

While Pembina has assured everybody that they have a great safety record and that no danger exists, we have heard these kinds of convictions in the past. Unexpected events occur, and there is no small danger related to a Pembina installation. Besides that, there is much less certainty that there won't be rail disaster. That we have seen numerous times recently. Who will be responsible for clean-up, for lives lost, for damage to property?

We are going in the wrong direction. We need to put our energy into the collection and distribution of solar power. Every forty minutes enough sufficient solar energy reaches us to meet 100% of the world's energy needs for a year. Continuing to support polluting industries is our usual short-sighted approach.

Do not allow Pembina to site here. Jobs are important, but the costs are too great. Portland can do better.
