permits a user to specify unique building profiles, including adjusted individual capacity curve or fragility curve parameters, we instead used the generic building profiles provided in the Hazus SQL database table [dbo].[eqAebmProfile]. The particular AEBM profile for an individual building in the building database is constructed from its occupancy class, building type, and seismic design level. The building's square footage, replacement cost, daytime occupants, and nighttime occupants were also supplied to the Hazus AEBM model.

The Hazus AEBM model was run for a given user-supplied seismic scenario, with site ground motions supplied in polygon form. The model returns a building repair cost and casualty estimate for each building, along with five probability of damage state (PDS) values, each, for the structural, nonstructural drift, and nonstructural acceleration components. We used the PDS values to calculate debris and displaced population and to estimate the total number of red-tagged and yellow-tagged buildings.

The Hazus AEBM model first calculates a building's structural and nonstructural probability of damage state values from the ground motion and liquefaction/landslide data provided to the model. It then uses the PDS values to calculate casualties, based on the number of user-specified people occupying the building and the building type. The methodology is based on the assumption of a strong correlation between building damage and number and severity of casualties (FEMA, 2011). Casualties are classified into four levels (**Table 4-1**). Levels 2 and 3 are generally interpreted as "injuries requiring hospitalization."

Table 4-1. Hazus casualty level descriptions (taken from FEMA, 2011). The broad description of each category is shown in boldface.

Injury Severity Level	Injury Level Description
Level 1: **Minor Injuries**	Injuries requiring basic medical aid that could be administered by paraprofessionals. These types of injuries would require bandages or observation. Some examples are: a sprain, a severe cut requiring stitches, a minor burn (first degree or second degree on a small part of the body), or a bump on the head without loss of consciousness. Injuries of lesser severity that could be self-treated are not estimated by Hazus.
Level 2: **Injuries Requiring Hospitalization**	Injuries requiring a greater degree of medical care and use of medical technology such as x-rays or surgery, but not expected to progress to a life threatening status. Some examples are third degree burns or second degree burns over large parts of the body, a bump on the head that causes loss of consciousness, fractured bone, dehydration, or exposure.
Level 3: **Life-Threatening Injuries**	Injuries that pose an immediate life-threatening condition if not treated adequately and expeditiously. Some examples are: uncontrolled bleeding, punctured organ, other internal injuries, spinal column injuries, or crush syndrome.
Level 4: **Deaths**	Instantaneously killed or mortally injured.

4.1.2 Building Debris Estimation

The Hazus AEBM does not provide a debris estimate for a damaged building. We manually calculated debris by first calculating the total weight of each building, in tons, using the total square footage of the building, the type of building (e.g., steel frame or wood frame), and the per-square-footage weight estimates listed in the Hazus SQL database table [dbo].[eqDebrisAnalParms]. Debris was then calculated based on the methods outlined in the Hazus Earthquake Technical Manual (FEMA, 2011, Equation 12-3), by using the structural and nonstructural drift probability of damage states obtained for the individual building from the Hazus AEBM.

The debris estimate is limited to buildings. We did not estimate debris tonnage from landslides, damaged bridges, buckled roads, sand and silt ejecta caused by liquefaction (Villemure and others, 2012), or damaged nonbuilding structures.

4.1.3 Displaced Population and Shelter Needs

Unlike the Hazus General Building Stock tool, Hazus AEBM does not calculate displaced households or displaced population. We adapted the methods outlined in the Hazus Earthquake Technical Manual (FEMA, 2011, Chapter 14), but instead of calculating displaced households we calculated displaced population. Displaced population is more direct to calculate given the methods discussed previously for assigning people, and not households, to distinct multi-family and single-family residential buildings (Section **2.1.7**). We followed the guidance provided by FEMA (2011, Table 14.1) that was based on the work of Perkins and Chuaqui (1998), but we altered the weight factor for multi-family residential building type, W_{MFE}, by setting it to zero. The displaced population then becomes a simple computation: the number of permanent residents in the building times the building's probability of *complete* structural damage state, with the latter factor directly obtained from the Hazus AEBM output.

We equated the red tag term used in a post-earthquake building safety evaluation context (ATC, 1989) with the Hazus "complete" structural damage state, following the guidance of FEMA (2010, Table 6.1). Similarly, yellow tag was associated with "extensive" damage state, and green tag with buildings in a none, slight, or moderate damage state. We recognize that alternate mappings of Hazus damage states or repair costs to ATC-20 tag levels exist (e.g., MMI Engineering [2012] presents two such definitions).

The Hazus displaced population computation assumes the building has been categorized into one of the three ATC-20 tags. In practice, the post-earthquake building inspection process is estimated to take weeks, if not months (EERI, 2015; p. 25). Thus, what is being computed is an estimation of *post*-inspection, longer-term displaced population. Our summary tables use the term *Long-term Displaced Population* to emphasize the point.

The topic of displaced population and shelter needs is involved, and estimates can vary throughout the response and recovery phases based on numerous factors, including psychological, sociological, and economic considerations. For example, some portion of the population may occupy a damaged building until it is officially inspected and red tagged, at which point they must vacate. An owner of a moderately damaged (green-tagged) apartment building may decide to replace the structure rather than repair it. For this project, we provide detailed information on permanent residents per building damage state, thereby allowing a basis from which to estimate Day 1, Day 7, and Day 30 displaced population and shelter needs (Appendix C, **Table 12-4** through **Table 12-7**). A portion of the displaced population may need long-term publicly provided shelter while residences are repaired or replaced (FEMA, 2011, Section 14.3). We determined that the ethnic, racial, and income level factors listed in Hazus Earthquake Technical Manual (FEMA, 2011, Equation 14.2) were too assumption-laden, and thus we did not calculate shelter requirements with such factors. For reference purposes, past Hazus runs for a Cascadia

Subduction Zone earthquake that used these assumptions calculated the portion of displaced population needing temporary shelter/housing solutions between 20% and 30% (Wang, 1998; Hofmeister and others, 2003; EERI, 2015, p. 34).

4.1.4 Aggregation Unit

Although the inputs into the Hazus model are individual buildings with occupants, loss estimates from the model are statistically meaningful only at an aggregated level. As Pinter and others (2016) emphasized, Hazus-calculated damages are estimates appropriate for comparison and planning purposes, particularly when pooled among a group of structures. Hazus-calculated damages are not appropriate for individual building analysis. We considered various aggregation units, including city neighborhoods and fire districts. Several jurisdictions in the study area have well-defined neighborhoods, but most do not. Further, unincorporated areas have no formal or usable neighborhood definitions. For example, we considered fire districts in unincorporated areas, but we determined they were too coarse to be useful for community level planning.

We chose the census block group (CBG), a U.S. Census Bureau-designated geographical unit that is between the census tract and the census block, as the basic mapping aggregation unit for damage estimates. Census block groups typically have between 600 and 3,000 people, but the number of buildings can vary widely, depending on the type of buildings and the number of multi-family residential structures within a CBG. Where warranted, we combined contiguous CBGs to create a larger unit encompassing at least 300 buildings. The process resulted in reducing the study area's 1,041 CBGs into 876 *neighborhood units.*

To provide a larger-scale perspective across the study area, we also aggregated loss at the jurisdictional level, with all buildings associated with a particular city, designated community, or unincorporated county. The jurisdiction layer combined city jurisdictional boundaries published by Metro RLIS (Metro, 2016), along with hamlet and village designations by Clackamas County (2017). Given the City of Portland's size relative to surrounding cities, we used the Portland Bureau of Emergency Management's (PBEM) Risk Reporting Areas (Tetra Tech, 2016a, Section 4.4, Table 4.4) as subdivisions for aggregation. All buildings not associated with a jurisdiction were designated as unincorporated.

4.1.5 Seismic Design Level Improvement Modeling Exercise

Most of the buildings in the study area were constructed with minimal consideration given to seismic resilience (**Table 10-3**). Seismic retrofits to more vulnerable buildings can reduce damage to the building and casualties to the building occupants when an earthquake occurs. Our Hazus model can be used to generate an overall benefit estimate for seismic retrofitting. Levi and others (2015) performed such an analysis for Israeli building inventory, where at least 25% of the building inventory was designed with minimal resistance to earthquakes.

We ran two alternative loss scenarios, wherein we upwardly adjusted seismic design levels within our building database. For the moderate scenario, all buildings with a seismic design level of pre code or low code were updated to moderate code, and all unreinforced masonry buildings were altered to RM1 (reinforced masonry) building type. Buildings with high code were left unchanged. For the high scenario, the seismic design level was set to high code for all buildings, with all unreinforced masonry buildings altered to RM1 (reinforced masonry) building type. We then ran Hazus AEBM, using the same ground motion, liquefaction/landslide susceptibility, and building population occupancy, and tabulated loss estimates (see Section 5.3.1). Our analysis was limited to the Cascadia Subduction Zone earthquake scenario, and run for both wet (saturated) and dry soil conditions.

4.2 Electric Power Transmission

Using the ground deformation estimates, we calculated the mean lateral spread within a 10-meter buffer of each transmission structure for the Cascadia Subduction Zone earthquake and Portland Hills fault earthquake, for wet (saturated) and dry soil moisture conditions. The mean permanent ground deformation at each point was then classified into three categories: less than 1 meter, 1 to 2 meters, and greater than 2 meters. For all points with greater than 1-meter permanent ground deformation, the probability of occurrence is between 20% and 30% (Appendix E, **Plate 13**).

4.3 Emergency Transportation Routes

The Hazus tool provides an analysis of linear features such as roads, but we determined it inadequately captures the range of variability of permanent ground deformation throughout the length of the segment. Currently, the tool samples only at the linear feature segment's endpoints and at its midpoint. We take a conservative approach in our evaluation of earthquake impact on surface transportation by considering the possibility of permanent ground deformation across the entire length of the road segment. A road segment is considered failed if any portion of that road segment exceeds an amount of ground deformation and a probability of occurrence.

Ground deformation and probability estimates were available in a 10-foot raster grid format (Section **3.4**). We combined the landslide and liquefaction PGD grids using Esri Spatial Analyst Cell Statistics function to obtain the maximum value per pixel. For our analysis purposes, the mechanism of the ground failure is not relevant; the amount and probability of lateral spread is of primary concern. Following the methods outlined by Mahalingam and others (2015), we then generated a new grid based on focal statistics of the ground deformation within a 100-foot window (10 pixel × 10 pixel; a pixel is 10 ft). Inclusion of surrounding areas adjacent to the road segment is a more conservative approach, because we wanted to include potential landslides slightly distant from the road. We then classified the maximum value of the ground deformation within each road segment into four bins, using Esri Spatial Analyst Zonal Statistics as Table tool: less than 0.5 meters, 0.5 to 1.0 meters, 1.0 to 2.0 meters, and greater than 2.0 meters. The process was repeated for the CSZ dry soil conditions scenario and the PHF wet (saturated) and dry soil conditions scenarios, with the results stored in the accompanying geodatabase. Appendix E, Plates 10 and 11 represent the impacts of ground failure per segment under a Cascadia Subduction Zone earthquake, given the two soil moisture scenarios. For another perspective, Appendix E, **Plate 12** highlights the maximum potential permanent ground deformation at specific locations throughout the segment.

4.4 Model Limitations

Our damage estimates were primarily derived from the Hazus AEBM. Limitations and uncertainties are inherent in any loss estimation methodology. They arise in part from incomplete scientific knowledge concerning earthquakes and their effects on buildings and facilities.

4.4.1 Geological Models

An actual earthquake may vary significantly in ground motion and site amplification compared to the synthetic data we provided the model in this study. Our analysis used the best available information for a subduction zone fault and a local crustal fault. We used the upper bound for the earthquake magnitude, recognizing that an actual earthquake may rupture on only a portion of its fault. Further, the

NEHRP site classification is a simplification of complex surficial geology, and local site amplification effects within a given NEHRP site class may be at significant variance with the standard ground motion amplification model.

We did not model damage from aftershocks. Wein and others (2017) presented scenario examples and the consequences of such earthquakes. The impact of aftershocks on slightly damaged buildings has be modeled in a Hazus context (Seligson and others, 2015), but we did not have aftershock scenarios available, nor was such modeling within the scope of our project.

Although our loss model includes the impact of earthquake-induced landslides on buildings, we do not model the impact of large landslide flows on structures downhill from the source. Such flow can wreak significant damage to buildings and people (Daniell and others, 2017), but such modeling capability is not available with existing tools.

4.4.2 Building Damage Models

Limitations and uncertainties also result from the approximations and simplifications that are necessary for comprehensive analyses. Although we gave extensive effort to correctly attributing each of the 615,852 individual buildings in this study, we recognize that misclassifications are present, and we made statistical distribution assumptions on building type when attribution information was not otherwise available.

We used the generic building damage models provided by the Hazus tool. These models simplify the vast variability present in existing building construction, such as vertical irregularities, plan irregularities, usage of cripple walls, hybrid construction techniques, and pounding from adjacent buildings (FEMA, 2015b). The Hazus AEBM allows a user to specify individual building-specific parameters, but it is not possible to conduct a study at this regional scale that incorporates such detail. The Hazus generic building damage model captures the *average* building response to an earthquake—the primary reason we present loss estimates not at the individual building level but at a minimum aggregation unit (Section **4.1.4**).

The duration of a subduction zone earthquake is significantly longer than for other types of earthquakes, including those generated from local crustal faults. Although the Hazus tool provides a method to distinguish short, medium, and long shaking duration (FEMA, 2011, Equation 5-10), the damage functions are expert- and model-driven. The most recent long-duration earthquake to impact the United States was Alaska's Good Friday earthquake in 1964, which was approximately 4.5 minutes long. Post-earthquake damage assessment protocols were not in place at the time. Hazus modelers do not have USA-construction-based empirical data for long-duration earthquakes from which to calibrate the model. The current Hazus model may be underestimating the damage to tall buildings and other large structures in response to great subduction zone earthquakes. Gomberg and others (2017) have identified this as an important research need.

In **Tables 12.8** through **Table 12.11**, we present Hazus damages and casualty estimates as single value. Such representations can be misleading, as they suggest a high level of precision that is not warranted, in part by the uncertainties of the data that were provided to the Hazus model (Remo and Pinter, 2012). One reason we chose to model both wet (saturated) and dry soil condition scenarios for a given earthquake is to better communicate our damage estimates as a range of values (**Table ES-1**).

4.4.3 Casualty Estimates

Casualty estimates are dependent on several assumptions and may underestimate the true impact from an earthquake. Daytime occupancy values use people-per-square-footage assumptions, which may be reasonable in the aggregate, but building occupancy density can vary significantly across businesses that

are grouped for our modeling purposes into a fixed classification, such as "Commercial-Retail." Running Hazus with a large number of alternate point-in-time population models may assist in better understanding the uncertainty in daytime casualties (FEMA, 2012a, Section 3.4).

In the Hazus AEBM, the casualty calculations do not include injuries to people outside of and proximal to a building. During strong ground motion, fascias can fall off buildings, masonry walls can collapse, and windows can shatter, sending shards of glass down to the pavement. Other casualties, such as from heart attacks, loss of power to medical devices such as respirators, electrocutions, collapsing bridges, exposure to released hazardous materials, and car accidents are not quantified in the Hazus model. Further, we did not model fire following earthquake, which can result in additional casualties.

4.4.4 Other Model Limitations

Fires typically follow a major earthquake and are exacerbated by compromised transportation networks and broken buried utilities. Fire following earthquake can be a major contributor to building loss and displaced population (Scawthorn and others, 2005). Early versions of the Hazus tool modeled "fire following earthquake" as an induced damage; however, due to significant bugs producing erroneous damage estimates, the option had been disabled in recent versions of the tool. The Hazus v4.2 release (FEMA, 2018) restored the Fire Following functionality, but the tool release was not available in time for this project, which used Hazus v4.0.

Several other sources may contribute to road damage, none of which we modeled in this project, and thus may lead to an underestimate of road damage. Our road damage model does not include debris generated by taller buildings that may block road access, or a road cordoned off due to a proximal building that is in danger of collapse (City Club of Portland, 2017). Our Hazus-based landslide ground deformation model does not incorporate deposits from distant earthquake-induced landslides that may block road access.

Past Hazus-based studies typically attached standardized reports generated by the Hazus tool that summarize casualties and losses in a convenient format. Such reports are currently available only with Hazus analyses using General Building Stock data, which are modeled at the census tract level. Users analyzing loss on a per-building basis, such as what we have done in this study, cannot obtain such summary reports from Hazus; thus, none are attached to this report. Instead, we present such information as tables in Appendices A and C, in graphical form in Appendix E, and in electronic form in the accompanying GIS database (Appendix D).

5.0 RESULTS

5.1 Population and Building Density

We developed a 20-acre hexagonal grid, then overlaid the grid on our building database, totaling the number of individual buildings, the number of residential buildings, and the number of permanent residents associated with the buildings within each hexagonal cell. Cells with no buildings were removed from the dataset. Cells with at least one building yet no permanent residents frequently occur in commercial/industrial corridors or predominantly agricultural areas (Appendix E, Plates 1–3). The hexagon layer provides a convenient overlay to explore population and building exposure relative to a particular natural hazard. The layer can also be useful in focusing the areas of building loss or casualties in neighborhood units with large tracts of undeveloped areas.

5.2 Building Statistics

Single-family residential buildings dominate the building inventory in all three counties (**Figure 5-1**). Wood frame construction dominates the residential buildings (**Table 5-1**). The number of masonry buildings in **Table 5-1** is due primarily to the Hazus building type statistical distribution described in Section **2.1.4**. **Table 10-8** in Appendix A contains a complete breakdown of building type for all generalized building use categories.

Figure 5-1. Building primary usage statistics by county. Tabular summary is in Table 10-7. Single-family residential combines Hazus occupancy classes RES1 and RES2 (manufactured housing). Institutional combines Hazus occupancy classes REL1, GOV1, GOV2, EDU1, and EDU2. Commercial combines all Hazus COM occupancy classes and RES4. Multi-family residential combines Hazus occupancy classes RES3, RES5, and RES6.

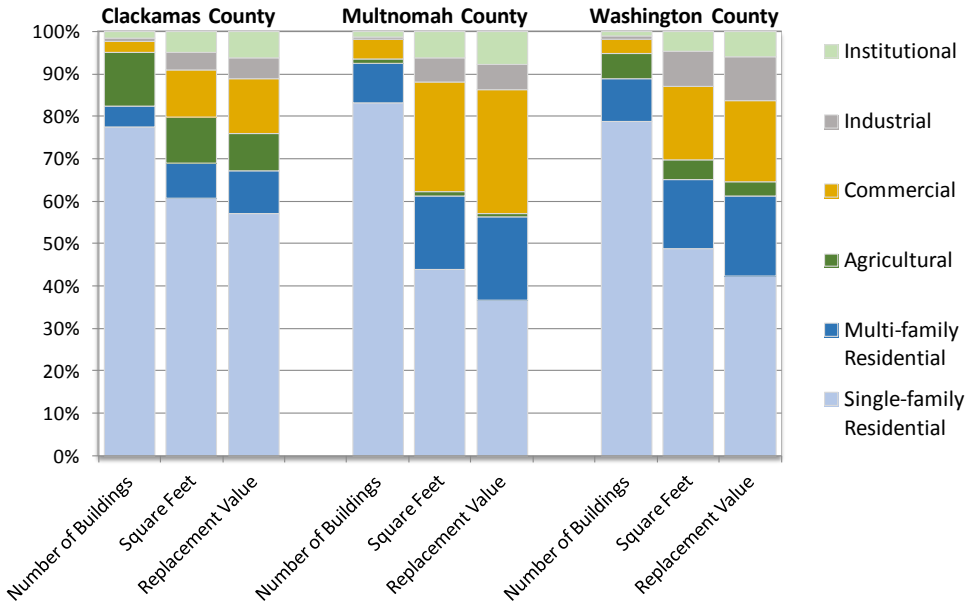


Table 5-1. Residential buildings by building type.

Occupancy Type	Building Type	Number of Buildings	Building Percent	Square Footage (Thousand)	Square Footage Percent	Permanent Residents	Permanent Residents Percent
Single-Family Residential	Wood	471,926	95.5%	914,096	96.7%	1,182,770	96.3%
	Manufactured Housing	16,852	3.4%	20,966	2.2%	32,969	2.7%
	Reinforced Masonry	3,549	0.7%	7,349	0.8%	9,321	0.8%
	Unreinforced Masonry	1,455	0.3%	2,298	0.2%	3,277	0.3%
	Other	138	0.0%	377	0.0%	581	0.0%
Multi-Family Residential	Wood	47,055	91.1%	204,253	73.0%	316,575	76.8%
	Reinforced Masonry	1,331	2.6%	16,026	5.7%	24,203	5.9%
	Unreinforced Masonry	403	0.8%	5,380	1.9%	8,139	2.0%
	Steel	1,636	3.2%	22,913	8.2%	24,051	5.8%
	Concrete*	1,206	2.3%	31,277	11.2%	39,150	9.5%

*Concrete includes the precast concrete building type.

Building occupancy within the different building types varies significantly between the daytime and nighttime scenario (**Table 5-2**). In the 2 AM scenario, most (87%) of the population is within wood frame construction. The daytime and nighttime occupancy models assume people from outlying counties commute into the study area; thus, daytime occupancy totals are generally higher than permanent resident population totals.

Table 5-2. Occupancy by building type.

Building Type	Number of Buildings	"2 PM" Daytime Occupancy	Daytime Percent	"2 AM" Nighttime Occupancy	Night Time Percent	Permanent Residents	Percent
Concrete	8,599	314,378	19%	60,383	4%	35,679	2%
Manufactured Housing	17,295	11,221	1%	31,387	2%	32,969	2%
Precast Concrete	6,603	195,438	12%	12,539	1%	3,811	0%
Reinforced Masonry	16,125	205,964	12%	43,218	3%	33,525	2%
Steel	16,487	213,478	13%	49,246	3%	24,291	1%
Unreinforced Masonry	5,092	52,271	3%	13,766	1%	11,416	1%
Wood	545,651	697,336	41%	1,442,287	87%	1,499,345	91%
All building types	615,852	1,690,086		1,652,825		1,641,036	

5.3 Building Damage, Casualties, and Displaced Population

We tabulated the impacts to buildings and people at the county and jurisdictional level (Appendix C, **Table 12-8** through **Table 12-11**) and at the neighborhood unit level for all earthquake scenarios. Jurisdictional and neighborhood unit level summaries are available in tabular form in the accompanying GIS database. Building damage results were also expressed as a *loss ratio*—the total repair cost estimate for all buildings in a given spatial unit divided by the total replacement cost for all buildings. Building debris tonnage was summarized at the given spatial unit. Casualties were summarized for the given spatial unit at the individual casualty level, and a total casualty level for daytime and nighttime was calculated. The tables in the GIS database enable one to express graphically the damage estimates in any

number of ways, such as displaying Level 2 casualties per 10,000 people. For demonstration purposes, we present the total injuries requiring hospitalization per neighborhood unit, daytime scenario, CSZ earthquake with saturated soil conditions, in Appendix E, Plates 14–16.

Damage estimates vary widely across the study area, depending on local geology, soil moisture conditions, type of building stock, and distance from the fault. In the Cascadia Subduction Zone scenario, damage is generally greater in the western portion of the study area than in the eastern portion. Yet local geology variations can result in significant damage even well east of the Willamette River, such as the neighborhood of North Troutdale (Appendix E, **Plate 15**).

The 9% ("dry" soil conditions) to 14% ("wet") overall estimated loss from a CSZ magnitude 9.0 earthquake includes all buildings in the study area (**Table 12-8** and **Table 12-9**). The damage is not equally distributed across all building uses or building types, as seen in the referenced tables. Many high-value commercial and industrial buildings exist on areas of high to very high liquefaction hazard. The average loss ratio for wood-framed single-family residential buildings ranges from 2% to 7% (for "dry" and "wet" soil conditions, respectively; **Table 5-3**).

Although the timing of an earthquake has no impact on building damage or displaced population, more people will experience casualties during a workday earthquake scenario than if the earthquake occurred at night (Appendix C, **Table 12-8** through **Table 12-11**). During the daytime scenario, most people are occupying non-wood structures (**Table 5-2**), which typically fare worse in an earthquake than wood-frame construction.

Even though a Portland Hills fault earthquake is of shorter duration than a CSZ earthquake, its placement relative to significant assets in the region would result in much higher damage overall (Appendix C, **Table 12-10** and **Table 12-11**). At distances beyond 15 miles from the Portland Hills fault zone, damages from a Cascadia Subduction Zone scenario generally exceed a Portland Hills fault scenario, which can be visualized by comparing the ground motion data in Appendix E, Plates 4 and 5.

Soil moisture conditions significantly influence loss estimates, with overall building loss ratios of 9% versus 14% for the Cascadia earthquake between the "dry" soil conditions and "wet" (saturated) soil conditions (Appendix C, **Table 12-8** and **Table 12-9**). The large percentage of buildings in moderately liquefiable zones, such as the Tualatin Basin in Washington County, combined with the high-value buildings in very high liquefiable zones in the Columbia Slough, downtown Portland near the Willamette River, and the northwest industrial area of Portland account for much of the increase in the wet scenario loss.

Several smaller jurisdictions exhibit higher or lower loss ratios compared to other jurisdictions, due to unique situations. Johnson City in Clackamas County is almost exclusively composed of manufactured housing—a building type that experiences significantly more damage for a given ground motion than does a wood frame house (Kircher and others, 1997). The city of Barlow in Clackamas County is situated entirely on soft soils (Section **3.2**) that amplify the ground motion, on potentially liquefiable soils, and much of its building value is contained in four storage facilities constructed of a more fragile building type compared to wood-frame construction. Although the City of Sandy's boundaries span multiple soil types and liquefaction susceptibility categories, nearly all of its assets are on firm, non-liquefiable soils, and thus its loss ratio is comparatively low (1%, **Table 12-8**).

Building damage is higher in non–single-family residential structures (**Table 5-3**). Single-family residential is dominated by light-frame wood construction (**Table 5-1**), the most resilient of the 36 generic building types available in the Hazus AEBM. Multi-family residential is a mixture of wood frame construction and less resilient building types. "Single-family residential: manufactured housing" was broken out to highlight its relative seismic vulnerability.

Table 5-3. Damage to buildings by building category and by earthquake scenario.

		Cascadia Subduction Zone Magnitude 9.0 Earthquake				Portland Hills Fault Magnitude 6.8 Earthquake			
		"Dry" Conditions		"Wet" (Saturated) Conditions		"Dry" Conditions		"Wet" (Saturated) Conditions	
Building Category	Building Value ($ Million)	Building Repair Cost ($ Million)	Loss Ratio	Building Repair Cost ($ Million)	Loss Ratio	Building Repair Cost ($ Million)	Loss Ratio	Building Repair Cost ($ Million)	Loss Ratio
Agricultural	9,263	947	10%	1,347	15%	1,271	14%	1,796	19%
Commercial	57,134	10,381	18%	14,133	25%	22,240	39%	27,326	48%
Industrial	18,485	3,651	20%	4,888	26%	6,578	36%	8,216	44%
Institutional	17,609	2,438	14%	3,114	18%	5,871	33%	7,089	40%
Multi-family residential	44,391	3,288	7%	5,621	13%	10,118	23%	14,423	32%
Single-family residential	111,408	2,695	2%	7,421	7%	14,234	13%	24,254	22%
Single-family residential: manufactured housing	879	158	18%	186	21%	257	29%	307	35%
Total	259,169	23,558	9%	36,710	14%	60,569	23%	83,411	32%

Institutional combines Hazus occupancy classes REL1, GOV1, GOV2, EDU1, and EDU2. Commercial combines all Hazus COM occupancy classes and RES4. Multi-family residential combines Hazus occupancy classes RES3, RES5, and RES6.

The Hazus AEBM model estimates each building's probability of being in one of five damage states: *None*, *Slight*, *Moderate*, *Extensive*, and *Complete*. The five individual probabilities sum to 1.0. General descriptions for the structural damage states of 16 common building types are provided by FEMA (2011, Section 5.3); **Figure 5-2** shows an example. We obtained the total number of buildings in a particular spatial unit by summarizing all buildings' individual structural probability of damage state values, per the guidance provided by FEMA (2017a). The data in Appendix C, **Table 12-3** can be used to estimate the number of red-tagged and yellow-tagged buildings, and the number of buildings needing structural inspection after an earthquake. In addition, we summarized all permanent residents per building damage state, by generalized building types: single family residential (excluding manufactured housing); single family residential in manufactured housing, and multi-family residential.

Figure 5-2. Example damage state descriptions for a light-frame wood building (FEMA, 2010). The "None" damage state is not provided.

Damage State		Description
	**Slight**	Small plaster cracks at corners of door and window openings and wall-ceiling intersections; small cracks in masonry chimneys and masonry veneers. Small cracks are assumed to be visible with a maximum width of less than 1/8 inch (cracks wider than 1/8 inch are referred to as "large" cracks).
	**Moderate**	Large plaster or gypsum-board cracks at corners of door and window openings; small diagonal cracks across shear wall panels exhibited by small cracks in stucco and gypsum wall panels; large cracks in brick chimneys; toppling of tall masonry chimneys.
	**Extensive**	Large diagonal cracks across shear wall panels or large cracks at plywood joints; permanent lateral movement of floors and roof; toppling of most brick chimneys; cracks in foundations; splitting of wood sill plates and/or slippage of structure over foundations.
	**Complete**	Structure may have large permanent lateral displacement or be in imminent danger of collapse due to cripple wall failure or failure of the lateral load resisting system; some structures may slip and fall off the foundation; large foundation cracks. Three percent of the total area of buildings with Complete damage is expected to be collapsed, on average.

5.3.1 Seismic Design Level Improvement Exercise

Modeling adjustments to the building inventory seismic design level results in much lower amounts across all categories of loss (**Table 5-4**), although the effect is muted in the "wet" (saturated) soil condition scenario. The Hazus building damage model assumes damage due to ground shaking is independent of damage due to ground failure (FEMA, 2011, Section 5.6.3). In the Hazus model, improved seismic design levels will reduce damage estimates from ground shaking but not from ground failure. In our study area, more than half of the building inventory is situated on sites with a moderate or higher liquefaction susceptibility rating (**Table 10-5**). Thus, the reduction in loss in the "wet" (saturated) soil conditions is muted, due primarily to liquefaction probability being incorporated into the damage estimate. The reduction in loss estimates is more dramatic in the "dry" soil conditions scenario, where liquefaction and earthquake-induced landslide impacts are minimal.

Table 5-4. Seismic design level improvement exercise, Cascadia Subduction Zone magnitude 9.0 earthquake. See Section 4.1.5 for scenario definitions.

	"Dry" Soil Conditions			"Wet" (Saturated) Soil Conditions		
Seismic Design Level Scenario	**Unchanged**	**Moderate**	**High**	**Unchanged**	**Moderate**	**High**
Building Repair Cost ($ million)	23,558	6,466	4,230	36,710	20,988	18,979
Building Loss Ratio	9%	2%	2%	14%	8%	7%
Debris (thousands of tons)	12,794	2,512	1,304	17,292	8,148	7,121
Long-term Displaced Population	16,852	2,438	1,664	85,211	72,329	71,617
Casualties — Daytime Scenario						
Total Casualties	18,286	2,032	987	27,175	12,606	11,711
Level 1 Casualties	13,342	1,681	839	19,489	9,005	8,281
Level 2 Casualties	3,518	278	118	5,454	2,567	2,431
Level 3 Casualties	484	25	10	758	352	340
Level 4 Casualties	942	48	20	1,473	682	659
Casualties — Nighttime Scenario						
Total Casualties	4,334	902	596	10,400	7,259	6,989
Level 1 Casualties	3,338	775	525	7,838	5,484	5,262
Level 2 Casualties	739	106	60	1,979	1,404	1,364
Level 3 Casualties	87	7	4	203	131	129
Level 4 Casualties	169	14	7	380	240	235

Loss estimates for unchanged scenario are taken from **Table 12-8** and **Table 12-9**, and provided for reference. Casualty Level definitions are provided in **Table 4-1**. Total building replacement costs used for building loss ratio taken from **Table 5-3**.

5.4 Electric Power Transmission

Of the 18,098 poles and towers in our database, 921 (5%) have a 20% to 30% chance of experiencing between 1 and 2 meters of ground deformation, and 2,203 (12%) have a 20% to 30% chance of experiencing more than 1 meter during a Cascadia magnitude 9.0 earthquake with "wet" (saturated) soil conditions (Appendix E, **Plate 13**). In the "dry" soil conditions, only 6 poles and towers have a 20% to 30% chance of experiencing between 1 and 2 meters of ground deformation, with none experiencing more than 2 meters of deformation. In the "dry" soil conditions scenario, permanent ground deformation is due exclusively to earthquake-induced landslides. In the "wet" (saturated) soil conditions scenario, liquefaction is a significant contributor to permanent ground deformation proximal to the power pole or tower.

Similar potential impact is observed for the Portland Hills fault magnitude 6.8 earthquake scenario. Of the 18,098 poles and towers in our database, 2,367 (13%) have a 20% to 30% chance of experiencing between 1 and 2 meters of ground deformation, and 3,687 (20%) have a 20% to 30% chance of experiencing more than 1 meter during "wet" (saturated) soil conditions. In the "dry" soil conditions scenario, 100 (0.5%) poles and towers have a 20% to 30% chance of experiencing between 1 and 2 meters of ground deformation, and 8 poles and towers have a 20% to 30% chance of experiencing more than 2 meters.

5.5 Emergency Transportation Routes

In the Cascadia magnitude 9.0 earthquake, "wet" (saturated) scenario, most (177 out of 238, or 74%) route segments will have a 20% to 30% chance of experiencing significant ground deformation along some portion of the segment (Appendix E, **Plate 10**). Although the regional post-earthquake road conditions significantly improve under the "dry" soil conditions scenario, (Appendix E, **Plate 11**), several road segments (6 out of 238, or 3%) may still be impacted. In the "dry" soil conditions scenario, the road segments that have a chance of failure are due to their placement on 1) existing landslides, 2) areas of elevated landslide susceptibility based on slope and geology, or 3) fill material that includes a significant slope proximal to the road segment. The 20% to 30% probability of failure on a per segment basis may sound modest when taken in isolation, but when individual location probabilities of failure are combined in a binomial distribution statistical method (probability of failure = $(1 - p)^n$), the overall failure estimate for the segment can increase significantly.

For mapping and planning purposes, we categorized road segments into distinct bins, even though only a fraction of a given road segment may experience significant ground deformation. An example of this effect can be observed in Washington County, where emergency transportation routes commonly cross alluvial deposits that may fail due to liquefaction (inset map in Appendix E, **Plate 12**). Although only a portion of the road may be impacted by ground failure, the road segment is considered impassable in its entirety until repairs are made. **Plate 12** (Appendix E) shows the portions of the segments that may experience significant ground failure in a Cascadia magnitude 9.0 earthquake.

For a Portland Hills fault magnitude 6.8 earthquake, 66 out of 238 (28%), and 205 of 238 (95%) of segments have a 20% to 30% chance of experiencing significant ground deformation along some portion of the segment, in the "dry" and "wet" soil condition scenarios, respectively. The increase in percentage compared to the CSZ can be explained by the significant difference in ground motion between the two earthquake scenarios (Plates 4 and 5).

6.0 DISCUSSION

This study is the first conducted in the three-county area that provides damage estimates at levels useful for both regional and local planning. It presents loss estimates as a range for two building occupancy scenarios and two soil moisture scenarios. By doing so, planners can get a better sense of the range of damages and casualties that may occur with a major earthquake: Which areas may have experienced more damage, given the potential for liquefaction and local site amplification? Where were people when the earthquake occurred? How many casualties might that produce?

A magnitude 9.0 Cascadia Subduction Zone earthquake will result in significant damage to buildings, with concomitant casualties, throughout the three-county area. Transportation networks may be severely impaired, compromising emergency response. Millions of tons of debris will need removal to staging areas for sorting and eventual permanent disposal. Hundreds of thousands of buildings will need timely safety inspections, and thousands to tens of thousands of people will need to find other permanent housing arrangements. In comparison, a magnitude 6.8 Portland Hills fault earthquake will be devastating, primarily due to its position relative to the study area's major assets and population centers, with losses more than double those from a magnitude 9.0 Cascadia Subduction Zone earthquake.

6.1 Earthquake Impacts

6.1.1 Geographic Variations

Damage and casualty estimates vary widely throughout the three-county area. Primary reasons for the variation include the seismology, local geology, and building development history. In a Cascadia Subduction Zone earthquake, ground motion will be less in eastern part of the study area compared to the western part. Local geological characteristics can produce significant variations in ground motion (Appendix E, Plates 4 and 5). Such variation should not be interpreted to suggest that some areas within the three counties are unaffected. The City of Sandy, for example, has a relatively low building loss ratio, at 1% (Appendix C, **Table 12-9**), yet the Cascadia earthquake is estimated to generate $12 million in damage within the city boundaries.

6.1.2 Casualties

For both the Cascadia Subduction Zone earthquake and the Portland Hills fault earthquake, and in both "dry" and "wet" (saturated) soil condition scenarios, casualty estimates for a daytime earthquake are at least double in quantity compared to a nighttime earthquake. During nighttime most, but not all, of the population are in more resilient wood-frame construction (**Table 5-1**, **Table 5-2**), while during the daytime, much of the population is dispersed among non-wood frame construction buildings, such as offices, schools, and factories. This temporal pattern has been observed in past earthquakes, most recently in Christchurch, New Zealand, where two earthquakes struck, one at 4:35 AM on September 4, 2010, and one at 12:51 PM on February 22, 2011 (EERI, 2011). No deaths occurred from the early morning earthquake, whereas the afternoon earthquake resulted in the deaths of 185 people.

We emphasize that our daytime building occupancy model used as a basis for generating daytime casualty numbers is a simplification of the dynamic and complex human environment, but it is still useful for planning purposes. Post-earthquake emergency operations can be enhanced by having an awareness of the types of population shifts between buildings throughout the day and week, and the seismic resiliency of those buildings.

6.1.3 Building Damage Inspection and Displaced Population

After a major earthquake, at least 200,000 buildings in the Portland Metropolitan Region will need timely ATC-20-based safety inspection by qualified personnel (ATC, 1989). Our estimate includes all buildings with slight to complete damage (Appendix C, **Table 12-3**), following the quantification method outlined by EERI (2015), which assumed a rate of four to five buildings per day per inspector. Assuming a goal of completing the task in 30 days, our results identify a need for 1,600 to 2,000 certified inspectors for a Cascadia Subduction Zone magnitude 9.0 earthquake. A Portland Hills fault earthquake would require twice the number of inspectors. Many out-of-area inspectors can be brought into an affected area after an earthquake, as discussed in the Oregon Resilience Plan (OSSPAC, 2013, Section 2). Inspection may displace some portion of building occupants who assumed buildings were structurally sound. In other cases, inspection may restore confidence in the building's structural integrity. We can only speculate on such dynamics, but we can provide permanent resident occupancy counts per building damage state (Appendix C, **Table 12-4** through **Table 12-7**).

6.1.4 Debris

Debris removal will require local staging areas for storing, sorting, and eventual transfer to a permanent disposal location. Assuming 25 tons per truckload, 400,000 to 680,000 truckloads of building debris would be generated by a Cascadia Subduction Zone earthquake ("wet" [saturated] soil scenario). We did not estimate other types of debris, such as buckled roads, collapsed overpasses, and landslide flows. Identifying staging areas is partly a GIS exercise that uses the debris-per-neighborhood estimates supplied with this report, along with information on potential long-term compromises to the local transportation network such as bridge collapse. In addition, debris staging site selection should be informed by other emergency or recovery planning efforts that may identify the same areas for other operational needs.

6.1.5 Infrastructure

Our emergency transportation route analysis graphically shows the likelihood of a fragmented emergency transportation route network, one where distribution of goods and services may be significantly affected. It is intended to inform the planning process, emphasizing the need for adaptability and consideration of alternative routes. Our analysis did not consider other potential route blockages, such as collapsed buildings and failed bridges and overpasses. Engineering judgment from transportation sectors can be applied to determine which segments may be quickly restored and which segments may be out for longer periods. Together, such information and perspectives can be used as a basis for establishing, prior to an earthquake, local points of distribution, including food, water, and fuel for emergency operations.

Portions of the electric distribution network may be significantly impacted due to ground failure compromising the integrity of transmission structures. As with the emergency transportation route analysis, our work is intended to inform the planning process. Engineering judgment from electrical utilities sectors can be applied to determine if some areas will be impacted for longer durations, and if additional capacity or redundancy is warranted. During the Christchurch, New Zealand, earthquake sequences of 2010-2011, electric poles and towers generally fared well in the presence of liquefaction (Kwasinksi and others, 2014).

6.1.6 Alternative Earthquake Scenarios

For planning purposes, we chose to model an earthquake at the upper end of its estimated potential energy release. The Cascadia Subduction Zone magnitude 9.0 earthquake scenario assumes a full margin rupture. Partial ruptures along the CSZ have been inferred from the geologic record, with the most frequent occurrences along the southern portion of the CSZ (summarized by Priest and others, 2014). The Oregon State University Hazard Explorer for Lifelines Program maintains a web-GIS tool that displays a full CSZ rupture and three partial rupture CSZ scenarios (http://ohelp.oregonstate.edu/). We obtained the same synthetic bedrock ground motion data used in the OHELP tool from A. Frankel (written communication, 2016) of the USGS. In the Portland Metropolitan Region, the synthetic CSZ magnitude 8.7 bedrock ground motion data averages about 85% of CSZ 9.0 bedrock ground motion data, and the synthetic CSZ magnitude 8.4 bedrock ground motion, with its northern rupture extent west of Waldport, Oregon, is about 40% of the full rupture CSZ magnitude 9.0 earthquake.

Damage estimates do not scale linearly with bedrock ground motion, and one should not assume damage from a CSZ magnitude 8.4 earthquake would be 40% of the CSZ magnitude 9.0 earthquake damage estimate. Yet significant damage could still occur in the study area, primarily due to the seismic site effect where the bedrock ground motion is strongly amplified by soft soils (Section **3.2**). The most dramatic consequence of the seismic site effect observed to date is from the 1985 Mexico City earthquake, where a relatively distant rupture produced devastating building damage within the historic lakebed (Singh and others, 1988). Future studies could quantify the influence of the site effect on damage estimates across lower magnitude CSZ earthquake scenarios.

The Portland Hills fault was modeled at the upper end of its estimated magnitude range (M 6.8); it could rupture at lower magnitude. Buildings above the rupture zone will likely experience the same damage as estimated in this report. Buildings more distant from the rupture zone but situated on softer soils would experience more damage than nearby buildings situated on stiffer soils. The Portland Hills fault is part of a fault zone that includes the Oatfield fault and the East Bank fault (Wong and others, 2001). Other seismogenic faults exist in the study area (Personius and others, 2003; USGS Quaternary Fault and Fold Database: https://earthquake.usgs.gov/hazards/qfaults/). Again, buildings above the fault will experience the most damage, but buildings distant from the fault situated on soft soils may be significantly damaged.

6.2 Seismic Design Level Improvements

Our seismic design level improvement modeling exercise (Section 5.3.1) provides strong support to the suggestion that seismic upgrades to buildings, or replacement of older buildings, can significantly reduce loss and casualties. Levi and others (2015) provided a case for a wide-scale retrofitting program to poor quality buildings throughout Israel, by using Hazus-generated loss estimates based on existing building inventory and a hypothetically retrofitted building inventory. The study assumed an average estimate of US$100/per square meter (US$9.30 per square foot) to upgrade older buildings to limit extensive or complete damage. Yet any proposed improvement should take site-specific conditions into account. In the “wet” (saturated) soil scenario, ground failure due to liquefaction reduces the benefits of retrofitting, as seismic upgrades do little to prevent foundation rupture, but mitigation techniques such as compaction grouting can minimize the ground failure impact, albeit at additional cost.

We urge caution in interpreting the results of **Table 5-4**. Although it offers a hypothetical upper bound of what could be achieved from seismic retrofitting, it should not be used to support the proposed retrofitting or replacement of a particular building. A building-specific analysis incorporates individual

characteristics of the structure, specifying parameters such as its yield point (FEMA, 2010). We used generic building type models in our Hazus AEBM (Section **2.1.4**), which in the particular case, may over- or underestimate the loss (Lu and others, 2017). Further, the exercise did not incorporate building foundation depth or other local site conditions that may mitigate the effects of ground failure from liquefaction. In the Moderate scenario, our modeling exercise assumed a retrofit brings buildings up to moderate or high seismic design standards. In practice, the decision to retrofit or replace an older structure is complex (Williams and others, 2009; City Club of Portland, 2017; Paxton and others, 2017), and one that we cannot address directly in this report.

6.3 Comparison with Previous Studies

Wang (1998), using an early version of Hazus, quantified the impact of a magnitude 8.5 Cascadia Subduction Zone earthquake scenario across the state of Oregon, reporting losses by individual county. Liquefaction and landslide information were not regionally available, nor was it possible to incorporate such information in the Hazus model at that time. Hofmeister and others (2003) used Hazus to estimate impact of a magnitude 6.8 Portland Hills fault and a magnitude 9.0 Cascadia Subduction Zone earthquake scenario to buildings and bridges in Clackamas County, Oregon. The study incorporated building data from the Metro (1998) inventory, and updated soil classification and liquefaction and landslide susceptibility. Local building data were aggregated into the Hazus-MH model's General Building Stock (GBS) inventory, a census track-based unit, with loss estimates derived at the GBS level. Excluding building content, the building repair cost, expressed as a percentage of the building replacement cost, was 13.3% for the Portland Hills fault and 3.4% for the Cascadia Subduction zone earthquake. More recently, Tetra Tech (2016a) updated General Building Stock inventory data for the City of Portland, using ground motion and ground failure data from Madin and Burns (2013), and estimated loss ratios of 4.3% for a Cascadia Subduction Zone scenario and 14.3% for a Portland Hills fault magnitude 6.5 scenario, using USGS ShakeMap data.

Our building loss ratio estimates of 9% to 14% for a Cascadia Subduction Zone magnitude 9.0 earthquake, and 23% to 32% for a Portland Hills fault magnitude 6.8 earthquake are higher than the loss ratios published in the aforementioned studies. We account for this increase due to several factors. The largest contributor to the difference is the method by which the two Hazus tools (General Building Stock [GBS] and Advanced Engineering Building Module [AEBM]) factor the probability of ground failure from liquefaction or from earthquake-induced landslide into the building damage model. In the GBS model, the Hazus tool distributes the ground failure probability across the Moderate, Extensive, and Complete damage states (FEMA, 2011, Equation 5-16), with most of the ground failure probability assigned to the Moderate and Extensive states and a small (<10%) portion assigned to the Complete state. In the AEBM model, the Hazus tool assigns the ground failure probability in its entirety to the Complete damage state. The effect is that AEBM-derived building loss, casualty, and debris estimates will be larger than GBS-derived estimates when all other model inputs are equal, local geological conditions are set to moderate or higher liquefaction and/or landslide susceptibility levels, and sufficient ground motion is present to induce landslides or liquefaction.

Other contributors to the difference are as follows. In our AEBM building database, our seismic design levels (Section **10.1**) were more conservative than the seismic design level distributions embedded within the GBS database, sometimes referred to as the default Hazus mapping scheme. Our review of that scheme suggested it was primarily based on California benchmark years and thus overly optimistic, as California building codes through the twentieth century were more stringent than Oregon

building codes (Olson, 2003; Judson, 2012, FEMA, 2017c, Table 3.5). Although it is possible to alter the Hazus mapping scheme in the General Building Stock (e.g., Seligson, 2008), to our knowledge, such manipulations were not done in the aforementioned GBS-based studies. A higher level of seismic design assignment to building inventory will result in reduced loss estimates (**Table 5-4**).

Within large portions of the developed areas in the study area, our updated liquefaction susceptibility ratings were higher than the liquefaction susceptibility ratings used in the aforementioned studies (primarily Mabey and others, 1997). Appleby and others (in preparation), using the guidelines provided by FEMA (2011, Table 4.10), classified large areas containing high-value building assets with a Very High and High rating compared to the rating of High and Moderate assigned by Mabey and others (1997), particularly in the Columbia Slough, northwest industrial Portland, and eastern downtown Portland. A large portion of the developed area in Washington County was assigned a Moderate liquefaction rating by Appleby and others, which also contributed to the increased loss estimates observed in our study.

We could not directly compare our loss estimates to the losses published by FEMA (2017b), due to their usage of a probabilistic model that did not include a 500-year earthquake, which most closely resembles the Cascadia Subduction Zone scenario modeled in our study. Their debris estimate for the state of Oregon (2.1 to 21.6 million tons) is smaller than our estimate of 12 to 17 million tons, after adjusting for our study's area. (We assume our study includes about 44% of the building assets in the state, based on the area's population ratio compared to the state of Oregon.) The FEMA report used the GBS model and a simplified NEHRP "D" assignment. To our knowledge, the study did not incorporate any liquefaction susceptibility data. Further, default Hazus building inventories, such as were used in the FEMA study, commonly underestimate the square footage for nonresidential buildings, which are generally more sensitive to ground motion. Although that study provided a good nationwide comparative perspective on earthquake hazards, it is too generalized to use for county loss estimation purposes.

We examined the geological updates and the updated ground motions within the Critical Energy Infrastructure (CEI) Hub, and we compared them to the datasets used by Tetra Tech (2016b). Although some increases were observed in the updated ground motion data, we determined that the changes were not large enough to significantly alter the overall damage estimates and recommendations made in the Tetra Tech study. We note that the Hazus GBS tool was not used to generate the damage estimates in that study; damage estimates to the infrastructure were obtained from a Hazus tool that incorporates the ground failure in a manner equivalent to the Hazus AEBM.

Our Portland Hills fault results are similar to what was estimated for a magnitude 7.0 Wasatch fault earthquake in the Salt Lake City area (EERI, 2015, p. 26). The Salt Lake City area has approximately 775,000 buildings, compared to 616,000 buildings in our study area. The two faults have significant assets constructed on top of, and near to, the fault. Both areas have major assets on moderate to high liquefaction potential soils. The key difference between the two faults is the frequency of occurrence—at least 22 large earthquakes have ruptured along the central segments of the Wasatch Fault in the past 6,000 years, whereas evidence suggests the Portland Hills fault has had two ruptures in the past 15,000 years (Liberty and others, 2003).

7.0 RECOMMENDATIONS

This study provides detailed, actionable earthquake loss estimation data for the Portland metropolitan region at a range of scales. Communities, counties, businesses, non-governmental organizations, and regional agencies can use the accompanying data to better plan for, respond to, and recover from a major earthquake. Many of these recommendations build upon those listed in the Oregon Resilience Plan (OSSPAC, 2013). Planning for, responding to, and recovering from a major earthquake is a multi-faceted, multi-disciplinary effort. The scope of this project was limited to estimating damage to buildings and the people that occupy them, and to two key infrastructure sectors. Our recommendations below are directly supported by the findings in this study, and they should not be considered comprehensive.

Our recommendations build on the efforts done to date by agencies, institutions, businesses, and private homeowners to improve the region's seismic resilience. The Oregon Seismic Rehabilitation Grant Program, in place since 2007, has funded upgrades to more than 50 schools and emergency service buildings (http://www.oregongeology.org/sub/projects/rvs/). Bonneville Power Administration has identified seismic vulnerability of its transmission system and has taken several actions to improve its resiliency (Scruggs, 2014). Modifications to the Oregon statewide building code have, through time, increased the seismic resiliency of newer construction (Judson, 2012). The City of Portland's current building code requires owners of unreinforced masonry buildings to seismically retrofit their buildings on the basis of certain triggers (PBEM, 2017). The Great Oregon Shakeout program, managed by Oregon Office of Emergency Management, has more than 580,000 participants, elevating public awareness of the earthquake hazard; the program suggests actions individuals can take to minimize casualties and preparation for post-earthquake disruption of services.

Planning

We encourage regional and local planners, each who have their own questions and needs, to explore the accompanying GIS data. Static maps, such as in Appendix E, Plates 14–16, are just one representation of the loss estimates. We suggest that a primary value of the database is the spatial component: in addition to asking how many or how much, we can ask *where*—where might we expect casualties to be higher, given the time of day of the earthquake? Where can we plan staging areas for debris? At the same time, we caution against over-interpreting the loss estimates, as the data and methods used in this project contain large uncertainties.

Casualty estimates supplied in this report can be used to compare with the region's existing medical facility capacity, including trained, available personnel. The spatial nature of the data supplied with this report can be used to better understand the potential demands on specific facilities, and to quantify emergency care coordination needs at a regional level.

Counties and jurisdictions updating their natural hazard mitigation plans (NHMPs) can use the earthquake damage estimates provided in this report.

Recovery

Hundreds of thousands of buildings in the study area will need safety inspections after a major earthquake. The state can sponsor annual Applied Technology Council (ATC)-20 training to qualified engineers, and negotiate mutual aid agreements with other neighboring states. Timely inspection of damaged buildings will reduce pressure on temporary shelters.

Resiliency: Buildings

The majority of buildings in the study area do not meet current seismic building code standards, although the buildings did meet code standards in place at time of construction. The state and counties can consider incentives and other options that encourage building owners to seismically upgrade their buildings. Such upgrades will reduce casualties and building repair costs and will minimize potential loss of businesses and workforce housing. Jurisdictions can consider triggers that require seismic upgrades, such as a major building renovation.

Resiliency: Infrastructure Improvements

We cannot overstate the need for a secure, regional liquid fuel supply that supports emergency response and recovery. The emergency transportation route analysis provided in this study suggests the need to identify strategically placed local fuel points of distribution. We encourage counties to work with the Oregon Department of Energy in implementing the Oregon Fuel Action Plan (ODOE, 2017), specifically, identifying priority lifeline routes and fuel points of distribution.

Electric utilities can use this study's updated ground motions and ground failure to evaluate the potential threat to their infrastructure, such as substations. Electric system resiliency analysis can incorporate the transmission structure information provided in our geodatabase to determine if additional capacity or redundancy is needed.

Resiliency: Essential and Critical Facilities

Our project did not explicitly identify or evaluate essential facilities, such as fire stations, in the study area. We encourage all communities and planners to clearly define such facilities and evaluate their seismic resilience by using the updated ground motion and ground failure data accompanying this report along with updated Rapid Visual Screening surveys (FEMA, 2015a; Lewis, 2007). Such facilities include emergency shelters and community points of distribution.

Enhanced Emergency Management Tools

Building footprints developed for this project can be incorporated into regional and statewide databases. Location and number of buildings, especially on larger rural lots, are essential information during emergency operations such as wildfire fighting.

A rapid earthquake loss assessment tool could be developed for Oregon by building on methods established in this study and other research such as that of Erdik and others (2011). Each earthquake presents scientists with new information. The synthetic earthquake ground motion data used for this project is the best estimate available from a full rupture subduction zone and a local crustal fault earthquake. In practice, the magnitude and location of an earthquake and the ground motions and ground deformation will likely vary from what was anticipated. In addition to the Portland Hills fault, several other active local crustal faults, such as the Gales Creek fault zone, exist in the study area (Personius and others, 2003). The USGS ShakeMap program (https://earthquake.usgs.gov/data/shakemap/) provides near-real-time maps of ground motion data following significant earthquakes. Having a building database and tools in place to estimate response to a particular earthquake with its own unique ground motions can provide emergency planners with a rapid post-earthquake assessment of the situation.

Database Improvements

County and city databases could be improved with information on seismic retrofits and upgrades to individual buildings. Currently, such information is not readily available for analysis or to potential buyers of a property. At present, only one jurisdiction in the study area maintains the basics of such a database (City of Portland [2017], Unreinforced Masonry buildings).

Public Awareness

The technical information contained in this report can be used to develop practical tools and materials aimed at increasing public awareness of regional earthquake risks and encouraging preparedness actions. Examples of such tools include the Seattle and King County Ready disaster preparedness website, https://hazardready.org/seattle/ (which incorporates other natural hazards), and the report developed by the Utah Chapter of the Earthquake Engineering Research Institute describing the Wasatch Fault in Salt Lake City (EERI, 2015). Public awareness efforts should strive to reach underserved communities and communities whose primary language is other than English, as well as community members with disabilities and access or functional needs.

Future Studies

Our study was primarily focused on direct physical impacts from a major earthquake, including building repair or replacement costs. It did not consider other direct and indirect economic losses, such as lost wages. We recommend incorporating the detailed loss information from this report into a more sophisticated economic analysis, one that factors in other items such as availability of investment capital and a trained labor force, and willingness of businesses to return to the area after a damaging earthquake.

We aggregated loss data at census block groups, which is often the same aggregation unit used when social vulnerability indices are constructed (e.g., Toké and others, 2015). Schmidtlein and others (2011) compared census tract Hazus-based earthquake loss estimates with their social vulnerability indices. A similar type of an analysis could be conducted in our study area at the census block group level.

The methods developed for this project could facilitate similar earthquake impact analyses for other urbanized areas of Oregon that have known earthquake hazards, such as Klamath Falls/Altamont, Salem/Keizer, Albany/Corvallis, and Eugene/Springfield.

Although our analysis focused on impacts from an earthquake, the underlying building database can be used to quantify potential loss due to other natural hazards, such as floods, landslides, or wildfires.

8.0 ACKNOWLEDGMENTS

The Regional Disaster Preparedness Organization (RDPO), Portland, Oregon, provided funding for this project through an Urban Areas Security Initiative grant (UASI) 15-170 from U.S. Department of Homeland Security (Funding Opportunity [NOFO] #DHS-15-GPD-067-000-01; Federal Award Identification Number [FAIN] EMW-2015-SS-0004-S01). Oregon Office of Emergency Management administered the grant on behalf of RDPO. Many people contributed to this report at various levels, ranging from data creation, literature research, methods, information technology, tool development, and technical review. From the Oregon Department of Geology and Mineral Industries: Ken Aaro, Christina Appleby, Lowell Anthony, Quinn Butler, Robert Hairston-Porter, Robert Houston, Lina Ma, Gustavo Monteverde, Jesse Schaefer, Deb Schueller, Yumei Wang, Rudie Watzig, and Matthew Williams. From the

Regional Disaster Preparedness Organization: Emma Stocker, Laura Bruno, and Denise Barrett. From FEMA: Doug Bausch and the Hazus Support Team. From USGS: Art Frankel, who provided custom ground motion simulations for the Portland Hills fault. County and city emergency leads reviewed a draft copy of this document and provided helpful comments: Lisa Corbly, Carmen Merlo, Chris Voss, John Wheeler, and Jay Wilson.
